21 Q. All right. So we're moving onto 174.

22 [Exhibit No. 174 was identified.]

23 BY MR. NOEL:

24 Q. And I guess, I wasn't -- I was talking about --

25 A. The bolted connector?

26 Q. The -- the -- exactly. The bolted connector.

1 What is the bolted connector?

2 A. Well, the bolted connector is where you have two
3 tails that come together and you need to mechanically
4 connect them together.

5 Q. All right. And now we will move onto 835. You
6 see the photograph marked as 835?

7 A. It's one that I looked at before.

8 Q. Right.

9 A. Yeah.

10 [Exhibit No. 835 was identified.]

11 BY MR. NOEL:

12 Q. What is 835?

13 A. So when you're looking at it, you're looking at
14 that bar, you're looking at the shoo and corona ring that
15 was attached to the ball and socket insulators. And here,
16 these are your tails coming in and this is the bolted
17 connector that we were looking at on the -- on the other
18 one, and what you're looking for when you do --

19 Q. Okay. Let's go on to the next one first, because
20 we're going to get a close-up here.

21 A. Okay.

22 Q. Now, we're on photograph 836.

23 [Exhibit No. 836 was identified.]

24 THE WITNESS: So what we teach them -- have always
25 taught, you're working on the tower, you're doing an
26 inspection, you're doing an infrared -- especially if

1 you're doing an infrared and this is showing hot, it's
2 going to tell you that there's corrosion that's building
3 between the body of this connector and these strands.
4 What would be concerning to me, if I was looking at this
5 doing an inspection, is when you put these on, you wire
6 brush and you clean the conductor -- the conductor was new
7 at the time. So you're going to put -- you're still going
8 to get oxidation, even though the wire is new, there's
9 still oxidation that builds up on it. So you wire brush
10 it, you clean it, and then you put an inhibitor on it.
11 It's a electrical inhibitor. Some people like to call it
12 a grease, it's -- it's -- it's really nasty to handle.
13 But you put it on and that is a bond that makes sure that
14 the stranding as well as the bolt connector bond together
15 and you don't get any resistance between the bodies of
16 both the bolted connector, and the -- and the -- the fact
17 that you don't see it in here, to me, in my years of -- of
18 being in the field and actually going and taking these
19 down specifically, because I wanted to see the inside of
20 them, is that that -- that grease has completed itself, so
21 it's just a matter of time before this bolted connector
22 would fail. If I was looking at it, it dark in these
23 areas, and I could still see the residue of the grease, I
24 wouldn't be as concern about it. So they either put this
25 on dry originally, and I don't know what they did in 1918?
26 ///

1 BY MR. NOEL:

2 Q. I'm sure it was.

3 A. I -- I don't remember the exact age on it.
4 Things that -- things, you know, have changed over the
5 years. But if you don't -- it's like your battery post on
6 your vehicle, right? You know, you open up your hood and
7 you got all this corrosion between those two connectors,
8 you have to correct it.

9 Q. So what happens if that connector fails?

10 A. You'll have an ignition.

11 Q. As in fire ignition?

12 A. As in fire ignition.

13 Q. As in arcing?

14 A. As in arcing.

15 Q. All right. All right. Changing gears a little
16 bit for the last two slides.

17 You should have 837 in front of you.

18 A. 8-3-7?

19 Q. 8-3-7. It be there some place.

20 A. Got 8-3-4. After the photos, Mr. Noel?

21 Q. Yep. Should be after the photos.

22 A. 8-3-7, got it.

23 Q. Got it?

24 A. Yes, sir.

25 Q. All right. You recognize 837?

26 A. I do recognize this.

1 [Exhibit No. 837 was identified.]

2 BY MR. NOEL:

3 Q. What is 837?

4 A. 837 is a e-mail from 2011 from Mike Badet, who
5 was a transmission line supervisor in the San Francisco
6 Bay area, and this had to do with the Jefferson-Hillsdale
7 115 KV line. And what he has done is -- as, Mr. Noel,
8 indicated before, you kind of read them from bottom to the
9 top on it.

10 So Mike Badet sends an e-mail to Peter Ng who is
11 a supervisor in the T-line engineering. CC'd myself as
12 well as Jeff Lockwood. Jeff was a senior transmission
13 specialist that worked for me, and he indicates to Pete:

14 "Pete, we have a notification to change out
15 hardware on the Jefferson-Hillsdale tower 10/66," I
16 believe is what it says. "We did not have a towerman
17 available to change out the attachment flange
18 (frogplate)." A lot of linemen refer to a hanger plate as
19 a frogplate. "So we went ahead and changed out the
20 insulators and all associated hardware. The crew took a
21 photo of the flange, (attached,) and would like to get your
22 recommendation on moving forward with changing out the
23 flange on this tower and other towers in the area."

24 And so Peter responds back, and he includes Randy
25 Hopkins in the e-mail, Gaylon Brock, who -- who was either
26 tower specialist or supervisor during this period of time

1 and as well as Henry Ho. Henry Ho is a mechanical
2 engineer with PG&E. He says:

3 "Mike, looking at the photo of the hanger plate,
4 I would recommend changing it to a new plate. It appears
5 that there is a groove" -- "that there is a groove cutting
6 into the plate probably caused by years of rubbing between
7 the C-hook and the plate. You might want to discuss this
8 with Dale too."

9 Q. All right. And that's -- and that's all we need
10 the read on this one.

11 A. Okay.

12 Q. Caused by years of rubbing between the C-hook and
13 the plate. In your experience, have you seen where a
14 C-hooks or hanger plates or hanger holes or frog plates or
15 flanges or whatever else they're called, based upon the
16 rubbing between C-hooks and the plates?

17 A. During my last tenure with PG&E for a year, I
18 seen a fair number of them.

19 Q. Let's push -- let's push that out, though.

20 A. If you push that out --

21 Q. Let's say pre-initial retirement.

22 A. -- I have -- I have seen where C-hooks have worn
23 ten percent metal loss in the hanger plate, which is
24 probably the same equivalent in the C-hook. I don't think
25 I have ever recalled seeing anything greater than
26 50 percent --

1 Q. Okay.

2 A. -- in it.

3 Q. So would it be fair to say that it -- that it's
4 common and well known that the C-hooks -- the rubbing
5 between the C-hooks and the hanger holes causes wear?

6 A. It's obvious.

7 Q. All right.

8 A. Yes.

9 Q. Show you finally 795. You see Exhibit
10 Number 795? I don't think it's in that stack. It's right
11 up here on the board.

12 A. Okay.

13 [Exhibit No. 795 was identified.]

14 BY MR. NOEL:

15 Q. All I want to know is, in your experience, have
16 you seen wear like that?

17 A. I haven't seen wear equal to that with a tag to
18 replace -- to replace it in one year.

19 Q. Okay.

20 A. But may I?

21 Q. We're talking pre 2018?

22 A. Yes.

23 Q. During your career?

24 A. Yes.

25 Q. All right. So this is not something that's
26 uncommon?

1 A. It's not something that -- insulators and
2 hardware move. Metal to metal is going to wear.

3 Q. That is it. It's been a long morning.

4 Now the jurors have an opportunity to ask you a
5 few questions. So hold tight for a just a second more.

6 All right. I am going to read these two juror --
7 some questions from the jurors.

8 Would the troubleman training, as you remember
9 it, have contained detailed instructions on the importance
10 of inspection of the C-hook and hanger plate complex on
11 the transposition towers?

12 A. I -- I kind of like to answer that in a different
13 way. In the -- in the training that I was involved in,
14 usually that became a question from the transmission
15 troubleman to myself on it. "How do I know when the
16 wear -- the wear is so severe that I need to create a tag
17 on it?" And then we would have that discussion. And then
18 that would basically be carried on then through the other
19 classes or even -- even a follow-up on it. Because that
20 would be an indicator that -- it's actually a good
21 indicator that, you know, they're talking about it. But
22 they are journeyman lineman, and they have been on towers.
23 They have hung insulators with C-hooks in hanger plates.
24 They have that experience. They have that knowledge.
25 They -- even though they may not be exposed to the
26 transmission in -- in the remainder of their career

1 because they decided to work at a different capacity but
2 still part of the electric side, they would hear about
3 those kinds of failures that would occur out there.

4 We -- one thing that was -- that we were always
5 very open about was when we learned something, we see --
6 we seen something, we shared it. We shared it throughout
7 the system with everybody. But to say that we specific --
8 specifically said, C-hooks and oval eyes and hanger
9 plates, you need to pay more attention to that then broken
10 strands that you might see on a conductor. You talk about
11 all of them together when you're doing the instructing.
12 What -- you know, what is the risk of failed conductors
13 and how many strands, and what's the risk of C-hooks and
14 Y-balls or these other types of cold-end hardware that you
15 have out there. There are some other ones that are
16 actually more riskier than say a C-hook because of their
17 design. But I can't -- to answer the question, I can't
18 say that is specifically something that we targeted. It
19 was more of global looking at and talking about how parts
20 and pieces fit and how they wear.

21 Q. Would such instruction, as you remember it, have
22 contained information on a specific diameter of C-hooks
23 used at hanger plate holds on the transmission lines?

24 A. I think I'm comfortable in saying that the hanger
25 plate hole was pretty universal. But you also have to
26 remember that as the tower gets larger, and you're loading

1 it more, the thickness is going to get -- could get
2 greater in thickness. So in a typical 115 -- but the
3 average is -- is going to be one inch in diameter, but not
4 on -- a quarter inch steel versus a half inch or a
5 three-quarter inch thickness is going to change what type
6 of -- how you're going to see that wear. Matter of fact,
7 it's going to change the hardware on it.

8 Q. Okay. But, sir, you weren't giving specific
9 details as in terms of schematics saying "This hole is
10 going to be one and one-eighth inch in diameter," "This
11 hook is 15/16th of an inch diameter"?

12 A. Correct.

13 Q. All right. Were you or any of those you
14 supervised aware of the appropriate age of the
15 Caribou-Palermo 115 line?

16 A. Well, the people that I supervised were not aware
17 of the Caribou-Palermo line, because I was in the central
18 part of the valley as a supervisor. If you're talking
19 about transmission troublemen, maybe that is where we're
20 going, but during that annual training, yes. They would
21 have been very much aware of -- they would know the line,
22 whether or not they would know the history or the age of
23 it, I -- I -- I wouldn't know whether they would.

24 Q. All right. Did you know prior to the Camp fire,
25 the age of the -- the appropriate age of the
26 Caribou-Palermo?

1 A. I knew the approximate age, yes, sir.

2 Q. Does the age of a transmission line and its
3 structural components figure into where it is
4 classified -- I think we already answered that one.

5 Is it fair to say that during your career, there
6 have been at least six company-wide reorganizations?

7 A. Somebody took a pretty good count.

8 Q. How many of these organizations, to your
9 knowledge, were caused by bankruptcy?

10 A. Oh, gosh. Just the one bankruptcy that I know
11 of.

12 Q. Okay. The next one pertains to 608, let me pull
13 that up here on the board. Exhibit 608 notes that the
14 document in question is the 85th manual change notice.

15 MS. DUPRE-TOKOS: Oh, I guess it does.

16 MR. NOEL: That's what I am trying to figure out.

17 MS. DUPRE-TOKOS: Do you want me to show you?

18 MR. NOEL: Sure.

19 THE WITNESS: It does say that.

20 BY MR. NOEL:

21 Q. Oh, yeah, there it is.

22 A. Yeah.

23 Q. Manual change notice number 85. Is this the 85
24 notice for the year 1987 or since the inception of the
25 manual?

26 A. I -- I think that is reading that it's the 85th

1 change of a document within the T&D manual, which is
2 probably about as thick -- twice as thick as what this is
3 right here. So it's not specific to this -- to this
4 rewrite or change in this document, but of a document
5 within the T&D manual.

6 Q. So that takes care of the first part of the
7 question.

8 How many times in your experience has the
9 transmission line maintenance manual undergone major
10 revisions?

11 A. There are -- when you say "major revisions," I --
12 I think the transition -- the guidelines in the T&D
13 bulletins into the ETPM manual was the biggest change in
14 the process that were used. There is a revision date on
15 the manual itself that is specific to documents but,
16 again, every year, the ISO -- California ISO comes in and
17 audits PG&E and the CPUC audits PG&E and the WSCC audits
18 PG&E. And there may be things that come out of those that
19 require some -- some modifications but they're not severe
20 changes to the manual.

21 Q. All right. In 200 -- 2018, do you know who the
22 Chief Operation Officer of PG&E?

23 A. 2018, it was our CFO and I can't remember his
24 name. He temporarily filled in until Bill Johnson was
25 hired by the Board of Directors.

26 Q. Okay. If a component has failed and proven

1 defective by testing, how is the failed component
2 identified in other towers?

3 A. Well, that's always the tricky one. What you
4 have to do is, if you have the original data sheets of
5 when the line was constructed, those data sheets and a
6 material list is going to be there and you're going to
7 know who you bought the components from. That's one way
8 of finding it out.

9 If it was something that was in the warehouse and
10 the crew just grabbed a -- you know, 25, 30, 50, C-hooks,
11 that's not even likely they would all be from the same
12 manufacturer, the design would be the same come, but it
13 could very well be from a different manufacturer. But
14 when you're doing a reconstruction and a new construction,
15 you're not using warehouse material. That's the good
16 thing about it.

17 So because if you're going to have a failure on a
18 reconstruction or a new construction of a line, it's going
19 to happen within the first three to five years. And then,
20 if you don't have anything, it's not likely after that
21 that you're going to have a failure. It's a early failure
22 occurrence that is going to take place.

23 Q. All right. Suppose a troubleman said that he was
24 not trained to inspect cold-end attachment points. What
25 would be your response?

26 A. My response would be, well, how did he get into

1 the department?

2 Q. When you did training for linemen and troublemen,
3 were there records kept of who were present for your
4 trainings?

5 A. Yes, sir.

6 Q. Do you know the size of the hole in the bracket,
7 the hanger hole, that hooked the C-hook, and do you know
8 the size of the C-hook?

9 A. Again, it's going depend on the type and
10 manufacturer of the C-hook, but it's usually equal to or
11 greater than the diameter -- half the diameter of the hole
12 that it's going to be fitted into.

13 Q. Okay. How long do the training sessions last and
14 did you train on the components of tower that may need to
15 be replaced?

16 A. Ask the question, again, please?

17 Q. How long did the training sessions last?

18 A. The ones that I conducted, they were -- I
19 believe, they were an eight -- eight hours.

20 Q. And did the training include training on the
21 components of the tower that may need to be replaced?

22 A. What was the last part?

23 Q. That may need to be replaced?

24 A. That was all discussed. As part of the training.

25 MR. NOEL: Anything else? Y'all look hungry.

26 That is all we have. Madam Foreperson will have

1 an admonishment for you.

2 GRAND JURY FOREPERSON: Mr. Stinnett, you are
3 admonished not to discussion or disclose at any time
4 outside of this jury room the questions that have been
5 asked of you or your answers unless authorized by this
6 grand jury or the Court.

7 A violation of these instructions on your part
8 may be the basis for a charge against you of contempt of
9 court. This does not preclude from discussing your legal
10 rights with your own attorney.

11 Mr. Stinnett, what I have just said is a warning
12 not to discuss this case with anyone except the Court,
13 your lawyer, or the district attorney.

14 Do you have any questions?

15 THE WITNESS: I have no questions.

16 THE COURT: Thank you for your time today.

17 THE WITNESS: Thank you. Thank all of you.

18 MR. NOEL: Ready for recess?

19 GRAND JUROR NUMBER TWO: Yes, we are.

20 MR. NOEL: Madam Foreperson?

21 GRAND JURY FOREPERSON: Oh, sorry. Yes.

22 MR. NOEL: We're going to be back at 2:00?

23 GRAND JURY FOREPERSON: 2:00.

24

25 [Lunch recess was taken from 12:38 p.m. until 2:07 p.m.
26 whereupon the grand jury came to order in Courtroom 9.]

[Witness enters the room.]

MS. DUPRE-TOKOS: We only the witness table, as
opposed to a witness stand.

GRAND JURY FOREPERSON: Right. Come to the chair and
before you have a seat, would please raise your right hand
to be sworn.

Is it Machuca?

THE WITNESS: Yes.

GRAND JURY FOREPERSON: Sergeant Machuca, do you
solemnly swear that the evidence you shall give in this
matter pending before the grand jury shall be the truth,
the whole truth and nothing but the truth so help you God?

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a seat,
please.

EXAMINATION

BY MS. DUPRE-TOKOS:

Q. Sergeant, would you state and spell your name for
us for the record?

A. Fernando Machuca, F-E-R-N-A-N-D-O, and
M-A-C-H-U-C-A.

Q. And can you tell us where you're employed and in
what capacity?

1 A. I'm employed by the Yuba County Sheriff's
2 Department. I'm a sergeant.

3 Q. And how long have been a sworn law enforcement
4 officer?

5 A. Nine and a half years.

6 Q. How long have you been with the Yuba County
7 Sheriff's Office?

8 A. Six and a half years.

9 Q. And how long have you been a sergeant?

10 A. Six months.

11 Q. Oh, congratulations.

12 A. Thank you.

13 Q. Prior to becoming a sergeant, what was your
14 title?

15 A. I was a detective.

16 Q. And prior to being -- how long were you a
17 detective?

18 A. Oh, a little less than two years.

19 Q. And prior to being a detective, what was your
20 title?

21 A. I was a patrol deputy.

22 Q. Okay. Did you work anywhere prior to the Yuba
23 County Sheriff's Office?

24 A. Yes, I did. I worked three years at the
25 Wheatland Police Department.

26 Q. And any place before that?

1 A. That was it.

2 Q. Were you assigning to assist with the Camp fire?

3 A. I was.

4 Q. And in what capacity did you help out?

5 A. So we were assigned to the coroner's team,
6 basically recovering the remains.

7 Q. And were you on a coroner's team to recover human
8 remains on November 10, 2018?

9 A. Yes.

10 Q. And did you go do a residence at 4220 Schwyhart
11 Lane in Concow?

12 A. Yes.

13 Q. Do you recall if that residence was destroyed?

14 A. It was.

15 Q. And were human remains located at that residence?

16 A. Yes.

17 Q. Was a case number assigned to those remains?

18 A. Yes.

19 Q. Was that 18-19532?

20 A. Yes.

21 Q. Now, you should have in front of you Exhibit 840
22 and that's also up on the screen.

23 [Exhibit No. 840 was identified.]

24 BY MS. DUPRE-TOKOS:

25 Q. At some point, did you learn that this is a
26 photograph of Ellen Walker?

1 A. Yes.

2 Q. And at some point did you learn that the remains
3 associated with case number 18-19532 were those of Ellen
4 Walker?

5 A. Yes.

6 Q. And do recall where the remains of Ms. Walker
7 were located generally?

8 A. They were inside the residence. It appeared to
9 be a bedroom.

10 Q. And then did you also go to a residence at 6664
11 Moore Road in Paradise on that same day?

12 A. Yes.

13 Q. Do you recall if that residence was destroyed, if
14 you recall.

15 A. I don't.

16 Q. Do you recall if human remains were located at
17 that residence?

18 A. Yes.

19 Q. And was a case number assigned to those remains?

20 A. Yes.

21 Q. Was that 18-1 -- was that 18-19533?

22 A. Yes.

23 Q. And then Exhibit 841 should be in front of you.
24 That's also up on the screen.

25 [Exhibit No. 841 was identified.]

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. Did you at some point learn that this is a
3 photograph of Rafaela Andrade?

4 A. Yes.

5 Q. And did you also at some point learn that the
6 remains associated with case number 18-19533 were those of
7 Rafaela Andrade?

8 A. Yes.

9 Q. And do you recall whether Ms. Andrade's remains
10 were located inside the house or outside?

11 A. I believe there were located inside. I would
12 have to look at the report.

13 Q. Okay. But your recollection is that they were
14 inside?

15 A. Yes.

16 Q. On that same day, did you go do residence at 5848
17 Black Olive Drive, Unit No. 3 in Paradise, California?

18 A. Yes.

19 Q. And do you happen to recall if that residence was
20 destroyed?

21 A. Yes.

22 Q. Was it?

23 A. Yes.

24 Q. It was?

25 A. Yes.

26 Q. And were human remains located at that residence?

1 A. Yes.

2 Q. Was a case number assigned to those remains?

3 A. Yes.

4 Q. And was that 18-19534?

5 A. Yes.

6 Q. And looking at Exhibit 842. Did you at some
7 point learn that this is a photograph of Deborah
8 Morningstar?

9 A. Yes.

10 [Exhibit No. 842 was identified.]

11 BY MS. DUPRE-TOKOS:

12 Q. And did you also at some point learn that the
13 remains associated with case number 18-19534 were those of
14 Deborah Morningstar?

15 A. Yes.

16 Q. Were the remains of Ms. Morningstar found inside
17 the residence or outside?

18 A. They were inside.

19 Q. Okay. And at that time, did you locate anything
20 else that lead you to believe that the remains were likely
21 to be those of Ms. Morningstar?

22 A. There was some indicia in one of the mailboxes.

23 Q. Okay. When you say "indicia," what do you mean?

24 A. Mail.

25 Q. Mail?

26 A. Yes.

1 Q. Was that addressed to Ms. Morningstar?

2 A. Yes.

3 Q. So the mailbox didn't burn?

4 A. No.

5 Q. And then did you also go to 1560 Sunny Acres Road

6 in Paradise, California that same day?

7 A. Yes.

8 Q. And was there anything of note there?

9 A. On Sunny Acres?

10 Q. Yes.

11 A. Well, we found a body.

12 Q. Okay. Where did you find that body?

13 A. I think I might be confused on the addresses. I

14 don't know if that was the one we found in the truck or

15 outside. I think that was -- it was outside.

16 Q. Okay. So where outside?

17 A. If I recall, it was -- it was like near an open

18 field.

19 Q. Okay. So in an open area?

20 A. Yeah, there was some houses around, but it was

21 outside.

22 Q. Okay. And looking at Exhibit 843, did you at

23 some point learn that that's a photograph of Sally Gamboa?

24 A. Yes.

25 [Exhibit No. 843 was identified.]

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. And you said you found a body. Was a case number
3 assigned to that body?

4 A. Yes.

5 Q. Was that 18-19535?

6 A. Yes.

7 Q. And at some point did you learn that the body
8 that you found in the field that had case number 18-15935
9 that that was Sally Gamboa?

10 A. Yes.

11 Q. Did you go to the address at 5471 Libby Road,
12 Unit No. 34 in Paradise that day?

13 A. Yes.

14 Q. Okay. Do you recall if that residence was
15 destroyed?

16 A. It was.

17 Q. And were any human remains located there?

18 A. Yes.

19 Q. Okay. Were those remains assigned to case number
20 18-15936?

21 A. Yes.

22 Q. Looking at Exhibit 844, at some point, did you
23 learn that that was a photograph of Sheila Rae Santos?

24 A. Yes.

25 [Exhibit No. 844 was identified.]

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. And at some point, did you also learn that the
3 remains that were associated with case number 18-19536
4 were those of Sheila Rae Santos?

5 A. Yes.

6 Q. And were the remains of Ms. Santos found inside
7 the remains of the residence or outside?

8 A. Inside.

9 Q. Did you also go to 39533 Windermere Lane in
10 Concow that day?

11 A. Yes.

12 Q. And did you locate anything of note there?

13 A. We located a truck that was burned. Off -- it
14 was off the roadway.

15 Q. Okay. Did you find any remains in the truck?

16 A. Yes.

17 Q. Where in the truck did you find those remains?

18 A. It was on the front passenger seat.

19 Q. And you said the truck was off the roadway, what
20 do you mean?

21 A. It was veered off to the side.

22 Q. Okay. It wasn't like it was just pulled over and
23 parked?

24 A. No.

25 Q. Was it far off a roadway or would it still have
26 been visible from the road?

1 A. It was visible.

2 Q. And was a -- the case number 18-19537 assigned to
3 the remains you found that the truck?

4 A. Yes.

5 Q. Looking at Exhibit 845, did you at some point
6 learn that that's a photograph of Marie Wehe?

7 A. Yes.

8 [Exhibit No. 845 was identified.]

9 BY MS. DUPRE-TOKOS:

10 Q. And did you at some point also learn that the
11 remains associated with case number 18-19537, the remains
12 that were found in the truck, were those of Marie Wehe?

13 A. Yes.

14 Q. And that's all I have for you.

15 Does anyone have any questions?

16 Okay. Sergeant Machuca, in regards to Marie
17 Wehe, was there any information regards the driver of the
18 truck?

19 A. There wasn't.

20 Q. Is it possible she was the driver and just moved
21 over?

22 A. It could have been. It's possible.

23 Q. Or there could have been a driver?

24 A. Correct.

25 Q. Okay.

26 A. We tried to locate a VIN or any information on

1 the vehicle, but it was burned. It was too bad.

2 Q. Okay. The next question is, can you tell us
3 specifically how identification was made in each of these
4 individuals?

5 A. I believe it was made through the coroner's
6 office. I believe Sac.

7 Q. Is that -- is that the extent of what you know?

8 A. Yes.

9 Q. Okay.

10 MS. DUPRE-TOKOS: Any other questions? No? Thank
11 you very much, Sergeant.

12 We got you out of here in time.

13 GRAND JURY FOREPERSON: Sergeant Machuca, I need to
14 read you an admonition.

15 You are admonished not to discuss or disclose at
16 any time outside of this jury room the questions that have
17 been asked of you or answers until authorized by this
18 grand jury or the court. A violation of these
19 instructions on your part may be the basis for a charge
20 against you for contempt of court.

21 This does not preclude you from discussing your
22 legal rights with your own attorney.

23 Sergeant Machuca, what I have just said is a
24 warning if you discuss this case with anyone except the
25 court, your lawyer or the district attorney.

26 Do you have any questions?

1 THE WITNESS: No.

2 GRAND JURY FOREPERSON: Thank you for your time.

3 THE WITNESS: Thanks.

4 MR. NOEL: Did everybody get the hand out for

5 (WITNESS #15)?

6 GRAND JURY SECRETARY: No.

7 MR. NOEL: Ready for (WITNESS #15)?

8 GRAND JURY FOREPERSON: Yes.

9 GRAND JUROR NUMBER FOUR: This isn't The (WITNESS

10 #15)?

11 MS. DUPRE-TOKOS: We wish.

12 MR. NOEL: It is a (WITNESS #15).

13 GRAND JURY FOREPERSON: Not "the."

14 MS. DUPRE-TOKOS: I have not seen him in red and

15 gold.

16 GRAND JUROR NUMBER FOUR: You have not seen him in

17 what?

18 MS. DUPRE-TOKOS: Red and gold. Didn't have any big

19 ole rings either.

20 [Witness enters the room.]

21 MR. NOEL: Stay standing and they'll swear you in.

22 GRAND JURY FOREPERSON: (WITNESS #15), if you can

23 raise your right hand to be sworn, please.

24 (WITNESS #15), do you solemnly swear that the

25 evidence you shall give in this matter pending before the

26 grand jury shall be the truth, the whole truth, and

1 nothing but the truth so help you God?

2 THE WITNESS: Yep.

3 GRAND JURY FOREPERSON: Thank you. Have a seat,
4 please.

5

6 **EXAMINATION**

7 BY MR. NOEL:

8 Q. (WITNESS #15), could you please state your full
9 name, spelling your last name for the record?

10 A. (WITNESS #15), [spelling redacted.]

11 Q. Before we get started, you and I know each other,
12 right?

13 A. Correct.

14 Q. We've known each other for a long time?

15 A. A lot of years.

16 Q. Way too many.

17 GRAND JURY FOREPERSON: I'm sorry.

18 BY MR. NOEL:

19 Q. All right. Now that we got that out of the way.
20 You employed?

21 A. Yes.

22 Q. By whom?

23 A. Pacific Gas & Electric.

24 Q. In what capacity?

25 A. I am a regional manager over construction.

26 Q. What does that job entail?

1 A. Currently my job entails rebuilding the fire
2 footprint of Butte County underground in the town of
3 Paradise. What it normally entails on a day-to-day basis
4 is I run the gas inspection, new business inspection
5 program for the state and all of PG&E's --

6 Q. Microphone.

7 A. I'm sorry.

8 Q. It's okay. I will move that closer.

9 A. All of the PG&E's service territory.

10 Q. Walk us through your career with PG&E.

11 A. Started in '97 in power generation. Left the
12 company for a period of about one year -- after a year, I
13 left the company for a period of about one year. Came
14 back to work in general construction line department for
15 about an 11-month period before I transferred to -- to
16 gas, our gas operations construction. Spent -- I don't --
17 I can't even tell you how many years in gas operations,
18 left from gas operations to project management on the --
19 both the gas and electric side at that time. Transitioned
20 over to transmission of electric project management. Left
21 from -- electric project management and became a
22 supervisor over project management for power generation
23 department and was in that position until the San Bruno
24 incident, and then I went back to gas operations where I
25 started a gas transmission construction organization for
26 the company and did that up until the point where they

1 asked me to start a -- come over and start a new
2 inspection gas operations program -- a new inspection
3 program there.

4 So that's currently where I'm at; however, I am
5 serving up in Paradise rebuilding the fire footprint.

6 Q. Explain to us your job as a project manager.
7 How -- how you manage projects or how do you get things
8 done?

9 A. Okay. As a project manager at PG&E, I always
10 call it you own a project basically from cradle to grave.
11 As a project manager, a project is presented to me in the
12 form of -- of what they call -- usually it was an advanced
13 authorization and it gave you X amount of dollars that
14 seeded your project to get it going. You -- as a project
15 manager, you would gather a group of subject matter
16 experts, decide the best alternatives on how to build a
17 project, then see that project through engineering into
18 construction and ultimately into the documentation phase
19 until it's completely closed out.

20 That's what -- that's why I say cradle to grave.
21 Start of engineering all the way through documentation.

22 Q. So in 2007, 2008, 2009, were you working up here
23 in the Feather River Canyon or in the Butte County area?

24 A. Yes.

25 Q. Were you assigned a project to do with
26 Caribou-Palermo line in the Feather River Canyon?

1 A. Yes.

2 Q. Ah, I forget we moved it. You have in front of
3 you Exhibit 838. Do you recognize Exhibit 838?

4 A. Yes, I do.

5 [Exhibit No. 838 was identified.]

6 BY MR. NOEL:

7 Q. What is Exhibit 838?

8 A. This is advanced authorization. This allows you
9 to begin your project. It give you, what we call, seeding
10 money, if you will. It allows you to gather your first
11 group of subject matter experts, hold meetings around the
12 project and ultimately try and determine which alternative
13 and what's the best route to proceed with this project
14 into construction.

15 Q. All right. So let's walk through this form a
16 little bit. Job title.

17 A. Correct.

18 Q. Caribou-Palermo 115 KV Structure and Conductor
19 Replacement, right? So that's the title of the job,
20 right?

21 A. Correct.

22 Q. Goes down gives a location. Job location:
23 Between Highway 70 and Caribou Road, Belden Power House.
24 All the way down and then project description,
25 justification. It says this part is -- "This project is
26 part of PG&E's deteriorated transmission equipment

1 replacement program."

2 Are you familiar with that program?

3 A. I'm -- I'm familiar with the program, yeah.

4 Well, I was. I'm not familiar with what it is nowadays
5 but, yes.

6 Q. What was it?

7 A. This was program that -- every project -- if I
8 can a little bit explain the projects --

9 Q. Go ahead.

10 A. -- how they fall in. Every project within PG&E
11 falls into a certain, we call it a, bucket, a major work
12 category. And that's how that project is funded.
13 There's X amount of funding and every major work category,
14 so, at least, I don't determine which buckets this money
15 comes out of as the project manager, it's just handed to
16 me and this is the -- the major work category that it was
17 represented to me under.

18 Q. Okay. And then we have some figures and the
19 total advanced expenditures requested is \$200,000. So was
20 that your budget?

21 A. Correct, to start, yeah.

22 Q. Okay. And then who is Keith Williams?

23 A. Keith Williams at the time was a manager that
24 basically signed off on this initial seeding money.

25 Q. All right. And we've got page two. Let's walk
26 through page two. Action required. What is the action

1 recommended?

2 A. Sorry, I'm reading it. It's been a little bit of
3 years. So it looks like it is for the preliminary
4 engineering and possible purchasing of any long lead
5 material items that we might discover we're going to need.

6 Q. All right. And then we have background. Says
7 there's already been multiple conductor failures on this
8 line due to the conduct being annealed and parting. Since
9 2002, eight even reports created on this line. Several IR
10 inspections have been performed with follow-up repairs.

11 So all of that is a justification for why this
12 needs to be done?

13 A. Correct.

14 Q. And then down on the bottom on the description of
15 recommendation, it says, "Replace deteriorated structures,
16 conductor, insulators and hardware on the Caribou-Palermo
17 115 line between structures 7/55 and 8/64"?

18 A. Correct. That's the recommendation.

19 Q. All right. So you get this AA, and then what
20 happens?

21 A. I assemble a team. These are the engineers that
22 actually had input into this AA. They've identified
23 issues with the line that need to be repaired, so they --
24 they went through the initial phase of this project so I
25 gathered those folks and, usually, we start off with a
26 kick-off meeting, a team meeting, in this case, where we

1 actually looked at the tower.

2 Q. Okay. Did this project get done before you left
3 to deal with the San Bruno issues?

4 A. No, it did not.

5 Q. Why not?

6 A. We were in the initial phases of trying to come
7 up with a recommendation and given the terrain of the
8 canyon and et cetera, we had to have a lot of testing
9 done, if you would, to see where towers would go. So we
10 were -- a lot of preliminary phases, environmental
11 reviews, things like that that did not allow us to even
12 come up with a final recommendation as of -- as of the
13 time I left. We were still working on that.

14 Q. All right. You should also have in front of you
15 a multi-page document, I believe an eight-page document,
16 marked as Exhibit 839.

17 A. Yes.

18 Q. Will you look through that and tell me if you
19 recognize 839?

20 A. Yes, I do.

21 [Exhibit No. 839 was identified.]

22 BY MR. NOEL:

23 Q. What is 839?

24 A. It's a series of e-mails between myself and --
25 and many of the team members on the transmission electric
26 side.

1 Q. All right. I am going to start walking through
2 these e-mails and as we've learned the e-mails are
3 actually backwards so we're going to start towards the
4 back of the packet with an e-mail from someone named
5 Douglas Cannell on Wednesday, November 4. Do you see
6 that?

7 If it's easier, you can look at it on the big
8 board. I've got it pulled up on the smart board here
9 behind you.

10 A. I left my glasses in the car.

11 Yes, I do. Hold on, okay. I see November 5th.
12 I see November 4th, Greg Starnes. Okay.

13 Q. All right. So first of all, who is Douglas
14 Cannell?

15 A. Doug Cannell would be the program manager.

16 Q. And how does that differ from you?

17 A. Program -- well, that major work category where
18 we talked about deteriorated towers, that would be a
19 program under major work category and as a program
20 manager, they're usually assigned one or more major work
21 categories where they manage the overall budget for those
22 major work categories.

23 Q. Okay. So you manage an individual project?

24 A. Correct.

25 Q. They manage the programs under which those
26 projects are undertaken; is that right?

1 A. That's right.

2 Q. All right. Who is Greg Starnes?

3 A. Greg Starnes, at the time, was our manager on --
4 over project management.

5 Q. And Lee Ellis?

6 A. Lee Ellis was another project manager.

7 Q. Clint Holsey?

8 A. He was my direct supervisor at the time.

9 Q. Ron Nixon?

10 A. He was also a program manager.

11 Q. And John Culbertson?

12 A. And I don't remember what John's role was.

13 Q. Okay. So the e-mail says, "Greg, Ron Nixon, the
14 T-Line maintenance program manager is unavailable. I am
15 trying to make sure that all planning orders in MWC 70,
16 71, 72, 92 and 93 get planned appropriately in PRJ. Could
17 you let me know which projects in these MWC have had
18 project managers formally assigned and which project
19 managers they are. Also, will you be communicated with
20 them to only authorize" -- "will you be communication with
21 them to only plan in PRJ to the authorized and published
22 target?

23 If you can let me know as soon as possible, John
24 Culbertson, myself and the M&C engineers will make sure a
25 plan is input for the others by Friday. Thanks, Doug."

26 Did I read that correctly?

1 A. Yes.

2 Q. All right. What is MWC?

3 A. That's the major work category. So that's the --
4 what we talked about a little bit ago. The transmission
5 deteriorated program is one of those in the major work
6 category. They're assigned a job number.

7 Q. All right.

8 A. Or a major work category number.

9 Q. All right. And what are these numbers 70, 71,
10 72, 92 and 93?

11 A. Different programs. Different major work
12 categories.

13 Q. Okay. PRJ, what does that?

14 A. So PRJ is a computer program within the SAP
15 accounting system where we go in and, on a monthly basis,
16 we identify where we're going to spend our money for
17 projects whether it's construction, engineering,
18 materials. So it's a detailed plan, if you will, in how
19 we're going to spend the money.

20 Q. All right. So let's go up one more. And this is
21 from Gregory Starnes, Wednesday, November 4th to Doug
22 Cannell, CC to yourself, Lee Ellis, Clint Holsey, Ron
23 Nixon, John Culbertson, and it says, "Here is the
24 direction I gave my project managers today regarding
25 detailed planning. My project managers will not match the
26 target if they don't see any way, given the current state

1 of the project that the target can be met. In this case,
2 they will forecast less."

3 And you can stand up and -- at the board if you
4 want. Can you explain to us what this means?

5 A. Yes, I can. So as a -- as a -- when you look at
6 overall project in a major work category for PG&E, all the
7 PRJ, all the different projects within that bucket of
8 money need to match that overall bucket's target. So if
9 it's a million dollars, at the end of the day, each
10 project needs to add up to a million dollars or they have
11 to decide where they need more money, more funding, et
12 cetera. So that's what they're discussing here.

13 Q. Okay. And it says, "Here is a link to the
14 Sharepoint site with the 2010 targets with a column added
15 that shows who the project manager is."

16 What is Sharepoint?

17 A. Sharepoint would be a site where they kept
18 different forms except in this case, it was probably an
19 Excel spreadsheet, that just shows the -- you saw all the
20 major work category numbers on the previous e-mail, it
21 would show those major work categories and the budgets
22 given for each and every project under that major work
23 category.

24 Q. Well, what would be the 2010 targets?

25 A. That would be your overall budget. That's your
26 target.

1 Q. Okay. Next is November 5th from Douglas Cannell
2 to yourself and somebody named Garrett Galimba? Do you
3 know who that is?

4 A. Yeah, Garrett was another project manager out of
5 the Fresno area.

6 Q. And CC to John Culbertson, Ron Nixon and Raymond
7 Thierry.

8 A. Yes.

9 Q. It says, "(WITNESS #15) and Garrett, I see that
10 the Caribou-Palermo Tivy Valley have monthly plans in PRJ.
11 I can't find any proposed target info or even a job
12 description in my reports for Tivy Valley. Could either
13 of you describe this work to me and let me know where the
14 2010 budget figure came from? My records only show a
15 previous job and don't show this one as being funded in
16 2010. Also, the Caribou job was not funded in 2010, it
17 fell below the prioritized cut line and should be removed
18 from the PRJ plan.

19 If you can confirm that these projects didn't
20 receive 2010 target allegations, please remove them from
21 PRJ. Let me know when this is completed."

22 All right. So Caribou plan, Caribou job, not
23 funded in 2010?

24 A. Correct.

25 Q. What does that mean?

26 A. So when they -- when they gave overall budget for

1 that major work category, it was not on the list. It's --
2 it's not in their list. It was not on this gentlemen's
3 list that is looking at it as being funded.

4 Q. Okay. All right. Now, we will get to your --
5 you're responding Monday, November 9th. This is your
6 voice, so can you read it for us?

7 A. Is it all right if I --

8 Q. Oh. Yeah.

9 A. Okay.

10 Q. You can stand up and walk around, feel free.

11 A. So "Caribou-Palermo is to replace deteriorated
12 towers in the Feather River Canyon. We are currently
13 looking at boring samples in the new proposed route to
14 insure we are" --

15 MS. DUPRE-TOKOS: Marc?

16 THE WITNESS: -- "on stable ground." Can you hear
17 me?

18 BY MR. NOEL:

19 Q. Go slow, for her.

20 A. Oh. "We have a year and a half of preliminary
21 work (permits, rights of ways, road work, logging, et
22 cetera.) prior to starting this work. If it is not
23 funding for permitting, et cetera, we could be picking up
24 these towers of the Feather River Canyon when they fall
25 over. Please advise."

26 Q. All right. So this is all the work that you've

1 been doing since your AA was signed to get ready for the
2 project?

3 A. That's correct.

4 Q. Boring samples, permits, right of ways, road
5 work. All of that was done before they cut the funding
6 for that?

7 A. That is correct.

8 Q. All right.

9 A. Or in progress.

10 Q. Okay. And then obviously you're concerned that
11 this project needs to get done and thought that there was
12 a danger of these towers falling down?

13 A. No, not exactly.

14 Q. Okay.

15 A. Would you like me to explain that more?

16 Q. Absolutely.

17 A. Okay. So, obviously, a year and a half into this
18 project, we're very vested into this project, and I am not
19 a -- as a project manager, I'm not an expert in towers or
20 conductors or anything like that. Yeah, do I begin to
21 know the work? Yes. However, my frustrations were that I
22 was running out of funding, could not get it funded and so
23 this was my statement that we'd be picking these up out of
24 the canyon. I didn't really feel that way, but I had a
25 passion about my project and I wanted it to continue. So
26 that's -- that's why that statement -- you know, when you

1 talk about deteriorated structures that would be worse
2 case scenario.

3 Q. All right. And now, we have a response from
4 somebody named Raymond Thierry? It says, "(WITNESS #15),
5 I was researching this project to see if we have scope and
6 authorization in place but could not find any records. Do
7 have a copy of the AA or PA? I'm concerned that we me may
8 spending funds without authorization. Also the PESR does
9 not show an authorized amount. Raymond."

10 So, what does he mean by scope and authorization
11 in place?

12 A. This original document we looked at is an
13 advanced authorization. He did not have a copy of that.

14 Q. Okay. And what is PESR?

15 A. That, I do not remember, Marc, what that acronym
16 is for.

17 Q. Okay. And the authorized amount, would that be
18 the AA amount?

19 A. Yes.

20 Q. All right. And next another long e-mail from
21 you. It's -- can you go ahead and read this for us?

22 A. Okay, project 30606109 CARIBOU-PALERMO, 7/55 to
23 8-64 RPL towers has been in my foul follow-up files since
24 March 2019" -- is that the one? Oh, you're looking at the
25 on up top. That's from my analyst.

26 Q. Oh, that's --

1 A. The bottom one or the top one?

2 Q. I think both of them.

3 A. Okay. Starting at the top, we have an AA for
4 200k which is overrun. Originally submitted for 800k but
5 reduced by Luther Dow during his authorization. We have
6 on numerous occasions asked for Ron Nixon to reauthorize
7 this but it has not been done as of yet. As you can see
8 below, we have asked Greg Starnes to follow up as of last
9 Friday. The bottom line is it needs to be reauthorized.
10 Greg's opinion and I must agree is if it does not get
11 reauthorized we should stop the work."

12 Q. All right. So your AA was for \$200,000?

13 A. Correct.

14 Q. But apparently it was originally requested
15 \$800,000 to look at the project, correct?

16 A. That's correct.

17 Q. And do you recall who Luther Dow was?

18 A. I believe Luther Dow at the time was a VP or
19 senior VP.

20 Q. And what does Ron Nixon have to do with all of
21 this?

22 A. So Ron Nixon was the program manager. As you seen
23 Doug Cannell, we talked about him being the program
24 manager. Ron was in an accident so Doug actually stepped
25 in and took his spot, but Ron is a program manager that
26 requests funding up front.

1 Q. Okay. And then the e-mail down below, who was
2 Cheryl Watkins?

3 A. So Cheryl was my analyst for all my financial
4 stuff.

5 Q. All right. So you grafting an e-fail from her to
6 Greg Starnes into your response to Raymond Thierry, right?

7 A. Uh-huh, correct.

8 Q. Go ahead and read this -- Ms. Watkins' response.

9 A. So "Greg, project 30606109 CARIBOU-PALERMO 7/55
10 to 8/64 RPL TOWERS has been in my follow-up files since
11 March 2009 regarding reauthorizing the AA for \$700,000 for
12 submittal by the project sponsor, Ron Nixon. To date, we
13 have heard nothing. I spoke with (WITNESS #15) this
14 morning to find out how your visit went yesterday and
15 asked him if he brought the issue to your attention and he
16 said, yes and that he was seeking your help to push this
17 forward. Attached is the paperwork. Please let me know
18 if you need anything else. Thanks, Cheryl Watkins."

19 Q. Again, who is Greg Starnes?

20 A. Greg is our manager.

21 Q. He's your manager?

22 A. Correct.

23 Q. Do you remember discussing with Starnes the
24 issues you were having with funding on the Caribou-Palermo
25 project?

26 A. Yeah, I do not remember, Marc.

Q. Okay.

A. Except for reading these e-mails.

Q. It's been a long time.

A. A long time.

Q. All right. Let's go on the next one, which --
let's start from the bottom up with Raymond Thierry
responds to you on Monday, December 14th: "If you have
not already, you should stop work until the project is
reauthorized."

And then your response to Mr. Thierry?

A. "The reauthorization is way overdue. When can we
expect it? Jerry."

Q. And then the response is? "Doug Cannell has
picked this up since Ron is out on long-term medical.
Doug, what is the schedule?"

So is that one of the problems with the project
that apparently Ron Nixon was not around to authorize?

A. Yeah, that's correct. He was in a -- I recall he
was in a motorcycle accident.

Q. Okay. And from reading Cheryl Watkins e-mail, it
seems like they were many efforts made to get
authorization for the funds with no response; is that
about correct?

A. Correct.

Q. All right. So move onto Wednesday, December
23rd. Doug Cannell to Raymond Thierry and you and CC

1 Cheryl Watkins, Clint Holsey, Gregory Starnes, (EMPLOYEE
2 #3), Chuck Stinnett and (WITNESS #5). By the way, do you
3 know who (WITNESS #5) is?

4 A. Yes. Jim was one of our transmission line
5 engineers.

6 Q. All right. And this e-mail says, "I'm not sure
7 we should reauthorize the AA for 800,000 when... this
8 project fell below the cut line for 2010 approved
9 projects. (Since early December this might have changed
10 because there's been additional monies made available.)

11 B, I'm not convinced all alternatives have been
12 explored. This project, as currently planned, will run
13 over \$10 million and we need to investigate more options
14 besides status quo and this one. Please refer to my
15 e-mail of November 12th in which I ask (WITNESS #15) and
16 Ron to work together to identify alternatives. At that
17 time, I thought Ron could do some limited work; however,
18 since then Ron has been too ill to proceed. (WITNESS #15)
19 has provided the attached word document as a starting
20 point. I think we should exchange additional alternatives
21 with (WITNESS #15), (EMPLOYEE #3), Chuck Stinnett,
22 (WITNESS #5), transmission planning, transmission routing
23 and substation design. Then we can proceed with a PPR to
24 decide which alternative to proceed with.

25 This project is too big to proceed with, without
26 addition analysis on alternatives."

1 All right. That's a lot.

2 A. That's a lot.

3 Q. So first off, am I reading this right? That A is
4 basically, "I don't think we should fund this because it
5 wasn't important enough to get funded in 2010"?

6 A. He's saying it fell below the cut line. "Since
7 early December, this may have changed." And there may
8 have -- looks like there has -- because there has been
9 additional monies made available. So -- so what he's
10 saying there, if you read it really quick, if something
11 doesn't make the cut line and people are putting in their
12 business cases -- putting their business cases in or
13 advanced authorization, often they will take from one
14 bucket of money where -- where there wasn't enough
15 projects to absorb that and they make an executive
16 decision to go ahead and move it over to projects where
17 there needs funding if -- you know, that -- that there
18 wasn't enough to begin with. So that's -- that's what
19 he's getting at. It wasn't approved, but there has been
20 since additional monies made available.

21 Q. All right. What is a PPR?

22 A. I don't know. I have been wondering that myself
23 every time I read this e-mail.

24 Q. And then it goes on, this is an e-mail from
25 11/12, "(WITNESS #15) and Ron, since you two are the most
26 familiar with this project, could you collaborate to come

1 up with a PPR? It doesn't have to be as complete as a
2 formal PPR, but I would should include a good background
3 on why the project is needed, any outages associated with
4 the conditions, and any mentions of safety. I'd like to
5 see several alternatives listed included repairing the
6 towers in place. Please use established unit costs to
7 come up with the estimated costs.

8 Jerry, since you are the project manager and the
9 most familiar, could you start the document? Include the
10 background information you have and the alternatives as
11 you see them along with your estimated cost then send it
12 to Ron.

13 Ron, after reviewing (WITNESS #15)'s alternatives
14 and costs, please include any alternative that you can
15 think of and run a preliminary EASOP" -- E-A-S-O-P.
16 "We'll analyze the alternatives, severity of current
17 conditions and come up with a game plan.

18 Jerry, at this time, this project is over its
19 authorized AA level and was not above the cut line for
20 2010. We need to stop all expenditures on it until an
21 agreed upon plan of action is made and a re-authorization
22 is completed."

23 A. Correct.

24 Q. Am I correct in understanding, "You're over
25 budget. Stop now"?

26 A. You're over budget, stop working.

1 Q. All right. So was any of this paperwork ever
2 done that Mr. Cannell is bringing up here?

3 A. So when you asked me what a PPR is, Doug was from
4 another department, it might have meant something
5 different in his department. In my department, everything
6 he described needing is in what we call a Project
7 Authorization. This is an Advanced Authorization. That's
8 where a -- you use an advanced authorization to come up
9 with your alternatives that went into a project
10 authorization. And it's the advanced authorization where
11 we had run out of money.

12 Q. Okay. Did you ever achieve a project
13 authorization?

14 A. Not while I was there, Marc.

15 Q. Why not?

16 A. We never got through all the alternatives before
17 I left. I left shortly after these series of e-mails to
18 another department.

19 Q. So all that stuff that you were doing leading up
20 to this -- we talked about in a previous e-mail. Why was
21 that being done?

22 A. It takes -- sometimes -- well, the amount of
23 investigation in areas like that, between permitting what
24 you can do in environmentally sensitive areas, we had --
25 we talked about bore sampling in there. They come in and
26 actually drill the mountain side and determine stable

1 ground that will hold towers so they were doing that all
2 that up-front work before you can even identify which
3 alternative -- which route is the best route so there's a
4 lot of preliminary engineering investigation and
5 permitting investigation that goes into these projects.

6 Q. So you guys were spending all of this money
7 determining what alternatives there were, and now you're
8 being told to stop spending money until you tell them what
9 are alternatives to alternatives?

10 A. Correct.

11 Q. Okay. All right. And then, finally, your e-mail
12 from Christmas Eve, Thursday, December 24, 2009.

13 If you can read that for us.

14 A. Okay. So it says, "Doug, we have studied five
15 alternative routes as part of our analysis and job
16 scoping. We are currently narrowed down to two
17 alternatives and need to first our geological bores to
18 insure we have a stable hillside to put these towers on.
19 This is what AAs are for. When we have a confirmed route
20 as a best alternatives, we will include the alternatives
21 in the PA. As a team, we are looking at the re" -- "we
22 are looking at the relocating towers" -- "these towers as
23 cheap as possible and to a stable and constructible
24 location we can access for future maintenance. I have
25 design engineers, civil engineers, foresters, biologists,
26 Land department, Hydro FERC licensing specialists, road

1 construction contractors, FERC, and many others on my
2 team. Trust me, we are doing what is best for the
3 company. Please proceed with revising the AA, and then
4 this project desperately needs funding in 2010 to proceed
5 with permitting. We have already notified FERC of the
6 project, and it will not look good if the towers that we
7 have identified as deteriorated fall over in the canyon
8 because we did not perform the work due to funding. As
9 well the bad towers are not accessible except by air so it
10 would not be very easy" -- "it would not be a very easy
11 emergency fix. If you have any further questions, please
12 let me know and happy holidays. Thanks, (WITNESS #15)."

13 Q. What do you mean you "already notified FERC"?

14 A. Through the permitting process, it's a FERC
15 watershed. So we -- we go through a lot of our permits
16 and to begin that permitting process, it sometimes take a
17 year or two and it may conflict with other FERC projects
18 that they have within our hydro-watershed.

19 Q. All right. And, finally, we're not going to try
20 to read through this entire --

21 A. Okay, thanks.

22 Q. Okay. But the -- the final of it is down at the
23 bottom: "For now, please mothball this project until its
24 genesis is determined, scope has been determined and a AA
25 is reauthorized."

26 Can you explain to us what that means?

1 A. Yeah, he's asking us not to proceed any further
2 until the scope has been determined, a PA put together and
3 then they'll reauthorize the AA.

4 Q. What is the scope?

5 A. The scope is we give them the final alternatives
6 or -- well, actually in this case, we've narrowed it down
7 to two. We give them those two alternatives, we put it in
8 the document, it goes to leadership and they come back
9 with the -- formal approval to proceed with the project.

10 Q. Okay. And what is -- what's the "genesis," he's
11 talking about? He says "until its genesis is determined."

12 A. I can't answer that. I don't know what he means
13 by that.

14 Q. All right. So prior to your leaving for -- to go
15 work in San Bruno or on the gas side, did this project
16 ever get done?

17 A. No, it did not.

18 Q. All right. I think that's all I have.

19 MR. NOEL: Any jurors have questions? All right.
20 Jury has a couple of questions, it looks like, for you, so
21 hang tight a second. I guess this goes to what is in
22 this.

23 To your knowledge, who is Ed Salas and what is or
24 was his position with PG&E?

25 A. Ed Salas, at that time, I would assume was our VP
26 or director of upper management.

1 GRAND JUROR NUMBER FOUR: Say it again?

2 THE WITNESS: He was either a director or VP, upper
3 management.

4 BY MR. NOEL:

5 Q. And then, to your knowledge, was this project
6 ever funded and/or completed?

7 A. That I do not know.

8 Q. Okay. Anything else? I believe that's it.

9 Madam foreperson will have an admonition for you
10 and then you are done.

11 GRAND JURY FOREPERSON: (WITNESS #15), you are
12 admonished not to discuss or disclose at any time outside
13 of this jury room the questions that have been asked of
14 you or your answers until authorized by this grand jury or
15 the court.

16 A violation of these instructions on your part
17 may be the basis for a charge against you for contempt of
18 court. This does not preclude you from discussing your
19 legal rights with your own attorney.

20 (WITNESS #15), what I have just said is a warning
21 not to discuss this case with anyone except the court,
22 your lawyer or the district attorney.

23 Do you have any questions?

24 THE WITNESS: No, I don't.

25 GRAND JURY FOREPERSON: Thank you for your time
26 today.

1 THE WITNESS: Okay.

2 MR. NOEL: All right. You're done.

3 MS. DUPRE-TOKOS: Ready for the next witness.

4 [Witness enters the courtroom.]

5 GRAND JURY FOREPERSON: Okay. Mr. Hancock, you're
6 already ahead of me. Could you raise your right hand to
7 be sworn?

8 Mr. Hancock, do you solemnly swear that the
9 evidence you shall give in this matter pending before the
10 grand jury shall be the truth, the whole truth and nothing
11 but the truth so help you God?

12 THE WITNESS: I do.

13 GRAND JURY FOREPERSON: Thank you. Have a seat,
14 please.

15

16 **EXAMINATION**

17 BY MS. DUPRE-TOKOS:

18 Q. Okay. Could you please state and spell your name
19 for the record.

20 A. Jacob Hancock, H-A-N-C-O-C-K.

21 Q. And can you tell us where you're employed and in
22 what capacity?

23 A. I work for the Butte County District Attorney's
24 Office and I'm a investigator.

25 Q. And how long have been a sworn law enforcement
26 officer?

1 A. I have finished 19 years.

2 Q. And how long have you been with Butte County DA's
3 Office?

4 A. Nine years.

5 Q. Where were you prior to the DA's office?

6 A. I was a with the Butte County Sheriff's Office as
7 a detective for 10 years.

8 Q. Okay. And were -- so 10 years at the sheriff's
9 department or ten years as a detective?

10 A. Ten years at the sheriff's office.

11 Q. Okay. And how long as a detective?

12 A. Seven years as a detective.

13 Q. And prior to that, what was your title?

14 A. Just a deputy. Deputy Sheriff.

15 Q. And do you have any other law enforcement
16 experience prior to that?

17 A. No.

18 Q. Now, were you assigning to assist with the Camp
19 fire here in Butte County?

20 A. Yes, I was.

21 Q. And in what capacity?

22 A. I was assigned to a team of coroners to go around
23 and look for victims of the fire.

24 Q. And were you on a team tasked with looking for
25 victims of the fire on November 14, 2018?

26 A. Yes, I was.

1 Q. And did you go to a residence at 1378 Herman Way
2 in Paradise?

3 A. Yes, I did.

4 Q. And that was on the 14th that you did that?

5 A. Yes.

6 Q. Was that residence destroyed?

7 A. Yes, it was.

8 Q. And were human remains located at that residence?

9 A. Yes, there were.

10 Q. Was a case number assigned to those remains?

11 A. Yes, there was.

12 Q. And was that 18-19665.

13 A. Yes, it was.

14 Q. Now, you should have in front of you Exhibit 846,
15 and it's up on the screen if you want to look there.

16 [Exhibit No. 846 was identified.]

17 BY MS. DUPRE-TOKOS:

18 Q. Did you at some point learn that that's a
19 photograph of Rose Farrell?

20 A. Yes, I did.

21 Q. And did you also at some point learn that the
22 remains associated with case number 18-19665, were those
23 of Rose Farrell?

24 A. Yes, I did.

25 Q. And where were the remains of Ms. Farrell located
26 generally in -- in --

1 A. Well, the -- they were in what appeared to be a
2 front porch area of the residence.

3 Q. Okay. And I've got Exhibit 847 up on the screen.

4 [Exhibit No. 847 was identified.]

5 BY MS. DUPRE-TOKOS:

6 Q. Can you tell us what that's a paragraph of?

7 A. This is standing in the driveway of the
8 residence, looking towards the residence, and it's been
9 burned to the ground. You can see the frames of the
10 residence and the pier blocks in front of the frames,
11 represent where the porch would have been.

12 Q. The what?

13 A. Porch. The pier blocks. These blocks.

14 Q. Oh, okay. The blocks.

15 A. Yeah.

16 Q. Thank you. And when you say "the residence,"
17 that's the one at 1378 Herman Way?

18 A. Yes.

19 Q. And you said the remains were located generally
20 in the porch area or what appeared to be a porch area?

21 A. Correct.

22 Q. And looking at Exhibit 848.

23 [Exhibit No. 848 was identified.]

24 BY MS. DUPRE-TOKOS:

25 Q. Can you tell us what this is a photograph of?

26 A. This a closer photograph of that same residence

1 on Herman. The steel beams being the residence. The
2 concrete blocks being what appeared to be the porch. And
3 the -- the mass in the center, the dark mass, is the
4 remains that we located.

5 Q. Okay. And so that was -- basically the porch was
6 outside, though, correct?

7 A. Yes. Outside the residence.

8 Q. Now, did you go to any other residences that day?

9 A. I did.

10 Q. And what was that address?

11 A. I was sent to -- dispatched originally to 3621
12 Hoffman Road in Concow. It's a very remote area. The
13 roads were -- the road signs were all burned by the fire
14 and the location where I was, I was unable to get a cell
15 signal to determine the exact address so the address was
16 later determined by deputies several days later as 13377
17 Eleran Lane.

18 Q. Eleran?

19 A. Eleran, yes.

20 Q. And that's in Concow?

21 A. In Concow, yes.

22 Q. And when you got there, did you locate anything
23 of note?

24 A. We located human remains there as well.

25 Q. Okay. Before we get there, looking at
26 Exhibit 849.

1 [Exhibit No. 849 was identified.]

2 BY MS. DUPRE-TOKOS:

3 Q. Did you, at some point in time, learn that that's
4 a photograph of Richard Brown?

5 A. Yes.

6 Q. Now you said you located human remains at the
7 Eleran address -- Eleran Lane address. Where were those
8 remains located?

9 A. There was located underneath a pick-up truck in
10 the driveway.

11 Q. Okay. Were -- was a case number assigned to
12 those remains?

13 A. Yes.

14 Q. Was that 18-19697?

15 A. Yes.

16 Q. And I'm showing you Exhibit 850.

17 [Exhibit No. 850 was identified.]

18 BY MS. DUPRE-TOKOS:

19 Q. Can you tell us what that's a photograph of?

20 A. This is a photograph of the truck we located on
21 the property, and if you look underneath the back right
22 rear wheel, you will see the -- the decedent.

23 Q. Okay. And those were Mr. Brown's remains?

24 A. Yes.

25 Q. Okay. And that's all I have.

26 Does anyone have any questions? Anyone?

1 GRAND JUROR NUMBER TWO: He's writing it.

2 GRAND JUROR NUMBER FOUR: Just not finished writing.

3 MR. NOEL: The jurors have potential questions for
4 you also.

5 THE WITNESS: Okay.

6 BY MS. DUPRE-TOKOS:

7 Q. And Investigator Hancock, if you know, can you
8 tell us specifically how identification was made on these
9 individuals?

10 A. Both of those individuals were identified using
11 DNA analysis from relatives. One was -- they were both
12 their children, direct children in both of those cases.

13 Q. Okay. Thank you. Any other questions?

14 Okay. Thank you very much.

15 GRAND JURY FOREPERSON: Mr. Hancock, before you
16 leave.

17 You're admonished not to discuss or disclose any time
18 outside this jury room the questions that have been asked
19 of you or your answers until authorized by this grand jury
20 or the court.

21 A violation of these instructions on your part
22 may be basis for a charge against you of contempt of
23 court. This does not preclude you from discussing your
24 own legal rights with your attorney.

25 Mr. Hancock, what I just said was a warning not
26 to discuss this case with anyone except the court, your

1 lawyer or the district attorney.

2 Do you have any questions?

3 THE WITNESS: No.

4 GRAND JURY FOREPERSON: Thank you for your time
5 today.

6 MR. NOEL: You'll be back.

7 GRAND JURY FOREPERSON: He'll be back?

8 MR. NOEL: He'll be back.

9 [Witness enters the courtroom.]

10 GRAND JURY FOREPERSON: Mr. Angle, can you please
11 raise your right hand to be sworn, please.

12 Do you solemnly swear that the evidence you shall
13 give in this matter pending before the grand jury shall be
14 the truth, the whole truth and nothing but the truth so
15 help you God.

16 THE WITNESS: I do.

17 GRAND JURY FOREPERSON: Thank you. Have a seat.

18

19 **EXAMINATION**

20 BY MS. DUPRE-TOKOS:

21 Q. Could you please state your name and spell it for
22 the record?

23 A. It's Jonathan Angle, A-N-G-L-E.

24 Q. And where are you employed and in what capacity?

25 A. I'm employed with a Butte County District
26 Attorney's Office and I'm an investigative lieutenant.

1 Q. And how long have you been at the DA's office?

2 A. 13 years as of last week.

3 Q. Oh, congratulations. How long have you been
4 lieutenant?

5 A. Approximately a year and a half now.

6 Q. What was your title prior to becoming lieutenant?

7 A. I was an investigator.

8 Q. And prior to working at the DA's office, where
9 did you work?

10 A. I was a police officer for a Paradise Police
11 Department for approximately six and a half years.

12 Q. And did you have any sworn law enforcement
13 experience prior to Paradise Police Department?

14 A. Yes. I started my career with the Butte County
15 Sheriff's Department as a deputy sheriff, and I worked
16 there approximately eight and a half years.

17 Q. Were you assigned to assist with the Camp fire?

18 A. Yes.

19 Q. And what was the -- in what capacity were you
20 assigned to assist?

21 A. Well, there was lots, but on the -- the -- the
22 last three or four days that I was up there, I was
23 assigned to an anthropology group to take them to
24 different locations to attempt to attempt to locate
25 potential fire victims.

26 Q. Okay. And were you on a team trying to locate

1 potential fire victims on November 12, 2018?

2 A. Yes.

3 Q. And did you go to a residence at 5303 Sawmill
4 Road in Paradise?

5 A. Yes, I did.

6 Q. Okay. Was that residence destroyed?

7 A. Yes.

8 Q. And were any human remains located in the ruins
9 of the house?

10 A. Yes, there was.

11 Q. Okay. Was a case number assigned to those
12 remains?

13 A. Yes.

14 Q. Was that 18-19617?

15 A. Yes.

16 Q. And you should have in front of you Exhibit 851.
17 It's also on the screen.

18 [Exhibit No. 851 was identified.]

19 BY MS. DUPRE-TOKOS:

20 Q. At some point in time, did you learn that that's
21 a photograph of Frederick Salazar?

22 A. Yes, I did.

23 Q. Did you at some point also learn that the remains
24 associated with 18-19617 were those of Frederick Salazar?

25 A. Yes.

26 Q. And then looking at Exhibit 852.

1 [Exhibit No. 852 was identified.]

2 BY MS. DUPRE-TOKOS:

3 Q. Can you tell us what that's a photograph of?

4 A. The -- the remains of the burned residence at
5 5303 Sawmill.

6 Q. And Exhibit 853.

7 [Exhibit No. 853 was identified.]

8 BY MS. DUPRE-TOKOS:

9 Q. Can you tell us what that's a photograph of?

10 A. Skeletal remains.

11 Q. Of?

12 A. Mr. Salazar.

13 Q. So were you also on a team that had similar
14 duties on November 13, 2018?

15 A. Yes.

16 Q. And did you go to a residence at 5883 Copeland
17 Road in Paradise?

18 A. Yes, I did.

19 Q. Was that residence destroyed?

20 A. Yes, it was.

21 Q. And were any human remain located there?

22 A. Yes.

23 Q. Was a case number assigned to those remains?

24 A. Yes.

25 Q. Was that 18-19633?

26 A. Yes.

1 Q. And looking at Exhibit 854.

2 [Exhibit No. 854 was identified.]

3 BY MS. DUPRE-TOKOS:

4 Q. At some point in time, did you learn that's the
5 photograph of Victoria Taft?

6 A. Yes.

7 Q. And at some point in time, did you also learn
8 that the remains associated with 18-19663 were those of
9 Victoria Taft?

10 A. Yes.

11 Q. And looking at Exhibit 855.

12 [Exhibit No. 855 was identified.]

13 BY MS. DUPRE-TOKOS:

14 Q. Can you tell us what that is a photograph of?

15 A. It's the burned remains of the residence at 5883
16 Copeland Drive -- or Road.

17 Q. And looking at Exhibit 856.

18 [Exhibit No. 856 was identified.]

19 BY MS. DUPRE-TOKOS:

20 Q. Can you tell us what that is a photograph of?

21 A. Very little of the skeletal remains located at
22 the residence.

23 Q. And were those remains located inside or outside
24 of the residence?

25 A. They would have been inside the -- that yellow
26 tape area, which was designated as inside of the

1 residence.

2 Q. Okay. I have nothing further. Let's see if any
3 of the jurors have any questions.

4 If you know, can you tell us specifically how
5 identification was made on each of these individuals?

6 A. From looking at the coroner's reports -- and I
7 might get them confused. One was by DNA, I believe, and
8 the other one was by dental records. I believe
9 Mr. Salazar was -- and I might be out of place without
10 seeing the report -- I believe was by dental records and I
11 think Ms. Taft by DNA.

12 Q. Okay. Thank you. And I believe -- any other
13 questions? I believe madam foreperson has an admonition
14 for you.

15 GRAND JURY FOREPERSON: Lieutenant Angle, you're
16 admonished not to discuss or disclose any time outside
17 this jury room the questions that have been asked of you
18 or your answers until authorized by this grand jury or the
19 court.

20 A violation of these instructions on your part
21 may be the basis for a charge against you of contempt of
22 court. This does not preclude you from discussing your
23 own legal rights with your own attorney.

24 Mr. Angle, what I just said was a warning not to
25 discuss this case with anyone except the court, your
26 lawyer or the district attorney.

1 Do you have any questions?

2 THE WITNESS: No, I do not.

3 GRAND JURY FOREPERSON: Thank you for your time
4 today.

5 THE WITNESS: Thank you.

6 MR. NOEL: Is that -- that's it.

7 MS. DUPRE-TOKOS: That's it for today.

8 MR. NOEL: That is what we have for today. I told
9 you 3:00ish. It's 3:20, so we didn't do that bad today.

10 GRAND JURY FOREPERSON: Are we entering the exhibits
11 from today?

12 MR. NOEL: Yes.

13 MS. DUPRE-TOKOS: Yes, please.

14 MR. NOEL: All of the exhibits. And that includes
15 some of the one from earlier that we --

16 GRAND JURY SECRETARY: The EPTM manuals?

17 MR. NOEL: Yes.

18 GRAND JURY FOREPERSON: Okay.

19 MR. NOEL: We still have some exhibits out there that
20 are dangling, waiting for final i's to be dotted and T's
21 to be crossed.

22 All right. So we are done for the day.

23 GRAND JURY FOREPERSON: Okay. It's been approved.

24 GRAND JUROR NUMBER FOUR: What does Friday look like
25 just out of curiosity?

26 MR. NOEL: Cloudy, chance of meatballs. No,

1 unfortunately, lots more death evidence.

2 MS. DUPRE-TOKOS: Well, more but different --
3 different types. Hopefully a good chunk of --

4 GRAND JUROR NUMBER THIRTEEN: This day went pretty --
5 pretty fast.

6 GRAND JUROR NUMBER FOUR: Just to tell you, if you
7 guys don't ask, I am going to ask how they identified
8 them.

9 MR. NOEL: Yeah.

10 GRAND JUROR NUMBER FOUR: Because I think that's an
11 important piece of information.

12 MR. NOEL: Well, but there's -- I will let you know,
13 and I was going to lead into that, there's a lot more
14 coming in. You know, basically for what these bodies --
15 the -- all -- all of our decedents, there's different
16 phases and you have the finders, who you've been hearing
17 from. These are the guys who are out combing through the
18 ruins and finding the remains of -- of bodies, tagging
19 them, literally bagging them, and--

20 GRAND JUROR NUMBER FOUR: So me asking them that
21 question, is that hearsay on his part?

22 MR. NOEL: Yeah.

23 GRAND JUROR NUMBER FOUR: Oh.

24 MR. NOEL: Oh yeah, it's huge hearsay.

25 MS. DUPRE-TOKOS: But --

26 MR. NOEL: Go ahead.

1 MS. DUPRE-TOKOS: In your PowerPoints, you have the
2 slide that has the four things, and then a check mark and
3 sometimes it has two check marks. So identification is
4 one of the things.

5 GRAND JUROR NUMBER THIRTEEN: We will get to it.

6 MS. DUPRE-TOKOS: We're going to be getting to it.

7 MR. NOEL: Right. So identification is something we
8 are going to be dealing with in a couple of different
9 ways. And like you said, and -- and when I got up here, I
10 was going one way and we have gone off in another is we
11 want to spare you guys as much of the graphic details, as
12 much of the death evidence as possible. So we think that
13 we have a way to do that by using the proof things like
14 identity, and the worst part of it is, the most gut
15 wrenching of the evidence is what is called the proof of
16 life evidence. Showing that these people were living when
17 -- when the Camp fire hit.

18 We think we can do that by using death
19 certificate, which are official records of the county of
20 Butte, of the state of California and have all that
21 information on there. But just to hedge our bets incase
22 somebody else comes on down the line and says, "No, see,
23 this doesn't work." We're going to choose about six to
24 ten of these deaths --

25 MS. DUPRE-TOKOS: Really?

26 MR. NOEL: -- that we -- yes.

1 MS. DUPRE-TOKOS: Oh, good to tow.

2 MR. NOEL: That we're going to focus on and we're
3 going to go into a lot more evidence.

4 MS. DUPRE-TOKOS: Well, we're also calling the
5 forensic pathologist --

6 MR. NOEL: Yes.

7 MS. DUPRE-TOKOS: -- who is going to go through every
8 cause of death.

9 GRAND JUROR NUMBER FOUR: How many of the -- okay,
10 first of all, what's the number? 82? 80 --

11 MR. NOEL: 83.

12 GRAND JUROR NUMBER FOUR: 83. Okay. How many of
13 those do you guys feel like there's sufficient evidence to
14 say --

15 MS. DUPRE-TOKOS: 83.

16 GRAND JUROR NUMBER FOUR: 83?

17 MR. NOEL: That's not the number that you read. The
18 number that generally you'll see in all of the public
19 stuff is 85. One of those people committed suicide.
20 Basically, he did not want to burn to death so he killed
21 himself. The worst part of that is that the fire ended up
22 turning and his house didn't burn down.

23 Another one, and this is what we were talking
24 about proof of life --

25 MS. DUPRE-TOKOS: Marc, do you still want to be on
26 the record?

1 MR. NOEL: Oh, yeah. There's another one that -- a
2 -- a woman that we cannot show -- we don't have positive
3 evidence to know that she was alive on the morning of
4 November 8th. So that's where we --

5 MS. DUPRE-TOKOS: Or that the fire killed her if she
6 was.

7 MR. NOEL: Yeah. So we're looking at 83. Like we
8 said, we have pathologists coming in to talk about the
9 autopsies and whatever else coming up over the course of
10 the next few weeks and trying to do it as lean and as
11 quick and painless as possible.

12 MS. DUPRE-TOKOS: Yeah, we're really trying not to
13 dwell on anything and certainly not any of the more
14 gruesome aspects of any of this. And like we said before,
15 we know it's upsetting, and so that's why we're trying to
16 streamline it as much as possible and go through it as
17 quickly as we did today. We know that was really fast,
18 but it got you the information that you needed, and that's
19 what we're going to keep trying to do.

20 GRAND JUROR NUMBER FOUR: Do --

21 MR. NOEL: That's --

22 GRAND JUROR NUMBER FOUR: -- we --

23 MR. NOEL: Go ahead.

24 GRAND JUROR NUMBER FOUR: Do we have a follow-up
25 witness to (WITNESS #15) that would be able to affirm one
26 way or the other if that project was ever completed?

1 MR. NOEL: Yes. That witness was named in some of
2 those e-mails, (WITNESS #5), was supposed to be the
3 follow-up witness today to (WITNESS #15). Unfortunately,
4 (WITNESS #5)'s wife passed away, and so we told him,
5 "Don't worry about this today." So he's taking care of
6 his family. And so that's why we're -- we knew we were
7 going to be a little short today because that witness, we
8 don't have.

9 So you will be hearing in the future from
10 (WITNESS #5). And so Friday is going to be more finders
11 and other --

12 MS. DUPRE-TOKOS: And possibly --

13 MR. NOEL: And possibly death certificates.

14 MS. DUPRE-TOKOS: Possibly.

15 MR. NOEL: Next Tuesday, hopefully, we will hear from
16 some of these engineers whose names you've been hearing
17 recently. Henry Ho, Feven Mihretu; the head of the
18 engineering department or their boss at least, Mukul
19 Shakur, and then Warren Ma, who, if you remember, was the
20 guy what comes up with formulation of how long it should
21 take to do the inspections and patrols.

22 So if there's anything else that you guys want to
23 hear from us, let us know. The main question, going back
24 to it, is after hearing a couple of days and hearing about
25 a few dead bodies, how are you guys all doing?

26 GRAND JUROR NUMBER TWO: Today was pretty easy.

1 GRAND JUROR NUMBER FOUR: It was --
2 MR. NOEL: Yeah.
3 GRAND JUROR NUMBER TWO: Better than the first day.
4 MR. NOEL: Okay.
5 GRAND JUROR NUMBER TWO: I don't think it was as big
6 a shock today as it was --
7 MS. DUPRE-TOKOS: Right.
8 GRAND JUROR NUMBER TWO: The first day. I think we
9 were all ready for it this time versus, "Hey, we're doing
10 death evidence today" --
11 MR. NOEL: Yep.
12 GRAND JUROR NUMBER TWO: -- which was kind of dropped
13 on us the first day, so I think was a little rough then.
14 MR. NOEL: Yep.
15 GRAND JUROR NUMBER FOUR: I think the format you
16 chose is probably as good as it gets.
17 MR. NOEL: Okay.
18 MS. DUPRE-TOKOS: Good. Thank you.
19 MR. NOEL: All right.
20 GRAND JUROR NUMBER THIRTEEN: I have a question.
21 MR. NOEL: If anybody -- if anybody starts having
22 problems with it, let us know.
23 GRAND JURY FOREPERSON: Hold on. One more thing,
24 please. Just want to let you know juror number 19 will
25 not be returning after today.
26 MS. DUPRE-TOKOS: What?

1 GRAND JURY FOREPERSON: So say your goodbyes now to
2 juror number 19.

3 GRAND JUROR NUMBER TWO: Another one down, uh-oh.

4 MR. NOEL: So what does that leave us with, 16?

5 GRAND JURY FOREPERSON: That leaves us at 16.

6 GRAND JUROR NUMBER TWO: Really?

7 GRAND JUROR NUMBER THIRTEEN: The guy that -- the
8 gentlemen was PG&E re called that they had several
9 trainings, and a lot of the troublemen and linemen said
10 they didn't have training. But he also said when these
11 guys went to the training, they're on record that they
12 were there, and it seems to me that these guys were lying.
13 And I'd like to kind of find out if we can get those
14 records that they were there. Because I think these guys
15 are the guys that screwed up.

16 MR. NOEL: We have records of training. But they are
17 basically Excel spreadsheets showing all the trainings
18 that people were supposed to -- supposedly went to for
19 however many years. For instance, you look at somebody
20 like (WITNESS #1), I think it's a five-page spreadsheet
21 showing class after class after class after class.

22 But in terms of having sign-in sheets or anything
23 like that. We don't have any proof for the troublemen.
24 We have not been able to locate any. So we will keep
25 trying, and we may present that stuff, but we will see.

26 All right. So are we in recess?

1 GRAND JURY FOREPERSON: We are. Monday at 8:30.

2 MR. NOEL: No, no, Friday.

3 GRAND JURY FOREPERSON: Friday.

4 [Matter adjourned at 3:29 P.M.]

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: Mr. Burnett, before you
have a seat, please raise your right hand to be sworn.

SERGEANT SAM BURNETT
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MS. DUPRE-TOKOS

Q. Can you make sure you speak into the
microphone.

A. Yes.

Q. Could you, please, state and spell your name

1 for the record.

2 A. It's Sam Burnett, B-U-R-N-E-T-T.

3 Q. And where are you employed and in what
4 capacity?

5 A. At the Butte County Sheriff's Office, and I'm a
6 sergeant.

7 Q. How long have you been a sworn law enforcement
8 officer?

9 A. Almost 26 years.

10 Q. And how long have you been at the sheriff's
11 office?

12 A. The entire time. My original law enforcement
13 career started in here.

14 Q. How long have you been a sergeant?

15 A. Little over four years, I think.

16 Q. And prior to that, what was your title?

17 A. Well, I've had several. I was a deputy
18 sheriff, I was a detective for nine years, and I've
19 worked in several areas of the sheriff's office.

20 Q. Now, were you assigned to assist with the Camp
21 Fire?

22 A. Yes.

23 Q. In what capacity?

24 A. Initially, I was assigned to do evacuations.
25 During the first day of the fire, I was doing
26 evacuations. After that, I was assigned to the Coroner's

1 Unit and I supervised the coroners and anthropologists.

2 Q. Did you actually go out and help look for
3 victims of the fire?

4 A. Yes. I'm pretty sure I went to almost every
5 scene where there was a coroner's case.

6 Q. And did you go out -- all probability then you
7 went out November 12th, helped recover any victims that
8 were located?

9 A. Yes.

10 Q. And did you go to a residence at 1865 Norwood
11 Circle in Paradise on that day?

12 A. Yes.

13 Q. Was that residence destroyed?

14 A. Yes.

15 Q. Were human remains located at that residence?

16 A. Yes.

17 Q. How many human remains were located there?

18 A. At the time, I wasn't sure. I believe -- is
19 that the one where there was three? I believe there was
20 three located there.

21 Q. And were you responsible -- how many were you
22 responsible for recovering the remains of?

23 A. Well, it was, it was kind of complicated
24 because we had the anthropologists there, and we were
25 trying to figure out how many sets of remains there were.
26 We confirmed that there were two initially, but we

1 weren't able to do the complete removal, and the
2 anthropologists had to come back the next day. And I
3 believe later on they determined there was a third one.
4 So I took the reports on two.

5 Q. Okay. And were case numbers assigned to those
6 remains?

7 A. Yes.

8 Q. And were they 18, dash, 19605 and 18, dash,
9 19967?

10 A. Yes.

11 Q. Hang on. Let me give you the exhibits, make
12 your life a little easier and not strain your neck.

13

14 (Grand Jury Exhibit 937 was introduced.)

15

16 Q. Okay. So now you should have in front of you
17 Exhibit 937?

18 A. Yes.

19 Q. That's also what's up on the screen?

20 A. Yes.

21 Q. Did you at some point learn that that's a
22 photograph of Ishka Heffern?

23 A. Yes.

24 Q. At some point did you learn that the remains
25 associated with case number 18, dash, 19605 were those of
26 Ishka Heffern?

1 A. Yes.

2

3 (Grand Jury Exhibit 938 was introduced.)

4

5 Q. And looking at Exhibit 938, did you at some
6 point learn that that's a photograph Matilde Heffern?

7 A. Yes.

8 Q. At some point did you learn that the remains
9 associated with case number 18, dash, 19967 were those of
10 Matilde Heffern?

11 A. Yes.

12

13 (Grand Jury Exhibit 939 was introduced.)

14

15 Q. In looking at Exhibit 939, can you tell us what
16 that's a photograph of.

17 A. That's the bathtub located at that residence.

18 Q. Okay.

19 A. And the remains inside.

20 Q. And the remains of who?

21 A. I believe that was Matilde, but I'm -- I would
22 have to look at my paperwork to see.

23 Q. Were any of the remains located at that
24 residence comingled?

25 A. Yes.

26 Q. And who were the two people's whose remains

1 were comingled?

2 A. Matilde and Ishka; the two that I'm aware of.

3 Q. Okay. And were their remains located comingled
4 in the bathtub?

5 A. Yes.

6 Q. Okay. And just so everyone understands, what
7 does "comingled" mean?

8 A. Mixed together.

9 Q. So they died very close together and their
10 remains ended up mixed together?

11 A. Yes.

12 Q. And did you also go out to an address, 8391
13 Montna Drive in Paradise on November 13th?

14 A. Yes.

15 Q. And, again, that's 2018?

16 A. Yes.

17 Q. Was that residence destroyed?

18 A. Yes.

19 Q. Were human remains located in that residence?

20 A. Yes.

21 Q. Was a case number assigned to those remains?

22 A. Yes.

23 Q. Was that case number 18, dash, 19655?

24 A. Yes.

25

26 (Grand Jury Exhibit 940 was introduced.)

1
2 Q. At some point did you learn that that's a
3 photograph -- looking at Exhibit 940 -- at some point did
4 you learn that that's a photograph of Anna Hastings?

5 A. Yes.

6 Q. And at some point did you also learn that the
7 remains associated with case number 18, dash, 19655 were
8 those of Anna Hastings?

9 A. Yes.

10
11 (Grand Jury Exhibit 941 was introduced.)
12

13 Q. And then looking at Exhibit 941, can you tell
14 us what that's a photograph of?

15 A. That's some of the remains that were collected.

16 Q. Collected from 8391 Montna Drive?

17 A. Yes.

18 Q. And so those would be Ms. Hastings' remains?

19 A. Yes.

20 MS. DUPRE-TOKOS: Nothing further.

21 Any questions?

22 GRAND JURY FOREPERSON: I have to read --
23 Deputy Burnett, I have to read an admonition to you.

24 Deputy Burnett, you are admonished not to
25 discuss or disclose at any time outside of this jury room
26 the questions that have been asked of you or your answers

1 until authorized by this Grand Jury or the Court. A
2 violation of these instructions on your part may be the
3 basis for a charge against you of a contempt of court.
4 This does not preclude you from discussing your legal
5 rights with your own attorney.

6 Deputy Burnett, what I have just said is a
7 warning not to discuss this case with anyone except the
8 court, your lawyer, or the district attorney. Any
9 questions?

10 THE WITNESS: Nope.

11 GRAND JURY FOREPERSON: Thank you for your time
12 today.

13 THE WITNESS: Thank you.

14 GRAND JURY FOREPERSON: Can you raise your
15 right hand to be sworn, please, Deputy Raggio.

16
17 DEPUTY JESSICA RAGGIO
18 having been called as a witness in
19 the matter now pending, having been first
20 duly sworn, testifies as follows:

21
22 THE WITNESS: I do.

23 GRAND JURY FOREPERSON: Thank you. Have a
24 seat, please.

BY MS. DUPRE-TOKOS

Q. Could you please state and spell your name for the record.

A. Jessica Raggio, R-A-G-G-I-O.

Q. And where are you employed and in what capacity?

A. I'm employed at the Butte County Sheriff's Office as a deputy sheriff.

Q. And you can pull the microphone closer instead of leaning in.

How long have you been a sworn law enforcement officer?

A. I've been a sworn law enforcement officer for five and a half years.

Q. And how long have you been at the sheriff's office?

A. About a year and a half.

Q. Where were you prior to the sheriff's office?

A. I was a sworn officer with the Oroville Police Department.

Q. And how long were you there?

A. As a sworn officer, I was there for approximately four years.

Q. So you said "as a sworn officer," so what did you do before that?

1 A. I was also a police cadet and dispatcher, so I
2 was there a total eight and a half years.

3 Q. Do you have any other law enforcement
4 experience?

5 A. That would be my total law enforcement
6 experience. In addition to that, I also have a police
7 academy.

8 Q. Now, were you assigned to assist with the Camp
9 Fire?

10 A. Yes.

11 Q. In what capacity?

12 A. I was assisting with essentially the Coroner's
13 Unit in recovering remains of people that were found.

14 Q. Were you on a team doing that on November 11th,
15 2018?

16 A. Yes.

17 Q. Did you go to a residence at 5684 Clara Lane in
18 Paradise that day?

19 A. Yes.

20 Q. Was that residence destroyed?

21 A. Yes.

22 Q. And were human remains located at that
23 residence?

24 A. Yes.

25 Q. And was a case number assigned to those
26 remains?

1 A. Yes.

2 Q. And was that case number 18, dash, 19568?

3 A. Yes.

4

5 (Grand Jury Exhibit 942 was introduced.)

6

7 Q. Now, you see the, should have exhibits in front
8 of you.

9 Looking at Exhibit 942, at some point did you
10 learn that that's a photograph of Robert Quinn?

11 A. Yes.

12 Q. And at some point did you learn that the
13 remains associated with 18, dash, 19568 were those of
14 Robert Quinn?

15 A. Yes.

16 Q. And were Mr. Quinn's remains located inside or
17 outside of the residence?

18 A. Inside.

19 Q. And were the remains of one person or were they
20 comingled with another person?

21 A. It was originally thought to be two people, but
22 ultimately found to be one person.

23 Q. Okay. Did you ever find out why it was thought
24 to be two people?

25 A. It's my understanding that Mr. Quinn's bones
26 reacted differently to the heat of the fire, so some of

1 the bones were bigger, making them believe that it was
2 two people.

3 Q. But ultimately the anthropologist determined
4 that it was just one person?

5 A. Yes.

6 Q. Now, did you also go to a residence at 1865
7 Norwood Drive in Paradise on November 12th?

8 A. Yes.

9 Q. And was that residence destroyed?

10 A. Yes.

11 Q. Were human remains located there?

12 A. Yes.

13 Q. How many remains total were located there?

14 A. Three.

15 Q. And were you responsible for taking the case
16 for all three, or a different number?

17 A. So I was responsible for taking one of the
18 cases.

19 Q. So --

20 A. Go ahead.

21 Q. Were you, for the case that you were
22 responsible for, was that assigned case number 18, dash,
23 19604?

24 A. Yes.

25

26 (Grand Jury Exhibit 943 was introduced.)

1
2 Q. And looking at Exhibit 943, did you at some
3 point learn that that's a photograph of Christina
4 Heffern?

5 A. Yes.

6 Q. And anytime you want to take a break, just let
7 us know.

8 A. Okay.

9 Q. At some point, did you learn that the remains
10 associated with case number 18, dash, 19604 were those of
11 Christina Heffern?

12 A. Yes.

13
14 (Grand Jury Exhibit 944 was introduced.)
15

16 Q. And looking at Exhibit 944, can you tell us
17 what that's a photograph of?

18 A. It's a photograph of the destroyed houses, in
19 particular the bathroom. It was discovered because there
20 was tile and a tub. And those were the remains that were
21 found.

22 Q. Were Ms. Christina Heffern's remains found
23 outside of the tub?

24 A. There were several remains. I'm not quite sure
25 which one she was. But they were all in the bathroom.
26 And I, I'm not sure if she was one in the bathtub or

1 outside of the bathtub.

2 Q. Now, on November 14th did you go to a residence
3 at 5471 South Libby Road, No. 33?

4 A. Yes.

5 Q. And was that residence destroyed?

6 A. Yes.

7 Q. Were human remains located at that residence?

8 A. Yes.

9 Q. And was a case number assigned to those
10 remains?

11 A. Yes.

12 Q. Was that case number 18, dash, 19679?

13 A. Yes.

14

15 (Grand Jury Exhibit 945 was introduced.)

16

17 Q. And looking at Exhibit 945, did you at some
18 point learn that that's a photograph of Ronald Schenk?

19 A. Yes.

20 Q. At some point did you learn that the remains
21 associated with case number 18, dash, 19679 were those of
22 Ronald Schenk?

23 A. Yes.

24

25 (Grand Jury Exhibit 946 was introduced.)

26

1 Q. And looking at Exhibit 946, can you tell us
2 what that's a photograph of?

3 A. It's a photograph of a destroyed residence at
4 the address that you stated, the inside. And there's
5 remains on the floor next to what appears to be a
6 mattress frame, or the springs.

7 Q. And so those are the remains of Mr. Schenk that
8 you located at 5471 South Libby Road, No. 33?

9 A. Yes.

10 Q. On November 15th did you go to a residence at
11 13816 Glover Lane in Magalia?

12 A. Yes.

13 Q. Was that residence destroyed?

14 A. Yes.

15 Q. And were human remains located at that --

16 A. Yes.

17 Q. Were, was a case number assigned to the
18 remains?

19 A. Yes.

20 Q. Was that case number 18, dash, 19699?

21 A. Yes.

22

23 (Grand Jury Exhibit 947 was introduced.)

24

25 Q. And looking at Exhibit 947, did you at some
26 point learn that that's a photograph of John Sedwick?

1 A. Yes.

2 Q. Now, were Mr. Sedwick's remains located inside
3 or outside of his residence?

4 A. Outside.

5 Q. And did you have occasion to speak with
6 Mr. Sedwick on November 8th, 2018?

7 A. Yes.

8 Q. Could you tell us about that.

9 A. I was at the intersection of Coutolenc and
10 Skyway, which is just right down the road from Glover.
11 And he approached in his vehicle, and I spoke with him
12 and told him to leave. And it's my understanding that he
13 returned to his residence.

14 Q. And you're sure that it was Mr. Sedwick?

15 A. Absolutely.

16 Q. Also on November 15th did you go to a residence
17 at 9289 Skyway, No. 15?

18 A. Yes.

19 Q. And was that residence destroyed?

20 A. Yes.

21 Q. Were human remains located at that residence?

22 A. Yes.

23 Q. And was a case number assigned to those
24 remains?

25 A. Yes.

26 Q. Was that case number 18, dash, 19712?

1 A. Yes.

2

3 (Grand Jury Exhibit 948 was introduced.)

4

5 Q. Looking at Exhibit 948, did you at some point
6 learn that that's a photograph of Shirlee Teays?

7 A. Yes.

8 Q. Also at some point did you learn that the
9 remains associated with case number 18, dash, 19712 were
10 those of Shirlee Teays?

11 A. Yes.

12

13 (Grand Jury Exhibit 949 was introduced.)

14

15 Q. And looking at Exhibit 949, can you tell us
16 what that's a photograph of?

17 A. It's a photograph of a destroyed residence at
18 the address that you described. In the corner you can
19 see orange tape which cordoned off the area in which the
20 remains were found.

21

22 (Grand Jury Exhibit 950 was introduced.)

23

24 Q. And then looking at Exhibit 950, can you tell
25 us what that's a photograph of?

26 A. Those were the remains that were found at that

1 address inside of the destroyed residence.

2 Q. On November 19th did you go to an address in
3 Magalia, or a piece of property in Magalia that didn't
4 have an assigned address but was in the vicinity of
5 Athens Way and South Park Drive?

6 A. Yes.

7 Q. Was that residence destroyed?

8 A. Yes.

9 Q. And were human remains located at that
10 residence?

11 A. Yes.

12 Q. Was a case number assigned to those remains?

13 A. Yes.

14 Q. And was that number 18, dash, 19809?

15 A. Yes.

16

17 (Grand Jury Exhibit 951 was introduced.)

18

19 Q. Looking at Exhibit 951, at some point did you
20 learn that that was a photograph of Warren Lessard?

21 A. Yes.

22 Q. At some point did you learn that the remains
23 associated with case number 18, dash, 19809 were those of
24 Warren Lessard?

25 A. Yes.

26

1 (Grand Jury Exhibit 952 was introduced.)

2

3 Q. And looking at Exhibit 952, can you tell us
4 what that's a photograph of?

5 A. It's a photograph of that property at the end
6 of Athens. That, in particular, is a vehicle that was
7 located. If, if you're facing the front of what used to
8 be the property, it was on the left side of what was the
9 structure.

10 Q. Okay. So can you describe a little bit about
11 what that property was like?

12 A. It's my understanding that he was an
13 off-the-grid liver. I don't know if it was a traditional
14 structure because it was reduced to what it was. Maybe a
15 makeshift property, but a structure that he was living
16 in. And so to the right of that vehicle was the main
17 structure with what appeared to be a porch or landing
18 outside of the residence.

19 Q. And where was Mr. Lessard's remains found?

20 A. His remains were found on that porch or landing
21 outside of what was the residence.

22 Q. Okay. And on November 21st did you go to a
23 residence at 1481 Sun Manor, Unit A, in Paradise?

24 A. Yes.

25 Q. And was that residence destroyed?

26 A. Yes.

1 Q. Were human remains located at that residence?

2 A. Yes.

3 Q. And was a case number assigned to these
4 remains?

5 A. Yes.

6 Q. Was that case number 18, dash, 19868?

7 A. Yes.

8

9 (Grand Jury Exhibit 953 was introduced.)

10

11 Q. And looking at Exhibit 953, did you at some
12 point learn that that is a photograph of David Marbury?

13 A. Yes.

14 Q. And at some point did you learn that the
15 remains associated with case number 18, dash, 19868 were
16 those of David Marbury?

17 A. Yes.

18

19 (Grand Jury Exhibit 954 was introduced.)

20

21 Q. And looking at Exhibit 954, can you tell us
22 what that's a photograph of?

23 A. It's a photograph of the destroyed residence at
24 the address on Sun Manor.

25

26 (Grand Jury Exhibit 955 was introduced.)

Q. And looking at Exhibit 955, can you tell us what that's a photograph of?

A. Those are the remains that were located, human remains, that were located on Sun Manor, at the residence.

Q. And is that inside or outside of the residence?

A. I was lucky enough to be able to look at a structure that was in the area that was the same build. It was a duplex. And based on the layout of the remaining homes that were still standing, it appeared as though it was inside of the residence. And there was a car just above, in 955, where the remains were found and appliances around him. And so, to the best of our knowledge, he was inside.

Q. And on November 24th did you go to a residence at 13747 Andover Drive in Magalia?

A. Yes.

Q. Was that residence destroyed?

A. Yes.

Q. And were human remains located at that residence?

A. Yes.

Q. Was a case number assigned?

A. Yes.

Q. And was that case number 18, dash, 19947?

1 A. Yes.

2

3 (Grand Jury Exhibit 956 was introduced.)

4

5 Q. Now, at some point -- looking at Exhibit 956 --
6 at some point, did you learn that that is a photograph of
7 Jean Forsman?

8 A. Yes.

9 Q. And at some point did you also learn that the
10 remains associated with case number 18, dash, 19947 were
11 those of Jean Forsman?

12 A. Yes.

13

14 (Grand Jury Exhibit 957 was introduced.)

15

16 Q. And looking at Exhibit 957, can you tell us
17 what that's a photograph of?

18 A. It's a photograph of the destroyed residence on
19 Andover, where the remains were located.

20

21 (Grand Jury Exhibit 958 was introduced.)

22

23 Q. And looking at Exhibit 958, can you tell us
24 what that's a photograph of?

25 A. It's a photograph of what used to be the
26 structure. Inside of the structure, human remains were

1 located in the top right corner of the photograph.

2 MS. DUPRE-TOKOS: Nothing further.

3 Does anyone have any questions?

4 You just need to get an admonition from Madam
5 Foreperson.

6 THE WITNESS: Okay.

7 GRAND JURY FOREPERSON: Deputy Raggio, you are
8 admonished not to discuss or disclose at any time outside
9 of this jury room the questions that have been asked of
10 you or your answers until authorized by this Grand Jury
11 or the Court. A violation of these instructions on your
12 part may be the basis for a charge against you of
13 contempt of court. This does not preclude you from
14 discussing your legal rights with your own attorney.

15 Deputy Raggio, what I have just said is a
16 warning not to discuss this case with anyone except the
17 Court, your lawyer, or the district attorney. Do you
18 have any questions?

19 THE WITNESS: I do not.

20 GRAND JURY FOREPERSON: Thank you for your
21 time.

22 THE WITNESS: Thank you.

23 MR. NOEL: I know we've only been going for 45
24 minutes. Take a break.

25 Madam Foreperson?

26 GRAND JURY FOREPERSON: Fifteen minutes.

1 MR. NOEL: Fifteen minutes. Stretch, get some
2 air.

3 (Break taken.)

4 GRAND JURY FOREPERSON: All members of the
5 Grand Jury are back from the break, so we can proceed.

6 Deputy Townsend, if you'd raise your right hand
7 to be sworn, please.

8
9 DEPUTY BRANDON TOWNSEND
10 having been called as a witness in
11 the matter now pending, having been first
12 duly sworn, testifies as follows:

13
14 THE WITNESS: I do.

15 GRAND JURY FOREPERSON: Thank you. Have a
16 seat, please.

17
18 EXAMINATION

19
20 BY MS. DUPRE-TOKOS

21 Q. Good morning.

22 A. Good morning.

23 Q. Could you state and spell your name for the
24 record for us.

25 A. It's Brandon Townsend. B-R-A-N-D-O-N, last
26 T-O-W-N-S-E-N-D.

1 MS. DUPRE-TOKOS: Can everyone hear him okay or
2 should he put the mic closer?

3 GRAND JUROR: Pull a little closer.

4 MS. DUPRE-TOKOS: You can pull it. You don't
5 have to lean.

6 Q. (By MS. DUPRE-TOKOS) Could you tell us where
7 you're employed and in what capacity.

8 A. Currently employed at the Butte County
9 Sheriff's Office as deputy sheriff.

10 Q. How long have you been a sworn law enforcement
11 officer?

12 A. Deputy sheriff since 2015.

13 Q. Have you had, have you had other positions
14 within the Butte County Sheriff's Office other than
15 deputy? Have you been a detective or anything like that
16 yet?

17 A. No, ma'am. Deputy since 2015. I have other
18 duties that I do, but also correctional deputy from 2010
19 to 2015 which shares the office.

20 Q. And do you have any other law enforcement
21 experience?

22 A. I was also a correctional officer for Cornell
23 Corrections in a private capacity in CDC in, here in
24 California for three years.

25 Q. And were you assigned to assist with the Camp
26 Fire?

1 A. I was.

2 Q. In what capacity?

3 A. Several capacities.

4 Q. Were you ever assigned to a team that went
5 looking for victims of the fire?

6 A. I was.

7 Q. And on November 12th were you on one of those
8 teams?

9 A. I was.

10 Q. And did you go to a residence at 6674 Pentz
11 Road, No. 19, in Paradise on that day?

12 A. I did.

13 Q. Was that residence destroyed?

14 A. It was.

15 Q. And were human remains located there?

16 A. There was.

17 Q. Was a case number assigned to those remains?

18 A. It was.

19 Q. And was that case number 18, dash, 19812?

20 A. It was.

21

22 (Grand Jury Exhibit 959 was introduced.)

23

24 Q. Now, looking at Exhibit 959, which should be in
25 front of you and is also up on the screen, did you at
26 some point learn that that's a photograph Dorothy Mack?

1 A. I did.

2 Q. And at some point did you learn that the
3 remains associated with case number 18, dash, 19812 were
4 those of Dorothy Mack?

5 A. I did.

6
7 (Grand Jury Exhibit 960 was introduced.)

8
9 Q. And looking at Exhibit 960, could you tell us
10 what that's a photograph of.

11 A. That was a scene of the residence where the
12 remains were collected, the structure.

13 Q. At 6674 Pentz?

14 A. Yes.

15
16 (Grand Jury Exhibit 961 was introduced.)

17
18 Q. And then looking at Exhibit 961, could you tell
19 us what that's a photograph of.

20 A. That's a photograph of a taped-off area where
21 remains were collected. And part of the remains are
22 visible.

23 Q. Okay. And those would be the remains of
24 Dorothy Mack from 6674 Pentz?

25 A. Yes.

26 Q. And then on November 20th were you also on a

1 team that went looking for victims of the fire?

2 A. I was.

3 Q. Did you go to a residence at 5775 Deanna Way in
4 Paradise?

5 A. I did.

6 Q. Was that residence destroyed?

7 A. It was.

8 Q. And were human remains located there?

9 A. They were.

10 Q. Is the case number assigned to that?

11 A. It was.

12 Q. And was that case number 18, dash, 19836?

13 A. It was.

14

15 (Grand Jury Exhibit 962 was introduced.)

16

17 Q. Looking at Exhibit 962, you see there's no
18 photograph of a person. Do you know why that is?

19 A. I believe there wasn't one located or in the
20 system for that individual that we believed was a match
21 for that residence.

22 Q. Okay. At some point did you learn whether or
23 not the person living at that address had any living
24 relatives?

25 A. I don't recall there being any.

26 Q. You don't recall there being any?

1 A. I don't recall there being any living relatives
2 that we found.

3

4 (Grand Jury Exhibit 963 was introduced.)

5

6 Q. Looking at Exhibit 963, what is that a
7 photograph of?

8 A. It's a photograph of numbers displayed for that
9 house, that address; and the garbage cans associated with
10 that address. Recycle bin.

11

12 (Grand Jury Exhibit 964 was introduced.)

13

14 Q. And Exhibit 964, what is that a photograph of?

15 A. Of the burned, destroyed structure so stated at
16 that address.

17

18 (Grand Jury Exhibit 965 was introduced.)

19

20 Q. And Exhibit 965, can you tell us what that's a
21 photograph of?

22 A. It's the area where the human remains were
23 collected.

24

25 (Grand Jury Exhibit 966 was introduced.)

26

1 Q. And then 966, it's a little hard to see. First
2 of all, what is that? Is that you?

3 A. That's me. That's a picture of my phone. It's
4 an application that I used to pinpoint GPS of the
5 location we were at.

6 Q. Okay. Does this application also sometimes
7 tell you the owner of a property?

8 A. It does. It gives owner address and
9 information.

10 Q. Okay. And right here, is that where it shows
11 the owner? And you can get up if you want.

12 A. Yes, that's the owner.

13 Q. What does it say for the owner?

14 A. I have to get closer.

15 Q. Okay. Go ahead.

16 A. Herbert Alderman.

17 Q. And I don't know if I asked you this, but at
18 some point did you learn that the remains associated with
19 case number 18, dash, 19836 were those of Herbert
20 Alderman?

21 A. Yes.

22

23 (Grand Jury Exhibit 967 was introduced.)

24

25 Q. In looking at Exhibit 967, can you tell us what
26 that's a photograph of.

1 A. That's the mail that I located inside the bin
2 that was associated with the address.

3

4 (Grand Jury Exhibit 968 was introduced.)

5

6 Q. And then what is Exhibit 968, the photograph?

7 A. That's the bin in front of the residence that
8 had the mail in it.

9 Q. You can actually see the mail there?

10 A. Correct. That was the same picture prior
11 shown, but inside the tote where it was located.

12 Q. And I'm going to jump back. In that picture
13 can you see that piece of mail in the blue bin?

14 A. Yes. It's the mail sitting there where the bin
15 opens up.

16 MR. NOEL: And that was 963 you were referring
17 to; right?

18 Q. (By MS. DUPRE-TOKOS) Yes.

19 That was Exhibit 963; correct?

20 A. Correct. Yeah.

21 Q. Thanks.

22 And so with all of that information, did that
23 lead you to believe that Mr. Herbert Alderman lived at
24 that address?

25 A. It did.

26 Q. And that those were his remains?

A. It did.

Q. And then on November 24th, were you also on a team that went looking for victims of the Camp Fire?

A. I was.

Q. Did you go to a residence at 2376 Clearview Drive in Paradise?

A. I did.

Q. Was that residence destroyed?

A. It was.

Q. And were human remains located there?

A. There was.

Q. Was a case number assigned?

A. There was.

Q. Was that 18, dash, 19949?

A. It was.

(Grand Jury Exhibit 969 was introduced.)

Q. At some point did you learn that the woman in this photograph is Dorothy, or was Dorothy Lee-Herrera?

A. I did.

Q. And at some point did you also learn that the remains associated with case number 18, dash, 19949 were those of Dorothy Lee-Herrera?

A. I did.

1 (Grand Jury Exhibit 970 was introduced.)

2

3 Q. And looking at Exhibit 970, can you tell us
4 what that's a photograph of.

5 A. It's a picture of the destroyed --

6 Q. I'm sorry?

7 A. Picture of the residence, destroyed.

8 Q. At 2376 Clearview?

9 A. Yes.

10

11 (Grand Jury Exhibit 971 was introduced.)

12

13 Q. And then looking at Exhibit 971, can you tell
14 us what that's a photograph of?

15 A. That's the area where the remains were
16 recovered.

17 Q. And are any remains visible in that photograph?

18 A. There are in the tray there.

19 Q. Okay. Can you just point to that very quickly.

20 And that's it, unless anyone has any questions.

21 No?

22 You just need an admonition from Madam
23 Foreperson.

24 GRAND JURY FOREPERSON: Deputy Townsend, you
25 are admonished not to discuss or disclose at any time
26 outside of this jury room the questions that have been

1 asked of you or your answers until authorized by this
2 Grand Jury or the Court. A violation of these
3 instructions on your part may be the basis for a charge
4 against you of contempt of court. This does not preclude
5 you from discussing your legal rights with your own
6 attorney.

7 Deputy Townsend, what I have just said is a
8 warning not to discuss this case with anyone except the
9 Court, your lawyer, or the district attorney. Do you
10 have any questions?

11 THE WITNESS: I do not.

12 GRAND JURY FOREPERSON: Thank you for your time
13 today.

14 THE WITNESS: Thank you.

15 (Pause in proceeding.)

16 GRAND JURY FOREPERSON: Please raise your right
17 hand to be sworn.

18

19 DEPUTY MANUEL AYALA

20 having been called as a witness in
21 the matter now pending, having been first
22 duly sworn, testifies as follows:

23

24 THE WITNESS: I do.

25 GRAND JURY FOREPERSON: Thank you. Have a
26 seat, please.

1
2 EXAMINATION
3

4 BY MS. DUPRE-TOKOS

5 Q. Good morning.

6 A. Good morning.

7 Q. You can move the microphone wherever you need
8 to. It slides. You don't have to lean forward.

9 Could you state and spell your name for the
10 record.

11 A. Manuel Ayala, M-A-N-U-E-L A-Y-A-L-A.

12 Q. Where are you employed and in what capacity?

13 A. I am currently employed by the Butte County
14 Sheriff's Office. I am assigned as a school resource
15 deputy at the time.

16 Q. And how long have you had that assignment?

17 A. I have been a school resource deputy for
18 approximately four months.

19 Q. And prior to that what was your assignment?

20 A. Prior to that my assignment was on patrol.

21 Q. And how long were you in that assignment?

22 A. Approximately a year.

23 Q. How long have you been a sworn law enforcement
24 officer?

25 A. I've been in law enforcement for approximately
26 eight years.

1 Q. And how long have you been with the sheriff's
2 office?

3 A. Sheriff's office I've been with 15 months.

4 Q. Where were you prior to that?

5 A. Prior to that I was with the Paradise Police
6 Department.

7 Q. Okay. And how long were you with Paradise
8 Police Department?

9 A. I was with the Paradise Police Department for
10 about six and a half years.

11 Q. Do you have any law enforcement experience
12 prior to that?

13 A. I do not.

14 Q. Were you assigned to assist with the Camp Fire?

15 A. I was.

16 Q. In what capacity?

17 A. Initially I was assigned with, to the Coroner's
18 Division to go out and assist the anthropologist team.

19 Q. And were you with the coroner's team looking
20 for victims of the Camp Fire on November 11th, 2018?

21 A. I was.

22 Q. Did you go to a residence at 5471 South Libby
23 Road, No. 34, in Paradise on that day?

24 A. I did.

25 Q. Was that residence destroyed?

26 A. It was.

1 Q. And were human remains located at that
2 residence?

3 A. There were.

4 Q. Was a case number assigned to those remains?

5 A. There was.

6 Q. Was that 18, dash, 19538?

7 A. Yes.

8

9 (Grand Jury Exhibit 972 was introduced.)

10

11 Q. And you should have exhibits in front of you.
12 They're also up on the screen.

13 Looking at Exhibit 972, did you at some point
14 learn that that's a photograph of Vincent Carota?

15 A. I did.

16 Q. Did you also at some point learn that the
17 remains associated with case number 18, dash, 19538, were
18 those of Vincent Carota?

19 A. Yes.

20 Q. Were Mr. Carota's remains located inside or
21 outside the residence?

22 A. Inside the residence.

23 Q. And there's an error on this PowerPoint with
24 "alive prior" checked, so we'll get you all a replacement
25 page.

26 On November 14th were you, again, on a team

1 looking for victims of the fire?

2 A. I was.

3 Q. And did you go to a residence at 8030 Skyway,
4 Unit A, in Paradise?

5 A. I did.

6 Q. Was that residence destroyed?

7 A. Yes.

8 Q. Were human remains located there?

9 A. Yes.

10 Q. And was a case number assigned to those
11 remains?

12 A. There was.

13 Q. Was that case number 18, dash, 19551?

14 A. That's correct.

15

16 (Grand Jury Exhibit 973 was introduced.)

17

18 Q. And looking at Exhibit 973, looks like we've
19 got a typo. There is a "6" on the end of that.

20 Did you at some point learn that that's a
21 photograph of Andrew Downer?

22 A. Yes.

23 Q. Did you also at some point learn that the
24 remains associated with case number 18, dash, 19551 were
25 those of Andrew Downer?

26 A. Yes.

(Grand Jury Exhibit 974 was introduced.)

Q. And looking at Exhibit 974, can you tell us what that's a photograph of?

A. That is a photograph of Mr. Downer's residence.

Q. And the remains of it?

A. And the remains of it, yes.

(Grand Jury Exhibit 975 was introduced.)

Q. And looking at Exhibit 975, can you tell us what that's a photograph of?

A. That is a photograph of human remains.

Q. And were those ones located at 8030 Skyway, Unit A?

A. Correct.

Q. So they were the remains of Mr. Downer?

A. Yes.

Q. And were Mr. Downer's remains located inside or outside?

A. Outside.

Q. Also, back on November 11th, 2018, did you go to a residence at 5436 Clark Road, No. 14, in Paradise to look for a victim of the fire?

A. I did.

1 Q. Was that residence destroyed?
2 A. It was.
3 Q. Were remains located there?
4 A. Yes.
5 Q. And was a case number assigned to those
6 remains?
7 A. Yes.
8 Q. Is that case number 18, dash, 19562?
9 A. Yes.
10
11 (Grand Jury Exhibit 976 was introduced.)
12
13 Q. And looking at Exhibit 976, did you at some
14 point learn that that's a photograph of Gerald Rodrigues?
15 A. Yes.
16 Q. And at some point did you also learn that the
17 remains associated with case number 18, dash, 19562 were
18 those of Gerald Rodrigues?
19 A. Yes.
20 Q. Was Mr. Rodrigues located inside or outside of
21 the residence?
22 A. Inside.
23 Q. On November 13th, 2018, did you go to a
24 residence at 5081 Wilderness Way in Paradise?
25 A. I did.
26 Q. And was that residence destroyed?

1 A. It was.

2 Q. And were human remains located at that
3 residence?

4 A. Yes.

5 Q. Was a case number assigned to those remains?

6 A. Yes.

7 Q. And was that case number 18, dash, 19647?

8 A. Yes.

9

10 (Grand Jury Exhibit 977 was introduced.)

11

12 Q. Looking at Exhibit 977, did you at some point
13 learn that that's a photograph of Dennis Hanco?

14 A. Yes.

15 Q. And at some point did you also learn that the
16 remains associated with case number 18, dash, 19647 were
17 those of Dennis Hanco?

18 A. Yes.

19

20 (Grand Jury Exhibit 978 was introduced.)

21

22 Q. And looking at Exhibit 978, can you tell us
23 what those, that's a photograph of?

24 A. That is a photograph of Mr. Hanco's residence.

25 Q. And that's the one at 5081 Wilderness Way?

26 A. Correct.

(Grand Jury Exhibit 979 was introduced.)

Q. In looking at 979, can you tell us what that's
a photograph of?
A. Mr. Hanko's remains.
Q. Did you go to a residence at 5393 Sawmill Road,
No. 27, in Paradise?
A. I did.
Q. Was that residence destroyed?
A. It was.
Q. And were human remains located there?
A. Yes.
Q. And were they assigned a case number?
A. Yes.
Q. Was that case number 18, dash, 19680?
A. Yes.

(Grand Jury Exhibit 980 was introduced.)

Q. Looking at Exhibit 980, at some point did you
learn that that's a photograph of Elizabeth Gaal?
A. Yes.
Q. And at some point did you also learn that the
remains associated with case number 18, dash, 19680 were
those of Elizabeth Gaal?

1 A. Yes.

2

3 (Grand Jury Exhibit 981 was introduced.)

4

5 Q. Looking at Exhibit 981, can you tell us what
6 that's a photograph of.

7 A. That is a photograph of Ms. Gaal's residence
8 which was destroyed.

9 Q. And so that's the one at 5393 Sawmill Road?

10 A. Correct.

11

12 (Grand Jury Exhibit 982 was introduced.)

13

14 Q. And looking at Exhibit 982, can you tell us
15 what that's a photograph of.

16 A. Those are Ms. Gaal's remains.

17 Q. On November 16th, 2018, did you go to a
18 residence at 1040 Buschmann Road in Paradise?

19 A. I did.

20 Q. Was that residence destroyed?

21 A. Yes.

22 Q. And were human remains located there?

23 A. Yes.

24 Q. Was a case number assigned to those remains?

25 A. There was.

26 Q. And was that case number 18, dash, 19732?

1 A. Correct.

2

3 (Grand Jury Exhibit 983 was introduced.)

4

5 Q. Looking at Exhibit 983, did you at some point
6 learn that this is a photograph of Christopher Maltby?

7 A. Yes.

8 Q. And did you also learn that at some point -- or
9 at some point did you learn that the remains associated
10 with case number 18, dash, 19732 were those of
11 Christopher Maltby?

12 A. Yes.

13

14 (Grand Jury Exhibit 984 was introduced.)

15

16 Q. And looking at Exhibit 984, can you tell us
17 what that's a photograph of.

18 A. That is a photograph of Mr. Maltby's residence.

19 Q. At 1040 Buschmann?

20 A. Correct.

21

22 (Grand Jury Exhibit 985 was introduced.)

23

24 Q. Then looking at Exhibit 985, can you tell us
25 what that's a photograph of.

26 A. That is a photograph of a prosthetic that we

1 located.

2 Q. Okay. When you say "a prosthetic," what do you
3 mean? Implant in the body?

4 A. Implant in the body, yes.

5 Q. Okay. And are there any human remains in that
6 picture as well?

7 A. I believe there are to the right of the metal
8 gusset.

9 Q. Okay. And those are -- is it my understanding
10 then that those -- is my understanding correct that those
11 are the remains of Mr. Maltby that you located at 1040
12 Buschmann?

13 A. Yes.

14 MS. DUPRE-TOKOS: Does anyone have any
15 questions?

16 That's it. You just have an admonition from
17 Madam Foreperson.

18 GRAND JURY FOREPERSON: Deputy Ayala, you are
19 admonished not to discuss or disclose at any time outside
20 of this jury room the questions that have been asked of
21 you or your answers until authorized by this Grand Jury
22 or the Court. A violation of these instructions on your
23 part may be the basis for a charge against you of
24 contempt of court. This does not preclude you from
25 discussing your legal rights with your own attorney.

26 Deputy Ayala, what I have just said is a

1 warning not to discuss this case with anyone except the
2 Court, your lawyer, or the district attorney. Do you
3 have any questions?

4 THE WITNESS: Not at all.

5 THE COURT: Thank you for your time today.

6 THE WITNESS: Thank you.

7 [DISCUSSION OMITTED.]

8 (Lunch break taken.)

9 [ROLL CALL OMITTED.]

10 MS. DUPRE-TOKOS: We all set?

11 GRAND JURY FOREPERSON: We are ready.

12 Mr. Curtis, before you have a seat, would you
13 please raise your right hand to be sworn.

14

15 SCOTT CURTIS

16 having been called as a witness in
17 the matter now pending, having been first
18 duly sworn, testifies as follows:

19

20 THE WITNESS: I do.

21 GRAND JURY FOREPERSON: Thank you. Have a
22 seat, please.

23

24 EXAMINATION

25

26 BY MS. DUPRE-TOKOS

1 Q. Good afternoon.

2 A. Good afternoon.

3 Q. Could you please state and spell your name for
4 the record.

5 A. Sure. Scott Curtis, S-C-O-T-T C-U-R-T-I-S.

6 Q. And where are you employed and in what
7 capacity?

8 A. I'm employed with the Tehama County District
9 Attorney's Bureau of Investigations as a DA investigator.

10 Q. How long have you been with the Tehama County
11 DA's office?

12 A. Little over three years.

13 Q. Where were you prior to that?

14 A. Red Bluff Police Department.

15 Q. How long were you there?

16 A. I started there in 2000, was there until 2004,
17 left and started my own investigations business. Did
18 that for eight years. Returned to Red Bluff in 2011 and
19 worked there until I came over to the DA's office.

20 Q. Did you have any law enforcement experience
21 prior to Red Bluff Police Department?

22 A. I worked for the Tehama County Probation
23 Department for five years.

24 Q. So all total how long have you been a sworn law
25 enforcement officer?

26 A. Including the probation time, about 18 years.

1 Q. Now, did you come down and assist with the Camp
2 Fire?

3 A. I did.

4 Q. In what capacity?

5 A. I was assigned to a team that went into locate
6 and recover victims from the fire.

7 Q. Were you on a team that was recovering victims
8 from the fire on November 9th, 2018?

9 A. Yes.

10 Q. Did you go to a residence at 102 Magnolia Drive
11 in Paradise on that day?

12 A. Yes.

13 Q. Was that residence destroyed?

14 A. Yes.

15 Q. And were human remains located at that
16 residence?

17 A. Yes, they were.

18 Q. Was the case number assigned to the remains?

19 A. It was.

20 Q. And was that 18, dash, 19540?

21 A. Yes.

22

23 (Grand Jury Exhibit 986 was introduced.)

24

25 Q. Now, showing you Exhibit 986, that should be in
26 front of you and it's also on the screen next to you.

1 At some point did you learn that that's a
2 photograph of Vernice Regan?

3 A. Yes.

4 Q. Did you also, at some point also learn that the
5 remains associated with case number 18, dash, 19540 were
6 those of Vernice Regan?

7 A. Yes.

8 Q. Where were Ms. Regan's remains located?

9 A. Outside by her garage. Or by the garage of the
10 residence.

11 Q. Now, on November 10th did you go to a single
12 vehicle, I think, traffic collision in the area of
13 Hoffman Road and Jordan Hill Road in Concow?

14 A. Yes.

15 Q. And what kind of vehicle was involved?

16 A. It was a minivan.

17 Q. Was that minivan burned?

18 A. Yes.

19 Q. And did you locate any human remains in the
20 van?

21 A. Yes.

22 Q. Was the case number assigned to those remains?

23 A. Yes, it was.

24 Q. And was that case number 18, dash, 19541?

25 A. Yes.

26

1 (Grand Jury Exhibit 987 was introduced.)

2

3 Q. And looking at Exhibit 987, did you at some
4 point learn that that is a photograph of David Young?

5 A. Yes.

6 Q. Did you also at some point learn that the
7 remains associated with the case number 18, dash, 19541
8 were those of David Young?

9 A. Yes.

10

11 (Grand Jury Exhibit 988 was introduced.)

12

13 Q. And I'm showing you Exhibit 988, can you tell
14 us what that's a picture of?

15 A. That's the van that we located in that area.
16 It was burned, and it appeared to have crashed into the,
17 a large tree. It's off the road.

18 Q. Okay. But looking at the picture, doesn't look
19 like it's very far off the road, is it?

20 A. No. You can see the vehicles parked on the
21 road. That's the roadway. And the person that's
22 standing looks like they're standing on the roadway.

23

24 (Grand Jury Exhibit 989 was introduced.)

25

26 Q. Then Exhibit 989, can you tell us what that's a

1 photograph of?

2 A. That's a photograph of the remains we located
3 in the back kind of the third row seat area of the van.

4 Q. Now, also on November 10th did you go to a
5 residence at 5580 Angel Drive in Paradise?

6 A. Yes.

7 Q. Was that residence destroyed?

8 A. Yes.

9 Q. And were any human remains located at that
10 residence?

11 A. Yes.

12 Q. And were, was a case number assigned?

13 A. Yes, there was.

14 Q. Was that 18, dash, 19543?

15 A. Yes.

16

17 (Grand Jury Exhibit 990 was introduced.)

18

19 Q. And in looking at Exhibit 990, did you at some
20 point learn that that is a photograph of Joseph Rabetoy?

21 A. Yes.

22 Q. And did you also at some point learn that the
23 remains associated with the case number 18, dash, 19543
24 were those of Joseph Rabetoy?

25 A. Yes.

26

1 (Grand Jury Exhibit 991 was introduced.)

2

3 Q. And then looking at Exhibit 991, can you tell
4 us what that's a photograph of.

5 A. The remains of the residence that burned down.

6 Q. And that's the one at 5, 5580 Angel Drive?

7 A. Correct.

8

9 (Grand Jury Exhibit 992 was introduced.)

10

11 Q. And then looking at Exhibit 992, could you tell
12 us what that's a photograph of.

13 A. It's a closer picture of that same residence.
14 And there's human remains inside the residence.

15 Q. Also on November 10th did you go to a residence
16 at 51523 Pentz Road?

17 A. Yes.

18 Q. And was that residence destroyed?

19 A. Yes.

20 Q. And did -- or were any human remains located
21 there?

22 A. Yes.

23 Q. How many sets?

24 A. Two sets at that location.

25 Q. Okay. And were case numbers assigned to both
26 of those remains?

1 A. Yes.

2 Q. Were those case numbers 18, dash, 19544 and
3 19545?

4 A. Yes.

5

6 (Grand Jury Exhibit 993 was introduced.)

7

8 Q. And then looking at Exhibit 993, did you at
9 some point learn that that's a photograph of Paula Dodge?

10 A. Yes.

11

12 (Grand Jury Exhibit 994 was introduced.)

13

14 Q. And Exhibit 994, at some point did you learn
15 that that's a photograph of Randall Dodge?

16 A. Yes.

17

18 Q. At some point did you learn that the remains
19 associated with case number 18, dash, 19544 were those of
Paula Dodge?

20 A. Yes.

21 Q. And the remains associated with 19545 were
22 those of Randall Dodge?

23 A. Yes.

24

25 (Grand Jury Exhibit 995 was introduced.)

26

1 Q. Looking at Exhibit 995, can you tell us what
2 that's a photograph of.

3 A. The two cars that were in the driveway of that
4 residence. And I believe we located the remains in
5 between the cars.

6 Q. Okay. Are you able to show us in that picture
7 where the remains were located?

8 A. I believe --

9 Q. And you can stand up.

10 A. Okay. I believe it was in this -- from memory,
11 this dark area. It's not, not what you would expect to
12 see.

13 Q. So both, that would be both of their remains?

14 A. The charred area, yes.

15 Q. Now, on, again, on November 10th, did you go to
16 6884 Pentz Road in Paradise?

17 A. Yes.

18 Q. And was that residence destroyed?

19 A. Yes.

20 Q. Were any human remains located there?

21 A. Yes.

22 Q. And was a case number assigned?

23 A. Yes.

24 Q. Was that 18, dash, 19546?

25 A. Yes.

26

1 (Grand Jury Exhibit 996 was introduced.)

2

3 Q. And looking at Exhibit 996, at some point did
4 you learn that that was a photograph of Russell Stewart?

5 A. Yes.

6 Q. And also at some point did you learn that the
7 remains associated with case number 18, dash, 19546 were
8 those of Russell Stewart?

9 A. Yes.

10

11 (Grand Jury Exhibit 997 was introduced.)

12

13 Q. And looking at Exhibit 997, can you tell us
14 what that's a photograph of.

15 A. That's a, the remains of Mr. Stewart's
16 residence.

17

18 (Grand Jury Exhibit 998 was introduced.)

19

20 Q. And then Exhibit 998, can you tell us what
21 that's a photograph of.

22 A. It's a close-up picture. It's a picture of the
23 remains of Mr. Stewart. Here.

24 Q. Okay. On November 14th did you go to 2376
25 Clearview Drive in Paradise?

26 A. Yes.

1 Q. And was the house at that address destroyed?

2 A. Yes.

3 Q. And were any human remains located there?

4 A. Yes.

5 Q. And was a case number assigned?

6 A. Yes.

7 Q. Was that 18, dash, 19672?

8 A. Yes.

9

10 (Grand Jury Exhibit 999 was introduced.)

11

12 Q. And looking at Exhibit 999, at some point did
13 you learn that the male in this photograph is Louis
14 Herrera?

15 A. Yes.

16 Q. And at some point did you also learn that the
17 remains associated with case number 18, dash, 19672 were
18 those of Louis Herrera?

19 A. Yes.

20 Q. Now, were Mr. Herrera's remains located inside
21 or outside of the residence?

22 A. I believe inside. Double check.

23 Q. Would it refresh your recollection if you were
24 to refer to your report?

25 A. Yes.

26 Q. Okay. And have you been able to review your

1 report?

2 A. I have.

3 Q. And does that refresh your recollection?

4 A. It did.

5 Q. Were Mr. Herrera's remains located inside or
6 outside of the residence?

7 A. Inside.

8 Q. On November 15th 2018, did you go to an
9 overturned vehicle in the area of Pearson Road and
10 Stearns Road in Paradise?

11 A. Yes.

12 Q. And were you able to locate the vehicle you
13 were looking for?

14 A. Yes.

15 Q. Was it burned?

16 A. Yes.

17 Q. And were any human remains located in that
18 vehicle?

19 A. Yes.

20 Q. Was a case number assigned to those remains?

21 A. Yes.

22 Q. And was that case number 18, dash, 19702?

23 A. Yes.

24

25 (Grand Jury Exhibit 1000 was introduced.)

26

1 Q. And looking at Exhibit 1000, did you at some
2 point learn that this is a photograph of Evva Alexander
3 Holt?

4 A. Yes.

5 Q. And were you able to tell if the vehicle
6 overturned in an accident or if there was some other
7 cause?

8 A. It was undetermined. There were some like
9 bulldozer tracks near it, so we didn't know if it was
10 overturned as a result of an accident or if at some point
11 when the road was being cleared if the car was turned
12 over to get off the road.

13 Q. Now, did you go to a residence at 5783 Waco
14 Lane in Paradise on November 16th, 2018?

15 A. Yes.

16 Q. Was that residence destroyed?

17 A. Yes.

18 Q. And were human remains located there?

19 A. Yes.

20 Q. Was a case number assigned?

21 A. Yes.

22 Q. Was that 18, dash, 19725?

23 A. Yes.

24

25 (Grand Jury Exhibit 1001 was introduced.)

26

1 Q. In looking at Exhibit 1001, did you at some
2 point learn that that's a photograph of Donna Ware?

3 A. Yes.

4 Q. And did you also at some point learn that the
5 remains associated with case number 18, dash, 19725 were
6 those of Donna Ware?

7 A. Yes.

8 Q. Were Ms. Ware's remains located inside or
9 outside the residence?

10 A. Inside.

11 Q. On November 17th, did you go to a residence at
12 5237 Black Olive Drive in Paradise?

13 A. Yes.

14 Q. Was that residence destroyed?

15 A. Yes.

16 Q. And were any human remains located there?

17 A. Yes.

18 Q. I assume a case number was assigned?

19 A. Yes.

20 Q. And was that case number 18, dash, 19755?

21 A. Yes.

22

23 (Grand Jury Exhibit 1002 was introduced.)

24

25 Q. Looking at Exhibit 1002, did you at some point
26 learn that that's a photograph of James Kinner?

1 A. Yes.

2 Q. And did you also at some point learn that the
3 remains associated with case number 18, dash, 19755 were
4 those of James Kinner?

5 A. Yes.

6 Q. Were Mr. Kinner's remains located inside or
7 outside the residence?

8 A. Inside.

9 Q. Then also on November 17th did you go to 1866
10 Stark Lane in Paradise?

11 A. Yes.

12 Q. Was that residence destroyed?

13 A. Yes.

14 Q. And were any human remains located there?

15 A. Yes.

16 Q. Was a case number assigned?

17 A. Yes.

18 Q. And was that case number 18, dash, 19764?

19 A. Yes.

20

21 (Grand Jury Exhibit 1003 was introduced.)

22

23 Q. Looking at Exhibit 1003, at some point did you
24 learn that that's a photograph of Carol Arrington?

25 A. Yes.

26 Q. And did you also at some point learn that the

1 remains associated with case number 18, dash, 19764 were
2 those of Carol Arrington?

3 A. Yes.

4 Q. Were Ms. Arrington's remains located inside or
5 outside of the residence?

6 A. Can I refer to my report to refresh my
7 recollection?

8 Q. If it would refresh your recollection, yes.

9 A. Okay.

10 Q. And did that refresh your recollection?

11 A. It did.

12 Q. Were Ms. Arrington's remains located inside or
13 outside of the residence?

14 A. Inside.

15 Q. On November 21st, 2018, did you go to 14175
16 Citadel Way in Magalia?

17 A. Yes.

18 Q. And was that residence destroyed?

19 A. Yes.

20 Q. Were any remains located there?

21 A. Yes.

22 Q. And was a case number assigned to those
23 remains?

24 A. Yes.

25 Q. Was that 18, dash, 19865?

26 A. Yes.

(Grand Jury Exhibit 1004 was introduced.)

Q. Looking at Exhibit 1004, did you at some point learn that this is a photograph Berniece Schmidt?

A. Yes.

Q. And did you also learn that at some point that the remains associated with case number 18, dash, 19865 were those of Berniece Schmidt?

A. Yes.

Q. And were Ms. Schmidt's remains located inside or outside of the residence?

A. Inside.

Q. Then on November 24th, 2018, did you go to a residence at 1009 Village Park Way in Paradise?

A. Yes.

Q. And was that residence destroyed?

A. Yes.

Q. Were human remains located there?

A. Yes.

Q. And was a case number assigned to the remains?

A. Yes.

Q. Was that case number 18, dash, 19948?

A. Yes.

(Grand Jury Exhibit 1005 was introduced.)

Q. In looking at Exhibit 1005, at some point did you learn that that is a photograph Judith Sipher?

A. Yes.

Q. Did you also learn at some point that the remains associated with case number 18, dash, 19948 were those of Judith Sipher?

A. Yes.

Q. And were Ms. Sipher's remains located inside or outside of the residence?

A. I'll need to refer to my report.

Q. Would that refresh your recollection?

A. Yes, ma'am.

Q. Okay. Go ahead.

A. I apologize.

Okay.

Q. Did that refresh your recollection?

A. It did.

Q. Were Ms. Sipher's remains located inside or outside the residence?

A. Inside.

MS. DUPRE-TOKOS: Does anyone have any questions?

You are all set except for an admonition from Madam Foreperson.

GRAND JURY FOREPERSON: Okay. Mr. Curtis, you

1 are admonished not to discuss or disclose at any time
2 outside of this jury room the questions that have been
3 asked of you or your answers until authorized by this
4 Grand Jury or the Court. A violation of these
5 instructions on your part may be the basis for a charge
6 against you of contempt of court. This does not preclude
7 you from discussing your legal rights with your own
8 attorney.

9 Mr. Curtis, what I have just said is a warning
10 not to discuss this case with anyone except the Court,
11 your lawyer, or the district attorney. Do you have any
12 questions?

13 THE WITNESS: No, ma'am.

14 GRAND JURY FOREPERSON: Thank you for your
15 time.

16 THE WITNESS: Thank you.

17
18 (Grand Jury Exhibit 827 was introduced.)
19

20 [DISCUSSION OMITTED.]

21 GRAND JURY FOREPERSON: Yes. We're ready to
22 proceed.

23 We're all here. All members of the Grand Jury
24 are present and ready to proceed.

25 Before you have a seat, would you please raise
26 your right hand to be sworn.

JENNIFER CELENTANO

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MS. DUPRE-TOKOS

Q. Good afternoon.

A. Hello.

Q. Could you state your name and spell your last
name for the record.

A. My name is Jennifer Celentano, spelled
C-E-L-E-N-T-A-N-O.

Q. And where are you employed and in what
capacity?

A. I work at the Butte County Sheriff's Office as
a coroner's investigator.

Q. Is that a sworn law enforcement position?

A. It is not.

Q. What is a coroner's investigator?

1 A. As a coroner's investigator, it's my job to
2 investigate the deaths that happen in this county and
3 determine the course of action that we're going to take
4 with each case.

5 Q. What type of things do you do to that end?

6 A. So I read every coroner's report, determine if
7 they need to have an autopsy or further investigation.
8 I'm also the autopsy assistant, so I assist in all the
9 autopsies that occur in our county. And I perform
10 limited autopsies, which means I will go into an external
11 exam of the body and take blood samples for toxicology.

12 Q. And how long have you been doing that?

13 A. I've been doing that for about a year and a
14 half.

15 Q. What did you do prior to being a coroner's
16 investigator at the Butte County Sheriff's Office?

17 A. So just before that I was at the Butte County
18 Sheriff's Office as an investigative assistant in the
19 Investigations Unit. And because of my special skillset,
20 they kind of gave me all of the, most of the coroner's
21 duties.

22 Q. So how long were you an investigative
23 assistant?

24 A. About a year and a half.

25 Q. And did you work with the sheriff's office
26 before that?

1 A. No, I did not.

2 Q. Where did you work before that?

3 A. Before that I was, I worked at Oroville
4 Gymnastics Sports Academy as a child care provider and
5 gymnastics coach.

6 Q. And you said you had a special skillset.

7 A. I do. I went to Chico State and majored in
8 anthropology. I have a bachelor's degree in anthropology
9 with a focus in physical anthropology, which is bones. I
10 spent about -- the entire time I was at Chico State I was
11 an intern in the human identification lab where we would
12 get human remains and -- I'm sorry, this is going to
13 sound terrible -- remove the flesh and put them in the
14 beetle tank, then we could look closely at the bones for
15 trauma, things like that.

16 Q. So you said you did that the whole time you
17 were at Chico State?

18 A. Correct.

19 Q. Did you do anything related to that between
20 Chico State and the coaching gymnastics?

21 A. I did not.

22 Q. Okay. So did you have other jobs in between
23 there, though?

24 A. No. My family was a family-owned business, and
25 we sold it. Once we sold it, I went back to school.

26 Then, as soon as I graduated from school, I began working

1 at the sheriff's office.

2 Q. Okay. So as a coroner's investigator and from
3 what you've described to us your duties were, I assume
4 you were heavily involved in the Camp Fire?

5 A. I was, yeah. I was heavily involved in the
6 Camp Fire. They sent me the remains, also the Camp Fire
7 liaison, which I have contact with pretty much all of the
8 next of kin on all of the cases. I'm also the contact
9 for Sacramento County Coroner's Office for anything
10 regarding any Camp Fire victims.

11 Q. So it would be safe to say that this became
12 pretty personal for you?

13 A. This is very, very personal to me.

14 Q. And you got to know the families?

15 A. I did.

16 Q. And the victims of the, of the fire weren't
17 just names anymore?

18 A. Oh, no.

19 Q. Okay. So this is going to be hard. Anytime
20 you need a break, just ask.

21 A. Okay.

22 Q. If I've asked a question and you haven't
23 answered it yet, though, you have to answer it before you
24 have a break.

25 A. Okay.

26 Q. Okay? But don't hesitate.

1 A. Okay.

2 Q. So were you, did you go out with teams of
3 people, even if it's just one other person, to look for
4 victims of the fire?

5 A. I did.

6 Q. And did you start that on November 8th or
7 November 9th?

8 A. On November 8th.

9 Q. Did you go up to Edgewood Road in Paradise?

10 A. Yes, I did.

11 Q. And was that on November 8th or November 9th?

12 A. November 8th.

13 Q. And when you went up to Edgewood Road on
14 November 8th, did you come across an area that had some
15 things of note?

16 A. Yes. We went down to the end of Edgewood and
17 there were four burned out vehicles.

18 Q. Do you recall what those vehicles were,
19 generally?

20 A. Minivan, two pickup trucks, and a passenger
21 car.

22 Q. So let's start with the van. Was -- you said
23 they were all burned out?

24 A. Yes.

25 Q. So were any human remains found in or near the
26 van?

1 A. Yes. One set of human remains and one set of
2 canine remains.

3 Q. And was a case number assigned to the human
4 remains?

5 A. Yes.

6 Q. Was that case number 18, dash, 19487?

7 A. Yes.

8

9 (Grand Jury Exhibit 1006 was introduced.)

10

11 Q. I'm showing you Exhibit 1006. Do you know who
12 that's a photograph of?

13 A. Yes, that's Andrew Burt.

14 Q. And at some point did you learn that the
15 remains associated with case number 18, dash, 19487 were
16 those of Mr. Andrew Burt?

17 A. Yes.

18 Q. And where were Mr. Burt's remains located?

19 A. Just outside of the minivan, on the passenger
20 side. The dog as well.

21

22 (Grand Jury Exhibit 1007 was introduced.)

23

24 Q. So I'm showing you what's Exhibit 1007. You
25 should have them in front of you, but they're also on the
26 screen. You can look at either one, but there should be

1 a little stack right in front of you.

2 A. Oh, these?

3 Q. Yeah. Okay. Can you tell us what that's a
4 photograph of.

5 A. That is a photograph of the minivan that
6 Mr. Burt was found on the other side.

7

8 (Grand Jury Exhibit 1008 was introduced.)

9

10 Q. And then showing you Exhibit 1008, what is that
11 a photograph of?

12 A. That's Mr. Burt's remains.

13 Q. And then you said there were two pickup trucks?

14 A. Yes.

15 Q. So talking about the first pickup truck, were
16 human remains found in it?

17 A. Yes.

18 Q. And was a case number assigned to those
19 remains?

20 A. Yes.

21 Q. Was that 18, dash, 19488?

22 A. Yes.

23

24 (Grand Jury Exhibit 1009 was introduced.)

25

26 Q. And do you know who the woman is in this

1 photograph?

2 A. Yes. That's Ms. Powers.

3 Q. Is that Beverly Ann Powers?

4 A. Yes.

5 Q. At some point did you learn that the remains
6 associated with case number 18, dash, 19488 were those of
7 Ms. Powers?

8 A. Yes.

9

10 (Grand Jury Exhibit 1010 was introduced.)

11

12 Q. And looking at Exhibit 1010, can you tell us
13 what that's a photograph of.

14 A. It's the photograph of the pickup truck that we
15 found Ms. Powers inside.

16

17 (Grand Jury Exhibit 1011 was introduced.)

18

19 Q. And looking at Exhibit 1011, can you tell us
20 what that's a photograph of.

21 A. Those are some of Ms. Powers' remains.

22 Q. In the pickup truck?

23 A. Yes.

24 Q. And then the second pickup truck, were human
25 remains found in that?

26 A. Yes.

1 Q. And was a case number assigned to those
2 remains?

3 A. Yes.

4 Q. Was that 18, dash, 19489?

5 A. Yes.

6

7 (Grand Jury Exhibit 1012 was introduced.)

8

9 Q. And do you recognize who the picture of the
10 male is?

11 A. Yes. That's Mr. Duvall.

12 Q. And at some point did you learn that the
13 remains associated with 18, dash, 1948 -- I think it's 9,
14 were those of Mr. Duvall?

15 A. Yes.

16

17 (Grand Jury Exhibit 1013 was introduced.)

18

19 Q. And looking at Exhibit 1013, can you tell us
20 what that's a photograph of.

21 A. That's the photograph of the pickup where we
22 found Mr. Duvall.

23

24 (Grand Jury Exhibit 1014 was introduced.)

25

26 Q. And looking at Exhibit 1014, can you tell us

1 what that's a photograph of.

2 A. Those are the remains of Mr. Duvall inside of
3 the pickup truck.

4 Q. Now, you said there was also a car?

5 A. Yes.

6 Q. Do you happen to remember what kind of car?

7 A. I think it was a Focus, a Ford Focus.

8 Q. Okay. It was some sort of --

9 A. Smaller car, yeah.

10 Q. And were any human remains located in the Ford?

11 A. Yes.

12 Q. How many?

13 A. Two.

14 Q. Were case numbers assigned to both of those
15 remains?

16 A. Yes.

17 Q. And were those case numbers 18, dash, 19490 and
18 19491?

19 A. Yes.

20

21 (Grand Jury Exhibit 1015 was introduced.)

22

23 Q. And looking at Exhibit 1015 --

24 A. That's Ms. Porter.

25 Q. Joy Porter?

26 A. Yes.

(Grand Jury Exhibit 1016 was introduced.)

Q. And then looking at Exhibit 1016?

A. That's her son, Dennis Clark.

Q. Now, at some point did you learn that the remains associated with 18, dash, 19490 were those of Ms. Porter?

A. Yes.

Q. And did you at some point learn that the remains associated with case number 18, dash, 19491 were those of Mr. Clark?

A. Yes.

(Grand Jury Exhibit 1017 was introduced.)

Q. Looking at Exhibit 1017, can you tell us what that's a photograph of.

A. That's a photograph of the cars on Edgewood.

Q. Okay. Is the Ford in that picture?

A. Yes. The first car was the small passenger car with Mr. Clark and his mother, and then the pickup, two pickup trucks behind it.

(Grand Jury Exhibit 1018 was introduced.)

1 Q. And looking at Exhibit 1018, can you tell us
2 what that's a photograph of.

3 A. It's a photograph of remains inside the car.

4 Q. Okay. How are you holding up?

5 A. I'm okay.

6 (Counsel confer.)

7 Q. (By MS. DUPRE-TOKOS) I'm going to back up
8 a second.

9 A. Okay.

10 Q. So there were two pickup trucks in that
11 picture. Just to confirm, are those the two pickup
12 trucks that Mr. Duvall and --

13 A. Ms. Porter.

14 Q. -- Ms. Porter were in?

15 A. Correct.

16 Q. And I was going to say, if you want water, help
17 yourself.

18 A. Thank you.

19 Q. I just need one second.

20 And it was not Ms. Porter, it was Ms. Powers in
21 the pickup truck; correct?

22 A. Can I look at my --

23 Q. Yes, absolutely.

24 A. Yes, I'm sorry, Powers.

25 Q. Now, did you go to Dubarry Lane in Paradise?

26 A. Yes.

1 Q. Do you recall if that was on the 8th or the
2 9th?

3 A. I believe that was on the 9th.

4 Q. Okay. Did you locate any human remains there?

5 A. I did.

6 Q. And was a case number assigned to those
7 remains?

8 A. Yes.

9 Q. Was that 18, dash, 19499?

10 A. Yes.

11

12 (Grand Jury Exhibit 1019 was introduced.)

13

14 Q. And do you recognize this photograph?

15 A. Yes. That's Mr. Bradburd.

16 Q. Okay. David Bradburd?

17 A. Yes.

18 Q. And at some point did you learn that the
19 remains associated with case number 18, dash, 19499 were
20 those of Mr. David Bradburd?

21 A. Yes.

22

23 (Grand Jury Exhibit 1020 was introduced.)

24

25 Q. Showing you Exhibit 1020, can you tell us what
26 that is?

1 A. That's Mr. Bradburd laying there in the middle
2 of the road.

3 Q. On, I believe, November 10th did you go to a
4 residence at a 5236 Edgewood Road?

5 A. Yes.

6 Q. Was that residence destroyed?

7 A. Yes.

8 Q. And were human remains located at that
9 residence?

10 A. Yes.

11 Q. Were the remains inside or outside?

12 A. Outside.

13 Q. Was a case number assigned to those remains?

14 A. Yes.

15 Q. And was that 18, dash, 19524?

16 A. Yes.

17

18 (Grand Jury Exhibit 1021 was introduced.)

19

20 Q. Looking at Exhibit 1021, do you recognize that
21 photograph?

22 A. Yes. That's Mr. Foss.

23 Q. Ernest Foss?

24 A. Yes.

25 Q. At some point did you learn that the remains
26 associated with case number 18, dash, 19524 were those of

1 Mr. Ernest Foss?

2 A. Yes.

3

4 (Grand Jury Exhibit 1022 was introduced.)

5

6 Q. Showing you Exhibit 1022, can you tell us what,
7 what that's a photograph of?

8 A. That is Mr. Foss, covered by a blanket.

9 Q. Now, somewhere on, I believe, November 9th did
10 you go to a residence at 3831 Camelot Lane in Concow?

11 A. Yes.

12 Q. And was that residence destroyed?

13 A. Yes.

14 Q. Were human remains located at that residence?

15 A. Yes.

16 Q. Was a case number assigned to those remains?

17 A. Yes.

18 Q. Was that number 18, dash, 19531?

19 A. Yes.

20

21 (Grand Jury Exhibit 1023 was introduced.)

22

23 Q. Looking at Exhibit 1023, do you recognize that
24 photograph?

25 A. Yes.

26 Q. What is that of?

1 A. That is Mr. Godbout.

2 Q. At some point --

3 MR. NOEL: Want to take a quick break?

4 THE WITNESS: No, I'm okay.

5 MR. NOEL: Sure?

6 THE WITNESS: Yeah.

7 Q. (By MS. DUPRE-TOKOS) At some point did you

8 learn that the remains associated with case number 18,

9 dash, 19531 were those of Mr. Godbout?

10 A. Yes.

11

12 (Grand Jury Exhibit 1024 was introduced.)

13

14 Q. Showing you Exhibit 1024, can you tell us what

15 that's a photograph of.

16 A. That's a photograph of Mr. Godbout's house.

17

18 (Grand Jury Exhibit 1025 was introduced.)

19

20 Q. And Exhibit 1025, what is that of?

21 A. That is Mr. Godbout's remains.

22 Q. Did you go to 5900 Canyon View Drive?

23 A. Yes.

24 Q. Was that in Paradise?

25 A. Yes.

26 Q. Was that around November 12th?

1 A. I'm sorry?

2 Q. Was that around November 12th?

3 A. Yes.

4 Q. Was that residence destroyed?

5 A. It was.

6 Q. And were human remains located there?

7 A. Yes.

8 Q. Was a case number assigned?

9 A. Yes.

10 Q. Is that case number 18, dash, 19599?

11 A. Yes.

12

13 (Grand Jury Exhibit 1026 was introduced.)

14

15 Q. Showing you Exhibits 1026, do you recognize

16 that?

17 A. Yes. That's Mr. Julian Binstock.

18 Q. At some point did you learn that the remains

19 associated with case number 18, dash, 19599 were those of

20 Julian Binstock?

21 A. Yes.

22 MR. NOEL: Let's take a break.

23 Thank you.

24 For the record, one of the jurors asked to take

25 a break.

26 (Break taken.)

1 GRAND JURY FOREPERSON: All members of the
2 Grand Jury have returned from their break, and we're
3 ready to proceed.

4 Q. (By MS. DUPRE-TOKOS) So, Investigator
5 Celentano, this one's particularly difficult, isn't it?

6 A. Yes.

7 Q. Why is that?

8 A. I became very close to Mr. Binstock's family,
9 and he had been touched, and he told me lots of wonderful
10 things about Mr. Binstock. I found him with his dog when
11 -- looked like he was trying to hide in the shower. I
12 just remember -- I apologize -- I remember the story
13 about the dog and his senior community, and they were
14 known as "Jack and the Binstock." And I just -- this
15 one's really hard for me.

16 Q. And Mr. Binstock was very accomplished, wasn't
17 he?

18 A. Yes, he was. He won an Emmy, he spoke eight
19 languages, traveled all over world. Very interesting.
20 Every year won the award for the funniest resident at his
21 senior facility.

22 Q. Thank you for sharing that.

23 A. You're welcome.

24 Q. And I think I asked this, but I'm not sure, so
25 I'm going to ask it again.

26 A. Okay.

1 Q. A some point did you learn that the remains
2 associated with case number 18, dash, 19599 were those of
3 Mr. Binstock?

4 A. Yes.

5
6 (Grand Jury Exhibit 1027 was introduced.)

7
8 Q. I'm going to show you Exhibit 1027.

9 A. That's Mr. Binstock's house.

10 Q. Is that 5900 Canyon View Drive?

11 A. Yes.

12
13 (Grand Jury Exhibit 1028 was introduced.)

14
15 Q. And 1028?

16 A. That's Mr. Binstock's remains.

17 Q. Now, did you go to a residence at 5908 Del Mar
18 Avenue in Paradise on or about November 12th?

19 A. Yes.

20 Q. And was that residence destroyed?

21 A. Yes.

22 Q. Were human remains located at that residence?

23 A. Yes.

24 Q. And was a case number assigned to those
25 remains?

26 A. Yes.

1 Q. Was that number 18, dash, 19627?

2 A. Yes.

3

4 (Grand Jury Exhibit 1029 was introduced.)

5

6 Q. I'm showing you Exhibit 1029. Do you recognize
7 that picture?

8 A. Yes, that's -- well, her family called her
9 Kimber. So that's Kimber Wehr.

10 Q. And at some point did you learn that the
11 remains associated with case number 18, dash, 19627 were
12 those of Kimber Wehr?

13 A. Yes.

14 Q. Is her real name Kimberly?

15 A. I believe so, Kimberly.

16

17 (Grand Jury Exhibit 1030 was introduced.)

18

19 Q. And Exhibit 1030, can you tell us what that is?

20 A. That is her home.

21 Q. That's 5908 Del Mar Avenue?

22 A. Yes.

23

24 (Grand Jury Exhibit 1031 was introduced.)

25

26 Q. And I'm showing you Exhibit 1031, could you

1 tell us --

2 A. In the center of that picture there's a dark
3 spot that is Ms. Wehr's remains.

4 Q. Are there any human remains that have not been
5 identified yet?

6 A. Yes.

7 Q. Where were they located?

8 A. They were located at 4220 Schwyhart in Concow.

9 Q. Were they located on their own?

10 A. No. They were located comingled with Ellen
11 Walker.

12 Q. What does "comingled" mean?

13 A. Comingled means that they were just found
14 together in the same proximity. So when we originally
15 recovered Ms. Walker and sent her to the Sacramento
16 County Coroner's Office, the anthropologist began to look
17 through the remains and discovered that there were two
18 individuals, not just one.

19 Q. And so that person has not yet been identified?

20 A. Correct.

21 Q. All right. Are we still trying?

22 A. Yes. So the ANDE Rapid DNA Company that
23 identified many of the Camp Fire victims is still
24 attempting to identify the John Doe.

25 (Counsel confer.)

26 Q. (By MS. DUPRE-TOKOS) So you mentioned the ANDE

1 Rapid DNA?

2 A. Uh-huh.

3 Q. Can you tell us a little bit about how that
4 came into play with this.

5 A. So I think it was the third or fourth day of
6 the fire, we were contacted by ANDE Rapid DNA. The
7 sheriff spoke with them. And they said that they could
8 identify people quickly with their new technology. The
9 sheriff said, "You better be able to." And so they came
10 up and they put a machine in Sacramento and then also a
11 machine in Chico. So the machine in Chico would, they
12 would collect buccal swabs, which is a cheek swab, of the
13 family members and they would analyze them here in this
14 machine. And in Sacramento they would collect samples
15 from the remains and run them through the machine down
16 there. Then they would compare the results and they
17 would be able to identify people. We identified about 30
18 people using that method in one month.

19 Q. How long would it normally have taken with
20 traditional DNA?

21 A. It would have taken about a year, one to two
22 years, for us to get any response back from DOJ -- DOJ.

23 Q. And that's the Department of Justice?

24 A. Yes.

25 Q. That's a pretty huge difference?

26 A. Yes. Pretty remarkable.

1 Q. And the results are reliable?

2 A. Yes.

3 Q. I assumed that that was checked before --

4 A. Yes. They're actually accredited with the FBI.
5 So, yeah, it's -- it was pretty amazing. Then they've
6 never done anything like that. But, yeah, just -- we
7 still would have unidentified people today had we not
8 used that technology.

9 MS. DUPRE-TOKOS: Does anyone have any
10 questions?

11 No.

12 Then you're done except for an admonition from
13 Madam Foreperson.

14 THE WITNESS: Okay.

15 GRAND JURY FOREPERSON: Investigator Celentano,
16 you are admonished not to discuss or disclose at any time
17 outside of this jury room the questions that have been
18 asked of you or your answers until authorized by this
19 Grand Jury or the Court. A violation of these
20 instructions on your part may be the basis for a charge
21 against you of contempt of court. This does not preclude
22 you from discussing your legal rights with your own
23 attorney.

24 Investigator Celentano, what I have just said
25 is a warning not to discuss this case with anyone except
26 the Court, your lawyer, or the district attorney. Do you

1 have any questions?

2 THE WITNESS: No.

3 GRAND JURY FOREPERSON: Thank you for your
4 time.

5 THE WITNESS: Thank you.

6 MR. NOEL: Hold on, something did come up we
7 forgot to ask you about. It was a question from one of
8 the jurors earlier with regard to the evidence --

9 THE WITNESS: Okay.

10 MR. NOEL: -- and the fact that --

11 MS. DUPRE-TOKOS: You may or may not know the
12 answer.

13 MR. NOEL: Right. That some of the bodies were
14 completely burned and were nothing but cremains. With
15 your background in anthropology -- and did you study
16 under Dr. Turhon Murad?

17 THE WITNESS: I did not.

18 MR. NOEL: Was he already retired when you went
19 through?

20 THE WITNESS: He was.

21 MR. NOEL: Okay. Who was your professor at
22 Chico State?

23 THE WITNESS: Dr. P. Willey, Dr. Eric
24 Bartelink, and Dr. Colleen Milligan.

25 MR. NOEL: And did you do any studies on the
26 application of heat to the human body and the amount of

1 heat that it takes to break down a body?

2 THE WITNESS: I did not myself, no.

3 MR. NOEL: Okay.

4 MS. DUPRE-TOKOS: Did you study --

5 THE WITNESS: I did.

6 MS. DUPRE-TOKOS: Basically did you learn that

7 information?

8 THE WITNESS: Yes. Yes.

9 MS. DUPRE-TOKOS: Do you happen to recall any

10 of that?

11 THE WITNESS: Well, you said some of them were

12 cremains. None of them were cremains. There was some

13 sort of tissue on all of them, bone, and that's, that's

14 why the DNA was so quick, because we were able to find

15 viable pieces of tissue that we could use. But none of

16 them were cremains.

17 MS. DUPRE-TOKOS: So for the -- and you saw

18 most of the remains --

19 THE WITNESS: I did.

20 MS. DUPRE-TOKOS: -- either in person or

21 photographs. Do you know about how hot that fire had to

22 have been to put the bodies in the condition that, that

23 we've seen?

24 THE WITNESS: I don't know the exact

25 temperature, no. But approaching cremation temperatures,

26 because the, most of the bones, especially in the

1 vehicles, were calcified, which means they were white and
2 brittle. I was picking them up, and they were just
3 crumbling to dust. So hot enough it was close to
4 cremation temperature, but there was still viable pieces
5 of tissue left.

6 MS. DUPRE-TOKOS: Do you know what, happen to
7 know what cremation temperature is?

8 THE WITNESS: I don't.

9 MS. DUPRE-TOKOS: I just didn't know if you
10 knew off the top of your head.

11 THE WITNESS: No, I'm sorry.

12 MR. NOEL: Does that answer your question that
13 came up earlier?

14 GRAND JUROR: That's fine. Thank you.

15 MS. DUPRE-TOKOS: Any other questions?

16 Okay. Then you're all set.

17 [DISCUSSION OMITTED.]

18

19 (Grand Jury Exhibits 935-1031 admitted into evidence.)

20

21 [DISCUSSION OMITTED.]

OROVILLE, BUTTE COUNTY, CALIFORNIA

JANUARY 24, 2020; 8:30 a.m.

(Confidential Special Grand Jury Hearing Proceedings)

[Confidential grand jury called into session at 9:03 a.m.
in Courtroom 9.]

[Grand jury role call omitted.]

MR. NOEL: Ready to start for the morning?

MS. DUPRE-TOKOS: Yes.

MR. NOEL: As soon as this comes up on the screen.
All right.

MS. DUPRE-TOKOS: We're bringing Sergeant Muchaca
back.

[Witness enters the courtroom.]

THE WITNESS: Good morning.

GRAND JURY FOREPERSON: Good morning. We're ready.

Sergeant Machuca, do you solemnly swear that the
evidence you shall give in this matter pending before the
grand jury shall be the truth, the whole truth and nothing
but the truth so help you God?

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you have a seat.

///
///

EXAMINATION

BY MS. DUPRE-TOKOS:

Q. Good morning.

A. Morning.

Q. Thank you for coming back. I understand you're on duty today?

A. I am.

Q. Thank you for abandoning the fine folks of Yuba County and taking some time to come back up here in the fog.

We've already gone through all of the initial questions and your background and stuff.

A. Correct.

Q. So I just wanted to ask you a few more questions. And I want to talk about Jesus Fernandez, and you should have in front of you Exhibit 1054.

A. Yes.

[Exhibit No. 1054 was identified.]

BY MS. DUPRE-TOKOS:

Q. Just initially, were you on one of the teams looking for victims of the fire on November 11, 2018?

A. I was.

Q. And were you in Concow?

A. Yes.

Q. And did you find a victim of the fire on Broken Glass Circle in Concow?

1 A. Yes.

2 Q. And was that person deceased?

3 A. Yes.

4 Q. Was a case number assigned to that person?

5 A. Yes.

6 Q. Was that 18-19563?

7 A. Yes.

8 Q. And at some point -- looking at Exhibit 1054, at
9 some point, did you learn that that is a photograph of
10 Mr. Jesus Fernandez?

11 A. Yes.

12 Q. And do recall where Mr. Fernandez was located?
13 Was he in -- by a house, in a driveway, on the street?
14 Was there anything of note near him?

15 A. He was located in between two vehicles, laying
16 face down. The vehicles were parked off the side of a
17 dirt road.

18 Q. And I think that's all I have for you.

19 A. Okay.

20 MS. DUPRE-TOKOS: Any questions?

21 GRAND JUROR NUMBER FOUR: Just a clarification. Is
22 Broken Glass Circle the name of the street?

23 MS. DUPRE-TOKOS: Yes.

24 GRAND JUROR NUMBER FOUR: Okay.

25 MS. DUPRE-TOKOS: And you've heard that street name
26 before with a different witness.

1 GRAND JUROR NUMBER FOUR: Okay.

2 MS. DUPRE-TOKOS: So you just need your admonition.

3 GRAND JURY FOREPERSON: Okay.

4 Sergeant Machuca, you are admonished not to
5 discuss or disclose, at any time outside of this jury
6 room, the questions that have been asked of you or your
7 answers until authorized by this grand jury or the court.

8 A violation of these instructions on your part
9 may be the basis for a charge against you of contempt of
10 court. This does not preclude you from discussing your
11 legal rights with your own attorney.

12 Sergeant Machuca, what I have just said is a
13 warning not to discuss this case with anyone except the
14 court, your lawyer or the district attorney.

15 Do you have any questions?

16 THE WITNESS: No.

17 GRAND JURY FOREPERSON: Thank you for coming back.

18 THE WITNESS: Thank you.

19 MR. NOEL: Who is next?

20 MS. DUPRE-TOKOS: Morgan Turner.

21 [The witness enters the courtroom.]

22 GRAND JURY FOREPERSON: Deputy Turner, before you
23 have a seat, please raise your right hand to be sworn.

24 Deputy Turner, do you solemnly swear that the
25 evidence you shall give in this matter pending before the
26 grand jury shall be the truth, the whole truth and nothing

1 but the truth so help you God?

2 THE WITNESS: I do.

3 GRAND JURY FOREPERSON: Thank you. Have a seat,
4 please.

5 MS. DUPRE-TOKOS: I just need one moment.

6

7 **EXAMINATION**

8 BY MS. DUPRE-TOKOS:

9 Q. Good morning. Could you state and spell your
10 name for us for the record?

11 A. Morgan Turner, M-O-R-G-A-N and T-U-R-N-E-R.

12 Q. And are you employed?

13 A. Yes.

14 Q. In what capacity?

15 A. An investigative assistant at the Butte County
16 Sheriff's Office.

17 Q. And did you previously work at the Butte County
18 Sheriff's Office in a different capacity?

19 A. Yes, I did.

20 Q. And what was that?

21 A. I was a deputy sheriff for 13 years.

22 Q. Do you mind telling us why you're no longer a
23 deputy sheriff?

24 A. I was injured on duty.

25 Q. Okay. And you said you were at the Butte County
26 Sheriff's Office for 13 years as a deputy?

1 A. Yes.

2 Q. Did you work anywhere prior to the Butte County
3 Sheriff's Office as a sworn peace officer?

4 A. No, I did not.

5 Q. Okay. Were you assigned to assist with the Camp
6 fire?

7 A. Yes, I was.

8 Q. In what capacity?

9 A. I was assisting with the coroners division in
10 locating victims.

11 Q. And did you actually go out with a team looking
12 for victims of the fire?

13 A. Yes, I did.

14 Q. And on November 15, 2018, were you on such a
15 team?

16 A. Yes, I was.

17 Q. And did you go to a residence at 13812 West Park
18 Drive in Paradise?

19 A. Yes.

20 Q. Was that residence destroyed?

21 A. Yes, it was.

22 Q. Were human remains located at that residence?

23 A. Yes.

24 Q. And was a case number assigned to those remains?

25 A. Yes, there was.

26 Q. Was that case number 18-19701?

1 A. Yes.

2 Q. And at some point, did you learn that that is --
3 what -- Exhibit 1042, which should also be in front of
4 you -- at some point, did you learn that that is a
5 photograph of Joanne Caddy?

6 A. Yes.

7 [Exhibit No. 1042 was identified.]

8 BY MS. DUPRE-TOKOS:

9 Q. And at some point, did you also learn that the
10 remains associated with case number 18-19701 were those of
11 Ms. Joanne Caddy?

12 A. Yes.

13 Q. And looking at Exhibit 1043, can you tell us what
14 that's a photograph of?

15 A. That's a photograph of a destroyed residence on
16 West Park.

17 [Exhibit No. 1043 was identified.]

18 BY MS. DUPRE-TOKOS:

19 Q. Is that the destroyed residence where you found
20 Ms. Caddy's remains?

21 A. Yes.

22 Q. And looking at Exhibit 1044, can you tell us what
23 that's a photograph of?

24 A. This is a close-up photograph of the same
25 residence where we located the victim.

26 [Exhibit No. 1044 was identified.]

1 MS. DUPRE-TOKOS:

2 Q. And does that photograph show the remains of
3 Ms. Caddy?

4 A. Yes, it does.

5 Q. And looking at Exhibit 1045, can you tell us what
6 that is?

7 A. This is a piece of mail that I located the trash
8 can that was in front of the residence.

9 [Exhibit No. 1045 was identified.]

10 BY MS. DUPRE-TOKOS:

11 Q. And does it list the name Joanne Caddy on it?

12 A. Yes, it does.

13 Q. And does it also list the address of 13812 West
14 Park Drive in Magalia, California?

15 A. Yes.

16 Q. And then on November 16, 2018, were you also on a
17 team looking for victims of the Camp fire?

18 A. Yes, I was.

19 Q. Did you go to an address at 578 Roberts Drive in
20 Paradise?

21 A. I did.

22 Q. And was that residence destroyed?

23 A. Yes, it was.

24 Q. Were human remains located at that residence?

25 A. Yes.

26 Q. Was a case number assigned to those remains?

1 A. Yes.

2 Q. Was that case number 18-19733?

3 A. Yes.

4 Q. Now, at some point, did you learn -- looking at
5 Exhibit 1046.

6 [Exhibit No. 1046 was identified.]

7 BY MS. DUPRE-TOKOS:

8 Q. At some point, did you learn that that is a
9 photograph of Ms. Evelyn Cline?

10 A. Yes.

11 Q. And at some point, did you learn that the remains
12 associated with case number 18-19733 were the remains of
13 Ms. Evelyn Cline?

14 A. Yes.

15 Q. And then looking at Exhibit 1047.

16 [Exhibit No. 1047 was identified.]

17 BY MS. DUPRE-TOKOS:

18 Q. Can you tell us what that's a photograph of?

19 A. It's a picture of the residence that was
20 destroyed on Roberts Drive.

21 Q. And then looking at Exhibit 1048, can you tell us
22 what that's a photograph of?

23 A. It's an up-close photograph of the same
24 residence.

25 [Exhibit No. 1048 was identified.]

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. And does this photograph also include a -- the
3 remains of Ms. Cline?

4 A. Yes, it does.

5 Q. Okay. Then on November 17, 2018, were you again
6 on a team looking for victims of the Camp fire?

7 A. Yes.

8 Q. Did you go to an address at 1449 Sleepy Hollow in
9 Paradise?

10 A. Yes.

11 Q. And was that residence destroyed?

12 A. Yes, it was.

13 Q. Were human remains located at that residence?

14 A. Yes.

15 Q. And was a case number assigned to those remains?

16 A. Yes.

17 Q. Was that case number 18-19754?

18 A. Yes.

19 Q. Looking at Exhibit 1049.

20 [Exhibit No. 1049 was identified.]

21 BY MS. DUPRE-TOKOS:

22 Q. At some point, did you learn that that is a
23 photograph of Ms. Isabel Webb?

24 A. Yes.

25 Q. And at some point, did you also learn that the
26 remains associated with case number 18-19754 were those of

1 Ms. Isabel Webb?

2 A. Yes.

3 Q. And looking at Exhibit 1050.

4 [Exhibit No. 1050 was identified.]

5 BY MS. DUPRE-TOKOS:

6 Q. Can you tell us what that's a photograph of?

7 A. That's a photograph of a destroyed residence.

8 Q. And is that the residence where you found

9 Ms. Webb's remains on Sleepy Hollow?

10 A. Yes.

11 Q. And looking at Exhibit 1051.

12 [Exhibit No. 1051 was identified.]

13 BY MS. DUPRE-TOKOS:

14 Q. Can you tell us what that's a photograph of?

15 A. It's a up close photograph of the same residence.

16 Q. And does this photograph also show the remains of

17 Ms. Webb?

18 A. Yes, it does.

19 Q. And looking at Exhibit 1052.

20 [Exhibit No. 1052 was identified.]

21 BY MS. DUPRE-TOKOS:

22 Q. Can you tell us what that's a photograph of?

23 A. That's a photograph of the street sign at the end
24 of the road where that residence was.

25 Q. So the street sign for Sleepy Hollow Lane?

26 A. Yes.

1 Q. And looking at Exhibit 1053.

2 [Exhibit No. 1053 was identified.]

3 BY MS. DUPRE-TOKOS:

4 Q. Can you tell us what that's a photograph of?

5 A. This is a piece of mail that I located in the
6 undamaged mailbox that was in front of the residence on
7 Sleepy Hollow.

8 Q. And is that piece of mail addressed to -- who the
9 piece of mail addressed to?

10 A. Isabel A. Webb.

11 Q. And does it list an address?

12 A. Yes, it does.

13 Q. What is that address?

14 A. 1449 Sleepy Hollow Lane in Paradise.

15 Q. And this mail is propped up on the open door of
16 the mailbox; is that correct?

17 A. Yes, it is.

18 Q. Is there a number on the open door of the
19 mailbox?

20 A. Yes, there is.

21 Q. And what number of is that?

22 A. 1449.

23 Q. So that corresponds with Ms. Webb's street
24 address?

25 A. Correct.

26 MS. DUPRE-TOKOS: I have nothing further.

1 Are there any questions? No.

2 Then your just need an admonition from madam
3 foreperson.

4 GRAND JURY FOREPERSON: Deputy Turner, you are
5 admonished not to discuss or disclose at any time outside
6 of this jury room, the questions that have been asked of
7 you or your answers until authorized by this grand jury or
8 the court.

9 A violation of these instructions on your part
10 may be the basis for a charge against you of contempt of
11 court. This does not preclude you from discussing your
12 legal rights with your own attorney.

13 Deputy Turner, what I have just said is a warning
14 not to discuss this case with anyone except the court,
15 your lawyer or the district attorney.

16 Do you have any questions?

17 THE WITNESS: I do -- no, I do not.

18 GRAND JURY FOREPERSON: Thank you for your time.

19 THE WITNESS: Thank you.

20 MS. DUPRE-TOKOS: Thank you.

21 Can we go off the record for just a moment?

22 MR. NOEL: Sure.

23 MS. DUPRE-TOKOS: Okay. We can go back on.

24 MR. NOEL: All right. Larson?

25 MS. DUPRE-TOKOS: Yes, Sergeant Larson.

26 MR. NOEL: After this witness, we will take a break

1 and give you a little breather before we get into the
2 really --

3 MS. DUPRE-TOKOS: Dry, boring stuff.

4 MR. NOEL: Yeah, that's the plan.

5 [The witness enters the courtroom.]

6 MR. NOEL: The witness stand has been condemned, so
7 you have to use the desk.

8 THE WITNESS: Okay.

9 GRAND JURY FOREPERSON: Sergeant Larson, before a
10 have a seat, please stand and raise your right hand to be
11 sworn.

12 Sergeant Larson, do you solemnly swear that the
13 evidence you shall give in this matter pending before the
14 grand jury shall be the truth, the whole truth and nothing
15 but the truth so help you God?

16 THE WITNESS: Yes, ma'am.

17 GRAND JURY FOREPERSON: Thank you. Have a seat,
18 please.

19 **EXAMINATION**

20 BY MS. DUPRE-TOKOS:

21 Q. Good morning.

22 A. Good morning.

23 Q. Could you please state and spell your last name
24 for us for the record?

25 A. Tiffany Larson, L-A-R-S-O-N.

26 Q. And where are you employed and in what capacity?

1 A. I work for the Butte County Sheriff's Office as a
2 patrol sergeant.

3 Q. How long have you been a sworn law enforcement
4 officer?

5 A. About nine years.

6 Q. And how long have you been with the Butte County
7 Sheriff's Office?

8 A. About four.

9 Q. Where were you prior to the sheriff's office?

10 A. I worked for the Paradise Police Department in
11 the capacity of an officer.

12 Q. And how long were you with Paradise Police?

13 A. A little over five years.

14 Q. Do you have any sworn law enforcement experience
15 prior to Paradise Police Department?

16 A. No, ma'am.

17 Q. Were you assigned to assist with the Camp fire?

18 A. Yes, I was.

19 Q. Is what capacity?

20 A. After the initial event, I was assigned to the
21 body recovery portion of the incident.

22 Q. You said "after the initial event," were you
23 participating during the actual event?

24 A. Yes, ma'am.

25 Q. Were you helping with evacuations?

26 A. Yes, ma'am.

1 Q. Were you on a team that was tasked with looking
2 for victims on November 16, 2018?

3 A. Yes, ma'am.

4 Q. And did you go to 1812 Drendel Circle in
5 Paradise?

6 A. Yes.

7 Q. Was that residence destroyed?

8 A. Yes, it was.

9 Q. And were you human remains located at that
10 residence?

11 A. Yes, ma'am.

12 Q. Was a case number assigned to those remains?

13 A. Yes, ma'am.

14 Q. Was that case number 18-19727?

15 A. Yes.

16 Q. At some point, looking at Exhibit 1032, which
17 should also be in front of you.

18 [Exhibit No. 1032 was identified.]

19 BY MS. DUPRE-TOKOS:

20 Q. At some point, did you learn that that's a
21 photograph of Sara Magnuson?

22 A. Yes, ma'am.

23 Q. And were you familiar with Ms. Magnuson already?

24 A. Yes, I was.

25 Q. At some point, did you learn that the remains
26 associated with case number 18-19727 were those of

1 Ms. Sara Magnuson?

2 A. Yes.

3 Q. Showing you Exhibit 1033.

4 [Exhibit No. 1033 was identified.]

5 BY MS. DUPRE-TOKOS:

6 Q. Can you tell us what that's a photograph of?

7 A. This is a photograph standing in front of
8 Ms. Magnuson's house or what was left of it.

9 Q. Okay. That's the house on Drendel Circle?

10 A. Yes, ma'am.

11 Q. And looking at Exhibit 1034.

12 [Exhibit No. 1034 was identified.]

13 BY MS. DUPRE-TOKOS:

14 Q. Can you tell us what that's a photograph of?

15 A. This a photograph of the bathtub where
16 Ms. Magnuson was -- her remains were located.

17 Q. And Exhibit 1035.

18 [Exhibit No. 1035 was identified.]

19 BY MS. DUPRE-TOKOS:

20 Q. Can you tell us what that's a photograph of?

21 A. This is a mailbox that is associated with
22 Ms. Magnuson's house.

23 Q. And does it say -- give her house number on it?

24 A. Yes, it does.

25 Q. And Exhibit 1036.

26 [Exhibit No. 1036 was identified.]

1 BY MS. DUPRE-TOKOS:

2 Q. It's a little hard to see, but can you tell us
3 what that is?

4 A. This is a photograph of the -- of her mailbox
5 opened with, looks like, a piece of mail or correspondence
6 in it.

7 Q. And then looking at Exhibit 1037.

8 [Exhibit No. 1037 was identified.]

9 BY MS. DUPRE-TOKOS:

10 Q. Can you tell us what that is?

11 A. It's a PG&E bill that was sent to Ms. Magnuson
12 that was in her mailbox at the time of the fire.

13 Q. So that's the correspondence that we could see in
14 the previous exhibit?

15 A. Yes, ma'am.

16 Q. And I'm sorry, that lists both her name and her
17 address, correct?

18 A. Correct.

19 Q. And then on November 17th, were you, again, on a
20 team looking for victims of the Camp fire?

21 A. Yes, ma'am.

22 Q. Did you go to 6674 Pentz Road in Paradise?

23 A. Yes, I did.

24 Q. And was that residence destroyed?

25 A. Yes, it was.

26 Q. And were human remains located there?

1 A. Yes, ma'am.

2 Q. And were those human remains given a case number?

3 A. Yes, they were.

4 Q. Was that case number 18-19760?

5 A. Yes.

6 Q. Looking at Exhibit 1038.

7 [Exhibit No. 1038 was identified.]

8 BY MS. DUPRE-TOKOS:

9 Q. At some point, did you learn that the older woman
10 on the right is a photograph of Ms. Helen Pace?

11 A. Yes, ma'am.

12 Q. And at some point, did you also learn that the
13 remains associated with case number 18-19760 were those of
14 Ms. Pace?

15 A. Yes, ma'am.

16 Q. Looking at Exhibit 1039.

17 [Exhibit No. 1039 was identified.]

18 BY MS. DUPRE-TOKOS:

19 Q. Can you tell us what that's a photograph of?

20 A. This is a bank of mailboxes that were at the
21 end -- closest to the road of Ms. Pace's mobile home park.

22 Q. And is there -- can you see Ms. Pace's mailbox in
23 the photograph?

24 A. Yes, you can. It's at the top, about the middle.
25 It's 105.

26 Q. Are you able to make out the name on the mailbox

1 below Ms. Pace's? You can get up and look if that helps.
2 It may not help.

3 A. It says Ammons.

4 Q. Ammons?

5 A. Yes, ma'am.

6 Q. And looking at Exhibit 1040.

7 [Exhibit No. 1040 was identified.]

8 BY MS. DUPRE-TOKOS:

9 Q. Can you tell us what this is a photograph of?

10 A. This is photo of Ms. Pace's house -- destroyed
11 residence from the driveway.

12 Q. And then Exhibit 1041.

13 [Exhibit No. 1041 was identified.]

14 BY MS. DUPRE-TOKOS:

15 Q. Can you tell us what this is photograph of?

16 A. That's a photograph of Ms. Pace's remains.

17 MS. DUPRE-TOKOS: And I have nothing further.

18 Does anyone have any questions? Okay. You just
19 need to get the admonition from madam foreperson. Thank
20 you.

21 THE WITNESS: Okay. Thank you.

22 GRAND JURY FOREPERSON: Sergeant Larson, you are
23 admonished not to discuss or disclose at any time outside
24 of this jury room, the questions that have been asked of
25 you or your answers until authorized by this grand jury or
26 the court.

1 A violation of these instructions on your part
2 may be the basis for a charge against you of contempt of
3 court. This does not preclude you from discussing your
4 legal rights with your own attorney.

5 Sergeant Larson, what I have just said is a
6 warning not to discuss this case with anyone except the
7 court, your lawyer or the district attorney.

8 Do you have any questions?

9 THE WITNESS: No, ma'am.

10 GRAND JURY FOREPERSON: Okay. Thank you for your
11 time today.

12 THE WITNESS: Thank you.

13 MR. NOEL: All right. We've buzzed through some --
14 some stuff pretty quickly. We've only been in session for
15 about 35 minutes, but let's go ahead and take a break
16 before we get into some more death evidence.

17 Madam Foreperson?

18 GRAND JURY FOREPERSON: 15 minutes.

19 MR. NOEL: Sounds good to me.

20

21 [Recess taken from 9:28 until 9:51 a.m. whereupon the
22 grand jury comes to order in Courtroom 9.]

23

24 GRAND JURY FOREPERSON: All members of the grand jury
25 are present, back from break, and we're ready to proceed.

26 [The witness enters the courtroom.]

1 MS. DUPRE-TOKOS: Okay. Except that I don't know why
2 the PowerPoint is not on the screen, and I have not
3 touched that thing.

4 GRAND JURY FOREPERSON: Please raise your right hand
5 to be is sworn.

6 Investigator Celentano, do you solemnly swear
7 that the evidence you shall give in this matter pending
8 before the grand jury shall be the truth, the whole truth
9 and nothing but the truth so help you God?

10 THE WITNESS: I do.

11 THE COURT: Thank you have a seat, please.

12 GRAND JUROR NUMBER TWO: I don't think the TV is on.

13 MS. DUPRE-TOKOS: That was going to be the next
14 thing. Yeah, he turned it off.

15

16 **EXAMINATION**

17 BY MS. DUPRE-TOKOS:

18 Q. Okay. Good morning.

19 A. Good morning.

20 Q. And I know you've done this before, but can you
21 state and spell your last name for the record?

22 A. Sure. Jennifer Celentano. Last name is spelled
23 C-E-L-E-N-T-A-N-O.

24 Q. And we've gone through your qualifications when
25 you testified last week?

26 A. Yes.

1 Q. So let's just start talking about death
2 certificates.

3 A. Okay.

4 Q. Who fills out death certificates?

5 A. So the death certificate is started by the
6 funeral home, and they collect all the information as far
7 as the name, date of birth of the decedent, and then the
8 bottom portion, causes of death and things like that are
9 filled out by the coroner's office.

10 Q. Okay. And so -- and you've got a binder in front
11 of you that has all of the certified copies of all the
12 death certificates so you can refer to section numbers
13 there, if that helps you.

14 A. Okay.

15 Q. And we're going to first take about Mr. Herbert
16 Alderman?

17 A. Okay.

18 Q. And his Butte County case number is 18-19836; is
19 that correct?

20 A. Yes.

21 Q. Okay. And I know the -- the jurors probably are
22 not going to be able to see the details on that, but they
23 can -- you might need to stand up and point to where some
24 of the sections are.

25 A. Okay.

26 Q. So you said the funeral home fills out a portion

1 of it, would that be sections 1 through 106?

2 A. Yes.

3 Q. So let's talk about sections 1 through 38.

4 A. Okay.

5 Q. And that's up at the very top, correct?

6 A. Yes.

7 Q. What kinds of information is that, just those 1
8 through 38?

9 A. Can I get up and point?

10 Q. Absolutely.

11 A. So the top portion that the funeral home fills
12 out has their name, their date of birth, the find date, in
13 this case for the Camp fire, the FND means the date that
14 they were found. Then it has the Social Security number,
15 it talks about his occupation, and then his home address.

16 Q. Okay. So 1 through 38, does that -- where is 38?

17 A. 38 is here. And that's birth state, and in this
18 case we did not know that information.

19 Q. Okay. And where does the funeral home get that
20 information?

21 A. The funeral home gets that information from the
22 next of kin, family members.

23 Q. What if in, for example, Mr. Alderman's case,
24 there is no next of kin?

25 A. So in Mr. Alderman's case, he had Ms. Henderson,
26 who husband his power of attorney, so she provided all the

1 information that she could.

2 Q. So sections 1 through 19, it looks like you were
3 pointing at, that has really the personal identifying
4 information?

5 A. Yeah, this top section up here.

6 Q. And then sections 20 through 25. That's place of
7 residence, would that be --

8 A. Yes, that's the decedent's residence.

9 Q. -- generally accurate?

10 A. Yes.

11 Q. And then sections 26 and 27. And if it's easier
12 for you, you can take that out of the --

13 A. Okay.

14 Q. -- you can pull it out of the sleeve or pull the
15 whole sleeve out.

16 A. Okay. So 26 and 27. These are really hard to
17 see. Okay. So that's informant. So in this case, it was
18 his power of attorney, Rose Henderson.

19 Q. So sections 28 through 38, what type of
20 information is that?

21 A. That would be the spouse's information, the
22 surviving spouse. In this case, he didn't -- we didn't
23 know. He didn't have one.

24 Q. Would it also include state registered domestic
25 partner?

26 A. Yes.

1 Q. And does it also generally include information
2 about the decedent's parents?

3 A. Yes.

4 Q. And then sections 39 through 47, what information
5 is included in those?

6 A. So that would be this section here. That's
7 filled out by the funeral home. It tells you where their
8 final disposition was and, in this case, it was the
9 Paradise Cemetery. And then it tells you -- what is that
10 one there? Type of disposition. So BU stands for burial,
11 and he was not embalmed.

12 Q. So you said "type of disposition," what does --
13 what does that mean? You said burial. What other options
14 would there be?

15 A. So there's cremation. You can be entombed.
16 Typically, it's usually burial or cremation.

17 Q. And then place of final disposition, what does
18 that mean?

19 A. Place of final disposition is where the remains
20 are placed. So in this case, it would be the Paradise
21 Cemetery.

22 Q. But if the person were cremated, it can be sent
23 to an address?

24 A. It could be, yes. If the next of kin decided to
25 keep the cremains, yes.

26 Q. And then are there sections number 48 through 100

1 also on the death certificate?

2 A. 48 through 100? No.

3 Q. Okay. And then are there sections 100 through
4 106? And I believe you said that's also filled out by the
5 funeral home?

6 A. Yes, that would be the place of death. So in
7 this case, he died in his own residence, and then the
8 address is here.

9 Q. And how does the funeral home get that
10 information?

11 A. That, in the Camp fire cases, was provided by us,
12 the coroner's office as we collected the remains.

13 Q. And then who fills out the remainder of the form,
14 so basically sections 107 to the end?

15 A. So from here down is the responsibility of the
16 coroner's office.

17 Q. And does the funeral home fill out, like, a paper
18 copy and then give it to the coroner's office, or is it
19 electronic or how does that work?

20 A. So we have an electronic death registry called
21 EDRS. So the funeral home will start this in EDRS, and
22 then they'll refer it to us and then we will complete it.

23 Q. So it's all computerized?

24 A. It's all computerized.

25 Q. Okay. And then how do you know that the funeral
26 home has done their part and it's ready for the coroner's

1 office to do their part?

2 A. They have to refer it to us, so it shows up in
3 our que, the ones that they have completed.

4 Q. And then is there a time limit for the coroner's
5 office to complete their portion of the form?

6 A. Yes. We have eight days to give causes of death
7 in every case.

8 Q. So what is section 107?

9 A. 107 is the cause of death.

10 Q. Okay. And so the coroner's office fills that
11 section out?

12 A. Correct.

13 Q. Where do you get that information? When I say
14 "you," I mean the coroner's office.

15 A. We get that from the pathologist.

16 Q. Okay. Would that be from an autopsy report
17 generally?

18 A. Yes.

19 Q. And then what is section 108?

20 A. Section 108 is the coroner's case number, and
21 then the box that is checked is that, yes, it was reported
22 to us.

23 Q. Okay. And so what is the coroner's case number?

24 A. Coroner's case number from Mr. Alderman is
25 18-19836.

26 Q. Is that the same as the case number that was

1 assigned to his remains when they were first located?

2 A. Yes.

3 Q. So it stays the same number throughout?

4 A. Yes.

5 Q. What is section one -- 109?

6 A. 109 says -- asks if there was a biopsy performed.

7 In this case, there was not.

8 Q. Were there any biopsies performed for any of the
9 people whose remains were located in the Camp fire zone?

10 A. No.

11 Q. What is section 110?

12 A. 110 asks if there was an autopsy performed and,
13 in this case, the box is checked "yes."

14 Q. What is section -- well, was an autopsy performed
15 on all of the people whose remains were found in the fire
16 zone following the Camp fire?

17 A. Yes.

18 Q. So that box is going to be checked on all of the
19 death certificates that we're going to talk about today?

20 A. Yes.

21 Q. And then section 111?

22 A. Section 111 asks if the autopsy was used -- let's
23 see -- used in determining the cause. So it's asking if
24 we used the findings in the autopsy to determine the cause
25 of death, and we did in this case and with all of the Camp
26 fire cases.

1 Q. What does section 119 include?

2 A. Man, these are so small. 119, gosh --

3 Q. Would that be manner of death?

4 A. Yes.

5 Q. I will help out.

6 A. Sorry, it's really hard to see. Yes, this
7 section is manner of death.

8 Q. What are the options for manner of death?

9 A. Natural, accident, homicide, suicide and pending
10 investigation.

11 Q. And is there also one for could not be
12 determined?

13 A. Oh, yes, could not be determined as well.

14 Q. What would a death due to a wildfire be
15 designated as?

16 A. That would be an accident.

17 Q. And then section 120, is that a question about
18 whether the decedent was injured at work?

19 A. Yes.

20 Q. Okay. And then 121, is that asking the date of
21 the injury?

22 A. Yes.

23 Q. And so in Mr. Alderman's case, is that filled in?

24 A. Yes. So in this case, we couldn't determine the
25 exact date that he had been injured by the fire. So we
26 have the month and the year. And so the dashes, just

1 indicate that we're not positive which day he passed away.

2 Q. And so that's the coroner's office custom and
3 habit for any time you don't know the exact date of the
4 injury, you just include the month and the year?

5 A. Yes.

6 Q. And then does 122 -- section 122, is that looking
7 for the hour of injury?

8 A. Yes.

9 Q. And is that filled in for Mr. Alderman?

10 A. Yes.

11 Q. And what's --

12 A. Sorry. In this case, it's up unknown, because we
13 didn't know exactly what time he expired.

14 Q. So for the death certificates for all the people
15 whose remains were found in the fire zone after the Camp
16 fire -- for all of them, was the date just "11/--/2018"
17 and then the time "unknown"?

18 A. Yes.

19 Q. And then does it ask for place of injury in
20 section 123?

21 A. Yes.

22 Q. And is that generally an address or?

23 A. So that's going to be a location of where the
24 person was found. In this case, he was found in his home.

25 Q. So if someone was at work, would it say work or?

26 A. Yes.

1 Q. And then section 124, was is that section?

2 A. So any time we rule something an accident, we
3 have to fill out this portion. And in this case, we had
4 to put in -- kind of explain about the accident. So in
5 this case, he was a victim of wildfire as will be all of
6 the Camp fire victims.

7 Q. Okay. And so is that box labeled something along
8 the lines of "description of how the injury occurred"?

9 A. Yes.

10 Q. And then section 125, what information goes
11 there?

12 A. So that is a specific address of where the injury
13 occurred. And in this case, it is his home address.

14 Q. What is section 126?

15 A. 126 is the signature of the chief deputy coroner,
16 Lieutenant Hale.

17 Q. So, generally, just -- to generalize, it would be
18 the signature of the coroner or deputy coroner who filled
19 this out?

20 A. Correct.

21 Q. And then 127, is that just the date of the
22 signature?

23 A. Yes.

24 Q. And then 128, the typed name and title of the
25 coroner or deputy coroner?

26 A. Yes.

1 Q. What do you do if you don't know the name of the
2 decedent?

3 A. Then we put John Doe for males and Jane Doe for
4 females.

5 Q. What do you do if you don't have a cause of death
6 by the time you need to file the death certificate with
7 ERDS?

8 A. Then "pending status" will be put right here, and
9 then when we get the causes of death, an amendment will be
10 created to insert the causes of death.

11 Q. How does the amendment work?

12 A. So after the autopsy, the pathologist will tell
13 us their causes of death, and then we will go through and
14 it's -- the amendment will show which lines that need to
15 be changed. So it'll show line -- where am I? 107 here,
16 whatever line this is, instead of saying "pending" on the
17 other side, it'll say "fire-related injuries."

18 Q. So it gives the line, and then what the new
19 information should be on the amendment?

20 A. Right.

21 Q. What types of ways are identification of remains
22 made?

23 A. DNA, fingerprints, dental. Let's see, what else
24 did we do? I think that's about it.

25 Q. Sometimes it done through circumstantial
26 evidence?

1 A. Oh, yes, and circumstantial, yes.

2 Q. And then when you say "dental," is that -- is the
3 formal name odontology?

4 A. Yes.

5 Q. And then I think you can sit down.

6 A. Okay.

7 Q. I think we're done going through that.

8 A. Okay.

9 Q. So what would make a determination of
10 identification by circumstantial evidence?

11 A. The Sheriff did in this case, because he is the
12 coroner in our county.

13 Q. So you're saying in this case -- was he the
14 ultimate decision maker regarding identification via
15 circumstantial evidence for all people whose remains were
16 found in the fire zone following the Camp fire?

17 A. Yes.

18 Q. And what exactly do you mean by "circumstantial
19 evidence"?

20 A. So what I did in circumstantial cases was I
21 gathered the information, for example, was it their home?
22 Was there vehicle there? Were there phone calls? Did
23 someone call and talk to them just before the fire and
24 knew that they were in the house? So I would gather up
25 all of that information and give it to the Sheriff, and he
26 would determine whether or not that was enough to identify

1 them.

2 Q. Now, this procedure that we just talked about for
3 filling out the death certificates. Is that the same
4 procedure that is followed for every death in Butte
5 County?

6 A. Yes.

7 Q. So not just for the victims of the Camp fire?

8 A. Right.

9 Q. Were all the death certificates for the people
10 whose remains were found in the fire zone following the
11 Camp fire prepared in the regular course of the coroner's
12 business?

13 A. Yes.

14 Q. Is the preparation of death certificates within
15 the scope of duties of the coroner's office?

16 A. Yes.

17 Q. And are the coroner and deputy coroner public
18 employees?

19 A. Yes.

20 Q. Were the death certificates for the people whose
21 remains were located in the fire zone following the Camp
22 fire, were their death certificates prepared at or near
23 the time of their death?

24 A. Yes.

25 Q. And is a few months considered near the time of
26 death if that's when you're getting the information that

1 you need?

2 A. Yes.

3 Q. Were you designated by the coroner's office to
4 come here today to testify as to the identity and mode of
5 preparation of the death certificates for the Camp fire
6 victims?

7 A. Yes.

8 Q. What if someone was hurt in the fire, and then
9 died from their injuries but they died in another county?
10 Who would be responsibility for that death certificate?

11 A. So we did have a couple of cases like that, where
12 victims were life flighted out of our county and they
13 passed away in another county. That county becomes
14 responsible for starting that death certificate, or the
15 funeral home in their county, wherever the family chooses
16 them to go.

17 Q. Can Butte County pull up death certificates on
18 ERDS on another county?

19 A. No.

20 Q. So Butte County are only has access to their own?

21 A. Yes.

22 Q. Were all the death certificates for the people
23 whose remains were located in the fire zone following the
24 Camp fire filed as required by law with the State Office
25 of Vital Records?

26 A. Yes.

1 Q. Okay. So we've already had it up on the screen,
2 Exhibit 857.

3 [Exhibit No. 857 was identified.]

4 THE WITNESS: Yes.

5 BY MS. DUPRE-TOKOS:

6 Q. What is that document?

7 A. That's the death certificate for Mr. Herbert
8 Alderman.

9 Q. And I believe you said it already, but what's the
10 case number listed on the death certificate?

11 A. The case number 18-19836.

12 Q. And what is the listed manner of death on
13 Mr. Alderman's death certificate?

14 A. The manner of death is an accident.

15 Q. And I think I asked you this, but just to be
16 safe, was accident -- I think you said it, was accident
17 listed as a manner of death on all the death certificates
18 of the people whose remains were located in the fire zone?

19 A. Yes.

20 Q. Okay. What is the description of how the injury
21 occurred on Mr. Alderman's death certificate?

22 A. How the injury occurred? Oh, victim of a
23 wildfire.

24 Q. And I think, again, you said that "victim of
25 wildfire" is listed as how the injury occurred on all of
26 the people whose remains were located in the fire zone

1 following the Camp fire?

2 A. Yes.

3 Q. And what is listed as the immediate cause of
4 death on Mr. Alderman's death certificate?

5 A. Immediate cause is fire-related injuries.

6 Q. Okay. And how was Mr. Alderman identified?

7 A. He was identified by circumstantial evidence.

8 Q. Okay. And in this case, do you recall what the
9 circumstantial evidence was?

10 A. He -- the anthropologist, the forensic
11 anthropologist down in Sac County had said it looks like
12 an older male. He was at the address where he should have
13 been, and they found some mail in the garbage addressed to
14 him.

15 In this case, we also identified him with
16 genealogy later, so.

17 Q. What do you mean by "identified with genealogy"?

18 A. So ANDE, the rapid DNA company, took -- was able
19 to get kind of snips of DNA and they sent those to
20 ancestry.com and they were able to make those links
21 between his ancestry and to go ahead and ID him by DNA
22 essentially.

23 Q. Okay. And Mr. Alderman did not have any known
24 next-of-kin; is this correct?

25 A. That's correct.

26 Q. And that's why it had to be done circumstantially

1 and then through genealogy?

2 A. Yes.

3 Q. Okay. Next is Teresa Ammons. So if you look at
4 Exhibit 856, I believe it is. What is Exhibit 856? Oh,
5 it's 858, sorry.

6 [Exhibit No. 858 was identified.]

7 THE WITNESS: They don't have the exhibit numbers on
8 them, but I figured it out, yeah. This is the death
9 certificate for Teresa Ammons.

10 BY MS. DUPRE-TOKOS:

11 Q. And what is the case number for Ms. Ammons?

12 A. 18-19598.

13 Q. Again, that's the same as the sheriff's case
14 number that was assigned to her remains when they were
15 located?

16 A. Yes.

17 Q. And that's the same for all of the people whose
18 remains were located in the fire zone?

19 A. Yes.

20 Q. What is listed as the manner of death on
21 Ms. Ammon's death certificate?

22 A. It is listed as pending.

23 Q. Okay. And so is that one of the ones where there
24 would be an amendment?

25 A. Yes.

26 Q. And does the death certificate list a description

1 of how the injury occurred?

2 A. It does not.

3 Q. Okay. And does it list immediate cause of death?

4 A. It just has pending.

5 Q. Okay. You may have to pull the death certificate
6 out of that sleeve for the second page.

7 A. For the amendment, okay.

8 Q. And what is that second page?

9 A. This is the amendment to the death certificate.

10 Q. And it does the procedure you described to us
11 where it gives the line that needs to be corrected and
12 what the correction information should be?

13 A. Yes. So you can see here where we had put
14 pending to cause of death, we changed it to fire-related
15 injury. And then pending investigation was changed to
16 accident, and then the rest of this was filled out.

17 Q. Does it give -- so the listed manner of death was
18 changed to accident, does it give a description of how the
19 injury occurred?

20 A. Did -- oh, yes, victim of wildfire.

21 Q. And what's listed as the immediate cause of
22 death?

23 A. Fire-related injuries.

24 Q. And how is Ms. Ammons identified?

25 A. She was identified by DNA.

26 Q. And then Rafaela Andrade should be the next.

1 A. Okay, yeah.

2 Q. Okay. The evidence numbers should be on the back
3 of the document.

4 A. Oh, thank you.

5 Q. So Ms. Andrade should be Exhibit 859, her death
6 certificate?

7 A. Yes.

8 [Exhibit No. 859 was identified.]

9 BY MS. DUPRE-TOKOS:

10 Q. And what is the listed case number on her death
11 certificate?

12 A. Her case number is 18-19533.

13 Q. Okay. And what is the listed manner of death on
14 Ms. Andrade's death certificate?

15 A. It's listed as an accident.

16 Q. What's the deposition of how the injury occurred?

17 A. She's a victim of wildfire.

18 Q. What's listed as the immediate cause of death?

19 A. Fire-related injuries.

20 Q. And how is Ms. Andrade identified?

21 A. She was identified by DNA.

22 Q. And then Ms. Carol Arrington should be
23 Exhibit 860.

24 [Exhibit No. 860 was identified.]

25 THE WITNESS: Yes.

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. And what exhibit number -- or I'm sorry -- case
3 number does it give on Ms. Arrington's death certificate?

4 A. Her case number is 18-19764.

5 Q. And so this is Exhibit 860. What's the listed
6 manner of death?

7 A. This one is pending.

8 Q. Okay. And does it give a description -- so since
9 it doesn't have a manner of death, does it also have
10 pending for description of how the injury occurred?

11 A. Yes.

12 Q. Does it list an immediate cause of death?

13 A. No, just pending.

14 Q. Okay. Is there an amendment?

15 A. Yes.

16 Q. Okay. And what does it list as manner of death?

17 A. Manner of death is an accident.

18 Q. And description of how the injury occurred?

19 A. That's a victim of wildfire.

20 Q. And what is listed as the immediate cause of
21 death?

22 A. Fire-related injuries.

23 Q. And how was Ms. Arrington identified?

24 A. She was identified by odontology, or we just say
25 dental.

26 Q. Okay. And just very briefly, are you able to

1 tell us, even what "dental" means?

2 A. Yeah, so it was really important when we were
3 collecting the remains to find as many teeth as we could,
4 because teeth kind of tell a story. So what -- what the
5 odontologist would do is lay out all the teeth and fill in
6 all the charts, look for crowns and fillings, things like
7 that. Things that could identify people easily. And then
8 we contacted the State Dental Board and they put out a --
9 kind of a search for all the dentists in California to see
10 if they can find the records of people that were victims
11 of the Camp fire, and we were able to identify several
12 people this way.

13 Q. So once the -- once a dentist is identified as
14 having treated one of the victims as their patient, do
15 they, then, just send their X-rays or their records to
16 whatever dentist is doing the comparison?

17 A. Yes. So all of the X-rays in this case were sent
18 to the Sacramento County Coroner's Office.

19 Q. Okay. And then Exhibit 861.

20 [Exhibit No. 861 was identified.]

21 BY MS. DUPRE-TOKOS:

22 Q. What is that document?

23 A. Oh, 861. That is the death certificate for
24 Mr. Julian Binstock.

25 Q. Okay. And what is the case number listed on the
26 death certificate?

1 A. 18-19599.

2 Q. And is there a listed manner of death on the
3 death certificate?

4 A. Yes, it was.

5 Q. What is that?

6 A. It was an accident.

7 Q. What's the description of how the injury
8 occurred?

9 A. He was a victim of wildfire.

10 Q. What's listed as immediate cause of death?

11 A. Fire-related injuries.

12 Q. And how was Mr. Binstock identified?

13 A. He was identified by DNA.

14 Q. And then going to Exhibit 862.

15 A. Okay.

16 [Exhibit No. 862 was identified.]

17 BY MS. DUPRE-TOKOS:

18 Q. Who is that a death certificate for?

19 A. Death certificate for Mr. David Bradburd.

20 Q. What's the case number listed on the death
21 certificate?

22 A. 18-19499.

23 Q. Is there a manner of death listed?

24 A. No.

25 Q. So is it listed as pending?

26 A. Yes.

1 Q. And then would it be correct then that the
2 description of how the injury occurred and the immediate
3 cause of death would also be pending?

4 A. Yes.

5 Q. So there an amendment?

6 A. Yes.

7 Q. And just so we're clear, the amendment is
8 attached to the death certificate; is that correct?

9 A. Yes.

10 Q. And it's basically considered part of -- it's all
11 one document?

12 A. Correct.

13 Q. Okay. So on the amendment, is the manner of
14 death listed?

15 A. Yes. An accident.

16 Q. What about description of how the injury
17 occurred?

18 A. Is a victim of wildfire.

19 Q. And immediate cause of death?

20 A. Fire-related injuries.

21 Q. And how was Mr. Bradburd identified?

22 A. He was identified by DNA.

23 Q. And then looking at Exhibit 863.

24 [Exhibit No. 863 was identified.]

25 BY MS. DUPRE-TOKOS:

26 Q. Who is that a death certificate for?

1 A. This is death certificate of Cheryl Brown.

2 Q. And what is case number listed on her death
3 certificate?

4 A. 18-19675.

5 Q. Is there manner of death listed?

6 A. Yes.

7 Q. What is that?

8 A. Accident.

9 Q. And what is the description of how the injury
10 occurred?

11 A. Victim of wildfire.

12 Q. What's listed as the immediate cause of death?

13 A. Fire-related injuries.

14 Q. And how was Ms. Brown identified?

15 A. She was identified by DNA.

16 Q. And moving on to Exhibit 864.

17 [Exhibit No. 864 was identified.]

18 BY MS. DUPRE-TOKOS:

19 Q. Whose death certificate is that?

20 A. It's a death certificate for Larry Brown.

21 Q. What is the case number listed on the death
22 certificate?

23 A. 18-19674.

24 Q. Is there a manner of death listed?

25 A. This one is pending.

26 Q. And would description of how the injury occurred

1 and immediate cause of death also be pending then?

2 A. Yes.

3 Q. Is there an amendment?

4 A. Yes.

5 Q. And does the amendment list manner of death?

6 A. Yes. Accident.

7 Q. Okay. Does the amendment list description of how
8 the injury occurred?

9 A. Yes. Victim of wildfire.

10 Q. And does it list an immediate cause of death?

11 A. Yes. Fire-related injuries.

12 Q. And how was Mr. Brown identified?

13 A. He was identified by odontology.

14 Q. Going to Exhibit 865.

15 [Exhibit No. 865 was identified.]

16 BY MS. DUPRE-TOKOS:

17 Q. What is that death certificate for?

18 A. This is death certificate of Richard Brown.

19 Q. What is the case number listed on the death
20 certificate?

21 A. 18-19697.

22 Q. Is manner of death listed?

23 A. This one is pending.

24 Q. Would description of how the injury occurred and
25 immediate cause of death also be pending then?

26 A. Yes.

1 Q. Is there an amendment?

2 A. Yes.

3 Q. Does amendment list the manner of death?

4 A. Yes. As an accident.

5 Q. And does it give a description of how the injury
6 occurred?

7 A. Yes. Is a victim of wildfire.

8 Q. What's listed as immediate cause of death?

9 A. Fire-related injuries.

10 Q. And how was Mr. Brown identified?

11 A. He was identified by DNA.

12 Q. And Exhibit 866.

13 [Exhibit No. 866 was identified.]

14 BY MS. DUPRE-TOKOS:

15 Q. Whose -- what is Exhibit 866?

16 A. It's a death certificate for Andrew Burt.

17 Q. What is the case number listed on the death
18 certificate?

19 A. 18-19487.

20 Q. Does it list a manner of death on the death
21 certificate?

22 A. Yes. It's an --

23 Q. What is that?

24 A. -- accident.

25 Q. And does it give a description of how the injury
26 occurred?

1 A. Victim of wildfire.

2 Q. Does it list an immediate cause of death?

3 A. Yes. Fire-related injuries.

4 Q. And how was Mr. Burt identified?

5 A. He was identified by DNA.

6 Q. And when you say "DNA," is that the ANDE rapid
7 DNA that you discussed in your prior testimony?

8 A. Yes.

9 Q. And it's used by the FBI and other agencies and
10 courts?

11 A. Correct.

12 Q. And then let's go to Exhibit 867.

13 [Exhibit No. 867 was identified.]

14 BY MS. DUPRE-TOKOS:

15 Q. Would you tell us what 867 is?

16 A. It's a death certificate for Joanne Caddy.

17 Q. Does it list a case number on the death
18 certificate?

19 A. Yes, it's 18-19701.

20 Q. Does it list a manner of death?

21 A. It's pending.

22 Q. So description of how the injury occurred and
23 immediate cause of death would also be pending?

24 A. Yes.

25 Q. Is there an amendment attached?

26 A. Yes.

1 Q. And does the amendment list the manner of death?

2 A. Yes. Accident.

3 Q. Does it give a description of how the injury
4 occurred?

5 A. Yes. She's a victim of wildfire.

6 Q. And does it list the immediate cause of death?

7 A. Yes. Fire-related injuries.

8 Q. How was Ms. Caddy identified?

9 A. She was identified by DNA.

10 Q. And then Exhibit 868.

11 [Exhibit No. 868 was identified.]

12 BY MS. DUPRE-TOKOS:

13 Q. Can you tell us what that is?

14 A. Death certificate for Barbara Carlson.

15 Q. Does it list a case number on the death
16 certificate?

17 A. Yes. 18-19573.

18 Q. Does the death certificate list manner of death?

19 A. Yes. Accident.

20 Q. And does it list description of how the injury
21 occurred?

22 A. Yes. She's a victim of wildfire.

23 Q. Does it list an immediate cause of death?

24 A. Yes. Fire-related injuries.

25 Q. And how was Ms. Carlson identified?

26 A. She was identified by DNA.

1 Q. Going to Exhibit 869.

2 [Exhibit No. 869 was identified.]

3 BY MS. DUPRE-TOKOS:

4 Q. Could you tell us what that is?

5 A. It's a death certificate for Vincent Carota.

6 Q. And what is the case number listed on the death
7 certificate?

8 A. 18-19538.

9 Q. Does the death certificate list a manner of
10 death?

11 A. Yes. Accident.

12 Q. Does it give a description of how the injury
13 occurred?

14 A. Yes. He's a victim of wildfire.

15 Q. And does it list an immediate cause of death?

16 A. Yes. Fire-related injuries.

17 Q. And how was Mr. Carota identified?

18 A. He was identified by DNA.

19 Q. Going to Exhibit 870.

20 [Exhibit No. 870 was identified.]

21 BY MS. DUPRE-TOKOS:

22 Q. Could you tell us what that is?

23 A. It's a death certificate for Dennis Clark, Jr.

24 Q. And does it list a case number?

25 A. Yes. 18-19491.

26 Q. And does it list a manner of death?

1 A. Yes. Accident.

2 Q. Does it give a description of how the injury
3 occurred?

4 A. Yes. Victim of wildfire.

5 Q. And what does it list as immediate cause of
6 death?

7 A. Fire-related injuries.

8 Q. And how was Mr. Clark identified?

9 A. He was identified by DNA.

10 Q. So did Mr. Clark have an amendment?

11 A. Not that I'm aware of. Let's see. Oh, yes, he
12 does.

13 Q. What is the amendment?

14 A. So let's see what we amended. So he was found
15 with his mother, Joy Porter. So in order to establish
16 they were two people in two separate cases, it had to be
17 changed to Dennis Clark, Jr. and then his mother will have
18 a separate death certificate with a different case number.

19 Q. So what actually has changed in the amendment?

20 A. So let's see, space 31. Okay. So I apologize,
21 so looks like they put the -- the parent, which would have
22 been Joy Porter, here and it was changed to his father
23 Dennis Clark, Sr.

24 Q. And does that cover all of the amendments? It
25 looks like they were several.

26 A. Yes. So we changed that. Let's see what we did

1 on 35 and 36. Okay. So we changed the name of the
2 mother. It looks like we just kind of got the mother and
3 father kind of reversed. So that was all corrected there.

4 Q. Okay.

5 A. And then the mortuary was also changed.

6 Q. Okay. So when you say it got reversed, you put
7 the mother's information in the father's slot and the --

8 A. Correct.

9 Q. -- father's information in the mother's slot?

10 A. Yeah.

11 Q. So that had to be fixed via an amendment?

12 A. Yes.

13 Q. Okay. And I believe we already -- I already
14 asked, but how was Mr. Clark identified?

15 A. By DNA.

16 MR. NOEL: I think we have been going on about 45
17 minutes. This is very dry.

18 MS. DUPRE-TOKOS: Yes.

19 MR. NOEL: Emotionally, I think some of the jurors
20 are indicating they'd like a break.

21 GRAND JURY FOREPERSON: Okay. 10 minutes, 15?

22 MR. NOEL: Whatever they like.

23 GRAND JURY FOREPERSON: 15? Okay. 15 minutes.

24

25 [Recess taken from 10:29 until 10:45 a.m. whereupon the
26 grand jury comes to order in Courtroom 9.]

1 GRAND JURY FOREPERSON: All members of the grand jury
2 have returned from break, and we are ready to proceed.

3 BY MS. DUPRE-TOKOS:

4 Q. Okay. Ms. Celentano, looking at Exhibit 871, who
5 is that a death certificate for?

6 A. It's a death certificate for Evelyn Cline.

7 [Exhibit No. 871 was identified.]

8 BY MS. DUPRE-TOKOS:

9 Q. And what's the case number listed on the death
10 certificate?

11 A. 18-19733.

12 Q. And what is the listed manner of death?

13 A. Manner of death in this case is an accident.

14 Q. And what's the description of how the injury
15 occurred?

16 A. She's a victim of wildfire.

17 Q. What is listed as the immediate cause of death?

18 A. Fire-related injuries.

19 Q. And how was Ms. Cline identified?

20 A. She was identified circumstantially.

21 Q. And what were the -- what was the circumstantial
22 evidence that lead to her identification?

23 A. Again, in this case, anthropology took a really
24 close look at the remains and described it as an elderly
25 adult with a screw found in one of the bones. The victim
26 lived alone at that address, and the vehicle registered to

1 the victim was also located at that address.

2 Q. Okay. And then Exhibit 872.

3 [Exhibit No. 872 was identified.]

4 THE WITNESS: It's a death --

5 BY MS. DUPRE-TOKOS:

6 Q. What --

7 A. Sorry.

8 Q. It's okay. What is that document?

9 A. It's a death certificate for John Digby.

10 Q. And what is the case number listed on the death
11 certificate?

12 A. 18-19643.

13 Q. What's the listed manner of death?

14 A. Accident.

15 Q. And description of how the injury occur?

16 A. Victim of wildfire.

17 Q. What is listed as the immediate cause of death?

18 A. Fire-related injuries.

19 Q. How was Mr. Digby identified?

20 A. He was identified by anthropology.

21 Q. Can you explain a little bit to us to what that
22 would be?

23 A. So anthropologists take a look at the bones and
24 often humans have different kinds of variations to their
25 bones, and sometimes that's a good indicator of who that
26 person is.

1 So in this case, they got X-rays. They had
2 X-rays from a previous injury or something like that and
3 were able to match that up to the bones that they were
4 looking at.

5 Q. Okay. You're looking at Exhibit 873, what is
6 that.

7 A. It's a death certificate for Gordon Dise.

8 [Exhibit No. 873 was identified.]

9 BY MS. DUPRE-TOKOS:

10 Q. And what is the case number listed?

11 A. 18-19775.

12 Q. I just need one moment. What is the listed
13 manner of death?

14 A. Accident.

15 Q. And description of how the injury occurred?

16 A. Victim of wildfire.

17 Q. And what's the immediate cause of death?

18 A. Fire-related injuries.

19 Q. And is there an amendment for Mr. Dise?

20 A. Yes, there is.

21 Q. What's the amendment?

22 A. It looks like we corrected his Social Security
23 number.

24 Q. How was Mr. Dise identified?

25 A. He was identified by DNA.

26 Q. Okay. Exhibit 874.

1 [Exhibit No. 874 was identified.]

2 BY MS. DUPRE-TOKOS:

3 Q. What is that exhibit?

4 A. It's a death certificate for Paula Dodge.

5 Q. And what's the case number listed?

6 A. 18-19544.

7 Q. And is there a listed manner of death?

8 A. This one is pending.

9 Q. Okay. And so is description of the -- how the
10 injury occurred and the immediate cause of death also
11 pending?

12 A. Yes.

13 Q. Is there an amendment?

14 A. There is.

15 Q. And does the amendment list the manner of death?

16 A. Yes.

17 Q. What is that?

18 A. Accident.

19 Q. And does the amendment also list a description of
20 how the injury occurred?

21 A. Yes. Victim of wildfire.

22 Q. And does the amendment list the immediate cause
23 of death?

24 A. Fire-related injuries.

25 Q. And how was Ms. Dodge identified?

26 A. She was identified by odontology.

1 Q. And then Exhibit 875.

2 [Exhibit No. 875 was identified.]

3 THE WITNESS: It's a death certificate for Randall
4 Dodge.

5 BY MS. DUPRE-TOKOS:

6 Q. And what's the case number?

7 A. 18-19545.

8 Q. And does the death certificate list the manner of
9 death?

10 A. In this case, it's pending.

11 Q. And is description of how the injury occurred and
12 immediate cause of death also pending?

13 A. Yes.

14 Q. Is there an amendment?

15 A. Yes.

16 Q. And does the amendment list the manner of death?

17 A. Yes. It's an accident.

18 Q. And description of how the injury occurred?

19 A. It was a victim of wildfire.

20 Q. Immediate cause of death?

21 A. Fire-related injuries.

22 Q. And how Mr. Dodge identified?

23 A. He was identified by odontology.

24 Q. Okay. And Exhibit 876?

25 [Exhibit No. 876 was identified.]

26 THE WITNESS: It's a death certificate for Andrew

1 Downer.

2 BY MS. DUPRE-TOKOS:

3 Q. And what is the case number listed on the
4 certificate?

5 A. 18-19551.

6 Q. And does the certificate list manner of death?

7 A. Yes. It's an accident.

8 Q. And the description of how the injury occurred?

9 A. He's a victim of wildfire.

10 Q. And what is listed in the immediate cause of
11 death?

12 A. Fire-related injuries.

13 Q. And how was Mr. Downer identified?

14 A. He was identified by DNA.

15 Q. Exhibit 877.

16 [Exhibit No. 877 was identified.]

17 THE WITNESS: Death certificate for Robert Duvall.

18 BY MS. DUPRE-TOKOS:

19 Q. And what's the case number listed on the death
20 certificate?

21 A. 18-19489.

22 Q. And does the death certificate list the manner of
23 death?

24 A. Yes. Accident.

25 Q. Does it list the description of how the injury
26 occurred?

1 A. Yes. Victim of wildfire.

2 Q. And does it list immediate cause of death?

3 A. Yes. Fire-related injuries.

4 Q. And how was Mr. Duvall identified?

5 A. He was identified by DNA.

6 Q. Exhibit 878, I think it is.

7 A. Yes.

8 [Exhibit No. 878 was identified.]

9 BY MS. DUPRE-TOKOS:

10 Q. Who is that death certificate for?

11 A. Death certificate for Rose Farrell.

12 Q. And what's the listed case number?

13 A. 18-19665.

14 Q. Does the death certificate list a manner of
15 death?

16 A. Yes. Accident.

17 Q. Description of how the injury occurred?

18 A. She's a victim of wildfire.

19 Q. And immediate cause of death?

20 A. Fire-related injuries.

21 Q. How was Ms. Farrell identified?

22 A. She was identified by DNA.

23 Q. And Exhibit 879.

24 [Exhibit No. 879 was identified.]

25 THE WITNESS: Is a death certificate for Jesus
26 Fernandez.

1 BY MS. DUPRE-TOKOS:

2 Q. And what's the listed case number?

3 A. 18-19563.

4 Q. And does it list the manner of death?

5 A. This one is pending.

6 Q. So are the spaces for description of how the
7 injury occurred and immediate cause of death also pending?

8 A. Yes.

9 Q. Is there an amendment?

10 A. Yes.

11 Q. And does that amendment list the manner of death?

12 A. Yes. Accident.

13 Q. Does it list description of how the injury
14 occurred?

15 A. Yes. He's a victim of wildfire.

16 Q. And does it list the immediate cause of death?

17 A. Fire-related injuries.

18 Q. And how was Mr. Fernandez identified?

19 A. He was identified by fingerprints.

20 Q. And then Exhibit 880.

21 [Exhibit No. 880 was identified.]

22 THE WITNESS: Is a death certificate for Jean
23 Forsman.

24 BY MS. DUPRE-TOKOS:

25 Q. And what's the listed case number?

26 A. 18-19947.

1 Q. And does it list a manner of death?

2 A. Yes. Accident.

3 Q. Does it list description of how the injury
4 occurred?

5 A. Yes. She's a victim of wildfire.

6 Q. Does it list immediate cause of death?

7 A. Yes. Fire-related injuries.

8 Q. And how was Ms. Forsman identified?

9 A. She was identified by DNA.

10 Q. If I can have one moment. And then going to
11 Exhibit 881.

12 [Exhibit No. 881 was identified.]

13 THE WITNESS: It's a death certificate for Ernest
14 Foss, Jr.

15 BY MS. DUPRE-TOKOS:

16 Q. And what is the listed case number on the death
17 certificate?

18 A. 18-19487.

19 Q. Okay. And to your knowledge, is that the correct
20 case number?

21 A. No.

22 Q. So what happens in a situation such as this where
23 the incorrect case number is listed on the death
24 certificate?

25 A. An amendment is created to correct that.

26 Q. How long does that normally take?

1 A. Depends on when we catch it. It doesn't take
2 long, just has to be approved.

3 Q. Okay. So it gets approved by whom?

4 A. By the chief deputy coroner, and then by the
5 state registrar.

6 Q. Okay. So in Mr. Foss's case, are you aware if an
7 amendment was signed by the chief deputy coroner?

8 A. Yes.

9 Q. Okay. And have we received an amendment from --
10 an approved amendment from the state?

11 A. It doesn't look like on this amendment that it
12 has been changed yet. We are currently working on that.

13 Q. Okay. So on the death certificate in front of
14 you for Mr. Foss, does that list a manner of death?

15 A. It's pending.

16 Q. Okay. And so is there already an amendment
17 attached to that death certificate for Mr. Foss?

18 A. Yes.

19 Q. And does that amendment list a manner of death?

20 A. Yes. Accident.

21 Q. And does that amendment list in the description
22 of how the injury occurred?

23 A. He was a victim of wildfire.

24 Q. And does it list immediate cause of death?

25 A. Fire-related injuries.

26 Q. Now, when the amendment is approved by the state

1 with the corrected case number, will there then be a
2 second amendment page?

3 A. Yes.

4 Q. Okay.

5 A. There'll be an additional amendment page.

6 Q. And then how was Mr. Foss identified, if you
7 recall?

8 A. I believe he was identified by fingerprints and
9 DNA. We did secondary on almost all victims.

10 Q. Okay. Exhibit 862 -- or 882.

11 A. 882.

12 [Exhibit No. 882 was identified.]

13 THE WITNESS: Is a death certificate for Elizabeth
14 Gaal.

15 BY MS. DUPRE-TOKOS:

16 Q. What is the case number listed on the death
17 certificate?

18 A. 18-19680.

19 Q. And does it list -- does her death certificate
20 list manner of death?

21 A. This one is pending.

22 Q. Okay. Is there an amendment attached?

23 A. Yes.

24 Q. And does that amendment list the manner of death?

25 A. Yes. Accident.

26 Q. Does the amendment list description of how the

1 injury occurred?

2 A. Yes. She's a victim of wildfire.

3 Q. And does the amendment list the immediate cause
4 of death?

5 A. Fire-related injuries.

6 Q. And how was Ms. Gaal identified?

7 A. She was identified by odontology.

8 Q. And Exhibit 883.

9 [Exhibit No. 883 was identified.]

10 HE WITNESS: It's a death certificate for Sally
11 Gamboa.

12 Q. And what is the listed case number?

13 A. 18-19535.

14 Q. And is the manner of death listed?

15 A. Yes. Accident.

16 Q. What about description of how the injury
17 occurred?

18 A. Yes. She's a victim of wildfire.

19 Q. And immediate cause of death?

20 A. Fire-related injuries.

21 Q. Now, is there an amendment for Ms. Gamboa's death
22 certificate?

23 A. Yes.

24 Q. And what was corrected?

25 A. Her Social Security number was corrected.

26 Q. How was Ms. Gamboa identified?

1 A. She was identified by fingerprints.

2 Q. Going to Exhibit 884.

3 [Exhibit No. 884 was identified.]

4 THE WITNESS: It's a death certificate for James
5 Garner.

6 Q. And what's the listed case number?

7 A. 18-19550.

8 Q. Is a manner of death listed?

9 A. Yes. Accident.

10 Q. And what about description of how the injury
11 occurred?

12 A. Yes. He's a victim of wildfire.

13 Q. And immediate cause of death?

14 A. Fire-related injuries.

15 Q. Is there an amendment for Mr. Garner's death
16 certificate?

17 A. Yes.

18 Q. What was corrected?

19 A. His Social Security number was corrected.

20 Q. Okay. And how was Mr. Garner identified?

21 A. He was identified by DNA.

22 Q. Okay. Exhibit 885.

23 [Exhibit No. 885 was identified.]

24 THE WITNESS: Is a death certificate for Richard
25 Garrett.

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. And what's the listed case number?

3 A. 18-19753.

4 Q. And is a manner of death listed?

5 A. Yes. Accident.

6 Q. And what about description of how the injury
7 occurred?

8 A. Yes, he's victim of wildfire.

9 Q. And immediate cause of death?

10 A. Is fire-related injuries.

11 Q. And how was Mr. Garrett identified?

12 A. He was identified by DNA.

13 Q. And Exhibit 886.

14 [Exhibit No. 886 was identified.]

15 THE WITNESS: Is a death certificate for William
16 Godbout.

17 BY MS. DUPRE-TOKOS:

18 Q. And what is the listed case number?

19 A. 18-19531.

20 Q. Is a manner of death listed?

21 A. Yes. Accident.

22 Q. What is description of how the injury occurred?

23 A. He's a victim of wildfire.

24 Q. And what's listed as the immediate cause of
25 death?

26 A. Fire-related injuries.

1 Q. And how was Mr. Godbout identified, if you
2 recall?

3 A. I believe Mr. Godbout was also identified by DNA.

4 Q. And Exhibit 887.

5 [Exhibit No. 887 was identified.]

6 THE WITNESS: Is a death certificate for Shirley
7 Haley.

8 BY MS. DUPRE-TOKOS:

9 Q. What is the listed case number?

10 A. 18-19566.

11 Q. And is a manner of death listed?

12 A. Yes. Accident.

13 Q. And is a description of how the injury occurred
14 listed?

15 A. Yes. She's a victim of wildfire.

16 Q. And what's listed as the immediate cause of
17 death?

18 A. Fire-related injuries.

19 Q. And how was Ms. Haley identified?

20 A. She was identified circumstantially. She was
21 found co-mingled with her sister, Barbara Carlson, who was
22 identified by DNA. They lived at the same address and we
23 have information from the family that they had talked to
24 Barbara that day and Shirley was there with her.

25 Q. And were her remains also examined by an
26 anthropologist?

1 A. Yes.

2 Q. And Exhibit 886.

3 MR. NOEL: Should be 888.

4 THE WITNESS: Yeah.

5 MS. DUPRE-TOKOS: Sorry, it's hard for me to see it
6 on there. 888.

7 [Exhibit No. 888 was identified.]

8 THE WITNESS: Exhibit 888 is a death certificate for
9 Dennis Hanko.

10 BY MS. DUPRE-TOKOS:

11 Q. What's the listed case number?

12 A. 18-19647.

13 Q. And is a manner of death listed?

14 A. Yes. Accident.

15 Q. And is there a description of how the injury
16 occurred?

17 A. Yes. He's a victim of wildfire.

18 Q. And what's listed as the immediate cause of
19 death?

20 A. Fire-related injuries.

21 Q. Is there an amendment for Mr. Hanko?

22 A. Yes.

23 Q. And what was corrected?

24 A. It looks like line 20. So the residence was
25 changed. You could see there they added an "A" to the
26 address, it was number 3A. Line 26 was changed, which is

1 the -- gosh, these are so hard to read. The informant was
2 changed to his sister and her address was added and it
3 looks like they also changed mortuaries.

4 Q. And how was Mr. Hanko identified?

5 A. He was identified by DNA.

6 Q. And then Exhibit 889.

7 [Exhibit No. 889 was identified.]

8 THE WITNESS: It's a death certificate for Anna
9 Hastings.

10 BY MS. DUPRE-TOKOS:

11 Q. And what's the listed case number?

12 A. 18-19655.

13 Q. And is a manner of death listed?

14 A. Yes. Accident.

15 Q. What's the description of how the injury
16 occurred?

17 A. She's a victim of wildfire.

18 Q. And what was listed as the immediate cause of
19 death?

20 A. Fire-related injuries.

21 Q. And how was Ms. Hastings identified?

22 A. She was identified by DNA.

23 Q. And Exhibit 890.

24 [Exhibit No. 890 was identified.]

25 THE WITNESS: Is a death certificate for Jennifer
26 Hayes.

1 BY MS. DUPRE-TOKOS:

2 Q. And what's the listed case number?

3 A. 18-19735.

4 Q. And is a manner of death listed?

5 A. Yes. It was an accident.

6 Q. And is there a description of how the injury
7 occurred?

8 A. Yes. She's a victim of wildfire.

9 Q. And what's listed as the immediate cause of
10 death?

11 A. Fire-related injuries.

12 Q. How was Ms. Hayes identified?

13 A. She was identified by odontology.

14 Q. And then Exhibit 891.

15 [Exhibit No. 891 was identified.]

16 THE WITNESS: This is a death certificate for
17 Christina Heffern.

18 Q. And what is the listed case number?

19 A. 18-19604.

20 Q. Is a manner of death listed?

21 A. Yes. Accident.

22 Q. And what is the description of how the injury
23 occurred?

24 A. She's a victim of wildfire.

25 Q. And what's listed as the immediate cause of
26 death?

1 A. Fire-related injuries.

2 Q. And how was Ms. Christina Heffern identified?

3 A. She was identified by DNA.

4 Q. Exhibit 892.

5 [Exhibit No. 892 was identified.]

6 THE WITNESS: This is a death certificate for Ishka
7 Heffern.

8 Q. What's the listed case number?

9 A. 18-19605.

10 Q. And is a manner of death listed?

11 A. Yes. Accident.

12 Q. And is there a description of how the injury
13 occurred?

14 A. Yes. She's a victim of wildfire.

15 Q. And what's listed as the immediate cause of
16 death?

17 A. Fire-related injuries.

18 Q. And then how was Ms. Ishka Heffern identified?

19 A. Ishka and her mother Christina and her
20 grandmother were all found co-mingled together at their
21 residence. And anthropology described this particular set
22 of remains as a young female victim, and there's also 911
23 calls that place her at that residence.

24 Q. And then Exhibit 893.

25 [Exhibit No. 893 was identified.]

26 THE WITNESS: It's a death certificate for a Matilde

1 Heffern.

2 BY MS. DUPRE-TOKOS:

3 Q. And what is the listed case number?

4 A. 18-19967.

5 Q. And is a manner of death listed?

6 A. Yes. Accident.

7 Q. And what is description of how the injury
8 occurred?

9 A. She's a victim of wildfire.

10 Q. And what's listed as the immediate cause of
11 death?

12 A. Fire-related injuries.

13 Q. And how was Ms. Matilde Heffern identified?

14 A. She was co-mingled with her daughter and her
15 granddaughter at the house -- home where she should have
16 been. Anthropology had those set of remains as a female
17 adult and we also have the 911 call that places her at the
18 residence.

19 Q. Exhibit 894.

20 [Exhibit No. 894 was identified.]

21 THE WITNESS: Is a death certificate for Louis
22 Herrera.

23 BY MS. DUPRE-TOKOS:

24 Q. What's the listed case number?

25 A. 18-19672.

26 Q. And what's -- is there a manner of death listed?

1 A. Yes. Accident.

2 Q. What's the description of how the injury
3 occurred?

4 A. He's a victim of wildfire.

5 Q. And what's listed as the immediate cause of
6 death?

7 A. Fire-related injuries.

8 Q. And how was Mr. Herrera identified?

9 A. He was identified by DNA.

10 Q. And Exhibit 895.

11 [Exhibit No. 895 was identified.]

12 THE WITNESS: Is a death certificate for Evva Holt.

13 BY MS. DUPRE-TOKOS:

14 Q. What's the listed case number?

15 A. 18-19702.

16 Q. And is there a manner of death listed?

17 A. Yes. Accident.

18 Q. What's the description of how the injury
19 occurred?

20 A. She's a victim of wildfire.

21 Q. And what's listed as the immediate cause of
22 death?

23 A. Fire-related injuries.

24 Q. And how was Ms. Holt identified?

25 A. DNA.

26 Q. Okay. And Exhibit 896.

[Exhibit No. 896 was identified.]

THE WITNESS: Is a death certificate for TK Huff.

Q. What's the listed case number?

A. 18-19586.

Q. Is there a manner of death listed?

A. Yes. Accident.

Q. And is there a description of how the injury occurred?

A. Yes. He's a victim of wildfire.

Q. And what's listed as the immediate cause of death?

A. Fire-related injuries.

Q. And how was Mr. Huff identified?

A. He was identified by DNA.

Q. Okay. Exhibit 897.

[Exhibit No. 897 was identified.]

THE WITNESS: Is a death -- excuse me, death certificate for Gary Hunter.

Q. What's the listed case number?

A. 18-19737.

Q. Is a manner of death listed?

A. Yes. Accident.

Q. And is there a description of how the injury occurred?

A. Yes. He was a victim of wildfire.

Q. What's listed as the immediate cause of death?

1 A. Fire-related injuries.

2 Q. And how was Mr. Hunter identified?

3 A. He was identified by DNA.

4 Q. Exhibit 898.

5 [Exhibit No. 898 was identified.]

6 THE WITNESS: Death certificate for James Kinner.

7 BY MS. DUPRE-TOKOS:

8 Q. What's the listed case number?

9 A. 18-19755.

10 Q. And is a manner of death listed?

11 A. Yes. Accident.

12 Q. And description of how the injury occurred?

13 A. He's a victim of wildfire.

14 Q. And immediate cause of death?

15 A. Fire -- excuse me, fire-related injuries.

16 Q. Is there an amendment for Mr. Kinner's death
17 certificate?

18 A. Yes.

19 Q. Is there one or two?

20 A. There are two.

21 Q. Okay. What does the first one amend?

22 A. The first one looks like we didn't really have
23 any information for Mr. Kinner, and so we added all the
24 additional information that was required.

25 Q. Is that, like, his personal identifying
26 information or?

1 A. Yeah, it looks like they added -- oh, wait that's
2 not the same one I am looking at.

3 Q. I think have my pages backwards. There we go,
4 sorry.

5 A. Okay. So the first one, line nine -- yeah, it's
6 just demographic information. It looks like on the death
7 certificate, we didn't have his birth state, any -- any
8 information for next-of-kin. So the first amendment is
9 adding -- what is line -- his middle name. Adding that he
10 was divorced. He has a high school diploma. That he's
11 Caucasian, added his occupation. And then 27 -- 27
12 added -- was his informant's mailing address. 32, it
13 looks like then we got next-of-kin information and that
14 was added as well.

15 Q. And then on the second amendment, what was
16 corrected?

17 A. So 36, looks like a middle name was added for
18 a -- the spouse or parent, and then the mortuary was also
19 changed.

20 Q. And how was Mr. Kinner identified?

21 A. Mr. Kinner was identified by his -- a serial
22 number that we found on hardware in his knee, and we were
23 able to get that number off and figure out who that
24 prosthetic belonged to and it was Mr. James Kinner.

25 Q. And how do you figure something like that out?

26 A. It's -- it's really difficult actually. So we

1 have to call around to several different companies that
2 make the prosthetic. So you have to figure out what type
3 it is first, then you have to contact each company. Some
4 companies gave push back, but we were able to get all the
5 information we needed. And I think there are three cases
6 where we identified them by hardware.

7 Q. Going to Exhibit 899.

8 [Exhibit No. 899 was identified.]

9 THE WITNESS: It's a death certificate for Dorothy
10 Lee-Herrera.

11 BY MS. DUPRE-TOKOS:

12 Q. What's the listed case number?

13 A. 18-19949.

14 Q. And is there a listed manner of death?

15 A. Yes. Accident.

16 Q. And description of how the injury occurred?

17 A. Yes. She's a victim of wildfire.

18 Q. And immediate cause of death?

19 A. Fire-related injuries.

20 Q. And how was Ms. Lee-Herrera identified?

21 A. She was identified by odontology.

22 Q. Okay. And going to Exhibit 900.

23 [Exhibit No. 900 was identified.]

24 THE WITNESS: It's a death certificate for Warren
25 Lessard.

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. And what's the listed case number?

3 A. 18-19809.

4 Q. Is there a listed manner of death?

5 A. Yes. Accident.

6 Q. And a description of how the injury occurred?

7 A. Yes, he's a victim of wildfire.

8 Q. And immediate cause of death?

9 A. Fire-related injuries.

10 Q. And how was Mr. Lessard identified?

11 A. He was identified by DNA.

12 Q. Okay. Going to Exhibit 901.

13 [Exhibit No. 901 was identified.]

14 THE WITNESS: This is a death certificate for Dorothy
15 Mack.

16 BY MS. DUPRE-TOKOS:

17 Q. And what's the listed case number?

18 A. 18-19812.

19 Q. And is there a listed manner of death?

20 A. Yes. Accident.

21 Q. And a description of how the injury occurred?

22 A. Yes, she's a victim of wildfire.

23 Q. What's listed as the immediate cause of death?

24 A. Fire-related injuries.

25 Q. And how was Ms. Mack identified?

26 A. She was identified by DNA.

1 Q. And Exhibit 902.

2 [Exhibit No. 902 was identified.]

3 THE WITNESS: It's a death certificate for Sara
4 Magnuson.

5 BY MS. DUPRE-TOKOS:

6 Q. What's the listed case number?

7 A. 18-19727.

8 Q. And is there a manner of death listed?

9 A. Yes. Accident.

10 Q. And is there a description of how the injury
11 occurred?

12 A. Yes. She's a victim of wildfire.

13 Q. And is there an immediate cause of death listed?

14 A. Yes. Fire-related injuries.

15 Q. Is there an amendment for Ms. Magnuson?

16 A. Yes.

17 Q. What does that correct?

18 A. That corrected her next-of-kin from George
19 Magnuson to George Randall.

20 Q. And how was Ms. Magnuson identified?

21 A. She was identified by DNA.

22 Q. And going to Exhibit 903.

23 [Exhibit No. 903 was identified.]

24 THE WITNESS: It's a death certificate for Dolores
25 Malarkey.

26 ///

1 BY MS. DUPRE-TOKOS:

2 Q. What's the listed case number?

3 A. 18-19596.

4 Q. Now, on the death certificate, the name is
5 listed, correct?

6 A. Yes.

7 Q. Is there also a spot for AKA?

8 A. Yes.

9 Q. And you testified previously that the name and
10 AKA information is provided by the family?

11 A. Correct.

12 Q. So do they have to give the birth name or can
13 they give what the person goes by or how does that work?

14 A. Yes, they can put any name that they like. It
15 does not have to go by their birth name or their driver's
16 license.

17 Q. Okay. Is there an AKA listed for Dolores
18 Malarkey?

19 A. Yes. Joanne Malarkey.

20 Q. And is it your understanding that Ms. Malarkey
21 went by Joanne?

22 A. Yes.

23 Q. Is there a manner of death listed on her death
24 certificate?

25 A. This one is pending.

26 Q. Okay. So I assume that the description of how

1 the injury occurred and the immediate cause of death are
2 also pending?

3 A. Yes.

4 Q. Is there an amendment?

5 A. Yes.

6 Q. And does the amendment list the manner of death?

7 A. Yes. Accident.

8 Q. Does the amendment list a description of how the
9 injury occurred?

10 A. Yes. She's a victim of wildfire.

11 Q. And does it list an immediate cause of death?

12 A. Yes. Fire-related injuries.

13 Q. And how was Ms. Malarkey identified?

14 A. She was identified by odontology.

15 Q. And going to Exhibit 904.

16 [Exhibit No. 904 was identified.]

17 THE WITNESS: It's a death certificate for John
18 Malarkey.

19 BY MS. DUPRE-TOKOS:

20 Q. What's the listed case number?

21 A. 18-19594.

22 Q. Is Mr. Malarkey's death certificate complete or
23 is there an amendment?

24 A. There's an amendment.

25 Q. So is the manner of death pending?

26 A. Yes.

1 Q. Okay. And the related questions for description
2 of the injuries and immediate cause of death, are they
3 also pending?

4 A. Yes.

5 Q. Does the amendment update that?

6 A. Yes.

7 Q. Could you tell us what the listed manner of death
8 is on the amendment?

9 A. Accident.

10 Q. And description of how the injury occurred?

11 A. Victim of wildfire.

12 Q. Immediate cause of death?

13 A. Fire-related injuries.

14 Q. And how was Mr. Malarkey identified?

15 A. He was identified by odontology.

16 Q. Exhibit 905.

17 [Exhibit No. 905 was identified.]

18 THE WITNESS: Is a death certificate for Chris
19 Maltby.

20 BY MS. DUPRE-TOKOS:

21 Q. What is the listed case number?

22 A. 18-19732.

23 Q. And is there a manner of death listed?

24 A. Yes. Accident.

25 Q. And is there a description of how the injury
26 occurred?

1 A. Yes. He's a victim of wildfire.

2 Q. And what is listed as the immediate cause of
3 death?

4 A. Fire-related injuries.

5 Q. And then how was Mr. Maltby identified?

6 A. He was identified by hardware as well. So the
7 medical implant in his shoulder had a serial number on it,
8 and that's how we identified him.

9 Q. Okay. Exhibit 906.

10 [Exhibit No. 906 was identified.]

11 THE WITNESS: It's a death certificate for David
12 Marbury.

13 BY MS. DUPRE-TOKOS:

14 Q. And what's the listed case number?

15 A. 18-19868.

16 Q. And does that death certificate list a manner of
17 death?

18 A. Yes. Accident.

19 Q. Does it give a description of how the injury
20 occurred?

21 A. Yes. He's a victim of wildfire.

22 Q. And does it list an immediate cause of death?

23 A. Yes. Fire-related injuries.

24 Q. And how was Mr. Marbury identified?

25 A. He was identified by DNA.

26 Q. And Exhibit 907.

1 [Exhibit No. 907 was identified.]

2 THE WITNESS: Is a death certificate for Deborah
3 Morningstar.

4 BY MS. DUPRE-TOKOS:

5 Q. And what's the listed case number?

6 A. 18-19534.

7 Q. And is there a manner of death listed?

8 A. This one is pending.

9 Q. So is the immediate cause of death and the
10 description of how the injury occurred also pending?

11 A. Yes.

12 Q. Is there an amendment?

13 A. Yes.

14 Q. And does that amendment list a manner of death?

15 A. Yes. Accident.

16 Q. Does it give a description of how the injury
17 occurred?

18 A. He was a victim of wildfire.

19 Q. And is the immediate cause of death listed?

20 A. Fire-related injuries.

21 Q. And how was Ms. Morningstar identified?

22 A. She was identified by DNA.

23 Q. Going to Exhibit 908.

24 [Exhibit No. 908 was identified.]

25 THE WITNESS: That is a death certificate for Helen
26 Pace.

1 BY MS. DUPRE-TOKOS:

2 Q. And what's the listed case number?

3 A. 18-19760.

4 Q. And does that death certificate list a manner of
5 death?

6 A. Yes. Accident.

7 Q. Does it give a description of how the injury
8 occurred?

9 A. Yes. She was a victim of wildfire.

10 Q. And what does it list as an immediate cause of
11 death?

12 A. Fire-related injuries.

13 Q. And how was Ms. Pace identified?

14 A. She was identified by DNA.

15 Q. Exhibit 909.

16 [Exhibit No. 909 was identified.]

17 THE WITNESS: Is a death certificate for Joy Porter.

18 BY MS. DUPRE-TOKOS:

19 Q. And what's the case number listed on the death
20 certificate?

21 A. 18-19490.

22 Q. And does that death certificate list a manner of
23 death?

24 A. Yes. Accident.

25 Q. And does it give a description of how the injury
26 occurred?

1 A. Yes. She's a victim of wildfire.

2 Q. And what's listed as the immediate cause of
3 death?

4 A. Fire-related injuries.

5 Q. Is there an amendment to Ms. Porter's death
6 certificate?

7 A. Yes.

8 Q. And what does that correct?

9 A. It corrected her Social Security number.

10 Q. Okay. And how was Ms. Porter identified?

11 A. She was identified by DNA.

12 Q. And then Exhibit 910.

13 [Exhibit No. 910 was identified.]

14 THE WITNESS: Is a death certificate for Beverly
15 Powers.

16 BY MS. DUPRE-TOKOS:

17 Q. And what's the listed case number on the death
18 certificate?

19 A. 18-19488.

20 Q. And is a manner of death listed?

21 A. Yes. Accident.

22 Q. And is there a description of how the injury
23 occurred?

24 A. Yes. She's a victim of wildfire.

25 Q. And what's listed as the immediate cause of
26 death?

1 A. Fire-related injuries.

2 Q. And how was Ms. Powers identified?

3 A. She's identified by DNA.

4 Q. And Exhibit 911.

5 [Exhibit No. 911 was identified.]

6 THE WITNESS: It's a death certificate for Robert
7 Quinn.

8 BY MS. DUPRE-TOKOS:

9 Q. What's the listed case number?

10 A. 18-19568.

11 Q. And does that death certificate list a manner of
12 death?

13 A. Yes. Accident.

14 Q. And does it give a description of how the injury
15 occurred?

16 A. Yes. Victim of wildfire.

17 Q. What's listed as the immediate cause of death?

18 A. Fire-related injuries.

19 Q. And how was Mr. Quinn identified?

20 A. He was identified by odontology and DNA.

21 Q. And then Exhibit 912.

22 [Exhibit No. 912 was identified.]

23 THE WITNESS: It's a death certificate for Joseph
24 Rabetoy.

25 BY MS. DUPRE-TOKOS:

26 Q. And what's the case number that's listed on the

1 death certificate?

2 A. 18-19543.

3 Q. Does it list a manner of death?

4 A. This one is pending.

5 Q. Okay. Would description of how the injury
6 occurred and immediate cause of death also be pending?

7 A. Yes.

8 Q. And is there an amendment?

9 A. Yes.

10 Q. Does that amendment list a manner of death?

11 A. Yes. Accident.

12 Q. And does the amend -- amendment give a
13 description of how the injury occurred?

14 A. Yes. He was a victim of wildfire.

15 Q. And does the amendment list an immediate cause of
16 death?

17 A. Fire-related injuries.

18 Q. And how was Mr. Rabetoy identified?

19 A. He was identified by odontology.

20 Q. And then exit 913.

21 [Exhibit No. 913 was identified.]

22 THE WITNESS: It's a death certificate for Forrest
23 Rae.

24 BY MS. DUPRE-TOKOS:

25 Q. And what's the listed case number?

26 A. 18-19530.

1 Q. Does Mr. Rae's death certificate list a manner of
2 death?

3 A. Yes. Accident.

4 Q. Does it give a description of how the injury
5 occurred?

6 A. Yes. He's a victim of wildfire.

7 Q. And does it list an immediate cause of death?

8 A. Yes. Fire-related injuries.

9 Q. And is there an amendment for Mr. Rae?

10 A. Yes.

11 Q. What was corrected?

12 A. It looks like line 33 was corrected, which is the
13 parent -- the last name was added of Rae.

14 Q. And how was Mr. Rae identified?

15 A. He was identified by DNA.

16 Q. Going to Exhibit 914?

17 [Exhibit No. 914 was identified.]

18 THE WITNESS: It's a death certificate for Vernice
19 Regan.

20 BY MS. DUPRE-TOKOS:

21 Q. And what's the listed case number?

22 A. 18-19540.

23 Q. And does this death certificate list a manner of
24 death?

25 A. This one is pending.

26 Q. So would description of how the injury occurred

1 and immediate cause of death also be pending?

2 A. Yes.

3 Q. Is there an amendment?

4 A. Yes.

5 Q. How many?

6 A. There are two.

7 Q. On the first amendment, what was changed?

8 A. Her name was spelled correctly.

9 Q. Okay. And then on the second amendment, does
10 that list a manner of death?

11 A. Yes. Accident.

12 Q. Does it list a description of how the injury
13 occurred?

14 A. Yes. She was a victim of wildfire.

15 Q. What is listed as the immediate cause of death?

16 A. Fire-related injuries.

17 Q. And how was Ms. Regan identified?

18 A. She was identified by DNA.

19 Q. And Exhibit 915.

20 [Exhibit No. 915 was identified.]

21 THE WITNESS: It's a death certificate for Ethel
22 Riggs.

23 BY MS. DUPRE-TOKOS:

24 Q. And what's the case number listed on the death
25 certificate?

26 A. 18-19730.

1 Q. And is there a manner of death listed on the date
2 of death certificate?

3 A. Yes. Accident.

4 Q. And what's the description of how the injury
5 occurred?

6 A. She's a victim of wildfire.

7 Q. What's listed as the immediate cause of death?

8 A. Fire-related injuries.

9 Q. And how was Ms. Riggs identified?

10 A. She was identified by circumstantial evidence.
11 We had conversation with her grandson where she said she
12 had -- I guess, he had spoke with her that day, and she
13 had no power and she couldn't open the garage door. This
14 was a case where she was trapped and couldn't get out.
15 She was not strong enough the lift the door.

16 Q. And you said she had a conversation with her
17 grandson?

18 A. Yes.

19 Q. And then going to Exhibit 916.

20 [Exhibit No. 916 was identified.]

21 THE WITNESS: It's a death certificate for Lolene
22 Rios.

23 BY MS. DUPRE-TOKOS:

24 Q. And what's the listed case number?

25 A. 18-19542.

26 Q. And is there a listed manner of death?

1 A. This one is pending.

2 Q. So is description of how the injury occurred and
3 immediate cause of death also pending?

4 A. Yes.

5 Q. Is there an amendment?

6 A. Yes.

7 Q. Does that amendment list a manner of death?

8 A. Yes. Accident.

9 Q. Does the amendment include a description of how
10 the injury occurred?

11 A. Yes. She was a victim of wildfire.

12 Q. And does the amendment also include an immediate
13 cause of death?

14 A. Yes. Fire-related injuries.

15 Q. And how was Ms. Rios identified?

16 A. She was identified by fingerprints and DNA.

17 GRAND JURY FOREPERSON: Can we get a break?

18 MS. DUPRE-TOKOS: I think we need to take about a 5
19 or 10-minute break.

20 GRAND JURY FOREPERSON: Five minutes? Okay. Five
21 minutes.

22

23 [Recess taken from 11:24 until 11:35 a.m. whereupon the
24 grand jury comes to order in Courtroom 9.]

25

26 GRAND JURY FOREPERSON: All members of the grand jury

1 have returned from break, and we're ready to proceed.

2 MR. NOEL: All right. Before we get started. Right
3 before the break, your heard Ms. Celentano testify about
4 the grandson having a conversation with his grandmother
5 and her being trapped and not being able to get out. We
6 have gone over this, God only knows how many times over
7 the last 11 months. Those statements are hearsay, and you
8 are not to consider those statements for any purpose
9 unless and until, for instance, the grandson would come in
10 and testify to that. So if the grandson comes in and
11 testifies and confirms that, you can consider that
12 evidence, otherwise, you cannot consider those statements
13 at all.

14 And second thing I meant to talk -- do this
15 morning before we started, we're taking a lot of breaks
16 this morning. This is very difficult evidence to go
17 through. We're trying to make it as easy and unemotional
18 as possible for you. But, obviously, you can't take all
19 the emotion out of it. We had this conversation last week
20 on Friday and now that we're hearing the evidence, the
21 death evidence and emotions are coming up. And some of
22 you have emotional reactions to some of the evidence, the
23 witnesses have emotional reactions to some of the
24 evidence. That is natural. We're human. This is
25 emotional stuff. We're talking about people dying. We're
26 talking about destruction. We're talking about mass

1 casualties of that on a completely different level from
2 any other. Emotion is expected. It's okay to feel the
3 emotion, but we can't allow the emotion to effect decision
4 making in the end.

5 After our conversation last week, I was trying
6 to -- to think about it and how to explain it to you. And
7 our boss, Mr. Ramsey is a -- believe it or not, a diehard
8 trekky. He is a devotee of the original William Shatner,
9 Leonard Nimoy, Star Trek. And he has Star Trek
10 memorabilia all over his office. Including, he has a
11 photo with himself photoshopped into the crew of Starship
12 Enterprise, and he has his phaser on his desk.

13 Why this is all relevant is looking at this and
14 made me think, a -- in Star Trek, you had Captain Kirk who
15 was the emotional human being and everything was emotion
16 and he was constantly mad and very animated, and then you
17 had Leonard Nimoy and that was Spock and he was completely
18 unemotional and, you know, completely logical with
19 everything. And kind of two sides of humanity. And what
20 we need in here is -- it's okay in here right now for you
21 guys to be a bunch of Captain Kirks, for you to be
22 emotional, for you the get angry, for you to get upset as
23 this evidence is coming in. But once it comes time to
24 make a decision, once it comes time to be in
25 deliberations, you guys all have to be Mr. Spock. Emotion
26 cannot play any role in the decisions that you make. It's

1 got to be simple logic. Here's the law. Here is the
2 evidence. Does the evidence match the law? If it does,
3 one decision. If it doesn't, another decision.

4 So don't feel bad about the emotion now. It's
5 only when we get down to the end, that's where you got to
6 take the emotion out of play.

7 All right. I know we keep checking on you guys
8 to make sure. This is -- this is tough no matter how hard
9 we try to make this as easy as possible, it's still tough
10 stuff.

11 All right. Everybody doing okay?

12 GRAND JURY FOREPERSON: Okay.

13 MS. DUPRE-TOKOS: You ready?

14 THE WITNESS: Yeah.

15 MR. NOEL: Yep.

16 BY MS. DUPRE-TOKOS:

17 Q. Okay. Exhibit 917.

18 [Exhibit No. 917 was identified.]

19 THE WITNESS: Is a death certificate for Gerald
20 Rodrigues.

21 Q. And what's that listed case number?

22 A. 18-19562.

23 Q. And does it list a manner of death?

24 A. Yes. Accident.

25 Q. What is the description of how the injury
26 occurred?

1 A. He's a victim of wildfire.

2 Q. And what's listed as the immediate cause of
3 death?

4 A. Fire-related injuries.

5 Q. And how was Mr. Rodrigues identified?

6 A. He was identified by DNA.

7 Q. And Exhibit 918.

8 [Exhibit No. 918 was identified.]

9 THE WITNESS: It's a death certificate for Frederick
10 Salazar.

11 BY MS. DUPRE-TOKOS:

12 Q. What's the case number listed on death
13 certificate?

14 A. 18-19617.

15 Q. And is a manner of death listed?

16 A. Yes. Accident.

17 Q. What's the description of how the injury
18 occurred?

19 A. He was a victim of wildfire.

20 Q. What is listed as the immediate cause of death?

21 A. Fire-related injuries.

22 Q. And how was Mr. Salazar identified?

23 A. He was identified by odontology.

24 Q. And Exhibit 919.

25 [Exhibit No. 919 was identified.]

26 THE WITNESS: It's a death certificate for Phyllis

1 Salazar.

2 BY MS. DUPRE-TOKOS:

3 Q. And what is the case number that is listed on the
4 death certificate?

5 A. 18-19595.

6 Q. And is the death certificate list a manner of
7 death?

8 A. Yes. Accident.

9 Q. And does it give a description of how the injury
10 occurred?

11 A. Yes. She was a victim of wildfire.

12 Q. And what's listed as the immediate cause of
13 death?

14 A. Fire-related injuries.

15 Q. And how was Ms. Salazar identified?

16 A. She was identified by DNA.

17 Q. Exhibit 920.

18 [Exhibit No. 920 was identified.]

19 THE WITNESS: Death certificate for Sheila Santos.

20 BY MS. DUPRE-TOKOS:

21 Q. And what's the listed case number?

22 A. 18-19536.

23 Q. And is there a manner of death listed?

24 A. Yes. Accident.

25 Q. What's the description of how the injury
26 occurred?

1 A. She's a victim of wildfire.

2 Q. What's listed as the immediate cause of death?

3 A. Fire-related injuries.

4 Q. And how was Ms. Santos identified?

5 A. She was identified by DNA.

6 Q. Exhibit 921.

7 [Exhibit No. 921 was identified.]

8 THE WITNESS: It's a debt certificate for Ronald
9 Schenk.

10 BY MS. DUPRE-TOKOS:

11 Q. And what's the case number listed on the death
12 certificate?

13 A. 18-19679.

14 Q. And is a manner of death listed on the death
15 certificate?

16 A. Yes. Accident.

17 Q. And what's the description of how the injury
18 occurred?

19 A. He's a victim of wildfire.

20 Q. What's listed as the immediate cause of death?

21 A. Fire-related injuries.

22 Q. And how was Mr. Schenk identified?

23 A. He was identified by DNA.

24 Q. Exhibit 922.

25 [Exhibit No. 922 was identified.]

26 THE WITNESS: Death certificate for Berniece Schmidt.

1 BY MS. DUPRE-TOKOS:

2 Q. What's the case number listed on the death
3 certificate?

4 A. 18-19865.

5 Q. Is a manner of death listed?

6 A. Yes. Accident.

7 Q. And what's the description of how the injury
8 occurred?

9 A. She's a victim of wildfire.

10 Q. What's listed as the immediate cause of death?

11 A. Fire-related injuries.

12 Q. And how was Ms. Schmidt identified?

13 A. Ms. Schmidt was identified by DNA.

14 Q. Exhibit 923.

15 [Exhibit No. 923 was identified.]

16 THE WITNESS: It's a death certificate for John
17 Sedwick.

18 BY MS. DUPRE-TOKOS:

19 Q. What's the case number listed on the death
20 certificate?

21 A. 18-19699.

22 Q. Is the manner of death listed on the death
23 certificate?

24 A. Yes. Accident.

25 Q. And what's the description of how the injury
26 occurred?

1 A. He was a victim of wildfire.

2 Q. What's listed as the immediate cause of death?

3 A. Fire-related injuries.

4 Q. How was Mr. Sedwick identified?

5 A. He was identified by DNA.

6 Q. Exhibit 924.

7 [Exhibit No. 924 was identified.]

8 THE WITNESS: It's a death certificate for Don
9 Shores.

10 BY MS. DUPRE-TOKOS:

11 Q. What case number is listed on the death
12 certificate?

13 A. 18-19704.

14 Q. And I have a typo on my slide. I apologize. Is
15 a manner of death listed on the death certificate?

16 A. Yes. Accident.

17 Q. What's the description of how the injury
18 occurred?

19 A. He's a victim of wildfire.

20 Q. What's listed as the immediate cause of death?

21 A. Fire-related death.

22 Q. And how was Mr. Shores identified?

23 A. He was identified by DNA.

24 Q. Okay. Do you know if there is -- an amendment
25 pending for Mr. Shores' death certificate?

26 A. Yes.

1 Q. Okay. So I don't have an error on this
2 PowerPoint. What is sought to be corrected on that death
3 certificate?

4 A. The case number needs to be changed to the
5 correct case number.

6 Q. So what is the correct case number?

7 A. The correct case number, I believe, should be
8 705.

9 Q. Okay.

10 A. And his wife -- him and his wife currently share
11 the same case number. That's why the amendment is being
12 made to adjust Mr. Shores' to 705.

13 Q. Okay. And that amendment is in process --

14 A. In process.

15 Q. -- as you described previously?

16 A. Yes.

17 Q. So Exhibit 925.

18 [Exhibit No. 925 was identified.]

19 THE WITNESS: Is Mr. Shores' wife, Kathy Shores.

20 BY MS. DUPRE-TOKOS:

21 Q. What is the case number listed on that death
22 certificate?

23 A. 18-19704.

24 Q. Okay. So the -- that's where you said they had
25 the same case number?

26 A. Correct.

1 Q. But is that the correct case number for
2 Mrs. Shores?

3 A. Yes.

4 Q. And does that death certificate list a manner of
5 death?

6 A. Yes. Accident.

7 Q. And what's the description of how the injury
8 occurred?

9 A. She's a victim of wildfire.

10 Q. What's listed as the immediate cause of death?

11 A. Fire-related injuries.

12 Q. And how was Mrs. Shores identified?

13 A. She was identified by DNA.

14 Q. Exhibit 926.

15 [Exhibit No. 926 was identified.]

16 THE WITNESS: It's a death certificate for Judith
17 Sipher.

18 BY MS. DUPRE-TOKOS:

19 Q. What case number is listed on the death
20 certificate?

21 A. 18-19948.

22 Q. Is the manner of death listed?

23 A. Yes. Accident.

24 Q. What's the description of how the injury
25 occurred?

26 A. She was a victim of wildfire.

1 Q. What's listed as the immediate cause of death?

2 A. Fire-related injuries.

3 Q. And how was Ms. Sipher identified?

4 A. She was identified by circumstantial evidence.

5 Anthropology described her as an older female adult. She
6 lived alone at the address where she was -- where the
7 remains were found, and she had not been heard of -- heard
8 from since the day the fire began.

9 Q. And did she have a vehicle?

10 A. Yes. And her vehicle was also at the address.

11 Q. Okay. Going to Exhibit 927.

12 [Exhibit No. 927 was identified.]

13 THE WITNESS: It's a death certificate for Russell
14 Stewart.

15 BY MS. DUPRE-TOKOS:

16 Q. And what case number is listed on the death
17 certificate?

18 A. 18-19546.

19 Q. And is there a manner of death listed?

20 A. Yes. Accident.

21 Q. And what's the description of how the injury
22 occurred?

23 A. He's a victim of wildfire.

24 Q. What's listed as immediate cause of death?

25 A. Fire-related injuries.

26 Q. And how was Mr. Stewart identified?

1 A. He was identified by DNA.

2 Q. Exhibit 928.

3 [Exhibit No. 928 was identified.]

4 THE WITNESS: It's a death certificate for Victoria
5 Taft.

6 BY MS. DUPRE-TOKOS:

7 Q. What case number is listed on the death
8 certificate?

9 A. 18-19633.

10 Q. And does the death certificate list a manner of
11 death?

12 A. This one is pending.

13 Q. So would the description of how the injury
14 occurred and the immediate cause of death also be pending?

15 A. Yes.

16 Q. Is there an amendment?

17 A. Yes.

18 Q. Does the amendment list the manner of death?

19 A. Yes. Accident.

20 Q. And does the amendment list a description of how
21 the injury occurred?

22 A. Yes. She was a victim of wildfire.

23 Q. And does the amendment list the immediate cause
24 of death?

25 A. Fire-related injuries.

26 Q. And how was Ms. Taft identified?

1 A. She was identified by DNA.

2 Q. Exhibit 929.

3 [Exhibit No. 929 was identified.]

4 THE WITNESS: Is a death certificate for Shirlee
5 Teays.

6 BY MS. DUPRE-TOKOS:

7 Q. What case number is listed on the death
8 certificate?

9 A. 18-19712.

10 Q. Is a manner of death listed?

11 A. Yes. Accident.

12 Q. What is the description of how the injury
13 occurred?

14 A. She's a victim of wildfire.

15 Q. What's listed as the immediate cause of death?

16 A. Fire-related injuries.

17 Q. How was Ms. Teays identified?

18 A. She was identified by DNA.

19 Q. Exhibit 930.

20 [Exhibit No. 930 was identified.]

21 THE WITNESS: Death certificate for Joan Tracy.

22 BY MS. DUPRE-TOKOS:

23 Q. What case number is listed on the death
24 certificate?

25 A. 18-19669.

26 Q. Is a manner of death listed on the death

1 certificate?

2 A. This one is pending.

3 Q. Are the description of how the injury occurred
4 and immediate cause of death also pending?

5 A. Yes.

6 Q. Is there an amendment?

7 A. Yes.

8 Q. Does the amendment list the manner of death?

9 A. Yes. It was an accident.

10 Q. Does the amendment list a description of how the
11 injury occurred?

12 A. Yes. She was a victim of wildfire.

13 Q. Does the amendment list an immediate cause of
14 death?

15 A. Yes. Fire-related injuries.

16 Q. And how was Ms. Tracy identified?

17 A. She was identified by odontology.

18 Q. Exhibit 931.

19 [Exhibit No. 931 was identified.]

20 THE WITNESS: It's a death certificate for Ellen
21 Walker.

22 BY MS. DUPRE-TOKOS:

23 Q. What's the case number listed?

24 A. 18-19532.

25 Q. Is the manner of death listed on that death
26 certificate?

1 A. Yes. Accident.

2 Q. What's the description of how the injury
3 occurred?

4 A. She was a victim of wildfire.

5 Q. What's listed as the immediate cause of death?

6 A. Fire-related injuries.

7 Q. And how was Ms. Walker identified?

8 A. She was identified by DNA.

9 Q. Exhibit 932.

10 [Exhibit No. 932 was identified.]

11 THE WITNESS: Death certificate for Donna Ware.

12 BY MS. DUPRE-TOKOS:

13 Q. And what case number is listed on the death
14 certificate?

15 A. 18-19725.

16 Q. Is a manner of death listed?

17 A. This one is pending.

18 Q. And so is it also pending the description of how
19 the injury occurred and the immediate cause of death?

20 A. Yes.

21 Q. Is there an amendment?

22 A. Yes.

23 Q. Does the amendment list a manner of death?

24 A. Yes. Accident.

25 Q. And does the amendment list a description of how
26 the injury occurred?

1 A. Yes. She's a victim of wildfire.

2 Q. Does the amendment list an immediate cause of
3 death?

4 A. Yes. Fire-related injuries.

5 Q. And how was Ms. Ware identified?

6 A. She was identified by odontology.

7 Q. Exhibit 933.

8 [Exhibit No. 933 was identified.]

9 THE WITNESS: Is a death certificate for Isabel Webb.
10 MS. DUPRE-TOKOS:

11 Q. What case number is listed on the death
12 certificate?

13 A. 18-19754.

14 Q. Is a manner of death listed?

15 A. Yes. Accident.

16 Q. What's the description of how the injury
17 occurred?

18 A. She's a victim of wildfire.

19 Q. What's listed as the immediate cause of death?

20 A. Fire-related injuries.

21 Q. And how was Ms. Webb identified?

22 A. She was identified by circumstantial evidence.

23 Q. What's the circumstantial evidence?

24 A. According to anthropology, she was a mid to older
25 adult. The victim lived alone at the address, and there
26 was mail for the victim in that mailbox.

1 Q. Exhibit 934.

2 [Exhibit No. 934 was identified.]

3 THE WITNESS: It's a death certificate for Marie
4 Wehe.

5 BY MS. DUPRE-TOKOS:

6 Q. And what's the case number listed on the death
7 certificate?

8 A. 18-19537.

9 Q. Is there a manner of death listed on this death
10 certificate?

11 A. It's pending.

12 Q. So are the description of how the injury occurred
13 and the immediate cause of death also pending?

14 A. Yes.

15 Q. And is there an amendment?

16 A. There are two.

17 Q. There are two?

18 A. Yes.

19 Q. What does the first amendment correct?

20 A. The first amendment corrects the last name of her
21 mother.

22 Q. And what does the -- does the second amendment
23 list a manner of death?

24 A. Yes. Accident.

25 Q. Does the second amendment give a description of
26 how the injury occurred?

1 A. Yes. She's a victim of wildfire.

2 Q. What does the second amendment list as the
3 immediate cause of death?

4 A. Fire-related injuries.

5 Q. And how was Ms. Wehe identified?

6 A. She was identified by DNA.

7 Q. Exhibit 935.

8 [Exhibit No. 935 was identified.]

9 THE WITNESS: Death certificate for Kimberly Wehr.
10 BY MS. DUPRE-TOKOS:

11 Q. What's case number is listed on the death
12 certificate?

13 A. 18-19627.

14 Q. And does the death certificate list a manner of
15 death?

16 A. This one is pending.

17 Q. Is the description of how the injury occurred and
18 the immediate cause of death also pending?

19 A. Yes.

20 Q. Is there an amendment?

21 A. Yes.

22 Q. Does the amendment list the manner of death?

23 A. Yes. Accident.

24 Q. What is the description of how the injury
25 occurred?

26 A. She's a victim of wildfire.

1 Q. What's listed as the immediate cause of death?

2 A. Fire-related injuries.

3 Q. And how was Ms. Wehr identified?

4 A. She was identified by DNA.

5 Q. And Exhibit 936.

6 [Exhibit No. 936 was identified.]

7 THE WITNESS: It's a death certificate for David
8 Young.

9 BY MS. DUPRE-TOKOS:

10 Q. What case number is listed on the death
11 certificate?

12 A. 18-19541.

13 Q. Does the death certificate list a manner of
14 death?

15 A. This one is pending.

16 Q. Is the description of how the injury occurred and
17 the immediate cause of death also pending?

18 A. Yes.

19 Q. Is there an amendment.

20 A. Yes.

21 Q. Does the amendment list the manner of death?

22 A. Yes. Accident.

23 Q. Does the amendment give a description of how the
24 injury occurred?

25 A. Yes. He's a victim of wildfire.

26 Q. And does the amendment list an immediate cause of

1 death?

2 A. Yes. Fire-related injuries.

3 Q. How was Mr. Young identified?

4 A. He was identified by DNA.

5 MS. DUPRE-TOKOS: And that is it. Does anyone have
6 any questions?

7 GRAND JUROR NUMBER FOUR: Yeah, I -- a whole bunch of
8 these are way out of order. I mean, I got lost because
9 you -- I don't see where you did Donna Ware or Ellen
10 walker.

11 MS. DUPRE-TOKOS: We did those.

12 GRAND JUROR NUMBER TWO: We did. They're just not in
13 order in the PowerPoint for some reason. In our
14 PowerPoint, they're in different locations.

15 GRAND JUROR NUMBER FOUR: Yeah, that's what I was
16 saying.

17 GRAND JUROR NUMBER TWO: They're not perfectly in
18 order.

19 MS. DUPRE-TOKOS: Oh, it looks like the pages got out
20 of order but all the pages are numbered so you get them.

21 GRAND JUROR NUMBER FOUR: Yeah, I know. My pages are
22 in order. I -- that's all right if you went over them, I
23 guess, I must have missed them. What about Isabel Webb?

24 MS. DUPRE-TOKOS: We did Ms. Webb. So do we need to
25 get you guys a new PowerPoint? No?

26 GRAND JUROR NUMBER TWO: No, we just know that

1 they're not in perfect order. She numbered them. They're
2 there.

3 GRAND JUROR NUMBER EIGHT: They were fine for me when
4 I grabbed the top copy. No, she handed them to me and it
5 came out just fine for me.

6 MS. DUPRE-TOKOS: Maybe some of them just got mixed
7 up.

8 GRAND JUROR NUMBER TWO: Yeah, they're just moved out
9 of order.

10 GRAND JUROR NUMBER FOUR: All right.

11 MS. DUPRE-TOKOS: We apologize for that.

12 Were there any other questions? No. Okay. I
13 guess we just need the admonition.

14 GRAND JURY FOREPERSON: Okay.

15 Investigator Celentano, you are admonished not to
16 discuss or disclose, at any time outside of this jury
17 room, the questions that have been asked of you or your
18 answers until authorized by this grand jury or the court.

19 A violation of these instructions on your part
20 may be the basis for a charge against you of contempt of
21 court. This does not preclude you from discussing your
22 legal rights with your own attorney.

23 Investigator Celentano, what I have just said is
24 a warning not to discuss this case with anyone except the
25 court, your lawyer or the district attorney.

26 Do you have any questions?

1 THE WITNESS: No.

2 GRAND JURY FOREPERSON: Okay. Thank you for your
3 time.

4 THE WITNESS: Thank you.

5 MR. NOEL: All right. This went quicker than we
6 expected. That's all the evidence that we have scheduled
7 for today. So we're going to get an early day. It's
8 right on noon.

9 Most of you will get an early day. A couple of
10 your members still have a lot of work to do. They're
11 going to be here for a while processing, because I think
12 we put in over a hundred exhibits today that all need to
13 be processed. So they'll be here for a while.

14 Upcoming, on Tuesday, there's no way to -- to
15 pussyfoot around this, it's going to be a difficult day.
16 We will be hearing mostly on Tuesday from the chief
17 forensic pathologist from the Sacramento Coroner's Office
18 that is going to be talking about autopsies. And I don't
19 expect that we're going to have any pictures. It's going
20 be very dry.

21 MS. DUPRE-TOKOS: It'll be very similar to --

22 MR. NOEL: Yes.

23 MS. DUPRE-TOKOS: -- what the PowerPoint that was
24 today.

25 MR. NOEL: He's going to be going through all of the
26 autopsies and essentially giving opinions on how, why each

1 person died. So it's going to be very difficult.

2 MS. DUPRE-TOKOS: We also have one other witness.

3 MR. NOEL: Yes. I said it over and over and over
4 again the last couple of weeks, we are trying to do the
5 absolute minimum on the death evidence to prove the deaths
6 and not have to subject you guys to anything more than --
7 than the minimum.

8 That being said, the toughest of the evidence --
9 the toughest category of the death evidence is what we
10 call the proof-of-life evidence, and we heard a little bit
11 come out this morning. The hearsay that we already talked
12 about at the break. The young man who told the sheriff's
13 department he was talking with his grandmother on the
14 phone that morning. That is the -- what is considered the
15 proof-of-life evidence. Some people -- the proof-of-life
16 is going to be how they were found, how they died. People
17 in cars. People in --

18 MS. DUPRE-TOKOS: Outside.

19 MR. NOEL: -- outside. But for some of these people
20 that died in their homes, we have to prove that they were
21 alive on the morning of November 8th. So Tuesday, you are
22 also going to hear your very first proof-of-life evidence
23 witness. You're going to hear a recording of one of the
24 deceased who was speaking with her brother on that morning
25 and encouraging him to evacuate. It's going to be
26 difficult.

1 As I said, we are trying to do this in the most
2 sensitive, easiest manner possible. And even then, some
3 of this stuff is still very difficult. So we can -- kind
4 of leading up to this -- and you guys have kind of started
5 getting used to it. I think, you know, the first day, the
6 death evidence really affected a lot of you, and with each
7 day and each witness, it seems to get a little bit easier.
8 Now, it's going to step up a little bit. So be ready for
9 it. Be prepared and know what to expect.

10 Like I said, it's okay to be a bunch of Captain
11 Kirks right now. As long as later on, you can all become
12 Spock and get rid of all of that emotion and all of that
13 anger. Everybody okay?

14 Madam Foreperson?

15 GRAND JURY FOREPERSON: Okay. We're done for the
16 day.

17 MR. NOEL: We're done for the day.

18 GRAND JURY FOREPERSON: Okay. So we will be back on
19 Tuesday at 8:30. See you then. Thank you.

20 [Matter adjourned at 12:02 P.M.]

1 OROVILLE, BUTTE COUNTY, CALIFORNIA

2 JANUARY 28, 2020; 8:52 a.m.

3 (Confidential Special Grand Jury Hearing Proceedings)

4
5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 [Witness enters the courtroom.]

10 MR. NOEL: Up there (indicating).

11 MS. DUPRE-TOKOS: And you can move the exhibits
12 wherever you want them.

13 THE WITNESS: Thank you.

14 GRAND JURY FOREPERSON: And, Dr. Tovar, before
15 you have a seat, would you please raise your right hand
16 to be sworn.

17 Dr. Tovar, do you solemnly swear that the
18 evidence you shall give in this matter pending before the
19 grand jury shall be the truth, the whole truth, and
20 nothing but the truth so help you God?

21 THE WITNESS: Yes, I do.

22 GRAND JURY FOREPERSON: Thank you. Have a seat.

23 THE WITNESS: Thank you.

24 **EXAMINATION**

25 BY MS. DUPRE-TOKOS:

26 Q. Good morning.

1 A. Good morning.

2 Q. Could you please state your name and spell your
3 last name for the record.

4 A. Jason Tovar, T-o-v-a-r.

5 Q. And where are you employed and in what capacity?
6 What's your title?

7 A. I work for the Sacramento County Coroner's
8 Office. I'm the chief forensic pathologist there.

9 Q. Okay. And what does that mean? What is a
10 forensic pathologist?

11 A. A forensic pathologist is a doctor of pathology
12 who specializes in forensics. And my primary goal is to
13 determine the cause of death of an individual.

14 [Exhibit 1055 introduced
15 as evidence.]

16 BY MS. DUPRE-TOKOS:

17 Q. I put up on the screen your CV. And I don't
18 know -- I did not see that in there. So we are going to
19 have to make sure that a copy is there. But you're
20 welcome to stand up if you need to read the screen.

21 Could you go through your education and training
22 for us.

23 A. Sure. Following my undergrad at Fresno State
24 University I went to medical school at the University of
25 California in San Diego, completed medical school there,
26 went into pathology at Harvard UCLA Medical Center for my

1 residency followed by a year in general pathology as a
2 fellowship at the same location.

3 I did two years as a pediatric pathologist in
4 training in a fellowship at Children's Hospital in Los
5 Angeles in addition to a one-year fellowship in forensic
6 pathology at the coroner's office in Los Angeles.

7 I have board certification in anatomic clinical
8 and forensic pathology and I hold an active license in
9 the state of California to practice medicine.

10 Q. And it also says that you're trained in medical
11 death investigations?

12 A. I completed a course during my fellowship
13 training at the coroner's office in Los Angeles, went to
14 a dedicated course in that training, yes.

15 Q. And then could you briefly go through your
16 experience for us, your work experience after you left
17 your residency and your fellowship.

18 A. I have been employed at the Sacramento County
19 Coroner's Office for almost seven years now since 2013.

20 Q. Okay. And how long have you been the chief
21 forensic pathologist there?

22 A. Almost -- about two and a half years.

23 Q. And then in your CV we also see your
24 professional memberships as well as lectures you've given
25 and then your bibliography. And then it looks like you
26 have been fairly extensively published in peer review

1 journals as well as non-peer journals. Is that accurate?

2 A. Yes.

3 Q. And then it looks also like you've done a lot of
4 presentations. What is a poster session?

5 A. A poster session is a way to put out some
6 preliminary information on research that's being done in
7 topics that you have identified. In my case, I have a
8 number of those just from during general pathology
9 training and pediatric training.

10 You identify a case you want to put out some
11 information on the specific topic. And it's -- it's not
12 a formal paper. It's an abstract you submit to the
13 committees to the society for the meeting that you're
14 going to and you create a poster in essence that's just
15 hanging on the wall. And you hang out and let the people
16 come and talk to you about it.

17 Q. Okay. So were you involved in conducting
18 autopsies of victims of the Camp Fire that started in
19 Butte County on November 8, 2018?

20 A. Yes, I was.

21 Q. Okay. And how did you come to be involved?

22 A. We were contacted by the sheriff's office here
23 in Butte. They contacted our coroner Kim Gin who -- to
24 ask for help. There was going to be unknown at that time
25 initially how many victims were involved. There was a
26 large number that were being reported, of course. So

1 they reached out to us for assistance since we have a
2 number of pathologists, forensic pathologists that could
3 assist in the autopsies and examinations of these
4 individuals.

5 They needed a facility that could house the
6 number of people that were coming, staff, et cetera. So
7 we were looked to for that assistance. We are kind of
8 this region's mutual aid center as well. So when there's
9 a mass disaster of such, we would be called to arms.

10 Q. So the sheriff's department contacted the
11 coroner and then they contacted you. And did you put a
12 team together or was it just the usual staff and you kind
13 of gave everyone the heads up? How did that work?

14 A. Yeah, pretty much that. I got a call from the
15 coroner general stating "We're being asked to assist in
16 this matter. There's a number of individuals and can you
17 call the staff to see if they can come in on the
18 weekends."

19 It's our normal operating procedure for the
20 doctors not to work on weekends. And so I rallied the
21 troops, and they showed up on Saturday.

22 Q. Okay. You called this a mass disaster. What
23 exactly is that or generally?

24 A. In general it's just a situation where there's
25 an excessively large number of -- an incident where -- a
26 mass disaster in itself is when some event happens that

1 can overwhelm the usual operating system. And so a
2 hurricane, a fire, something like that. You know, a
3 global nature that is going to take out cities and towns
4 is a mass disaster. There are some problems. And
5 FEMA --

6 You know, words and stuff. I don't know all the
7 details of that, but it's just anything that's going to
8 potentially overwhelm the usual system and will allow for
9 certain things to come into play; mutual aid, assistance
10 from federal government, and so forth. And this would
11 have been also a mass casualty incident.

12 Q. Okay. And that would mean a large number of
13 casualties?

14 A. A large number, yeah.

15 Q. Okay. Did you need to develop a protocol for
16 this mass casualty incident in terms of how to conduct
17 the autopsies, how to do IDs, basically how to do
18 everything?

19 A. We've had to come up with some modifications.
20 We have a mass disaster plan in place for mass
21 casualties. We just had some training, for example, like
22 in an airport disaster. Of course, that doesn't pertain,
23 but so we had some documents in play. We had some
24 protocols and sequencing of how we wanted to do things
25 that pretty much went out the door.

26 Q. Why?

1 A. Because we didn't know what to expect. Fire
2 deaths bring a lot of different possibilities, but the --
3 it was the -- the way that the remains came in that
4 really just kind of threw all normalcy, if you will. If
5 you can imagine an autopsy and examination pretty much
6 out the door and you had to rely on "Okay. Here's what
7 we need to do" and come up with some on-the-fly aspects.

8 Q. And is that because there were very few whole
9 bodies and lots of, I guess, charred remains? And I'm
10 probably not using the right terms, but in laymen's terms
11 charred remains. Is that what the difference was?

12 A. Yes, for the most part. I mean, we had some --
13 some more intact individuals. We had partial bodies and
14 then we had bones and debris.

15 And, you know, I didn't know what to expect.
16 For example, we're going to have all these individuals.
17 We showed up on that weekend, and I go to my station to
18 begin my exam and I have boxes and buckets and bags of an
19 individual. You know, not a normal situation. So we had
20 to decide "What are we going to do with this?"

21 And, you know, each case you had to -- we
22 started to find a pattern that we could do. And so then
23 that kind of on the fly created the sequencing of events
24 that we were going to do with each individual.

25 Q. And did you still try to -- to the extent
26 possible still follow your standard autopsy procedures?

1 A. We did for the most part. There would be some
2 things that would still remain in place. You know, you
3 have an individual -- you know, with fire victims there
4 are certain things that we would do normally in the
5 course of working up an individual that was involved in a
6 fire. Where we could do the bulk of that we did, where
7 we had to modify it a little bit we did. So we just
8 adapted as we went.

9 Q. Now, I'm sure you're familiar with CSI and what
10 a lot of us in law enforcement call the CSI effect. And
11 that's where on TV they get the tiniest fragment of bone
12 and within minutes they have a complete DNA profile and
13 an identification.

14 Did you do that?

15 A. Yes and no actually.

16 Q. Okay. Can you explain.

17 A. Yeah. This -- this -- we were able to actually
18 use a rapid DNA process that is -- was the first time it
19 was ever used in this type of situation in a mass
20 disaster and mass casualties. The technology for DNA has
21 come a long way. It does take a very, very long time and
22 routine practice to get results from DNA. However, this
23 allowed us to actually get within about two hours a
24 profile that could then be matched to a family member or
25 other profiles to say "This is the likely
26 identification."

1 So, yes, we did get it. Not in 20 minutes but
2 we did get -- we were able to obtain IDs or profile --
3 DNA profiles for these individuals fairly quickly and
4 being able to use these bones. So it was technology that
5 has been now employed in numerous situations and has
6 really good results.

7 So, yes. I mean, that technology -- we're not
8 there in 20 minutes or in a half hour show or an hour CIS
9 show, but it -- the technology is moving in that
10 direction. So we were able to do that very quickly, yes.

11 Q. Okay. How did you and your team approach
12 determining the cause of death?

13 A. The cause -- to determine a cause of death you
14 have to take in the totality of the situation and what
15 the body is even showing. So we had to go through those
16 on-the-fly attempts to figure out things, modifying those
17 things, and come to a consensus there.

18 [Exhibit 1056 introduced
19 as evidence.]

20 THE WITNESS: This is a flowchart, if you will,
21 of what we did in order to try to make sure we were
22 capturing every element possible with every decedent.
23 You know. So we would start with our examination from
24 the pathologist. We'd get information from the scene,
25 we'd get information from the investigation, Butte County
26 coroner's office, or the recovery aspects of it.

1 So we had some information, and we would take
2 that and put it into play. We'd start with us examining
3 the body, the remains, or whatever it was and then step
4 wise and move forward. So we would go from our
5 examination to we would look at the remains, kind of
6 separate things out from what was human and nonhuman and
7 debris from any buildings or anything like that that may
8 be there.

9 We would do x-rays looking for any -- to make
10 sure that there wasn't, you know, something else going
11 on. You know. If we start to find a projectile or a
12 bullet with these remains, we'd have to worry about that.
13 I don't think we found any of that.

14 But so we would -- and part of the pathology
15 exam we would look at the remains, separate things out,
16 sort things, try to make some sense of what we had, then
17 go to x-ray and x-ray those remains as just the standard
18 operating procedure.

19 Because this is an undetermined cause of death
20 at the moment, we don't know really what's going on. We
21 don't know who this individual is. It would help us to
22 identify an x-ray, for example, a prosthesis, medical
23 implantations, things that might help in aiding
24 identification.

25 Then once we were done with that portion of it
26 and doing as much as we could in looking for tissues and

1 things to look for toxicology or DNA, it would move onto
2 the anthropologist. The anthropologist would come in and
3 look at it. "Okay. We have one individual or we have
4 three individuals in this set of remains, two
5 individuals. We think that there's this or --"

6 And so then it would come back to us. We would
7 say "Okay. Well, what do we need to do here?" Now we
8 need to separate these two out the best we can with the
9 anthropologist.

10 If there were teeth, we could use that for
11 odontology. So we had separated those out trying to see
12 if it's one individual or not. Again, we had our DNA.
13 We have profiles. And then, you know, the arrows are in
14 one direction, but those arrows go back and forth and
15 back and forth. And it went on for a while because we
16 would identify new things at each step of the way that
17 would have to bring it back to the pathologist.

18 So once we got all that information together, we
19 were able to go forward and say what we think the reason
20 that this individual passed away and the cause of death
21 in that.

22 BY MS. DUPRE-TOKOS:

23 Q. Now, did you and your team, I guess, essentially
24 settle on standards or terms of cause --

25 MR. NOEL: Jen, back up. You need to identify
26 it.

1 MS. DUPRE-TOKOS:

2 Q. Oh, I'm sorry. And that's Exhibit 1056, the
3 flowchart.

4 A. Yes.

5 Q. And then looking --

6 MR. NOEL: You've been referring to 1056, the
7 flowchart between pathology, anthropology, odontology,
8 and DNA; correct?

9 THE WITNESS: Correct, yes.

10 MR. NOEL: All right.

11 [Exhibit 1057 introduced
12 as evidence.]

13 MS. DUPRE-TOKOS:

14 Q. And then looking at Exhibit 1057, did you and
15 your team settle on standard terms for cause of death if
16 they applied just so that everyone would be using the
17 same nomenclature or guidelines?

18 A. Yes, we did. We tried to come up with some
19 standard language to use so that we would all be kind of
20 consistent. You know, we didn't want to have a whole
21 bunch of -- we had six or so pathologists. They could
22 all come up with different language to use if we let them
23 if we did that.

24 So we decided let's try to come up with
25 something that would help to provide some uniformity to
26 the diagnosis but in addition also lend some information

1 about to the state of the remains, the ability to
2 identify certain things or not.

3 So as you can see in this -- from this exhibit
4 here 1057 that we -- not every decedent or/and body was
5 going to allow for every possible test that we were going
6 to use that is standard in the usual practice of a
7 fire-related death.

8 There are certain things with toxicology that we
9 do. We always want to do carbon monoxide testing. We
10 want to do any other ancillary tox that we can do on
11 these individuals. And we want to examine, if possible,
12 the airways, the larynx, the trachea, and the lungs to
13 look for evidence of smoke inhalation, soot in the
14 airway, kind of that dark stuff that you see on your
15 chimney. The black stuff also deposits within the
16 airways.

17 So if we could see that, it would provide
18 evidence to help support whether or not maybe somebody
19 was alive during the fire and breathing in smoke.

20 A lot of our cases didn't fulfill any of those
21 criteria. So we needed something to try to relate that.
22 So if we were able to perform toxicology testing on a
23 sample of liquid blood from the decedent, caked blood,
24 blood that had been kind of congealed due to heat and
25 fire, or tissue, we wanted to -- we wanted to do a CO
26 test.

1 In those cases where we didn't have any of that
2 but we had more intact individuals, more soft tissues,
3 maybe we did see soot in the airways, but we didn't -- it
4 was limited because we didn't have any blood products or
5 other things to test for that. We would use the middle
6 one there (indicating) thermal injuries.

7 The top one -- if we could prove that there was
8 smoke inhalation and/or an elevation of the
9 carboxyhemoglobin, the CO in the blood or tissues, we'd
10 be able to use that top line there "Inhalation of
11 products of combustion" and then whether or not we saw
12 injuries due to fire.

13 Most cases ended up being fire-related injuries
14 because we just had low -- not a lot of soft tissues. We
15 didn't have anything to test. And so most of them fell
16 into that category down below.

17 So it just kind of added to being able to
18 describe with some uniformity in addition to some
19 description about what the remains consisted of.

20 Q. Okay. And then you just mentioned
21 carboxyhemoglobin. What is that?

22 A. That is the product that is created when carbon
23 monoxide binds to the hemoglobin molecule in the blood.
24 Hemoglobin carries oxygen usually. But when you're
25 exposed to carbon monoxide, that also binds to that and
26 displaces the oxygen and that's how you become toxic

1 because you can't deliver oxygen to the tissues. So it's
2 a product of you inhaling carbon monoxide.

3 Q. So is that how it's a factor in determining
4 cause of death and if someone was alive at the time of
5 the fire? Because it bonded to the carbon monoxide or --

6 A. To the hemoglobin, yes. So it helps to aid --
7 it's a finding that could aid in the identification.

8 Very few cases had liquid blood meaning that the
9 blood was still in fluid form where there's an
10 interpretation that could be -- there is a finding that
11 could be better interpreted.

12 The toxicologies come back on these individuals
13 where we sent stuff. And when there's a liquid
14 component, there's good correlation to the number, the
15 actual quantity that they've identified of
16 carboxyhemoglobin. That can be constrapulated out and
17 given a percentage; 10, 12, 20, 30, 40, 50, 60 percent.
18 Okay.

19 And that has meaning in itself because we know
20 that at certain concentrations, it becomes toxic and
21 lethal. And by finding that level in that particular
22 liquid component, we're able to say "This person was
23 inhaling carbon monoxide and the blood was becoming
24 saturated with it and that would lead to toxicity. It's
25 also an indicator that that person was alive at the time
26 that the fire was burning because they're breathing it

1 in.

2 The problem that we faced in this case was that
3 much of the blood that we have was actually congealed and
4 caked. And that brings about problems because the actual
5 fluidity of the blood, the liquid component of the blood,
6 the change in the composition of the blood due to the
7 heat and due to the drying doesn't lend to that easy as
8 an interpreter.

9 So we had to -- by standardized procedure we
10 would submit anything that we could because that was what
11 we decided and because we would also be able to find
12 other potential things in that. Other drugs, for
13 example, abuse, or anything else that may be in that --
14 in the blood to help decide whether this was fire-related
15 or possibly something else. And so we did it on
16 everything.

17 But the interpretation is very muddled on any
18 case that does not have that fluid component of blood.
19 And it becomes what was -- and if you see -- when you --
20 if you review these cases, in the top you'll see that
21 it's brought in as tissue. It will say "blood" but then
22 it will say "tissue." And that's because it was really
23 dried and caked and had undergone the thermal changes.

24 There is a number that is going to be associated
25 with that, but the interpretation of that number has --
26 is so difficult to understand. Any time you start moving

1 into the tissue components, the toxicologist will talk a
2 lot about different concentrations of the molecule here.
3 And it's just muddled.

4 So even though we wanted to do that to try to
5 have some uniform language, some cases where we had the
6 blood, we couldn't really jump to that conclusion to say
7 that it was evidence of inhalation of products of
8 combustion.

9 So even though we have a number and it may be a
10 little bit elevated or it may be lower, the actual
11 interpretation of that number is muddled. And whether
12 that represents an artifactual lower number or an
13 artifactually high number is also muddled. So it just
14 provides information. But it didn't really help us
15 coming to one of those particular conclusions other than
16 the fact that we couldn't definitively say that there was
17 evidence of smoke inhalation so therefore. But we had
18 something that may suggest it. So it put us into the
19 middle language there on that chart.

20 Q. I'm going to jump back a little bit and ask you
21 about the affinity of carbon monoxide to blood or
22 hemoglobin.

23 Does that question make sense?

24 A. I will paraphrase this to see if this is what
25 the question is is that you want to see which has more
26 binding affinity for hemoglobin oxygen or carbon

1 monoxide.

2 Carbon monoxide -- so let me -- maybe it's -- so
3 carbon monoxide -- the hemoglobin protein has areas that
4 allow oxygen to come in and bind to it, gets circulated
5 to the tissues. As it reaches the tissues, there's
6 certain things that happen physiologically that allow the
7 oxygen to come off and get utilized by the tissues.
8 Carbon dioxide comes in. It gets carried back to the
9 lungs. You breath it out. You breath in oxygen. And it
10 goes through there. So it binds and releases at
11 different physiologic parameters.

12 Carbon monoxide competes for the location where
13 oxygen also binds. So when you breath in carbon
14 monoxide, it actually binds to the site where oxygen
15 would normally want to go and -- but it's a poison. So
16 what happens is it actually has a higher -- it stays
17 longer and it doesn't go away.

18 So even though it reaches the tissues, it
19 doesn't come off in the tissues and it goes to the lungs.
20 And it doesn't come off there. It stays bound very
21 tightly so that now you can imagine that if you have
22 something that doesn't go away and you keep breathing,
23 it's just going to increase in concentration.

24 So, yes, it's better bound than oxygen.

25 Q. Thank you.

26 So then going back to what you were talking

1 about with the muddy interpretation, so if carbon
2 monoxide or if -- if that's a marker, if it's not there,
3 does it mean that someone didn't die from other products
4 of combustion or --

5 A. No, it doesn't. Carbon monoxide is a marker of
6 fire, if you will. I mean, it's produced when there's a
7 fire. And it's -- we know this physiology of attaching
8 and binding. So it's something that we can identify and
9 it's readily available in most labs to look for that
10 product.

11 And so when it's there, it's a great marker to
12 say, yes, this person was breathing in smoke and
13 breathing in this carbon monoxide that was created by a
14 fire if that's the circumstances of course. Then we can
15 look for that. And when we find it, it's great.

16 Sometimes though people die too quickly. You
17 know, in these fires it was hot and it was very rapid.
18 So an individual could be overcome by the fire so quickly
19 that they didn't breath in a lot of it and then suffered
20 as a consequence of burning and succumb to that.

21 There may be other things in a fire -- in a
22 house fire. Carbon monoxide isn't the only thing that
23 can be produced. There's other toxins and other gases
24 that are created that we just don't routinely test for.
25 We could, but it's -- there's just too many to really
26 make any sense of that.

1 So it's possible that even though -- even in an
2 individual who was -- has a good concentration of liquid
3 blood and we're able to get a good number and the body
4 wasn't dramatic -- you know, so altered that we couldn't
5 make some sense of it, that this person -- and there's
6 evidence that they were breathing in smoke, we have a
7 little bit of validation of carbon monoxide.

8 They're also breathing other things, other
9 toxins, and other poisons that could cause respiratory
10 problems, cardiovascular events, and so forth that we
11 just can't test for in a routine setting.

12 So there's a lot of things that could be in
13 play. So the fact that carbon monoxide isn't there or
14 isn't present, it could still be related to the fire in
15 the right circumstances and in the right setting. But we
16 just didn't test for all of those things. There's just
17 some limitations to cost. And, you know, you can't just
18 "I'm going to test for everything." You have to have a
19 reason. You know, a reasonable certainty we're going to
20 look for something that is going to give us this marker.
21 So it is possible.

22 And if they die too quickly, they may have a
23 very low level. But we look in the airway and we see
24 soot in the airway that creates burning and charring.
25 There are effects where oxygen is displaced because the
26 fire is consuming all the oxygen and now they just --

1 even though they're breathing this in or they can
2 suffocate because there's no oxygen in the air.

3 So there's a lot of other things that can come
4 about and create a low carbon monoxide in the blood.

5 Q. So would one of those other things also possibly
6 be -- you said the fire was hot, the air was hot, there
7 were all these gases in the air from things that were
8 burning. Could that cause someone's throat to close up
9 and also then prevent any or very limited amount of soot
10 in the airway and then also low carboxyhemoglobin?

11 A. Yes, that is possible. There's a lot of things
12 that the body will do in order to try to protect itself.
13 And, you know, it's -- those are mechanisms that we can't
14 account for. But that would be something that could
15 happen that you just can't breath because it's so hot and
16 you create the injury to the airways.

17 Q. Now, you talked a little bit about some of the
18 results that can come up in toxicology results. And one
19 of the things -- excuse me -- that you mentioned was
20 drugs of abuse. Is that like street drugs?

21 A. Yes.

22 Q. Okay.

23 A. Or prescription drugs. Either way.

24 Q. Oh, that's true.

25 A. Right.

26 Q. So if that comes up in the toxicology report as

1 positive for whatever drug of abuse, normally -- in more
2 standard cases does the toxicology report also often
3 include information about therapeutic levels, toxic
4 levels? Things like that?

5 A. It does, yes.

6 Q. In this case in this incident was that generally
7 included if drugs of abuse were located?

8 A. Yes. There would be -- there are some
9 limitations of course. In the fluid components of blood
10 there are these kind of normal grams, numbers that can be
11 created just like for the carbon monoxide. But when you
12 start getting into the tissue levels and certain things,
13 there are some numbers -- but again, it also becomes very
14 difficult to interpret. You know. So but there are a
15 number that may be associated with that.

16 Q. And including the drugs of abuse and things like
17 that, is that -- would that have been part of your due
18 diligence and part of running toxicology tests on, for
19 example, blood that is being -- having to be run as
20 tissue?

21 A. Yes. That would have been our standard
22 operating procedure for these to go ahead and do as much
23 toxicology as we can. You know, we wanted to include and
24 look for any other possibilities. Our goal -- remember,
25 at the end of the day our goal is to come up with why
26 this person passed away, the cause of death of this

1 individual.

2 And so the more you do, the more information
3 that you're able to get, that allows for a better
4 interpretation. Even if it is muddy, you could come to a
5 better medical opinion about "This is what I think has
6 happened."

7 Q. So, for example, is someone's toxicology came
8 back and there was meth in their system, how would you
9 determine if the meth was the cause of death or something
10 else was?

11 A. Again, we would -- this is where we would be
12 looking at the -- the totality of the particular case.
13 So if somebody came back with a drug of abuse,
14 methamphetamine or cocaine or heroin or any other
15 prescription drugs which was the case in some of these,
16 we would use everything that we had available to come to
17 a medical opinion about what we think happened.

18 They may come back with a methamphetamine level
19 that is potentially toxic, but they also have a CO carbon
20 monoxide that's toxic and they have evidence of burns on
21 their body. In that case it's like "Well, you know,
22 there is evidence that this carbon monoxide is present
23 and they're alive." And then they also have burns.

24 With reasonable medical certainty it's more
25 likely the fact that they're intoxicated on
26 methamphetamine, but they're dying with it and not from

1 it. And it's the carbon monoxide that is playing a
2 bigger role and the thermal injuries to the body that are
3 playing a bigger role in that person's death.

4 And so it's a finding, but the interpretation is
5 then based upon the pathologist's interpretation of all
6 of the data including the circumstances of the case.

7 You know, we have -- you know, people die all
8 the time intoxicated with drugs, but they were shot in
9 the head. You know, it had -- that has nothing to do
10 with their actual cause of death because they got shot in
11 the head. And the meth is -- it might be a reason that
12 they potentially got shot because they may have been
13 acting erratic or something or doing deviant behavior,
14 but that didn't really contribute in any way directly to
15 them being dead from the gunshot wound, for example.

16 So we had to look at the totality of all of
17 these cases, put things in place, and come up with that
18 medical opinion.

19 I don't believe that any of these were -- where
20 toxicology -- when there were potentially competing
21 causes of death from drugs or high levels of drugs, there
22 were none that were like "I'm going to favor that over it
23 being part of the fire." They were all related to the
24 fire in the end.

25 Q. So once you determine the cause of death, is
26 that the only thing listed on the autopsy or is there

1 other information generally listed?

2 A. So if you were to look at the -- using the first
3 page of all of these autopsy reports, you're going to see
4 a lot of information about cause of death, other
5 significant conditions, autopsy findings. And so we --
6 some have that, some don't, and some just have the cause
7 of death on the first page.

8 So Dr. Resk just puts that out in front and
9 doesn't list much else, but in our facility we do other
10 things in our report templates. So, for example, if you
11 see where it says "autopsy findings" on the front page
12 here, those are things that we seen at the time of the
13 exam. When we perform the autopsy, here's what we
14 identified. Some have more, some have less. You know.

15 But we also were looking for natural diseases.
16 We also were looking for unnatural components other than
17 the fire. So we're looking at it all because we've got
18 to come to some conclusion about what happened. So we
19 would list those various things there. That would
20 include findings of toxicology, findings of x-ray,
21 findings of the remains themselves at the time of the
22 autopsy, any natural disease where there was enough
23 organs and tissues left to make some diagnosis. And
24 those would be the autopsy findings.

25 Then we -- based on all of the assimilation of
26 everything, we came to -- the pathology would come to a

1 conclusion about what was the cause of that death. And
2 the cause of death would then try to fit into one of
3 these three language categories that we talked about
4 previously.

5 Sometimes there's a section we call other
6 significant conditions. And for death certification
7 there is actually a spot on a death certificate that
8 allows for other significant conditions. And what
9 that -- the way that that reads is that there are other
10 significant conditions -- other significant conditions
11 contributing to the cause of death but that are not
12 related to the underlying cause of death as stated above.
13 Because it's below on the death certificate it says it
14 above in line. So one of the line numbers there.

15 For example, if we have an individual that has a
16 whole bunch of natural diseases, they're treated for
17 coronary artery disease, they have histories of myocardia
18 infarction or heart attacks, they have hypertension, they
19 have diabetes, they're smokers so they have COPD,
20 they're -- they drink a lot so they have fatty liver and
21 alcohol disorder, all of these -- any one of these things
22 from a reasonable certainty could lead to somebody to
23 die. Well, we have to pick one. As a medical doctor we
24 can only list one of them as the main cause of death for
25 an individual. So we're stuck with trying to decide on
26 just one.

1 So given that history I would opine that he died
2 as a result of his underlying heart disease, his coronary
3 arteries, atherosclerosis of the heart, coronary arteries
4 de graffitis, and cardiovascular disease. However, he
5 has all these other things that are -- or she has all
6 these other conditions that are making them debilitated.
7 And they are going to contribute some way to the demise,
8 but they are not directly related to that one particular
9 entity. They have other affects on the body. You know.
10 And so they're going to contribute because they are
11 making this person much susceptible to death in general.

12 So as to this other significant condition I
13 would then make a laundry list of the other things that
14 this person had -- diabetes, hypertension, COPD -- that
15 are all going to contribute to the debility of this
16 individual, but my main reason that this person died is
17 related to just this sole entity. And so they're
18 contributing to the death, but they're not necessarily
19 related to them. So sometimes in these particular cases
20 where we had more intact individuals and we had some
21 history and we can see things at the time of autopsy --
22 at the time of the autopsy, the ultimate reason that they
23 may have passed.

24 For example, I'm looking at one here just as an
25 example. It's thermal injuries. So in that particular
26 case there was something that we couldn't show that they

1 inhaled the smoke, but we had enough evidence that there
2 was -- it was related to the burning of the body and --
3 but this person had an enlarged heart. And an enlarged
4 heart can cause somebody to die anyway. It's another
5 really strong competer, you know, for a reason for
6 somebody to die.

7 So the enlarged heart could represent a lot of
8 underlying conditions that would make this person more
9 debilitated. They would make them more susceptible to
10 death, make them more susceptible to succumb to some
11 outside stressor, but it's not related to that particular
12 stressor which in this case was the fire.

13 And so maybe there was some aberrations in the
14 toxicology and it was like, well, somebody that has
15 underlying conditions will die from a lower level of a
16 particular toxin than somebody that's really robust and
17 healthy where you need to have a higher level to reach
18 that toxicity because there's already problems with the
19 heart, maybe problems with the kidneys, problems with the
20 lungs.

21 So these are all going to be contributing person
22 from person who is on, you know, a titter-totter who's
23 "I'm over here. I'm kind of sick, and anything that's
24 going to add to that side is going to tip me over." So
25 it's going to contribute.

26 Now, that doesn't mean that it trumps the

1 underlying cause of death. It's just a factor that we're
2 using to say that somebody else could look at this and
3 say "Well, this is not that much injury due to the fire
4 and not that much high elevation of carbon monoxide."

5 Well, maybe for a robust 20-year-old athlete that may
6 not -- that -- none of that may have played a role from
7 those fire-related injuries. But in somebody that has an
8 underlying potential heart disease it's a bigger factor
9 that is going to say that that individual is more likely
10 to succumb to those particular things that were involved
11 with that individual at the time of autopsy.

12 So they're going to contribute. And so they'll
13 be some in here that you may come across that will be
14 listing different things that are there.

15 Q. I want to get into the elements of an autopsy
16 report. But before I forget, if someone was injured in
17 the fire and they were transported to Sacramento and then
18 later died in Sacramento, what would the process be?
19 Would there be an autopsy or would the coroner's office
20 be involved in any way?

21 A. Yes. The coroner's office would be involved to
22 some degree. So this -- it would be -- the reason that
23 it would be -- we at the coroner's office in Sacramento
24 would be involved is because it is a result of an
25 unnatural death. There's something that was unnatural
26 about this person's death; the burns or the fire injuries

1 or whatever was created. And so that death would
2 hopefully be reported to the coroner's office. Our --
3 and so then in our situation our coroner would get a
4 report from the hospital or the skilled nursing facility,
5 or wherever they may have been and our deputy coroner
6 would investigate the death, gather as much information,
7 say "Okay. Whoa. This is a person from Butte County.
8 They were involved in the fire. They had burns. They
9 were life-flighted to U.C. Davis or Shriners. They were
10 taken care of."

11 Okay. So depending on the situation, if
12 there's -- if that doctor -- because let's say they've
13 been in the hospital for many, many, many weeks or days
14 and the doctor at the hospital is willing to sign the
15 death certificate as, you know, complications of
16 fire-related injuries or some other wording that would
17 indicate that it's a result of that unnatural component.
18 Our office could either decide we're going to bring that
19 case in and we're going to perform an exam, an autopsy,
20 an external exam just to look at the body, or do a full
21 autopsy or say "We're going to let this doctor sign it,
22 but we're going to take jurisdiction and certify the
23 death as unnatural or as an accidental death due to the
24 fire, give it a coroner number, and not bring the body in
25 and just say that "This is a result of a fire of an
26 injury -- you know, of fire-related injury in Butte

1 County," whatever, however detailed they wanted to get in
2 their description.

3 And so there's different pathways, but it could
4 be captured. I think there were a couple where that was
5 the case. You know, the facility or the trauma center.
6 We get -- it happens with a lot of other cases as well.

7 Q. And so in the example you gave you basically get
8 all the information and then you're like "Okay. Yeah, we
9 agree with the doctor and we're going to certify that
10 cause of death." Is that essentially --

11 A. The coroner would, yes. Not myself or the
12 pathologists. The coroner would work with the attending
13 physician at the hospital or wherever they're at or
14 whatever facility, and they would come to some use of
15 "Hey, this is how you need to describe this" or whatnot.

16 Q. Okay. Can you tell us generally what the
17 elements of an autopsy report would be especially in this
18 situation where you might not have all the same ones you
19 normally do.

20 So, for example, if there are any witnesses to
21 an autopsy, would they be listed?

22 A. They would. In some cases they're listed or in
23 some situations they're not. It just depends. We don't
24 list everybody that's involved in the autopsy on our
25 reports necessarily. Usually, when there's like law
26 enforcement or somebody that's coming or that's going to,

1 we try to do that. And it's just -- just our operating
2 procedures.

3 I believe Dr. Resk lists lots of people. So
4 whoever was there. And that's his style, which is fine.
5 And there is no right or wrong for that.

6 But so when you say autopsy report, are you --

7 Q. I will kind of do it step by step.

8 A. Okay.

9 Q. Because I might not be using the right
10 nomenclature.

11 So is any identification information the -- and
12 when I say "you," I mean the coroner's office or the
13 pathologist doing the autopsy.

14 If there's -- if the -- if there's any
15 identification information that accompanies the body, is
16 that included in the report?

17 A. Yes.

18 Q. Is a list of clothing and personal effects, if
19 any are present, is that included?

20 A. Yes.

21 Q. If there was any physical evidence of injury,
22 would that be included?

23 A. Yes.

24 Q. And then is there an examination that is done
25 that kind of lists whatever it is that the pathologist
26 sees and any samples that might be taken or submitted for

1 toxicology or any other testing? Is there a section that
2 goes through the examination?

3 A. Yes.

4 Q. And then would it mention if toxicology was
5 done, if x-rays were done, or is that not always the
6 case?

7 A. Usually, it is the case. And again, some of
8 that starts to get more stylistic on individual
9 pathologists whether they listed it or not, yeah.

10 Q. And then is there also generally a section that
11 would list if any representative samples were retained
12 for any reason?

13 A. Yes.

14 Q. Okay. And were all of those steps done in every
15 case related to people whose remains were found in the
16 fire zone following the Camp Fire that went to your
17 office to the extent that it's possible to do all those
18 steps?

19 A. Yes, I believe it was.

20 Q. Okay. Were autopsy reports prepared for every
21 person whose remains were located in the fire zone?

22 A. Yes.

23 Q. And were the autopsy reports made in the regular
24 course of business?

25 A. Yes.

26 Q. Were they made at or near the time of the

1 autopsies?

2 A. Yes.

3 Q. And did you personally do every autopsy for
4 every person whose remains were found in the fire zone
5 after the Camp Fire?

6 A. No, I did not.

7 Q. Okay. Who performed the autopsies?

8 A. There were a number of -- we have our staff
9 pathologists. There are --

10 Do you want their names or do you want just how
11 many? Because there's about five or six of us in total
12 that actually participated in this -- these exams. At
13 our Sacramento County Coroner Office there's five of us
14 and then we had an outside person and Dr. Resk as well.

15 Q. Okay. Who is Dr. Resk?

16 A. He's the Butte County -- he was -- at this time
17 he was doing most of Butte County's autopsies.

18 Q. And he's retired?

19 A. He's retired.

20 Q. Okay. Are these all qualified forensic
21 pathologists?

22 A. They are all board certified qualified
23 pathologists.

24 Q. And this is what they do for a living?

25 A. Correct.

26 Q. And so you said that you had the -- I think the

1 five from your office and then you said there was one
2 other and Dr. Resk. Where did the other ones come from
3 if you know?

4 A. He's from Placer County. Dr. Reiber. He's
5 worked for Placer and he's worked for Sacramento County.
6 He was in Sacramento County when I started.

7 Q. So these -- all of these forensic pathologists
8 then were acting as public employees as they were doing
9 these autopsies? They weren't being paid privately by
10 families to do them or anything?

11 A. No. We were -- the Sacramento County I know for
12 sure we were working in our capacity as county employees.
13 I assume Dr. Resk was at that time still working for
14 Butte in his capacity there.

15 As for Mr. Reiber I don't know if he came in as
16 a contractor for us to assist us or if it was through his
17 facility. I don't know all the details of how he was
18 getting paid or if he was going to get paid for the exams
19 that he did. He could have just been saying "I'm going
20 to step up." So I don't know the answer for his
21 component.

22 Q. Okay. Did you personally review the factual
23 portions of each autopsy? And when I say the factual
24 portions, I mean all the information, the examinations,
25 any test results that came in that were run? Essentially
26 everything except for the conclusion.

1 A. For preparation for today, yes. I did go back
2 through every report. I looked at the photos. I looked
3 at whatever information we still had of people.

4 Q. And as chief forensic pathologist is it common
5 for you to review and approve reports and conclusions of
6 pathologists or do you ever do that?

7 A. I do that on occasion. It's not -- I don't have
8 ultimate say. You know, I'll never ask one of my
9 pathologists to change their diagnosis for anything
10 because they're sound physicians. But we have a process
11 in our facility where we do quality control, quality
12 improvement, and quality assurance. And it's actually
13 part of our actual board certification that we need to
14 participate in that process.

15 So I do review a lot of reports. We all share
16 reports with each other. And so it's pretty custom for
17 me to see some reports of my other -- of my staff and say
18 whether I agree or disagree or "Hey, what about this?"
19 and look for quality improvement, quality assurance. And
20 so I do review those. It's not necessarily in my job
21 description to say I need to approve every report, you
22 know, but I do participate in that aspect of it.

23 Q. Okay. Now, you said that you have -- you
24 reviewed all of the autopsy reports for the victims who
25 remained and were located in the fire zone of the Camp
26 Fire?

1 A. Yes.

2 Q. And based on that review did you form your own
3 conclusion as to the cause of death for each person?

4 A. I did.

5 Q. I'm going to switch gears a little bit. Were
6 identifications made for all the remains found in the
7 fire zone either at or through the Sacramento Coroner's
8 Office?

9 A. The remains were identified. And where we could
10 do it at our facility we did. I don't know the
11 intricacies of all of that. We were applying that rapid
12 DNA technology. We were utilizing it at our facility.
13 Whether or not things were actually made at DOJ or
14 something because whatever purpose I don't know the
15 answer to that.

16 But ultimately, any remains that were identified
17 through DNA or other means were given a name; Jane Doe or
18 John Doe or some form of that to an actual name. So they
19 were identified. And it would have been through some
20 course of action at our facility and maybe another
21 facility all but one.

22 Q. Right. There's one that remains unknown.

23 Okay. You mentioned DNA. What other means of
24 identification might there have been?

25 A. There were other things. I believe there were
26 some fingerprints that were able to be acquired. Dental

1 comparisons were utilized, hardware, surgical hardware,
2 knee replacements, et cetera. Anything that may have had
3 hardware, surgical hardware. If there was a serial
4 number, we'd try to get medical records and we were able
5 to make a few of those.

6 And circumstantial. There's just, you know, one
7 person in the house and they fit the category. And
8 through all of these other means that we used we were
9 able to just say "We think it's them."

10 Q. Okay. And were those identification procedures
11 recorded?

12 A. They were -- yeah. How they got IDed was
13 recorded, yes.

14 Q. And is it the regular course of business for the
15 Sacramento County Coroner's Office to try and identify
16 bodies?

17 A. Yes.

18 Q. So trying to get the IDs was done in the
19 ordinary course of business?

20 A. Correct.

21 Q. And were the different means by identification,
22 were they conducted by experts in their field who
23 regularly use those methods?

24 A. Yes.

25 Q. And then you said there were -- the
26 identification procedures were recorded. Were -- was a

1 report or a packet made with all the steps that were gone
2 through if you know?

3 A. For the identification?

4 Q. Yes.

5 A. Yeah. There would be some form of a trail of
6 the tissue or samples that we used whether it was DNA or
7 whether it is fingerprints or something, yeah.

8 Q. Okay. Were those reports to your knowledge made
9 or recorded at or near the time the identification was
10 made?

11 A. Yes.

12 Q. And in the ordinary course of business does the
13 Sacramento County Coroner's Office rely on those
14 identification reports?

15 A. Yes.

16 Q. And then does the Sacramento County Coroner's
17 Office retain these records in the ordinary course of
18 business?

19 A. Yes, they do.

20 [Pause in proceedings.]

21 **EXAMINATION**

22 BY MR. NOEL:

23 Q. Dr. Tovar, a couple of follow-up questions real
24 quick.

25 A. Sure.

26 Q. You've used two different terms. You work for

1 the Sacramento County Coroner who you identified as Kim
2 Gin and you're a forensic pathologist. Can you explain
3 for us what the difference is between who you work for
4 and what you do.

5 A. Yes. So I work for Sacramento County in their
6 coroner's office. Our coroner office is a -- I'll give
7 you a little bit of background because it's important
8 because it's different than the Butte County office.

9 So our coroner's office is an independent
10 coroner office. It's governed by the Board of Directors
11 for Sacramento County. Sacramento County directs or
12 appoints a coroner. The coroner is the head of the
13 department at our facility. It's Kim Gin. So she's the
14 coroner. So she's the manager or the head of the
15 department.

16 And under her are two divisions. We'll call
17 them two divisions. There's the investigation component
18 and there is the medical component. So the investigation
19 component are the deputy coroners that are responsible
20 for investigating the circumstances surrounding an
21 individual's death. They're not -- they're deputized,
22 but they are not necessarily law enforcement.

23 So their job is to figure out what surrounded
24 the potential reason that this individual is dead. They
25 would go to a scene. They would talk to family. They
26 gather history. They gather information. They try to

1 figure out who this person's doctor is. They look into
2 all of these things.

3 And if it's a homicide, for example, they'll
4 deal with law enforcement who is actually investigating
5 the crime. They won't investigate the crime themselves.
6 They leave that to that jurisdiction, but they get
7 information, gather information. So that information is
8 the investigation deputy coroner's side of the
9 department.

10 As a forensic pathologist, I am -- we're charged
11 with determining why, a reason a person has died, their
12 cause of death. The cause of death could only be put on
13 to an individual by a physician. So the coroner needs
14 physicians in order to write a cause of death. And so as
15 a forensic pathologist my goal and our team is to
16 determine why an individual has passed away.

17 The coroner has another obligation as well.
18 They are going to apply a manner of death. Manner of
19 death in California -- there are five. There's natural
20 death, accidental, homicide, suicide, and an undetermined
21 category. They are going to apply that depending on the
22 cause of death and the circumstances surrounding the
23 death.

24 So as our agency is in play, we are together and
25 communicate, but we have two different things. So I work
26 for the coroner's office in the capacity of a physician,

1 a forensic pathologist to determine the cause of death.
2 And we're stand alone.

3 Butte County is actually a sheriff coroner. And
4 most or many jurisdictions cover sheriff coroners.
5 They're in a coroner's division under their sheriff
6 deputy. It's just a little nuance there. But in the
7 end, that is my capacity there.

8 And I think it's important to understand a
9 little bit more about our involvement of this. And I
10 want to talk a little bit because it kind of fits into
11 it. So ultimately, the overriding agency that is
12 responsible for all of these cases is Butte County.
13 Okay. They're the ones that are going to -- based on the
14 information that we give, they can agree with
15 circumstantial evidence for identification.

16 There could be -- they could utilize the
17 information that was available or whatever, but their
18 goal ultimately is the governing agency. And it's based
19 upon our findings at autopsy.

20 The coroner's office really supplies only a
21 facility, staffing, assistance, whatever kind of
22 technical aspects of it. As the forensic pathologists we
23 are working as coroner employees of Sacramento County and
24 as under a contract with Butte County to provide those
25 services as well and then part of the mutual aid
26 component.

1 So our findings at autopsy were then relayed in
2 a report to Butte County, and Butte County would then
3 also apply a manner of death. Our office wasn't involved
4 with that because we're not the governing agency of this.
5 Butte County was. So our reports are from the
6 pathologists in Sacramento County, but some of the other
7 things that I have described were then applied to by
8 Butte County.

9 Okay. So their -- you know, some identification
10 was probably done through circumstantial evidence that
11 may have been applied that way. So we would try to help
12 them with fingerprints and DNA. We were running all of
13 that. But in the end, all those things are generated.
14 "This is who we think this is." Okay. "This is their
15 name." That was the ultimate decision of Butte County.

16 Q. Okay. Backing up here to Exhibit 1056, the
17 examination flowchart, what is anthropology?

18 A. Anthropology is the -- a field of science where
19 they deal with bones. They're able to look at bones and
20 come to some determination as to whether -- what length,
21 what heritage they're from, what ancestry, male, female,
22 human, nonhuman. They deal with looking at bones in
23 order to come to some conclusions about that particular
24 bone itself.

25 Q. Is it common for a forensic pathologist like
26 yourself to work together with the anthropologists to

1 determine a cause of death?

2 A. Yes.

3 Q. And is it scientifically accepted for you to do
4 so?

5 A. Yeah. To work together? Yeah.

6 Q. Yeah.

7 A. I mean, yeah.

8 Q. So it's scientifically accepted or it's accepted
9 in the community between the pathologists that you can
10 rely upon for the conclusions and the investigation of an
11 anthropologist?

12 A. Yes.

13 Q. Okay. Odontology. What is odontology?

14 A. That's -- I'll probably get dinged for this.
15 Dentistry, if you will. But it's basically using teeth,
16 jaw structures in order to -- well, in our cases they are
17 not just dentists. Most of them are dentists, but they
18 have a -- many times they have a subspecialty in forensic
19 odontology. It's a practice where you can look at dental
20 x-rays from somebody who's had a lot of restoration and
21 somebody that is unidentified and you don't know who this
22 person is. And you can compare those x-rays and chart
23 the teeth and look at all these things together as a
24 forensic pathologist.

25 And as a medical doctor I can't look at a dental
26 chart and, you know, have some rudimentary background. I

1 can't say "Yep, that's this individual's crown and that
2 matches here." That is their field. So they can
3 positively identify people from the structures of the
4 mouth and the teeth and the restoration that may have
5 been done.

6 Q. Is it common as a forensic pathologist to work
7 with forensic odontologists in the normal course of your
8 autopsies and coroner's reports?

9 A. Yes, it is.

10 Q. And is it scientifically accepted as appropriate
11 to do so?

12 A. Yes.

13 Q. And finally, what is toxicology?

14 A. Toxicology is the -- it's a study of drugs,
15 toxins, poisons, anything that potentially could be
16 ingested or administered, any of that when looking at
17 those particular compounds in blood or in tissues.

18 They do a lot more than just that. I mean,
19 they're developing protocols to create tests in order
20 to -- platforms to test things as well and look at the
21 data and interpret that data. They will provide
22 information about how drugs get distributed in the body,
23 but they will not say whether or not they killed that
24 person.

25 So we use them routinely. We use their labs
26 routinely. We use the information that is provided from

1 them routinely. It's scientifically accepted.

2 Q. Is it scientifically accepted as a forensic
3 pathologist to rely upon the test and results of the
4 toxicologist?

5 A. Yes.

6 MR. NOEL: All right. Ready to start going?

7 MS. DUPRE-TOKOS: We should take a break.

8 MR. NOEL: This would be a great time for a
9 break. We've been going about an hour and 15 minutes.

10 GRAND JURY FOREPERSON: Fifteen minutes.

11 MR. NOEL: Yep.

12 MS. DUPRE-TOKOS: And she needs to give an
13 admonition.

14 THE WITNESS: Sorry?

15 MS. DUPRE-TOKOS: And you need to receive an
16 admonition from madam foreperson.

17 GRAND JURY FOREPERSON: Sorry. I was busy doing
18 this.

19 Dr. Tovar, you are admonished not to discuss or
20 disclose at any time outside of this jury room the
21 questions that have been asked of you or your answers
22 until authorized by this grand jury or the Court. A
23 violation of these instructions on your part may be the
24 basis for a charge against you of contempt of court.
25 This does not preclude you from discussing your legal
26 rights with your own attorney.

1 Dr. Tovar, what I have just said is a warning
2 not to discuss this case with anyone except the Court,
3 your lawyer, or the district attorney.

4 Do you have any questions?

5 THE WITNESS: No.

6 GRAND JURY FOREPERSON: Thank you.

7 THE WITNESS: Thank you.

8 [Recess taken from

9 10:15 until 10:38 a.m.]

10 GRAND JURY FOREPERSON: All members of the grand
11 jury are present and ready to proceed. We are ready to
12 proceed.

13 MS. DUPRE-TOKOS: Okay. You ready?

14 THE WITNESS: I am.

15 **FURTHER EXAMINATION**

16 [Exhibit 1059 introduced
17 as evidence.]

18 BY MS. DUPRE-TOKOS:

19 Q. Okay. In front of you you should have
20 Exhibit 1059. Do you see that in front of you in one of
21 those stacks?

22 A. I do.

23 Q. Okay. Can you tell us what that document is.

24 A. This is the autopsy report drafted by Dr. Resk
25 for -- at the time of the autopsy it was an unknown
26 individual. It's for Sacramento County Coroner case

1 number B18-102 and the Butte County Sheriff coroner case
2 number 18-19836.

3 Q. Okay. Were the standard procedures that were in
4 place followed for this autopsy?

5 A. To my understanding, yes.

6 Q. And everything you could see in the report?

7 A. Yes.

8 Q. And did you review all the facts and procedures
9 in the report?

10 A. I did.

11 Q. Did you reach your own conclusion as to the
12 cause of death?

13 A. Yes, I did.

14 Q. And what was your conclusion?

15 A. Fire-related injuries.

16 [Exhibit 1060 introduced
17 as evidence.]

18 BY MS. DUPRE-TOKOS:

19 Q. And then looking at Exhibit 1060, do you have
20 that in front of you? It should be clipped to --
21 hopefully. If you could undo the clip, it might be
22 easier. And this one may be a little different.

23 Is it there?

24 A. I don't have it.

25 Q. Okay. Well, do you recognize what is on the
26 screen as Exhibit 1060?

1 A. I do, yeah.

2 Q. And what is that?

3 A. This is the -- and I guess as it reads it's a
4 identification summary report. I will refer to it as
5 that. It just basically shows how the individual is
6 identified, by what means, and signed off by Coroner Gin
7 and by the DNA doctor Dr. Selden.

8 Q. Okay. And does it have the Sacramento coroner
9 case number on it?

10 A. Yes, it does at the top there. Yeah, 102 and
11 the Butte County number.

12 Q. Okay. Same as on the autopsy report?

13 A. Yes, it is.

14 Q. And so does that identify the remains associated
15 with Butte County case number 18-19836 as Herbert
16 Alderman?

17 A. Yes, it does.

18 And I'm just -- I'll reference -- I think for
19 most of Dr. Resk's autopsies this Sacramento County
20 coroner number is going to differ a little bit only that
21 he didn't have the two leading zeros for his numbers.

22 Q. Okay.

23 A. But it did reference that so . . .

24 Q. Okay. Thank you.

25 [Exhibit 1061 introduced
26 as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. And then looking at Exhibit 1061.

3 A. Yes.

4 Q. Can you tell us what that document is.

5 A. This is a autopsy report for Teresa Ammons.

6 Q. Does it have the Sacramento County case number
7 on it?

8 A. It has our case number at the top with the case
9 number B18-0058 and the Butte County coroner number
10 18-19598.

11 Q. Were the standard procedures followed for
12 Ms. Ammons' autopsy?

13 A. Yes.

14 Q. And did you review all the facts and procedures
15 in this autopsy?

16 A. I did.

17 Q. Did you reach your own conclusion as to
18 Ms. Ammons' cause of death?

19 A. Yes, I did.

20 Q. What was your conclusion?

21 A. Thermal injury.

22 [Exhibit 1062 introduced
23 as evidence.]

24 BY MS. DUPRE-TOKOS:

25 Q. And then looking at Exhibit 1062 which is
26 hopefully clipped to 1061.

1 A. Yes.

2 Q. Okay. Can you tell us what that document is.

3 A. This is an identification summary report.

4 Q. And who is that for?

5 A. Teresa Ammons.

6 Q. Does it have the Sacramento County coroner case
7 number on it?

8 A. Yes, it does.

9 Q. And does it have the Butte County case number on
10 it?

11 A. Yes, it does.

12 Q. And is that case number 18-19598?

13 A. Yes.

14 Q. And does it identify the remains associated with
15 that Butte County case number as Teresa Ammons?

16 A. Yes, it does.

17 [Exhibit 1063 introduced
18 as evidence.]

19 BY MS. DUPRE-TOKOS:

20 Q. And then going to Exhibit 1063.

21 A. This is one of my autopsy reports indicating
22 Sacramento County case number B18-00021 and Butte County
23 18-19533.

24 Q. And were the standard procedures followed for
25 that autopsy?

26 A. Yes, they were.

1 Q. And did you -- well, you said this was yours
2 so . . .

3 A. I agree with myself.

4 Q. So you reviewed all the facts and procedures in
5 this autopsy report?

6 A. I did.

7 Q. And what was your conclusion as to the cause of
8 death?

9 A. Thermal injuries.

10 [Exhibit 1064 introduced
11 as evidence.]

12 BY MS. DUPRE-TOKOS:

13 Q. And then looking at Exhibit 1064 which again is
14 hopefully clipped to it.

15 A. Yes, it is.

16 Q. What is that document?

17 A. This is the identification summary report. It
18 lists both the Sacramento County and Butte County IDs,
19 case numbers, and it refers to this individual being
20 identified as Rafaela Andrade.

21 Q. And so it identifies the remains associated with
22 Butte County case number 18-19533 as Rafaela Andrade?

23 A. Correct.

24 [Exhibit 1065 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. And then going to Exhibit 1065.

2 And there's an empty box next to you. If it's
3 easier for you, you can put them in there or just stack
4 them up. Whatever your preference is.

5 A. Okay.

6 Q. Okay. Exhibit 1065. Can you tell us what that
7 document is.

8 A. This is an autopsy report drafted by Dr. Resk
9 for Sacramento County case number B18-96 and 18 -- Butte
10 County number 18-19764 of Carol Ann Arrington.

11 Q. Were the standard procedures followed for
12 Ms. Arrington's autopsy?

13 A. Yes.

14 Q. And did you review all the facts and procedures
15 of Ms. Arrington's autopsy?

16 A. Yes, I did.

17 Q. Did you reach your own conclusion as to her
18 cause of death?

19 A. Yes, I did.

20 Q. What was your conclusion?

21 A. Fire-related injuries.

22 [Exhibit 1066 introduced
23 as evidence.]

24 BY MS. DUPRE-TOKOS:

25 Q. And then Exhibit 1066.

26 A. This is the identification summary report. This

1 was identified by odontology for Sacramento County case
2 number B18-00096 and Butte County 18-19764. It
3 identified the decedent as Carol Arrington.

4 [Exhibit 1067 introduced
5 as evidence.]

6 BY MS. DUPRE-TOKOS:

7 Q. Okay. And Exhibit 1067. Could you tell us what
8 that document is.

9 A. This is a report drafted by Dr. Raven for
10 Sacramento County case number B18-00057 and Butte County
11 case number 18-19599 for Julian Binstock.

12 Q. Was standard procedures followed for
13 Mr. Binstock's autopsy?

14 A. Yes, they were.

15 Q. And did you review all the facts and procedures
16 in the autopsy?

17 A. Yes, I did.

18 Q. Did you reach your own conclusion as to
19 Mr. Binstock's cause of death?

20 A. Yes, I did.

21 Q. What was your conclusion?

22 A. Thermal injuries.

23 [Exhibit 1068 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. And Exhibit 1068. Can you tell us what that

1 document is.

2 A. This is the identification summary report for
3 Sacramento County case number B18-00057 and Butte County
4 18-19599 identifying the decedent as Julian G. Binstock.

5 [Exhibit 1069 introduced
6 as evidence.]

7 BY MS. DUPRE-TOKOS:

8 Q. Exhibit 1069.

9 A. This is an autopsy report drafted by Dr. Su for
10 Sacramento County case number B18-00043 and Butte
11 County -- it doesn't list the Butte County number on this
12 particular one.

13 Q. Okay. And did this autopsy follow the standard
14 procedures?

15 A. Yes, it did.

16 Q. And did you review all the facts and procedures
17 in this autopsy?

18 A. Yes, I did.

19 Q. And who is the autopsy for? Does it state?

20 A. This is for David Bradburd.

21 Q. Did you reach your own conclusion as to
22 Mr. Bradburd's cause of death?

23 A. Yes, I did.

24 Q. And what was that conclusion?

25 A. Thermal injuries and smoke inhalation.

26 [Exhibit 1070 introduced

1 as evidence.]

2 BY MS. DUPRE-TOKOS:

3 Q. And we're going to show you what has been marked
4 as Exhibit --

5 MS. DUPRE-TOKOS: What number?

6 MR. NOEL: 1070.

7 MS. DUPRE-TOKOS:

8 Q. Exhibit 1070. Can you tell us what that is.

9 A. This is an identification addendum from County
10 of Sacramento from deputy -- from Supervising Deputy
11 Coroner Allyson Rogers, I believe.

12 Q. And does it make a correction? I know we
13 haven't gotten to it yet, but does it make a correction
14 to the identification summary report?

15 A. It does, yes.

16 Q. And what is that correction?

17 A. It --

18 Q. Does it correct the spelling of Mr. --

19 A. Yeah. There's -- I'm trying to figure out what
20 it's actually correcting because I think I have -- I
21 think the first identification summary in the packet is
22 the same.

23 Q. Okay.

24 A. But it does say that it was -- the spelling was
25 changed.

26 Q. On Mr. Bradburd's name?

1 A. Bradburd, yes.

2 Q. Okay. In looking at Exhibit 1069 it looks like
3 there's a whole lot of information there then we have
4 seen on some of the other autopsy reports.

5 Can you explain that to us. We don't need to go
6 into all the different findings, but if you could just
7 explain a little bit about this.

8 A. So this is a report where there was more
9 remains, if you will. Probably a more intact body. And
10 basically in this report you can see under the autopsy
11 findings the main heading there one through five it talks
12 about what the thermal injuries were that were identified
13 and some underlying natural conditions that this
14 individual had with his heart, his kidneys.

15 It talks about what other ancillary reports were
16 created for this process, the anthropology, and then, of
17 course, the toxicology findings. It states a cause of
18 death and it also puts in an opinion from the pathologist
19 as to why he favored this particular cause of death.

20 Q. Okay. So under "Autopsy Findings" where it says
21 "thermal injuries," is that a list of essentially the
22 different thermal injuries that were observed? So for
23 example "Second to fourth-degree burns over 100 percent
24 of the body surface."

25 A. Yes.

26 Q. And then black carbonization matter or soot

1 identified in the larynx?

2 A. Yes.

3 Q. And then that is what you were talking about
4 earlier with the (indicating)?

5 A. Yes.

6 Q. Okay. And then looking at Exhibit 1070 can you
7 tell us what that is.

8 A. This is the -- this is the identification of --

9 Q. Oh, I'll amend the second 1070 to a 1070-A. And
10 I'll do that right now.

11 [Exhibit 1070-A marked
12 as evidence.]

13 BY MS. DUPRE-TOKOS:

14 Q. So this is 1070 and then the one we corrected
15 that we gave you is 1070-A.

16 A. Okay.

17 Q. So looking at regular 1070 will you tell us
18 about this.

19 A. So this is the original identification summary
20 report with the Sacramento County case number 18-00043
21 and the Butte County 19499 where the name is spelled
22 David Bradburgh, B-r-a-d-b-u-r-g-h.

23 Q. Okay. And does it identify the remains as David
24 Bradburgh associated with that case number?

25 A. Yes, it does.

26 Q. The Butte County case number?

1 A. Yes, it does.

2 Q. And then the correction sheet just corrects, as
3 you've stated, the spelling of the last name to what?

4 A. Bradburd, B-r-a-d-b-u-r-d.

5 [Exhibit 1071 introduced
6 as evidence.]

7 BY MS. DUPRE-TOKOS:

8 Q. And then going to Exhibit 1071.

9 A. This is an autopsy report drafted by Dr. Resk
10 for Cheryl Brown, Sacramento County number B18-73 and
11 Butte County case number 18-19675.

12 Q. Okay. And were standard procedures followed for
13 Ms. Brown's autopsy?

14 A. Yes, they were.

15 Q. And did you review all the facts and procedures
16 in this autopsy?

17 A. Yes, I did.

18 Q. Did you reach your own conclusion as to
19 Ms. Brown's cause of death?

20 A. Yes, I did.

21 Q. What was your conclusion?

22 A. Fire-related injuries.

23 [Exhibit 1072 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. And then looking at Exhibit 1072, could you tell

1 us what that document is.

2 A. This is the identification summary report for
3 Sacramento County case number B18-00073 and the Butte
4 County number 18-19675 indicating that the decedent is
5 Cheryl Brown.

6 [Exhibit 1073 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And Exhibit 1073.

10 A. Autopsy report from Dr. Resk for Sacramento
11 County case B18-72 and Butte County case 18-19674 for a
12 Larry Brown.

13 Q. And were the standard procedures followed for
14 this autopsy?

15 A. Yes, they were.

16 Q. Did you review all the facts and procedures in
17 Mr. Brown's autopsy?

18 A. Yes, I did.

19 Q. Did you reach your own conclusion as to
20 Mr. Brown's cause of death?

21 A. Yes, I did.

22 Q. And what was your conclusion?

23 A. Fire-related injuries.

24 [Exhibit 1074 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. And Exhibit 1074. Can you tell us what that
2 document is.

3 A. This would be identification summary report for
4 case numbers Sacramento B18-00072 and Butte County
5 18-19674 identifying the decedent as Larry Brown.

6 [Exhibit 1075 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And Exhibit 1075.

10 A. This is the autopsy report from Dr. Resk for
11 Sacramento County case B18-70 and Butte County number
12 18-19697 for Richard Brown.

13 Q. Were the standard procedures followed for this
14 autopsy?

15 A. Yes, they were.

16 Q. And did you review all the facts and procedures
17 in Mr. Brown's autopsy?

18 A. Yes, I did.

19 Q. Did you reach your own conclusion as to
20 Mr. Brown's cause of death?

21 A. Yes, I did.

22 Q. And what was your conclusion?

23 A. Fire-related injuries.

24 [Exhibit 1076 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. Exhibit 1076. So could you tell us what that
2 document is.

3 A. The identification summary report for Richard
4 Brown for Sacramento case B18-00070 and Butte County
5 18-19697.

6 Q. And who does it identify the decedent as?

7 A. Richard Brown.

8 [Exhibit 1077 introduced
9 as evidence.]

10 BY MS. DUPRE-TOKOS:

11 Q. Exhibit 1077.

12 A. This is my autopsy report for Andrew Burt,
13 Sacramento County number B18-00032 and Butte County case
14 number 18-19487.

15 Q. And did you follow all the standard procedures?

16 A. Yes, I did.

17 Q. And what was your conclusion as to the cause of
18 death?

19 A. Thermal injuries.

20 Q. And you also have another finding on there.

21 A. Yes. Ethenol intoxication is a finding.

22 Q. But not the cause of death?

23 A. No.

24 [Exhibit 1078 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. And then Exhibit 1078. Could you tell us what
2 this document is.

3 A. This is the identification summary report
4 identifying the decedent as Andrew Burt for case number
5 Sacramento B18-00032 and Butte County number 18-19487.

6 [Exhibit 1079 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. Okay. Exhibit 1079.

10 A. This is the autopsy report of Dr. Resk for
11 Joanne Caddy, Sacramento County case number B18-82 and
12 Butte County number 18-19701.

13 Q. And were the standard procedures followed for
14 Ms. Caddy's autopsy?

15 A. Yes, they were.

16 Q. And did you review all the facts and procedures
17 in Ms. Caddy's autopsy?

18 A. Yes, I did.

19 Q. Did you reach your own conclusion as to
20 Ms. Caddy's cause of death?

21 A. Yes, I did.

22 Q. What was your conclusion?

23 A. Fire-related injuries.

24 [Exhibit 1080 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. And Exhibit 1080. If you could tell us what
2 that document is.

3 A. This is the identification summary report for
4 Sacramento County case number B18-00082 and Butte County
5 case number 18-19701 identifying the decedent as Joanne
6 Marie Caddy.

7 [Exhibit 1081 introduced
8 as evidence.]

9 BY MS. DUPRE-TOKOS:

10 Q. Exhibit 1081.

11 A. This is the autopsy report drafted by
12 Dr. Reiber, R-e-i-b-e-r, for Barbara Carlson, Sacramento
13 County case number B18-00047 and agency -- Butte County
14 18-19573.

15 Q. And were the standard procedures followed for
16 Ms. Carlson's autopsy?

17 A. Yes, they were.

18 Q. Did you review all the facts and procedures in
19 this autopsy?

20 A. Yes, I did.

21 Q. Did you reach your own conclusion as to the
22 cause of death?

23 A. Yes, I did.

24 Q. What was your conclusion?

25 A. Fire-related injuries.

26 [Exhibit 1082 introduced

1 as evidence.]

2 BY MS. DUPRE-TOKOS:

3 Q. And Exhibit 1082. Could you tell us what this
4 document is.

5 A. This is the identification summary report for
6 Sacramento County case B18-00047 and Butte County case
7 number 18-19573 identifying the decedent as Barbara
8 Carlson.

9 [Exhibit 1083 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. And Exhibit 1083.

13 A. This is an autopsy report from Dr. Reiber for
14 Vincent Carota, case number Sacramento County B18-0040
15 and Butte County 18-19538.

16 Q. Were the standard procedures followed for this
17 autopsy?

18 A. Yes, they were.

19 Q. Did you review all the facts and procedures of
20 this autopsy?

21 A. Yes, I did.

22 Q. Did you reach your own conclusion as to
23 Mr. Carota's cause of death?

24 A. Yes, I did.

25 Q. And what was your conclusion?

26 A. Fire-related injuries.

1 [Exhibit 1084 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. And Exhibit 1084. Can you tell us what this
5 document is.

6 A. This is the identification summary report for
7 Sacramento County case numbers B18-00040 and B18-00052
8 and Butte County case number 18-19538 identifying the
9 decedent as Vincent Carota.

10 Q. Do you know why there would be two Sacramento
11 County case numbers?

12 A. This is likely that there were either commingled
13 remains or this individual was identified at a later
14 time. I'm going to review. I think -- so 52 was added.

15 And let me see what this refers to here. It
16 looks like when case B -- Sacramento number B18-00052
17 came in, the remains got identified through DNA and were
18 found to be the same as case B18-00040.

19 Q. So remains came in separately?

20 A. They came in separately. The other report was
21 drafted by Dr. Raven, R-a-v-e-n.

22 Q. Okay. Thank you.

23 [Exhibit 1085 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. And Exhibit 1085.

1 A. It's an autopsy report from Dr. Raven,
2 Sacramento County number B18-00027 and Butte County
3 18-19491 for Dennis Clark.

4 Q. Were the standard procedures followed for this
5 autopsy?

6 A. Yes, they were.

7 Q. And did you review all the facts and procedures
8 in the autopsy?

9 A. Yes, I did.

10 Q. Did you reach your own conclusion as to
11 Mr. Clark's cause of death?

12 A. Yes, I did.

13 Q. What was your conclusion?

14 A. Thermal injuries.

15 [Exhibit 1086 introduced
16 as evidence.]

17 BY MS. DUPRE-TOKOS:

18 Q. And then Exhibit 1086. Could you tell us what
19 that is.

20 A. This is the identification summary report for
21 Sacramento case B18-00027 and Butte County 18-19491
22 identifying the remains of Dennis Clark.

23 [Exhibit 1087 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. Exhibit 1087.

1 A. This is the autopsy report from Dr. Resk for
2 Sacramento case number B18-87 and Butte County case
3 number 18-19733. Time of drafting was an unknown
4 individual.

5 Q. Were the standard procedures followed for this
6 autopsy?

7 A. Yes, they were.

8 Q. Okay. And did you review all the facts and
9 procedures in the autopsy?

10 A. Yes, I did.

11 Q. Did you reach your own conclusion as to the
12 cause of death?

13 A. Yes, I did.

14 Q. What was your conclusion?

15 A. Fire-related injuries.

16 [Exhibit 1088 introduced
17 as evidence.]

18 BY MS. DUPRE-TOKOS:

19 Q. Is there an attached identification report?

20 A. There is a Butte County circumstantial
21 identification report, yes.

22 Q. Okay. And does that list a case number?

23 A. For Butte County it's 18-19733.

24 Q. And does that match the case number on the
25 autopsy?

26 A. Yes, it does.

1 Q. And who does it list as the decedent?

2 A. It lists Evelyn Cline.

3 Q. Thank you.

4 [Exhibit 1089 introduced
5 as evidence.]

6 BY MS. DUPRE-TOKOS:

7 Q. And Exhibit 1089.

8 A. The autopsy report from Dr. Resk for John Digby,
9 Sacramento case number B18-67 and Butte County 18-19643.

10 Q. Were the standard procedures followed for
11 Mr. Digby's autopsy?

12 A. Yes, they were.

13 Q. And did you review all the facts and procedures
14 in the autopsy?

15 A. Yes, I did.

16 Q. And did you reach your own conclusion as to
17 Dr. Digby's cause of death?

18 A. Yes, I did.

19 Q. What was your conclusion?

20 A. Fire-related injuries.

21 [Exhibit 1090 introduced
22 as evidence.]

23 BY MS. DUPRE-TOKOS:

24 Q. And Exhibit 1090. Could you tell us what this
25 document is.

26 A. This is the identification summary report for

1 Sacramento County case numbers B18-0067 and B18-00066 and
2 Butte County case number 18-19643 identifying the remains
3 in those cases as John Arthur Digby.

4 Q. And is there -- do we know why there are two
5 Sacramento County case numbers? There may be a note on
6 the cover page of 1090 or notation.

7 A. So the two cases were identified as one
8 person --

9 Q. Okay. So --

10 A. -- through anthropology.

11 Q. They came in as two separate --

12 A. They came in as two different ones.

13 [Exhibit 1091 introduced
14 as evidence.]

15 BY MS. DUPRE-TOKOS:

16 Q. Okay. And moving on to Exhibit 1091, can you
17 tell us what that is.

18 A. It's the autopsy report from Dr. Resk for Gordon
19 Dise, Sacramento County case number B18-99 and Butte
20 County 18-19775.

21 Q. And were the standard procedures followed for
22 Mr. Dise's autopsy?

23 A. Yes, they were.

24 Q. Did you review all the facts and procedures in
25 the autopsy?

26 A. Yes, I did.

1 Q. Did you reach your own conclusion as to
2 Mr. Dise's cause of death?

3 A. Yes, I did.

4 Q. What was your cause conclusion?

5 A. Fire-related injuries.

6 [Exhibit 1092 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And Exhibit 1092.

10 A. This is the identification summary report for --
11 I don't think it's in here.

12 Q. Was it not included?

13 A. I don't think so.

14 Q. Perhaps you could look at the screen, and we'll
15 get that added at the break.

16 A. There is a blank one in here.

17 Q. Oh, how odd.

18 A. It has the number 99.

19 Q. And we will get the correct one at a lunch
20 break.

21 A. Okay. So this is the autopsy -- this is for
22 case number Sacramento B18-00099 and Butte 18-19775
23 identifying the decedent as Gordon Robert Dise.

24 It's here.

25 Q. Oh, okay. Great.

26 [Exhibit 1093 introduced

1 as evidence.]

2 BY MS. DUPRE-TOKOS:

3 Q. And Exhibit 1093. Tell us what that is.

4 A. This is the autopsy report from Dr. Raven for
5 Paula Dodge, Sacramento County number B18-0033 and Butte
6 County number 18-19544.

7 Q. Were the standard procedures followed for this
8 autopsy?

9 A. Yes, they were.

10 Q. Did you review all the facts and procedures in
11 Ms. Dodge's autopsy?

12 A. Yes, I did.

13 Q. Did you reach your own conclusion as to
14 Ms. Dodge's cause of death?

15 A. Yes, I did.

16 Q. And what was your conclusion?

17 A. Thermal injuries.

18 [Exhibit 1094 introduced
19 as evidence.]

20 BY MS. DUPRE-TOKOS:

21 Q. And then Exhibit 1094. If you could tell us
22 what that number is. Or I'm sorry. What that document
23 is.

24 A. This is the identification summary report for
25 Sacramento County number B18-00033 and Butte case number
26 18-19544 identifying the remains as Paula Dodge.

Q. And going back to the autopsy report, is there a notation in the opinion section?

A. Yes, there is.

Q. And does that indicate that additional remains were brought in under different case numbers and ultimately found to be associated with Mr. and Mrs. Dodge?

A. Yes, they do.

[Exhibit 1095 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. And now Exhibit 1095.

A. This is the autopsy report from Dr. Raven for Randall Dodge, Sacramento County case number B18-00026 and Butte 18-19545.

Q. And does this also have that same notation in the opinion section regarding additional remains having been found?

A. Yes, it does.

[Exhibit 1096 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. And then Exhibit 1096. Can you tell us what that is.

A. This is the identification report for Sacramento case number B18-00026 and B18-00061 and Butte County

1 18-19545 identifying the remains as Randall Dodge.

2 Q. And then the two Sacramento case numbers are --
3 relate back to that note in the autopsy?

4 A. That is correct.

5 [Exhibit 1097 introduced
6 as evidence.]

7 BY MS. DUPRE-TOKOS:

8 Q. And Exhibit 1097.

9 A. This is the autopsy report from Dr. Resk for
10 Andrew Downer, Sacramento case number B18-74 and Butte
11 County 18-19551.

12 Q. And were the standard procedures followed for
13 Mr. Downer's autopsy?

14 A. Yes, they were.

15 Q. And did you review all the facts and procedures
16 in Dr. Downer's autopsy?

17 A. Yes, I did.

18 Q. Did you reach your own conclusion as to
19 Mr. Downer's cause of death?

20 A. Yes, I did.

21 Q. And what was that conclusion?

22 A. Fire-related injuries.

23 [Exhibit 1098 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. And Exhibit 1098. Could you tell us what this

1 document is.

2 A. This is the identification summary report for
3 Sacramento case B18-00074 and Butte County 18-19551
4 identifying the remains of Andrew James Downer.

5 [Exhibit 1099 introduced
6 as evidence.]

7 BY MS. DUPRE-TOKOS:

8 Q. And Exhibit 1099.

9 A. This is the autopsy report from Dr. Su for
10 Robert Duvall, Sacramento case number B18-00038 and Butte
11 County -- it's not listed.

12 Q. Were the standard procedures followed for
13 Mr. Duvall's autopsy?

14 A. Yes, they were.

15 Q. And did you review all the facts and procedures
16 in Mr. Duvall's autopsy?

17 A. Yes, I did.

18 Q. Did you reach your own conclusion as to
19 Mr. Duvall's cause of death?

20 A. Yes, I did.

21 Q. And what was that conclusion?

22 A. Thermal injuries and smoke inhalation.

23 [Exhibit 1100 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. Looking at Exhibit 1100, could you tell us what

1 that is.

2 A. This is the identification summary report for
3 Sacramento case number B18-00038 and Butte 18-19489
4 identifying the remains of Robert Duvall.

5 Q. And the autopsy did not have the Butte County
6 case number, but the identification summary report has
7 the same Sacramento case number as the autopsy report
8 did?

9 A. Yes, it does.

10 [Exhibit 1102 introduced
11 as evidence.]

12 BY MS. DUPRE-TOKOS:

13 Q. Exhibit 1102.

14 A. This is the autopsy report from Dr. Resk for
15 Rose Farrell, case number -- Sacramento case number
16 B18-71 and Butte County case number 18-19665.

17 [Exhibit 1103 introduced
18 as evidence.]

19 BY MS. DUPRE-TOKOS:

20 Q. And Exhibit 1103.

21 A. This is the identification summary report for
22 Sacramento County case B18-00071 and Butte 18-19655
23 identifying -- or it looks like maybe that is 665
24 handwritten in identifying the remains.

25 Q. Identifying the remains of who?

26 A. Rose Farrell.

1 [Exhibit 1104 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. And Exhibit 1104.

5 A. This is my autopsy report for Jesus P.
6 Fernandez, Sacramento case number B18-00049 and Butte
7 County 18-19563.

8 Q. Did you follow the standard procedures for
9 Mr. Fernandez's autopsy?

10 A. Yes, I did.

11 Q. And what was your conclusion as to
12 Mr. Fernandez's cause of death?

13 A. Inhalation of products of combustion and thermal
14 injuries.

15 Q. And this is one of those cases where
16 methamphetamine intoxication was listed in the autopsy
17 findings, but that was not the cause of death; correct?

18 A. That's correct.

19 [Exhibit 1105 introduced
20 as evidence.]

21 BY MS. DUPRE-TOKOS:

22 Q. And then Exhibit 1105.

23 A. It should be identification summary report for
24 Sacramento B18-00049 and 18-19563, the Butte County
25 number for Jesus Fernandez.

26 [Exhibit 1106 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. Exhibit 1106.

A. The autopsy report for Dr. Resk for Jean Forsman, Sacramento case number B18-107 and Butte County 18-19947.

Q. Were all the standard procedures followed for this autopsy?

A. Yes, they were.

Q. And did you review all the facts and procedures in Ms. Forsman's autopsy?

A. Yes, I did.

Q. Did you reach your own conclusion as to Ms. Forsman's cause of death?

A. Yes, I did.

Q. What was your conclusion?

A. Fire-related injuries.

[Exhibit 1107 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. And then Exhibit 1107.

A. This is the identification summary report for Sacramento case B18-00107 and Butte County 18-19947 identifying the decedent as Jean Forsman.

[Exhibit 1108 introduced
as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. Exhibit 1108.

3 A. This is the autopsy report from Dr. Nagao,
4 N-a-g-a-o, for Ernest F. Foss, Sacramento case number
5 B18-00039 and Butte County 18-19524.

6 Q. Were the standard procedures followed for
7 Mr. Foss's autopsy?

8 A. Yes, they were.

9 Q. Did you review all the facts and procedures in
10 Mr. Foss's autopsy?

11 A. Yes, I did.

12 Q. Did you reach your own conclusion as to
13 Mr. Foss's cause of death?

14 A. Yes, I did.

15 Q. And what was your conclusion?

16 A. Thermal injuries and I agree the heart is
17 enlarged with cardiomyopathy.

18 Q. Which is listed under "autopsy findings"?

19 A. As a significant condition, yes.

20 Q. And then there also was cannabinoids and a
21 nonlethal level of medication. And again, not a cause of
22 death?

23 A. Correct.

24 [Exhibit 1109 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. And then Exhibit 1109.

2 A. This is the identification summary report for
3 Sacramento case B18-00039 and Butte County 18-19524
4 identifying the remains of Ernest Foss.

5 MS. DUPRE-TOKOS: Does anybody need a break? Do
6 you need a break? We're good.

7 GRAND JUROR NUMBER FOUR: Could you do something
8 for me.

9 MS. DUPRE-TOKOS: Excuse me?

10 GRAND JUROR NUMBER FOUR: Under the ID there, I
11 can't read that word where -- the one that's signed off.

12 MS. DUPRE-TOKOS: Where? Here?

13 GRAND JUROR NUMBER FOUR: No. Where the doctor
14 signs up above.

15 MS. DUPRE-TOKOS: Here?

16 GRAND JUROR NUMBER FOUR: Yeah. No. The fourth
17 from the letter.

18 MS. DUPRE-TOKOS: "M. Vargas via SSD Cal ID."

19 GRAND JURY FOREPERSON: No, no. The word to the
20 left of the signature.

21 MS. DUPRE-TOKOS: Oh, fingerprints.

22 GRAND JUROR NUMBER FOUR: Thank you.

23 MS. DUPRE-TOKOS: Sorry. I was going the wrong
24 left.

25 [Exhibit 1110 introduced
26 as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. Exhibit 1110.

3 A. This is the autopsy report from Dr. Resk on
4 Elizabeth Gaal, Sacramento case B18-77 and Butte County
5 18-19680.

6 Q. Were the standard procedures followed for
7 Ms. Gaal or Gaal's autopsy?

8 A. Yes, they were.

9 Q. Did you review all the facts and procedures in
10 this autopsy?

11 A. Yes, I did.

12 Q. And did you reach your own conclusion as to
13 Ms. Gaal's cause of death?

14 A. Yes, I did.

15 Q. What was your conclusion?

16 A. Fire-related injuries.

17 [Exhibit 1111 introduced
18 as evidence.]

19 BY MS. DUPRE-TOKOS:

20 Q. And Exhibit 1111. Tell us what that is.

21 A. This is the identification summary report for
22 Sacramento case B18-00077 and Butte County 18-19680
23 identifying the remains as Elizabeth Gaal.

24 MS. DUPRE-TOKOS: And just for the record, Gaal
25 or Gaal is G-a-a-l.

26 [Exhibit 1112 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. Exhibit 1112.

A. This is the autopsy report from Dr. Nagao on Sally -- or sorry. Yeah, Sally L. Gamboa, Sacramento case B18-00034 and Butte County 18-19535.

Q. Were the standard procedures -- excuse me, procedures followed for Ms. Gamboa's autopsy?

A. Yes, they were.

Q. Did you review all the facts and procedures in Ms. Gamboa's autopsy?

A. Yes, I did.

Q. And did you reach your own conclusion as to Ms. Gamboa's cause of death?

A. Yes, I did.

Q. What was that conclusion?

A. Thermal injuries.

[Exhibit 1113 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. Exhibit 1113.

A. This is the identification summary report for Sacramento case B18-00034 and Butte County 18-19535 identifying the remains as Sally Lee Gamboa.

[Exhibit 1114 introduced
as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. Exhibit 1114.

3 A. Dr. Resk's autopsy report for James Garner,
4 Sacramento case number B18-81 and Butte County 18-19550.

5 Q. Were the standard procedures followed for
6 Mr. Garner's autopsy?

7 A. Yes, they were.

8 Q. Did you review all the facts and procedures in
9 Mr. Garner's autopsy?

10 A. Yes, I did.

11 Q. Did you reach your own conclusion as to
12 Mr. Garner's cause of death?

13 A. Yes, I did.

14 Q. What was that conclusion?

15 A. Fire-related injuries.

16 [Exhibit 1115 introduced
17 as evidence.]

18 BY MS. DUPRE-TOKOS:

19 Q. Exhibit 1115.

20 A. This is the identification summary report for
21 Sacramento B18-00081 and Butte 18-19550 identifying the
22 remains as James Doyle Garner.

23 [Exhibit 1116 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. Exhibit 1116.

1 A. This is the autopsy report from Dr. Reiber on
2 Richard Garrett, Sacramento case B18-00098 and Butte
3 County 18-19753.

4 Q. Were the standard procedures followed for
5 Mr. Garrett's autopsy?

6 A. Yes, they were.

7 Q. And did you review all the facts and procedures
8 in this autopsy?

9 A. Yes, I did.

10 Q. Did you reach your own conclusion as to
11 Mr. Garrett's cause of death?

12 A. Yes, I did.

13 Q. What was your conclusion?

14 A. Thermal total -- thermal injuries.

15 Q. And again, this autopsy listed other significant
16 conditions, and you talked about that earlier. Correct?

17 A. Correct.

18 [Exhibit 1117 introduced
19 as evidence.]

20 BY MS. DUPRE-TOKOS:

21 Q. And Exhibit 1117.

22 A. This is the identification summary report for
23 Sacramento B18-00098 and Butte 18-19753 identifying the
24 remains as Richard J. Garrett.

25 [Exhibit 1118 introduced
26 as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. Exhibit 1118.

3 A. This is the autopsy report from Dr. Reiber on
4 William Godbout, Sacramento case B18-00042 and Butte
5 County 18-19531.

6 Q. Were the standard procedures followed for
7 Mr. Godbout's autopsy?

8 A. Yes, they were.

9 Q. And did you review all the facts and procedures
10 in this autopsy?

11 A. Yes, I did.

12 Q. Did you reach your own conclusion as to
13 Mr. Godbout's cause of death?

14 A. Yes, I did.

15 Q. What was that conclusion?

16 A. Inhalation of products of combustion and thermal
17 injuries and I agree with the other significant
18 condition.

19 Q. Which is atherosclerotic cardiovascular disease?

20 A. Correct.

21 [Exhibit 1119 introduced
22 as evidence.]

23 BY MS. DUPRE-TOKOS:

24 Q. And then Exhibit 1119.

25 A. This is the identification summary report for
26 Sacramento B18-00042 and Butte 18-19531 identifying the

1 remains as William Godbout, G-o-d-b-o-u-t.

2 Q. Now, jumping back to 1118, which was the autopsy
3 report, so it had inhalation of products of combustion.
4 And so that indicates that Mr. Godbout breathed in some
5 of the products of combustion that we talked about
6 earlier?

7 A. Correct.

8 Q. And so he was alive at the time of the fire?

9 A. Correct.

10 [Exhibit 1120 introduced
11 as evidence.]

12 BY MS. DUPRE-TOKOS:

13 Q. Okay. Exhibit 1120.

14 A. This is Dr. Resk's report for Shirley Haley,
15 Sacramento case B18-48 and Butte County case 18-19566.

16 Q. And were the standard procedures followed for
17 Ms. Haley's autopsy?

18 A. Yes, they were.

19 Q. Did you review all the facts and procedures in
20 that autopsy?

21 A. Yes, I did.

22 Q. Did you reach your own conclusion as to
23 Ms. Haley's cause of death?

24 A. Yes, I did.

25 Q. And what was your conclusion?

26 A. Fire-related injuries.

1 [Exhibit 1121 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. And is there an identification summary attached
5 to that?

6 A. Yes, there is. It's a circumstantial
7 identification for Butte case 18-19566 identifying the
8 remains as Shirley Haley.

9 [Exhibit 1122 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. And then Exhibit 1122.

13 A. It's the autopsy report from Dr. Reiber on
14 Dennis Hanko, H-a-n-k-o, case number Sacramento B18-00068
15 and Butte County 18-19647.

16 Q. Were the standard procedures followed for
17 Mr. Hanko's autopsy?

18 A. Yes, they were.

19 Q. And did you review all the facts and procedures
20 in Mr. Hanko's autopsy report?

21 A. Yes, I did.

22 Q. Did you reach your own conclusion as to the
23 cause of death?

24 A. Yes, I did.

25 Q. And what was that conclusion?

26 A. Inhalation of products of combustion and thermal

1 injuries.

2 Q. And so again, the inhalation of products of
3 combustion, that indicates he would have been alive at
4 the time of the fire?

5 A. Correct.

6 [Exhibit 1123 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And then Exhibit 1123.

10 A. The identification summary report for Sacramento
11 B18-00068 and Butte County 18-19647 identifying the
12 remains as Dennis John Hanko.

13 [Exhibit 1124 introduced
14 as evidence.]

15 BY MS. DUPRE-TOKOS:

16 Q. Exhibit 1124.

17 A. This is Dr. Raven's report on Anna Hastings,
18 Sacramento case B18-00069 and Butte County 18-019655.

19 Q. Were the standard procedures followed for
20 Ms. Hastings' autopsy?

21 A. Yes, they were.

22 Q. And then did you review all the facts and
23 procedures in Ms. Hastings' autopsy report?

24 A. Yes, I did.

25 Q. Did you reach your own conclusion as to
26 Ms. Hastings' cause of death?

1 A. Yes, I did.

2 Q. And what was that?

3 A. Thermal injuries.

4 [Exhibit 1125 introduced
5 as evidence.]

6 BY MS. DUPRE-TOKOS:

7 Q. And is there an attached identification summary
8 report?

9 A. Yes, there is here, yeah. Slightly different
10 than the one -- usual one but, yes.

11 Q. Okay. And could you -- does it list the
12 Sacramento County case number?

13 A. It's listed as B18-00069 and Butte County
14 18-19655. It identifies the remains as Anna Irene
15 Hastings.

16 Q. Thank you.

17 [Exhibit 1126 introduced
18 as evidence.]

19 BY MS. DUPRE-TOKOS:

20 Q. And Exhibit 1126.

21 A. This is Dr. Reiber's report of Jennifer Hayes,
22 Sacramento case B18-00093 and Butte County 18-19735.

23 Q. And was the standard -- were the standard
24 procedures followed for Ms. Hayes' autopsy?

25 A. Yes, they were.

26 Q. And did you review all the facts and procedures

1 in the autopsy?

2 A. Yes, I did.

3 Q. Did you reach your own conclusion as to
4 Ms. Hayes' cause of death?

5 A. Yes, I did.

6 Q. What was that conclusion?

7 A. Inhalation of products of combustion and thermal
8 injuries.

9 Q. And again, with the inhalation of products of
10 combustion, that would indicate that she was alive at the
11 time of the fire?

12 A. That is correct. And I agree with the other
13 significant condition of atherosclerotic cardiovascular
14 disease.

15 [Exhibit 1127 introduced
16 as evidence.]

17 BY MS. DUPRE-TOKOS:

18 Q. And then Exhibit 1127.

19 A. This is the autopsy -- or I'm sorry,
20 identification summary report for Sacramento B18-00093
21 and Butte case 18-19735 identifying the remains as
22 Jennifer Hayes.

23 [Exhibit 1128 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. Exhibit 1128.

A. This is my autopsy report of Christina Heffern, H-e-f-f-e-r-n, Sacramento case B18-0063 and Butte County 18-19604.

Q. And did you follow the standard procedures?

A. Yes, I did.

Q. And what was your conclusion regarding Christina Heffern's cause of death?

A. Thermal injuries.

[Exhibit 1129 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. And Exhibit 1129.

A. This is the identification summary report for Sacramento B18-00063 and Butte County 18-19604 identifying the remains as Christina Heffern.

[Exhibit 1130 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. And Exhibit 1130.

A. I'm looking. There is an addendum
identification report so . . .

Q. Oh, to Ms. Christina Heffern?

A. Yeah. I'm just reading what that means there. So I think it's just -- oh, there was a name change on there.

Q. A correction in spelling?

1 A. A correction in spelling of the last name.

2 Q. Okay.

3 A. Yeah.

4 Q. Thank you. And Exhibit 1130.

5 A. This is Dr. Su's autopsy report of Ishka
6 Heffern, Sacramento case B19-00064. And the Butte County
7 case is not listed here.

8 Q. And were the standard procedures followed for
9 Ishka Heffern's autopsy?

10 A. Yes, they were.

11 Q. And did you review all the facts and procedures
12 in Ms. Heffern's autopsy?

13 A. Yes, I did.

14 Q. Did you reach a conclusion as to Ishka Heffern's
15 cause of death?

16 A. Yes, I did.

17 Q. And what was your conclusion?

18 A. Fire-related injuries.

19 [Exhibit 1131 introduced
20 as evidence.]

21 BY MS. DUPRE-TOKOS:

22 Q. Okay. Is there an identification summary
23 attached?

24 A. There is a Butte County circumstantial
25 identification report for Butte County case number
26 18-19605 and that is identifying the decedent as Ishka

1 Heffern.

2 MR. NOEL: And that should be marked as 1131.

3 THE WITNESS: That is correct.

4 [Exhibit 1132 introduced
5 as evidence.]

6 MS. DUPRE-TOKOS:

7 Q. And then Exhibit 1132.

8 A. The previous report has -- there's going to be
9 multiple people. There's a note to identify how come
10 they are mixed together here.

11 Q. Okay.

12 A. And so for the record, the diagram with the
13 skeleton in Dr. Su's report lists a Butte County number
14 as 18-19605.

15 Q. Okay. Thank you. And that is part of the
16 autopsy report or part of the identification?

17 A. Part of the autopsy report, yes.

18 Q. Okay. And Exhibit 1132.

19 A. This is my autopsy report for Matilde Heffern,
20 Sacramento case number 18 -- or B18-00108 and Butte
21 County 18-19967.

22 Q. Did you follow the standard procedures for this
23 autopsy?

24 A. Yes, I did.

25 Q. And what was your conclusion regarding Matilde
26 Heffern's cause of death?

1 A. This was a result of fire-related injuries.

2 Q. And is there an identification report with that?

3 A. There is no identification report for this one.

4 And this -- this is -- so this -- this exam was performed
5 when cases or Sacramento case B18-00063 and B18-00064
6 were conducted. When anthropology reviewed these two
7 cases, they identified a third individual mixed among the
8 remains of those two cases. That is this case B18-00108.

9 It's unclear where they actually found that,
10 whether it was with case 63 or 64. So it wasn't an
11 independent exam, but it did go through -- because both
12 previous cases did undergo that exam and the procedure
13 and then this one was just kind of separated out when it
14 was identified.

15 Q. Okay. And again, you did this autopsy report
16 and you did Christina Heffern's autopsy as well; correct?

17 A. That is correct.

18 [Exhibit 1133 introduced
19 as evidence.]

20 BY MS. DUPRE-TOKOS:

21 Q. And 1133.

22 A. And I don't know how she -- her identification
23 may be circumstantial.

24 Q. Oh, on Matilde Heffern?

25 A. There is no report for that.

26 Q. Correct.

1 A. Oh, so this is the autopsy report from Dr. Resk
2 on Louis Herrera, Sacramento case B18-86 and Butte County
3 18-19672.

4 Q. Were the standard procedures followed for
5 Mr. Herrera's autopsy?

6 A. Yes, they were.

7 Q. Did you review all the facts and procedures in
8 Mr. Herrera's autopsy report?

9 A. Yes, I did.

10 Q. Did you reach your own conclusion as to
11 Mr. Herrera's cause of death?

12 A. Yes, I did.

13 Q. And what was that conclusion?

14 A. Fire-related injuries.

15 [Exhibit 1134 introduced
16 as evidence.]

17 BY MS. DUPRE-TOKOS:

18 Q. Exhibit 1134.

19 A. This should be identification summary for
20 Sacramento B18-00086 and Butte County 18-19672
21 identifying the remains as Louis Anthony Herrera, Senior.

22 [Exhibit 1135 introduced
23 as evidence.]

24 BY MS. DUPRE-TOKOS:

25 Q. And Exhibit 1135.

26 A. This is Dr. Resk's report for Evva Holt,

1 Sacramento B18-85 and Butte County 18-19702.

2 Q. Were the standard procedures followed for this
3 autopsy?

4 A. Yes, they were.

5 Q. Did you review all the facts and procedures in
6 Ms. Holt's autopsy?

7 A. Yes, I did.

8 Q. Did you reach your own conclusion as to
9 Ms. Holt's cause of death?

10 A. Yes, I did.

11 Q. And what was that conclusion?

12 A. Fire-related injuries.

13 [Exhibit 1136 introduced
14 as evidence.]

15 BY MS. DUPRE-TOKOS:

16 Q. And Exhibit 1136.

17 A. This is the identification summary report for
18 Sacramento B18-00085 and Butte County 18-19702
19 identifying the remains as Evva M. Holt.

20 [Exhibit 1137 introduced
21 as evidence.]

22 BY MS. DUPRE-TOKOS:

23 Q. Okay. Exhibit 1137.

24 A. This is Dr. Abedschmidt, A-b-e-d-s-c-h-m-i-d-t,
25 for TK Huff, Sacramento case B18-00046 and Butte County
26 18-19586.

1 Q. Were the standard procedures followed for
2 Mr. Huff?

3 A. Yes, they were.

4 Q. Did you review all the facts and procedures of
5 Mr. Huff's autopsy?

6 A. Yes, I did.

7 Q. Did you reach your own conclusion as to
8 Mr. Huff's cause of death?

9 A. Yes, I did.

10 Q. What was that conclusion?

11 A. Thermal injuries and I'd agree with the other
12 significant condition listed.

13 Q. The --

14 A. Atherosclerotic cardiovascular.

15 Q. Thank you.

16 [Exhibit 1138 introduced
17 as evidence.]

18 BY MS. DUPRE-TOKOS:

19 Q. And Exhibit 1138.

20 A. This is the identification summary report for
21 B18-00046 and Butte County 18-19586 identifying the
22 remains as TK Huff.

23 [Exhibit 1139 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. Exhibit 1139.

1 A. This is Dr. Resk's report for Gary Hunter,
2 Sacramento case B18-88 and Butte County 18-19737.

3 Q. Were the standard procedures followed for
4 Mr. Hunter's autopsy?

5 A. Yes, they were.

6 Q. Did you review all the facts and procedures in
7 Mr. Hunter's autopsy?

8 A. Yes, I did.

9 Q. Did you reach your own conclusion as to
10 Mr. Hunter's cause of death?

11 A. Yes, I did.

12 Q. And what was that conclusion?

13 A. Fire-related injuries.

14 [Exhibit 1140 introduced
15 as evidence.]

16 BY MS. DUPRE-TOKOS:

17 Q. And Exhibit 1140.

18 A. Identification summary report for Sacramento
19 case B18-00088 and Butte County 18-19737 identifying the
20 remains as Gary Hunter.

21 [Exhibit 1141 introduced
22 as evidence.]

23 BY MS. DUPRE-TOKOS:

24 Q. Exhibit 1141.

25 A. This is Dr. Resk's report for James Kinner,
26 Sacramento case B18-97 and Butte County 18-19755.

1 Q. Were the standard procedures followed for
2 Mr. Kinner's autopsy?

3 A. Yes, they were.

4 Q. Did you review all the facts and procedures in
5 Mr. Kinner's autopsy?

6 A. Yes, I did.

7 Q. Did you reach your own conclusion as to
8 Mr. Kinner's cause of death?

9 A. Yes, I did.

10 Q. What was that conclusion?

11 A. Fire-related injuries.

12 [Exhibit 1142 introduced
13 as evidence.]

14 BY MS. DUPRE-TOKOS:

15 Q. And Exhibit 1142.

16 A. This is the identification summary report for
17 Sacramento B18-00097 and Butte County 18-19755
18 identifying the remains as James Kinner.

19 Q. And it says "See Attached." What is attached in
20 terms of how the identification was made?

21 A. It looks like they were identified from medical
22 records and using the hardware for his right knee.

23 Q. Okay. And that's what you mentioned earlier
24 when sometimes you would do x-rays to see if there was
25 any sort of hardware that would have a serial number.

26 A. Yes.

1 Q. And this would be one of those cases?

2 A. Yeah, but the hardware was a loss because of the
3 damage. It was identified and it was -- based on that it
4 was -- some of the hardware numbers were not completely
5 visible, but it was based on the information provided and
6 identified.

7 [Exhibit 1143 introduced
8 as evidence.]

9 BY MS. DUPRE-TOKOS:

10 Q. Okay. Exhibit 1143.

11 A. This is Dr. Resk's report for Dorothy
12 Lee-Herrera, L-e-e, dash, H-e-r-r-e-r-a, Sacramento case
13 B18-105 and Butte County 18-19949.

14 Q. Were the standard procedures followed for
15 Ms. Lee-Herrera's autopsy?

16 A. Yes, they were.

17 Q. Did you review all the facts and procedures of
18 Ms. Herrera's autopsy report?

19 A. Yes, I did.

20 Q. Excuse me. Did you reach your own conclusion as
21 to Ms. Lee-Herrera's cause of death?

22 A. Yes, I did.

23 Q. And what was that conclusion?

24 A. Fire-related injuries.

25 [Exhibit 1144 introduced
26 as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. Is there an identification summary report
3 attached?

4 A. Yes, there is.

5 Q. So is that Exhibit 1144?

6 A. It is 1144. And it's from James D. Wood,
7 forensic dentistry. It identifies the decedent as
8 Dorothy Lee-Herrera.

9 Q. Does it list any case numbers on it?

10 A. It lists Sacramento case B18-00105 and Butte
11 County 18-19949.

12 [Exhibit 1145 introduced
13 as evidence.]

14 BY MS. DUPRE-TOKOS:

15 Q. Okay. Exhibit 1145.

16 A. Dr. Resk's report for Warren Lessard, Sacramento
17 case B18-101 and Butte County 18-19809.

18 Q. Were the standard procedures followed for
19 Mr. Lessard's autopsy?

20 A. Yes, they were.

21 Q. Did you review all the facts and procedures of
22 Mr. Lessard's autopsy?

23 A. Yes, I did.

24 Q. And did you reach your own conclusion as to
25 Mr. Lessard's cause of death?

26 A. Yes, I did.

1 Q. What was that conclusion?

2 A. Fire-related injuries.

3 [Exhibit 1146 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. And Exhibit 1146.

7 A. This is the identification summary report for
8 Sacramento case B18-00101 and Butte County 18-19809
9 identifying the remains as Warren Lessard.

10 Q. There's a note on there that says "See attached
11 for supporting documentation."

12 A. So it talks -- this is a report from our office
13 from Coroner Gin. It looks like where this body was
14 recovered there was only one resident. And I think it's
15 the decedent's sister who says that the decedent was a
16 squatter at that address. And Dr. Galloway, an
17 anthropologist -- G-a-l-l-o-w-a-y -- determined that they
18 were male, adult, old but not elderly.

19 He was -- the decedent was born in 1950 which
20 puts him into that range for the anthropologist. And
21 then Dr. Resk performed the autopsy and identified male
22 genitalia within the remains.

23 The DNA from an individual who claims that
24 Mr. Lessard is her brother did not reach the required
25 statistical probability that they are related. So the
26 identification couldn't be definitive based on the DNA.

1 Q. And what percentage did it reach or does it not
2 list it?

3 A. It says it did not reach 99.5 percent.

4 Q. Okay.

5 A. So it was below that. I don't know what that
6 87.7 under a string of numbers is. So it sounds like it
7 may be a little bit of circumstantial on this one as
8 well.

9 Q. Okay.

10 MR. NOEL: Remember, Ladies and Gentlemen, the
11 admonition you have been given where we remind you of
12 hearsay. Statements of the person alleging to be
13 Mr. Lessard's sibling would be hearsay. And the
14 difference between, say, those and the statements of
15 Dr. Resk or Dr. Selden or any of those others would be
16 that those are medical opinions and medical facts that
17 are being relied upon by this expert to form his own
18 conclusions. So that you can use, but the substance of
19 what the sister said you cannot use for any purposes.

20 **EXAMINATION**

21 BY MR. NOEL:

22 Q. All right. It's just about noon. Can I ask you
23 one clarifying question real quick before we break for
24 lunch. We've gone through now all of these --
25 approximately 100 exhibits, the autopsy reports,
26 identification reports.

1 We're concentrating on the face pages of those
2 things. Is that correct?

3 A. Yeah.

4 Q. The autopsy results, the identification results.
5 But what you're referring to actually in each exhibit is
6 a packet; correct?

7 A. That is correct.

8 Q. And is the contents of that packet attached to
9 the face page of the autopsy or identification report the
10 items that you relied upon in your review and in making
11 your medical opinion or giving your medical opinion?

12 A. There are the -- yes. There are things in here
13 that I didn't have access to that are part of the packet.
14 And most of that is just, you know, some of these other
15 statements and these other charts and diagrams of the DNA
16 and all that, graphs for identification.

17 But for every case I had access to the autopsy
18 report, the photographs of the remains, and the -- and I
19 don't know for each particular case. There were other
20 things that were available in our system. I don't know
21 what they may have been, but they may or may not have
22 included what else is in this packet so -- but they
23 didn't -- if they were there or not there based on the
24 information that I did have, I was able to come to my
25 opinion and conclusion about the case from a medical
26 standpoint.

1 Q. Okay. So each packet is the result of the
2 autopsy plus supporting documentation and other items as
3 part of the autopsy itself; correct?

4 A. That is correct.

5 MR. NOEL: All right. Ready for lunch?

6 GRAND JURY FOREPERSON: Yes. Everybody seems
7 ready.

8 MS. DUPRE-TOKOS: Are you going to give the
9 admonition again?

10 MR. NOEL: Yep.

11 GRAND JURY FOREPERSON: Dr. Tovar, you are
12 admonished not to discuss or disclose at any time outside
13 of this jury room the questions that have been asked of
14 you or your answers until authorized by this grand jury
15 or the Court. A violation of these instructions on your
16 part may be the basis for a charge against you of
17 contempt of court. This does not preclude you from
18 discussing your legal rights with your own attorney.

19 Dr. Tovar, what I have just said is a warning
20 not to discuss this case with anyone except the Court,
21 your lawyer, or the district attorney.

22 Any questions?

23 THE WITNESS: No.

24 GRAND JURY FOREPERSON: Thank you.

25 [Whereupon the luncheon recess

26 is taken from 12:00 to 1:33 p.m.]

1 [ROLL CALL OMITTED.]

2
3 [Witness enters the courtroom.]

4 MS. DUPRE-TOKOS: And then before you sit, you
5 need to face madam foreperson as well.

6 THE WITNESS: I'm sorry. I don't know what to
7 do.

8 GRAND JURY FOREPERSON: That's okay.

9 And what is your name, Ma'am?

10 THE WITNESS: Cheryl Krueger.

11 GRAND JURY FOREPERSON: I'm sorry?

12 THE WITNESS: Cheryl Krueger.

13 GRAND JURY FOREPERSON: Krueger.

14 Okay. Ms. Krueger, do you solemnly swear that
15 the evidence you shall give in the matter pending before
16 the grand jury shall be the truth, the whole truth, and
17 nothing but the truth so help you God?

18 THE WITNESS: Yes.

19 GRAND JURY FOREPERSON: Thank you. Have a seat,
20 please.

21 **EXAMINATION**

22 MS. DUPRE-TOKOS:

23 Q. Good afternoon.

24 A. Hi.

25 Q. I was going to say you can pull that closer to
26 you a little bit. I know no one in your family will

1 believe it, but you are soft spoken. So you might need
2 to pull the microphone closer.

3 A. They wouldn't believe you. They would not
4 believe you.

5 Q. Could you state your name and spell your last
6 name for us.

7 A. My name is Cheryl Krueger and it's
8 K-r-u-e-g-e-r.

9 Q. Now, just as an initial matter, are you related
10 to someone by the name of Lisa Beach?

11 A. I am. She's my sister.

12 Q. And is that the same Lisa Beach who works at the
13 Butte County DA's Office?

14 A. Yes.

15 Q. Is there anything about that relationship that
16 would cause you to be anything less than truthful today?

17 A. Absolutely not.

18 Q. She's your little sister?

19 A. Yeah. And she would slap me if I lied.

20 Q. Did you have a brother by the name of James
21 Garner?

22 A. I do.

23 Q. Okay. And to some family members did he go by
24 the nickname Jimbo?

25 A. Yes.

26 Q. Where did he live?

1 A. I lived at 6284 Woodbury Drive, Magalia,
2 California.

3 Q. And where in relation -- on November 8th of
4 2018, where did you live in relationship to your brother
5 Jimbo?

6 A. Two blocks over.

7 Q. Did you speak to him on November 8, 2018?

8 A. I did.

9 Q. Is that in person or over the phone?

10 A. Over the phone.

11 Q. Okay. Had you spoken to him on the phone before
12 at any time in your life?

13 A. For about 60 some-odd years.

14 Q. Okay. So were you able to recognize the
15 voice -- when you spoke to him on the phone that day, did
16 you recognize the voice as his and the one you heard
17 over -- as his over the phone for years and years?

18 A. Yes.

19 Q. Now, did you call him or did he call you?

20 A. I called him.

21 Q. Did you call on the same phone number you always
22 call in order to reach him?

23 A. Yeah.

24 Q. Okay. And did he have a unique way of answering
25 the phone?

26 A. "How do?"

1 Q. When you called him on November 8th, did he
2 answer the phone "How do?"

3 A. He did.

4 Q. Did you have any doubt in your mind that you
5 were speaking with your brother Jimbo?

6 A. No doubt at all.

7 Q. How many times did you speak with him on the
8 phone on November 8, 2018?

9 A. I called him twice.

10 Q. Okay. And when you -- the number you called,
11 was that a landline?

12 A. Yes.

13 Q. So you know he was at his house in Magalia?

14 A. Yes.

15 Q. Okay. Did you brother survive the Camp Fire on
16 November 8 of 2018?

17 A. No, he did not.

18 Q. Can you tell us the times that you spoke to him.
19 You said you spoke to him twice.

20 A. I did. Our son showed up at our house probably
21 around 8:00, 8:30 maybe and said that there was a fire
22 headed towards, I guess, Paradise. And so he said there
23 may be evacuations. And so he left us and went to
24 Paradise where his house was.

25 And so I called my brother to let him know that,
26 you know, we may all have to evacuate, should we pick him

1 up. And he said "No." He says "We've had fires around
2 here all around us." And I agreed with him. You know.
3 He was going to wait it out. Those were his exact words.

4 Q. So that first time was shortly after 8:00?

5 A. Yeah.

6 And then I called him again. We left our house
7 between 10:00 and 10:30, I believe. And I called him
8 just before we went out the door to see if I could come
9 pick him up. Because by that time my son was panicking
10 because he was in Paradise trying to get out. And he
11 wanted us out. And I explained to my son that I couldn't
12 get Jimmy to budge. And so when I called Jim the second
13 time, he said no. He was going to wait it out. You
14 know.

15 Q. So did he have a car?

16 A. No.

17 Q. Okay. So he would have been reliant on you or
18 someone else for a ride?

19 A. Yes, yes.

20 Q. Did you lose your house in the Camp Fire?

21 A. Yes.

22 Q. Can you tell us what your address was in
23 Magalia?

24 A. 13720 West Park Drive.

25 MS. DUPRE-TOKOS: Does anyone have any
26 questions?

1 Okay. If you could just give the admonition.

2 GRAND JURY FOREPERSON: Okay.

3 MS. DUPRE-TOKOS: Madam foreperson is going to
4 give you an admonition.

5 GRAND JURY FOREPERSON: Ms. Krueger, you are
6 admonished not to discuss or disclose at any time outside
7 of this jury room the questions that have been asked of
8 you or your answers until authorized by this grand jury
9 or the Court. A violation of these instructions on your
10 part may be the basis for a charge against you of
11 contempt of court. This does not preclude you from
12 discussing your legal rights with your own attorney.

13 Ms. Krueger, what I have just said is a warning
14 not to discuss this case with anyone except the Court,
15 your lawyer, or the district attorney.

16 Do you have any questions?

17 THE WITNESS: No, Ma'am.

18 GRAND JURY FOREPERSON: Okay. Thank you for
19 your time today.

20 MR. NOEL: Thank you.

21 [Witness exits the courtroom.]

22 MR. NOEL: Again, the hearsay admonition, Ladies
23 and Gentlemen. The content of her conversations with her
24 son, with her brother Jimbo are hearsay. Just out of an
25 abundance of caution, although those statements aren't
26 being offered to prove the truth of the matter asserted,

1 don't consider those statements in any way. It's simply
2 the fact that she spoke to her brother sometime shortly
3 after 8:00 a.m. and again right around 10:00 a.m. and at
4 that time he was alive.

5 Ready to go back to Dr. Tovar?

6 [Witness enters the courtroom.]

7 GRAND JURY FOREPERSON: Dr. Tovar, you are still
8 under oath. Have a seat.

9 MS. DUPRE-TOKOS: I'm just waiting for the TV to
10 warm up. Okay. You all set?

11 **EXAMINATION CONTINUED**

12 [Exhibit 1147 introduced
13 as evidence.]

14 BY MS. DUPRE-TOKOS:

15 Q. Let's start by looking at Exhibit 1147.

16 A. Okay. So this is the autopsy report of Dr. Resk
17 for Dorothy Mack, Sacramento case B18-100 and Butte
18 County 18-19812.

19 Q. And were the standard procedures followed for
20 Ms. Mack's autopsy?

21 A. Yes, they were.

22 Q. Did you review all the facts and procedures in
23 Ms. Mack's autopsy report?

24 A. Yes, I did.

25 Q. Did you reach your own conclusion as to
26 Ms. Mack's cause of death?

1 A. Yes, I did.

2 Q. What was your conclusion?

3 A. Fire-related injuries.

4 [Exhibit 1148 introduced
5 as evidence.]

6 BY MS. DUPRE-TOKOS:

7 Q. And then Exhibit 1148.

8 A. This is the identification summary report for
9 Sacramento case B18-00100 and Butte County 18-19812
10 identifying the remains as Dorothy Lee Mack.

11 [Exhibit 1149 introduced
12 as evidence.]

13 BY MS. DUPRE-TOKOS:

14 Q. And then Exhibit 1149.

15 A. This is the autopsy report from Dr. Resk for
16 Sara Magnuson, Sacramento case B18-92 and Butte County
17 18-19727.

18 Q. Were the standard procedures followed for
19 Ms. Magnuson's autopsy?

20 A. Yes, they were.

21 Q. Did you review all the facts and procedures in
22 her autopsy report?

23 A. Yes, I did.

24 Q. Did you reach your own conclusion as to
25 Ms. Magnuson's cause of death?

26 A. Yes, I did.

1 Q. What was that conclusion?

2 A. Fire-related injuries.

3 [Exhibit 1150 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. And then Exhibit 1150. If you can tell us what
7 that is.

8 A. This is the identification summary report for
9 Sacramento B18-00092 and Butte County 18-19727
10 identifying the remains as Sara Magnuson.

11 [Exhibit 1151 introduced
12 as evidence.]

13 BY MS. DUPRE-TOKOS:

14 Q. Exhibit 1151.

15 A. This is the autopsy report from Dr. Resk for
16 Joanne Delores Malarkey, Sacramento case B18-55 and Butte
17 County 18-19596.

18 Q. Were the standard procedures followed for
19 Ms. Malarkey's autopsy?

20 A. Yes, they were.

21 Q. And did you review all the facts and procedures
22 in her autopsy report?

23 A. Yes, I did.

24 Q. Did you reach your own conclusion as to
25 Ms. Malarkey's cause of death?

26 A. Yes, I did.

1 Q. And what was your conclusion?

2 A. Fire-related injuries.

3 [Exhibit 1152 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. And in Exhibit 1152.

7 A. This is the identification summary report for
8 Sacramento B18-00055 and Butte County 18-19596
9 identifying the remains has Joanne Malarkey.

10 [Exhibit 1153 introduced
11 as evidence.]

12 BY MS. DUPRE-TOKOS:

13 Q. Exhibit 1153.

14 A. This is the autopsy report from Dr. Su for John
15 Malarkey, Sacramento case B18-00056. And no Butte County
16 case number is on the autopsy report, but in the
17 accompanying diagram lists it 18-19594. And that's on
18 the diagram with the skeleton.

19 Q. Were the standard procedures followed for
20 Mr. Malarkey's autopsy?

21 A. Yes, they were.

22 Q. Did you review all the facts and procedures in
23 Mr. Malarkey's autopsy?

24 A. Yes, I did.

25 Q. Did you reach your own conclusion as to
26 Mr. Malarkey's cause of death?

1 A. Yes, I did.

2 Q. And what was that conclusion?

3 A. The fire-related injuries.

4 [Exhibit 1154 introduced
5 as evidence.]

6 BY MS. DUPRE-TOKOS:

7 Q. And Exhibit 1154.

8 A. This is the identification summary report for
9 Sacramento B18-00056 and Butte County 18-19594
10 identifying the remains as John Malarkey.

11 [Exhibit 1155 introduced
12 as evidence.]

13 BY MS. DUPRE-TOKOS:

14 Q. And Exhibit 1155.

15 A. This is Dr. Resk's autopsy report of Christopher
16 Maltby, Sacramento case B18-89 and Butte County case
17 18-19732.

18 Q. And were the standard procedures followed for
19 Mr. Maltby's autopsy?

20 A. Yes, they were.

21 Q. Did you review all the facts and procedures in
22 Mr. Maltby's autopsy?

23 A. Yes, I did.

24 Q. Did you reach your own conclusion as to
25 Mr. Maltby's cause of death?

26 A. Yes, I did.

1 Q. What was that?

2 A. Fire-related injuries.

3 [Exhibit 1156 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. In looking at Exhibit 1156, which may or may not
7 be attached, but we have --

8 MR. NOEL: I should have 1156.

9 THE WITNESS: Okay. This is the document for
10 support of identification. It describes a location where
11 the remains were found. There was surgical hardware that
12 was present. It looks like there were two ---

13 I'm not familiar with who Dr. Zehpre is. And
14 then Dr. Galloway is an anthropologist. I don't know who
15 Dr. Bartelink is.

16 They looked at two cases, B18-00044 and
17 B18-00089, and thought that they were older male
18 individuals. And they asked Dr. Bartelink to look at
19 those two cases. And he determined that they were one
20 person. And then there was surgical hardware with the
21 same matching serial numbers identifying the decedent as
22 Christopher Maltby.

23 BY MS. DUPRE-TOKOS:

24 Q. You gave two numbers. Those were both
25 Sacramento County coroner numbers, were they not?

26 A. That is correct.

1 Q. And does this document also list a Butte County
2 case number?

3 A. It lists 18-19732, yes.

4 Q. And this is on County of Sacramento Department
5 of the Coroner letterhead; correct?

6 A. Correct.

7 [Exhibit 1157 introduced
8 as evidence.]

9 BY MS. DUPRE-TOKOS:

10 Q. Exhibit 1157.

11 A. This is Dr. Resk's autopsy for David Marbury,
12 Sacramento case B18-404 and Butte County 18-19868.

13 Q. Were the standard procedures followed for
14 Mr. Marbury's autopsy?

15 A. Yes, they were.

16 Q. And did you review all the facts and procedures
17 in that autopsy?

18 A. Yes, I did.

19 Q. Did you reach your own conclusion as to
20 Mr. Marbury's cause of death?

21 A. Yes, I did.

22 Q. What was your conclusion?

23 A. Fire-related injuries.

24 [Exhibit 1158 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. And then Exhibit 1158.

2 A. This is the identification summary report for
3 Sacramento County case B18-00104 and Butte County
4 18-19868 identifying the remains as David Marbury.

5 [Exhibit 1159 introduced
6 as evidence.]

7 BY MS. DUPRE-TOKOS:

8 Q. Exhibit 1159.

9 A. This is Dr. Nagao's autopsy for Debbie
10 Morningstar, Sacramento case B18-00024 and Butte County
11 18-19534.

12 Q. And there's a note under "Autopsy Findings:
13 Nonlethal levels of --" I think it's "-- paroxetine in
14 liver tissues."

15 So again, just as we discussed earlier, that is
16 just pointing out something else?

17 A. Correct.

18 Q. Were the standard procedures followed for
19 Ms. Morningstar's autopsy?

20 A. Yes, they were.

21 Q. Did you review all the facts and procedures of
22 her autopsy?

23 A. Yes, I did.

24 Q. Did you reach your own conclusion as to her
25 cause of death?

26 A. Yes, I did.

1 Q. And what was that?

2 A. Thermal injuries.

3 [Exhibit 1160 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. And Exhibit 1160.

7 A. This is the identification summary report for
8 Sacramento B18-00024 and Butte County 18-19534
9 identifying the remains as Debbie Morningstar.

10 [Exhibit 1161 introduced
11 as evidence.]

12 BY MS. DUPRE-TOKOS:

13 Q. Exhibit 1161.

14 A. This is Dr. Resk's autopsy report for Helen
15 Pace, Sacramento case B18-94 and Butte County 18-19760.

16 Q. Were the standard procedures followed for
17 Ms. Pace's autopsy?

18 A. Yes, they were.

19 Q. And did you review all the facts and procedures
20 in her autopsy?

21 A. Yes, I did.

22 Q. Did you reach your own conclusion as to
23 Ms. Pace's cause of death?

24 A. Yes, I did.

25 Q. What was that?

26 A. Fire-related injuries.

1 [Exhibit 1162 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. Exhibit 1162.

5 A. This is the identification summary report for
6 Sacramento B18-00094 and Butte County 18-19760
7 identifying the remains as Helen Louise Pace.

8 [Exhibit 1163 introduced
9 as evidence.]

10 BY MS. DUPRE-TOKOS:

11 Q. Exhibit 1163.

12 A. This is my autopsy report for Joy Porter,
13 Sacramento B18-00030 and Butte County 18-19490.

14 Q. And did you follow the standard procedures for
15 this autopsy?

16 A. Yes, I did.

17 Q. What was your conclusion as to the cause of
18 death of Ms. Porter?

19 A. Thermal injuries.

20 [Exhibit 1164 introduced
21 as evidence.]

22 BY MS. DUPRE-TOKOS:

23 Q. And Exhibit 1164.

24 A. The identification summary report for Sacramento
25 B18-00030 and Butte 18-19490 identifying the remains as
26 Joy Porter.

1 [Exhibit 1165 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. And then Exhibit 1165.

5 A. This is the autopsy report of Dr. Nagao for
6 Beverly Powers, Sacramento case B18-00029 and Butte
7 County 18-49488.

8 Q. Excuse me. Were the standard procedures
9 followed for Ms. Powers' autopsy?

10 A. Yes, they were.

11 Q. And did you review all the facts and procedures
12 in her autopsy?

13 A. Yes, I did.

14 Q. Did you reach your own conclusion as to the
15 cause of death?

16 A. Yes, I did.

17 Q. What was that?

18 A. Thermal injuries.

19 [Exhibit 1166 introduced
20 as evidence.]

21 BY MS. DUPRE-TOKOS:

22 Q. And Exhibit 1166.

23 A. This is the identification summary report for
24 Sacramento B18-00029 and Butte County 18-19488
25 identifying the remains as Beverly Powers.

26 [Exhibit 1167 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. And Exhibit 1167.

A. This is the autopsy report of Dr. Raven for Robert Quinn, Sacramento case B18-00050 and Butte County 18-19568.

Q. And those are autopsy findings. There's a note "possible remains of more than one individual."

To your knowledge, was it ever determined that it was only one individual?

A. I do not recall.

Q. And it's fine if you don't recall.

A. I don't know. I just looked at the report and it says "possibly two people or more than one person."

Q. Is there a page at the end from Chico State University? And if there's not, that's fine.

A. Their notes aren't in here but . . .

Q. Okay. So were the standard procedures followed for Mr. Quinn's autopsy?

A. Yes, they were.

Q. And did you review all the facts and procedures in Mr. Quinn's autopsy?

A. Yes, I did.

Q. Did you reach your own conclusion as to Mr. Quinn's cause of death?

A. Yes, I did.

1 Q. And what was your conclusion?

2 A. Fire-related injuries.

3 [Exhibit 1168 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. And then Exhibit 1168.

7 A. It's the identification summary report for
8 Sacramento B18-00050 and Butte County 18-19568
9 identifying the remains as Robert Quinn.

10 [Exhibit 1169 introduced
11 as evidence.]

12 BY MS. DUPRE-TOKOS:

13 Q. Exhibit 1169.

14 A. This is Dr. Raven's report for Joseph Rabetoy,
15 R-a-b-e-t-o-y, case number Sacramento B18-00035 and Butte
16 County is 18-19543.

17 Q. Were the standard procedures followed for this
18 autopsy?

19 A. Yes, they were.

20 Q. And did you review all the facts and procedures
21 in Mr. Rabetoy's autopsy?

22 A. Yes, I did.

23 Q. Did you reach your own conclusion as to
24 Mr. Rabetoy's cause of death?

25 A. Yes, I did.

26 Q. And what was that conclusion?

A. Inhalation of products of combustion.

Q. I'm just going to ask you a general question so that I don't have to ask it over and over. When we see that the cause of death is inhalation of products of combustion, does that mean the person was alive at the time of the fire?

A. Yes.

Q. Okay. And then looking at your autopsy -- or Dr. Raven's autopsy findings, we have "soot lining the airway" and then the carboxyhemoglobin level of 48 percent. Is that high?

A. Yes, it is.

Q. Is it very high?

A. It's -- yeah. It's lethal.

0. Lethal?

A. Yeah.

[Exhibit 1170 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. Okay. Looking at Exhibit 1170.

A. This is the identification summary report for Sacramento B18-00035 and Butte County 18-19543 identifying the remains as Joseph Rabetoy.

Q. And just to ask another general question so I don't have to focus on it again, when we have the soot lining the airway, that's also an indication that the

1 person was alive at the time of the fire; correct?

2 A. That is correct.

3 [Exhibit 1171 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. Okay. Exhibit 1171.

7 A. This is Dr. Nagao's report for Forrest M. Rae,
8 Sacramento B18-00022 and Butte County 18-19530.

9 Q. Were these standard procedures followed for
10 Mr. Rae's autopsy?

11 A. Yes, they were.

12 Q. Did you review all the facts and procedures in
13 Mr. Rae's autopsy?

14 A. Yes, I did.

15 Q. Did you reach your own conclusion as to
16 Mr. Rae's cause of death?

17 A. Yes, I did.

18 Q. And what was that conclusion?

19 A. Thermal injuries.

20 [Exhibit 1172 introduced
21 as evidence.]

22 BY MS. DUPRE-TOKOS:

23 Q. And Exhibit 1172.

24 A. This is the identification summary report for
25 Sacramento B18-00022 and Butte County 18-19530
26 identifying the remains as Forrest Rae.

1 [Exhibit 1173 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. Exhibit 1173.

5 A. This is Dr. Abedschmidt's report for Vernice
6 Regan, Sacramento case B18-00031 and Butte County
7 18-19540.

8 Q. Were the standard procedures followed for
9 Ms. Regan's autopsy?

10 A. Yes, they were.

11 Q. Did you review all the facts and procedures in
12 Ms. Regan's autopsy?

13 A. Yes, I did.

14 Q. Did you reach your own conclusion as to
15 Ms. Regan's cause of death?

16 A. Yes, I did.

17 Q. And what was that conclusion?

18 A. Thermal injuries.

19 Q. Now, looking at the autopsy findings it points
20 out "There's no significant elevation in
21 carboxyhemoglobin and no soot deposition in left distal
22 airway." But this was -- I assume this would be the type
23 of situation you explained earlier where either the
24 person died too quickly or their airway closed off.

25 A. Yes. And it could be -- in this case some of
26 the tissues weren't available for exam because they had

1 burned away.

2 [Exhibit 1174 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. Okay. And then Exhibit 1174.

6 A. This is the identification summary for
7 Sacramento B18-00031 and Butte 18-19540 identifying the
8 remains as Vernice Regan.

9 [Exhibit 1175 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. Exhibit 1175.

13 A. This is the autopsy report for Dr. Resk on a
14 doe, Sacramento case B18-90 and Butte 18-19730.

15 Q. Were the standard procedures followed for this
16 autopsy?

17 A. Yes, they were.

18 Q. Did you review all the facts and procedures in
19 this autopsy?

20 A. Yes, I did.

21 Q. Did you reach your own conclusion as to the
22 cause of death?

23 A. Yes, I did.

24 Q. And what was that conclusion?

25 A. Fire-related injuries.

26 Q. Okay. Is there -- is there an identification

1 summary with that?

2 A. There is not.

3 Q. Okay. But we do have case numbers on the
4 autopsy report; correct?

5 A. Both, yes.

6 [Exhibit 1176 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. This is Exhibit 1176.

10 A. This is Dr. Nagao's autopsy for Lolene Rios,
11 Sacramento case B18-00036 and Butte County 18-19542.

12 Q. Were the standard procedures followed for
13 Ms. Rios' autopsy?

14 A. Yes, they were.

15 Q. And did you review all the facts and procedures
16 in her autopsy?

17 A. Yes, I did.

18 Q. Did you reach your own conclusion as to
19 Ms. Rios' cause of death?

20 A. Yes, I did.

21 Q. And what was that conclusion?

22 A. Inhalation of products of combustion.

23 Q. So again, she was alive at the time of the fire?

24 A. That is correct.

25 [Exhibit 1177 introduced
26 as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. And then Exhibit 1177.

3 A. This is the identification summary report for
4 Sacramento B18-00036 and Butte County 18-19542
5 identifying the remains as Lolene Rios.

6 [Exhibit 1178 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And Exhibit 1178.

10 A. This is Dr. Raven's report for Gerald Rodrigues,
11 Sacramento case B18-00051 and Butte County 18-19562.

12 Q. Were the standard procedures followed for
13 Mr. Rodrigues' autopsy?

14 A. Yes, they were.

15 Q. And did you review all the facts and procedures
16 in that autopsy?

17 A. Yes, I did.

18 Q. Did you reach your own conclusion as to
19 Mr. Rodrigues' cause of death?

20 A. Yes, I did.

21 Q. And what was that conclusion?

22 A. Fire-related injuries.

23 [Exhibit 1179 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. And then Exhibit 1179.

1 A. This is the identification summary report for
2 Sacramento B18-00051 and Butte County 18-19562
3 identifying the remains as Gerald Rodrigues.

4 [Exhibit 1180 introduced
5 as evidence.]

6 BY MS. DUPRE-TOKOS:

7 Q. Exhibit 1180.

8 A. This is Dr. Resk's report for Frederick Salazar,
9 Sacramento case B18-59 and Butte County 18-19617.

10 Q. Were the standard procedures followed for
11 Mr. Salazar's autopsy?

12 A. Yes, they were.

13 Q. And did you review all the facts and procedures
14 in his autopsy?

15 A. Yes, I did.

16 Q. Did you reach your own conclusion as to
17 Mr. Salazar's cause of death?

18 A. Yes, I did.

19 Q. And what was that conclusion?

20 A. Fire-related injuries.

21 [Exhibit 1181 introduced
22 as evidence.]

23 BY MS. DUPRE-TOKOS:

24 Q. And then Exhibit 1181.

25 A. This is the identification summary report for
26 Sacramento B18-00059 and Butte 18-19617 identifying the

1 remains as Frederick Christopher Salazar.

2 [Exhibit 1182 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. And Exhibit 1182.

6 A. This is my autopsy report for Phyllis Salazar,
7 Sacramento case B18-00054 and Butte County 18-19595.

8 Q. Did you follow the standard procedures for this
9 autopsy?

10 A. Yes, I did.

11 Q. And what was your conclusion as to Ms. Salazar's
12 cause of death?

13 A. Thermal injuries.

14 [Exhibit 1183 introduced
15 as evidence.]

16 BY MS. DUPRE-TOKOS:

17 Q. And Exhibit 1183.

18 A. This is the identification summary report for
19 Sacramento B18-00054 and Butte County 18-19595
20 identifying the remains as Phyllis Salazar.

21 [Exhibit 1184 introduced
22 as evidence.]

23 BY MS. DUPRE-TOKOS:

24 Q. Exhibit 1184.

25 A. This is Dr. Raven's report for Sheila Santos,
26 Sacramento B18-00037 and Butte County 18-19536 and

1 18-19496.

2 Q. And were the standard procedures followed for
3 Ms. Santos' autopsy?

4 A. Yes, they were.

5 Q. And did you review all the facts and procedures
6 in this autopsy?

7 A. Yes, I did.

8 Q. Did you reach your own conclusion as to
9 Ms. Santos' cause of death?

10 A. Yes, I did.

11 Q. And what was that conclusion?

12 A. Thermal injuries.

13 Q. And under "Autopsy findings" it includes upper
14 airway soot; correct?

15 A. Yes.

16 [Exhibit 1185 introduced
17 as evidence.]

18 BY MS. DUPRE-TOKOS:

19 Q. And Exhibit 1185.

20 A. It's the identification summary report for
21 Sacramento B18-00037 and 18-19536 identifying the remains
22 as Sheila Santos.

23 [Exhibit 1186 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. Exhibit 1186.

1 A. This is Dr. Resk's autopsy report for Ronald
2 Schenk, Sacramento B18-75 and Butte County 18-19679.

3 Q. Were the standard procedures followed for
4 Mr. Schenk's autopsy?

5 A. Yes, they were.

6 Q. And did you review all the facts and procedures
7 of his autopsy?

8 A. Yes, I did.

9 Q. Did you reach your own conclusion as to
10 Mr. Schenk's cause of death?

11 A. Yes, I did.

12 Q. And what was that conclusion?

13 A. Fire-related injuries.

14 [Exhibit 1187 introduced
15 as evidence.]

16 BY MS. DUPRE-TOKOS:

17 Q. And then Exhibit 1187.

18 A. This is the identification summary report for
19 Sacramento B18-00075 and Butte County 18-19679
20 identifying the remains as Ronald Schenk.

21 [Exhibit 1188 introduced
22 as evidence.]

23 BY MS. DUPRE-TOKOS:

24 Q. And then Exhibit 1188.

25 A. This is Dr. Resk's autopsy for Berniece Schmidt,
26 Sacramento B18-103 and Butte County 18-19865.

1 Q. Were the standard procedures followed for
2 Ms. Schmidt's autopsy?

3 A. Yes, they were.

4 Q. And did you review all the facts and procedures
5 in her autopsy?

6 A. Yes, I did.

7 Q. Did you reach your own conclusion as to
8 Ms. Schmidt's cause of death?

9 A. Yes, I did.

10 Q. And what was your conclusion?

11 A. Fire-related injuries.

12 [Exhibit 1189 introduced
13 as evidence.]

14 BY MS. DUPRE-TOKOS:

15 Q. And then Exhibit 1189.

16 A. This is the identification summary report for
17 Sacramento B18-00103 and Butte County 18-19865
18 identifying the remains as Berniece Schmidt.

19 Q. Is there a note on there indicating that there
20 is a typo of the case number on the DNA report?

21 A. Yes, there is.

22 Q. And the case number that you read to us from the
23 identification summary report cover page is the correct
24 number?

25 A. That is correct.

26 [Exhibit 1190 introduced

1 as evidence.]

2 BY MS. DUPRE-TOKOS:

3 Q. Exhibit 1190.

4 A. Dr. Resk's autopsy report for John Sedwick,
5 Sacramento B18-83 and Butte County 18-19699.

6 Q. Were the standard procedures followed for
7 Mr. Sedwick's autopsy?

8 A. Yes, they were.

9 Q. And did you review all the facts and procedures
10 of his autopsy?

11 A. Yes, I did.

12 Q. Did you reach your own conclusion as to
13 Mr. Sedwick's cause of death?

14 A. Yes, I did.

15 Q. And what was that?

16 A. Fire-related injuries.

17 [Exhibit 1191 introduced
18 as evidence.]

19 BY MS. DUPRE-TOKOS:

20 Q. Exhibit 1191.

21 A. It's the identification summary report for
22 Sacramento B18-00083 and Butte 18-19699 identifying the
23 remains as John Sedwick.

24 [Exhibit 1192 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. And Exhibit 1192.

2 A. This is Dr. Resk's report for Don Shores,
3 Sacramento B18-80 and Butte County 18-19705.

4 Q. Were the standard procedures followed for
5 Mr. Shores' autopsy?

6 A. Yes, they were.

7 Q. Did you review all the facts and procedures in
8 Mr. Shores' autopsy?

9 A. Yes, I did.

10 Q. Did you reach your own conclusion as to
11 Mr. Shores' cause of death?

12 A. Yes, I did.

13 Q. And what was that conclusion?

14 A. Fire-related injuries.

15 [Exhibit 1193 introduced
16 as evidence.]

17 BY MS. DUPRE-TOKOS:

18 Q. And Exhibit 1193.

19 A. This is the identification summary report for
20 Sacramento B18-00080 and Butte 18-19705 identifying the
21 remains as Don Shores.

22 [Exhibit 1194 introduced
23 as evidence.]

24 BY MS. DUPRE-TOKOS:

25 Q. And Exhibit 1194.

26 A. This is the autopsy report of Dr. Resk for Cathy

1 Shores, Sacramento B18-79 and Butte County 18-19704.

2 Q. And were the standard procedures followed for
3 Ms. Shores' autopsy?

4 A. Yes, they were.

5 Q. Did you review all the facts and procedures in
6 Ms. Shores' autopsy?

7 A. Yes, I did.

8 Q. Did you reach your own conclusion as to
9 Ms. Shore' cause of death?

10 A. Yes, I did.

11 Q. And what was that conclusion?

12 A. Fire-related injuries.

13 [Exhibit 1195 introduced
14 as evidence.]

15 BY MS. DUPRE-TOKOS:

16 Q. And Exhibit 1195.

17 A. This is the identification summary report for
18 Sacramento B18-00079 and Butte 18-19704 identifying the
19 remains as Cathy Shores.

20 Q. And is there a handwritten correction on there
21 basically indicating that the DNA report lists Kevin
22 Keeling as a sister of Cathy Shores and it should
23 actually list him as a brother of Cathy Shores?

24 A. That is correct.

25 [Exhibit 1196 introduced
26 as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. Exhibit 1196.

3 A. This is Dr. Resk's report for a doe, Sacramento
4 case B18-106 and Butte County 18-19948.

5 Q. And were the standard procedures followed for
6 this autopsy?

7 A. Yes, they were.

8 Q. Did you review all the facts and procedures of
9 this autopsy?

10 A. Yes, I did.

11 Q. Did you form your own conclusion as to the cause
12 of death for this person?

13 A. Yes, I did.

14 Q. And what was that conclusion?

15 A. Fire-related injuries.

16 [Exhibit 1197 introduced
17 as evidence.]

18 BY MS. DUPRE-TOKOS:

19 Q. Is there an identification summary report
20 attached?

21 A. There is a Butte County identification
22 supplement with the case 18-19948 identifying the
23 decedent as Judith Sipher.

24 Q. Is there an exhibit sticker on there?

25 A. It's 1197.

26 [Exhibit 1198 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. Do you have Exhibit 1198 in front of you?

A. Yes, I do.

Q. Is that a standard coroner's report that we've been looking at?

A. This is different than what we've been looking at.

Q. Okay. Where did -- what is the name on that report in front of you Exhibit 1198? Does it give the name of a decedent?

A. Larry Ronald Smith.

Q. And are you familiar with where Larry Ronald Smith died?

A. I am familiar in reviewing this report, yes.

Q. And where did he die?

A. U.C. Davis Medical Center in Sacramento.

Q. So he died after the fire? Would that be accurate?

A. Yes.

Q. And in your job as coroner -- and we touched on this -- or as a forensic pathologist -- and we talked about this a little bit beforehand. If someone is injured in the fire and then later dies in Sacramento County, would your office become involved if it was a fire-related death?

1 A. Yes.

2 Q. And did your office, in fact, review anything to
3 do with Mr. Smith to your knowledge?

4 A. I would imagine that we did, yes.

5 Q. Okay. And, in fact, a death certificate would
6 issue out of Sacramento County for Mr. Smith, wouldn't
7 it?

8 A. Yes.

9 Q. And if Mr. Smith had died at the hospital, there
10 likely would not be an autopsy report; correct?

11 A. That's correct.

12 Q. And that is the situation where you can trust
13 the doctor and what they say is the cause of death?

14 A. Correct.

15 Q. Okay. So then let's look at Exhibit 1199.
16 Actually, I'm sorry.

17 What was Mr. Smith's cause of death? Do you
18 know?

19 A. I don't know what the doctor put on the death
20 certificate. But in my review, it would be related to
21 results from being involved in the fire. He had body
22 burns and had complications that arose from that.

23 Q. So fire-related injuries as well?

24 A. Yeah.

25 Q. Okay. Thank you.

26 [Exhibit 1199 introduced

1 as evidence.]

2 BY MS. DUPRE-TOKOS:

3 Q. Now let's move on to 1199.

4 A. Okay. This is my report for Russell Stewart,
5 Sacramento B18-00025. It did not list the Butte County
6 case number.

7 Q. Okay. And did you follow the standard
8 procedures for this autopsy?

9 A. Yes, I did.

10 Q. And what was your conclusion as to the cause of
11 death for Mr. Stewart?

12 A. Thermal injuries.

13 [Exhibit 1200 introduced
14 as evidence.]

15 BY MS. DUPRE-TOKOS:

16 Q. And then Exhibit 1200.

17 A. That is the identification summary report for
18 Sacramento B18-00025 and Butte number 18-19546
19 identifying the remains as Russell Stewart.

20 I have documentation in the packet here on the
21 admitting form that has a Butte number as 18-19546 that
22 matches that identification.

23 Q. Thank you. And then a Sacramento case number
24 that also matches; correct?

25 A. That is correct.

26 MR. NOEL: We've been going now for almost an

1 hour. Out of the 30 autopsies we have approximately ten
2 left. Do we want to take a short break and come back and
3 finish it up? Our next witnesses won't be here until
4 3:15. So we can take a short break now and a short break
5 after Dr. Tovar and power through this and take a long
6 break after Dr. Tovar.

7 GRAND JUROR NUMBER FOUR: Power through.

8 MS. DUPRE-TOKOS: We're going to have to take a
9 short break for the other PowerPoint.

10 MR. NOEL: Okay.

11 [Exhibit 1201 introduced
12 as evidence.]

13 BY MS. DUPRE-TOKOS:

14 Q. All right. Let's look at Exhibit 1201.

15 A. This is Dr. Raven's report for Victoria Taft,
16 case Sacramento B18-00065 and Butte County 18-19633.

17 Q. Were the standard procedures followed for
18 Ms. Taft's autopsy?

19 A. Yes, they were.

20 Q. Did you review all the facts and procedures in
21 Ms. Taft's autopsy?

22 A. Yes, I did.

23 Q. Did you reach your own conclusion as to
24 Ms. Taft's cause of death?

25 A. Yes, I did.

26 Q. And what was that conclusion?

1 A. Thermal injuries.

2 [Exhibit 1202 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. And then Exhibit 1202.

6 A. This is the identification summary report for
7 Sacramento B18-00065. It does not have the Butte County
8 number, but the remains were identified as Victoria Taft.

9 [Exhibit 1203 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. Okay. And then Exhibit 1203.

13 A. This is Dr. Resk's report for Shirlee Teays.

14 Q. I believe it's Teays.

15 A. Teays, Sacramento B18-84 and Butte County
16 18-19712.

17 Q. Were the standard procedures followed for
18 Ms. Teays' autopsy?

19 A. Yes, they were.

20 Q. And did you look at all the facts and procedures
21 in her autopsy?

22 A. Yes, I did.

23 Q. Did you reach your own conclusion as to
24 Ms. Teays' cause of death?

25 A. Yes, I did.

26 Q. And what was that conclusion?

1 A. Fire-related injuries.

2 [Exhibit 1204 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. And 1204.

6 A. This is the identification summary report for
7 Sacramento B18-00084 and Butte County 18-19712
8 identifying the remains as Shirlee Teays.

9 [Exhibit 1205 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. Exhibit 1205.

13 A. This is Dr. Resk's report for Joanne Tracy,
14 Sacramento B18-76 and Butte 18-19669.

15 Q. Were the standard procedures followed for
16 Ms. Tracy's autopsy?

17 A. Yes, they were.

18 Q. And did you review all the facts and procedures
19 in her autopsy?

20 A. Yes, I did.

21 Q. Did you reach your own conclusion as to
22 Ms. Tracy's cause of death?

23 A. Yes, I did.

24 Q. And what was that conclusion?

25 A. Fire-related injuries.

26 [Exhibit 1206 introduced

1 as evidence.]

2 BY MS. DUPRE-TOKOS:

3 Q. And then Exhibit 1206.

4 A. This is the identification summary report for
5 Sacramento B18-00076 and Butte 18-19669 identifying the
6 remains as Joanne Tracy.

7 [Exhibit 1207 introduced
8 as evidence.]

9 BY MS. DUPRE-TOKOS:

10 Q. And Exhibit 1207.

11 A. This is my report for Ellen Walker, Sacramento
12 B18-00023 and Butte County 18-19532.

13 Q. And did you follow the standard procedures for
14 this autopsy?

15 A. Yes, I did.

16 Q. And what was your opinion on cause of death?

17 A. Thermal injuries.

18 Q. And I see a note in there that there were
19 commingled remains.

20 A. That is correct.

21 Q. And so the other individual is under case number
22 B18-00053?

23 A. That is correct.

24 [Exhibit 1208 introduced
25 as evidence.]

26 BY MS. DUPRE-TOKOS:

1 Q. Exhibit 1208.

2 A. This is the identification summary report for
3 Sacramento B18-00023 and Butte 18-19532 identifying the
4 remains as Ellen Walker.

5 [Exhibit 1209 introduced
6 as evidence.]

7 BY MS. DUPRE-TOKOS:

8 Q. Exhibit 1209.

9 A. Are these different?

10 Q. They may not be different.

11 A. Okay. So this is for -- this is Dr. Resk's
12 report for Donna Ware, Sacramento B18-91 and Butte County
13 18-19725.

14 Q. And were the standard procedures followed for
15 Ms. Ware's autopsy?

16 A. Yes, they were.

17 Q. Did you review all the facts and procedures in
18 Ms. Ware's autopsy report?

19 A. Yes, I did.

20 Q. And did you reach your own conclusion as to
21 Ms. Ware's cause of death?

22 A. Yes, I did.

23 Q. And what was your conclusion?

24 A. Fire-related injuries.

25 [Exhibit 1210 introduced
26 as evidence.]

1 BY MS. DUPRE-TOKOS:

2 Q. And Exhibit 1210.

3 A. This is the identification summary report for
4 Sacramento B18-00091 and Butte 18-19725 identifying the
5 remains as Donna Ware.

6 [Exhibit 1211 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And Exhibit 1211.

10 A. This is Dr. Resk's report for a doe, Sacramento
11 B18-95 and Butte 18-19754.

12 Q. And were the standard procedures followed for
13 this autopsy?

14 A. Yes, they were.

15 Q. And did you review all the facts and procedures
16 then?

17 A. Yes, I did.

18 Q. Did you reach your own conclusion as to the
19 cause of death?

20 A. Yes, I did.

21 Q. And what was that conclusion?

22 A. Fire-related injuries.

23 [Exhibit 1212 introduced
24 as evidence.]

25 BY MS. DUPRE-TOKOS:

26 Q. And is there an identification summary report?

A. Yes, put out by Butte County on a circumstantial identification for their case number 18-19754 identifying the remains as Isabel Webb.

Q. And is that Exhibit Number 1212?

A. Yes, it is.

[Exhibit 1213 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. And Exhibit 1213.

A. This is Dr. Raven's report for Marie Wehe.

Q. Wehe.

A. Wehe, W-e-h-e, Sacramento B18-00028 and Butte County 18-19537.

Q. Okay. Were the standard procedures followed for Ms. Wehe's autopsy?

A. Yes, they were.

Q. And did you review all the facts and procedures in Ms. Wehe's autopsy?

A. Yes, I did.

Q. Did you reach your own conclusion as to the cause of death?

A. Yes, I did.

0. And what was that conclusion?

A. Thermal injuries.

Q. And then this also notes soot in airways; is that correct?

1 A. That's correct.

2 [Exhibit 1214 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. Exhibit 1214.

6 A. This is identification summary report for case
7 Sacramento B18-00028 and Butte 18-19537 identifying the
8 remains as Marie Lorain Wehe.

9 [Exhibit 1215 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. And Exhibit 1215.

13 A. This is Dr. Su's report for Kimberly Wehr.

14 Q. Wehr?

15 A. Wehr, Sacramento B18-00060. No Butte County is
16 listed on the case here.

17 Q. And were the standard procedures followed for
18 Ms. Wehr's autopsy?

19 A. Yes.

20 Q. Did you review all the facts and procedures in
21 her autopsy?

22 A. Yes, I did.

23 Q. And did you reach your own conclusion as to
24 Ms. Wehr's cause of death?

25 A. Yes, I did.

26 Q. What was that conclusion?

1 A. Thermal injuries and smoke inhalation.

2 Q. And then this also notes that there was soot in
3 the trachea; is that correct?

4 A. Yes.

5 [Exhibit 1216 introduced
6 as evidence.]

7 BY MS. DUPRE-TOKOS:

8 Q. And then Exhibit 1216.

9 A. This is the summary identification for
10 Sacramento B18-00060 and Butte County 18-19627
11 identifying the remains as Kimberly Wehr.

12 I do have a notation that on the outside of the
13 body bag at the time of the exam the Butte number was
14 18-19627. That matches the other identification summary.

15 [Exhibit 1219 introduced
16 as evidence.]

17 BY MS. DUPRE-TOKOS:

18 Q. And then it should jump to Exhibit 1219.

19 A. Yes. This is Dr. Su's report for David Young,
20 Sacramento B18-00041.

21 Q. And were the standard procedures followed for
22 Mr. Young's autopsy?

23 A. Yes, they were.

24 Q. Did you review all the facts and procedures in
25 Mr. Young's autopsy?

26 A. Yes, I did.

1 Q. Did you reach your own conclusion as to
2 Mr. Young's cause of death?

3 A. Yes, I did.

4 Q. What was your conclusion?

5 A. Thermal injuries and smoke inhalation.

6 [Exhibit 1220 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And then Exhibit 1220.

10 A. It's the identification summary report for
11 Sacramento B18-00041 identifying the remains as David
12 Glenn Young. No Butte number was listed.

13 MS. DUPRE-TOKOS: Okay. And on that note we
14 need to take a short break.

15 I'll cover that one. We have another one to
16 cover, too.

17 [Conferring off the record.]

18 [Exhibit 1221 introduced
19 as evidence.]

20 BY MS. DUPRE-TOKOS:

21 Q. Okay. If you could look at Exhibit 1221 in
22 front of you. I know the PowerPoint says 1219, but it
23 should say 1221.

24 A. Okay. I have that here, yes.

25 Q. And did you perform that autopsy?

26 A. Yes, I did. This is for Sacramento case

1 B18-00053 and Butte County 18-20004.

2 Q. And the -- I'm sorry.

3 A. For a doe.

4 Q. Did you follow the standard procedures for this
5 autopsy?

6 A. Yes, I did.

7 Q. And did you reach a conclusion as to the cause
8 of death?

9 A. Yes, I did.

10 Q. And what was your conclusion?

11 A. Fire-related injuries.

12 [Exhibit 1222 introduced
13 as evidence.]

14 BY MS. DUPRE-TOKOS:

15 Q. Now, it says here "commingled remains." So were
16 these remains commingled with the individual in
17 Sacramento case number B18-00023?

18 A. Yes.

19 Q. Okay. And then Exhibit 1220, is that an
20 amendment -- or I guess actually it should be 1222.

21 A. Yes.

22 Q. Is that an amendment to the autopsy?

23 A. Yes. It's to correct some typos. The --

24 Q. Okay.

25 A. In my note on the original one I had the number
26 is not correct. So I corrected those to be that the

1 tissue that was found in these -- in this commingled case
2 belonged to case B18-00023 and the teeth, mandible, and
3 maxilla belonged to 18-00053.

4 Q. And 00053 is this current case; correct?

5 A. That is correct.

6 Q. Okay. And it didn't change the cause of death;
7 correct?

8 A. No.

9 Q. And to your knowledge, has any identification
10 been made on these remains to date?

11 A. No.

12 [Exhibit 1101 introduced
13 as evidence.]

14 BY MS. DUPRE-TOKOS:

15 Q. And then we should have one last exhibit in
16 front of you. I'm not certain what number that is.

17 A. Exhibit 1101.

18 Q. Thank you.

19 And again, 1101 is also not the typical autopsy
20 report that we've been looking at today; is that correct?

21 A. That is correct.

22 Q. And why is that?

23 A. This is another hospital death delayed, and it
24 was from a nursing center River Bend Nursing Center.

25 He -- this is Butte case 19-05657 and the decedent is

26 Paul Robert Ernest. And based on my review of the deputy

1 coroner's narrative and investigation, this is a result
2 of a fire-related injury that led to his demise.

3 Q. And did Mr. Ernest die in Sacramento County? Is
4 that where the nursing facility is?

5 A. Yes, that is correct.

6 Q. Okay.

7 A. In Sacramento County.

8 Q. And so this again would be a situation where the
9 death certificate would issue out of Sacramento County?

10 A. Correct.

11 Q. And the coroner's office would receive notice
12 because it was a fire-related death but had the option of
13 relying on the attending physician's information;
14 correct?

15 A. That is correct.

16 Q. Okay. And in this case Mr. Ernest did die from
17 his injuries sustained in the fire making it a
18 fire-related death?

19 A. Based on my review of this information, that is
20 my opinion, yes.

21 MS. DUPRE-TOKOS: Okay. Does anybody have any
22 questions?

23 BY MS. DUPRE-TOKOS:

24 Q. So, Dr. Tovar, in your professional experience
25 have you ever experienced anything like this?

26 A. No, I have not.

1 MS. DUPRE-TOKOS: Any other questions? No.

2 Thank you very much, Dr. Tovar. And you just
3 need to get the admonition again.

4 GRAND JURY FOREPERSON: Okay. Dr. Tovar, you
5 are admonished not to discuss or disclose at any time
6 outside of this jury room the questions that have been
7 asked of you or your answers until authorized by this
8 grand jury or the Court. A violation of these
9 instructions on your part may be the basis for a charge
10 against you of contempt of court. This does not preclude
11 you from discussing your legal rights with your own
12 attorney.

13 Dr. Tovar, what I have just said is a warning
14 not to discuss this case with anyone except the Court,
15 your lawyer, or the district attorney.

16 Do you have any questions?

17 THE WITNESS: No. Thank you.

18 GRAND JURY FOREPERSON: Thank you for your time
19 today.

20 THE WITNESS: You're welcome.

21 MS. DUPRE-TOKOS: And at this time, Madam
22 Foreperson, a break, I guess, for quite a bit.

23 GRAND JURY FOREPERSON: Okay.

24 MS. DUPRE-TOKOS: Sorry. The witnesses won't be
25 here until 3:15.

26 GRAND JURY FOREPERSON: Okay. So on break until

1 3:15.

2 [Break taken from
3 2:41 until 3:15 p.m.]

4 GRAND JURY FOREPERSON: Okay. All members of
5 the grand jury are present and ready to proceed.

6 MR. NOEL: Oh, go ahead. Back on the record.

7 MS. DUPRE-TOKOS: So with Dr. Tovar there were
8 some exhibits that were missing from the stack that we
9 will submit. And their numbers are 1055, 1056, 1057,
10 1060, 1121, 1125, 1144, and 1197. Now 1121 and 1125 we
11 did not specifically mention the numbers, but they were
12 up on the screen and they were discussed by Dr. Tovar.
13 So we will be submitting those separately.

14 GRAND JURY FOREPERSON: Okay. Okay. I think
15 we're ready.

16 [Witness enters the courtroom.]

17 GRAND JURY FOREPERSON: Captain Kluge, will you
18 raise your right hand to be sworn again, please.

19 THE WITNESS: Yes.

20 GRAND JURY FOREPERSON: Captain Kluge, do you
21 solemnly swear that the evidence you shall give in this
22 matter pending before the grand jury shall be the truth,
23 the whole truth, and nothing but the truth so help you
24 God?

25 THE WITNESS: I do.

26 GRAND JURY FOREPERSON: Thank you. Have a seat,

1 please.

2 **EXAMINATION**

3 BY MR. NOEL:

4 Q. Captain, you've already testified in this
5 proceeding a couple of times; correct?

6 A. Yes, Sir.

7 Q. And the first time you testified we talked about
8 evidence collection from the area including 27/222 and
9 specific parts that were taken off of 27/222; correct?

10 A. That is correct.

11 Q. Do you recall what specific parts were taken off
12 27/222?

13 A. I do.

14 Q. Could you please remind us.

15 A. Yes. So the -- starting with the conductor and
16 the conductor stiffener that was collected, that included
17 the corona arms and the corona plates and the insulation
18 strings with individual insulator bells we spoke of
19 before. It also included the hooks on the left and right
20 phase -- we call those right phase of the transposition
21 tower assembly and the support arms on the right and left
22 phase as well that supported that transposition conductor
23 assembly and the -- what we refer to as the dead-end
24 insulator and the hook dead-end insulators as well.

25 Q. What was done with all of the items that were
26 collected off of 27/222?

1 A. It was packaged and transported to a secure
2 holding facility.

3 Q. Now, you also testified about evidence
4 collection from 24/199.

5 A. I did.

6 Q. That was in March of 2018 as part of the
7 exemplar tower project; correct?

8 A. That is correct.

9 Q. And can you remind us of what evidence you
10 removed from 24/199.

11 A. The same assembly equipment as 27/222 as an
12 exemplar set.

13 Q. All right. And what was done with the evidence
14 that was removed from 24/199?

15 A. That was also booked and transported to a secure
16 holding facility for storage.

17 Q. All right. So semantically for 27/222 you said
18 it was packaged and sent to a security location, but was
19 it also booked?

20 A. Yes, it was. It was also booked.

21 Q. In April of 2019 did you remove the evidence
22 from -- or some of the evidence from 27/222 and 24/199?

23 A. I did.

24 Q. And give it to somebody else?

25 A. Yes, I did.

26 Q. Do you recall what evidence you removed from the

1 secure location and gave to someone else?

2 A. Yes, I do.

3 Q. What did you remove?

4 A. I removed the --

5 May I speak of the modifications to some
6 equipment that we did?

7 Q. We're going to get to that in a second.

8 A. Okay. The hooks from 27/222, the right and the
9 left phase, support hooks from 27/222 and the dead-end
10 hook as well from 27/222 as well as the -- I believe just
11 the right --

12 May I refer to my notes.

13 Q. Yes.

14 [Exhibit 1223 introduced
15 as evidence.]

16 THE WITNESS: Okay. I believe this is a copy of
17 the -- yes, this is a copy of the receipt of property
18 that was used during the transition of the evidence. And
19 this is marked 1223.

20 BY MR. NOEL:

21 Q. All right. And I'm going to put that up on the
22 board. We're looking at Exhibit 1223.

23 A. And this is the same likeness of the -- this is
24 a copy of the exact document with my signature on it.

25 Q. All right. Your signature being where?

26 A. On the right-hand corner just above my printed

1 name.

2 Q. All right. Received from is your signature?

3 A. Yes, Sir.

4 Q. And this receipt of property documents the
5 property, the evidence that you pulled out of the
6 evidence facility on April 19, 2019?

7 A. Yes, it is.

8 Q. And to whom did you give this evidence?

9 A. This was to Matt Catalano. I believe I'm
10 pronouncing that correctly.

11 Q. And for what purpose did you give this to
12 Catalano?

13 A. Matt Catalano is charged with securing this
14 evidence and transporting it to the metallurgy lab in
15 Quantico, Virginia.

16 Q. Now, included in the evidence that you turned
17 over to Catalano were four jumper arms; correct?

18 A. Yes.

19 Q. What you described as jumper arms?

20 A. Yes.

21 Q. Two from 24/199 and two from 27/222; correct?

22 A. Correct.

23 Q. Prior to giving that evidence to Catalano, did
24 you modify or change that evidence in any way?

25 A. I did.

26 Q. What did you do?

1 A. On the evidence removed from 27/222 specifically
2 referring to the right and left phase jumper arms, those
3 came to us in, I believe, 14-foot sections. And we were
4 unable to ship those in their entirety. We had removed
5 the jumper arms from 24/199 after we removed the
6 equipment from 27/222. And in doing so in the first --
7 in the beginning of that collection we had cut those down
8 to only receive the end sections that had the critical
9 components that we wanted to examine.

10 So in order to logistically make it possible to
11 ship these -- send these jumper arms, we had to cut them
12 down to a manageable size. I personally cut those using
13 a battery-operated reciprocating saw under the
14 observation of Matt Catalano.

15 Q. All right. So you cut off the relevant ends of
16 the arms --

17 A. I did.

18 Q. -- from 27/222?

19 A. I did.

20 [Exhibit 773 introduced
21 as evidence.]

22 BY MR. NOEL:

23 Q. All right. So showing you what's up as
24 Exhibit 773. And I'll ask you if you recognize what is
25 depicted in Exhibit 773.

26 A. May I stand up?

1 Q. Yes, absolutely. I'm sorry.

2 A. Yes, I recognize that.

3 Q. And what is depicted in 773?

4 A. That is the hook that was attached to the broken
5 insulator string from 27/222, the left phase.

6 Q. And that's one of the items that you turned over
7 to Special Agent Catalano?

8 A. Yes, it is.

9 [Exhibit 778 introduced
10 as evidence.]

11 BY MR. NOEL:

12 Q. Next up 778. Do you recognize Exhibit 773 or
13 what is depicted in 778?

14 A. I do.

15 Q. And what is depicted in Exhibit 773?

16 A. That is the right phase C-hook from the right
17 insulator string from the right phase.

18 Q. There's some writing on the C-hook. Do you
19 recognize that writing?

20 A. I do.

21 Q. And whose writing is that?

22 A. I believe that is Matt Catalano's writing that
23 was put on there as we separated it from the insulator
24 string the day we collected or transitioned the evidence
25 into the FBI's custody.

26 Q. All right. So the hook depicted in 778 is

1 another item that you turned over to Special
2 Agent Catalano?

3 A. Yes, it is.

4 [Exhibit 783 introduced
5 as evidence.]

6 BY MR. NOEL:

7 Q. And next is 783. Do you recognize what is
8 depicted in Exhibit 783?

9 A. Yes.

10 Q. And what is depicted in 783?

11 A. That is the dead-end hook from 27/222.

12 Q. And is that another item that you turned over to
13 Special Agent Catalano?

14 A. Yes, it was.

15 [Exhibit 787 introduced
16 as evidence.]

17 BY MR. NOEL:

18 Q. Exhibit 787. Do you recognize what is depicted
19 in Exhibit 787?

20 A. Yes, I do.

21 Q. And what is depicted in 787?

22 A. That is the right phase support hook from
23 24/199.

24 Q. Is that right phase hook from 24/199 one of the
25 items that you turned over to Special Agent Catalano?

26 A. Yes, it is.

1 [Exhibit 794 introduced
2 as evidence.]

3 BY MR. NOEL:

4 Q. Okay. It's upside down but Exhibit 794. Do you
5 recognize what is depicted in 794?

6 A. I do.

7 Q. What is depicted in Exhibit 794?

8 A. That's the left phase support hook, C-hook from
9 24/199.

10 Q. And is the hook depicted in 794 one of the hooks
11 that you turned over to Special Agent Catalano?

12 A. Yes, it is.

13 [Exhibit 799 introduced.
14 as evidence.]

15 BY MR. NOEL:

16 Q. And 799. Do you recognize the hook depicted in
17 Exhibit 799?

18 A. I do.

19 Q. What is the hook depicted in 799?

20 A. That is the dead-end hook from 24/199.

21 Q. Is that also one of the hooks that you turned
22 over to Special Agent Catalano?

23 A. It is.

24 [Exhibit 801 introduced
25 as evidence.]

26 BY MR. NOEL:

Q. All right. On to 801. Do you recognize what is depicted in Exhibit 801?

A. I do.

Q. What is depicted in Exhibit 801?

A. I believe that is the right phase from 24/199.

Q. And is that another piece of evidence that you turned over to Special Agent Catalano?

A. Yes, it is.

[Exhibit 808 introduced
as evidence.]

BY MR. NOEL:

Q. Exhibit 808. Do you recognize what is depicted in Exhibit 808?

A. Yes, I do.

Q. What is depicted in 808?

A. That is the left phase jumper arm from 24/199.

Q. Did you also turn over the arm depicted in 808 to Special Agent Catalano?

A. I did.

[Exhibit 813 introduced
as evidence.]

BY MR. NOEL:

Q. Exhibit 813. Do you recognize what is depicted in that photograph?

A. I do.

Q. And what is depicted in that photograph?

1 A. That is the right jumper support arm from
2 27/199. Excuse me. 27/222.

3 Q. All right. And this one you can actually see
4 the entire length of the section; correct?

5 A. Correct.

6 Q. And it looks like about a two-foot section after
7 you cut it off?

8 A. Yes.

9 Q. And is the jumper arm -- the cut jumper arm
10 depicted in 813 another one of the items that you turned
11 over to Special Agent Catalano?

12 A. Yes, it is.

13 [Exhibit 819 introduced
14 as evidence.]

15 BY MR. NOEL:

16 Q. And 819. Do you recognize what is depicted in
17 819?

18 A. I do.

19 Q. What is depicted in 819?

20 A. That is the left -- that is the left jumper
21 support arm from 27/222.

22 Q. And again, we can see the entire length of the
23 piece?

24 A. Yes.

25 Q. Approximately two feet?

26 A. Yes, it is.

1 Q. And is the jumper arm depicted in 819 also one
2 of the items that you turned over to Special
3 Agent Catalano?

4 A. Yes, it is.

5 Q. And all of those items were turned over to
6 Special Agent Catalano on April 19th, 2019; correct?

7 A. Correct, in the morning.

8 Q. All right. And that was done -- there's an
9 address on there on, I believe, Steiffer?

10 A. Steiffer.

11 Q. Steiffer in Magalia?

12 A. Yes.

13 Q. And that's a Cal Fire facility?

14 A. Yes, it is.

15 MR. NOEL: That's all I have.

16 Do we have any questions from the jurors? We're
17 good.

18 All right. Thank you, Captain.

19 THE WITNESS: Thank you.

20 MR. NOEL: She has the admonition for you. You
21 should be used to this.

22 GRAND JURY FOREPERSON: Captain Kluge, you are
23 admonished not to discuss or disclose at any time outside
24 of this jury room the questions that have been asked of
25 you or your answers until authorized by this grand jury
26 or the Court. A violation of these instructions on your

1 part may be the basis for a charge against you of
2 contempt of court. This does not preclude you from
3 discussing your legal rights with your own attorney.

4 Captain Kluge, what I have just said is a
5 warning not to discuss this case with anyone except the
6 Court, your lawyer, or the district attorney.

7 Do you have any questions?

8 THE WITNESS: No.

9 GRAND JURY FOREPERSON: Thank you for your time.

10 THE WITNESS: Thank you, Madam Foreperson.

11 [Witness exits the courtroom.]

12 MR. NOEL: All right. Next up Special Agent
13 Matthew Catalano. "SA" is the abbreviation for special
14 agent.

15 [Witness enters the courtroom.]

16 GRAND JURY FOREPERSON: Would you mind standing,
17 please, so I can swear you in.

18 Special Agent Catalano, do you --

19 Raise your right hand, please.

20 Do you solemnly swear that the evidence you
21 shall give in this matter pending before the grand jury
22 shall be the truth, the whole truth, and nothing but the
23 truth so help you God?

24 THE WITNESS: I do.

25 GRAND JURY FOREPERSON: Thank you. Have a seat,
26 please.

EXAMINATION

BY MR. NOEL:

Q. For the record, can you state your name spelling -- state your full name spelling your last.

A. Yes. Matthew Catalano, C-a-t-a-l-a-n-o.

Q. Are you employed?

A. I am employed with the FBI; Federal Bureau of Investigation.

Q. In what capacity?

A. I'm a special agent.

Q. Just because we have some time here and I'm sure curiosity, what exactly is a special agent to the FBI?

A. A special agent is a federal agent -- a federal investigator given powers through the executive branch to gather and present evidence in federal and law enforcement proceedings.

Q. What kind of law enforcement training do you have?

A. My training in law enforcement started at the FBI academy. It was a 21-week course in Quantico, Virginia. There I learned about the constitution, federal law. I learned about investigative techniques, tactics, and the like.

Q. How long have you been with the FBI?

A. I've been a special agent for ten years.

Q. Any law enforcement experience prior to that?

1 A. No.

2 Q. All right. In April of 2019 were you asked to
3 secure evidence from the Camp Fire investigation for
4 transport to the FBI lab?

5 A. Yes, I was.

6 Q. And in doing so did you meet with Captain Tom
7 Kluge of Cal Fire?

8 A. Yes, I did.

9 Q. Did that occur on April 19th of 2019?

10 A. Yes, it did.

11 Q. And that occurred on Steiffer Road at a Cal Fire
12 facility in the area of Magalia?

13 A. Yes.

14 Q. And you have -- in front of you we have up on
15 the big board what is marked as Exhibit 1223 for
16 identification. Do you recognize 1223?

17 A. I do.

18 Q. What is 1223?

19 A. This is an FBI property receipt. I did this. I
20 prepared it with Captain Kluge. These listed items here
21 are the ten items that I signed for on April 19th.

22 Q. All right. Why a receipt for property?

23 A. We use this on the FBI side to start or initiate
24 the chain of custody.

25 Q. So the ten items that are listed on this receipt
26 of property Exhibit 1223 are the ten items that you

1 received from Captain Kluge that day?

2 A. Yes, Sir.

3 Q. What did you do with those items?

4 A. I took those items down to the Sacramento FBI
5 office. We photographed them with a photographer and
6 then I left them with the evidence control room in
7 Sacramento which -- and then I sent them a lead to have
8 those items transported to the FBI lab for examination.

9 Q. So you received these items from Cal Fire and
10 then you booked these into the FBI evidence system;
11 correct?

12 A. That's correct.

13 Q. All right. So I'm going to go through a couple
14 of those items. You have up in front of you Exhibit 787.
15 Do you recognize 787?

16 A. Yes, I do.

17 Q. How do you recognize 787?

18 A. A couple ways. I have seen it many times. I've
19 seen the photo. That's my handwriting in the Magic
20 Marker. I had recognized it as the right phase hook for
21 Transposition Tower 24/199.

22 Q. So the big black lettering "24/199 RO" with a
23 slash in it, that is your handwriting?

24 A. Yes, it is.

25 Q. And is this one of the items that you received
26 on April 19th from Captain Kluge?

1 A. Yes, it is.

2 Q. Is this one of the items that you booked into
3 the FBI evidence system for transport to the FBI lab in
4 Washington D.C.?

5 A. In Quantico, Virginia.

6 Q. Quantico.

7 A. Yes, it is.

8 Q. How do I not know that? It's been a long day.

9 And the reason they're making fun of me is that
10 my father was an FBI agent for 31 years and worked very
11 closely with the lab. And I've got the T-shirts to show
12 it, but they don't fit me anymore.

13 All right. Next up is 794. And I would ask you
14 the same question. Do you recognize the item depicted in
15 Exhibit 794?

16 A. Yes, I do.

17 Q. And how do you recognize that?

18 A. Again, this is my handwriting on it. This is
19 the left phase hook from Transposition Tower 24/199.

20 Q. And is this one of the items that was turned
21 over to you from Captain Kluge to -- that you placed into
22 the FBI evidence for transport to the FBI lab?

23 A. Yes, it is.

24 Q. And 799. Do you recognize 799?

25 A. Yes, I do. It is the dead-end hook for the same
26 tower.

1 Q. And how do you recognize this?

2 A. Again, I recognize my handwriting and I've seen
3 it many times.

4 Q. And is the hook depicted in 799 one of the items
5 you received from Captain Kluge on April 19th and
6 subsequently booked into the FBI evidence system for
7 transport to the lab?

8 A. Yes, it is.

9 Q. And 801. Do you recognize Exhibit 801?

10 A. I do.

11 Q. And how do you recognize what's depicted in 801?

12 A. I recognize it because I have seen it numerous
13 times. Also, I see my handwriting in the black marker.
14 This is the end section for the -- oh, gosh, the -- the
15 jumper arm for the right phase of the same tower 24/199.

16 Q. And this another item that was provided to you
17 by Captain Kluge and you booked it into the FBI system
18 for transport to the FBI lab?

19 A. Yes, it is.

20 Q. And 808. Do you recognize what's depicted in
21 808?

22 A. I do for the same reasons. This is the left
23 phase end section of the jumper arm taken from
24 Transposition Tower 24/199.

25 Q. And again, this is evidence that you received on
26 April 19th from Captain Kluge and subsequently booked

1 into FBI evidence for transport to the lab?

2 A. Yes, it is.

3 Q. I guess we should briefly go through the
4 evidence taken from 24/199. Were you present for the
5 removal of that evidence?

6 A. Yes, I was. I was present the day that PG&E
7 removed that in conjunction with Cal Fire and Butte
8 County District Attorney's Office.

9 Q. And what was your assignment that day?

10 A. The FBI had opened a subsequent case or a
11 parallel case, I should say, to this one. By "this one"
12 I mean the Cal Fire and the Butte County District
13 Attorney's Office case in a way to support them and
14 specifically for the evidence as we were asked to help
15 receive the evidence, organize the evidence, and then get
16 it examined by the lab.

17 So the first part of that was the reception of
18 the evidence. And this happened -- I do not recall the
19 day but in conjunction with a crew from PG&E and the
20 district attorney's office as well as Cal Fire.

21 Q. And what was your assignment on that day? What
22 were you doing?

23 A. I was part of a -- I think there were three of
24 us. I'm also a member of the FBI's evidence response
25 team. So I am trained in the forensic collection of
26 evidence. And as part of that team we went out and

1 helped recover the evidence, package it, and label it.

2 So that was my job. I served as lead on that team.

3 MR. NOEL: I have nothing further.

4 Does the jury have anything?

5 GRAND JUROR NUMBER FOUR: Can I just say it
6 instead of writing it?

7 MR. NOEL: Probably should write it down. We
8 need a record of it.

9 Here, we can go ahead with that one while he's
10 finishing his.

11 [Conferring off the record.]

12 BY MR. NOEL:

13 Q. All right. First question. And this obviously
14 would just be from the moment that you took possession on
15 behalf of the FBI of the evidence.

16 "Are you personally certain that none of these
17 items has been removed from secure evidence storage and
18 transportation and tampered with in any way?"

19 A. Yes.

20 Q. And the second question, again if you know. "Do
21 you know how old any of these parts are?"

22 A. I can't speak to how old the parts are.

23 MR. NOEL: Anything else?

24 Thank you, Agent.

25 THE WITNESS: Thank you.

26 MR. NOEL: The foreperson will have an

1 admonition for you.

2 GRAND JURY FOREPERSON: Okay. Special
3 Agent Catalano, you are admonished not to discuss or
4 disclose at any time outside of this jury room the
5 questions that have been asked of you or your answers
6 until authorized by this grand jury or the Court. A
7 violation of these instructions on your part may be the
8 basis for a charge against you of contempt of court.
9 This does not preclude you from discussing your legal
10 rights with your own attorney.

11 Special Agent Catalano, what I have just said is
12 a warning not to discuss this case with anyone except the
13 Court, your lawyer, or the district attorney.

14 Do you have any questions?

15 THE WITNESS: No.

16 GRAND JURY FOREPERSON: Thank you for your time
17 today.

18 THE WITNESS: Thank you.

19 [Witness exits the courtroom.]

20 MR. NOEL: All right. I am absolutely
21 flabbergasted that it is a quarter to 4:00 and we are
22 done for the day. Oh, we need to make a record.

23 MS. DUPRE-TOKOS: Okay. At this time we would
24 like to move in Exhibits 1055, 1056 and 1057 and then
25 Exhibits 1059 --

26 Do you want me to read the individual numbers or

1 just say "through"?

2 GRAND JURY SECRETARY: Just "through."

3 MS. DUPRE-TOKOS: That's what I was rooting for.

4 -- through 1216 and then 1219 through 1222 and
5 then Exhibit 1223. Those are all the exhibits with
6 Dr. Tovar.

7 [Exhibits 1055 through 1057, 1059
8 through 1216, and 1219 through 1222
9 admitted into evidence.]

[PROCEEDINGS OMITTED.]

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: Mr. Ma, before you have
a seat, would you please raise your right hand to be
sworn.

THE WITNESS: Yes.

WARREN MA
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: Yes.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. Mr. Ma, can you please state and -- state your

1 full name, spelling your last name for the record.

2 A. Sure thing. My first name is Warren; last name

3 Ma, M-A.

4 Q. Are you currently employed?

5 A. Yes, I am.

6 Q. And by whom?

7 A. By copy called PicsArt.

8 Q. How long have you been employed with that

9 company?

10 A. Since June of last year. So roughly seven

11 months or so.

12 Q. Okay. Were you employed prior to going to work

13 for PicsArt?

14 A. Yes, I was.

15 Q. By whom?

16 A. PG&E.

17 Q. In what capacity?

18 A. In the Business Finance Department.

19 Q. How long were you employed with PG&E?

20 A. Almost six years.

21 Q. What is the business finance department?

22 A. It is under the finance department within the

23 company.

24 Q. Okay. What is the main focus or business

25 process of the Business Finance Division?

26 A. Some of the main focus, at least in my role,

1 was around budgeting forecasting reporting.

2 Q. Okay. What, what kind of education or training
3 do you have that qualified you for that job?

4 A. Sure. I went to the University of California,
5 Davis. I majored in managerial economics. And
6 ultimately I believe that helped me get a role with the
7 Business Finance at PG&E.

8 Q. What is managerial economics?

9 A. It's mainly around economic studies, macro
10 theories, micro theories. It was the closest thing to
11 finance over at the University of California, Davis,
12 California of Davis.

13 Q. Okay. Can you explain to us what macro and
14 micro are.

15 A. I can't fully explain that.

16 Q. All right. Walk us through your career with
17 PG&E, where you started and where you ended up.

18 A. Sure thing.

19 So I started my career at PG&E in June 2013,
20 about a couple weeks after I graduated from UC Davis. I
21 started off in the Business Finance Electrician
22 Department. I was an Associate Business Finance Analyst.
23 I mainly focused around, at least in that role in 2013,
24 focused around supporting the Transmission operation
25 organization. Mainly focused around high-level reporting
26 automated reporting, helping out the team in any capacity

1 that I could.

2 Eventually in 2014, I began supporting the
3 Transmission Line Department, and I continued supporting
4 various programs within Transmission Line until I left
5 the company in June of 2019.

6 Q. What do you mean when you say you were
7 supporting Transmission or Transmission Line?

8 A. Supporting as in providing financial support
9 around reporting, helping out with any budget sort of
10 cycles in planning processes. I would say those are the
11 main focus areas.

12 Q. Okay. Can you explain to us kind of the nuts
13 and bolts of the job of supporting Transmission Line.

14 A. What do you mean by "nuts and bolts"?

15 Q. The basics of what you were doing.

16 A. Got it.

17 A lot of pulling reports from the internal
18 database, financial reports, in terms of numbers spent or
19 costs spent. Looking at that to prepare a budget. A lot
20 of other things in regards to the accounting;
21 reconciliation, creating orders, moving costs to the
22 right orders in case there's any misalignments. Those
23 are some areas that I worked on as an associate analyst
24 supporting technician operations.

25 Q. Okay. Did you have any power over what
26 projects either did or did not get done?

1 A. No.

2 Q. Did you have any power over how money was
3 spent?

4 A. No.

5 Q. In essence, would it be safe to say that your
6 job was just tracking how the money was spent?

7 A. Yes.

8

9 (Grand Jury Exhibit 1224 introduced.)

10

11 Q. All right. You should have in front of you a
12 stack of exhibits with exhibit tags. We have them up on
13 the big board. And first, I'm going to ask you to look
14 at Exhibit 1224.

15 A. Okay.

16 Q. Got that?

17 A. Got it.

18 Q. Recognize 1224?

19 A. I vaguely recall it.

20 Q. Okay. Can you explain to us briefly what 1224
21 is.

22 A. Which part of 1224?

23 Q. Just give us a general idea of what it is.

24 A. Sure thing.

25 So reading this document, Doug Durbin at that
26 point was my supervisor, and he's introducing myself and

1 Michael Olson, my counterpart on the same team, to the
2 Transmission Line's team as Business Finance Support for
3 the organization.

4 Q. All right. So first, this is a copy of an
5 email; correct?

6 A. Correct.

7 Q. And this is an email from somebody named Doug
8 Durbin?

9 A. Yes.

10 Q. And this is an email that happened or came out
11 on January 3rd, 2014?

12 A. Yes.

13 Q. All right. So this email was sent out to a
14 bunch of people. Can you tell us who all, or any, of
15 those people are?

16 A. I can tell you who I remember.

17 Q. Sure.

18 A. First person on the "to" line, Harold Taylor,
19 was the senior director of Transmission Lines at that
20 point. Bob Daniels, I believe he was a manager of
21 Engineering. Clint Hulsey (phonetic) was a principal
22 portfolio manager. I don't recall the specific roles of
23 these next few individuals, but I'll name who I see that
24 I recognize. Sean Cleason (phonetic) was the Expense
25 Program Manager.

26 And then moving on down to the CC portion of

1 the email, I recognize my teammate. Jennie Lou
2 (phonetic) was our manager at that time. Michael Olson,
3 who I alluded to earlier, was my counterpart on the
4 Transmission Lines team, who was also an analyst. Damon
5 Calver (phonetic), as mentioned in this email, previously
6 supported Transmission Lines supporting the Expense
7 Program as Business Finance. And then Vincent Long was a
8 supervisor supporting Substations at that point in time.

9 Q. Okay. Try to define a couple of terms that you
10 mentioned. What is a principal portfolio manager?

11 A. I can't describe that fully.

12 Q. How about an expense program manager?

13 A. I can't define the role.

14 Q. Okay. Now, you said that you were on the
15 expense side; correct?

16 A. In 2014?

17 Q. Yes.

18 A. Yes.

19 Q. Can you explain to us the difference between
20 expense and capital?

21 A. Sure. At a high level, they fall within two
22 different cost categories. A lot of capital work
23 involved larger capital projects. On the expense side,
24 that's where you see patrols and inspections as well as
25 any sort of expense maintenance repair work as well.

26 Q. Do you budget?

1 A. Yes.

2 Q. Money comes from two different sources?

3 A. I can't fully answer that question.

4 Q. Okay. So you can't fully explain, but why
5 don't you just let us know what, give us your
6 understanding of it.

7 A. My own understanding?

8 Q. Yes.

9 A. If I had to provide my own understanding of it,
10 capital projects eventually do get -- at PG&E, capital
11 projects, or capital expenditures, do eventually get,
12 they eventually come back to PG&E by investing in certain
13 capital projects. They eventually do get that money paid
14 back. As far as expense, those go straight to the bottom
15 line. My understanding.

16 Q. Right. So the expense projects would come out
17 of profits; right?

18 A. I'm not in the position to answer that since I
19 didn't support the profit side at PG&E.

20 Q. Okay.

21 A. Or the revenue side.

22 Q. All right. So you started in this position
23 supporting the T-line expense budget in January of '14;
24 correct?

25 A. Correct.

26 Q. So explain to us what your duties were, how it

1 was that you supported the Transmission Line expense
2 budget?

3 A. Sure thing.

4 In 2014, I would help out with budgeting,
5 financial reporting, as well as finance forecasting.

6 Q. So can you go a little deeper on budgeting.
7 How did you -- what did you do in terms of budgeting?

8 A. So in regards to budgeting, as part of the
9 budgeting cycle at PG&E, we would plan around the
10 September time frame for the following year. So in
11 regards to what we did for budgeting, we would collect --
12 we would extract the historical information from the
13 system, take that number, review it with the Transmission
14 Line's operation team. And ultimately we would get
15 numbers from their team as well as what they manage
16 various projects, various programs. Then we would
17 ultimately put those numbers in the system as a budget
18 number. And then actually -- sorry, taking a step back
19 -- before I get to put in the system, gets reviewed and
20 approved by the Transmission Line's organization first,
21 all the way up to the senior director. And then
22 ultimately that leads to more discussions with the
23 overall transmission team. And then we end up planning
24 those numbers in the system for the budget for the
25 following year.

26 Q. So what type of historical info would you

1 extract?

2 A. Mainly around hours per unit. So total amount
3 of hours spent on doing certain jobs. How many units
4 were complete on those jobs. And then ultimately getting
5 back hours per unit number.

6 Q. All right. You also said you did financial
7 reporting. What is financial reporting?

8 A. Financial reporting was mainly done on a
9 monthly basis. So that would be extract reports, actual
10 costs spend versus budget or versus forecast. Just to
11 compare how we're trending, to basically give leadership
12 an assessment how we're performing so far.

13 Q. Why is that important?

14 A. That is important to see the financial health
15 of the program, to see whether or not we're trending
16 high, trending low; what can we do to help out if we're
17 trending high, above budget; what areas where we can
18 increase spending if we're low on budget. That's why I
19 feel that it's important.

20 Q. Okay. And finally, what was financial
21 forecasting?

22 A. Yes. Financial forecasting was done on a
23 monthly basis. That is a reassessment of the budget.
24 Basically called out anywhere where we're maybe trending
25 high or trending low, and adjust that in the forecast.

26 Q. All right. You did this job you said until

1 what 20, 2017?

2 A. Yes.

3

4 (Grand Jury Exhibit 1225 introduced.)

5

6 Q. You should have in front of you Exhibit No.
7 1225. Do you see Exhibit 1225?

8 A. Yes.

9 Q. And this is an email chain, but it starts at
10 the top an email from you. Do you recognize it?

11 A. Yes, I do.

12 Q. All right. This email's dated August 28th,
13 2017. All right. So this is an email you sent August
14 28th, 2017 --

15 A. Yes.

16 Q. -- correct?

17 A. Correct.

18 Q. And so tell us what this email is about.

19 A. Sure thing.

20 This email is in regards to specific
21 Transmission Line Business Finance Support that happened
22 in August of 2017. At this point in time, my supervisor
23 left to an opportunity within Business Finance. And so
24 at this point in time, my supervisor went on to a new
25 opportunity within Business Finance, and I ended up
26 taking a different role -- still supporting Transmission

1 Line -- but my role was a business finance analyst
2 expert. I was no longer supporting the expense program
3 anymore. And I was basically introducing the
4 Transmission Line team to my backfill, which I mention
5 here is Nisha Patel. So that's what this email is about
6 is basically giving them an update around Business
7 Finance support changes, and there was a soft transition
8 occurring where we're going to slowly backfill the
9 position.

10 Q. So what was your new job?

11 A. My title was a Business Finance Analyst Expert.

12 Q. And what does that mean?

13 A. I was more high-level Transmission Line
14 support. Basically consolidating input from the capital
15 analyst, which was Michael Olson, and the expense
16 analyst, which is Nisha Patel, rolling up that, helping
17 lead overall monthly financial reviews of leadership, and
18 then funneling that back up to my manager to have my
19 manager provide financial review and support to the
20 overall Transmission operations organization.

21 Q. Okay. And a few names in here. Who is Matt
22 Heitzmann?

23 A. Matt Heitzmann was my former supervisor at that
24 point in time who took on a new role.

25 Q. Okay. And who is Eric Back?

26 A. Eric Back at that time was the senior director

1 of Transmission Lines.

2 Q. And Robert Cupp?

3 A. At that point in time, I don't specifically
4 recall his role, but he was in the Maintenance and
5 Construction organization.

6 Q. Greg Gabbard?

7 A. At that point, I'm not sure if he was a
8 director or senior manager, but he oversaw the
9 Engineering Services Department.

10 Q. Okay. Jefferson Heidelberger?

11 A. He was in the Transmission Line Department at
12 that specific time frame. I don't recall his exact
13 position.

14

15 (Grand Jury Exhibit 1241 introduced.)

16

17 Q. Okay. All right. So next up you have Exhibit
18 1241. Should be right there. It was there.

19 A. Sorry. I don't see the document.

20 Q. Because I left it out the first time around,
21 and had to -- so I put it --

22 All right. Do you recognize 1241?

23 A. I vaguely remember this.

24 Q. Okay. What is 1241?

25 A. It looks like this is an org chart showing
26 support for certain programs within the capital and

1 expense budget.

2 Q. Okay. So you're listed down there?

3 A. Yes.

4 Q. Finance support. Are you familiar with what

5 the, what each column is?

6 A. Not fully. I vaguely remember these MWC

7 numbers.

8 Q. All right. Do you recall what MWC 93 is?

9 A. I don't recall everything within MWC 93.

10 Q. Okay. And then you have the expense that

11 you're supporting, which includes Maintenance, P and I,

12 Mark and Locate, and Special Projects?

13 A. Yes.

14 Q. Does P and I stand for patrol and inspection?

15 A. Yes.

16 Q. Okay. So that last column on the right would

17 be all the people that were supporting the Transmission

18 Line patrol and inspections; correct?

19 A. No. It would be everybody supporting expense,

20 which includes various other programs listed in the box

21 as well.

22 Q. But expense would include the patrol and

23 inspection?

24 A. Yes.

25 Q. Do you remember what the MWC stands for?

26 A. MWC stands for Major Work Category.

1 Q. And what do you remember about the different
2 numbers 70, 71, 72, 93?

3 A. In regards to what I remember, MWC 70
4 represented primarily the Pole Replacement Program as
5 well as a Steel Structure Replacement Program, I believe.

6 Q. Okay. Did you ever work in that area?

7 A. Briefly.

8 Q. What was briefly?

9 A. I can't recall the specific time frame. I
10 would jump in whenever my teammates needed help.

11 Q. What do you recall about the Steel Structure
12 Replacement Program?

13 A. I don't recall a lot. I was more involved
14 around the Pole Replacement Program.

15 Q. And then what do you recall about MWC 71 and
16 72?

17 A. I don't recall much around that. I do remember
18 that, just looking at the description here, roads,
19 boardwalks, those are some of the capital projects that
20 were within that MWC.

21 Q. All right. Did you ever work in those
22 projects?

23 A. I supported it for a bit. Mainly just looking
24 at the forecast that was put in the system from the
25 project manager and rolling that up into the overall
26 forecast for Transmission Lines.

1 Q. Okay. What do you mean by "forecast"?

2 A. There would be various project managers that
3 would manage those programs, or these projects, and they
4 would put their system, or put their forecast in the
5 system that we extract to roll up into overall
6 Transmission Lines forecast.

7 Q. Can you explain to us what is a forecast.

8 A. It's an estimated amount of spent.

9 Q. Okay. So forecast is how much that they
10 believe they're going to spend on something?

11 A. Yes.

12 Q. And then finally, the MWC 93, what do you
13 recall about that Major Work Category?

14 A. Main program I can recall from that MWC 93 is
15 capital maintenance.

16 Q. What is capital maintenance?

17 A. For example, insulator replacements. I don't
18 remember all the other items within that MWC.

19 Q. How is capital maintenance different from
20 expense maintenance?

21 A. I'm not an expert in this field, but it's due
22 to capital accounting guidelines within PG&E.

23 Q. Are you familiar with those guidelines?

24 A. No.

25 Q. Who is, who -- if you had to ask a question
26 about the capital accounting guidelines, who would you go

1 to?

2 A. I would recommend somebody from the Capital
3 Accounting Department. I believe at that point in time
4 our capital accounting support was Weiwen Wang.

5 Q. So there's actually a division, the Capital
6 Accounting Department?

7 A. Yes.

8 Q. And for the court reporter, do you know how to
9 spell Weiwen Wang?

10 A. I think I remember. Weiwen is W-E-I-W-E-N, I
11 believe. Last name W-A-N-G.

12 Q. I think the middle is W-E-I-N. Same thing, I'd
13 have to check it.

14 All right. So is that who you would go to if
15 you had a question about capital expense budgets or
16 capital accounting issues?

17 A. Yes. In regards to any sort of capital
18 accounting issues or capital accounting I needed, I would
19 reach out to her.

20 Q. All right. Are you familiar -- well, the term
21 that we know of it, you may have a different term, is
22 "allotments." The amount of time that is allotted for
23 patrols and inspections.

24 A. Okay.

25 Q. Were you involved in determining that?

26 A. In regards -- can you clarify allotments one

1 more time?

2 Q. The amount of time allotted to the troublemen
3 or to the individual T-line headquarters to do individual
4 patrols or inspections.

5 A. We would help out during the budgeting cycle in
6 regards to setting targets.

7 Q. Okay. So what are, what the targets? Explain
8 that to us.

9 A. Sure thing.

10 As I alluded to earlier, as part of budget
11 planning process, which happens around the September time
12 frame, for the following year, we extracted historical
13 information from the system as a starting point.
14 Basically take all hours done on inspections divided by
15 all units done on inspections, getting an approximate
16 hours per unit. And then we would review those numbers
17 as a starting point with the Operation team starting with
18 the front line supervisors to ensure that they are
19 comfortable with the numbers.

20 If they don't -- if they're not comfortable
21 with the numbers, we'll go ahead and they'll provide
22 adjustments or modifications. We'll take that feedback,
23 we'll adjust it, and then we ultimately get their
24 approval.

25 That goes up to another round of review, and it
26 results with the superintendents. After the

1 superintendent reviews those numbers and ultimately
2 approve or review and change, we'll take that feedback
3 and will review with the senior director to get their
4 approval.

5 Once we get final approval, we plan those
6 numbers in the system and then those are the targets.

7 Q. What's your role? In the process you just
8 described, what was your role?

9 A. Extracting historical information from the
10 system and then reviewing that with the supervisors,
11 superintendent, and then with the senior director;
12 although the senior director meetings, depending on which
13 year we were talking about, were led by whoever led the
14 T-line Business Finance team.

15 Q. Okay. And who was the Business team Finance
16 team at the time?

17 A. Which year are we discussing?

18 Q. When you were supporting T-line.

19 A. There's been various leads.

20 Q. Right. Name them, please.

21 A. Starting in 2014, Doug Durbin. I can't recall
22 the exact years, but it was Matt Heitzmann afterwards.
23 And then once Matt Heitzmann left, as part of Exhibit
24 1225, then I became the lead in 2017.

25 Q. Okay. So you were the guy in charge in 2017;
26 is that correct?

1 A. Starting in August of 2017.

2 Q. Okay. Can you please explain this concept of
3 extracting historical information.

4 A. Sure thing.

5 What do you mean by "concept"?

6 Q. What is it? What do you mean? What kind of
7 historical information?

8 A. Sure.

9 So we're pulling from SAP, which is PG&E's
10 system, our internal database, total amount of hours
11 spent on inspections, total amount of units done on
12 inspections. And that's how we're getting in hours per
13 units number. And that's the concept of how that works
14 is we take a query in Excel and then you're able to
15 choose these parameters, you're able to extract that data
16 into Excel. And that's how we get the numbers.

17 Q. So creating Excel spreadsheets, are those done
18 per line or for all lines?

19 A. That was for all lines. It's basically at the
20 order level.

21 Q. What do you mean the order level?

22 A. Order is basically represented a collection of
23 where units and hours are charged to, and that's what it
24 represents.

25 Q. Okay. So walk us through in a general year,
26 let's say 2015, how you would come up with the target

1 number for, say, the Caribou-Palermo line.

2 A. We never set a target for a specific line. If
3 we are going to walk through, can you remind me where
4 Caribou-Palermo was in regards to headquarters? Was
5 that --

6 Q. Feather River Canyon. Butte County.

7 A. In regards to Transmission Line headquarters,
8 would that be within Table Mountain?

9 Q. Yes.

10 A. Okay. So if we were in September of 2015, so
11 our planning processes vary, but around that time frame
12 we'd pull all of the orders within Table Mountain,
13 historical information that is, and then we would get an
14 estimated amount of all hours charged as well as all
15 units complete for Table Mountain. And then that would
16 lead to hours per unit amount. And then we would review
17 that number with the supervisor of Table Mountain to
18 ensure that they are comfortable with that number for the
19 next year's cycle of inspections.

20 Q. How far back do the historical records for the
21 hours or the units go?

22 A. I can't recall exactly how far back it went.

23 Q. How far back would you go in looking at
24 historical data?

25 A. Typically around three to five years.

26 Q. So you'd look at all the data for the last

1 three or five years, get an average time for how much
2 time they have to, how much time they had spent doing
3 patrols and inspections in previous years?

4 A. Yes.

5 Q. And then based upon that you'd give them a
6 target number for total number of hours for patrol and
7 inspections the following year?

8 A. We wouldn't give them that as a target. We'd
9 use that as a baseline for review with the supervisors
10 first. And typically it would start with various points,
11 like a year-to-date number, basically showing how many
12 months have we gone through the year, through maybe
13 August or September. That's what you guys are running at
14 right now. And then we'd review that with the supervisor
15 to see if they're comfortable with that number for the
16 next year to see if that's an attainable target.

17 If they feel that that is not a number that
18 they are, that's attainable, they'll get back to us and
19 we'll adjust as needed.

20 Q. So did you meet with the T-line supervisors
21 from, say, Table Mountain to go over these numbers?

22 A. What do you mean by meet? I person or --

23 Q. Just in general.

24 A. Yes.

25 Q. How did you meet with them?

26 A. We'd have reviews. Whether it's in person or

1 through a web conference. Video conference, that is.

2 Q. Okay. So basically video chat?

3 A. Yes.

4 Q. Or what is it? I can't remember the name of
5 the service the state uses, but Skype?

6 A. I don't recall the actual tool or application
7 used.

8 Q. So you would actually meet with the supervisors
9 of Table Mountain and go over the proposed target numbers
10 each fall?

11 A. Yes.

12 Q. And they had input as to the target, what the
13 target number was eventually going to be?

14 A. Yes.

15 Q. Did the supervisors from Table Mountain ever
16 express that their target numbers were too low?

17 A. I can't recall specifically.

18 Q. Do you recall specifically who the supervisors
19 were that you talked to?

20 A. Which year are we --

21 Q. Any year.

22 A. I can't recall who was the supervisor in Table
23 Mountain. Yeah, I'm sorry, I'm trying my best to
24 remember, but there were roughly 10 to 11 supervisors.

25 Q. Do you recall the name (WITNESS #12)?

26 A. Yes, I do.

1 Q. And what do you recall about (WITNESS #12)?

2 A. He, during my times, according to Transmission

3 Lines, he filled in as a superintendent at some point,

4 but he was also a supervisor.

5 Q. Okay. How about (EMPLOYEE #16)?

6 A. I recall the name; don't recall specifically

7 his role.

8 Q. (WITNESS #22)?

9 A. I remember (WITNESS #22).

10 Q. What do you recall about (WITNESS #22)?

11 A. He was a supervisor during my time at PG&E. I

12 believe he was a supervisor on the Tower side as well as

13 on the Maintenance side.

14 Q. Do you ever recall any of them expressing any

15 objections to the target numbers being set for Table

16 Mountain?

17 A. I can't recall any specific examples.

18 Q. So if you're using historical data to set

19 target numbers for the future, you're relying upon the

20 credibility of that historical data; correct?

21 A. As a starting point, yes.

22 Q. Okay. So if that historical data is garbage,

23 then ultimately where you end up is garbage; correct?

24 A. That would be the case.

25 Q. So let's, let's look at, say, 2014. Let's say

26 in 2014 the inspection, detailed inspection, for line X

1 on paper took 91 hours.

2 A. Okay.

3 Q. In reality, it took 121 hours. When you're
4 setting the schedule then for 2015, you're relying upon
5 that 91 hours; correct?

6 A. We never looked at line level detail in regards
7 to how many hours it took.

8 Q. Okay. So you're looking just at -- in a whole?

9 A. Yes.

10 Q. So if the T-men at, let's say, headquarters Y
11 were under reporting their hours spent on inspections and
12 patrols every year, then the numbers that you had would
13 be greatly minimized; correct?

14 A. If they were under reporting, then yes.

15 Q. Yes?

16 A. Then yes.

17 Q. So if it wasn't uncommon, like we talked about
18 on transmission line X, that the inspection actually took
19 121 hours, but 91 were reported, if you had another ten
20 lines that the same thing was being done on, your numbers
21 or what you ultimately came up with for a target for the
22 next year would be skewed extremely; right?

23 A. As a starting point, they would be, but that's
24 the reason why we review with the Operational team to get
25 their feedback to see if they're comfortable with those
26 numbers.

1 Q. Who is the Operational team?

2 A. The supervisors, the superintendents, as well
3 as the NNC director, if we're still speaking about that
4 time frame, also the senior director ultimately.

5 Q. You keep saying this is just a starting point.
6 So now walk us through. Let's say in 2014 you've got
7 the, all of the numbers, how many hours were spent doing
8 detailed ground patrols or detailed ground inspections
9 and aerial patrols in headquarters Y.

10 A. Okay.

11 Q. Now walk us through how you ultimately come to
12 the end of the target.

13 A. Sure thing.

14 So we'd review the historical information with
15 the supervisor at headquarter Y, get their feedback. If
16 they want to make any adjustments, they'll let us know.
17 We'll ultimately adjust that historical information to
18 account for their feedback. That leads to review with
19 the superintendents to get the review, their feedback,
20 and ultimately their approval. Then at the very end,
21 that rolls up now to a higher level meeting with the
22 senior director to ultimately get review and approval.
23 And that's where the targets are set.

24 Q. How often, in your experience doing this, did
25 the Operational team say that they weren't comfortable?

26 A. I can't recall how often.

1 Q. I mean, was it common for the Operational team
2 to say this isn't enough time?

3 A. What do you mean by common?

4 Q. I mean, every year you would go back to these
5 people and say, "Okay, here's what the numbers show, are
6 you comfortable with this number?" How often do they say
7 "No, we need more time"?

8 A. I don't recall how often. But in the event
9 that they needed more time, we would go ahead and put
10 that in as part of adjustments for the budget planning
11 process.

12 Q. Did you ever -- were you ever told by any of
13 the Operational team not only are we not comfortable but
14 last year we had to misreport time because we were so
15 over our time on certain lines?

16 A. I don't recall any examples of misrepresenting
17 of time, at least from the Operational team.

18

19 (Grand Jury Exhibit 577 introduced.)

20

21 Q. So we have up here in front of us Exhibit 577.
22 And this is a spreadsheet for Table Mountain headquarters
23 2014 patrols and inspections. Do you recognize this
24 document?

25 A. I do not recognize this document.

26 Q. Okay. What we're talking about here is this

1 column that says "work"; right?

2 A. Okay.

3 Q. And this number, 89 hours.

4 A. Okay.

5 Q. That's the target number that you were talking
6 about earlier; correct?

7 A. I don't recall this 89 hours, since I've never
8 seen this document before.

9 Q. Right. Now, we have been told that this
10 number, this 89 number, was produced by the Transmission
11 asset specialist based upon a formula that they were
12 provided by you.

13 A. For this specific example, looks like it's
14 2014, I did not plan the budget for 2014.

15 Q. Right. We are just talking in general right
16 now. We're talking about this target number. We're
17 talking about how we're coming to this number right here.

18 A. Okay.

19 Q. Not just in 2014, in any -- 2015, 2016, 2017.

20 A. Got it.

21 Q. So we're told that the Transmission asset
22 specialists get that number by applying a formula that
23 they were provided by you. Is that correct? Are we
24 understanding that correctly?

25 A. In regards to the formula, do you know what
26 formula they mentioned?

1 Q. Nope. They said that to figure out how much
2 time for each line, that they plugged in a formula with
3 numbers that were provided by you and it spat out a
4 number for that line for that year.

5 A. I'm not familiar with the specific formula that
6 they use.

7 Q. Okay. So what did you provide to the
8 Transmission asset specialists to allow them to determine
9 how many hours per transmission line?

10 A. They would get the target hours-per-unit number
11 that I was discussing earlier. That's part of budget
12 planning process.

13 Q. Okay. What is that number?

14 A. What do you mean by what it is? I can't recall
15 the exact number.

16 Q. Okay. But what does that number represent?

17 A. It represents the amount of hours it takes to
18 complete one unit.

19 Q. And what is one unit?

20 A. One unit is one asset or one structure.

21 Q. Okay. So a unit is a structure. And so you're
22 figuring out how much time should be spent by a
23 troubleman to patrol or inspect each unit?

24 A. Yes.

25 Q. And how are you doing that?

26 A. That's based on the budget planning process

1 where we set the targets, where we look at, as I
2 mentioned earlier, all hours spent doing inspections, how
3 many units are complete. You get an estimated amount of
4 how many hours does it take to complete one unit. That
5 goes through the whole review process, as I mentioned
6 earlier, the supervisors, superintendents, and senior
7 director. That's how we ultimately land on a target for
8 hours per unit.

9 Q. So you're actually setting the targets of how
10 much time per unit for patrol and inspection?

11 A. Not just me. It's a collaborative effort with
12 the Transmission Line's team as well.

13 Q. All right. So you tell the Transmission
14 specialist how much time can be spent on each structure
15 each year; right?

16 A. Yes.

17 Q. And that number changes year to year?

18 A. It could vary.

19 Q. And sometime it varies several times during the
20 year; correct?

21 A. The target shouldn't change throughout the
22 year.

23
24 (Grand Jury Exhibit 578 introduced.)

25
26 Q. Okay. Well, 577 that we have up here shows 89

1 hours for Caribou-Palermo. And then 578 shows 90.5. So
2 -- and both of these are for 2014. And I understand you
3 didn't have anything to do with this, this precedes you,
4 but why would those numbers change during the course of
5 the year?

6 A. I don't know why that number would change.

7 Q. Now, are you given, or were you given an
8 overall maintenance and inspection budget each year?

9 A. That would be part of the budget planning
10 cycle, yes.

11 Q. Okay.

12 A. You would have an overall number for budget.

13 Q. How would the budget fit into or affect the
14 target per unit, the target time per unit calculation?

15 A. So how the hours per unit target plays a role
16 in the overall budget; is that correct?

17 Q. Yes.

18 A. Sure.

19 So once we land on a target hours per unit,
20 that's ultimately multiplied by a fully burdened hourly
21 rate to get a unit cost. There's also, there could be
22 also other costs that play a role in the unit, which
23 could be materials, contracts, et cetera. But ultimately
24 what that formula, you get a unit cost, you multiply your
25 unit cost by total amount of units for the next year to
26 get a dollar amount with regard to the budget for the

1 following year.

2 Q. Okay. So budgets generally go up and down year
3 to year; correct?

4 A. Yeah, it can vary.

5 Q. And on the expense side, you have -- did you
6 have hard budget parameters?

7 A. What do you mean by "parameters"?

8 Q. I mean, here's your budget, you can't overspend
9 this?

10 A. I don't recall any examples of hard parameters
11 during my time supporting the program.

12 Q. Okay. And talk a little economics. General
13 economics. Costs, certain costs are part of doing
14 business and can't be avoided; correct?

15 A. Yes. There are certain face costs.

16 Q. Things like employee salaries; correct?

17 A. Yes.

18 Q. Cost of materials?

19 A. Yes.

20 Q. Other things that you can't control. Things
21 like inflation also affect the budget; correct?

22 A. Yes.

23 Q. So is it safe to say that the same amount of
24 money doesn't buy as much today as it did in 2014?

25 A. I'm not sure if it would be safe to say. It
26 would vary on what we're discussing here.

1 Q. Okay. So if the budget stays the same every
2 year, but the related costs continue to go up, then you
3 have less money for each one of the units; correct?

4 A. If that was the case, yes.

5
6 (Grand Jury Exhibit 618 introduced.)

7
8 Q. Okay. All right. So let's move on, this is
9 Exhibit 618, another one of the spreadsheets showing the
10 hours.

11 A. Okay.

12
13 (Grand Jury Exhibit 587C introduced.)

14
15 Q. Now we're moving on to 587C, I believe it is.
16 This is an email. And I don't expect that you -- that
17 you're not part of this, but what I want to know is can
18 you explain this chart down here?

19 A. So I didn't track this document, but I can help
20 explain if you'd like.

21 Q. Yes, what we want.

22 A. Okay.

23 Q. And you can stand up and walk over and use the
24 board as much as you want.

25 A. Sure thing.

26 So in regards to the table, on the far left,

1 that represents your MAT code, which is -- I forget what
2 the acronym stands for, but the description of that MAT
3 code is on the right. It shows annual ground patrols for
4 BFU and detailed ground inspection for BFZ.

5 Column third from the left, "HQ," represents
6 your headquarters. All headquarters are listed.

7 "2016 Units," from what I can see here,
8 represents the total volume of units for that MAT code
9 for that headquarter.

10 "UC Target" represents the unit cost target
11 that I mentioned earlier as part of budget planning
12 process.

13 "HRS tar" should stand for target.

14 Q. Okay. What's H-R-S?

15 A. Hours.

16 Q. Okay.

17 A. Should represent hours per unit target that was
18 basically approved in the budget planning process. Since
19 I didn't draft this email, I don't recall exactly where
20 these numbers came from, but they should be as part of
21 the budget planning process in regards to the targets.

22 Q. Okay. So down here, BFZ, we have detailed
23 ground inspections for the year, and this is done in May
24 of 2016. For Table Mountain, 9,919 units. So that means
25 they have 9,919 structures to be inspected, or detailed
26 ground inspection?

1 A. Yes, according to this table.

2 Q. And 30.5, does that mean they're supposed to
3 spend \$30.50 per structure?

4 A. Yes.

5 Q. And then .30 hours on target, which would be a
6 little bit less than one third, so little bit less than
7 20 minutes per structure?

8 A. Yes, according to the table.

9 Q. Okay. So those numbers they're coming up with
10 are reached based upon the historical general numbers for
11 all the previous inspections; correct?

12 A. Yes. And historical can vary between time
13 frames, depending on how the budget planning process
14 went.

15 Q. And the hours on target doesn't take into
16 account the individual attributes of a line; correct?

17 A. What do you mean by taking into account the
18 individual attributes of a line?

19 Q. It doesn't differentiate between a line that's
20 running up in the mountains and a line that's running
21 right next to Highway 70 in the valley?

22 A. Yes. Essentially, it would be an average
23 across all the lines within that headquarters.

24

25 (Grand Jury Exhibit 1226 introduced.)

26

1 Q. All right. Let's move on to 1226. We've been
2 talking about unit costs. You have in front of you
3 what's marked as 1226. First off, can you tell me if you
4 recognize 1226?

5 A. I vaguely remember the, this specific email,
6 but I do recall the format here and the report.

7 Q. Okay. What is 1226?

8 A. 1226 is a monthly email sent out to the
9 Transmission Line's team in regards to unit costs
10 performance.

11 Q. Okay. Unit cost is how much it costs to do any
12 single job; correct?

13 A. Can you clarify what you mean by a job?

14 Q. Inspect a tower, fix a tower?

15 A. Yes.

16 Q. All right. So walk us through this email and
17 how to, how to read this and similar emails.

18 A. Sure thing.

19 Starting with the top, in the summary, it's
20 basically a high-level description of how we're
21 financially performing in regards to unit costs, actual
22 performance versus unit costs target performance.

23 As we can see here in the specific example for
24 September 6th, 2016, YTD represents year to date through
25 August. It looks like we're achieving an unfavorable
26 financial impact of 1.2 million. Looks like that's

1 mainly driven by actually preventive maintenance, which
2 is the Expense Repair Budget. You'll notice that patrols
3 and inspections actually performed favorably, came under
4 budget by \$.11 million. And expense repairs performed
5 above budget at \$1.3 million.

6 Areas below that are just showing areas of
7 focus showing which unit cost has trended high over the
8 past month, which unit costs have trended lower over the
9 past month. And various notes around the actual report
10 itself on the bottom of the email.

11 Q. All right. So, first off, who is this email
12 going out to?

13 A. It is -- well, starting off, Eric Back, who is
14 the senior director of Transmission Line at that point in
15 time. And also the superintendent, Robert Cupp. Trevor
16 Hammon I believe was a superintendent at that point in
17 time as well. Also goes out, as you can see, on the
18 two-line email to the M&C North Leadership Team, M&C
19 South Leadership Team, and M&C Central Leadership Team.

20 Q. Okay. What is the M&C North and South
21 Leadership Team? What does that mean?

22 A. That means the Maintenance and Construction
23 North Leadership Team. I don't recall everyone who was
24 in that specific email box, but involves or includes the
25 superintendent, the front line supervisors, and there
26 could have been various other individuals.

1 Q. How often did you send out these emails?
2 A. This was on a monthly basis.
3 Q. All right. So every month you're sending these
4 emails out to the, to the Transmission Line supervisors,
5 charting how they did this past month financially?
6 A. Yes.
7 Q. So let's walk through this. What does it mean
8 to have an unfavorable financial impact?
9 A. That means if we take all units done through
10 August of that year times the difference between their
11 unit cost, actual number versus their unit cost target
12 number, that means, with that equation, we are performing
13 1.2 million above unit cost.
14 Q. So to put that in layman's terms, does that
15 mean we're over budget?
16 A. For these two categories of work, yes.
17 Q. All right. And we go down here, P&I, does that
18 stand for patrol and inspection?
19 A. Yes.
20 Q. What is a favorable financial impact?
21 A. That means they are performing below unit cost
22 target for however many units they completed at that
23 point in time.
24 Q. So patrol and inspection is under budget
25 basically; correct?
26 A. I can't recall the exact number, but if you

1 looked at just unit cost performance, yes.

2 Q. Now, we go down in this little area here, areas
3 of focus, and we have trending higher with this red
4 arrow?

5 A. Yes.

6 Q. And, actually, I should back up. This email
7 and the other one similar to it, monthly emails, are in
8 color with green and red and blue; right?

9 A. Let me look through the other ones. They
10 should be.

11 Q. Okay. I'm guessing green means good; red means
12 bad?

13 A. If we're looking at financial performance,
14 above, above budget or below budget, then yes.

15 Q. Okay. So here this month we have the red arrow
16 going up, trending higher, and we have ICI, BFX, and ICW.

17 So BFX says annual air patrols unit cost
18 increase of 8 percent from last month, \$10 per unit to
19 \$10 -- looks like -- 70 cents, 10.7 per unit. Am I
20 reading that correctly?

21 A. You are.

22 Q. So what does that mean?

23 A. That means that we're looking at unit costs
24 based on the report that was sent out a month before,
25 which is in August, comparing that to the report now in
26 September. We notice about an 8 percent increase in unit

1 cost.

2 Q. Okay. And then trending lower, this month we
3 have green arrow going down. BFX and ICD both are going
4 down; correct?

5 A. Yes.

6 Q. So what are these reports, these monthly
7 reports, that you're sending out to the T-line
8 supervisors used for?

9 A. It would be used for providing unit cost
10 information, just how they're performing compared to
11 target. Supervisors would look into their area to look
12 at specific jobs at a lower-level detail.

13 Q. Do you know if supervisors were rewarded for
14 coming in under budget?

15 A. I don't know.

16 Q. Or punished for coming in over budget?

17 A. I don't know.

18

19 (Grand Jury Exhibit 1227 introduced.)

20

21 Q. All right. So let's move on to 1227. And I'll
22 ask you -- look at 1227 and tell us what 1227 is.

23 A. Okay. So this is a similar layout to the
24 Exhibit 1226. Essentially, this is a report sent out on
25 December 5th, 2016. Looks like it compares performance
26 through November of the year, and looks like there was an

1 unfavorable financial impact of about \$3 million during
2 this year. Mainly on the Expense Repair side, which is
3 labeled under "preventive maintenance."

4 Q. Okay. Do you know what ICW means?

5 A. This was a MAT code. I believe that was around
6 expense repairs on wood structures.

7 Q. So -- and then here in patrol and inspection
8 for the year, you're under budget by .1 -- I'm guessing
9 "M" means million?

10 A. Yes.

11 Q. So basically a hundred thousand dollars?

12 A. Yes.

13 Q. So what happens when one side of the equation,
14 or one, one MAT code or area goes over its budget to the
15 other sides, the other areas?

16 A. Ultimately, if we see a certain area over
17 budget, we'll look at ways to reallocate maybe other
18 areas under running. If we can't do that, it goes
19 ultimately to a higher level, looking at various
20 organizations that may be under running.

21 Q. When you're talking about reallocating, taking
22 from Peter to pay Paul; correct?

23 A. Yes.

24 Q. So if one area is overrunning its budget, then
25 you've got to go get that money from somewhere else?

26 A. Yes.

1 Q. All right. So here, this preventive
2 maintenance is way overrunning the budget, so to pay for
3 that in the expense side, you're going to have to take
4 money from other places, for instance, patrol and
5 inspection budgets?

6 A. I don't recall if it was ever taken from the
7 patrol, patrol and inspection budget.

8
9 (Grand Jury Exhibit 1228 introduced.)

10
11 Q. All right. Let's move on. 1228.

12 A. Okay.

13 Q. Tell us, what is 1228?

14 A. Sure. Same run through as before. Looks like
15 this was sent out March 3rd of 2017. Showing performance
16 through February. Looks like net financial impact was
17 essentially zero; roughly, rounding to the closest
18 number, \$0.0 million.

19 Looks like P&I was pretty much on target, net
20 financial impact \$0.0 million as well.

21 Preventive maintenance, judging by the red,
22 rounded to \$0.0 million, slightly unfavorable.

23 Q. All right. Now, areas of focus here where we
24 have trending lower, go down to BFZ, what's the detailed
25 ground inspection.

26 A. Okay.

1 Q. Unit cost decrease of 63 percent from last
2 month; from \$57 per unit to \$22 per unit?

3 A. Okay.

4 Q. What does that mean?

5 A. That means they improved unit cost combining
6 January and February data. It improved from the January
7 performance, just looking at January data.

8 Q. Okay. How do you improve your unit cost for
9 doing a detailed ground inspection?

10 A. I am not in a position to answer that in
11 regards to how you improve that.

12 Q. What do you look at to see that, that this is
13 happening? How can you tell that there's been a unit
14 decrease of 63 percent on detailed ground inspections?

15 A. Yeah. So we extract that information from SAP
16 as well. It's a query that we pull data from. Look at
17 all of the orders that had costs charged to during that
18 time frame, as well as looking at all the units on that
19 specific order. That way we can get an approximate unit
20 cost dividing your total cost on that order divided by
21 total units complete on that order.

22

23 (Grand Jury Exhibit 1229 introduced.)

24

25 Q. Okay. Let's move on to 1229. And what is
26 1229?

1 A. Okay. Running through the same example, looks
2 like this was sent out an April 5th, 2017, showing data
3 through March. Looks like at this point in time
4 favorable financial impact of .3 million, favorable
5 financial impact on P&I of .2 million, favorable
6 financial impact on preventative maintenance at .1
7 million.

8 Q. All right. So now we're trending lower. We
9 have BFX, annual air patrols, unit cost decrease of 42
10 percent from last month; \$14.5 per unit to \$8.4 per unit;
11 correct?

12 A. Correct.

13 Q. Again, do you have any idea how you decrease
14 the unit cost for an aerial patrol?

15 A. I'm not in a position to answer how you
16 decrease unit cost for aerial patrols, but if we're
17 talking from a systemic standpoint from pulling this
18 information, it would basically be the amount of cost on
19 those orders divided by unit. And looks like that ratio
20 improved, essentially leading to improved unit cost.

21

22 (Grand Jury Exhibit 1230 introduced.)

23

24 Q. Okay. 1230.

25 A. Okay.

26 Q. Can you explain 1230 to us.

1 A. Sure thing.

2 This was sent out on May 3rd, 2017. Looks like
3 this is performance through April. Favorable financial
4 impact of \$.2 million.

5 On the P&I side, favorable financial impact of
6 \$.1 million.

7 Favorable financial impact of .1 million on
8 preventive maintenance as well.

9 Q. Okay. And then trending higher, now we have
10 the BFX again, the annual air patrols, increase 22
11 percent, from 8.4 to 10.3?

12 A. Correct.

13 Q. All right. So this month they've almost
14 bounced back to where they were in April -- in March;
15 correct?

16 A. It's trending towards that direction based on
17 what I'm seeing.

18 Q. Okay. Was it common to see those unit costs
19 and inspections vary like that from month to month?

20 A. I don't recall those common, but we would see
21 fluctuation in cost every month.

22

23 (Grand Jury Exhibit 1231 introduced.)

24

25 Q. Okay. All right. 1231.

26 A. Okay.

1 Q. Did I get those out of order? We went -- now,
2 this is '18, I'm sorry. I saw April.

3 A. Gotcha.

4 Q. Tell us what you're looking at.

5 A. Sure thing.

6 Sent out April 4th, 2018, showing financial
7 performance through year-to-date March. We're achieving
8 a favorable financial impact of about 251k.

9 Looks like the formating is a little different
10 on this one, but looks like P&I was experiencing
11 unfavorable financial impact of about \$7,000.

12 On the preventive maintenance side, favorable
13 financial impact of roughly \$257,000.

14 Q. So in patrol and inspection they're over their
15 budget by \$700,000 or 7,000?

16 A. Seven thousand.

17 Q. All right. Seven thousand.

18 Okay. We go to areas of focus. And then BFZ,
19 detailed ground inspections, unit cost decrease. Unit
20 cost decrease of 14 percent from last month; \$28 a unit
21 to \$24 a unit. Reading that correctly?

22 A. Correct.

23 Q. So costs are going down for detailed ground
24 inspections?

25 A. Yes.

26 Q. All right.

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24
25
26

(Grand Jury Exhibit 1232 introduced.)

Q. All right. So this is 1232. Look at 1232.
We're going to start with the email on the bottom. We
always read the emails here. Emails are backwards.

A. Okay.

Q. So the second half of the page, basically front
page, starts with an email from you. If you'll let us
know what we're looking at here.

A. Yes. In regards to the email that I sent out
at the bottom of the page, looks like this was sent out
October 6th of 2015. Looks like that is a link to the
unit cost report that was sent out to the Transmission
Line Leadership team.

Q. Okay. And that would be the reports like we
were just looking at or --

A. It should be very similar. Looks like this is
in 2015, so could have been a different iteration of that
report.

Q. All right. Above that, who is John Parks?

A. At that point in time, he was the senior
director of Transmission Lines. Also noted in the
signature of the email.

Q. Right. And he says, "T-line supervisors, thank
you for your continued focus on your unit costs. Your

1 efforts have yielded about \$1.5 million year-to-date in
2 expense savings while all along working safely. Please
3 pass on thanks to the crews and troublemen."

4 Am I reading that correctly?

5 A. You are reading it correctly.

6 Q. Then above that there's an email from (WITNESS
7 #12). You said earlier (WITNESS #12) is a T-line
8 supervisor or superintendent?

9 A. Yes.

10 Q. So he says, "You appear to be doing a good job.
11 Thank you for all your efforts."

12 Correct?

13 A. Yes.

14 Q. So you send out these monthly emails to the
15 supervisors, tracking how they did this week, this month.
16 Is it common for -- when they're saving money, they're
17 under budget, that's a good thing; right?

18 A. In regards to financial performance? Yes.

19 Q. In regards to everything.

20 A. In regards to financial performance, we're
21 under, typically that would be a good thing. But it also
22 depends on other areas within the budget as well.

23 Q. Okay. All right. This would probably be a
24 good time to take a break.

25 GRAND JURY FOREPERSON: Okay.

26 MR. NOEL: We've been going for almost an hour

1 and a half.

2 GRAND JURY FOREPERSON: Fifteen-minute break.

3 Admonition?

4 MR. NOEL: Yep, admonition.

5 GRAND JURY FOREPERSON: Mr. Ma?

6 THE WITNESS: Yes.

7 GRAND JURY FOREPERSON: You are admonished not

8 to discuss or disclose at any time outside of this jury

9 room the questions that have been asked of you or your

10 answers until authorized by the Grand Jury or the Court.

11 A violation of these instructions on your part may be a

12 basis for a charge against you of contempt of court.

13 This does not preclude you from discussing your legal

14 rights with your own attorney.

15 Mr. Ma, what I have just said is a warning not

16 to discuss this case with anyone except the Court, your

17 lawyer, or the district attorney.

18 THE WITNESS: Okay.

19 GRAND JURY FOREPERSON: Do you have any

20 questions?

21 THE WITNESS: No questions.

22 GRAND JURY FOREPERSON: Thank you.

23 THE WITNESS: Thank you.

24 MR. NOEL: Take a break.

25 (Break taken.)

26 [PROCEEDINGS OMITTED.]

1 GRAND JURY FOREPERSON: Everyone's back, and
2 all members of the Grand Jury are present. We shall
3 proceed.

4 Mr. Ma, I'd like to remind you that you're
5 still under oath.

6 THE WITNESS: Okay.

7 Q. (By MR. NOEL) Before we get back, one of the
8 questions I neglected to ask you earlier, I had asked you
9 about if other people's compensation was tied to how well
10 they performed. How about your compensation? Was your
11 compensation ever tied to the budget and how well the
12 T-lines performed or did not perform?

13 A. I don't know. It was one of our goals, but I
14 don't know if that was directly tied to my compensation.

15 Q. So you don't know if you got bonuses for good
16 performance?

17 A. For overall performance. Not in regards to
18 budget. That -- depending on how well you performed each
19 year, there's a year-end evaluation that dictates a bonus
20 percentage.

21 Q. And you, just to confirm, make sure we got this
22 clear, you don't work for PG&E anymore; correct?

23 A. Correct.

24 Q. When you left PG&E did you have to sign a
25 nondisclosure agreement?

26 A. I don't recall.

1 Q. Did you have to sign anything saying that you
2 would not cooperate with any investigations or speak ill
3 of PG&E?

4 A. I don't recall.

5 Q. And you left after the Camp Fire; correct?

6 A. Yes.

7 Q. At any time did you have to sign for PG&E a
8 nondisclosure agreement or anything that limited your
9 ability to talk about the company?

10 A. I don't recall.

11 Q. Now, we talked a little bit about historical
12 data. You said you pulled the historical data to make
13 determinations for the targets. And you said that the
14 prior three to five years. How did you decide whether to
15 use three years or to go all the way to five years?

16 A. We would just pull all the historical
17 information as a reference point. In case we ever wanted
18 to use a certain time frame, we would start as a basis
19 with the year-to-date performance, which is basically
20 whatever year it is -- or whatever month we're in.
21 September, say, for example, we'd use year-to-date August
22 performance as a starting point. And we'd have
23 historical information before that year as a reference
24 point if we ever needed to utilize that.

25 Q. Right. If you're doing the, say, the '16
26 budget, you're going to be starting in September of '15;

1 correct?

2 A. Yes. That simple.

3 Q. So your base level, you're going to be looking
4 at the year-to-date numbers as of August?

5 A. Yes.

6 Q. And part of your job, you compiled those
7 year-to-date numbers on a monthly basis; correct?

8 A. Yes.

9 Q. And then you sent them all out to all of the
10 T-line supervisors, superintendents, and above, to track
11 budgetary performance to that point, or for that month?

12 A. Yes.

13 Q. And why did you leave PG&E?

14 A. I left because I was given an opportunity to
15 work for a different company that would help me out with
16 my own personal career development and growth.

17

18 (Grand Jury Exhibit 1233 introduced.)

19

20 Q. Okay. All right. So now I want to go back.
21 We left off, we were at 1233. And I'm not going to ask
22 you if you recognize this because you're not involved in
23 this, but what I want to know is the terms on 1233.

24 "YTD," year-to-date?

25 A. Okay.

26 Q. All right. You're familiar with all these

1 terms?

2 A. With most of them.

3 Q. Okay. Which ones are you not familiar with?

4 A. Scanning through the list, I don't recall

5 everything within ICQ or ICS or ICW.

6 Q. And those would be -- steel structure

7 preventative maintenance for the towers is ICQ, and ICS

8 is steel structure preventative maintenance for the line

9 itself, the T-line; correct?

10 A. Based on the description we're seeing, yes.

11 Q. Then we talked earlier about what was ICW.

12 This means the maintain wood structures?

13 A. Yes.

14 Q. I want to bring the actual emails itself.

15 A. Okay.

16 Q. We'll have page 2 of the email and a large

17 chart. I'll ask you if you recognize that chart or what

18 that chart is.

19 A. I vaguely recognize this. It looks like it's

20 showing unit cost performance by month, by region, MAT

21 code, and headquarter.

22 Q. Okay. So can you explain to us how to read

23 this chart? And, like I said, feel free to get up and

24 use the board.

25 A. Sure thing.

26 So the far left, that grouping is central and

1 north, which represents the region.

2 Right next to that you see MAT, which is your
3 maintenance -- I forget, forgot what that stands for. I
4 think it's maintenance activity type of -- essentially
5 you see the description for that in the third column from
6 the left.

7 Annual air patrols associated with BFX, and
8 detailed ground inspection associated with BFZ.

9 Column next to that on the right, "HQ"
10 represents headquarters. See all the headquarters listed
11 down.

12 Then across these columns, January, February,
13 March, April, May, that shows your monthly unit cost
14 performance associated to each of these groupings.

15 Q. All right. So let's see if we can go down.
16 And there we have the north and Table Mountain. So under
17 BFU, annual ground patrols, for Table Mountain, we have
18 nothing in the right-hand columns; correct?

19 A. Correct.

20 Q. So what does that mean?

21 A. That can mean that there might not have been
22 unit complete. It could mean other things. Jobs were
23 scheduled later on in the year. Basically what it
24 indicates with zero showing up is either you have no
25 units or you have no costs hitting BFU for Table
26 Mountain.

1 Q. Okay. So, now going through the north and the
2 BFU column, we show 122 -- in January, 122.0 for Concord;
3 19.3 for Metcalf; then we have nothing for Eureka,
4 Lakeville, and Table Mountain. Am I reading that
5 correctly?

6 A. Yes.

7 Q. But then in the shaded column, it says -- BFU
8 total, it says 55.1. Explain to us how that comes about.

9 A. That would be a weighted average between the
10 Concord numbers and the Metcalf numbers.

11 Q. What do you mean a "weighted average"?

12 A. So we take all the costs in BFU for these
13 headquarters and divide all the units for all these
14 headquarters to get the 55.1.

15 Q. Okay. Well, 122 and 19 would be 141; correct?

16 A. I'm not sure how you get to the 141 you
17 mentioned.

18 Q. Well, you get 122 plus 19 would be 141?

19 A. That's if you add it, yes.

20 Q. 141.3. So 141.3 divided by 5 doesn't equal
21 55.1. So how, how are you coming up with this figure?
22 What does it mean to be a weighted average?

23 A. Where did you get the 5 from?

24 Q. Well, there's five columns. One, two, three,
25 four, five. Concord, Eureka, Lakeville, Metcalf, and
26 Table Mountain. And you said this 55.1 represents a

1 weighted average.

2 A. Yes. So what's not shown here in this table is
3 the amount of units complete and the costs associated to
4 these units. This is a unit cost chart showing your
5 dollars spent divided by units complete. So you don't
6 get the full picture from just looking at this.

7 Q. So this means for \$55.1, so \$55 and 10 cents,
8 per unit for annual ground patrols in January; correct?

9 A. Yes. For all of those headquarters.

10 Q. Okay. Now, we go to air patrols. And Concord,
11 Lakeville, Metcalf, Sacramento, Table Mountain. They all
12 are checking in here, everybody but Eureka. So that's
13 \$67, that's the cost per unit air patrols that month --

14 A. Yes.

15 Q. -- overall?

16 A. For those headquarters, yes.

17 Q. For the northern headquarters.

18 And for Table Mountain we see 108.8 in January.
19 And then it goes down to 6. Then it goes down -- it goes
20 up to 28. Then it goes down to 16.1. Then it continues
21 down to 8.5. And we see the same in the totals: 67,
22 12.1, 18.3, 20.8, 15.7. Why are all those vacillating so
23 wildly?

24 A. I don't know why they're vacillating so wildly.

25 Q. Is that common?

26 A. We would see unit costs fluctuate over per

1 month.

2 Q. Okay. So now the next chart on page 2, can you
3 explain to us this chart.

4 A. Sure.

5 Basically this chart is showing your
6 headquarters for your region on the far left. Looks like
7 in the first row you have your actual units complete.
8 And you have your actual dollars. Then you have unit
9 costs variance. And then target unit cost. And it shows
10 your actual unit cost on the bottom right here.

11 Then across the columns, from left to right,
12 you have your MAT codes.

13 Q. All right. So for Table Mountain there's
14 nothing under BFK, nothing under BFR, nothing under BFS,
15 nothing under BFT. And for BFU, which would be annual
16 ground patrols --

17 A. Yes.

18 Q. -- \$16. That's the cost per unit that an
19 annual ground patrol for Table Mountain headquarters
20 should be costing, \$16 per structure?

21 A. Based on this table, yes.

22 Q. And then BFX is annual air patrols. And it
23 should be \$15 per structure for an annual air patrol;
24 correct?

25 A. Correct. Based on what we're seeing in this
26 table.

1 Q. All right. Then BFZ, which is the detailed
2 ground inspection, \$51 per structure; is that correct?

3 A. Correct. Based on the table.

4 Q. And this is what you'd use to form your budget
5 for this, this headquarter?

6 A. I don't recall if this is what we used.

7 Q. Okay. And then down at the bottom we have the
8 actual costs. And so BFU, which is annual ground
9 patrols, looks like they're costing a whole lot more than
10 they're supposed to. \$143 per unit. Am I reading that
11 right?

12 A. You are.

13 Q. And it's supposed to cost \$16, so they're way
14 overspending. But it looks like in actual dollars they
15 only spent \$573?

16 A. Yes.

17 Q. All right. What does that unit cost variance
18 mean?

19 A. Based on what I'm seeing in this table, it
20 looks like it is taking the difference between your
21 target unit cost and your actual unit cost.

22 Q. Okay. So -- all right. So actual unit cost,
23 BFU, which is very, very slight, is way over budget, but
24 BFX, which is the annual air patrols, is actually a
25 dollar per unit under budget; correct?

26 A. Correct.

1 Q. And BFZ, which is the detailed ground
2 inspections, is \$5 under budget; correct?

3 A. Correct.

4 Q. Okay. And do you remember who Mary Hvistendahl
5 is?

6 A. Yes. She was a superintendent.

7 Q. Okay. And this is an email from 2014. "Your
8 HQ is way over --" and this is directed towards (WITNESS
9 #12) and (EMPLOYEE #16) -- "Your HQ is way over in BFU
10 unit costs. Only shows one month of them."

11 So is that true based upon the spread chart?

12 A. Let me take a look at the table and see.

13 Q. Yep.

14 A. Looks like the table might be cut off since I
15 don't see BFU Table Mountain unit cost. But I do see in
16 the bottom table, which is the one we just reviewed.

17 Q. Right.

18 A. And that one shows that it's over target unit
19 cost.

20 Q. All right. So -- and going back to how you're
21 involved in this one, all the way back to the beginning
22 it starts with an email from you; correct?

23 A. Correct.

24 Q. Year-to-date July performance. And then Robert
25 Cupp. Who did you say that was?

26 A. He was a superintendent at that time.

1 Q. And he's asking you to break out the north and
2 the south by HQ and total for each department for all the
3 unit costs; correct?

4 A. Correct.

5 Q. And you did so and sent it back to he and Mary
6 Hvistendahl?

7 A. Yes.

8 Q. So that's the chart that we've been looking at,
9 breaking down all those costs?

10 A. Correct. Correct.

11

12 (Grand Jury Exhibit 1234 introduced.)

13

14 Q. All right. Let's move on to Exhibit 1234.
15 1234.

16 A. Okay.

17 Q. Who is Jennifer Burrows?

18 A. She was the Transmission Line's work management
19 manager.

20 Q. All right. And who is Kelly Leal?

21 A. I don't recall that specific time frame that
22 she was on Jennifer's team.

23 Q. Who is Jake Meyers?

24 A. He was also on Jennifer's team, but I don't
25 recall his exact title.

26 Q. All right. This is an email and a response to

1 an email, the email that you sent on September 18th,
2 2017, to Eric Back and Jennifer Burrows. And remind us
3 who Eric Back is.

4 A. He is the senior director of Transmission
5 Lines, at least at that point.

6 Q. So tell us what you're, what you're doing in
7 this email.

8 A. So it looks like I was providing Eric and
9 Jennifer an update on the latest budget adjustments based
10 on feedback from Eric and Jennifer. This is a roll-up
11 summation of the changes that were going into the latest,
12 looks like S2 Ask numbers.

13 Q. That's why we're having you explain this.

14 Here you're involved -- this is September of
15 '17, and you are involved in putting together a budget
16 for T-line division for '18; is that correct?

17 A. Yes.

18 Q. All right. So explain this chart to us.

19 A. Sure. I can explain at least what I know.

20 Q. You put together that chart; right?

21 A. I did. I did.

22 Q. So you should know everything that's in that
23 chart.

24 A. I can't recall all the definitions of S1, S2
25 Guidance, Ask. I got those targets from a different
26 department. But essentially the table starts out Major

1 Work Category. Far left. These are the five rows listed
2 outside the -- that is how the budget was composed. So
3 like we talked about earlier with MAT codes, those MAT
4 codes go into certain major categories. This is a
5 hire-level roll-up of the budgeting.

6 Starting with BF, CH, DF, IB, and IC, there is
7 a description associated to each category as well next to
8 it.

9 And then there's various columns here that
10 shows target budget for 2018 based on different iteration
11 on targets we've received.

12 S1, S2 Guidance, ultimately S2 Ask.

13 Then a variance between basically your guidance
14 from CH versus your S2 Ask.

15 Q. So, just in general, can you define for us what
16 S1 is? What does it represent?

17 A. I can't define the process of S1.

18 Q. Just what it means.

19 A. That represents a target that was set in 2018,
20 targeted budget number for each major category.

21 Q. Targeted by who?

22 A. I can't recall who gave us the targets. It was
23 a different department than within the company.

24 Q. All right. So somebody else sat the budget for
25 Electric Transmission Distribution Patrol and Inspection
26 at 5,606, or is that a truncated number?

1 A. That is 5.6 million.

2 Q. All right. So the budget is 5.6 million.
3 Somebody has set that as the target for the budget?

4 A. Yes.

5 Q. What is S -- just in general, what is S2
6 Guidance?

7 A. It looks like S2 Guidance had changes from S1.
8 Based on what I recall during that process, they were
9 different iterations of prioritization led by different
10 departments. So that's why you can see the number is
11 different from S1. In regards to what change, I can't
12 recall what changed.

13 Q. Right. But just in general, what does S2
14 Guidance mean? It's a process that you go through every
15 single year, so there has to be some definition for what
16 S2 Guidance is.

17 A. That is a recommended target. I don't know the
18 whole process around S2 Guidance and how those numbers
19 were calculated.

20 Q. So, same question, S2 Ask?

21 A. Yes. So as soon as I received the targets for
22 S2 Guidance, we basically went back to the Transmission
23 Line's team with Eric and Jennifer listed in this email
24 to get their feedback in regards to those numbers and
25 take anything back and make those adjustments, which you
26 see here listed in S2 Ask. That's the reason why I sent

1 out that email back to Eric and Jennifer here.

2 Q. Okay. And then the final column, D, Gold Ask?

3 A. Looks like that is the variance between S2
4 Guidance and S2 Ask.

5 Q. Okay. So you're asking for \$187 million more,
6 or hundred 1.87 million more than what some unknown
7 person has set as your target for that year?

8 A. It would be \$187,000.

9 Q. A hundred eighty-seven thousand.

10 Okay. All right. And the number that you're
11 asking is what you're being told by, for lack of a better
12 term, the subject matter experts as to how much they need
13 to do the job correctly; correct?

14 A. Yes.

15

16 (Grand Jury Exhibit 1235 introduced.)

17

18 Q. All right. Now, moving on to 1235.

19 A. Okay.

20 Q. And can you explain to us the chart? This is
21 your email from Monday, October 26th, 2015, somebody
22 named Jefferson Heidelberger. And can you explain to us
23 this chart.

24 A. Okay. I don't recall exactly what this
25 analysis regarding, analysis of a file, but I know from a
26 high-level what I'm seeing here and explain the table.

1 Q. Right.

2 A. So just going over the table here, you'll
3 notice breaks down your headquarters in the far left,
4 shows your regions -- north, south.

5 Obviously short for "headquarters" right next
6 to it.

7 Head count. I can't recall exactly if those
8 were actual head count numbers or projected head count
9 numbers.

10 In the middle here you'll see FY, FTE billable
11 capacity. That's the estimated amount of total billable
12 hours for a Transmission Line maintenance employee.

13 Q. What does FY mean?

14 A. I believe that represents full year.

15 Q. What is FTE?

16 A. Full-time employee.

17 Q. Okay.

18 A. In 2012, 2013, 2014, these columns, based on
19 what I'm reading in the email, it looks like those are
20 average -- looks like those are 2012, 2013, 2014 hours
21 billable from T-line, T-man based on what's described in
22 the email.

23 Q. Okay. So, for instance, Table Mountain, 4
24 T-men, 5 on the crew; total billable hours, 1,725. And
25 is this year-to-date?

26 A. I don't know.

1 Q. But it shows 2012, 6,731; 2013, 5,355; 2014,
2 4,288. So am I correct in reading those numbers that the
3 billable hours that are being put in by the Table
4 Mountain crew are going down every year?

5 A. Based on what we're seeing, yes.

6 Q. And going down substantially?

7 A. Can I clarify what you mean by "substantially"?

8 Q. Big.

9 A. If we're looking at percentage change, I would
10 say yes.

11 Q. Okay.

12 GRAND JUROR #13: Marc, could you make the
13 chart a little bigger so we can see it, please.

14 Thank you.

15 Q. (By MR. NOEL) So looks like the billable hours
16 for Table Mountain are going down. And do you see any
17 other trends in here?

18 A. I do.

19 Q. What's that?

20 A. Other headquarters are actually increasing.
21 And then at the bottom, grand total area, you can see
22 that as an increasing as well.

23 Q. Okay. For instance, Fresno 2012 starts off
24 with 2,566. '13 goes up to 4,960. And '14, that's up to
25 6,279. So that's a pretty substantial increase in man
26 hours; correct?

1 A. Yes.

2 Q. And this is just the man, the billable hours
3 for the T-men and -- well, just for their T-men; correct?

4 A. Based on what's described in the email, yes.

5 Q. Okay. That's your email. That's what you say
6 in the email.

7 A. Yes.

8

9 (Grand Jury Exhibit 1236 introduced.)

10

11 Q. All right. Let's move on to 1236.

12 A. Okay.

13 Q. See No. 1236?

14 A. Yes.

15 Q. And this is an email, it's not really addressed
16 to you, but the question is talking about a training, and
17 it says, "Unit cost reporting review, Warren Ma."

18 So do you remember providing training on those,
19 on that topic?

20 A. I vaguely recall.

21 Q. Was it common for you to go out and give
22 training to the actual crews?

23 A. Not the actual crews, but the supervisors at
24 times.

25 Q. And what -- explain for us the training that
26 you were giving to the supervisors.

1 A. It was primarily around how to navigate through
2 the unit cost report. It was on Excel, so a lot of
3 supervisors needed help navigating through that report to
4 see where their areas were and kind of how to read and
5 digest those reports.

6 Q. So you're talking about the monthly reports you
7 sent out tracking year-to-date spending?

8 A. Yes.

9 Q. Did you teach them how to be able to read it to
10 be able to identify how they're doing on a month-to-month
11 basis?

12 A. Yes.

13

14 (Grand Jury Exhibit 1237 introduced.)

15

16 Q. All right. Let's go on to 1237.

17 A. Okay.

18 Q. Do you recognize 1237?

19 A. I don't recognize the first email here from
20 Mary. I was not on that email.

21 Q. Then the second email is from you?

22 A. Yes.

23 Q. And then when you go back -- we've learned you
24 have to review these things from back to front --

25 A. Okay.

26 Q. -- chronological.

1 So these things start off, this exhibit starts
2 off with an email on August 5th, 2014, from you to a
3 whole bunch of people. "Year-to-date July performance by
4 HQ"; correct?

5 A. Correct.

6 Q. And then, again, Robert Cupp is asking you to
7 break it down by headquarters and by region?

8 A. Yes.

9 Q. And, again, we've already gone through this,
10 this is a similar chart to the one we went through
11 earlier; is that correct?

12 A. Correct.

13 Q. And you say that there's columns missing on
14 these charts; correct?

15 A. There could be. I don't know if they were cut
16 off or not, but looks like since this is a year-to-date
17 July performance email, there should be June and July
18 there as well.

19 Q. Okay. And then there's your email. You're
20 sending out this chart to everybody. What does it mean
21 when you say, "I've modified the Unit Cost Report to
22 split the data between north and south"?

23 A. That is based on Robert's request in the prior
24 email saying, "Hey, Warren, can you break out the north
25 and south by HQ and total?"

26 Yeah, basically what he mentioned earlier.

1 Q. And you say, "Please feel free to let me know
2 if you'd like to make any additional modifications."

3 What type of modifications could be made?

4 A. I don't know. Depending on what Robert and
5 Eric were thinking, I would take that feedback into
6 account and make any modifications as requested if it
7 made sense.

8

9 (Grand Jury Exhibit 1238 introduced.)

10

11 Q. Let's move on. This is -- let's move on to
12 1238.

13 A. Okay.

14 Q. And can you explain to us what we're looking
15 at, 1238.

16 A. Sure.

17 Looks like this is an email from me to the
18 T-line Leadership team basically going over high-level
19 how the T-line performed year-to-date through August in
20 this case.

21 Q. It says, "Day 2 summary of financial results."
22 What does that mean?

23 A. Day 2 is a day when we typically get all of our
24 cost information for the prior month. And that's -- if
25 you go back in this email, you'll notice there at the
26 very beginning, if we're going in order here,

1 chronological order that is, there should be an email
2 from our director that kicks off this chain. And, yes,
3 there is.

4 Q. There's 39. So this is a long email chain;
5 right?

6 A. Yeah. There's a lot of tables in here. It's a
7 piggyback off several emails.

8 Q. Okay. So let's start walking through some of
9 these tables and what they mean. I'm going to actually
10 have to lower this down a little bit so we can actually
11 see the context.

12 So we're starting off, we're on page 8 of 9 in
13 this email with some tables marked as "30-day Forecast."

14 Can you explain to us what that means.

15 A. Thirty-day forecast represents comparison of
16 the August spend versus forecast to spend. And you'll
17 see the variance to forecast versus actual spent.

18 Q. All right. So in the expense budget, again,
19 red bad, green good, yellow neutral?

20 A. I wouldn't necessarily say it's good or bad,
21 but it's over if it's red; yellow if it's about the same;
22 and then, then red would be over.

23 Q. All right. So explain to us how to read that
24 expense chart for the month of August.

25 A. Sure.

26 Starting at the very far left, you'll see "LOB

1 Hierarchy." LOB represents Line of Business.

2 At the very top you'll notice Operations as a
3 whole, which includes all of the different organizations
4 under Operations. Starting again, Electric Distribution,
5 Electric Transmission, Emergency Preparedness and
6 Response, and Fleet Service.

7 On the column here, you'll see actual spend.

8 Then you'll see forecast right next to that,
9 which represents the forecast amount of spend to the
10 month.

11 Then you'll notice the variance between all
12 that.

13 And forecast on the far right.

14 Q. All right. Overall, for Electrical Operations
15 the forecast was \$72,262; in actual you spent \$79,907;
16 correct?

17 A. 72.3 million versus actual 79.9 million.

18 Q. Okay. On the distribution side, forecast was
19 24.1 million; correct?

20 A. Yes.

21 Q. And the actual spending to that point was 29.2
22 million?

23 A. Yes.

24 Q. Transmission forecast, 23 million; actual is 22
25 million?

26 A. Yes.

1 Q. And Electric Transmission actually is in the
2 green, \$792,000; is that correct?

3 A. That is correct.

4 Q. All right.

5 A. Actually, let me clarify what you meant by
6 green, red, yellow here in this case.

7 Q. Okay.

8 A. I don't remember the exact percentages, but if
9 it's green, that means it's within a certain percentage.
10 It's red -- or yellow, that means it's within a certain
11 percentage beyond green. If it's red, that means it's
12 beyond a certain percentage beyond that.

13 Q. And the bottom, it says, "Electric
14 Distribution, 5.1 million." That's how far over its
15 forecast is. "Driven primarily by distribution support,
16 1.4 million, and small variance." Do you understand what
17 that means?

18 A. I don't besides Electric Distribution being
19 over by 5.1 mill.

20 Q. Okay. Now, up above here on page 7 we have
21 another chart, MTD, year-to-date results, expense. Can
22 you explain that to us.

23 A. Sure thing.

24 Based on what I'm seeing here, looks like far
25 left we're seeing again Electric Operation, then Electric
26 Distribution, Transmission, et cetera.

1 Across the columns to the right of that,
2 up-to-date performance here in August showing actual
3 budget and variance. Actually, looks like this is
4 showing variance to the original budget instead of
5 forecast. I just want to keep emphasis from what we saw
6 earlier.

7 Then YTD on the far right here shows
8 year-to-date actual performance, year-to-date budget, and
9 then year-to-date variance.

10 Q. Okay. So, again, overall Electric Operations,
11 year-to-date in the red, \$12.8 million; is that correct?

12 A. Correct.

13 Q. Transmission, in the green, 10. That
14 represents, what, \$10 million?

15 A. Yes.

16 Q. And the variance to budgeted, all these things
17 are what are causing, what, the overruns in certain
18 areas?

19 A. Based on what I'm reading here, it looks like
20 those are high-level call-outs.

21 Q. What's a "call-out"?

22 A. An explanation for why there's a variance in
23 the budget.

24 Q. All right. Now, next up we have a whole bunch
25 more charts.

26 And, let's see. All right. We want to focus

1 on the top one up there, "ED Expense." If you could
2 explain that chart to us.

3 A. Okay. Looks like ED Expense represents
4 Electric Distribution expense, part of T-O portion only.

5 On the far left, it shows budget level 3, which
6 is just, is a hierarchy of where these different
7 organizations sit. Level three is where Transmission
8 Operations sits. Then it shows the associated programs
9 that are under ED Expense on that second-to-left column.

10 Q. Okay.

11 A. Then you'll notice performance on the right.

12 Q. There's ET capital, there's TE expense. This
13 is on page 4. Can you explain to us this chart.

14 A. Sure.

15 It looks like all the budget level 3s are
16 listed in the far-left. Distribution Operation,
17 Electrical, Transmission Operation, et cetera.

18 Then the associated programs are on the right
19 next to it.

20 And then you'll notice the far right is those
21 August actual costs, August DET, which represents budget
22 and variance to the budget. Shows August forecast on the
23 far right.

24 Q. Again, it looks like this cuts off and doesn't
25 have the entire chart?

26 A. It appears to.

1 Q. Okay. And what does DET mean?

2 A. I don't know what it stands for, but that is

3 the budget that we set the year before the actual budget

4 year.

5 Q. Can you explain the hierarchies? You used the

6 term "hierarchy."

7 A. I can't fully explain the hierarchy.

8 Q. What does that term mean to you?

9 A. It means different groupings of organizations.

10 So, as you can see here, in budget level 3 you see

11 Transmission Operations. Hierarchy above that would be,

12 it could be Electric Operations. I don't know if that

13 was specifically the case. But it shows groupings

14 depending on the organization structure.

15 Q. And what were the range of numbers in the chart

16 here?

17 A. What do you mean by range?

18 Q. Range of hierarchy. I'm sorry, budget level 3,

19 is there a budget level 2, budget levels below this?

20 A. It starts budget level 1, but I don't know how

21 many budget levels it goes down to.

22 Q. What would be budget level 1?

23 A. I don't know what is in budget level 1. My

24 guess is it would be --

25 Q. Don't guess.

26 A. -- company level.

1 Q. How about budget level 2?

2 A. That would be, say, for example, Electric
3 Operation, Gas Operations, et cetera.

4 Q. Okay. Any idea what budget level 4 would be?

5 A. It would be one level lower than Transmission
6 Operations. So that would probably -- the Transmission
7 Lines transmission substations.

8 Q. Okay. And these numbers in here, thousands
9 ranging to, ranging down to hundreds, are these true
10 numbers or do they represent millions?

11 A. This would be in thousands.

12 Q. Thousands. So if it says 194, that would
13 actually be 194,000?

14 A. Yes.

15 Q. Thirteen would be 13,000, and so on; correct?

16 A. Correct.

17 Q. Do you know where on this chart patrol and
18 inspections would fall?

19 A. Yes. It would be within this Transmission
20 Lines group.

21 Q. Okay. So in this year, Transmission Lines is
22 actually under budget by \$66,000 at the time of this;
23 correct?

24 A. That would just be for August.

25 Q. Just for August. Okay. We can't see the
26 year-to-date because the chart cuts off; is that correct?

1 A. Yes.

2 Q. All right. Who is David Young?

3 A. At that point in time, he was my counterpart.
4 He supported I believe substation at that point. Just
5 another member of our Business Finance Team.

6 Q. All right. And then some more charts by you.
7 If you could explain these for us.

8 A. Sure.

9 This is essentially a breakdown of the
10 Transmission Line budget and actual costings for the
11 months.

12 So top table represents Transmission Line
13 capital, with all the associated major category
14 descriptions of major categories. You can see actually
15 spent for the month major categories.

16 DET, which is the budget for the, for those
17 categories.

18 Then PRM is the forecast that would be used for
19 that month for those categories.

20 Then on the far right, those are variance
21 columns, actual performance compared to DET, percentage
22 variance DET -- I'm sorry, actual PRM and percentage
23 variance.

24 Middle table represents expense.

25 Bottom table, looks like that's a different
26 type, capital portfolio and programs.

1 Q. When you use the term "portfolio," what do you
2 mean?

3 A. Essentially everything within the capital
4 budget.

5 Q. Okay. All right. Let's go back to this. And
6 I think our last one --

7 MS. DUPRE-TOKOS: On 1239 now.

8
9 (Grand Jury Exhibit 1239 introduced.)
10

11 Q. (By MR. NOEL) 1239.

12 Okay. Let's talk about 1239. If you could
13 explain to us what we're looking at here in 1239.

14 A. Sure.

15 I vaguely recall this meeting, but it looks
16 like Jake Meyer sent out this email to Eric, who was the
17 senior director of Transmission Lines at that point in
18 time. And it looks like, based on what I'm reading here,
19 Jake is exploring areas where expense costs could be
20 reduced. And that's listed in the 126 items in the
21 middle of the email.

22 Q. Right. So this is scheduling a meeting;
23 correct?

24 A. Yes.

25 Q. And the meeting is on, this is in August of
26 2016, and the meeting's for 2017 expense funding request;

1 correct?

2 A. Correct.

3 Q. And you're one of the required attendees for
4 this meeting; correct?

5 A. Yes.

6 Q. Now, specifically of interest is the line,
7 "This input is important given the expense reduction
8 pressures being pushed down on Transmission Operations
9 for 2017."

10 Correct?

11 A. Correct.

12 Q. So do you remember budget reduction pressure in
13 2017?

14 A. I don't recall specifically in 2017.

15 Q. Okay. But expense reduction would refer to the
16 expense budget; correct?

17 A. Yes.

18 Q. And the expense budget in Transmission
19 Operations would include patrol and inspections; correct?

20 A. Correct.

21 Q. Do you remember why there was pressure to
22 reduce the budget in the expense budget and Transmission
23 Operations?

24 A. I don't recall what the drivers were.

25 Q. And the term "drivers," is that the causes
26 or --

1 A. Yes.

2

3 (Grand Jury Exhibit 1240 introduced.)

4

5 Q. All right. And finally, 1240. Again, can you
6 tell us what 1240 is.

7 A. Sure.

8 Can you give me a moment to read through?

9 Q. Yes. Go ahead.

10 A. Yes. This looks like a similar exploratory
11 exercise from Jake Meyer. Looks like he's looking for
12 areas where, areas where for the year you can reduce the
13 expense budget.

14 Q. Okay. Let's back up a little bit. First, this
15 is a meeting invitation; correct?

16 A. It appears so, yes.

17 Q. And you're, on this one, one of the optional
18 attendees --

19 A. Yes.

20 Q. -- correct?

21 And the subject of this meeting, the discussion
22 is expense reduction opportunities. Am I reading that
23 right?

24 A. Correct.

25 Q. And it goes down and says, "Team, please join
26 me for a discussion around our patrol and inspection

1 cycles and standard due dates for our maintenance tags as
2 laid out in the *ETPM*. I'd like to explore these areas
3 for opportunities to reduce our operating expenses
4 without reducing public safety by refining and adjusting
5 the due dates and/or frequencies for this work."

6 Did I read it correctly?

7 A. Yes, you did.

8 Q. It says, "Area of opportunity number 1, patrol
9 and inspection frequencies. Idea, are there any
10 opportunities to reduce our patrol and inspection
11 frequencies without reducing public safety?"

12 Read that correctly?

13 A. Yes.

14 Q. So did you, in fact, make any changes or
15 reductions to the patrol and inspection frequencies?

16 A. I don't recall if I did.

17 Q. Okay. Do you remember attending these
18 meetings?

19 A. I don't recall.

20 Q. And, now, who are these other people that are
21 in this meeting that were invited to this meeting? Boris
22 Andino?

23 A. I remember Boris Andino was in the Asset
24 Management Department.

25 Q. Ron Nixon?

26 A. I don't recall who Ron Nixon was.

1 Q. Chuck Stinnett?

2 A. I don't recall his exact role.

3 Q. Mike Peterson?

4 A. I don't know Mike Peterson.

5 Q. Robert Cupp?

6 A. Superintendent.

7 Q. Jefferson Heidelberger?

8 A. I believe at that point in time he was the

9 T-line work manager manager.

10 Q. Mickey Willy?

11 A. Also a superintendent.

12 Q. (EMPLOYEE #11)?

13 A. Also a superintendent.

14 Q. Stacie Doyle?

15 A. I believe at that point she was asset

16 maintenance planner.

17 Q. Greg Gabbard?

18 A. He was either manager or director of Project

19 Delivery.

20 Q. Wayne Pouncey?

21 A. At that point, I believe he still might have

22 been a superintendent. I don't recall specifically.

23 Q. All right. So in early 2017 you're invited to

24 a meeting to look at ways to reduce patrol and inspection

25 frequencies, or to reduce the budget for patrol and

26 inspections; correct?

1 A. Yes. As part of those meetings, I would be
2 involved to basically make any changes, if needed.

3 Q. In terms of the language "expense reduction
4 opportunities" -- that's the term used by PG&E; correct?
5 Or by Jake Meyer?

6 A. Yes.

7 Q. So if you didn't actually reduce the patrol and
8 inspections frequencies, how could you reduce the patrol
9 and inspections budget, or how much they would cost?

10 A. Can you clarify what you mean by how can you
11 reduce the spent?

12 Q. Yeah. You know, frequency would mean how often
13 you do the inspections; correct?

14 A. Correct.

15 Q. If you can't reduce that, but you still want to
16 reduce the budget, how would you reduce the budget?

17 A. I don't know. I'm not in a position to answer
18 that question. I would have to refer to somebody from
19 the operational side.

20 Q. Well, you'd want to get down your unit costs;
21 correct?

22 A. If you were to reduce the budget, yes, your
23 cost would have to go down.

24 Q. So if you were, say, averaging \$10.2 per unit
25 for a patrol, the way to reduce your budget would be to
26 reduce that unit cost down to \$8; correct?

1 A. Yes. If you went down from 10.2 to 8, yes.

2 Q. And are you familiar with how you would reduce
3 the, those actual unit costs?

4 A. That would be based on if we received feedback
5 from the operational side, if they were to reduce their
6 hours per unit.

7 Q. And did you ever receive that?

8 A. I can't recall.

9 Q. Did you ever have any discussions with the
10 operations side as to how they can reduce their costs per
11 unit?

12 A. Not from me.

13 MR. NOEL: Anything else? I think that's all I
14 have with this witness. Do the members of the jury have
15 any questions?

16 I see heads shaking.

17 The jurors are allowed to ask questions,
18 follow-up questions, or ask anything they want. They do
19 so in writing by giving those to us, we review them, and
20 make a determination if they're --

21 (Counsel and Grand Jury Foreperson confer).

22 Q. (By MR. NOEL) All right. How did you
23 reconcile charges in SAP versus actual expenses so that
24 over- and under-reporting could be determined?

25 A. I was not able to reconcile that. That would
26 be done more the operational side.

1 Q. When discrepancies occurred, what procedures
2 were followed to address?

3 A. What kind of discrepancies?

4 GRAND JUROR #13: If there were discrepancies
5 between actuals what were in SAP and actuals of what
6 happened.

7 THE WITNESS: As in accruals in the month.
8 There could be days where accruals are posted. Accruals
9 are estimate for the contract cost for the month that
10 would essentially be up in the next month.

11 GRAND JUROR #13: I'm saying what was reported
12 by -- live in SAP, S-A-P, what was actuals as opposed
13 to --

14 THE WITNESS: Those could be corrected in the
15 following months in case there was any discrepancies. I
16 was not involved in that process, though.

17 Q. (By MR. NOEL) When unit costs between HQ
18 differed significantly, was this questioned?

19 A. Yes. If a superintendent or supervisor had
20 questions on that, there would be questions around what's
21 causing it.

22 Q. And who would be the ones questioned and what
23 would be done?

24 A. I think it would depend on what the questions
25 are.

26 Q. Was there a protocol established, an

1 established protocol to determine why the differences?

2 A. No established protocol.

3 Q. What is the process to readjust the hours given
4 if the supervisor disagrees with the original allotment?

5 A. As part of the budget planning?

6 Q. Yes.

7 A. If they disagree, we would go ahead and adjust
8 based on their suggestion or recommendation, and then
9 ultimately that would lead to review with the
10 superintendent to get their approval as well.

11 Q. Is terrain or access to the structures factored
12 in when providing the number of hours per unit?

13 A. That would depend on the supervisor reviewing
14 the information.

15 Q. You used the term "fully burdened" in regards
16 to calculating budget expenditures. What does that mean?

17 A. I am not an expert on the fully burdened rate,
18 but if I were to explain, it would include salary and
19 various other costs that are overheads on top of the
20 salary of the employee.

21 Q. In your analysis of assets, expenses, and
22 budgeting, were the specific age of any specific assets
23 brought to your attention?

24 A. Not to my attention, but I do recall other
25 teams potentially looking at that.

26 Q. Do you think having that information would be

1 helpful in allocating unit costs?

2 A. Depending on what the supervisor provides as
3 feedback, I think it could be helpful.

4 Q. As a finance analyst, would you say capital
5 expenditures have a direct or indirect relationship to
6 operational expenses?

7 A. I don't know.

8 Q. Who at PG&E utility was responsible for
9 approving capital expenditures?

10 A. That would go through various individuals.

11 Q. Who are they?

12 A. I can't recall the names, but it would go
13 through directors, senior directors, VPs.

14 Q. Dave Gabbard?

15 A. Dave Gabbard would be a person involved in
16 capital expenditures.

17 Q. Who would be the top person?

18 A. I don't know who the top person would be.

19 MS. DUPRE-TOKOS: Do you know the title?

20 THE WITNESS: I don't know the title.

21 Q. (By MR. NOEL) Who at PG&E Corporation was
22 responsible for capital expenditures?

23 A. I don't know.

24 Q. When exactly did you leave PG&E?

25 A. June 2019.

26 Q. Do you know the exact date you left, you last

1 spent working a full day at PG&E?

2 A. I don't recall the specific date, but it was
3 early June.

4 Q. Have you ever heard the phrase "accounting
5 legerdemain"?

6 A. No.

7 Q. You've never heard that phrase?

8 A. Accounting legerdemain?

9 Q. Legerdemain.

10 GRAND JUROR #4: Legerdemain; sleight of hands.

11 THE WITNESS: No.

12 Q. (By MR. NOEL) Why are PG&E employees cycling
13 through positions so frequently, as in you stated "at
14 that time" when asked about employee status?

15 A. I don't know what the drivers were for
16 turnover.

17 Q. PG&E, or you as an analyst, relies on the
18 historical data. Did PG&E consider global warming in
19 data analysis?

20 A. I don't know.

21 Q. Would it be correct to say that a project
22 involving repairing or replacing significant segments of
23 transmission aging infrastructure would be considered a
24 capital project?

25 A. It would depend on the job.

26 Q. Who within the Business Finance Division would

1 be responsible for approving aging infrastructure capital
2 projects?

3 A. I don't know if anyone in the Business Finance
4 would be approving capital projects.

5 Q. In attracting -- extracting historical data,
6 was the average age of any given asset considered in
7 setting inspection hour targets?

8 A. I don't know.

9 Q. If the feedback from Operational Team was way
10 off, varying from historical data by more than 20
11 percent, how would the decision for a target number be
12 made?

13 A. Supervisor would have to provide justification
14 for that change. And then ultimately that justification
15 would roll up through the superintendent.

16 MR. NOEL: Anything further?

17 GRAND JUROR #13: So I'm confused. And maybe
18 you can help explain this. If all your budgeting was out
19 of SAP, is that correct, then how would you go from
20 actuals in budgeting? Did you use actuals or did you use
21 what was entered in SAP in your budget?

22 THE WITNESS: Could you please clarify that, as
23 in you mentioned using actuals in budget; right?

24 GRAND JUROR #13: Budget versus actual. If SAP
25 only contained cost --

26 THE WITNESS: Yep.

1 GRAND JUROR #13: -- and that was what budgets
2 were based off of in the calculation, that is different
3 than what is in actuals of what was incurred in cost.

4 THE WITNESS: Yeah. Sure thing.

5 So we plan the budget for the current year in
6 the year prior.

7 GRAND JUROR #13: Uh-huh.

8 THE WITNESS: So we'll leverage historical
9 information, get feedback from other project managers and
10 program managers on their costs and forecast, and we roll
11 all that up into a system within SAP. And that plan is
12 called DET, which is uploaded into SAP. Then once we
13 head into the next year, we're able to track actual costs
14 that come in that year versus that plan or budget that's
15 put in the system. So that's how we can compare month
16 over month.

17 GRAND JUROR #13: Okay.

18 Q. (By MR. NOEL) So the final follow-up question,
19 who had a financial interest, other than the company, in
20 decreasing the expense budget?

21 A. I don't know.

22 Q. I mean, you're not aware of any bonus program
23 or anything for saving money in the expense budgets?

24 A. Not aware of any bonus programs.

25 Q. And you didn't, you weren't getting bonuses for
26 the expense budget coming in, or the expense coming in

1 under budget?

2 A. I don't recall.

3 MR. NOEL: All right.

4 GRAND JURY FOREPERSON: Mr. Ma?

5 THE WITNESS: Yes.

6 GRAND JURY FOREPERSON: I need to read the
7 admonishment.

8 You are admonished not to discuss or disclose
9 at any time outside of this jury room the questions that
10 have been asked of you or your answers until authorized
11 by this Grand Jury or the Court. A violation of these
12 instructions on your part may be the basis for a charge
13 against you of contempt of court. This does not preclude
14 you from discussing your legal rights with your own
15 attorney.

16 Mr. Wah, what I have just said is a warning not
17 to discuss this case with anyone except the Court, your
18 lawyer, or the district attorney.

19 THE WITNESS: Okay.

20 GRAND JURY FOREPERSON: Any questions?

21 THE WITNESS: No questions.

22 GRAND JURY FOREPERSON: Okay. Thank for your
23 time.

24 THE WITNESS: Thank you.

25 MR. NOEL: All right. You're done. Thank you.

26 [DISCUSSION OMITTED.]

1 GRAND JURY FOREPERSON: Ms. Mihretu, before you
2 have a seat, I need to swear you in.

3 THE WITNESS: Okay.

4 GRAND JURY FOREPERSON: Ms. Mihretu, please
5 raise your right hand.

6
7 FEVEN MIHRETU
8 having been called as a witness in
9 the matter now pending, having been first
10 duly sworn, testifies as follows:

11
12 THE WITNESS: Yes.

13 GRAND JURY FOREPERSON: Thank you. Have a
14 seat, please.

15
16 EXAMINATION

17
18 BY MR. NOEL

19 Q. All right. Now, could you state your full
20 name, spell your last name for the record.

21 A. Feven Mihretu, M-I-H-R-E-T-U.

22 Q. Ma'am, are you employed?

23 A. Employed with PG&E.

24 Q. Let's turn this microphone. You're very soft
25 spoken. Everybody has to be able to hear you, so it's --

26 A. Sorry.

1 Q. That's okay. Have you ever done this before?
2 A. No.
3 Q. So are you nervous?
4 A. Yes.
5 Q. We'll try and make this as easy as we can. All
6 these people are nice, smiling at you.
7 All right. Again, where are you employed?
8 A. Yes, at PG&E.
9 Q. And how long have you been with PG&E?
10 A. Since 2008.
11 Q. What do you do for PG&E?
12 A. I'm an engineer.
13 Q. What kind of engineer?
14 A. Electrical engineer.
15 Q. What is an electrical engineer?
16 A. What is an electrical engineer --
17 Q. Yeah.
18 A. -- at PG&E?
19 Q. No, just in general what's an electrical
20 engineer?
21 A. It depends what we do.
22 (Court reporter interrupts proceeding.)
23 Q. Okay. All right. Did you go to school to be
24 an electrical engineer?
25 A. Yes, sir.
26 Q. Where did you go to school?

1 A. Cal Poly, San Luis Obispo.

2 Q. What year did you go to Cal Poly?

3 A. I graduated in 2008.

4 Q. Okay. How did you like Cal Poly?

5 A. I loved it.

6 Q. Nice area, huh?

7 A. Very nice.

8 Q. How did you get to come to work at PG&E?

9 A. I guess a lot of different companies come to

10 campus and then you pass on your resumes and you

11 interview through the process. And I got the -- a job at

12 PG&E.

13 Q. Okay. Why did you pick PG&E?

14 A. Well, my -- the focus that I, electrical

15 engineering, we have various specialties that we study.

16 So what I focused on was on power electronics.

17 Q. On what?

18 A. Power electronics.

19 Q. What does that mean?

20 A. It means that you focus on how power flows and

21 mainly focus on power engineering.

22 Q. All right. As a little girl did you grow up

23 dreaming of one day working for PG&E?

24 A. No, I didn't even know PG&E. I was a kid.

25 Q. So why PG&E? Why did you choose PG&E?

26 A. My grandfather actually used to work for PG&E

1 for, I don't know, 25, 30 years. And that would have
2 something to do with it.

3 Q. All right. Some of the -- walk us through your
4 PG&E career from when you started to the present.

5 A. I started off on engineering rotational
6 program. My home base was Distribution Planning
7 engineer, but I rotated in various groups because that's
8 what the program is. In the program you rotate every
9 four months in different departments to learn what they
10 do.

11 So I started the Distribution Planning for one,
12 then I did at one with Operation Engineering for another
13 four months, then I also did underground engineering for
14 another four months.

15 Q. Okay. Once you finished your rotational
16 assignment, what did you do?

17 A. I liked the underground engineering aspect of
18 it, so I wanted start working with Asset Management and
19 underground.

20 Q. Okay. What is Asset Management?

21 A. Well, Asset Management is big, but it -- in
22 Asset Management we have various departments. I was, I
23 was in strategy engineering group, so my role of an
24 associating engineer was to learn from the seniors and
25 consulting engineers. So look to see what they do and to
26 learn assets, how they perform.

1 Q. Are you still an associate engineer?

2 A. No, I'm a senior engineer now.

3 Q. So you are -- you've risen to senior engineer

4 status; correct?

5 A. Yeah. I worked my way to become a senior

6 engineer.

7 Q. All right. And you're in Transmission Asset

8 Strategy?

9 A. Yes.

10 Q. What is Transmission Asset Strategy?

11 A. What --

12 Q. What do you do?

13 A. What's our role?

14 Q. Why does Transmission Asset Strategy exist?

15 A. So the Transmission Asset Strategy looks at all

16 the conditions that come from the field and look at

17 different types of criteria, study how the assets are

18 performing, and developing a strategy.

19 Q. What kind of strategy?

20 A. A repair or replace strategy.

21 Q. All right. How do you make a repair or replace

22 strategy?

23 A. From -- to speak from me, I look at the

24 notifications that come from the field to determine what.

25 Q. Notifications, you're talking about the tags

26 that are filled out by the workers in the field, for

1 instance, the towermen or the linemen or the troublemen,
2 of issues that they see; correct?

3 A. That's correct.

4 Q. Okay. So if somebody sees an issue in the
5 field, they generate a tag, that comes up to you as a
6 notification, and you decide what to do with it?

7 A. No. It goes through their supervisors, and the
8 supervisors -- this is before Camp Fire. That's how it
9 was done.

10 Q. Okay.

11 A. They process -- the supervisors process the
12 tag, and then I have the visibility to see the tag
13 afterwards.

14 Q. Okay. You made a very good point right there.
15 We're talking, we want to continue to talk about pre-Camp
16 Fire. So we don't really want to talk about what
17 happened post-Camp Fire.

18 All right. So if a supervisor's making a
19 decision on the tag, why do you need to see it?

20 A. To look at, to add other factors to it to make
21 sure that, that we may need a replacement, or repair is
22 sufficient enough.

23 Q. Okay. So --

24 A. What I develop is long-term solution; they
25 might be developing a short-term.

26 Q. You used the term repair, replace -- repair or

1 replace. Are there protocols within PG&E or standards
2 for how you make a decision whether to repair or replace?

3 A. I don't know.

4 Q. Well, you're the one that's partially making
5 that decision; right?

6 A. I recommend based on what the criterias that I
7 think should be. But --

8 Q. Okay.

9 A. I'm not the only one that makes that decision.
10 Various departments get involved.

11 Q. Okay. So how do you recommend -- on what basis
12 do you make a decision to recommend repair or replace?

13 A. On top of my head?

14 Q. Yeah.

15 A. The -- like I said, the notifications. Age,
16 environmental, public safety, or reliability, and others.

17 Q. Okay. How big a part does reliability play in
18 that decision?

19 A. I have to look at the data to see what
20 percentage we contributed to it.

21 Q. Well, reliability is a life blood of PG&E;
22 correct?

23 A. I don't understand. What do you mean?

24 Q. Reliability is what CALISO, CPUC, FERC, NERC,
25 WEC (phonetic), all of the regulatory agencies look at;
26 correct?

1 A. I don't make that determination. My boss tells
2 me which, what are we focusing on. Could be reliability,
3 could be --

4 Q. Okay. So -- but reliability is one of the main
5 focuses of your work; correct?

6 A. In the past, yes, it has been.

7 Q. And we're talking about pre-Camp Fire, that a
8 great detail of your work was based upon the simple
9 metric of reliability; correct?

10 A. That's when I was a reliability engineer.

11

12 (Grand Jury Exhibit 1242 introduced.)

13

14 Q. All right. You should have in front of you a
15 stack, and I have up on the big board Exhibit 1242. Do
16 you see Exhibit 1242? Do you see it?

17 A. Yes. I'm sorry.

18 Q. Can you tell us what 1242 is.

19 A. It's a, looks like it's a, the team that we're
20 at, Jon Eric Thalman.

21 Q. Okay.

22 A. Organizational chart.

23 Q. This org chart doesn't have any date or
24 anything on it. Do you remember when this was
25 approximately?

26 A. I don't remember.

1 Q. Well, who is Jon Eric Thalman?
2 A. He was my director.
3 Q. Is Jon Eric Thalman still with PG&E?
4 A. As far as I know, yes.
5 Q. Okay. Is he still your director?
6 A. No.
7 Q. How long has it been since Jon Eric Thalman was
8 your director?
9 A. How long was he my director?
10 Q. No. How long has it been since he's not?
11 A. I don't remember.
12 Q. Okay. And this is you --
13 A. Yes, sir.
14 Q. -- Feven Mihretu; correct?
15 A. Yes.
16 Q. And you were part of the Transmission
17 Reliability Division --
18 A. Yes, sir.
19 Q. -- correct?
20 What was Transmission Asset Reliability?
21 A. We looked at outage reports, and based on the
22 safety, and we determined which ones were performing
23 worse performance.
24 Q. Bingo. What is an outage report?
25 A. When an asset had a fault, when a circuit had a
26 fault, a momentarily or sustained outage.

1 Q. So basically a line stops working, that's an
2 outage; correct?

3 A. Yes.

4 Q. Electricity stops flowing through from point A
5 to point B, that's an outage?

6 A. Yes, sir.

7 Q. And so, and so a reliability, you're tracking
8 outages; correct?

9 A. Dave Gregory was tracking the outages.

10 Q. What were you doing?

11 A. The outage that he tracked, I look at the data
12 and analyze it.

13 Q. Analyze what data?

14 A. The data that Dave Gregory generates, which is
15 the outage report. When there's an outage, he has a
16 document that he tracks about the outage.

17 Q. Why is it important to have outage reports?

18 A. To make sure that the outage doesn't recur
19 again.

20 Q. Okay. Do you know where those outage reports
21 go outside PG&E?

22 A. I don't know who it was.

23 Q. Okay. So you don't know what's being done with
24 the outage reports?

25 A. What I know is what I used it for.

26 Q. What did you use it for?

1 A. To see how the asset, how the circuit is
2 performing.
3 Q. And did you generate reports?
4 A. Did I generate reports based on --
5 Q. Yes.
6 A. I believe so.
7 Q. Okay. Is that to identify the worst performing
8 circuits? Correct?
9 A. Yes, sir.
10 Q. And what happened to the worst performing
11 circuits?
12 A. So I was also part of a team where we went out
13 in the field and we looked structure by structure to see
14 if there is anything that is causing that outage to have
15 to occur.
16 Q. Did you ever go out in the field and look at
17 the Caribou-Palermo line?
18 A. I don't remember. Too many lines.
19 Q. Ever been up here?
20 A. It looked familiar, actually, when I was
21 driving here.
22 Q. Ever been up in the Feather River Canyon?
23 A. I don't remember.
24 Q. So I think I cut you off. What happens to the
25 worst performing circuits?
26 A. Like I mentioned, we look at all the worst

1 performing circuits and then we go out in the field and
2 we look at them --

3 Q. Okay.

4 A. -- line-by-line.

5 Q. And looking at the, at the circuit for what
6 purpose?

7 A. To make sure that the outage doesn't occur
8 again.

9 Q. Okay. How do you do that?

10 A. By walking tower to tower or structure to
11 structure.

12 Q. But how does your walking tower to tower,
13 structure to structure, prohibit or reduce the chances of
14 an outage happening again?

15 A. We're trying to see what, what could -- if you
16 have -- I'm going to give you an example.

17 Q. Okay.

18 A. If there is corroded insulator, then that might
19 be an indication of that we may need to replace that
20 insulator. So that's what the walk is. So I'm not
21 walking alone by myself, obviously; I have my boss and
22 other field folks with me.

23 Q. Right. So you go out and you walk these lines
24 and you find the source of the outages, then what?

25 A. We recommend for repair or replace.

26 Q. Recommend to who?

1 A. To the Implementation Team.

2 Q. Who is the Implementation Team?

3 A. That's a different group in Asset Management.

4 Q. Okay. Who are they? What's the -- is there a
5 special name for them or what?

6 A. The Asset Implementation Team.

7 Q. Okay. Do you know the names of any of the
8 people in the Asset Implementation team?

9 A. Prior to Camp Fire?

10 Q. Yeah.

11 A. I don't remember their names.

12 Q. Okay. You still work for PG&E; right?

13 A. I still work for PG&E.

14 Q. Have you been asked to sign any kind of
15 nondisclosure agreement?

16 A. No. I don't think so.

17 Q. Nobody's told you not to talk about the, how
18 the process works inside PG&E?

19 A. No.

20 Q. Is there anything you've been told not to talk
21 about?

22 A. No. In fact, my boss told me to be honest.

23 Q. All right. Let's move on to -- well, there's
24 page 2, I forgot about of that, 1242. Transmission Asset
25 Management and Regulatory Strategy.

26 Now, at the time that you were in Reliability;

1 right?

2 A. Yes, sir.

3 Q. "Developing and refining reliability strategy,
4 separated to increase focus." What does that mean?

5 A. So reliability strategy, to my understanding,
6 is that, like I mentioned, we look at the outage reports
7 and we identify the -- so the way I look at it,
8 reliability strategy is a short-term plan. You're trying
9 to fix from the outage recur. Where Asset Strategy
10 develops long-term solution.

11 Q. Okay. Asset strategy, where you're at now?

12 A. Yes.

13 Q. All right. So you said when outages occur that
14 you look at the line, that circuit, and you said to make
15 a decision repair, replace; correct?

16 A. I make recommendation to repair, replace with
17 my other -- at that time I was an associating engineer,
18 so I had senior engineers and subject matter experts.

19 Q. Are there other options besides repair or
20 replace?

21 A. Before Camp Fire?

22 Q. Yeah.

23 A. No, I don't really know. There might be. I
24 don't know. I didn't know of one.

25 Q. How about ignore? That was an option, wasn't
26 it?

1 A. It wasn't an option for me.

2 Q. Okay. But that was an option that was
3 available by the company, that when things went wrong you
4 simply just ignore them; correct?

5 A. I can't speak for everybody else. I can only
6 speak for me.

7 Q. Familiar with the term run to failure?

8 A. Yes.

9 Q. What does run to failure mean?

10 A. To me, run to failure is you still, you inspect
11 but you don't have a plan to replace it.

12 Q. What's the role of run to failure in PG&E Asset
13 Strategy?

14 A. I never really liked to use the term run to
15 failure. I use the term "assess and replace" or
16 "conditioned failure."

17 Q. Explain to us what those things mean and how
18 they differ from run to failure.

19 A. Because run to failure sounds like we don't
20 have any inspection program, where I think that we have
21 a, inspection programs. It's in our book.

22 Q. Well, in certain areas run to failure is
23 accepted industry standard; correct?

24 A. What was that?

25 Q. In certain areas in Transmission, run to
26 failure is an industry standard; correct?

1 A. Yes.

2 Q. Okay. So run to failure is not a bad word?

3 A. Yeah, I just never liked it as a person.

4 Q. You're preferred "run to condition"?

5 A. Condition to failure.

6 Q. Right. And failure being one of the

7 conditions?

8 A. Yeah. But if you're seeing an issue out in the

9 field, they will, they will repair it or they will

10 replace it. They do have that ability.

11 Q. Okay. So how about, how about if they can't

12 repair or replace it in the field?

13 A. Then they will involve the engineering.

14 Q. And how does an engineering make a decision

15 whether they're just going to ignore and let it fail or

16 repair or replace?

17 A. The T-line engineering group, I don't know how

18 they do it, but --

19 Q. But it would come to you at some point;

20 correct?

21 A. It will come to an SAP as a notification.

22 Q. Right. And you would be involved in the

23 ultimate decision of what are we going to do with this;

24 correct?

25 A. I recommend, I recommend to the Implementation

26 Group.

1 Q. Right. So your recommendation is either ignore
2 and let it go, repair it, or replace it; correct?

3 A. No, I didn't say ignore it. I never ignored a
4 condition that I'm aware of.

5
6 (Grand Jury Exhibit 1243 introduced.)

7
8 Q. Okay. All right. Let's move on to December
9 31st, 2017, Exhibit 1243. Do you see that?

10 A. Blurry, but yes.

11 Q. You can get up. You can walk around. You can
12 look. There's also printed copies of everything sitting
13 right in front of you.

14 A. Okay. Is this the copy, sir?

15 Q. Yes. That's the one we just got done looking
16 at. There's the one we have up right now.

17 Do you recognize what is Exhibit 1243?

18 A. Yes, sir.

19 Q. What is Exhibit 1243?

20 A. It's an organizational chart.

21 Q. From when?

22 A. Year says 12/31/2017.

23 Q. Okay. So as of 12/31/17 this shows you T-line
24 Asset Strategy and Reliability; correct?

25 A. Yes, sir?

26 Q. And you were reporting directly to Boris

1 Andino, the Electrical Transmission Asset Strategy
2 manager?

3 A. Yes, sir.

4 Q. Okay. And who are these other people?

5 A. The first one, Jeff Lockwood, Karla
6 Valenzuela --

7 Q. We can read the names. Can you tell us who
8 they, what they do, what their positions are, what their
9 jobs are?

10 A. Jeff Lockwood is the Reliability specialist.
11 Karla Valenzuela is an Asset Strategy engineer. Dr. Doug
12 Cannell, who is an Asset Strategy engineer. Michael
13 Best, he's specialize on -- I don't know exactly what his
14 title is, but he deals a lot with bird stuff.

15 Q. All right. And then looks like in your job and
16 T-line Asset Strategy and Reliability you have two other
17 people, looks like Michelle Sakamoto, and who is the
18 other person?

19 A. Vipin.

20 Q. Vipin?

21 A. Yes, Vipin Mathew.

22 Q. And then there's three positions there that are
23 open. Or is that something else?

24 A. Open positions, yes.

25 Q. And then down here there's Dave Gregory?

26 A. Yes, sir.

1 Q. And what does Dave Gregory do?

2 A. He's a Reliability. I don't know what his
3 title is, but I know him by the person that collects all
4 the data for T-line outages.

5

6 (Grand Jury Exhibit 1244 introduced.)

7

8 Q. All right. And 1244, now we're up to June of
9 2018. Do you recognize this?

10 A. Yes, sir.

11 Q. Explain to us what we're looking at here.

12 A. It's, again, another organizational change.

13 Q. Okay. So am I right in assuming that you will
14 no longer report directly to Boris Andino?

15 A. No. We had a supervisor between us.

16 Q. Okay. And at that, at this point in June that
17 position is vacant?

18 A. Yes, sir.

19 Q. All right. So if that position is vacant, who
20 do you actually report to?

21 A. We were still reporting to Boris.

22 Q. Okay. All right. And then we have some more
23 here. Going up the corporate chain, can you explain to
24 us on page 2 what we're looking at.

25 A. It's another organizational chart.

26 Q. Okay. So where do you fit in in this, this

1 chart?

2 A. Can I -- may I get up?

3 Q. Absolutely. No, no, always feel free to get
4 up, use the board.

5 A. So blurry I can't see my name.

6 Q. I don't think your name is going to be on
7 there. This is T-line Asset Strategy; correct?

8 A. Yes, sir.

9 Q. And they report directly to Boris Andino, and
10 this is an open supervisor position; correct?

11 A. Yes, sir.

12 Q. So that would be the supervisory position
13 directly above you; right?

14 A. Yes. I'll be underneath of the supervisor.

15 Q. All right. And now let's move on, move up to
16 the next level here.

17 Now we're up ultimately -- let's see -- you're
18 in Boris Andino's organization; correct?

19 A. Yes, sir.

20 Q. Boris Andino is right here; correct?

21 A. Yes, sir.

22 Q. And Boris Andino reports directly to Dave
23 Gabbard; that is correct?

24 A. That's correct.

25 Q. So ultimately you work under Dave Gabbard?

26 A. Yes, sir?

1 Q. Who is Dave Gabbard?

2 A. Dave Gabbard was the senior manager of Asset
3 Management.

4 Q. Was?

5 A. Yes, he was.

6 Q. Is he still with PG&E?

7 A. Yes, sir.

8 Q. Okay. What's his position now?

9 A. He got a new position as a senior director of
10 engineering and something. I don't remember his new
11 title.

12 Q. Okay. All right. Let's go through a few of
13 these others. You know Joscelyn Wong?

14 A. Yes, I do.

15 Q. Who is Joscelyn Wong?

16 A. She was the manager of Implementation Team, I
17 believe, at one point.

18 Q. So that's the team that when you make
19 recommendations about which jobs should be done or what
20 should be done about a problem, you said the
21 Implementation Team is the team that actually you send it
22 up to with the recommendation?

23 A. I send the recommendation through a tool.

24 Q. Right.

25 A. I don't directly send it to her.

26 Q. Right. But it's the Implementation Team that's

1 making a decision as to whether or not to do that
2 project; correct?

3 A. I don't know if it's up to them to make the
4 decision, but what I recommended, and then they --

5 Q. At the very least, though, the next step?

6 A. Above me, the next step, yes.

7

8 (Grand Jury Exhibit 1245 introduced.)

9

10 Q. All right. Now, let's move on to one more.
11 Now we're talking about October of 2018. Can you explain
12 to us what we're looking at here.

13 A. This is when we have the supervisor that we
14 report to.

15 Q. All right. What's your supervisor's name?

16 A. Mukul -- I'm going to probably mess up his last
17 name, but Shekhar.

18 MR. NOEL: Madam Reporter, that's first name
19 Mukul, M-U-K-U-L; last name Shekhar, S-H-E-K-H-A-R.

20 Q. (By MR. NOEL) All right. So your group here,
21 Transmission Line Asset Strategy, yourself working for
22 Mr. Shekhar; correct?

23 A. Yes, sir.

24 Q. All right. And goes up, ultimately Mr. Shekhar
25 reports to who?

26 A. I don't know. Report to Boris Andino. I can't

1 see.

2 Q. Boris Andino. Feel free, you can get up and
3 walk around, stand up, use the board.

4 Reports of -- for Andino, who it looks like on
5 this now reports to somebody named Tom Wright?

6 A. Yes, sir.

7 Q. Who is Tom Wright?

8 A. Tom Wright was senior director of Asset
9 Management and Rotation.

10 Q. When did Tom Wright take over?

11 A. He was there in Rotation. I don't remember
12 what day he took on.

13 Q. What does it mean to be "there in Rotation"?

14 A. The temporary assignment is how I understand
15 it.

16 Q. All right. So explain to us exactly what is
17 your job at Asset Strategy.

18 A. In Asset Strategy, my job is to look at the, to
19 look at the notifications in SAP, to look at other
20 factors; as I mentioned, age and other criteria to
21 determine to recommend repair or replace. That's really
22 like in the short way of explaining it.

23 Q. How much of your job in Asset Strategy is
24 engineering and how much of it is budgeting or finance?

25 A. I don't do much of finance. The only finance
26 that I consider in my job is to do net present value

1 analysis, which means that it helps me where I make a
2 recommendation whether to repair or replace. Sometimes I
3 look at it from what makes sense; if the repaired cost is
4 more than the replacement, then it don't make any sense
5 to recommend for repair.

6 Q. So is the decision to, repair-replace decision
7 in some part financially based?

8 A. You can say that, if it's relevant.

9 Q. All right. Moving on to 1241, can you explain
10 to us what 1241 is.

11 A. It's the various Major Work Categories that we
12 have.

13 Q. Okay. Looks like there are five columns --

14 A. Yes, sir.

15 Q. -- is that correct?

16 And going from left to right, it looks like the
17 left-hand column that doesn't have a name on it would be
18 a position; is that correct?

19 A. Yes.

20 Q. And then the columns go MWC 70, then MWC 71,
21 72, and MWC 93. And those are under the heading
22 "Capital." And then "Expense," MWC BF CH DF IB IC,
23 Maintenance, P&I, Mark and Locate, Special Projects."

24 Am I reading that right?

25 A. Yes, sir.

26 Q. All right. So your name appears on this chart

1 twice; correct?

2 A. That's right.

3 Q. So can you explain to us what your jobs were,
4 what the --

5 A. From what I can remember, there's one under
6 Major Work Category 93, and then it has my name on it, in
7 parenthesis "switches." So I was manager the assets
8 called, the assets that are switch assets.

9 On that one column where it says "Expense," it
10 shows assessments and underground under my name. The, if
11 I remember correctly, that would be the underground
12 projects that I had for expense work which repair or
13 recommend for inspection.

14 Q. What does "assessments" mean?

15 A. Assessment means you assess that asset and then
16 you make a determination. So I recommend: I would like
17 you to assess the underground system because I have this
18 and that concerns.

19 Q. Okay. So the patrol and inspections, does that
20 mean you're reviewing the patrol and inspection data?

21 A. If it's in SAP, I will review it once a year.

22

23 (Grand Jury Exhibit 1246 introduced.)

24

25 Q. Okay. Let's move on. 1246. Do you recognize
26 1246?

1 A. I'm sorry, but I don't.

2 Q. Okay. This appears to be a White Paper. Are
3 you familiar with the term "White Paper"?

4 A. Yes, sir.

5 Q. What is a White Paper?

6 A. It's a summary.

7 Q. Okay. And this is a White Paper dealing with
8 EO Transmission. That would be Electric Operation
9 Transmission; correct?

10 A. That's correct.

11 Q. Let's start with the back. We are all the way
12 to the end. And it lists subject matter experts. Is
13 that your name?

14 A. Yes, sir.

15 Q. And lists as a subject matter expert in
16 transmission line failures; correct?

17 A. I might have provided data. I don't remember
18 this document. I mean, I've seen it because it was sent
19 to me recently, but I couldn't recollect it.

20 Q. Well, how did you come, how did you come to be
21 an expert on transmission line failures?

22 A. Like I said, I might have provided data and
23 somebody just decided to put my name. I'm not sure.

24 Q. Okay. What kind of data?

25 A. I don't know. Whatever data they asked me.
26 I'm assuming. I don't remember giving them any

1 information. I just couldn't remember this document,
2 what my involvement was on this.

3 Q. Okay. But you've read this document; right?
4 You're familiar with all the statistics and numbers in
5 this document?

6 A. Yeah, the voltage classes, of the circuit
7 miles, yes. The type of conductor that we have in the
8 system, yes.

9 Q. So we're looking at figure 1. Can you explain
10 to us what a Root Cause Pareto Chart is?

11 A. I don't know who developed this. I don't know
12 what they were thinking.

13 Q. Okay. How about figure 2, trend of three
14 highest root causes?

15 A. Do I know what it means?

16 Q. Yeah. Can you explain this to us, tell us how
17 to read this?

18 A. If I were going to read this document and I was
19 going to make a speculation, it looks like, by year,
20 every year there is a number of outages that occur due to
21 tree, hardware, or conductor jumper, and they are trying
22 to see for a trend.

23 Q. Okay. Conductor failures by voltages?

24 A. Conductor failures by type.

25 Q. How about figure -- what is this? There's no
26 figure number on this. "Wire down events by year and

1 kV."

2 A. Yes. Looks like color coded by the voltage
3 class, kV.

4 Q. Okay. So what do the numbers in each of the
5 columns mean?

6 A. If I was going to speculate, what would be the
7 number, the numbers -- number of outages. Or could be
8 the number of failures, I'm not sure.

9 Q. So number of wires down events in a year?

10 A. That's what it looks like.

11 Q. Okay. All right. Let's move on.

12 All right. At some point were you involved in
13 something called the T-line Structures Committee?

14 A. Do I remember it?

15 Q. Yes.

16 A. Yes, sir.

17 Q. What was the T-line Structures Committee?

18 A. This was when I first started with the team. I
19 was an associating engineer scheduling the meetings and
20 taking notes, organizing the meeting. That was my role.
21 And then T-line Structure Committee, the purpose of the
22 team, the committee, was to look at various conditions in
23 the system and to determine what, what's a higher
24 priority. That's what I remember of it.

25

26 (Grand Jury Exhibit 1247 introduced.)

1
2 Q. All right. So what is 1247?
3 A. 1247. 1247?
4 Q. Yes. What is this document?
5 A. Oh, looks like meeting minute. At that
6 meeting, what the people that were assigned with an
7 action item.
8 Q. Okay.
9 A. That's what it looks like to me.
10 Q. So first it says "T-line Structures Committee,"
11 then it says "2009, 2010 goals"; correct?
12 A. Yes.
13 Q. And then we have three columns: Items, who,
14 and status. And you're listed in the item, "Define and
15 implement a structure rehabilitation and replacement
16 program"; correct?
17 A. Yes, sir.
18 Q. And who are the other people in your group that
19 are assigned to that project?
20 A. Rick Stockand was my supervisor; Randy Hopkins,
21 who was the senior consulting engineer; Nick Bhatt, who
22 was also a senior consulting engineer; and I believe
23 Cheung, that could be Mike Michael Cheung. I'm not sure
24 who the Cheung is.
25 Q. All right. So tell us about how you defined
26 and implemented a structure rehabilitation and

1 replacement program.

2 A. In 2009 and 2010?

3 Q. Yes.

4 A. Imagine young engineer following all the senior
5 engineers. I was pretty much taking notes at that point.

6 Q. Okay.

7 A. But later on I developed a, strategies when I
8 became a senior.

9 Q. So it says under "Status," "In progress,
10 program outline due by June 30th, 2010"; correct?

11 A. Yes, sir.

12 Q. So did you guys come up with a strategy for
13 structure rehabilitation and replacement?

14 A. I don't remember.

15 Q. Now, it also lists, "All, review draft Quanta
16 Component Strategy Report"?

17 A. Yes, sir.

18 Q. So what does, is a Quanta Component Strategy
19 Report?

20 A. Quanta is a contractor company that was hired
21 by PG&E to do a strategy recommendation. So they look at
22 every asset and they recommend what the strategy should
23 be for that asset.

24 Q. So that says postponed by September 18th, 2009;
25 date is recast to February 1, 2009."

26 All right. So eventually did you receive the

1 Quanta Strategy Report?

2 A. Yes, sir.

3 Q. And what did you do with it?

4 A. What did I personally do with it?

5 Q. Well, as your committee, it says T-line
6 Structures Committee, what did you do with the report?

7 A. The report, when the report was finalized, I
8 moved from the Reliability Strategy to T-line Asset
9 Strategy.

10

11 (Grand Jury Exhibit 1248 introduced.)

12

13 Q. Okay. I want to move on to 1248 that you have
14 in front of you.

15 A. Yes, sir.

16 Q. This is the report we're talking about,
17 correct, the Transmission Line Component Management
18 Report Summary?

19 A. That's correct.

20 Q. This is the, the report that your committee was
21 waiting for back in 2010 -- 2009? I'm sorry.

22 A. Yes, for the Quanta report to be completed.

23 Q. Okay. But you don't recall what, if anything,
24 was done with this report?

25 A. If anything was done with the report?

26 Q. Yeah.

1 A. We had a reorganize, and I -- they put me in
2 T-line Asset Strategy.

3 Q. Okay. But wouldn't a report on component
4 management be relevant to your position at Asset
5 Strategy?

6 A. Yes, it will.

7 Q. Okay. So the report was still relevant to what
8 you were doing with the T-line Structures Committee;
9 correct?

10 A. That's correct.

11 Q. So what was done with this report?

12 A. I used it to -- in 2017 and 2018 strategy that
13 I developed, I used this document to refer to.

14 Q. Okay. But in 2010, when this report came out,
15 did this report result in any changes within the Asset
16 Strategy Asset Management portion of PG&E?

17 A. I don't know.

18

19 (Grand Jury Exhibit 826 introduced.)

20

21 Q. Okay. And 1249 we're going to withdraw. So
22 put a big X across 1249.

23 All right. Let's move on. This one you're
24 going to have to use the paper one because that is a bad
25 copy of a bad copy of a bad copy. But you should have in
26 front of you Exhibit 826. It's already been entered into

1 evidence. Should be right after. That's right. I
2 forgot to pull them. We didn't pull them.

3 Okay. Well, the best we can do here, this is
4 -- come here and look at this. This is a meeting notice
5 for the T-line Structures Committee in 2010. You're the
6 organizer. Required attendees: Yourself and this whole
7 list of people. And it says that, the Quanta Structures
8 Report; correct?

9 A. I'm --

10 Q. It should say Quanta Report T-line Structure.
11 She has the actual exhibit there for you.

12 A. Thank you.

13 Yes, sir. T-line Structures.

14 Q. Okay. So that's another separate report from
15 Quanta; correct?

16 A. No, I think this was -- if I remember
17 correctly, this was the day the Quanta people came and
18 presented the report to the team.

19 Q. That's the T-line Structures Report, Exhibit
20 827, but it is being referred to?

21 A. I think it was the whole package of the Quanta
22 Report.

23 Q. Okay. Quanta did lots of reports; right?

24 A. Yes. For every asset.

25 Q. Right. One of those is the T-line Structures
26 Report, Exhibit 827; correct?

1 A. Yes.

2 Q. And you reviewed the T-line Structures Report?

3 A. I have reviewed it before, yes.

4 Q. Why were none of the recommendations of the

5 Quanta T-line Structures Report ever adopted at PG&E?

6 A. I don't know.

7 Q. Whose decision is it to not adopt these

8 recommendations?

9 A. It wasn't my decision.

10 Q. Whose was it?

11 A. I don't know, to be honest with you.

12 Q. Well, you're part of T-line Structures

13 Committee, you're part of the committee that's reviewing

14 this document right here; right? You're setting meetings

15 to review this document?

16 A. Yes, sir, but I was associating engineering;

17 pretty much take notes at that point.

18 Q. Right. You're not a decision maker?

19 A. No, not at all.

20 Q. Right. That's why you're sitting here. What

21 we want to know is who is the decision makers? Who are

22 the people that looked at this report and did not act on

23 those recommendations?

24 A. The senior directors, the directors; I don't

25 know.

26 Q. Okay. Well, you're part of the committee

1 that's advising them; correct? You're making
2 recommendations on what should be done; correct?

3 A. For this, no. I was an associating engineer;
4 didn't have the leverage to recommend or --

5 Q. You're still there; right?

6 A. Yes, sir.

7 Q. And now it's, it's, now it's ten years later
8 almost, and you're now a senior, senior engineer;
9 correct?

10 A. That's right.

11 Q. And let's go back to 2017. You were a senior
12 engineer in 2017; correct?

13 A. I became a senior engineer 2017, I believe,
14 2018.

15 Q. Do you ever go back and look -- do you remember
16 the Camp Fire happening?

17 A. Yes, I remember the Camp Fire happening.

18 Q. Did you watch and participate in all of the
19 emergency stuff at PG&E?

20 A. I was in the G-O, but I was part of the
21 Wildfire Inspection Enhancement Program.

22 Q. So -- and did you track the progress -- or
23 track why the Camp Fire happened?

24 A. That wasn't my role. My role was to look at
25 the notifications that were coming in and review and
26 assign priority.

1 Q. But you're talking about the post-Camp Fire?
2 A. Yes.
3 Q. You're talking about the CERT team. You're one
4 of the people who was evaluating the inspections that
5 were being done all over the place; correct?
6 A. In tier 2 and tier 3.
7 Q. And you knew what caused the Camp Fire by that
8 point; correct?
9 A. I don't know what caused the Camp Fire.
10 Q. You still don't know?
11 A. I mean, personally I don't know.
12 Q. Okay. What do you mean personally you don't
13 know? Have you been told by your employer what caused
14 the fire?
15 A. Yes. They said a C-hook.
16 Q. Right. A C-hook that broke?
17 A. Yeah.
18 Q. Okay.
19 A. I never seen the C-hook.
20 Q. You've seen the C-hook?
21 A. Not that C-hook that --
22 Q. You've seen other C-hooks?
23 A. Yes.
24 Q. You've seen lots of pictures of C-hooks with
25 lots of wear on them; correct?
26 A. As part of the CERT team?

1 Q. Right.

2 A. Yes.

3 Q. Did you ever go back and ask yourself, or ask
4 anybody else, why did we not adopt the recommendations of
5 the Quanta T-line Structures Report?

6 A. Well, in my Strategy I don't recommend.

7 Q. But you were on the committee that was
8 appointed to review this document. You were waiting --
9 you were setting up meetings for this document; correct?

10 A. Yes, sir.

11 Q. And none of these recommendations in that
12 document were ever adopted, correct, prior to the Camp
13 Fire?

14 A. I wouldn't say none of them. I implemented --
15 for example, I revised inspection forms to make sure that
16 I get the right information.

17 Q. Okay. Well, one of the biggest things in this
18 Structures Report was age of infrastructure; correct?

19 A. Yes, sir.

20 Q. Sixty-eight years is the mean life span of a
21 transmission structure; correct?

22 A. I don't remember top of my head, but that
23 sounds about right.

24 Q. If you want your old structures, if you want
25 your aged infrastructure to continue, you need to up your
26 game when it comes to inspection and maintenance;

1 correct?

2 A. Yes.

3 Q. Climbing inspections?

4 A. Yes.

5 Q. Enhanced, other enhanced inspections for older
6 structures; correct?

7 A. Yeah. So I don't know if you seen the 2018
8 Steel Structure Strategy that I developed, but all of
9 them --

10 Q. We're going to get to that in a few minutes.

11 A. Okay.

12 Q. Because you actually quote from this document;
13 correct?

14 A. Yes, I did.

15 Q. In 2018, when you're talking, and in 2017, when
16 you're talking about strategy going forward, you're
17 quoting from this document?

18 A. Yes, I do.

19 Q. And the question is why weren't those things
20 adapted, adopted prior to the Camp Fire and who made that
21 decision?

22 A. I don't know who made that decision, but I know
23 that at one point this was published or handed to PG&E
24 and went to Asset Strategy. And I wasn't in charge of
25 the T-line Steel Structures. I had a new boss, Erick
26 Corona, who assigned me different assets. I was in

1 charge of insulators, conductors.

2 Q. Okay. What was your boss's name?

3 A. Erick Corona.

4 Q. How do you spell that?

5 A. Erick, I believe it's E-R-I-C-K.

6 Q. We get that. I --

7 A. Corona?

8 Q. Yeah.

9 A. Like the beer Corona.

10

11 (Grand Jury Exhibit 1250 introduced.)

12

13 Q. Okay. 1250. And I got to go back and forth
14 here because some of these are lengthy documents and --

15 All right. So you recognize 1250, and you have
16 it in front of you, also?

17 A. I remember this email, yes.

18 Q. Okay. So tell us what we're looking at here.

19 A. This is --

20 Q. Well, just in general tell us what we're
21 looking at, then we'll get to specifics on the email
22 itself.

23 A. Okay. I see project, the Bay Water and Salt
24 Pond Foundation Detailed Inspection, the year, and the
25 money that was allocated for it.

26 Q. All right. So, in general, what is this email

1 chain about?

2 A. In general, this email is -- I raised a concern
3 with my boss that we need to look at the Bay Waters
4 structures and the salt ponds, another project along with
5 that, foundation structures that we have in our system,
6 and we presented this. My boss wanted me to review with
7 him for technical purposes technical information. And we
8 presented to the -- I believe he was a senior manager of
9 Maintenance and Inspection.

10 Q. Okay. So what was the Bay Waters Project?

11 A. Bay Water Project, we have 505 I believe steel
12 structures that are either in the water, of the Bay
13 water, crossing the bridge or in marshland. That was
14 the, those are the towers that I'm referring to when I
15 say Bay Water towers.

16 Q. Okay. So am I correct in reading this that
17 money's being taken from the Bay Waters towers to pay for
18 an underground transmission program?

19 A. No. This was multiple projects being discussed
20 in one email, and Bay Water being one of them and then
21 the underground being one of them.

22 Q. Okay. So I guess we'll just get into the meat
23 of this, which is this chart. Here in the middle on page
24 4 of 8, who is Raymond Trinh?

25 A. That was my manager at one time.

26 Q. Okay. What is PE?

1 A. PE?

2 Q. Yes.

3 A. Professional engineer.

4 Q. Okay. All right. So page 4, this is where we
5 end up. We have this chart that breaks down, I'm
6 guessing, spending; is that right?

7 A. So Jefferson was, I believe he was in charge
8 of, might have been Capital and Expense. So we're
9 asking, we're telling him that this is how much money we
10 need to have those towers for the underground project to
11 be inspected.

12 Q. All right. So --

13 A. And the money usually comes from the account
14 number that we're assigning to do the work.

15 Q. So Mr. Trinh is saying, "For the overhead tower
16 inspections, I don't think we would be able to do any
17 repairs and incur any land costs shown in items 3 and 4
18 in 2015."

19 So is 3 and 4 "Severe Deterioration Repair" and
20 "Land and Environmental"?

21 A. That's how I read it.

22 Q. So am I reading this right that Mr. Trinh is
23 saying those budgets are going away?

24 A. Yes, that's what it reads.

25 Q. Okay. So the budget for Transmission, that
26 budget, that \$1.1 million that was forecasted for severe

1 deterioration repair and land and environmental weren't
2 actually there, they disappeared for 2015; correct?

3 A. I, actually I went to maternity -- that's how
4 -- I went on maternity leave necessary when I had my son
5 and child. That's why you'll see in the email up saying,
6 "out."

7 Q. There's another one -- you're right. There's
8 an email saying that Feven is out.

9 A. I went on maternity leave.

10 Q. What is the severe deterioration repair of the
11 Tower Department?

12 A. Tower Department had notifications on towers
13 that were corroding. They were deteriorating. So they
14 were in need of repair.

15 Q. Okay. Repair as opposed to replace?

16 A. Tower Department recommend them to be repaired.

17 Q. Okay. But they're severely corroded, but now
18 they're not going to be done; right?

19 A. That's what it says from the, Raymond's email.

20

21 (Grand Jury Exhibit 1251 introduced.)

22

23 Q. Let move on to 1251.

24 Do you recognize -- you read 1251. I
25 specifically want to focus on the email June 10th, 2016,
26 from Raymond Trinh to a group of people that includes

1 yourself.

2 A. Yes, sir.

3 Q. All right. Who is Laszlo Forgo?

4 A. He is the corrosion engineer.

5 Q. Jake Meyer?

6 A. He was, he was, he worked with Jefferson. He
7 was, he was in the finance side.

8 Q. Okay. Logan Magness?

9 A. I actually don't remember him.

10 Q. Okay. How about Manho Young?

11 A. Manho Young was my liaison; he was a senior
12 director.

13 Q. What was his job at this time?

14 A. I believe he was the, still a senior, senior
15 director.

16 Q. All right. Now, "Thank you for your time this
17 morning. Here are some action items and notes I took.
18 Let me know if I missed anything. Develop a
19 comprehensive plan for tower risk with an emphasis on
20 steel corrosion risks."

21 A. Yes, sir.

22 Q. At this point, PG&E had no plan for,
23 comprehensive plan for tower risk and steel corrosion
24 risks?

25 A. Not that I know. The Quanta report is the only
26 one I knew. Raymond Trinh, before he became my manager,

1 he was the person that was managing the asset, steel
2 structure assets.

3 Q. Okay. And then, "Plans should include
4 maintenance plans, detailed inspections specification,
5 repair versus replace criteria, capital and expense cost
6 estimates, risk database, and update standards."

7 Do I read that correctly?

8 A. Where are you reading? I wasn't following.

9 Q. I'm sorry, right here. First bullet point
10 under "Develop comprehension plan."

11 A. Yes, sir.

12 Q. Okay. So, to your knowledge, was there ever a
13 maintenance plan developed, comprehensive maintenance
14 plan, for tower risk with emphasis on steel corrosion
15 risks?

16 A. Prior to, prior to this date?

17 Q. No, prior to the Camp Fire.

18 A. Yes, the one that I developed in 2017 and 2018.

19 Q. Okay. And how about are there developed
20 written established repair versus replace criteria?

21 A. I had developed one for the Bay Water and the
22 standard one that I used throughout.

23 Q. Okay. But is there a PG&E standard criteria
24 for making repair versus replace determinations for
25 everything for all of the transmission assets?

26 A. Not that I'm aware of.

(Grand Jury Exhibit 1252 introduced.)

Q. Let's move on to 1252. 1252, right there in front of you.

A. Yes, sir.

Q. What is 1252?

A. Looks like a meeting requested by David Gabbard.

Q. Who is Dave Gabbard?

A. He was, at this time he was the senior director of Asset, Assets Management.

Q. All right. And this is a meeting that you were attending?

A. To answer, I don't remember attending this meeting. I wasn't even -- I'm not even sure why I was being invited.

Q. All right. Well, the subject for the meeting says, "Discuss Aging Infrastructure Initiative"; correct?

A. That's what it says here, yes, sir.

Q. What is the Aging Infrastructure Initiative?

A. I don't know what they talked about. Like I said, I don't remember going to this meeting.

Q. Have you ever heard of anything called the Aging Infrastructure Initiative within PG&E?

A. I have heard of the aging infrastructure.

1 Q. Well, "infrastructure" is just a description --
2 A. Yes.
3 Q. -- of PG&E's, basically, assets; correct?
4 A. Yes.
5 Q. But what about the Aging Infrastructure
6 Initiative?
7 A. I might have heard the word before, I don't
8 remember. But I just don't remember this document.
9 Q. All right. So you don't remember attending
10 this meeting?
11 A. No, I don't remember.
12 Q. There's a PowerPoint that's listed herein,
13 Aging Infrastructure Initiative?
14 A. Yeah.
15 Q. Do you remember the Deteriorating Transmission
16 Assets Project?
17 A. Deteriorating Asset, a program?
18 Q. Okay. Could be a program.
19 A. I know the Tower Replacement Program.
20 Q. That's going to be the next one.
21 A. That's the one that I remember.
22 Q. All right. What's the Tower Replacement
23 Program?
24 A. The Tower Replacement Program was put by
25 various subject matter experts to come up with when and
26 how do we replace a tower --

1 Q. And --

2 A. -- was the plan.

3 Q. -- when did the Tower Replacement Program

4 start?

5 A. The Tower Replacement Program started, I want

6 to say, either late 2017 or early 2018.

7 Q. What was the goal of the Tower Replacement

8 Program?

9 A. Well, just like every other utilities, we have

10 an aging structures, so before we have a cascading

11 failure, we want to make sure that we start replacing

12 them based on different criteria.

13 Q. What do you mean by "cascading failure"?

14 A. Meaning like we may not, we don't want to have

15 a bubble of failures.

16 Q. Of what?

17 A. Failure. Like a structure failure. We had --

18 there was one structure that fell, river crossing, so we

19 start noticing that maybe there might be other ones that

20 look like that.

21 Q. By "failure," do you mean tower falling down?

22 Right?

23 A. Yes, sir.

24 Q. That's not a good thing; right?

25 A. Not at all.

26 Q. Okay. So five towers on the Caribou-Palermo

1 fell down in December of 2012. How was that viewed?

2 A. I don't know.

3 Q. You're the Transmission Line transmission
4 failure expert, the structure failure expert; correct?

5 A. Not at that time.

6 Q. Okay. All right. So you don't remember
7 anything about this Aging Infrastructure Initiative;
8 right?

9 A. No, I don't.

10 Q. And you never heard of the Deteriorating
11 Transmission Assets Project or Program; correct?
12 Deteriorating Transmission Assets Replacement Program?

13 A. I don't recall.

14 Q. But you're in Asset Strategy?

15 A. We hear the word, I heard the word "aging,
16 deterioration," but what was throwing me off is the
17 "program."

18 Q. So in your time in Asset Strategy, has there
19 been any actual program to replace the aging
20 infrastructure? For instance, the Caribou-Palermo line?

21 A. The Caribou-Palermo line?

22 Q. Yeah. Like the Caribou-Palermo line?

23 A. Can you ask the question again, a different way
24 maybe?

25 Q. Do you know of any programs, projects,
26 initiatives, anything else in PG&E that actually started

1 replacing these transmission assets that have survived
2 past their useful life?

3 A. We were, have a lot of projects, the Bay Waters
4 and the salt pond, the high risk structures, identified
5 in my strategy.

6 Q. Right.

7 A. Yes.

8 Q. But how old are the Bay Waters towers?

9 A. It varies. Some of them go up to 92.

10 Q. Ninety-two years old or --

11 A. Ninety-two year old.

12 Q. -- 1992?

13 A. Ninety-two year olds.

14 Q. Okay. Outside the Bay Waters -- now, the Bay
15 Waters, that's all down in the inner Bay Area; correct?

16 A. That's correct.

17 Q. Those are the transmission lines that feed San
18 Francisco, Marin County -- or not Marin County -- San
19 Francisco and the peninsula; correct?

20 A. Correct. And we have salt water, Delta water,
21 and other identified high-risk steel structures that have
22 been within PG&E territory or system.

23 Q. And those, all of those systems, all those
24 areas you're talking about are high-density population;
25 correct?

26 A. Can be.

1 Q. If you get a failure in those, in one of those,
2 it's going to affect a lot of people; right?

3 A. In my strategy, I focused on various things.
4 Public safety was one of them. Reliability was one of
5 them. Age was one of them. The environmental impact.
6 So I considered all that and more to determine to
7 nominate the work.

8 Q. What was your budget for the Bay Waters towers
9 for repair and replace? Didn't I see something?

10 A. I'm an engineer. My focus is I try to stay
11 away from the finance part.

12 Q. Right.

13 A. Because it doesn't help me with the
14 determination. Conditions really helps me to nominate.

15 Q. But didn't I see somewhere that your budget in
16 the Bay Waters was something like \$500 million for repair
17 and replace?

18 A. I think I had gotten a quote for replacement of
19 a tower in the Bay Waters before. I believe that was
20 roughly about 10 million per structure.

21 Q. Okay. All right. So other than the Bay Watch
22 [sic], are you aware of any other project in the 12 years
23 you've been with PG&E now at Asset Strategy, any other
24 projects that actually replaced, repaired aging
25 infrastructure?

26 A. Yes.

1 Q. What?

2 A. I don't remember the name of the line, but it
3 was in what is -- I'm trying to remember the city name or
4 the -- it's past San Jose. That there was a line that I
5 developed a repair, replace strategy for.

6 Q. Do you remember when that was and why?

7 A. That was in, that was before Camp Fire, I want
8 to say either late 2017 or early 2018. Might have been
9 late 2018. But the reason was because the inspectors
10 had, the linemen and the troublemen had concerns with the
11 condition of the structures, and they created
12 notifications. And once I look at the notifications, I
13 told them to use a different format to capture the
14 conditions better for me so I can analyze the data and
15 help them.

16 Q. What kind of conditions?

17 A. The deterioration of the asset, like material
18 losses.

19 Q. What kind of deterioration? Where was it
20 deteriorating?

21 A. It could be because it wearing in the
22 environment it was in.

23 Q. No, no, I'm talking about what parts of the
24 tower were deteriorating.

25 A. Oh, mainly those ones, if I remember correctly,
26 were of the stand angle, where the foundation comes and

1 is placed with the structure.

2 Q. Okay. We've got to move on because I know you
3 have a child you have to go pick up.

4 A. Yes, I do.

5 Q. So we need to get you out of here.

6 Now we've moved on. 1239. This is another
7 meeting notice. It's probably out of -- we've already
8 talked about it. This is another meeting you're being
9 invited to, you're a required attendee here; right?

10 A. Yes, sir.

11 Q. And this is a meeting that's being called by
12 Jake Meyer?

13 A. Yes.

14 Q. And who is Jake Meyer?

15 A. He was working closely with Jennifer and with
16 Jefferson. He was in the, in the Finance side of the
17 house.

18 Q. Okay. And this, the subject is Expense Funding
19 Request; correct?

20 A. Okay. Yeah. Yes.

21 Q. So you're being invited to a meeting to talk
22 about expense funding requests?

23 A. They wanted to inform me -- or if they needed
24 technical support, they would invite me to a meeting.

25 Q. Okay. And actually I shouldn't say "invited."
26 You're being told you're going to a meeting; correct?

1 You're a required attendee?

2 A. They required me to go, yes.

3 Q. All right. So, "The purpose of the meeting is
4 to obtain leadership guidance of which items to pursue
5 and where." Let's see. Oh, the, "This input is
6 important given the Expense reduction pressures being
7 pushed down on Transmission Operations for 2017."

8 So can you explain that to us.

9 A. In my role, it doesn't really mean anything to
10 me. I attend the meeting for technical purpose. And I'm
11 assuming Eric and -- Eric Back, who was in charge of the
12 Expense, so it was mainly for him to make a decision
13 which ones he wanted to move forward with first.

14 Q. So am I reading this right, pressure is being
15 put on to reduce expense budget for Transmission in '17?

16 A. Yes.

17 Q. And that would include things like patrol and
18 inspection?

19 A. I would assume so.

20 Q. Okay. So that would affect you; right?

21 A. Yeah, it would. It would affect me because I
22 wouldn't get all the information from the, from the field
23 if they are not inspecting the --

24 Q. Right. Walk us through how it is that a,
25 basically a project goes from notification to happening.

26 A. So linemen or troublemen or towermen will go to

1 the site and they inspect. It they find something, they
2 will create a notification. And the notification goes to
3 their supervisors. And the supervisors would either
4 agree with what they are saying or they will go out into
5 the field. At least that's the process that I was told.
6 And then they make the notification in LC. From what we
7 call it, S5, which is the stage, becomes a line
8 corrective. They give it a priority code, how long the
9 repair needs to take.

10 And once that has been closed, I want to see
11 like what repairs have been done to the asset, because
12 that would help me. How many times are we repairing this
13 asset in terms of maybe now it's time to retire the
14 asset, meaning replace the asset.

15
16 (Grand Jury Exhibit 1253 introduced.)
17

18 Q. Okay. All right. Let's move on to 1253. Do
19 you recognize 1253?

20 A. Yes, sir.

21 Q. What is 1253?

22 A. The Steel Structure Strategy I developed in
23 2017.

24 Q. All right. What is a Steel Structure Strategy?

25 A. A Steel Structure Strategy in 2017, basically,
26 basically it look at the highest risk of structures that

1 I know of or other supervisors send me an email for. So,
2 as I say, oh, in our area -- because I send them an email
3 saying, "Do you have any area of concerns with the towers
4 that are in your area?" And some of them responded
5 saying, "Yes, we have those." And I included those into
6 this, into the 2017 strategy.

7 Q. Why are you writing a 2017 strategy?

8 A. This was actually the first time I was told to
9 develop a Steel Structure Strategy. Remember, I told you
10 earlier I had conductors and --

11 Q. Right.

12 A. This is the first time that Raymond, Raymond
13 Trinh became my boss. And he had me the Steel Structure
14 Strategy.

15 Q. Should there be Steel Structure Strategies
16 written before this by other people?

17 A. I can't speak for them. Yeah, Raymond should
18 have developed one.

19 Q. Okay. All right. Let's go through this.

20 So, "Transmission Line Steel Structure Strategy
21 will manage the asset life cycle based on risk."

22 What does that mean?

23 A. "Based on risk" means based on different
24 criteria that we have to come with up with. A risk in
25 Asset Management has been defined, probability of failure
26 times the consequence. The consequence could be the

1 consequence of public safety, reliability, or
2 environmental.

3 Q. Which of those is the most important?

4 A. Public safety comes first. Public safety comes
5 first.

6 Q. Comes first in the section, but in reality
7 which is the most important of those criteria?

8 A. To me it's -- safety is the, always been the
9 highest.

10 Q. Okay. So the first thing you want to look at
11 when you're making a decision is safety?

12 A. Yeah. The condition first and then safety.
13 Meaning like as they go hand-in-hand with the other. If
14 the asset is in held condition, then probability of asset
15 failing is less, so impact from a safety perspective is
16 also less.

17 Q. All right. So we have short-term goals, we
18 have long-term goals; correct?

19 A. That's correct.

20 Q. Structure count?

21 A. Yes, sir.

22 Q. Age of steel structures. Explain this chart to
23 us.

24 A. This is the age that we have on steel
25 structures in the system, color coded by the voltage
26 class.

1 Q. Okay. Blue is 230, green is 115, and purple is
2 500?

3 A. Yes, sir.

4 Q. Then down at the bottom it says, "Structures
5 age data life expectancy is from a 2010 Quanta Technology
6 study"; correct?

7 A. That's correct.

8 Q. So those are the studies that we talked about
9 earlier that you were looking -- you were on the T-line
10 Structures Committee in 2010, you guys were waiting for?

11 A. Yes, sir.

12 Q. The same report to which the recommendations,
13 none of the recommendations were ever adopted; correct?

14 A. You can say that I guess.

15 Q. So the mean life expectancy is 65 years. The
16 average age of PG&E's asset inventory is 68 years;
17 correct?

18 A. Yes, sir.

19 Q. All right. Let's see what we got. This is
20 interesting. Over six years, 2011 to 2016, outage has
21 claimed one tower failure. Can you explain to us what
22 that means?

23 A. Where were you?

24 Q. The top.

25 A. Over outage history, one tower failure.

26 Q. Right here.

1 A. Yes.

2 Q. Talks about the Moss Landing. One tower fell
3 down from Moss Landing?

4 A. Yes, sir.

5 Q. So are you saying that this is the only tower
6 failure in PG&E at that time?

7 A. From the data that I was looking at, that's the
8 only one that I found.

9 Q. 2011 to 2016, the 2015 Moss Landing is the only
10 tower failure you found?

11 A. Yes, sir.

12 Q. You didn't find that five towers on the
13 Caribou-Palermo fell down in December of 2012?

14 A. Not on the data record that I was looking at,
15 no.

16 Q. Any idea why the fact that five towers --
17 that's a pretty big thing, five towers just falling down;
18 right?

19 A. Yes, sir.

20 Q. You're in Asset Strategy. Why would you not
21 know about five towers falling down?

22 A. I was an associate engineer. I didn't know.
23 But the record that I was looking at was in the outage
24 history.

25 Q. That is then. This is now. This is 2017.
26 You're now a senior consulting engineer; right?

1 A. Not at this time when I developed this.

2 Q. All right. This is an exhibit that was
3 submitted by PG&E to FERC proceedings; correct?

4 A. It might have been. I know that it was
5 approved in that fashion.

6 Q. In the United States of America, before the
7 Federal Energy Regulatory Commission, docket number ER
8 162320, Exhibit PUC 0057, Steel Structure Strategy. And
9 then you have the markings up in the right-hand corner,
10 Exhibit, PUC 0057, page 1 of 17, and so on.

11 All right. So can you explain to us the, this
12 chart on page 11, how we read this?

13 A. Yes. The, on the bottom it's the year, and on
14 the right-hand side -- may I?

15 Q. Go, please do.

16 A. Emergency T-line replacement. How many are
17 replacing 2012. And they are color coded. So the blue
18 one is emergency, the red one is T-line replacement, and
19 the green is NERC compliance replacement.

20 So the blue under emergency 2012, I was
21 informed that we had one tower replacement. And then our
22 steel structure replacement appears to be the power pole.

23 Q. Right.

24 A. Then red had the T-line replacement, replace
25 three.

26 Q. Right.

1 A. Then the NERC is on this side. So NERC
2 compliance, for example, so 2014 we NERC replaced nine,
3 nine steel structures.

4 Q. Right. Because we have, on the left side we
5 have 0 through 6, then on the right side we have 0
6 through 140?

7 A. Yes.

8 Q. So how do you read a chart like that?

9 A. So the reason for the chart like that is
10 because the numbers on the NERC, for example, is higher.
11 So it wouldn't fit in one, in one graph. Like here you
12 would not be able to see the 1s and the 3s --

13 Q. Right. So --

14 A. -- wanted to.

15 Q. -- why not just do two separate charts?

16 A. I'm an engineer; we complicate things.

17 Q. Next one, transmission steel structures average
18 installations next five years. So this is looking in the
19 future; correct?

20 A. Yes, sir.

21 Q. This is forecasting what you're going to be
22 doing in the future; right?

23 A. Yes, sir.

24 Q. So explain to us how to read this chart.

25 A. Based on historical emergency data, capital,
26 Capital projects are due to increase due to the load of

1 the conductor, and it might require the towers to be
2 replaced. Because with the newer, bigger conductor the
3 structure on the foundation may not be able to handle it.
4 So the Capital project, I asked them, "How many
5 structures do you plan to replace in the next five
6 years?"

7 Q. Okay.

8 A. And so that's those.

9 Then this is the T-line replacement and NERC.
10 So out of the worst model that I followed, I anticipated
11 that in 2018 replace this many, in 2019 replace 160.

12 Q. And in 2019, 2018 you were predicting that you
13 would replace 42 towers for NERC compliance?

14 A. Yes.

15 Q. And in 2019 that would be 15 towers?

16 A. Yes. And the program was --

17 (Court reporter interrupts proceeding.)

18 A. The NERC program was ending, so that's why you
19 don't see any more green on 2020 and 2021.

20 Q. Now, this, on page 13, those are all the plans,
21 steel structure replacements; correct?

22 A. Yes, sir.

23 Q. Okay. Finally, page 18, can you explain to us
24 how to read this page?

25 A. This slide was put together by Boris Andino,
26 who was my manager. He has his own ways of explaining

1 things I don't understand. This is, this is the asset
2 conductor steel structures and then the counts and the
3 miles. I believe he got this from the PAS 55 document on
4 what a risk is. And this is his way of defining a life
5 cycle for a low risk, medium risk, and high risk that he
6 defined.

7 Q. So what would be considered low risk?

8 A. That would be a question for Boris. Boris.
9 And he would have put his name on it.

10 Q. So low risk. It says, "Life cycle, low risk;
11 strategy, run to failure." Correct?

12 A. Yes.

13 Q. "Create low end controls." Do you understand
14 what that means?

15 A. I don't.

16 Q. "Utilize minimal patrols to continuously assess
17 risk"; is that correct?

18 A. That's what it says.

19 Q. "Maintain, no maintenance. Renew, only
20 replacement. No repairs. And dispose, leave and do not
21 maintain."

22 So if it's a low risk asset, whatever this is,
23 basically you're just going to run it to failure, you're
24 going to do the very least that you can and let it go;
25 correct?

26 A. Like I said, that question should be better

1 answered by Boris Andino.

2 Q. But this is attached to a report that you
3 authored; right?

4 A. Yeah, but I made sure that his name was there.

5 Q. Right. So why do you have a slide that you
6 don't understand in a report that you authored that was
7 submitted in a federal regulatory proceeding?

8 A. I -- my name was for the other slides, not this
9 specific slide.

10 Q. Right. But the report is yours. Name on the
11 front page of that report is yours; correct?

12 A. Yes, sir. I was the engineer for the, for the
13 majority of the report in this.

14 Q. But --

15 A. Contacts with PG&E, I put his name on there.

16 Q. Contacts within PG&E Asset Strategy, Boris
17 Andino?

18 A. That's right.

19

20 (Grand Jury Exhibit 1254 introduced.)

21

22 Q. Okay. Final exhibit. The last one you have in
23 front of you. Brought this up earlier. The Transmission
24 Line Overhead Asset Management Plan from December of
25 2018?

26 A. Yes, sir.

1 Q. What is this document?

2 A. This is a -- so the format that you looked at
3 earlier was of the ways that I developed the strategy,
4 what PAS 55 has, the ISO Standardized Asset Management
5 Plan. And this is the, using the ISO PAS 55 standardized
6 format for all the strategies.

7 Q. Okay. So this lists documents owner David
8 Gabbard, or Dave Gabbard; correct?

9 A. Yes, sir.

10 Q. Document approve Kevin Dasso?

11 A. Yes, sir.

12 Q. But you actually wrote this document; correct?

13 A. I didn't write the whole document.

14 Q. Okay. Did -- was this a team of people or --

15 A. Yes.

16 Q. Explain to us how this document was created.

17 A. So all the Asset Strategy engineers have assets
18 that they, we manage. So I manage three assets, so
19 anything that are related to those.

20 Q. What three assets?

21 A. Steel structures, underground system, and
22 sewages.

23 Q. Okay.

24 A. This is for the overhead portion of the
25 strategies that I have, will be the steel structures,
26 which is the steel structure will be part of mine, for

1 example. So if -- but there are other assets like
2 insulators that were developed by other people.

3 Q. All right. Who else participated with you in
4 the drafting of this document?

5 A. Michelle Sakamoto, Raymond Trinh, and Boris
6 Andino, and Mukul Shekhar.

7 Q. Okay. What was the purpose of this document?

8 A. So PG&E was moving with the standardized ISO
9 PAS 55 format.

10 Q. Okay. What is the PAS 55?

11 A. It's how all other utilities or other big
12 companies use to communicate their plan. That's how I
13 understand it.

14 Q. Okay. Was there a Transmission Line Overhead
15 Asset Management Plan prior to this?

16 A. Not to my knowledge, no. I don't think so.

17 Q. How long did it take you to draft this?

18 A. Well, Michelle was the main person drafting
19 this one. And then I was drafting the underground one.

20 Q. All right. Is Michelle still with the company?

21 A. Yes, sir.

22 Q. All right.

23 Do you have anything else?

24 MS. DUPRE-TOKOS: No.

25 Q. (By MR. NOEL) I'm guessing, just to make sure
26 it's clear --

1 A. Yes, sir.

2 Q. -- the date of publication is December 14th,
3 2018; correct?

4 A. Yes.

5 Q. But you were actually drafting this document
6 well before that; correct?

7 A. I was helping with portions of it --

8 Q. Right.

9 A. -- in 2018, yes.

10 Q. 2017?

11 A. No.

12 Q. Okay.

13 All right. Any questions?

14 The jurors have the opportunity to ask you
15 questions now that I'm done.

16 A. Okay.

17 Q. We will review their questions real quickly and
18 ask you in a second.

19 (Grand Jury Foreperson and counsel confer.)

20 Q. (By MR. NOEL) All right. In your experience,
21 do age and environmental factors have a substantial
22 effect on the reliability of a transmission asset?

23 A. Yes.

24 Q. We have seen reports generated by PG&E that
25 proposed a \$10 million Capital project made in 2010
26 through 2014 that appears to have simply disappeared from

1 consideration after 2014. Are you or any -- or are you
2 or were you aware of this proposed project?

3 A. No, I'm not aware of.

4 Q. Would the catastrophic failure of five tower
5 structures on any given transmission line move to the
6 head of the line for replacement and repair?

7 A. I don't understand the question.

8 Q. The catastrophic failure of multiple structures
9 on a line, in this case five structures on one line,
10 wouldn't that fact alone move that transmission line to
11 the head of the line for replacement or repair?

12 A. That will be a Transmission Planning proposal.

13 Q. So that would be up to somebody else?

14 A. Yes, sir.

15 Q. Who is that?

16 A. Transmission Planning.

17 Q. Who is Transmission Planning?

18 A. Transmission Planning is in charge of what
19 needs to be revealed.

20 Q. Okay. Do you have any names of people in
21 there?

22 A. Are you looking for a senior director,
23 director, manager?

24 Q. Sure. Senior director.

25 A. I believe it fell under Dave Gabbard, his
26 organization.

1 Q. That's now?

2 A. No, before.

3 Q. Before?

4 A. Before Camp Fire.

5 Q. And what about back in 2012/2013, would that be
6 Manho Young?

7 A. That would -- I believe so. I think so.

8 Q. If you recommend the urgent replacement of an
9 asset and someone above your management level simply
10 conceals or fails to move on your recommendation, what,
11 if any, mechanism do you have to have that decision
12 revisited?

13 A. I don't have much of a leverage. I nominate it
14 and people above me make the decision to whether we
15 repair or replace or not do anything at that point.

16 MR. NOEL: Anything further? Any follow-up?

17 All right. Madam Foreperson will have an
18 admonition for you. Barely getting you out in enough
19 time to go get your kids.

20 THE WITNESS: Thank you.

21 GRAND JURY FOREPERSON: Ms. Mihretu?

22 THE WITNESS: Yes.

23 GRAND JURY FOREPERSON: You are admonished not
24 to discuss or disclose at any time outside of this jury
25 room the questions that have been asked of you or your
26 answers until authorized by this Grand Jury or the Court.

1 A violation of these instructions on your part may be the
2 basis for a charge against you of contempt of court.
3 This does not preclude you from discussing your legal
4 rights with your own attorney.

5 Ms. Mihretu, what I have just said is a warning
6 not to discuss this case with anyone except the Court,
7 your lawyer, or the district attorney.

8 THE WITNESS: Yes.

9 GRAND JURY FOREPERSON: Any questions?

10 THE WITNESS: No questions.

11 GRAND JURY FOREPERSON: Thank you for your time
12 today.

13 THE WITNESS: Thank you.

14 MR. NOEL: All right. You are done. Thank
15 you.

16 [DISCUSSION OMITTED.]

17 (Lunch break taken.)

18 [PROCEEDINGS OMITTED.]

19 [ROLL CALL OMITTED.]

20 [DISCUSSION OMITTED.]

21 GRAND JURY FOREPERSON: Mr. Ho, before you have
22 a seat, would you please raise your right hand to be
23 sworn.

24

25 HENRY HO

26 having been called as a witness in

1 the matter now pending, having been first
2 duly sworn, testifies as follows:

3
4 THE WITNESS: Yes, I do.

5 GRAND JURY FOREPERSON: Thank you. Have a
6 seat, please.

7
8 EXAMINATION

9
10 BY MR. NOEL

11 Q. Mr. Ho, for the record, could you please state
12 your full name, spelling your last name.

13 A. It's Henry W. Ho. Do you want the middle name,
14 also?

15 Q. No, we don't need that.

16 A. Okay.

17 Q. Spell your last name, please.

18 A. Ho, H-O.

19 Q. Are you employed, Mr. Ho?

20 A. Yes.

21 Q. By whom?

22 A. By Pacific Gas & Electric.

23 Q. What do you do for Pacific Gas & Electric?

24 A. I was a senior consulting civil engineering
25 with Transmission Line's civil engineering group.

26 Q. What does a senior consulting engineer do?

1 A. Well, in the civil engineering department, we
2 design, construct, and -- transmission line, tower
3 foundations, and tower.

4 Q. What's the difference between a senior and a
5 junior or associate?

6 A. Well, it's just the more experienced you are,
7 the, you know, you take that title. You go from
8 journeyman to the senior level.

9 Q. Are you a licensed civil engineer?

10 A. Yes, I am.

11 Q. Please explain to us your education and
12 training that qualifies you as a civil engineer.

13 A. Okay. So I got my, I got a bachelor's degree
14 from University of California, Berkeley, and also a
15 master's degree at the same institute. That was a bit
16 back, in 1982. Besides education, you have to have your
17 13 years of minimum experience to get to your senior
18 consulting level.

19 Q. How long have you worked for PG&E?

20 A. Twenty-nine years and two months.

21 Q. Could you walk us through your, your career
22 with PG&E, please.

23 A. I started PG&E back in 2000 as a senior
24 engineer in the nuclear energy service, which is
25 supporting the Diablo Canyon Nuclear Power Plant. I can
26 -- so it's been, it's been 20 years in the Transmission

1 and Substation Department.

2 Q. I'll draw your attention to Exhibit 1247. It's
3 up there on the board. Do you -- it's also up on the
4 table. Do you recall the part of a T-line Structures
5 Committee back in 2009, 2010?

6 A. Yes. I was called to attend a committee,
7 structure committee meeting around that time.

8 Q. Okay. What can you tell us about the T-line
9 Structures Committee?

10 A. I think they formed the committee to kind of go
11 over some of the T-line, the mainly maintenance program
12 requirements, and some of the stuff that's relating,
13 because we had a lot of issue with these big tower
14 foundation, the towers around the San Francisco Bay,
15 which has a lot of corrosion issue.

16 Q. Uh-huh.

17 A. So -- and that committee was mainly focusing on
18 how to tackle the maintenance issues of those towers.

19 Q. All right. So looks like there are several
20 subcommittees here. And the first one says, "Finalize
21 and implement detailed tower inspection proposal." It
22 looks like you're one of the people who are assigned to
23 that subcommittee. Do you recall?

24 A. I don't have much recollection on that. I
25 remember we went to, you know, Asset Strategy
26 Department's office for a, for a short meeting. And

1 afterwards I think this was what come out of it. But I
2 don't recall, you know, whether or not we generate those
3 reports or not.

4 Q. All right. Then there's also one on there,
5 "Create a guide for tower inspections"?

6 A. Uh-huh.

7 Q. Do you remember creating a guide for tower
8 inspections?

9 A. In numerous occasion, I participate in putting
10 in input on these what are called TP, T --

11 Q. *ETPM*?

12 A. *ETPM Manual*. So *ETPM* stands for *Electric*
13 *Transmission* --

14 Q. -- *Preventative* --

15 A. -- *Preventive Maintenance* program. So the
16 attributes in the tower, the inspection, part of that
17 manual I think they wanted engineer to provide input on
18 that. So I did provide input to that *ETPM Manual*.

19 Q. All right. Then it says -- well, there's
20 another committee in there. They're "Define and
21 implement a structure rehabilitation." Looks like you
22 were part of that.

23 And "Review draft Quanta Component Strategy
24 Reports." What can you tell us about that?

25 A. Again, the *ETPM Manual* input along these -- I
26 really do not recall what I, what I contributed to.

1 Q. Why would you be involved in a program to do a
2 detailed tower inspection proposal?

3 A. Because I was a civil engineer. I'm
4 responsible for the structural integrity of towers and
5 foundations.

6 Q. Same question, why would you be involved in
7 creating a guide for tower inspections?

8 A. Well, I think a lot of times we have to make
9 the call when they find anomalies. They have to seek our
10 opinion or, you know, certain things that warrant
11 immediate replacement, or we can defer that until later
12 date.

13 Q. Okay. Clarify. Was this committee looking at
14 all towers or just at the Bay towers?

15 A. I think it started out with the Bay tower
16 because there was some issue with those towers, but I
17 think it's kind of getting into other issues. Like on
18 that bottom right-hand corner, became topic of the
19 grillage foundation, which is a tower steel foundation,
20 no concrete protection, which is buried in the ground.
21 Some of the, that there's some concern about the, after
22 being buried in the ground for so many years, you know,
23 do we need to assess the condition?

24

25 (Grand Jury Exhibit 1257 introduced.)

26

1 Q. All right. Let's move on to 1257. And what
2 was your assignment within PG&E on December 21st, 2012?

3 A. My assignment? You mean my --

4 Q. Your job.

5 A. Same function.

6 Q. Okay. In December of 2012, did you get
7 assigned to assist with a project on the Caribou-Palermo
8 line in the Feather River Canyon?

9 A. Yes. I was called close to pretty late at
10 night to go out and look at, you know, some failure on
11 that line.

12 Q. Okay. And this, 1257, is a string of emails.
13 And you should have the string right there in front of
14 you.

15 All right. Bring up the emails themselves.
16 And it looks like here the first time you're mentioned is
17 in an email from (EMPLOYEE #3) on Saturday, December
18 22nd, at 6:00 p.m. And this email is addressed -- or
19 CC'd, you're one of the persons to have been CC'd;
20 correct?

21 A. That's correct.

22 Q. It says, "Bob Daniels is working on getting
23 some additional civil engineering help in to Table
24 Mountain tomorrow to support (WITNESS #12)."

25 So would that be you?

26 A. It would be me, yes.

1 Q. All right. So explain to us what happened and
2 why you were getting pulled up here to deal with it?

3 A. Well, after a failure, civil engineering would
4 get called to the site to look at the failure condition
5 and make an assessment to find out the root cause and if
6 there's a way we can, you know, mitigate that for that
7 particular instance, and also some lessons learned for
8 future potential failure.

9 Q. All right. So did you actually come up here?

10 A. Yes. I went up there, I think, that night.
11 The next morning, actually. Close to 5:00 o'clock,
12 something like that.

13

14 (Grand Jury Exhibit 1258 introduced.)

15

16 Q. All right. Let's move on to 1258. This is an
17 email string. And we always start from the end of the
18 email string.

19 All right. So this is some emails that start
20 up on Friday afternoon. Do you know who (WITNESS #5) is?

21 A. He was the -- I think in 2000 -- back, see, he
22 has different roles over time. He was at one point a
23 General Construction tower supervisor. Later on he
24 became a, what we call EMC, Engineer Maintenance and
25 Construction, engineer. So I don't recall in 2012 what
26 role he was playing exactly.

1 Q. Okay. So he sends out an email on December
2 21st, 2012, at 3:39 p.m. that's addressed to yourself,
3 somebody named Peter Ng. Can you tell us what Peter Ng
4 is?

5 A. Peter Ng was my supervisor at the time.

6 Q. Sergio Chung?

7 A. He was one of the lead T-line engineer.

8 Q. Randy Kihara?

9 A. He's also in the same row, T-line engineer.

10 Q. Email says, "Not sure if any of you are around,
11 but I got just a report of towers down on 23/191 on the
12 above line, so I'm sure T-line Maintenance will be
13 needing assistance. Contact is (WITNESS #12), and it's
14 an area that requires a snow cat."

15 Is that how you got notified of the collapse of
16 the towers on the Caribou-Palermo?

17 A. I'm not sure if the email was the first
18 notification like that, or it was a phone call from Peter
19 Ng at the time. So --

20 Q. All right. So the next email in line, Randy
21 Kihara, and it's talking about somebody named Fanuel
22 Aberra and Tony Lau. Can you tell us who those people
23 are?

24 A. Same; Fanuel Aberra is a T-line engineer. He
25 works out of the Sacramento office. And Tony Lau is one
26 of our civil engineers in the group.

1 Q. Okay. And it says, "Henry is on vacation for
2 the remainder of the year."

3 Were you on vacation?

4 A. I was on vacation, yes.

5 Q. Did you come back from vacation to deal with
6 this problem?

7 A. Yes. Unfortunately, yes.

8 Q. All right. And then we got emails from Fanuel
9 and Peter. And now it looks like your first email is
10 sent on Sunday, December 23rd, at 2:13 p.m.; is that
11 correct?

12 A. Yes.

13 Q. And can you read us your email.

14 A. You want me to read it?

15 Q. Yeah. Sure.

16 A. Okay. "So we went up to the tower sites and
17 looked at the two towers, 186 and 192, at the ends.
18 First order of business is to install anchors to hold the
19 conductors in place without trying to re-plumb the bells.

20 GC Tower will try to use Stingray, slash, Manta
21 Ray anchors about 200 feet back span from tower 192, as
22 it appears to be a soil site. At the other end, tower
23 196, rock anchor will be used to hold the conductors at a
24 point close to the collapsed tower, 187, and next to the
25 access road.

26 The immediate restoration plan is to set up

1 wood shoo-fly poles at selected locations after
2 Christmas.

3 Chuck Stinnett indicates that he will take the
4 lead to find an estimator, either call Chris Guranis,
5 Guranis (phonetic), or get Jeff Lockwood back from
6 vacation to put the shoo-fly together."

7 Q. Okay. So by the 23rd you've already been up
8 and taken a look at this collapse?

9 A. Yes.

10 Q. And you're specifically, at this point,
11 focusing in on the two end towers that are still
12 standing --

13 A. Uh-huh.

14 Q. -- opposed to the collapsed?

15 A. That's correct. Because we need to stabilize
16 these end towers, make sure that chain reaction doesn't
17 go beyond the end towers.

18 Q. Okay. Now we'll get to some of that in a
19 minute.

20

21 (Grand Jury Exhibit 1255 introduced.)

22

23 Q. All right. So next up, I'm showing you what's
24 marked as 1255. Exhibit 1255. Do you recognize Exhibit
25 1255?

26 A. That is my handwriting.

1 Q. That's your handwriting?

2 A. Yes.

3 Q. What is Exhibit 1255?

4 A. So this is an attempt to explain -- I have, I
5 have a, kind of a meeting with my group after the
6 failure, kind of explained to them what I speculated as
7 to the root cause of the failure.

8

9 (Grand Jury Exhibit 1256 introduced.)

10

11 Q. All right. And 1256, what is 1256?

12 A. This is another illustration of -- you know,
13 this is -- the top part of that document is a horizontal,
14 you know, plane view of the line of alignment. And the
15 bottom part of the exhibit is elevation view showing, you
16 know, in relation to the terrain how tall these towers
17 are and how far they are situated apart.

18 Q. All right. So this is actually the different
19 ridges along the tower line; correct?

20 A. That is correct.

21 Q. And each number represents, or X represents the
22 location of a tower?

23 A. Yes.

24 Q. So all the towers are located, looks like, on
25 peaks?

26 A. Yes. That is ideal location for a transmission

1 line.

2 Q. And the towers that went down were 87 through
3 91; is that correct?

4 A. Didn't I have some crosses -- that is correct.

5 Q. All right. And then this, the top half, can
6 you explain again a little bit better what this is.

7 A. That is an alignment of the line in plane view.
8 That shows you what line angle the line is turning. So a
9 transmission line, we have angle tower and transmission
10 tower and suspension tower. Suspension towers is taking
11 the load of the conductor. Angle tower has to take that
12 as well as the conductor line tension.

13 Q. All right. All right. Next up, 1258. And
14 this is similar to the email chain we looked at before,
15 but at the top there's an email from you to somebody
16 named Amin Ezial?

17 A. Uh-huh.

18 Q. Who is Amin Ezial?

19 A. He is a pretty experienced T-line designer.

20 Q. Okay. It starts off with Ezial sending you an
21 email that says, "I am attaching some drawings that may
22 provide some information to repair the line. Structure
23 Data Sheet Drawing. Tower type, SA erection drawing,
24 loading diagram. Tower type SA-H, drawing."

25 So can you explain to us what those drawings
26 are that he's sending to you.

1 A. Those, I believe, were the outlined diagrams of
2 the tower showing the makeup of these towers. Basically
3 showing the configurations of the failed towers.

4

5 (Grand Jury Exhibit 1259 introduced.)

6

7 Q. Okay. Next we're going to move on to 1259.
8 There's three pages for 1259.

9 All right. So there's 1259, three pages. And
10 is Exhibit 1259, are those the diagrams that you're
11 talking about that Ezial, Amin Ezial was sending to you?

12 A. Yes, I believe so.

13 Q. So explain to us what these diagrams are in
14 1259 and why they would be important to you.

15 A. The first diagram is a depiction of the stop
16 angle as buried in the ground. This is what's holding up
17 the tower in the ground. So, as I alluded earlier on,
18 some of the older towers do not have concrete encasements
19 to protect the steel portion below grade. And there are
20 a bunch of structural angles. And at the bottom of the
21 angle, we have a set of what we call the "grillage."
22 That's to, that's to provide the bearing resistance
23 against a tower leg being lifted up in case there's
24 loading that produces tension on that leg. This is what
25 we call a "direct buried grillage anchor."

26 Q. All right. Second page.

1 A. This is just a set of tower extension.
2 Different terrain, depending on the height we need how to
3 go up to, these are the additional extensions to the base
4 tower that we need to add to to make up for the height so
5 that there's conductors at the optimum height but provide
6 enough ground clearance to the surrounding.

7 Q. And page 3?

8 A. Page 3 I think this is a, a transmission
9 transposition arm for one of the SA towers. Standard
10 detail. It depicts how that arm is made up of.

11 Q. All right. So this is, this is what you're
12 being sent when you're up here in December of 2012
13 looking at, looking at these towers to figure out what
14 went wrong?

15 A. That is correct.

16 Q. All right. So I want to go back and point out
17 down there in the bottom lower right corner of page 1,
18 there's a date. Can you read us that date?

19 A. It is January 22nd, 1920.

20 Q. Okay. Then on page 2?

21 A. Same thing.

22 Q. And page 3?

23 A. This is February 2nd, 1921.

24 Q. All right. So these were documents that you
25 were provided to use in your investigation of what caused
26 the towers to fall down?

1 A. That's one of the, one of the documents, yes.

2

3 (Grand Jury Exhibit 1260 introduced.)

4

5 Q. Okay.

6

7 All right. Now, moving on 1260. Some more
8 emails. Do you know what -- well, go ahead, tell us what
9 this is.

10 A. I'm sorry, it's not quite clear.

11 Q. Yeah.

12 MS. DUPRE-TOKOS: Mr. Ho, there should be a
13 hard copy in that little stack on the desk.

14 THE WITNESS: Oh, okay.

15 MS. DUPRE-TOKOS: That might be easier.

16 THE WITNESS: Thank you. My eyes not that
17 good.

18 This is in the order of you just showed these?

19 Q. (By MR. NOEL) Yes, should be in order.

20 A. All right. I have it.

21 Q. All right.

22 A. Okay. This was an email that Amin sent me
23 after that first email we talked about. So we still in
24 the process of finding the exact drawings that pertinent
25 to the failed towers.

26 Q. Okay. Were you ever provided with specific
drawings of the specific towers you were looking at?

1 A. Yes and no. These are very old lines. We
2 don't have a lot of good records on them. So a lot of
3 times we have to go, actually go to the tower, measure
4 the tower legs and kind of do some verification.

5 Q. Yeah. All right. So what is an SDS?

6 A. It's a Structure Data Sheet.

7 Q. That's what we're talking about then?

8 A. Right.

9 Q. Okay. So these -- it goes on. This line was,
10 the plan maps were produced in the early 1920s, by Great
11 Western Power Company?

12 A. Yes.

13

14 (Grand Jury Exhibit 1261 introduced.)

15

16 Q. All right. Let's move on to 1261. What is
17 1261?

18 A. This looks to be a very old copy of a, may have
19 been original line, because the, as you can see, the
20 tower number may not be even matching up with the, what
21 we have been discussion. So also the name. The line is
22 called "Caribou Butte." So they -- we do not show
23 whether this pertains to the failed segment or not. We
24 just have based on what he can put his hands on, you
25 know, everything.

26 Q. Okay. So this is another piece of historical

1 record that was being sent to you?

2 A. Yes.

3

4 (Grand Jury Exhibit 1262 introduced.)

5

6 Q. All right. At 1262, some more emails. Do you
7 have 1262 there in front of you?

8 A. Yes.

9 Q. First off, you've got food poisoning?

10 A. I guess so. I don't recall, but I guess must
11 have.

12 Q. All right. And you got to go for a helicopter
13 ride?

14 A. Yes.

15 Q. And what was the purpose of the helicopter
16 ride?

17 A. I think this is the trip that we took with
18 Fanuel Aberra and Chuck Stinnett, if I recall. So that
19 trip was meant to, after everything stabilized, the end
20 towers were anchored properly. So we go up there and see
21 if we could retrace the failure chain to see if we can
22 find out the root cause of the failure.

23 Q. All right. Were you able to figure out what
24 went wrong?

25 A. I had some suspicion, but -- you know -- but I
26 think the very first exhibit, that, the sketch that you

1 show, was --

2 Q. Right.

3 A. -- was one of the pieces of document we put
4 together to try to explain what happened and what might
5 have been root cause? I think you have one of the email
6 that I sent to (EMPLOYEE #3).

7 Q. Okay. Well, let's go back to 1262. In your
8 email on January 4th, you say, "I think the mini tower
9 cascading started at the angled tower 188, where the line
10 turns 42 degrees. There was evidence of foundation
11 pullout on the tension legs that may have caused the
12 toppling of the tower. When the tower toppled over, it
13 hit a big boulder nearby and resulted in broken crossarm
14 conductors that unzipped in both directions. I've put
15 together a recon report Chuck requested today."

16 Can you explain to us what that paragraph
17 means.

18 A. So this is kind of a quick summary to my
19 supervisor after the trip as to what may have caused that
20 chain failure of these five or six towers.

21

22 (Grand Jury Exhibit 1263 introduced.)

23

24 Q. All right. Then 1263. What is 1263?

25 A. So this is the email I sent to the whole team,
26 including Chuck Stinnett, that there was a probable cause

1 of the failure.

2 Q. So what did you determine was the cause of the
3 failure that took out five towers on the Caribou-Palermo
4 in December of 2012?

5 A. So, as I alluded earlier on, towers of
6 different types, the suspension towers take only the dead
7 weight of the conductor, but the angle tower, in addition
8 to having to take the dead weight of the conductor, they
9 also have to take the tension from the conductor. And
10 the loading is a lot more severe in those cases.

11 So I think, based on the failure that I
12 observed on the ground, that there was a, probably some
13 unusually high loading that pulled a tower leg out. As
14 you recall, the anchor to rock, the soil anchor that was
15 depicted in one of the sketches, they're nothing but a
16 steel angle with some grillage in the bottom. And --
17 but, you know, it's been -- it had been performing
18 satisfactorily for the last 80, 90 years. But reportedly
19 during the wind storm, snow storm, there was ice
20 accumulated on the conductor. And if you ever hold a
21 rubber band with your finger, you put something in
22 between, like somebody pull on that, the rubber band, you
23 will feel it tug, additional tug from the rubber band.
24 This was exactly what happened. There is probably snow
25 on the wire that's creating additional tension that
26 pulled that angle tower.

1 Also, that is designed value. So the
2 foundation had been pulled out of the ground and
3 resulting in overall toppling of that, the tower. When
4 the tower hit the boulder around that area, likely the
5 conductor also hit the rock. When these aluminum
6 conductor hit the rock, it -- they're aluminum built,
7 built to be soft, so it could have severed. Then, when
8 you have a regular transmission line going to, straight
9 across, everything's well balanced, but if you cut the
10 wire between two of these towers, they have very high
11 unbalanced load going into opposite directions.

12 So that is what causing the additional, or
13 cascade failure which essentially is like a domino going
14 in the two different directions. So there was three
15 towers down in one direction, and one tower down in the
16 other direction in addition to the tower that failed.

17 Q. Other than this email to Eric Back, Exhibit No.
18 1263, is there any root cause analysis of that tower
19 failure?

20 A. To my knowledge, that's the only one.

21 Q. Why was there no root cause analysis in a
22 report done of this tower failure?

23 A. I'm not, I'm not sure.

24 Q. Like, for instance, are you familiar with the
25 tower failure at Moss Landing in 2015?

26 A. Yes.

1 Q. And were you involved in that?

2 A. I was down there, yes.

3 Q. How many hundreds of pages were devoted to the
4 root cause of that tower failure?

5 A. What initially the failure a little different,
6 because what happened -- well, this line is serving only,
7 you know, Caribou Powerhouse and some, you know, small
8 generators, I believe. But in that Moss Landing failure
9 that you allude to, it caused a whole Monterey peninsula
10 to go into an outage. Literally we lost about, I think,
11 I think over a hundred thousand people. So that was a
12 much more impactful event, if you would.

13 Q. So, in other words, how much time and energy
14 you put into a root cause analysis depends upon how
15 important the line is?

16 A. Well, the thing is depends on the impact of
17 outage.

18 Q. Right.

19 A. And I think that's the point.

20 Q. The impact of the outage goes to reliability;
21 correct?

22 A. Yes.

23 Q. And reliability is what the regulators look at
24 to address the company; correct?

25 A. It's one of the parameters.

26 Q. So Caribou-Palermo line falls down, nobody

1 really cares because nobody's really out of power?

2 A. Well, I wouldn't say nobody cares, but, you
3 know, it's just the, there's a local maintenance
4 organization handling the failure. It's not like, you
5 know, there was a larger area, more than a hundred
6 thousand customers, affected. You know, that's a much
7 bigger event than Caribou-Palermo, in that sense.

8 Q. Right. But, in the other sense,
9 Caribou-Palermo was five towers falling down --

10 A. Yes.

11 Q. -- and Moss Landing was one tower breaking
12 because of human error; correct?

13 A. Well, human error and also I think the quality
14 of steel may be in question as well.

15 Q. Okay. Are towers supposed to collapse under
16 load?

17 A. I hope not.

18

19 (Grand Jury Exhibit 1264 introduced.)

20

21 Q. So -- all right. 1264. Do you recognize the
22 photograph marked as 1264?

23 A. Yes.

24 Q. What is 1264?

25 A. That's one of the pictures I took on the failed
26 tower stub.

1 Q. And you can always get up and move around and
2 use the board.

3 A. Okay.

4 Q. Can you explain to us what we're looking at
5 here.

6 A. This, I believe, is one of the stub
7 compression. So the two tower, tower legs -- the tower
8 failed in the transverse direction. The two tower legs
9 in tension and two tower legs in compression. This is
10 one of the compression legs that will kind of just, when
11 the tower toppled over, rotated about that, that point,
12 and just snap off like that.

13 Q. All right. So the tower feet that were in
14 compression, would those be the downhill side of the
15 tower?

16 A. That would be the legs that are closest to the
17 edge of the cliff.

18 Q. Okay. So, so what we're looking at here is the
19 tower is standing like this, straight up and down, and
20 now it's fallen over here --

21 A. Yes.

22 Q. -- correct?

23

24 (Grand Jury Exhibit 1265 introduced.)

25

26 Q. All right. 1265. What are we looking at?

1 A. There's also -- this is the, may have been the
2 same leg, just panned out a little bit, or the other
3 compression leg. So just rotated about this point as
4 opposed to laying on that thing. You have some pictures
5 that show the tension leg drastically different in terms
6 of the failure mode.

7
8 (Grand Jury Exhibit 1266 introduced.)
9

10 Q. There's 1266.

11 A. That's one of the two tension legs. As you can
12 see, this was the, this was the ground line. The stubs
13 were buried right around here. Because, as evident from
14 the subsequent paint they put on the tower leg. So this
15 stub had been pulled out of the ground. And --

16 Q. Now you can write on it.

17 A. -- in addition to that, the connection between
18 the tower leg and the stub also got sheared off. And
19 that tells me is significant overload on that design at
20 that point of that connection.

21 Q. All right. Go back so we have a good record,
22 because she's taking down everything we're talking about,
23 to make sure.

24 A. Okay.

25 Q. So we're looking at the three metal angle irons
26 that are sticking up out of the ground; correct?

1 A. That's correct.

2 Q. And when you were talking about the, where the
3 ground line is, that, that would be where the green paint
4 ends and the bare metal. So putting red lines across
5 there all the way.

6 A. That is correct.

7 Q. So that should have been ground level?

8 A. That's right.

9 Q. So all of the silver stuff should be buried
10 underneath the ground?

11 A. Right.

12 Q. Everything above, in the green, should be above
13 ground?

14 A. Correct.

15 Q. And what's going on up here at the top where
16 the -- is this the -- looks to me like it's folded over
17 or --

18 A. Yeah. This is the tower stub at the top.
19 Well, the tower leg at the top. This used to be
20 connecting to these three, these three tower stubs, which
21 forms like a tripod in the ground.

22 Q. All right. So we've got to put our red lines
23 back up here.

24 And so are these metal pieces broken off or
25 just pulled off? Supposed to be nuts and bolts there?

26 A. They had connection. These are the bolts that

1 used to be connectors. You can see the outline of that
2 top part of the stub. These would be bolt holes where
3 the tower legs are connected to.

4 Q. Okay.

5 A. Sheared off.

6 Q. Sheared off or came undone?

7 A. Sheared off.

8 Q. So actually cut, metal on metal, just --

9 A. Almost like have a knife, just cut through that
10 bolt, shear.

11

12 (Grand Jury Exhibit 1267 introduced.)

13

14 Q. All right. Okay. Let's move on to 1267.

15 All right. Now we can move on to 1267. Will
16 you tell me what we're looking at in 1267.

17 A. This is, this is a picture of the other tension
18 leg. So in a way they're similar. See portions of that
19 stub pulled out of the ground, and also the connection to
20 the leg also severed.

21 Q. I know I asked you this before, but that's not
22 supposed to happen; right?

23 A. No, that's not supposed to happen.

24

25 (Grand Jury Exhibit 1268 introduced.)

26

1 Q. Next up, 1268. If you can tell us what 1268
2 is.

3 A. This is the email from Mr. (WITNESS #5). I
4 think this is (WITNESS #5's) response to my email. It
5 was copied on that email I sent to (EMPLOYEE #3)
6 regarding speculated root cause of the failure.

7 Q. Okay.

8 A. So apparently he's in agreement.

9 Q. All right. So rock slides had nothing to do
10 with the towers collapsing; right?

11 A. I wouldn't completely rule that out, but I did
12 not see any large boulder big enough that would cause
13 that kind of failure when I was at the site.

14 Q. Did you see any damage to the towers themselves
15 that would have been caused by the collision with rocks?

16 A. I don't know. You know, my -- I would stick to
17 my, the root cause I came up with.

18 Q. Right. Any idea why the people of the Table
19 Mountain center would think that this was caused by a
20 rock slide?

21 A. Well, along Highway 70 we have a lot of rock
22 slides all the time. Actually, Cal Trans have to come
23 over, come through that Highway 70 every morning to do a
24 sweep on rock that had fallen the night before. So it's
25 not uncommon that you would say, "Well, there's rock
26 slides maybe." And we do have towers here and there that

1 got hit by rock so we replace and repair.

2 Q. All right. At the end of your email of January
3 4th, you say, "Due to this failure phenomenon, it would
4 be advisable to inspect towers with similar line angle on
5 this line to ensure no other foundations had experienced
6 similar uplift during same wind storm"?

7 A. Yes.

8 Q. What does that mean?

9 A. That means I'm advising the folks in that
10 email, in particular (EMPLOYEE #3), to follow up on this
11 particular failure to see if elsewhere in the, along that
12 same line, especially with the angle tower that actually
13 have the big V's, on the severe loading, whether or not
14 they observed similar pull-up of that stub. Because if
15 maybe, you know, the stubs are in the process of being
16 pulled out and may escalate into a similar failure in the
17 future.

18 Q. To your knowledge, were any such inspections
19 ever done?

20 A. I'm not aware it was done.

21

22 (Grand Jury Exhibit 1269 introduced.)

23

24 Q. All right. And then 1269. You should have
25 that right there in front of you.

26 A. Okay.

1 Q. Okay. What is 1269?

2 A. So this is May 13, so I think we -- it was
3 decided that the five failed tower would be replaced by
4 tubular H frame, meaning these are going to be -- instead
5 of lattice tower, they will be tubeless steel pole with
6 horizontal arms on them. So a little different tower
7 type. And we had to go through quite a bit of iteration
8 because in the beginning National Forest wouldn't let us
9 go back with the lattice tower because they said this is
10 historic in nature. We had to go back in kind, replace
11 these towers with lattice tower. So it went through
12 quite a bit of iteration. I think it was finally decided
13 that we were going with a much better structure, the
14 tubular H frame.

15 Q. Am I hearing you right that the National Forest
16 Service didn't want you to replace the Caribou-Palermo
17 towers with new, modern towers because the towers were
18 historical?

19 A. Well, this was the original opinion, at least
20 from our land people. The land people, they coordinate
21 with different agencies to go through environmental
22 permits and stuff to, so that, you know, whatever is
23 proposed will be accepted by an agent, various agencies.
24 This is what I heard in the beginning, where we want to
25 go back to the lattice tower, kind of replace them in
26 kind. It was not perceived positively.

1 Q. All right. Why did it take so long to replace
2 these towers?

3 A. I'm not sure. I cannot pinpoint a cause,
4 but --

5
6 (Grand Jury 837 introduced.)
7

8 Q. All right. 837. It's hard to read up there.
9 I forgot to pull that. We're dealing with, some of this
10 stuff, copies of copies of copies of copies.

11 A. I can see it from this copy. This is the one,
12 right?

13 Q. No.

14 A. Nope? I don't have that copy.

15 Q. Madam Clerk has it for you.

16 A. Thank you.

17 Q. You remember the email, Exhibit 837?

18 A. I think you were the one who brought to my
19 attention when we first met.

20 Q. So we're talking about the Jefferson Hillsdale
21 line here; correct?

22 A. Yes.

23 Q. Specifically wear around hanger holes?

24 A. Jefferson Hillsdale is an opinion. I believe
25 Jefferson substation is somewhere south of San Francisco.
26 Hillsdale was where the Hillsdale mall is, around San

1 Mateo bridge.

2 Q. So this email, Michael Baday (phonetic) is
3 saying, we found some worn hanger plates and sent some
4 pictures of them; correct?

5 A. Yes.

6 Q. And wants to know what to do?

7 A. Yes.

8 Q. And what, what's he advised?

9 A. I think the advice is to change it in kind.

10 Q. So why isn't a bigger deal being made of these
11 worn hanger holes?

12 A. 2011, that was -- my experience, that's the
13 first incident of these C-hook hanger plate wore out
14 issue that I encountered myself.

15 Q. That you encountered yourself?

16 A. Yes.

17 Q. All right. Were you aware that in 1987 the
18 hooks were taken off at hanger holes; key holing and the
19 wear on the hooks?

20 A. No, I wasn't aware of that. I was dealing with
21 nuclear energy service at the time.

22 Q. So if this is the first time that you're
23 hearing about this issue, why isn't this a lot bigger
24 issue being made of it?

25 A. Well, it was brought to my supervisors's
26 attention. So at the time, this was 2011, I just joined

1 the Transmission Line group. So --

2 Q. Is this type of wear normal?

3 A. I would imagine in the high wind area that, you
4 know, this insulator move up back and forth a lot. I
5 would imagine that would be -- you know, that kind of
6 wear would be usual, usual occurrence.

7 Q. Are you familiar with the concept of
8 body-on-body wear?

9 A. Yes.

10 Q. And note that anytime you have two bodies
11 rubbing, they're going to wear; correct?

12 A. Yes. Yes.

13 Q. And that is a known phenomenon in engineering?

14 A. That is actually a known, known issue with
15 Transmission Line, because we have seen, now seen some of
16 the utilities that created a sleeve in that, in that
17 hanger plate to address that wear issue. What it is is a
18 doughnut they put into that hole and so the C-hook will
19 have less chance of wearing out that hanger hole.

20 Q. So who is doing that?

21 A. Well, I've seen pictures of it. After the Camp
22 Fire --

23 Q. Okay.

24 A. -- they started looking at, you know, what are
25 the possible mitigation for a C-hook versus hanger plate
26 failure. And they came across this other utilities they

1 have these doughnut they put in there.

2 Q. So the ultimate question is, as an engineer in
3 the Transmission Line Division, is why is nobody looking
4 for that wear prior to the Camp Fire?

5 A. That I don't know.

6 Q. You expect when you have two pieces of metal
7 rubbing up against each other that there's going to be
8 wear; correct?

9 A. Yes.

10 Q. As somebody said earlier, that's why we put oil
11 in our cars; right?

12 A. Yes.

13 Q. So why is nobody looking for that kind of wear?

14 A. I don't have an answer to that. Sorry.

15 Q. As an engineer, as someone who is trained, how
16 -- you know -- how do you allow this to happen? That --
17 not you. I mean "you" in a global sense.

18 A. Right. So you realize that the engineering, we
19 evaluate the, technically how things work and how we
20 should, you know, mitigate certain things, but the
21 ultimate decision does not rest on us. A lot of
22 recommendations are put forth, you know. That's really
23 the end of our responsibility.

24 Q. Who makes the ultimate decisions?

25 A. I would say the first organization would be
26 Asset Strategy, because these are really the asset, but,

1 you know, ultimately I think somebody higher up maybe
2 need to make it, need to make that kind of decision.

3 Q. What part, to you, in your experience, does
4 reliability or the importance of a line play in that
5 decision?

6 A. That's part of the design. We want to make
7 sure that whatever we put forth will be safe; will, you
8 know, will last a long time; and easy to maintain those,
9 are kind of the parameters that we put forth in our
10 design.

11 MR. NOEL: Anything else?

12 MS. DUPRE-TOKOS: You have one more exhibit.

13

14 (Grand Jury Exhibit 1270 introduced.)

15

16 MR. NOEL: I do have one more exhibit, 1270. I
17 thought I was done.

18 Q. (By MR. NOEL) All right. Do you have Exhibit
19 No. 1270 there in front of you?

20 A. Yes.

21 Q. Can you tell me what 1270 is?

22 A. It is an email I sent to Mukul, who is the
23 supervisor for Asset Strategy Group. We found out that
24 there was a tower, upper part of the tower, is distorted.
25 There was some member bank we needed to replace that top
26 part of the tower. But it's been kind of a longstanding

1 accounting procedure that we have to replace entire tower
2 before it becomes, we can capitalize that job.

3 Q. Right.

4 A. So this is only a partial replacement, so
5 that's why I ask Mukul to see if we can capitalize that
6 particular replacement job.

7 Q. All right. So this, is this happening in
8 October of 2018 --

9 A. Yes.

10 Q. -- correct?

11 A. Yes.

12 Q. And this replacement is what would generally be
13 an Expense job; right?

14 A. Yes. Part of the structure, yes.

15 Q. And was there Expense money available to do
16 this necessary repair?

17 A. Well, typically Expense dollars is a little
18 harder to come by.

19 Q. Yeah.

20 A. Yeah. So that's why I asked his opinion on
21 that.

22 Q. "So I understand Asset Strategy has been
23 working on a new way to define unit of Capital to make it
24 easier to capitalize a partial replacement on tower
25 sections."

26 Am I reading that correctly?

1 A. That is correct.

2 Q. So basically from where are you hearing this?

3 A. From where on this capitalization of a
4 certain --

5 Q. Yes. This information that you understand at
6 Asset Strategy. Where are you getting that information?

7 A. I can't pinpoint where, but, you know, it's
8 been kind of a, I wouldn't say common knowledge, but
9 every time we replace part of a structure, it would be
10 Expense.

11 Q. Okay. And that's what I'm trying to get at, is
12 you're talking to Mukul and saying, "Hey, I understand
13 you're working on, on a policy to change the definition
14 of Capital so we can charge these partial replacements to
15 Capital instead of Expense"?

16 A. Yes.

17 Q. But my question is, where are you getting the
18 information that makes you think that, that this policy
19 is underway or under consideration?

20 A. It's kind of a known fact, you know, in our
21 department, so I can't pinpoint exactly where or who I
22 heard it from.

23 Q. Okay. So basically what you're hearing is
24 "we're going to take these Expense projects and turn them
25 into Capital projects"?

26 A. That's the intent of it.

1 MR. NOEL: Anything else?

2 The jurors get the opportunity to ask
3 questions. They write them down and submit them to us.
4 It looks like they have a few questions. We'll review
5 them, finish up in a second.

6 (Counsel and Grand Jury Foreperson confer.)

7 Q. (By MR. NOEL) In your opinion, should the
8 failure of five towers on the Caribou-Palermo line in
9 2012 have raised issues of deteriorating infrastructure
10 along the entire Caribou-Palermo line?

11 A. That was a very unusual failure, you know, in
12 terms of loading. So I think the focus was on why there
13 was such a gross overloading of the tower instead of the
14 conditions of these, you know, older asset. So that
15 wasn't, there wasn't a primary focus of the restoration
16 as far as -- and also the team was looking for more of a
17 root cause to see if we can mitigate future failure of
18 that same region.

19 Q. Speaking of that, you knew this was a very old
20 line; correct?

21 A. Yes.

22 Q. While you were looking at these -- well, let me
23 back up a bit.

24 Have you ever heard of the Deteriorating
25 Transmission Assets Replacement Project, or Program?

26 A. Yes.

1 Q. And what was that?

2 A. Well, we currently have a little more
3 comprehensive program for Tower Replacement Program.
4 Essentially, we are looking at the whole system to see
5 which line warrants replacement. We try to prioritize
6 these older lines to start replacing them over time. So
7 we know that these are older assets, we try to catch up
8 with that, that degradation curve, if you would, try to
9 replace this line before, before the failure.

10 Q. Is priority based upon density, population
11 density, in the area?

12 A. That's one of the attributes, I believe. The
13 other attributes would be age, exposure, and also the,
14 you know, I think the capacity of these towers, if we
15 know where weaker towers are.

16 Q. Well, were you aware that in 2007 the
17 Caribou-Palermo line, a portion of it, was nominated for
18 replacement under the Deteriorated Asset, Transmission
19 Asset Replacement Program?

20 A. 2007?

21 Q. Yes.

22 A. Was it that walk down we had with Chuck
23 Stinnett that we went up to this relatively inaccessible
24 tower segment?

25 Q. That very well could be.

26 A. That was the concern that maintenance could not

1 get to it.

2 Q. Right.

3 A. So we don't really know the conditions of that
4 unless we use helicopter to fly people in.

5 Q. Right.

6 A. So that was the concern. We haven't looked at
7 these towers for a long time, so let's look at it to see
8 if it warrants replacement.

9 Q. Were you aware in 2009 that the project manager
10 on that, (WITNESS #15), predicted that towers would fall
11 off into the canyon?

12 A. I'm not aware of that.

13 Q. At the time of this failure, did you consider
14 that the 80- and 90-year-old age of this line make any
15 significant -- made any significant contribution to the
16 failure?

17 A. To -- in this particular failure --

18 Q. Right.

19 A. -- back in two thousand -- again, you know,
20 based on what I observed at the site of that tower that
21 toppled over, age may not play into, in the root cause,
22 because, as you can see from some of the pictures, the
23 section that pulled out of the ground, it still has the
24 original galvanizing. So that tells me -- most of the
25 concern of these direct buried grillage towers are the
26 conditions of the various steel. For instance, this

1 post. You bury a piece of steel in the ground,
2 invariably they will get corroded. But the section that
3 got pulled out, they seemed to be in very good condition.
4 So --

5 Q. So it seemed that at least the base of these
6 towers there was in pretty good condition; right?

7 A. Actually, that's an area of most concern,
8 because, you know, without taking it out, you really do
9 not know what conditions they were in.

10 Q. I was going to show you another picture, but
11 doesn't look like I can find it.

12 A. Actually, a lot of these direct buried grillage
13 tower lines, there are a couple of priorities. That's
14 just an area of our main concern.

15 Q. Now, right?

16 A. Yeah.

17 Q. Post-Camp Fire?

18 A. Well, it's been a longstanding concern, because
19 we can't see it, how do you know the condition? If we
20 have concrete cap in the ground, and then I think our
21 concern level will ease a bit.

22 Q. Concern by engineers like yourself?

23 A. Yes.

24 Q. Then why was nothing ever done about it?

25 A. That's why this program, to address those
26 concerns. And, you know, above ground you can see the

1 tower condition. You can assess it. What's in the
2 ground, buried deep, we really cannot tell. So that's
3 why we don't know, you have to, you know, voice your
4 concern.

5 Q. Given this failure and subsequent failures on
6 the Caribou-Palermo line, do you think you might have
7 recommended in 2012 that this line be retired or rebuilt?

8 A. Based on the age, based on the foundation
9 condition, meaning the direct buried steel, it would be
10 ranked high in that prioritization mark.

11 Q. Now, prior to the Camp Fire, did you or are you
12 aware of anybody else recommending the replacement or
13 retirement of the Caribou-Palermo line?

14 A. Yes. We had some ongoing NERC mitigation
15 project. You know, this NERC program is essentially to
16 address a lot of the low wire condition where these
17 conductor sag low, violating some kind of ground
18 clearance condition. This, this NERC project to try to
19 address that, those low lines. So as a part of the NERC
20 mitigation project, I believe, you know, that we did
21 propose the replacement of this area.

22 Q. Replacement of the entire line?

23 A. Most of it, yes.

24 Q. You were involved in the 2013 NERC project?

25 A. I was involved in the NERC project, yes.

26 Q. As part of that project, did anybody ever come

1 out and inspect these towers?

2 A. I'm not aware of that.

3 MR. NOEL: Anything further?

4 Mr. Ho, thank you. Madam Foreperson will have
5 an admonition for you before you can go.

6 GRAND JURY FOREPERSON: Mr. Ho, you are
7 admonished not to discuss or disclose at any time outside
8 of this jury room the questions that have been asked of
9 you or your answers until authorized by this Grand Jury
10 or the court. A violation of these instructions on your
11 part may be the basis for a charge against you of
12 contempt of court. This does not preclude you from
13 discussing your legal rights with your own attorney.

14 Mr. Ho, what I have just said is a warning not
15 to discuss this case with anyone except the Court, your
16 lawyer, or the district attorney. Do you have any
17 questions?

18 THE WITNESS: I understand.

19 GRAND JURY FOREPERSON: Thank you for your
20 time.

21 THE WITNESS: Thank you.

22 MR. NOEL: You are done. You can head back.
23 Thank you, Henry. It was a pleasure.

24 THE WITNESS: Thank you.

25 [DISCUSSION OMITTED.]

26 --oOo--

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 203

are certified to be a complete transcription of said stenographic shorthand notes.

DATED: THIS 6TH day of JUNE 2022

OROVILLE, BUTTE COUNTY, CALIFORNIA

FEBRUARY 4, 2020; 8:30 a.m.

(Confidential Special Grand Jury Hearing Proceedings)

[Confidential grand jury called into session at 8:39 a.m.
in Courtroom 9.]

[Grand jury role call omitted.]

GRAND JURY FOREPERSON: Okay. We can proceed.

[Discussions omitted.]

MS. DUPRE-TOKOS: Okay.

MR. NOEL: Get going.

MS. DUPRE-TOKOS: Jennifer Celentano.

[Witness enters the courtroom.]

GRAND JURY FOREPERSON: Raise your right hand to be
sworn.

Investigator Celentano, do you solemnly swear
that the evidence you shall give in this matter pending
before the grand jury shall be the truth, the whole truth
and nothing but the truth so help you God?

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a seat,

1 please.

2

3

EXAMINATION

4 BY MS. DUPRE-TOKOS:

5 Q. Good morning.

6 A. Morning.

7 Q. I know you've done this twice already, please
8 state your full name and spell your last name for us.

9 A. Sure. Jennifer Celentano. Last is spelled
10 C-E-L-E-N-T-A-N-O.

11 Q. Now, you testified previously about the death
12 certificates, and there were two that we knew had
13 incorrect case numbers. Do you recall that?

14 A. Yes.

15 Q. So in front of you -- oh, Marc.

16 In front of you, you should have Exhibit 881A?

17 A. Yes.

18 Q. Okay. Can you tell us what that is?

19 A. It's the death certificate for Ernest Foss.

20 Q. Okay. And are you looking at 881 or 881A?

21 A. Oh, sorry. Also -- the 881A is the death
22 certificate for Ernest Foss.

23 [Exhibit No. 881A was identified.]

24 BY MS. DUPRE-TOKOS:

25 Q. Okay. And does that death certificate -- what's
26 the case number listed on 881A?

1 A. 18-19487.

2 Q. And what is the case number listed on 881?

3 A. 18-19487.

4 Q. Okay. Is there an amendment to 881A?

5 A. Yes.

6 Q. How many?

7 A. Two.

8 Q. And what does the second amendment correct?

9 A. The second amendment corrects line 108A, the case
10 number.

11 Q. Okay. And what does it correct the case number
12 to?

13 A. The corrected case number is 18-19524.

14 Q. And to your knowledge is that actually the
15 correct case number for Mr. Ernest Foss?

16 A. Yes.

17 Q. Okay. And then if you could flip to 924 in the
18 binder, and then you should also have 924A in front of
19 you.

20 A. Okay.

21 Q. And can you tell us what Exhibit 924 is?

22 A. 924 is the death certificate for Don Shores.

23 Q. What is case number listed on 924?

24 A. 18-19704.

25 Q. And then looking at 924A, is there a case number
26 listed on the -- the front page of 924A?

1 A. Yes. It's 18-19704.

2 [Exhibit No. 924A was identified.]

3 BY MS. DUPRE-TOKOS:

4 Q. Is there an amendment attached to 924A?

5 A. Yes.

6 Q. How many?

7 A. Just one.

8 Q. And what does that amendment correct?

9 A. It corrects the case number on line 108A.

10 Q. And what does it correct the case number to?

11 A. The corrected case number is 18-19705.

12 Q. And to your knowledge is 19705 the correct case
13 number for Mr. Donald Shores?

14 A. Yes.

15 MS. DUPRE-TOKOS: Okay. Nothing further.

16 Anyone have any questions? That's it. Thank you
17 very much. Oh, you need to be -- need the admonishment.

18 GRAND JURY FOREPERSON: Okay. Investigator
19 Celentano, you are admonished not to discuss or disclose
20 at any time outside of this jury room the questions that
21 have been asked of you or your answers until authorized by
22 this grand jury or the Court.

23 A violation of these instructions on your part
24 may be the basis for a charge against you of contempt of
25 court. This does not preclude you from discussing your
26 legal rights with your own attorney.

1 Investigator Celentano, what I have just said is
2 a warning not to discuss this case with anyone except the
3 Court, your lawyer, or the district attorney.

4 Do you have any questions?

5 THE WITNESS: No.

6 THE COURT: Okay. Thank you for your time today.

7 THE WITNESS: Thank you.

8 MR. NOEL: Before you close that whole thing up, get
9 those processed and get them put into evidence.

10 MS. DUPRE-TOKOS: Oh.

11 MR. NOEL: 881 and 924.

12 MS. DUPRE-TOKOS: Could you have said something
13 before I put them in.

14 MR. NOEL: I didn't know what you were doing until...

15 MS. DUPRE-TOKOS: Okay.

16 MR. NOEL: We will move 881A and 924A into evidence.
17 Get that done so you can put those away.

18 [Exhibit No. 881A was admitted.]

19 [Exhibit No. 924A was admitted.]

20 GRAND JURY FOREPERSON: Okay. Ready.

21 [Witness enters the courtroom.]

22 THE WITNESS: Good morning.

23 GRAND JURY FOREPERSON: Good morning. Please, raise
24 your right hand to be sworn.

25 Investigator Dodd, do you solemnly swear that the
26 evidence you shall give in this matter pending before the

1 grand jury shall be the truth, the whole truth and nothing
2 but the truth so help you God?

3 THE WITNESS: I do.

4 GRAND JURY FOREPERSON: Thank you. Have a seat,
5 please.

6 **EXAMINATION**

7 BY MS. DUPRE-TOKOS:

8 Q. Good morning.

9 A. Good morning.

10 Q. You probably want to turn that around.

11 A. Okay.

12 Q. Could you please state your full name and spell
13 your last name for the record.

14 A. My name is Jason Dodd, D-O-D-D.

15 Q. Where are you employed and in what capacity?

16 A. I am employed with the Butte County District
17 Attorney's Office as an investigator.

18 Q. And how long have you been a sworn law
19 enforcement officer?

20 A. For 18 years.

21 Q. And how long have you been with the DA's office?

22 A. For four years.

23 Q. Where did you work prior to the DA's office?

24 A. The Butte County Sheriff's Office.

25 Q. How long did you work for the Sheriff's office?

26 A. For almost 20 years.

1 Q. Did you spend that whole 20 years as a sworn
2 officer?

3 A. No. Five of the years, I was a correctional
4 officer in the jail.

5 Q. Okay. Do you have any other law enforcement
6 experience other than the Sheriff's Department and DA's
7 office?

8 A. No.

9 Q. Now, were you assigned to assist with the Camp
10 fire in November of 2018?

11 A. I was.

12 Q. Were you assigned to help find victims of the
13 fire?

14 A. Yes.

15 Q. Were you assigned to do that on
16 November 11, 2018?

17 A. Yes, I was.

18 Q. And did you go to a residence at 13471 Green
19 Forest Lane in Concow on that date?

20 A. I did.

21 Q. Was that residence destroyed?

22 A. Yes.

23 Q. Were human remains located at that property?

24 A. Yes, they were.

25 Q. Was a case number assigned to those remains?

26 A. Yes.

1 Q. Was that case number 18-19586?

2 A. Yes.

3 Q. Now, looking at Exhibit 1271, which is on the
4 board and also right in front of you, did you, at some
5 point, learn that the male in that photograph is a
6 photograph of T.K. Huff?

7 A. Yes.

8 [Exhibit No. 1271 was identified.]

9 BY MS. DUPRE-TOKOS:

10 Q. And did you also, at some point, learn that the
11 remains associated with case number 18-19586 were those of
12 Mr. T.K. Huff?

13 A. Yes.

14 Q. Were Mr. Huff's remains located inside or outside
15 of the residence?

16 A. Outside.

17 Q. And could you describe generally where on the
18 property they were located?

19 A. It was on the backside of the property, near the
20 fence line. Yeah. So it would be the southeast side of
21 the property.

22 Q. Okay. And then just one last question: Was the
23 remains that you located, was it a full body or was it
24 ashes?

25 A. Full body.

26 Q. Thank you.

1 MS. DUPRE-TOKOS: I have nothing further.

2 Does anyone have any questions? No?

3 Okay. You just need an admonition from madam
4 foreperson and we're done.

5 THE WITNESS: Okay.

6 GRAND JURY FOREPERSON: Investigator Dodd, you are
7 admonished not to discuss or disclose at any time outside
8 of this room the questions that have been asked of you or
9 your answers until authorized by this grand jury or the
10 Court.

11 A violation of these instructions on your part
12 may be the basis for a charge against you of contempt of
13 court. This does not preclude you from discussing your
14 legal rights with your own attorney.

15 Investigator Dodd, what I have just said is a
16 warning not to discuss this case with anyone except the
17 Court, your lawyer, or the district attorney.

18 Do you have any questions?

19 THE WITNESS: No.

20 GRAND JURY FOREPERSON: Thank you for your time
21 today.

22 THE WITNESS: Thank you.

23 MS. DUPRE-TOKOS: And, Madam Foreperson, at this
24 time, we would move to have Exhibit 1271 admitted into
25 evidence.

26 [Exhibit No. 1271 was admitted.]

1 MS. DUPRE-TOKOS: So this was shorter than we had
2 planned today. We did have one other witness who had to
3 reschedule to Friday. He will do just about the last of
4 the finder evidence, which I suspect will make all of you
5 very happy. It will only leave two -- once he's done
6 testifying, that will take care of 81 of the victims
7 leaving just two more to do.

8 So I just wanted to let you folks know that. So
9 the end of the finder evidence is in sight.

10 MR. NOEL: Yep.

11

12 [Discussions omitted.]

2 FEBRUARY 7, 2020; 8:45 a.m.

3 (Confidential Special Grand Jury Hearing Proceedings)

4
5 [PROCEEDING OMITTED.]

6
7 [ROLL CALL OMITTED.]

8
9 [DISCUSSION OMITTED.]

10
11 MR. NOEL: All right. (WITNESS #5), please.

12 [Witness enters the courtroom.]

13 GRAND JURY FOREPERSON: (WITNESS #5), before you
14 have a seat, please raise your right hand to be sworn.

15 (WITNESS #5), do you solemnly swear that the
16 evidence you shall give in this matter pending before the
17 grand jury shall be the truth, the whole truth, and
18 nothing but the truth so help you God?

19 THE WITNESS: I do.

20 GRAND JURY FOREPERSON: Thank you. Have a seat,
21 please.

22 **EXAMINATION**

23 BY MR. NOEL:

24 Q. (WITNESS #5), for the record can you please
25 state your full name spelling your last name.

26 A. (WITNESS #5), [Redacted spelling].

1 Q. (WITNESS #5), are you currently employed?

2 A. No. I'm retired.

3 Q. Retired from what?

4 A. PG&E.

5 Q. What did you do for PG&E?

6 A. I primarily worked in the tower department
7 starting off from --

8 Q. First of all, what was your position when you
9 retired?

10 A. M&C engineer, senior M&C engineer.

11 Q. What does the M&C stand for?

12 A. Maintenance and construction.

13 Q. Okay. So are you a trained engineer?

14 A. Trained?

15 Q. Right. Do you have an engineering degree?

16 A. No, I do not.

17 Q. How long did you work for PG&E?

18 A. Slightly under 34 years.

19 Q. Do you remember when you started?

20 A. The second time I was rehired was in '83.

21 Q. Okay. What do you mean the second time you were
22 rehired?

23 A. I hired on shortly out of school and worked a
24 little over five months and got laid off in the gas
25 department. At the time I got laid off they laid off up
26 to 15-year seniority.

1 Q. Okay. Why don't you walk us through your PG&E
2 career.

3 A. So on the gas side it was just a welder's helper
4 following him around, grinding his welds. Just kind of a
5 gofer to help a welder out. So that's all I did on the
6 gas side.

7 On the electric transmission side I was hired on
8 for a project out of the Santa Rosa area. It was called
9 the Castle Rock Lakeville Line. It was a whole brand new
10 transmission line that was being installed.

11 I started out in the steel yard bundling the
12 appropriate individual tower members to make complete
13 units of towers and load them on a truck to be taken out
14 to a remote location where these towers were being built.

15 I later became a truck driver. So I was
16 delivering the steel. I never was a tower man, but I
17 would temp at the rate and I would build towers. I
18 operated crane, CAT.

19 They saw that I was proficient in reading
20 blueprints so they moved me into -- they called me an
21 inspector. You didn't really inspect things, but that's
22 just the title they gave you. And it was more of putting
23 job packages together for the crews with the right
24 blueprints and things, doing some job estimating. I
25 moved up as an inspector from inspector B, C, and D.

26 I was a tower construction supervisor for a

1 while out of Davis. I oversaw their fabrication shop
2 where we would start off with 40-foot lengths of link
3 galvanized steel, cut them to the right length, punch the
4 holes where they go to be either complete or individual
5 tower components.

6 I moved into a M&C engineer position. That's --
7 basically I left the tower department and went to work
8 for another group, but it was still tied to tower. It
9 just also added some components to the structure itself.
10 Dealt with providing jobs for replacing insulators and
11 small reconductoring jobs.

12 Q. So what exactly does an M&C engineer do?

13 A. There's no defined job scope. It's kind of
14 whatever. It's -- it's estimating jobs, project managing
15 small-dollar, fast-paced work, projecting what months
16 work is going to be done, forecasting work hours, field
17 work hours under those appropriate months, coordination
18 with the work force to make sure the job is scheduled and
19 going to be done, track dollars spent on said jobs.

20 You're kind of a liaison between the field crews
21 and both civil and electrical engineers.

22 Q. Okay. What kind of training did you get to
23 qualify you for this job?

24 A. I don't think I could honestly say that I had
25 any formal training related to the work. It was just
26 more of my -- what they saw in me, my capabilities past

1 work through the whole implement of tower construction.

2 There might have been some short classes along
3 the way that were just high-level oversights of different
4 things. But when you become a M&C engineer, it's usually
5 somebody that you're replacing that is teaching you how
6 to go forward and then it's you take on your own whatever
7 you're capable of doing.

8 Q. When did you become an M&C engineer?

9 A. My best guess would be 2005.

10 Q. Now, did you have a specific geographic area
11 that you were assigned as the M&C engineer?

12 A. Not in 2005. There was only me, and I did the
13 entire PG&E system.

14 Q. Eventually, did you -- well, let me back up.
15 Did you have an office where you worked out of?

16 A. When I first became an M&C engineer, I was in an
17 office in Sacramento.

18 Q. Eventually did you obtain a region or geographic
19 area?

20 A. Yeah. I initially took the north area.

21 Q. Okay. And what's the north area encompass?

22 A. So it's the T-line headquarters for Sacramento,
23 Table Mountain, Eureka, Lakeville, and then it would off
24 and on be between the East Bay and the bay.

25 Q. Did you have an office that you worked out of at
26 that point?

1 A. Well, eventually I moved to the Oroville office
2 to the customer payment center.

3 Q. Okay. And that was your base of operations as
4 the M&C engineer?

5 A. It was negotiated. It was "If you want me to
6 continue with this work assignment, I need an office
7 closer to home instead of reporting to Sacramento every
8 day."

9 Q. Okay. So you wanted to be in Oroville?

10 A. Yeah. I wanted to be at home.

11 Q. Were you at the PG&E office in Oroville or were
12 you at the Table Mountain Center?

13 A. No. I was at the customer payment office in
14 Oroville, Downtown Oroville.

15 THE COURT REPORTER: There's some water right
16 there for you. That's for you if you need it.

17 BY MR. NOEL:

18 Q. Yeah. Sorry. Ms. Dupre-Tokos also reminded me
19 there's a remnant of a case of water back there. Help
20 yourself.

21 A little nervous this morning, aren't you?

22 A. I'm not good speaking.

23 Q. Okay. You've never done this before, I'm
24 guessing?

25 A. Not this particular thing, no.

26 Q. All right. Okay. So talk to us about your

1 duties, your job as an M&C engineer for the north region
2 operating out of Oroville.

3 A. Well, I mean, the duties are such as I described
4 earlier. They don't change region to region.

5 Q. Okay. So you were estimating jobs?

6 A. Yes.

7 Q. Putting together work packages?

8 A. Yes.

9 Q. For all of the headquarters which would include
10 Table Mountain Center?

11 A. Yes, for small jobs, normally quick turn-around
12 and fast-paced work.

13 Q. In 2007 did you get involved with a project to
14 relocate towers on the Caribou-Palermo line?

15 A. Yes.

16 Q. Can you explain to us how you got involved in
17 that project.

18 A. Table Mountain supervisor -- well, let me back
19 up one step. I was at a meeting in San Ramon, and a
20 gentleman by the name of Keith Williams, I think -- no,
21 not Keith Williams. His name is mentioned inside some of
22 these documents in front of me. I can't remember it
23 right now. But he was a manager who let me know that
24 there was monies available for projects if anybody had
25 anything to do. The bucket itself was to replace -- the
26 Deteriorated Tower Replacement Program.

1 So I went and asked all the headquarters that I
2 worked over if anybody had anything in their area that
3 they needed replaced or wanted replaced or to get on a
4 wish list. And the only person that spoke up was
5 (EMPLOYEE #3).

6 Q. Who was (EMPLOYEE #3)?

7 A. At the time he was the T-line -- T-line Table
8 Mountain supervisor.

9 Q. Okay. And at the time (EMPLOYEE #3) was the
10 T-line supervisor at Table Mountain, eventually was
11 (EMPLOYEE #3) replaced in that position?

12 A. Well, he rotated in and out a lot and he
13 eventually retired.

14 Q. Retired?

15 A. That's my knowledge.

16 Q. Okay. Who took (EMPLOYEE #3)'s place as the
17 T-line supervisor for Table Mountain?

18 A. I mean, there was several. And I don't remember
19 the chronological order, but (EMPLOYEE #16) filled in.
20 (WITNESS #12) eventually took that position as a whole.

21 Q. Now, after leaving the T-line supervisor, did
22 (EMPLOYEE #3) take another job before he retired?

23 A. I don't know.

24 Q. Okay. All right. So (EMPLOYEE #3) suggests or
25 nominates a job on the Caribou-Palermo line?

26 A. Correct.

1 Q. All right. And so did you apply for funds for
2 the job on the Caribou-Palermo line?

3 A. I filled out an Advance Authorization to get
4 some dollars approved to initiate looking into (EMPLOYEE
5 #3)'s request.

6 [Exhibit 1298 introduced
7 as evidence.]

8 BY MR. NOEL:

9 Q. Okay. All right. You should have in front of
10 you what has marked as Exhibit 1298. Do you see a tag
11 there on the top right corner?

12 A. Yes.

13 Q. And it's a two-page document. And do you
14 recognize Exhibit 1298?

15 A. Yes.

16 Q. What is Exhibit 1298?

17 A. It's an Advance Authorization form.

18 Q. Okay. And is this the Advance Authorization
19 form that you initially completed for the Caribou-Palermo
20 job in 2007?

21 A. Yes. This was the first draft before it was
22 routed for approval.

23 Q. All right. So this was just a draft?

24 A. Yes.

25 Q. And there's, for instance, some blue
26 interlineated lines and words and comments on it?

1 A. Yeah. I mean, I see what you're referring to.

2 Q. All right.

3 MS. DUPRE-TOKOS: And, (WITNESS #5), if it helps
4 at all, you can stand up and look at the TV.

5 BY MR. NOEL:

6 Q. Yeah. We've got it up on the big board behind
7 us. You've got the original in front of you.

8 All right. So under "project manager" it says
9 (WITNESS #5). Is that you?

10 A. That's me.

11 Q. And the date May 7, 2007?

12 A. Yes.

13 Q. All right. So what's the title of the job?

14 A. "Caribou-Palermo 115 kV structure and conductor
15 replacement."

16 Q. And how much money were you seeking originally
17 for this job or from the Advance Authorization?

18 A. \$800,000.

19 Q. And did you estimate how much the -- estimate
20 how much the project eventually would cost?

21 A. Yeah. I threw a rough guess out. I felt it
22 would be around 5 million.

23 Q. Okay. What was the project description
24 justification that you put in your application in your
25 Advance Authorization form?

26 A. What's on here is "It is recommended that the

1 director of electric asset strategy approve an Advance
2 Authorization of \$800k for preliminary engineering and
3 the purchase of long lead-time material to replace a line
4 section on the Caribou-Palermo between towers 7/55 and
5 8/64.

6 This project is part of PG&E's Deteriorated
7 Transmission Equipment Replacement Program and is
8 included in the PG&E five-year plan. This project has an
9 estimated cost of 5 million. We expect to seek full
10 approval for this project by March 28 -- or March 2008."

11 Q. Okay. Now, the PG&E Deteriorated Transmission
12 Equipment Replacement Program, is that the program you
13 were talking about that you were told about down in San
14 Ramon?

15 A. Yes.

16 Q. And can you give us any other information as to
17 what that program was.

18 A. It's -- it was a capital program under Major
19 Work Category 70 that just had a bucket of money
20 available for projects, identified projects.

21 Q. Okay. Well, the title of it is "PG&E's
22 Deteriorated Transmission Equipment Replacement Program."

23 Were you told that the program was to replace
24 equipment -- deteriorated equipment on transmission
25 lines?

26 A. It's just a pot that had money in it. They're

1 just -- they can move money between any of the programs
2 they want to.

3 Q. Okay. So the projects that were funded by the
4 Deteriorated Transmission Equipment Replacement Program
5 didn't have to necessarily have anything to do with
6 deteriorated transmission equipment?

7 A. I honestly don't know the correct answer to
8 that.

9 Q. All right. And what do you mean when it says
10 that it is included in PG&E's 5-year plan?

11 A. PG&E has a rolling 5-year plan that identifies
12 both PG&E management's wish list of projects to be done
13 and local regional supervisor's wish list of work that
14 needs to be done. So it's an ongoing list of work that
15 they'd like to have completed.

16 Q. So was replacement of section -- a section of
17 the Caribou-Palermo line something that PG&E's 5-year
18 plan was to be done or was it the Deteriorated
19 Transmission Equipment Replacement Program that was in
20 the 5-year plan?

21 A. The program was in the five years.

22 Q. Okay. All right. So and then down below we've
23 got some signature lines. Do you recall who Keith
24 Williams was?

25 A. Yeah. Keith is the one that said he had money
26 available.

1 Q. Okay. And do you remember what his job was at
2 the time?

3 A. Just -- it says here "Lifecycle planning
4 manager."

5 Q. All right. And do you recall what the initials
6 EAS stand for?

7 A. I do not.

8 Q. Is it possible that that's Electric Asset
9 Strategy?

10 A. I was going to say I see that down below, yes.

11 Q. Okay. And T&D. Do you know what that stands
12 for?

13 A. Transmission distribution.

14 Q. Okay. And are you aware of what the job of
15 lifecycle planning was?

16 A. No.

17 Q. Okay. And how about the next guy Robert
18 Malahowski?

19 A. I don't recall who he was.

20 MR. NOEL: That's Malahowski, Madam Reporter.

21 BY MR. NOEL:

22 Q. And finally, Luther Dow.

23 A. Yeah, I know who Luther Dow is.

24 Q. Who is Luther Dow?

25 A. He was the director of Electric Asset Strategy.
26 He's the one that had to sign off on allocating some

1 funds toward looking into this line replacement, line
2 section replacement.

3 Q. All right. And so you requested \$800,000 which
4 included money for engineering, land review,
5 environmental review, materials? All of that?

6 A. Yes.

7 Q. Right?

8 Okay. Let's go to page 2. And can you read us
9 what you wrote under "Action recommended."

10 A. "It is recommended that the director of the
11 Electric Asset Strategy approve an Advance Authorization
12 for \$800k for preliminary engineering and purchase of
13 long lead-time material to replace conductor and towers
14 on a section of the Caribou-Palermo 115 kV transmission
15 line between structures 7/55 and 8/64. This project is
16 part of PG&E's Deteriorated Transmission Equipment
17 Replacement Program and is included in the PG&E's 5-year
18 plan."

19 Excuse me. "The project has an estimated total
20 cost of \$5 million. We expect to see full approval for
21 this project by November 2007."

22 Q. All right. And then can you read us what you
23 put in the background section.

24 A. "There have already been multiple conductor
25 failures on this line due to the conductor being annealed
26 and parting. Since 2002 there have been eight event

1 reports created on this line five of which was
2 equipment-related failures. Several infrared inspections
3 have also been performed with follow-up repairs and
4 shunts on multiple conductor splices. This line section
5 is located across the Feather River with no access roads
6 and in very steep terrain. It is very time consuming and
7 costly to correct any failures that occur in this
8 dilapidated line section especially during the winter
9 months when failures are more likely.

10 There is also probability of existing G095
11 impaired ground clearance issues due to the age of the
12 line. This won't be confirmed until after a line survey,
13 but other areas of this line have been corrected in past
14 years for the same thing."

15 Q. All right. And then do you know who's added the
16 blue comments?

17 A. I do not.

18 Q. All right. So let's break this down. "Since
19 2002 there have been eight event reports created on this
20 line five of which were equipment-related failures."

21 Do you recall where you got that information?

22 A. From the GCC event reports.

23 Q. Okay. And what do you mean by equipment-related
24 failures?

25 A. It means that a mechanical component of the line
26 was determined to cause an outage instead of like it

1 would have been a bird striking the line which caused a
2 momentary.

3 Q. Right. If a bird hit a line, that wouldn't be
4 an equipment failure?

5 A. Not normally.

6 Q. If a mylar balloon got stuck in a line and
7 caused an outage, that wouldn't be equipment failure?

8 A. Correct.

9 Q. Would a lightening strike be equipment failure?

10 A. I don't know what they determine as equipment
11 failures.

12 Q. Okay. So then we go down. What is the
13 importance of shunts on multiple conductor splices?

14 A. Typically, it would mean that during that
15 infrared patrol at the splice location the infrared
16 picked up some heat coming out of that splice which could
17 be determined as improper splice connection. And so then
18 they wrap wires on the conductor over the splice and back
19 onto the conductor to mitigate that heat transfer
20 difference. That's what a shunt is.

21 Q. Okay. Then you used the term "dilapidated line
22 section." Okay. Do you remember where you -- how you
23 formed the description of the Caribou-Palermo in that
24 area of being dilapidated?

25 A. There is no general reason why except for it's
26 verbiage to get attention to hopefully get this job

1 pushed through. So it fulfilled what (EMPLOYEE #3)
2 wanted to do to move this line from one side of the river
3 to the other.

4 Q. All right. So let's drop down to description of
5 recommendation. And if you could read us what you wrote
6 in that section.

7 A. "The following is recommended by March 2009. It
8 was determined in the field by T/Line, GC Tower, Civil &
9 Electrical Engineering that this tower line section would
10 be very difficult and costly to replace in the event of a
11 failure. Probability of that failure is imminent due to
12 the age of both the towers and conductor. The intent of
13 this project is to be proactive and replace this
14 deteriorated line section in a controlled and planned
15 manner instead of under emergency conditions."

16 Q. Okay. "Probability of that failure is imminent
17 due to the age of both the towers and conductor."

18 Do you recall how you came to that conclusion?

19 A. Well, again, I know how old the line was, but
20 using the word "imminent" it's more likely -- the older
21 something is the more likely a chance that at some point
22 you're going to have a failure.

23 Q. Exactly.

24 A. Plus five of those outages outside of this line
25 section was equipment related.

26 Q. Why is that important?

1 A. You already shown that failures have occurred
2 within the transmission line.

3 Q. Okay. You said you new how old this line was.
4 Could you explain that.

5 A. Well, I mean, I know it's early 1900s and it was
6 owned by Great Western Power Company prior to PG&E.

7 Q. Okay. And how does -- in your experience how
8 does age affect reliability or failure rates?

9 A. Well, it's not just age alone. There's multiple
10 factors in determining potential lifecycle. The age in
11 this case is more related to conductor insulators and me
12 not knowing or having access to when any of that, if any,
13 have been upgraded over the years.

14 Q. What did you know about the age of the
15 conductors and insulators?

16 A. I didn't have any direct knowledge of the age of
17 that other than -- you know, if nothing had been done
18 since the line was built, then that's -- that's, in my
19 experience, a long time to be leaving the same component
20 up for that length of time.

21 Q. Okay. All right. And then the final section
22 "other alternates." If you could read us what you wrote.

23 A. "Status quo (Do nothing). The status quo is not
24 acceptable because this line section -- this line
25 section's inaccessibility and the failures that have
26 occurred over the years. A severe failure would put

1 customers at risk of an outage and could cause damage to
2 other electrical system components in the area."

3 [Exhibit 1299 introduced
4 as evidence.]

5 BY MR. NOEL:

6 Q. All right. Okay. Let's move on to 1299. You
7 should have that in front of you. It's an e-mail.

8 A. Yes.

9 Q. And do you recognize that?

10 A. Yes.

11 Q. And what can you tell us about this e-mail.

12 A. It's from Keith Williams who is the first
13 approver on the day-to-day.

14 Q. Okay. And it's directed to you?

15 A. Yes.

16 Q. And dated May 8, 2007?

17 A. Yes.

18 Q. And can you read what Keith Williams says.

19 A. It says "(WITNESS #5), see my comments. I think
20 we are close to having this ready for approval."

21 Q. Okay. Does that refresh your recollection as to
22 whose comments were in blue?

23 A. No.

24 Q. Okay. So did you have multiple people reviewing
25 your AA?

26 A. Yes.

1 Q. Okay. Great.

2 [Exhibit 838 introduced
3 as evidence.]

4 BY MR. NOEL:

5 Q. So let's move on now to 838. It should be --
6 actually, it's up there on the board. We didn't pull it.
7 It's already in evidence.

8 And we have 838 up here, another AA. Do you
9 recognize 838?

10 A. Yes.

11 Q. What is 838?

12 A. It's a revised version of the first document.

13 Q. What is different between this version and 1298
14 that we just reviewed?

15 A. Luther Dow asked me to take the "long lead-time
16 material" out of it and re-word some of what I had put in
17 there.

18 Q. Okay. So first difference or big difference,
19 material difference you're now only asking for \$200,000;
20 correct?

21 A. Yes.

22 Q. And let's look at the changes in your -- in the
23 section at the end. If you can read to us what you
24 put -- what you wrote in the background in the revised
25 version.

26 A. "There have already been multiple conductor

1 failures on this line due to the conductor being annealed
2 and parting. Since 2002 there have been eight event
3 reports created for this line five of which were
4 equipment-related failures. Several infrared inspections
5 have also been performed with follow-up repairs and
6 shunts on multiple conductor splices. This line section
7 is located across the Feather River where there are no
8 access roads and the terrain is very steep. As a result,
9 emergency response is slow, time-consuming, and costly.

10 There is also a probability of existing G095
11 impaired ground clearance issues due to the age of the
12 line. This won't be confirmed until after line survey,
13 but other areas of this line have been corrected in past
14 years for ground to line clearance issues.

15 The Caribou-Palermo 115kv line supports hydro
16 generation. A sustained outage would affect Grizzly
17 Powerhouse. The biggest concern with Caribou-Palermo 115
18 outage planned or unplanned is the load at risk in the
19 event of a Caribou-Table Mountain 230 outage.

20 Approximately 10,000 customers would experience the
21 sustained outage. Additionally, if we cannot
22 sectionalize and restore the section of Caribou-Palermo
23 between Wyandotte and Palermo, we would be concerned
24 about Wyandotte load at risk in the event of a
25 Caribou --" or excuse me -- "in the event of a
26 Palermo-Wyandotte outage we wouldn't be able to restore

1 off the Caribou-Palermo line as designed. Wyandotte
2 substation serves 16,515 customers."

3 Q. All right. So first off, do you recall why you
4 took out the description of the line as being
5 dilapidated?

6 A. Would have been by one of the reviewers.

7 Q. Okay. And this third paragraph here starts with
8 "The Caribou-Palermo 115 line supports hydro generation"
9 was added.

10 A. Yes.

11 Q. Do you recall why that information was added?

12 A. Not exactly. I believe Keith Williams requested
13 it or Luther requested to know what's the support.

14 Q. Okay. Why is that important?

15 A. It's just showing the customers at risk if they
16 lost load.

17 Q. Customers at risk of losing power?

18 A. Yes.

19 Q. Not customers at risk of contact with the line
20 or anything like that?

21 A. No.

22 Q. So this last paragraph, would that be what would
23 generally be considered the reliability metrics for this
24 line?

25 A. I can't answer that.

26 Q. Okay.

1 A. It's information that came from the GCC.

2 Q. But why is it important in a request for money
3 to fix an aging, deteriorating line to show the customers
4 are going to be affected by an outage on that line?

5 A. Can't answer that. It was something that one of
6 the approvers wanted added.

7 Q. Okay. And then could you read for us the
8 description of the recommendation.

9 A. "The following is recommended by March 2009:
10 Replace deteriorated structures, conductor, insulators,
11 and hardware on the Caribou-Palermo 115 line between
12 structures 7/55 and 8/64."

13 Q. Why did you take out all of the language about
14 the imminent failure due to the age of both the towers
15 and the conductor?

16 A. Again, it would have been directed by the
17 reviewers.

18 Q. Okay. All right. Let's move on. Now, 2012
19 you're still the M&C engineer for the north?

20 A. I believe so.

21 Q. Okay. Do you recall in 2000 -- December of 2012
22 an incident where five towers on the Caribou-Palermo line
23 fell down?

24 A. Yes.

25 Q. And actually, I got ahead of myself here. The
26 AA we just did -- 838 -- was that AA approved for the

1 Caribou-Palermo relocate project?

2 A. It was approved to do advanced pre-engineering
3 and looking into if it needed to be done or not, yes.

4 Q. Once the project was approved, they -- I guess
5 the research for the project was approved, did you remain
6 with the job?

7 A. No. It was outside of the scope of an M&C
8 engineer.

9 Q. Okay. So do you know what happened to the job?

10 A. It was assigned a project management. And I
11 believe (WITNESS #15) was the first project manager who
12 had the job.

13 Q. Now, once a project manager was assigned, did
14 you stay involved in the project?

15 A. I was just -- seemed like I was always cced on
16 everything whether I wanted to be or not.

17 Q. Okay. Now, by 2009 had the project been done?

18 A. Been done? No.

19 Q. Okay. In 2009 -- in late 2009 did you again get
20 roped into the project?

21 A. I don't remember the year or anything.

22 [Exhibit 839 introduced
23 as evidence.]

24 BY MR. NOEL:

25 Q. All right. We have up here on the board an
26 e-mail that's marked as -- or is in evidence as 839. So

1 we have Exhibit 839 on the board.

2 Do you know who Douglas Cannel was?

3 A. Yes.

4 Q. Who was Douglas Cannel?

5 A. I don't know his title but somewhere in the
6 asset management realm.

7 Q. How about Raymond Thiery?

8 A. He was Doug's boss.

9 Q. And (EMPLOYEE #3)?

10 A. Table Mountain supervisor.

11 Q. Chuck Stinnett?

12 A. He's a -- he's got multiple hats; substation and
13 transmission, asset lifecycle.

14 Q. Okay.

15 A. He's pretty diverse.

16 Q. You're cced into this e-mail marked as 839 from
17 Doug Cannel; correct? You were cced into this e-mail
18 chain?

19 A. Yes.

20 Q. And specifically, I want to ask you about one
21 section in here. And I think we have it blown up in the
22 next -- well, a couple of sections. First, in the
23 December 23rd e-mail Mr. Cannel writes "I'm not sure we
24 should re-authorize the AA for \$800,000."

25 Now, 800,000 is what you originally asked for;
26 correct?

1 A. Yes.

2 Q. And we have below it a clip from your original
3 request of \$800,000. So it looks like this project is
4 now almost at \$800,000.

5 A. I have no idea.

6 Q. Okay. Why did you drop your submission from
7 800,000 to 200,000?

8 A. As I explained, because Luther Dow told me to
9 take the advanced material purchase off which was
10 600,000.

11 Q. Okay. And then it's says "The project is
12 currently planned and will run over \$10 million."
13 Correct?

14 A. That's what it says.

15 Q. And you originally estimated it at 5 million?

16 A. Okay.

17 Q. Is that correct?

18 A. That's what I threw out there as a ballpark.

19 Q. Okay. Do you remember what you based that
20 estimate on?

21 A. Historic builds per line mile.

22 Q. Okay. Now, next we get to the heart of it. In
23 that e-mail from Doug Cannel he says "I asked (WITNESS
24 #5) about the current condition of the towers and he
25 informed me he couldn't answer the question since he was
26 not aware of an inspection that took place. If there was

1 an inspection, could you please forward me the findings.
2 I'll need them if we're going to proceed with a replace
3 deteriorated facilities project."

4 Do you recall having that conversation with
5 Douglas Cannel?

6 A. He just asked me if I had seen the inspection
7 reports or had initiated any inspection on it.

8 Q. Okay. Why would there be an inspection on it?

9 A. To determine the condition of the structures.

10 Q. Well, in your application -- your initial
11 application you wrote all about the event reports and
12 equipment failures; correct?

13 A. Yeah.

14 Q. And infrared inspections we already talked
15 about; correct?

16 A. That's not in this section of line. That's the
17 line as a whole.

18 Q. And dilapidated line sections?

19 A. It's just verbiage. I have no actual knowledge
20 that they were dilapidated.

21 Q. Okay. And then the age of the line. We talked
22 about that?

23 A. Yes.

24 Q. And then down in the -- in the bottom section
25 "The probability of that failure is imminent due to the
26 age of both the towers and the conductor."

1 A. Again, just verbiage.

2 Q. So again, now those are being questioned?

3 A. Yeah. They want to know is there facts -- is
4 there factual evidence to support moving forward with
5 this project.

6 Q. So when you're doing at least the initial draft,
7 you were making -- you said verbiage with no factual
8 evidence?

9 A. That is the direction of what (EMPLOYEE #3)
10 wanted to do to relocate the line so if there was a
11 failure, it could be addressed easier and quicker.

12 Q. Okay. So was (EMPLOYEE #3) telling you this
13 information about the line?

14 A. I think he was assisting in coming up with data
15 and verbiage, yeah.

16 Q. Right.

17 A. And then the GCC for the event reports.

18 Q. And (EMPLOYEE #3) is the person -- the T-line
19 supervisor; right?

20 A. Yes.

21 Q. And he's the person who is in charge of doing
22 the inspections and patrols on this line; correct?

23 A. Yes and no.

24 Q. And so were you getting this information about
25 dilapidated line section from (EMPLOYEE #3)?

26 A. Probably not.

1 Q. Okay. Were you getting this information about
2 "failure is imminent" from (EMPLOYEE #3)?

3 A. Probably not.

4 Q. So are you saying that you're just putting in
5 verbiage with absolutely no support just to get money for
6 a project that (EMPLOYEE #3) wants to do?

7 A. To get money to investigate if a project is
8 feasible, yes.

9 Q. Okay. So the title of this project fund is "The
10 Deteriorated Transmission --" and all of a sudden I
11 forgot the rest of the phrase. But the title of the
12 project would seem to infer that the money was there to
13 replace deteriorated transmission assets; correct?

14 A. So it's a bucket of where there was money
15 currently. And if it wasn't identified under that title,
16 they would have moved that money to another bucket under
17 another title.

18 MR. NOEL: All right. Not a good place but we
19 need to take a break right now because madam reporter has
20 to go deal with something else at 10 o'clock. So madam
21 foreperson is going to read you an admonition and then
22 we're going to take a recess for a little while.

23 GRAND JURY FOREPERSON: Okay. (WITNESS #5), you
24 are admonished not to discuss or disclose at any time
25 outside of this jury room the questions that have been
26 asked of you or your answers until authorized by this

1 grand jury or the Court. A violation of these
2 instructions on your part may be the basis of a charge
3 against you of contempt of court. This does not preclude
4 you from discussing your legal rights with your own
5 attorney.

6 (WITNESS #5), what I have just said is a warning
7 not to discuss this case with anyone except the Court,
8 your lawyer, or the district attorney.

9 Do you have any questions?

10 THE WITNESS: No. Thank you.

11 GRAND JURY FOREPERSON: Okay. Thank you.

12 [Recess taken from

13 10:00 until 10:28 a.m.]

14 GRAND JURY FOREPERSON: All members of the grand
15 jury have returned from a break and are ready to proceed.

16 [Witness enters the courtroom.]

17 GRAND JURY FOREPERSON: Mr. Bradley, before you
18 have a seat, please raise your right hand to be sworn.

19 Mr. Bradley, do you solemnly swear that the
20 evidence you shall give in this matter pending before the
21 grand jury shall be the truth, the whole truth, and
22 nothing but the truth so help you God?

23 THE WITNESS: Yes.

24 GRAND JURY FOREPERSON: Thank you. Have a seat,
25 please.

26 **EXAMINATION**

1 BY MS. DUPRE-TOKOS:

2 Q. Good morning. Could you state your name and
3 spell your last name for us.

4 A. Of course. My name is Brett Bradley. That is
5 B-r-a-d-l-e-y.

6 Q. And do you know someone by the name of Ethel
7 Riggs?

8 A. Yes. That is my grandmother.

9 [Exhibit 1275 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. And looking up at the board at Exhibit 1275, do
13 you recognize that person?

14 A. Yes. That would be my grandmother.

15 Q. Okay. Is your grandmother still with us?

16 A. Unfortunately she passed in the Camp Fire.

17 Q. Okay. Did you speak with your grandmother on
18 November 8th, 2018?

19 A. Yes. I spoke to her three times.

20 Q. And was that over the phone or in person?

21 A. It was over the phone.

22 Q. Did you call her or did she call you?

23 A. I called her each one of the times.

24 Q. Had you spoken to your grandmother on the phone
25 before?

26 A. Yes. I normally talked to her, you know, two to

1 three times a week.

2 Q. And when you spoke with her on November 8, 2018,
3 you said you called her all three times?

4 A. Yes.

5 Q. Did you call the number or numbers that you
6 normally would call to get in touch with her?

7 A. Yes.

8 Q. And when you heard her voice, was that the voice
9 that you recognized as that of your grandmother's that
10 you spoke with so frequently?

11 A. Yes, it was.

12 Q. Okay. And do you recall about what time it was
13 the last time you spoke with your grandmother?

14 A. I believe it was around 11 o'clock. Yeah, it
15 was about 11 o'clock.

16 Q. And do you recall about what time it was the
17 first time you spoke with her that morning?

18 A. I believe around 10:00.

19 Q. Okay. I have nothing --

20 So the first call, was that to her landline or
21 her cellphone?

22 A. The first call was on her landline and the
23 second call was to her -- the second and third call were
24 on her cellphone.

25 Q. And why did you switch from landline to
26 cellphone?

1 A. Because her landline was no longer working
2 because of, I believe, power outages.

3 MS. DUPRE-TOKOS: Okay. I have nothing further
4 for you.

5 Do the jurors have any questions? Nope.

6 Okay. Madam foreperson has an admonition for
7 you.

8 GRAND JURY FOREPERSON: Okay. Mr. Bradley, you
9 are admonished not to discuss or disclose at any time
10 outside of this jury room the questions that have been
11 asked of you or your answers until authorized by this
12 grand jury or the Court. A violation of these
13 instructions on your part may be the basis for a charge
14 against you of contempt of court. This does not preclude
15 you from discussing your legal rights with your own
16 attorney.

17 Mr. Bradley, what I have just said is a warning
18 not to discuss this case with anyone except the Court,
19 your lawyer, or the district attorney.

20 Do you have any questions?

21 THE WITNESS: No, I do not.

22 GRAND JURY FOREPERSON: Okay. Thank you for
23 your time.

24 [Witness Bradley exits as Deputy Tavelli enters.]

25 GRAND JURY FOREPERSON: Deputy Tavelli, would
26 you raise your right hand to be sworn, please.

1 Deputy Tavelli, do you solemnly swear that the
2 evidence you shall give in this matter pending before the
3 grand jury shall be the truth, the whole truth, and
4 nothing but the truth so help you God?

5 THE WITNESS: Yes, Ma'am.

6 GRAND JURY FOREPERSON: Thank you. Have a seat,
7 please.

8 **EXAMINATION**

9 BY MS. DUPRE-TOKOS:

10 Q. And, Sergeant Tavelli, could you please state
11 your full name and spell your last name for the record.

12 A. My name is Angelo Tavelli, and it's
13 T-a-v-e-l-l-i.

14 Q. Where are you employed and in what capacity?

15 A. Currently employed by the Butte County Sheriff's
16 Office, and I'm a sergeant assigned to patrol at this
17 time.

18 Q. Are you assigned to any other duties?

19 A. I'm also assigned to SWAT amongst many other
20 things.

21 Q. And we're interrupting your SWAT training for
22 you to be here, aren't we?

23 A. Yes, Ma'am.

24 Q. So we'll try and get you in and out of here
25 quickly.

26 How long have you been at the Butte County

1 Sheriff's Office?

2 A. Been employed at the Butte County Sheriff's
3 Office since 2008.

4 Q. And did you have any law enforcement experience
5 prior to joining the sheriff's office?

6 A. No, Ma'am.

7 Q. Did you assist with evacuations for the Camp
8 Fire on November 8, 2018?

9 A. Yes, Ma'am.

10 Q. And where were you working on evacuations?

11 A. I started -- attempted to get to the Concow side
12 and then due to the fire taking over the road I was
13 redirected to the Pentz side. I was sent from Highway 70
14 to assist with the hospital and surrounding area
15 evacuations.

16 Q. And were there any assisted-living type
17 facilities or things like that near the hospital?

18 A. Yes. That's the first place we were directed to
19 was the hospital and then there was a large facility
20 behind the hospital multi-story. And then I guess to the
21 east of that there was like a duplex-style assisted
22 living.

23 Q. And you were trying to direct people to evacuate
24 in that area as well?

25 A. Yes.

26 [Exhibit 1026 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. Okay. Looking at Exhibit 1026 -- and I apparently did not put it in front of you. So I apologize. But if you can look at the board, do you recognize this gentleman?

A. I do.

Q. How do you recognize him?

A. He lived in the duplex-style living by the assisted-living facility.

Q. Okay. And did you give him instructions and encouragement to evacuate?

A. I did amongst many other people, him and his dog.

Q. Okay. And you're sure that is the person you spoke with?

A. Yes, Ma'am.

Q. And do you know approximately what time you were giving evacuation instructions in that area and especially to the duplexes? If you know.

A. I couldn't really give you an approximate time. Time is not really relative for that day.

Q. Right.

A. It was early-on morning hours. I don't know what time though.

MS. DUPRE-TOKOS: Okay. So I have no further

1 questions.

2 Do the jurors have any questions?

3 Okay. You just need an admonition from madam
4 foreperson.

5 GRAND JURY FOREPERSON: Deputy Tavelli, you are
6 admonished not to discuss or disclose at any time outside
7 of this jury room the questions that have been asked of
8 you or your answers until authorized by this grand jury
9 or the Court. A violation of these instructions on your
10 part may be the basis for a charge against you of
11 contempt of court. This does not preclude you from
12 discussing your legal rights with your own attorney.

13 Deputy Tavelli, what I have just said is a
14 warning not to discuss this case with anyone except the
15 Court, your lawyer, or the district attorney.

16 Any questions?

17 THE WITNESS: No, Ma'am.

18 GRAND JURY FOREPERSON: Thank you for your time
19 today.

20 THE WITNESS: Thank you.

21 [Witness exits the courtroom.]

22 MR. NOEL: Next is Waananen.

23 [Witness enters the courtroom.]

24 GRAND JURY FOREPERSON: Deputy Waananen, please
25 raise your right hand to be sworn.

26 Deputy Waananen, do you solemnly swear that the

1 evidence you shall give in this matter pending before the
2 grand jury shall be the truth, the whole truth, and
3 nothing but the truth so help you God?

4 THE WITNESS: I do.

5 GRAND JURY FOREPERSON: Thank you. Have a seat,
6 please.

7 **EXAMINATION**

8 BY MS. DUPRE-TOKOS:

9 Q. Good morning.

10 A. Good morning.

11 Q. Would you please state your full name and spell
12 your last name for the record.

13 A. Jay Waananen, W-a-a-n-a-n-e-n.

14 Q. And where are you employed and in what capacity?

15 A. I'm employed by the Butte County Sheriff's
16 Department as a deputy sheriff currently assigned to our
17 Boating Enforcement Unit and Marine Unit.

18 Q. And how long have you been with the Butte County
19 Sheriff's Office?

20 A. What is the date today? The 7th? Tomorrow will
21 be 28 years.

22 Q. Congratulations.

23 And have you been a sworn law enforcement
24 officer that entire time?

25 A. The entire time with Butte County, correct.

26 Q. And did you have any law enforcement experience

1 prior to that?

2 A. No. I started -- I went to the Butte College
3 Academy and started my first job here in Butte County.

4 Q. And were you assigned to assist with the Camp
5 Fire?

6 A. I was.

7 Q. In what capacity?

8 A. We were documenting where remains were found.

9 Q. So did you essentially go to every site that
10 remains were found?

11 A. Yes. My partner and I -- we have a piece of
12 equipment. To simplify it, it's like a surveying piece
13 of equipment that measures distances and everything. So
14 we would document where all the remains were found. We
15 went to every single case.

16 Q. And what's that piece of equipment called?

17 A. It is -- the name of it is a Trimble Scanner.

18 Q. What do most people call it?

19 A. A scanner. It's like a piece of surveying
20 equipment when you see road crews on the side of the road
21 with a tripod and they have that equipment and the guys
22 are measuring distances, the road department people. It
23 is essentially that, but it takes photographs and then it
24 takes digital measurements. And it lays it on top of
25 each other and then we can take, oh, a marker and mark
26 the exact location. And it gives elevation and

1 everything. It puts it into a computer program that we
2 could recreate at a later time if needed.

3 Q. Great. I'm going to probably jump around a
4 little bit on dates so please bear with me. But were you
5 doing that on November 17th, 2018?

6 A. November 17th, yes.

7 Q. And did you go to a residence at 2735 Eskin
8 Maidu Trail in Paradise on that date?

9 A. Yes, we did.

10 Q. Okay. Was that residence destroyed?

11 A. Yes, it was.

12 Q. Were human remains located at that residence?

13 A. Human remains were found, yes.

14 Q. And was a case number assigned to those remains?

15 A. Yes.

16 Q. Okay. Was that case number 18-19775?

17 A. Yes.

18 [Exhibit 1272 introduced
19 as evidence.]

20 BY MS. DUPRE-TOKOS:

21 Q. And in looking at Exhibit 1272, which is up on
22 the board but should also be in front of you, did you at
23 some point learn that this is a photograph of Gordon
24 Dise?

25 A. I did.

26 Q. And did you at some point learn that the remains

1 associated with the case number 18-19775 were those of
2 Gordon Dise?

3 A. Yes.

4 [Exhibit 1273 introduced
5 as evidence.]

6 BY MS. DUPRE-TOKOS:

7 Q. And looking at Exhibit 1273 can you tell us what
8 this is a picture of.

9 A. It's a picture of the residence on Eskin Maidu
10 Trail.

11 Q. Okay. And that's --

12 A. A burned residence.

13 [Exhibit 1274 introduced
14 as evidence.]

15 BY MS. DUPRE-TOKOS:

16 Q. Okay. And that was -- well, looking at 1274 can
17 you tell us what that's a photograph of.

18 A. That's a photograph of the remains that were
19 located at that property.

20 Q. So Mr. Dise's remains?

21 A. Mr. Dise's remains.

22 Q. Okay. And then did you on November 16th go to a
23 residence at 220 Berry Creek Drive in Paradise?

24 A. Yes.

25 Q. Was that residence destroyed?

26 A. Yes, it was.

1 Q. Were human remains located at that residence?

2 A. Yes, they were.

3 Q. And was a case number assigned to those remains?

4 A. A case number was assigned.

5 Q. Was that case number 18-19730?

6 A. Yes.

7 [Exhibit 1275 introduced
8 as evidence.]

9 BY MS. DUPRE-TOKOS:

10 Q. Looking at Exhibit 1275, did you at some point
11 learn that that is a photograph of Ethel Riggs?

12 A. I did.

13 Q. And did you at some point also learn that the
14 remains associated with case number 18-19730 were those
15 of Ethel Riggs?

16 A. Yes, I did.

17 [Exhibit 1276 introduced
18 as evidence.]

19 BY MS. DUPRE-TOKOS:

20 Q. In looking at Exhibit 1276 can you tell us what
21 that is a photograph of.

22 A. That is a burned-out residence.

23 Q. Okay. Do you know where -- would that be the
24 burned-out residence at 220 Berry Creek Drive?

25 A. 220 Berry Creek Drive, correct.

26 [Exhibit 1277 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. And then looking at Exhibit 1277 can you tell us what that is a photograph of.

A. This was a location where the remains were found.

Q. Okay. And when you say the remains, that would be the remains of 220 Berry Creek Drive?

A. Yes, it was.

Q. And then on November 15th, 2018, did you go to a residence at 6778 Ishi Drive in Magalia?

A. Yes.

Q. Okay. Was that residence destroyed?

A. Yes, it was destroyed.

Q. And were human remains located at that residence?

A. Human remains were found.

Q. Okay. Do you recall how many sets of remains?

A. I believe there were two at this location.

Q. And case numbers were assigned to those?

A. Yes, they were. Yes, it was.

Q. Was one of those case numbers 18-19704?

A. Yes.

Q. And was the other 18-19705?

A. Yes.

[Exhibit 1278 introduced

1 as evidence.]

2 BY MS. DUPRE-TOKOS:

3 Q. Looking at Exhibit 1278, did you at some point
4 learn that this is a photograph of Kathy Shores?

5 A. I did learn that.

6 [Exhibit 1279 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And then Exhibit 1279 did you at some point
10 learn that is a photograph of Donald Shores?

11 A. I did.

12 Q. Did you at some point learn that the remains
13 associated with case number 18-19704 were those of Kathy
14 Shores?

15 A. Yes.

16 Q. And did you at some point learn that the remains
17 associated with case number 18-19705 were those of Donald
18 Shores?

19 A. I did, yes.

20 [Exhibit 1280 introduced
21 as evidence.]

22 BY MS. DUPRE-TOKOS:

23 Q. In looking at Exhibit 1280 can you tell us what
24 that is a photograph of.

25 A. That is the burned-out property.

26 Q. On Ishi Drive?

1 A. On Ishi Drive.

2 [Exhibit 1281 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. And then Exhibit 1281. Can you tell what that
6 is a photograph of.

7 A. That was the location of the remains.

8 Q. Of Kathy and Donald Shores?

9 A. Kathy and Donald. I believe they were fairly
10 close together, yes.

11 Q. And then did you on November 15th go to a
12 residence at 6284 Woodbury Drive in Magalia?

13 A. Yes, I did.

14 Q. Okay. Was that residence destroyed?

15 A. Yes, it was destroyed.

16 Q. Were human remains located at that home?

17 A. And human remains were found at that property.

18 Q. Was a case number assigned to those remains?

19 A. A case number was assigned.

20 Q. Is that case number 18-19550?

21 A. Yes, it was.

22 [Exhibit 1282 introduced
23 as evidence.]

24 BY MS. DUPRE-TOKOS:

25 Q. Looking at Exhibit 1282 did you at some point
26 learn that that's a photograph of James Garner?

1 A. Yes, I did.

2 Q. And did you at some point learn that the remains
3 associated with case number 18-19550 were those of James
4 Garner?

5 A. I did.

6 [Exhibit 1283 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. And looking at Exhibit 1283 can you tell us what
10 that's a photograph of.

11 A. That's the burned property on --

12 Q. Woodbury Drive?

13 A. Woodbury Drive. Sorry.

14 [Exhibit 1284 introduced
15 as evidence.]

16 BY MS. DUPRE-TOKOS:

17 Q. And then looking at Exhibit 1284 can you tell us
18 what that is a photograph of.

19 A. That was where the remains were found on the
20 property.

21 Q. And by property you mean the one on Woodbury
22 Drive?

23 A. The property on Woodbury Drive.

24 Q. Okay. And then November 17, 2018, did you go to
25 a residence or property at 4238 Schwyhart Lane in Concow?

26 A. I did.

1 Q. Was there a residence of any type on that
2 property?

3 A. I believe it was a trailer.

4 Q. Okay. A trailer or possibly a fifth-wheel?

5 A. Like a -- I think it was a small trailer.

6 Q. Okay. A travel trailer?

7 A. It could have been a fifth-wheel, but it wasn't
8 a residence. I believe he lived in it.

9 Q. Okay. And was that trailer or fifth-wheel
10 destroyed?

11 A. Yes, it was.

12 Q. Were human remains located at that property?

13 A. Yes, they were.

14 Q. Was a case number assigned to those remains?

15 A. A case number was assigned.

16 Q. And was that 18-19753?

17 A. Yes, it was.

18 [Exhibit 1285 introduced
19 as evidence.]

20 BY MS. DUPRE-TOKOS:

21 Q. Looking at Exhibit 1285 did you at some point
22 learn that that's a photograph of Richard Garrett?

23 A. I did learn that.

24 Q. And at some point did you also learn that the
25 remains associated with case number 18-19753 were those
26 of Richard Garrett?

1 A. I did.

2 [Exhibit 1286 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. In looking at Exhibit 1286 can you tell us what
6 that's a photograph of.

7 A. That's a photograph of the burned property or
8 trailer. And in the distance the tape is where the
9 subject or the decedent was found.

10 [Exhibit 1287 introduced
11 as evidence.]

12 BY MS. DUPRE-TOKOS:

13 Q. Okay. So looking at 1287 --

14 A. Oh, there it is.

15 Q. -- is that --

16 A. Yes.

17 Q. So that's a picture of where the decedent was
18 found?

19 A. Yes, like he fled the trailer. He was found
20 out --

21 Q. Out back?

22 A. -- between the trees.

23 Q. Okay. And then on November 16th, 2018, did you
24 go to 13554 Andover Drive in Magalia?

25 A. I did.

26 Q. Was that residence destroyed?

1 A. Yes, it was.

2 Q. And were human remains located at that
3 residence?

4 A. Yes, they were.

5 Q. Was a case number assigned to those remains?

6	A. A case number was assigned.
---	--------------------------------

7 Q. Was that case number 18-19737?

8	A. Yes.
---	---------

9	[Exhibit 1288 introduced
0	as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. At some point did you learn -- looking at
13 Exhibit 1288, did you at some point learn this is a
14 photograph of Gary Hunter?

15 A. I did learn that.

16 Q. And at some point did you also learn that the
17 remains associated with case number 18-19737 were those
18 of Gary Hunter?

19	A. I did.
----	-----------

20 [Exhibit 1289 introduced
21 as evidence.]

22 BY MS. DUPRE-TOKOS:

23 Q. Looking at Exhibit 1289 can you tell us what
24 that's a photograph of.

25 A. It's a burned property on Andover Drive.

26 [Exhibit 1290 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. And then looking at Exhibit 1290 can you tell what that is a photograph of.

A. It's the location where the remains were found on Andover.

Q. And then on November 12, 2018, did you go to a residence at 5303 Sawmill Road in Paradise?

A. Yes, I did.

Q. Was that residence destroyed?

A. Yes, it was.

Q. And were human remains located at that residence?

A. Yes, they were.

Q. Was a case number assigned to those remains?

A. A case number was assigned.

Q. Was that 18-19595?

A. Yes, it was.

[Exhibit 1291 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. In looking at Exhibit 1291 did you at some point learn that the female in this photograph was Phyllis Salazar?

A. I did.

Q. And did you at some point learn the remains

1 associated with case number 18-19595 were those of
2 Phyllis Salazar?

3 A. I did learn that.

4 Q. And do you recall if Ms. Salazar was found
5 inside or outside of the residence, if you recall?

6 A. I can't say for sure, but I believe she was
7 inside. Yeah, she was inside. Yes, she was.

8 Q. Okay. And then on November 11th, 2018, did you
9 go to 5577 Heavenly Place in Paradise, California?

10 A. Yes, I did.

11 Q. Was that residence destroyed?

12 A. It was destroyed.

13 Q. Were human remains located there?

14 A. Yes, they were.

15 Q. How many sets?

16 A. I believe there were two sets at this location.

17 Q. Okay. Were they commingled?

18 A. They were close together. That was determined
19 after the fact. I believe they were but --

20 Q. Okay. Were case numbers assigned to both of
21 their remains?

22 A. A case number was assigned.

23 Q. Was one of those 18-19573?

24 A. Yes.

25 Q. Was the other case number 18-19566?

26 A. Yes.

1 [Exhibit 1292 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. In looking at Exhibit 1292 did you at some point
5 learn that that's a photograph of Barbara Carlson?

6 A. Yes, I did.

7 Q. Did you at some point learn that the remains
8 associated with case number 18-19573 were those of
9 Barbara Carlson?

10 A. Yes, I did.

11 [Exhibit 1293 introduced
12 as evidence.]

13 BY MS. DUPRE-TOKOS:

14 Q. And then looking at Exhibit 1293 did you at some
15 point learn that that's a photograph of Shirley Hayley?

16 A. Yes, I did.

17 Q. At some point did you learn that the remains
18 associated with case number 18-19566 were those of
19 Shirley Hayley?

20 A. Yes.

21 [Exhibit 1294 introduced
22 as evidence.]

23 BY MS. DUPRE-TOKOS:

24 Q. Looking at Exhibit 1294 can you tell us what
25 that is a photograph of.

26 A. That was the address of 15 -- or I mean 5577 --

1 Q. Heavenly?

2 A. -- Heavenly, the burned property.

3 [Exhibit 1295 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. And then looking at Exhibit 1295 can you
7 actually tell us what that photograph is of.

8 A. The remains that were found on that property of
9 Heavenly.

10 Q. Okay. Of Barbara Carlson and Shirley Hayley?

11 A. Yes.

12 Q. On November 16th, 2018, did you go to a
13 residence at 5683 Scotty Lake Drive in Paradise?

14 A. Yes, I did.

15 Q. Was that residence destroyed?

16 A. Yes, it was.

17 Q. Were human remains located there?

18 A. Yes, they were.

19 Q. Were case numbers assigned to those remains?

20 A. A case number was assigned.

21 Q. Was that case number 18-197 -- hang on. I have
22 19595.

23 A. Yes.

24 MS. DUPRE-TOKOS: Can we have a moment.

25 [Conferring off the record.]

26 MR. NOEL: Sorry. We found a typo of the case

1 number that's on the slide in the PowerPoint.

2 BY MS. DUPRE-TOKOS:

3 Q. Okay. Was the case number assigned to the
4 remains that were located at 5683 Scotty Lake Drive
5 18-19735?

6 A. Yes. That's not what it says.

7 MR. NOEL: For the record, the correct number in
8 your PowerPoint should be 19735, not 595.

9 [Exhibit 1296 introduced
10 as evidence.]

11 BY MS. DUPRE-TOKOS:

12 Q. And looking at Exhibit 1296 did you at some
13 point learn that that was a photograph of Jennifer Hayes?

14 A. I did.

15 Q. And at some point did you learn that the remains
16 associated with case number 18-19735 were those of
17 Jennifer Hayes?

18 A. Yes, I did.

19 [Exhibit 1297 introduced
20 as evidence.]

21 BY MS. DUPRE-TOKOS:

22 Q. Can you see Exhibit 1297. What is that a
23 photograph of?

24 A. Those are the remains that were found on Scotty
25 Lake Drive.

26 MS. DUPRE-TOKOS: I have nothing further.

1 Do the jurors have any questions?

2 And that slide does have the correct case
3 number.

4 Okay. Deputy Waananen, you just need an
5 admonition from madam foreperson and you'll be all set to
6 go.

7 GRAND JURY FOREPERSON: Deputy Waananen, you are
8 admonished not to discuss or disclose at any time outside
9 of this jury the questions that have been asked of you or
10 your answers until authorized by this grand jury or the
11 Court. A violation of these instructions on your part
12 may be the basis for a charge against you of contempt of
13 court. This does not preclude you from discussing your
14 legal rights with your own attorney.

15 Deputy Waananen, what I have just said is a
16 warning not to discuss this case with anyone except the
17 Court, your lawyer, or the district attorney.

18 Do you have any questions?

19 THE WITNESS: I do not.

20 GRAND JURY FOREPERSON: Thank you for your time
21 today.

22 THE WITNESS: Thank you.

23 MR. NOEL: Don't leave with the exhibits. We
24 have had that happen before.

25 [Pause in proceedings.]

26 MS. DUPRE-TOKOS: We might as well just take a

1 five-minute break.

2 GRAND JURY FOREPERSON: Okay.

3 [Break taken from
4 11:00 to 11:10 a.m.]

5 MR. NOEL: So are we ready to go?

6 GRAND JURY FOREPERSON: We re ready to proceed.
7 All members of the grand jury are present, and we're
8 ready to proceed. We're ready.

9 [Witness enters the courtroom.]

10 GRAND JURY FOREPERSON: (WITNESS #5), I'd like
11 to remind you that you're still under oath.

12 THE WITNESS: Thank you.

13 GRAND JURY FOREPERSON: Thank you.

14 **EXAMINATION CONTINUED**

15 BY MR. NOEL:

16 Q. All right. Thank you for your patience so we
17 can get those short witnesses out of the way before
18 bringing you back.

19 All right. When we left off, we were talking
20 about the representations that were made and the Advance
21 Authorization by you compared to when you were asked by
22 Mr. Cannel about the condition of the line.

23 Do you recall that?

24 A. I'm familiar with what is on the board, yes.

25 Q. Okay. So I guess where I was going when we left
26 off is when you filled out especially the initial Advance

1 Authorization where you used terms like "dilapidated" and
2 "failure is imminent," were you representing to your
3 supervisors -- when you say that was just verbiage, are
4 you saying that you were representing to the people in
5 charge of administering this fund that you were making
6 representations that you had no basis for?

7 A. So if I may explain, I think it's more of how
8 things are generally written to describe a worse case
9 scenario in order to get initial funding to investigate a
10 project and make sure it's a viable project.

11 Q. Okay. But you were applying for funds from a
12 project fund that was entitled "Deteriorated Transmission
13 Equipment Replacement Program." The title would imply
14 that that was a fund dedicated to replacing deteriorating
15 transmission assets, but that wasn't necessary true;
16 correct?

17 A. No. That fund could be -- the title of that
18 fund could be changed tomorrow, you know, back then.
19 That title could be whatever Asset Management wants it to
20 be.

21 Q. Right. And so the title has nothing to do with
22 the goal of the project or the fund; correct?

23 A. Correct.

24 Q. In your experience, in your 34 years with PG&E,
25 is that common?

26 A. It's common that they move pots of money around

1 to other identified capital projects within that
2 five-year plan.

3 Q. Well, I mean, is it common -- was it common in
4 your experience that PG&E would create these programs
5 with these great sounding names like Deteriorating
6 Transmission Asset Fund or Aging Infrastructure
7 Initiative or, you know, Aging Tower Replacement Fund?
8 Was it common in your experience that PG&E would create
9 things like that where the name of the fund or the
10 project didn't necessarily reflect what the project was
11 actually to do?

12 A. So there's -- I'm not sure how to answer that.

13 Q. Well, this is the Deteriorating Transmission
14 Asset Replacement Fund, but you're telling us that to get
15 money for that fund for a project it didn't necessarily
16 have to be a deteriorating transmission asset?

17 A. That's correct as long as it would be a capital
18 project. It didn't matter the names of those other pots
19 because those actually rolled up another level.

20 Q. Okay. You just had to check the correct boxes
21 on an application and use the correct terms like
22 "deteriorating" and "failing" whether you had basis for
23 that or not?

24 A. I can't answer that. I didn't do that many AAs.
25 Actually, it wasn't in my line of business. I was asked
26 to help out because project management workload was full.

1 Q. Okay. Well, then why did you feel it necessary
2 to use verbiage such as "dilapidated" and "failure is
3 imminent" when you were filling out your AA?

4 A. Again, it's just words. It's just writing a
5 story to get some initial funding to see if it's a valid
6 project or not. It wasn't "Here's this order we need to
7 move full force ahead on."

8 Q. Right. But why that specific verbiage?

9 A. I couldn't tell you. I come up with stuff all
10 the time.

11 Q. Okay. And then you redid the ultimate AA that
12 was approved. You used terms like "deteriorated
13 structures" when you were describing this section of the
14 Caribou-Palermo line. Is that just verbiage?

15 A. Well, it's what I was told to write by, I
16 believe --

17 Q. Keith Williams?

18 A. Keith Williams, yes.

19 Q. Okay. So the person who was -- the first-level
20 person in charge of reviewing this and approving this
21 project was telling you how to write this project?

22 A. Sure. That was common.

23 Q. All right. And this Keith Williams, he was
24 someone who was in charge of administrate or -- I can't
25 think of the phrase I was looking for but, you know,
26 determining what kinds of projects got approved for

1 funding in the Deteriorated Transmission Asset
2 Replacement Program?

3 A. He would have been the person that helped decide
4 what projects under Major Work Category 70 move forward
5 on.

6 Q. Now, you said he was, you believe, the person
7 who told you about the Deteriorating Transmission Asset
8 Replacement Program to start with; correct?

9 A. Yes. He said he had some money in this
10 particular program if anybody had anything that they
11 wanted to spend it on. And if not, the money would be
12 moved to another program.

13 Q. Did he specify in that that the projects had to
14 be to replace aging deteriorating transmission assets?

15 A. No. It was to replace capital assets, period,
16 whether it was deteriorating or not.

17 Q. And he was the one who assisted in your filling
18 out the AA and describing the project you were nominating
19 so that it would get funding?

20 A. So, I mean, I don't recall exactly, but the
21 people that were involved in this was -- gosh, Keith
22 Williams, John Culbertson, and (EMPLOYEE #3). So it's
23 combined efforts to get some initial funding approved to
24 again see if it's a viable project.

25 Q. To your knowledge, did Keith Williams have any
26 personal knowledge of the Caribou-Palermo line?

1 A. Personal knowledge? I couldn't answer that.

2 Q. Okay.

3 A. I'm sure he's seen reports but not hands-on
4 personal.

5 Q. All right. So the program -- the project is
6 basically cancelled in 2010; correct?

7 A. I couldn't tell you the year. I don't know.

8 Q. Okay. At some point does the program -- the
9 project come back to you?

10 A. Yeah, it comes back to me to do a small portion
11 of the line for improvements and to try to settle the
12 cost to the right assets.

13 Q. All right. And what do you mean "settle the
14 cost to the right assets"?

15 A. Since the project cancelled, are there any
16 identifying elements of that -- of the work done to date
17 that can be placed into a capital improvement asset?

18 Q. Okay. So anything that was accomplished that
19 could be passed off to the rate payers?

20 A. I don't know how much of it passed off to the
21 rate payers, but a capital job is a capital job.

22 Q. Do you know the difference between a capital job
23 and an expense job in terms of where the money comes
24 from?

25 A. It's simplified, but there's much more depth to
26 it.

1 Q. Okay. So can you explain to us how you settled
2 the money spent on this project out?

3 A. Well, we completed a whole new road. So that's
4 a capital improvement. And I knew the rough dates that
5 the road was done and the people that worked on it and
6 the contractors that worked on it. So pulled those costs
7 out, itemized them, and e-mailed the financial people
8 "Hey, here's a way we can capitalize the road aspect of
9 this." And then any work that was done on replacing the
10 insulators, those could come out and go to another asset
11 for capital work.

12 And the only thing left on the job would have
13 been initial engineering that was 100 percent related
14 to -- if the new -- if new towers were to be stalled, the
15 engineering on that. So I separated out work classes and
16 categories and --

17 Q. Okay. Do you recall how much was charged off to
18 this road?

19 A. I don't recall, no.

20 Q. \$588,000 sound about right?

21 A. Okay. I don't recall. I mean, you're reading
22 through stuff; right?

23 Q. Yeah.

24 Where was this road built?

25 A. Across the river where the new line would have
26 went adjacent to some existing 230 lines, Caribou-Table

1 Mountain, and -- I don't know the other line name.

2 Q. So in the end money from the Deteriorating
3 Transmission Asset Replacement Program that was funded so
4 the Caribou-Palermo which was actually used to build an
5 access road for the Caribou-Palermo?

6 A. No, that's not true.

7 Q. Isn't that how it ended up in the end?

8 A. No.

9 Q. Okay. Where was that access road?

10 A. Where was what?

11 Q. The access road that all this money was spent
12 on, where was it built?

13 A. Adjacent to the Caribou-Palermo line.

14 Q. And did that benefit the Caribou-Palermo line in
15 any way?

16 A. No, but what you're messing is, if I may
17 explain, the money that went to the road got transferred
18 in a whole different planning order level and Major Work
19 Category level. It's got nothing to do with money that
20 actually sat in a deteriorated facility after things
21 settled down.

22 Q. Right. But that money was originally allocated
23 for improvements on the 100-year-old Caribou-Palermo line
24 that never occurred; right?

25 A. Not -- not when everything settled down, that's
26 not correct.

1 Q. I'm talking about the original.

2 A. It doesn't --

3 Q. Not the ledgers afterwards but when you're going
4 back and settling it out. Originally, the money that was
5 spent was spent on a project that you applied for money
6 for the Deteriorating Transmission Asset Replacement Fund
7 to improve the 100-year-old Caribou-Palermo. That money
8 was spent to essentially build an access road for the
9 Caribou-Table Mountain; correct?

10 A. It was built as an access road to make the new
11 Caribou-Palermo line section. And since that day it also
12 benefited at that time the Caribou-Palermo and the
13 other -- I'm sorry, the Caribou-Table Mountain and the
14 other adjacent line.

15 So since the Caribou-Palermo got cancelled, all
16 the money and assets of the dollars that were spent came
17 out of a road budget. A totally different pot.

18 Q. Okay.

19 A. And any money that would have originally been
20 spent under that initial Caribou line got replenished
21 when the transfer occurred.

22 Q. I guess that's a good question. If that money
23 got replaced, where did that money come from?

24 A. From the road budget from Major Work
25 Category 71. When you do a journal entry, you're moving
26 dollars from one pot to another pot.

1 Q. Right. Okay. So in 2007 you applied for money
2 from the Deteriorating Transmission Asset Replacement
3 Fund to do a job to replace the deteriorating,
4 dilapidated, going-to-fail Caribou-Palermo. And that
5 ultimately gets cancelled; correct?

6 A. Caribou -- the line section that I applied for
7 got cancelled because after an inspection was done, it
8 was determined that the towers were sound enough to be
9 left alone.

10 Q. Who did that inspection?

11 A. It would have been the tower department.

12 Q. And would there have been records of that
13 inspection?

14 A. I have no direct knowledge. I've never seen
15 them.

16 Q. Okay. So then there's the -- you've seen the
17 e-mail exchange that you were part of between Doug Cannel
18 and (WITNESS #15). And (WITNESS #15) says "You can't
19 cancelled this. How is it going to look if those towers
20 fall off into the canyon?" Correct?

21 A. That's what that e-mail says.

22 Q. And he says it twice in two different e-mails;
23 right?

24 A. I don't recall but . . .

25 Q. Two years later in 2012 were you involved with
26 the collapse of the towers?

1 A. No, not directly.

2 Q. Okay. Were you involved indirectly?

3 A. Yeah. I went and looked and seen what took
4 place and the damage.

5 Q. How did it feel that two years after the
6 statement about towers falling off into the canyon and
7 now you have six towers that are -- or five towers
8 falling off into the canyon?

9 A. What do you mean how did it feel? I don't
10 understand that.

11 Q. I mean --

12 A. There's no feeling for me on that.

13 Q. Did anybody point up and say "This is kind of
14 what we warned you about"?

15 A. No.

16 [Exhibit 1300 introduced
17 as evidence.]

18 BY MR. NOEL:

19 Q. Okay. All right. I have up in front of you
20 1300. This is -- do you recognize this e-mail chain?

21 A. Somewhat.

22 Q. Okay. This is an e-mail from October of 2013.
23 And specifically, I want to --

24 Can you read for us your October 30th, 2013,
25 e-mail?

26 A. "I think we may have too many Caribou-Palermo

1 jobs and we are getting confused. The Planning Order
2 that Clint references below was created back on 9/14/12
3 and is for the old (WITNESS #15) job for relocating
4 towers 7/55 through 8/64 job number 30606109. It has
5 nothing to do with the towers that fell over during last
6 winter back on 12/21/12 under 30967455 under Major Work
7 Category 92 and in the subject matter above.

8 I do not believe there was a PO created under
9 Major Work Category 70 yet for that replacement project
10 that is now sitting on wood poles and was not intended
11 for long-term reliability."

12 Q. All right. A couple of things. Do you remember
13 how many were too many Caribou-Palermo jobs?

14 A. My guess is, like, between -- well, okay. So
15 when I'm referring to this, there is other
16 Caribou-Palermo projects --

17 Q. Okay.

18 A. -- going on throughout that line. And each one
19 of those projects has its own order number. But what I'm
20 stating here, I believe, was just that relocation section
21 had five to seven order numbers already.

22 Q. Okay. Can you explain that to us, please, how
23 that has five to seven order numbers.

24 A. The order number I initially pulled for the
25 planning order to -- I mean, excuse me, the Advance
26 Authorization to be tied to. When it went to project

1 management, they have their order number and creation
2 policies and format. PG&E went through a SAP Program
3 upgrade and so it automatically generated another order.
4 And then there was an order created for the road, an
5 order created for the insulator replacement.

6 Q. Okay. All right. And then it says "The PO that
7 Clint references below was created back on 9/14/12 and
8 it's the old (WITNESS #15) job for relocating the towers
9 30606109."

10 So what was created on 9/14/12?

11 A. I don't know because I'm not seeing a PO number
12 on what you have in front of me.

13 Q. Okay. And then "It has nothing to do with the
14 towers that fell over during last winter back on 12/21."
15 And that gives a number 30967455; correct?

16 A. Yes.

17 Q. All right. And then it says "I do not believe
18 there was a PO created under MWC 70 yet for that
19 replacement project." What does that mean?

20 A. So the emergency work that was done on the five
21 towers that fell down --

22 Q. Okay.

23 A. -- was done under Major Work Category 92
24 emergency. And nothing was created, when I was looking
25 through stuff, to replace that temporary wood pole line
26 back with a permanent transmission line which would have

1 been done under Major Work Category 70 or tower
2 replacements.

3 Q. Okay. So the shoofly is the 30967455. Am I
4 reading --

5 A. The clean-up of the failure.

6 And to go back on the shoofly, I don't know if
7 that was the exact number, but that was what that's
8 referring to.

9 Q. Okay. And then there needs to be a new PO
10 number created for the actual replacement of the towers
11 that fell down?

12 A. Yeah, a new -- so a PO is just again a holding
13 pot. Like, you can have several order numbers under it.

14 Q. Okay.

15 A. But there was no PO for project management on
16 Major Work Category 70 to replace the wood with steel.

17 Q. So ten months after the towers fell down and
18 there still isn't a project to replace those towers?

19 A. It's nothing to do with me.

20 Q. That's why I'm asking. Am I reading that
21 correctly?

22 A. And it doesn't matter because it was on a good
23 reliable shoofly. Shooflies have been known to be in
24 place for years.

25 Q. But you say right here it was not intended for
26 long-term reliability.

1 A. Right.

2 Q. So the shoofly wasn't intended for long term?

3 A. One to five years is not long term.

4 Q. Okay. Wasn't the shoofly built only as a patch
5 until the spring when allegedly people would be able to
6 get in and permanently fix it?

7 A. Can't answer that. It wasn't my project.

8 [Exhibit 1268 introduced
9 as evidence.]

10 BY MR. NOEL:

11 Q. Okay. Well, then we have 1268 here. Do you
12 recognize this e-mail?

13 A. Yeah.

14 Q. Okay. And this is an e-mail from you to Henry
15 Ho?

16 A. Yeah. The last part of it, yeah. The top part?

17 Q. Yeah.

18 A. Yeah.

19 Q. Okay. And this is where Henry Ho explains --
20 this e-mail 1268 is where Henry Ho explains what caused
21 the towers to fall down?

22 A. Yes.

23 Q. And your response is "Well, after reviewing the
24 write-up and all of the evidence myself, I will accept
25 your theory."

26 A. It was a thing between him and I that we had

1 different beliefs on why those failed.

2 Q. Okay. Now, although your title is M&C
3 engineering, you weren't an engineer; correct?

4 A. That's correct.

5 Q. You didn't go to school? You don't have any
6 engineering degree?

7 A. No, I don't.

8 Q. You're not a licensed engineer; correct?

9 A. That's correct. Never been.

10 Q. Okay. But Henry Ho is an engineer?

11 A. Yes.

12 Q. Why do you think those towers fell?

13 A. Well, from what I saw out there, a bolder came
14 down and smashed one of them and then that's what caused
15 the uplift on the other footing. It was initiated by a
16 boulder because there was evidence of a boulder or rocks
17 on the top portion of the tower laying on the hill. And
18 that's the only way it could have been marked up. It was
19 not -- the tower didn't flip over or anything like that.
20 It was leaning down. There was a void above where a rock
21 slide was, and that's my -- it was my opinion in the
22 field.

23 Q. Okay. But the expert came in and said "No,
24 there was no bolder."

25 A. Well, that's why I replied to him like that
26 because it was a thing between him and I. We both have

1 mutual respect for each other's knowledge. And sometimes
2 he's wrong and sometimes he's right.

3 [Exhibit 1301 introduced
4 as evidence.]

5 BY MR. NOEL:

6 Q. Okay. All right. Let's move on to 1301. Do
7 you recognize 1301?

8 A. Yes.

9 Q. What is 1301?

10 A. It's an e-mail to the Table Mountain T-line
11 personnel that engineering has determined that on the
12 following towers this is the scope of work that needs to
13 be done to help insure that the reliability through that
14 section that (EMPLOYEE #3) had originally a question was
15 made sound and that helped reduce the chance of any
16 emergencies through that inaccessible area.

17 Q. Okay. So (WITNESS #18) and (WITNESS #12) are
18 the Table Mountain T-line people you're talking about?

19 A. Yes.

20 Q. And the subject to this is "Caribou-Palermo
21 Towers." And start off where it says "Looks like we will
22 be forced into trying to capture the \$650K plus/minus
23 that has been spent on the now cancelled project for
24 relocating Towers 6/53 to 7/65 from the non-accessible
25 river side to the highway side that (WITNESS #15)/Rich
26 Pettingill was managing."

1 All right. What do you mean that you were being
2 forced into trying to capture?

3 A. Meaning it left project manager's hand and left
4 a potential contractor doing that work. Now, it became
5 my mess to clean up and Table Mountain T-line's
6 responsibility to install the engineering requested --
7 engineering suggested materials so we could finally close
8 the job and put it to bed.

9 Q. Okay. All right. So then it says "In order to
10 not have to expense the dollars we spent, we will be
11 required to perform the following work." And the first
12 one is a new suspension insulator assembly for Towers
13 7/56, 7/57, 7/58 with eight bells of corrosion resistant
14 ceramic insulators PG&E Code 31-4125. Hardware assembly
15 per drawing 056414 type SA."

16 So what does that mean?

17 A. It means on those three towers we need to put
18 new insulators and hardware per that material code and
19 suggested engineering drawing.

20 Q. Okay. Why?

21 A. Why?

22 Q. Yeah. Why?

23 A. That's just what engineering came up with. Like
24 I just stated earlier, it's to help insure (EMPLOYEE
25 #3)'s suspectability that there could be a failure in
26 that. So since it's inaccessible, let's go ahead and put

1 these insulators in. And then we can also capture
2 this -- a portion of this as a capital project.

3 Q. Right. It starts off with "In order to not have
4 to expense the dollars --" Correct?

5 A. Yeah, that's what it says.

6 Q. And so that means that you're trying to find
7 capital projects for the money that has already been
8 spent; correct?

9 A. Trying to find -- yes. That's common.

10 Q. Right. So you're trying to capitalize it so it
11 comes out of this pot over here on the left instead of
12 this pot over here on the right; correct?

13 A. Correct.

14 Q. And the basis of that is it comes out of the
15 rate payers what you can get from FERC as opposed to out
16 of the profits; right?

17 A. I don't know that verbatim.

18 Q. Okay. So it seems to me that this list of
19 things that you're doing on the Caribou-Palermo line
20 you're only doing it so that you can capitalize it, not
21 because it's necessary.

22 A. It -- it helped mitigate a T-line supervisor's
23 concern. And by me not seeing the inspection reports I
24 don't know what was found. This is engineering reviewing
25 those inspection reports and coming up with this
26 subjected scope of work.

1 Q. Okay. So you have no idea whether this is
2 necessary or not? You're just doing this because you
3 were told to do it?

4 A. Correct.

5 Q. And the only reason you know is so that it can
6 be capitalized as opposed to expensed?

7 A. Correct.

8 [Exhibit 1302 introduced
9 as evidence.]

10 BY MR. NOEL:

11 Q. Okay. All right. Let's move on to 1302. Do
12 you see 1302 up there?

13 A. Yeah.

14 Q. All right. And this is some more e-mails or an
15 e-mail string between you and somebody named John
16 Culbertson in April of 2014 or from -- starting in
17 November of '13 and going to April '14.

18 All right. See that? Recognize it?

19 A. Yeah.

20 Q. Okay. We're going to go backwards because we
21 read these from the front -- from back to front. So
22 we're going to go to page 3 and the e-mail that starts
23 off.

24 Who is Rich Pettingill?

25 A. He would have been the project manager after
26 (WITNESS #15).

1 Q. Okay. Who is John Culbertson?

2 A. Someone in the Asset Management group.

3 Q. And back down on the signature line Rich
4 Pettingill. It says he's a CPA. So he's an accountant?

5 A. No. He's a project manager. He might have
6 degrees in that area, but that's --

7 Q. Okay. And his e-mail starts out -- it says "I'm
8 nearing the end of getting this scope approved. The
9 question I received is what is the EDRO? John, do you
10 have a budget next year to do this work?

11 (WITNESS #5) assuming we have budget, what
12 should I put as the EDRO?"

13 What is the EDRO?

14 A. Estimated date released to operations.

15 Q. What does that mean?

16 A. When are you estimating you will have the work
17 completed?

18 Q. Okay. And then your response to him is on
19 November 19. "If there is budget, 11/15/14." Can you
20 explain that.

21 A. If there's funds available to re-insulate,
22 that's when we'll try to have it done by.

23 Q. Okay. And this is referring to the
24 Caribou-Palermo insulator replacement project now;
25 correct?

26 A. Yes.

1 Q. All right. And then he responds back "(WITNESS
2 #5), the engineering and materials cost estimate to
3 complete this work is \$60,000. How much should I put in
4 for PM and construction?"

5 Can you explain that.

6 A. It looks to me like he got a quote from
7 engineering how much time it would take them to make that
8 punch list that was on the other e-mail and the cost of
9 the materials purchased.

10 Q. And then up above the very top "My rough guest
11 in this terrain would be \$275,000 for the 13 tower
12 locations."

13 A. Yeah, I wrote that.

14 Q. So how is it now 13 towers?

15 A. It's a scope engineering determined.

16 Q. Okay. All right. Now we're onto page 2, I
17 believe. Or did I skip it? There we go. Page 2. And
18 then on Wednesday, November 20th you said "That puts this
19 whole thing over \$1 million, doesn't it? With the --"
20 something that doesn't translate apparently "-- already
21 incurred."

22 Do you know what you were talking about there?

23 A. The dollars that would have been in the project
24 as a whole before it's separated out to the individual
25 components.

26 Q. All right. And then he responds -- Pettingill

1 responds "Sure does. Those are some very expensive
2 insulators."

3 And then can you read us your response to that.

4 A. "Hope you don't think I'm trying to throw a
5 monkey wrench into your scope change. But if I remember
6 right, (WITNESS #15) spent a lot of money on having
7 enough roads put in for where the new line was going to
8 be installed. Wouldn't we be better off as a company to
9 make the roads that were put in the unit of plant and
10 just close out the job that was -- or that way -- the way
11 it currently is? We can still plan on doing the
12 insulator work and moving forward, but I think we should
13 just close out this order as all road work and surveys.
14 I can pull a totally different order number under the
15 correct planning order for the insulator work.

16 Your thoughts."

17 Q. And then he responds "I think all of that will
18 need to be handled in project re-authorization."

19 A. Yeah.

20 Q. So now you have to get this whole thing
21 re-authorized?

22 A. I don't. I'm not the project manager.

23 Q. Oh, and then it goes on to further discuss that,
24 and it talks about LIDAR. And if we could go up here to
25 the next response that starts with "We used --"

26 Can you read that to us and explain to us what

1 that means.

2 A. "We used the LIDAR so we knew exactly where our
3 roads should be installed with all of the side hill
4 contours out there. LIDAR sure isn't needed for the
5 insulator replacements. It's trying to make this
6 simplified and stop the AFUDC charges and start with a
7 clean slate. There shouldn't be anyone left in the
8 system that would question us settling the costs to date
9 to ETP359000 Roads and Trails."

10 Q. So what are you talking about here? Can you
11 explain it to us.

12 A. Well, it's kind of what I explained earlier by
13 splitting off all these different order numbers and
14 transferring the dollars to the proper assets that were
15 installed.

16 Q. So what is LIDAR?

17 A. LIDAR is a flyover with an airplane and you take
18 contour shots of the ground.

19 Q. Okay. So are they trying to charge the LIDAR to
20 the insulator project?

21 A. No.

22 Q. Okay. All right. Let's move on to the next
23 exhibit.

24 THE WITNESS: I need to take a break for a
25 second.

26 MR. NOEL: Okay. Madam Foreperson.

1 GRAND JURY FOREPERSON: Yes. Okay.

2 MR. NOEL: You should be admonished. And do we
3 want to break for lunch or do we want to push through
4 with him? Everybody good? Okay.

5 GRAND JURY FOREPERSON: Push through.

6 MR. NOEL: All right. Go ahead.

7 [Recess taken from 11:53 a.m.
8 until 12:00 p.m.]

9 GRAND JURY FOREPERSON: Okay. All members of
10 the grand jury are present and ready to proceed back from
11 break.

12 BY MR. NOEL:

13 Q. All right. (WITNESS #5), you had an opportunity
14 to go out and consult with your attorney?

15 A. Yes.

16 [Exhibit 1303 introduced
17 as evidence.]

18 BY MR. NOEL:

19 Q. Okay. All right. Moving on to Exhibit 1303.
20 Do you see 1303?

21 A. Okay.

22 Q. Do you recognize 1303?

23 A. Somewhat.

24 Q. This is another e-mail string from July of '14
25 between you and somebody named (EMPLOYEE #16) and
26 (WITNESS #12) and (WITNESS #21).

1 A. Well, that's all Table Mountain T-line people.

2 Q. Okay. So let's start at the bottom and read
3 your initial e-mail here to us.

4 A. "(EMPLOYEE #16), I'm sure you are familiar with
5 the section of towers that (EMPLOYEE #3) wanted to
6 relocate onto this side of the Feather River at Beldon
7 Town area and Caribou Road. In order to try to capture
8 the \$900K that was spent for nothing, Asset Management
9 decided that we would just replace the insulators and
10 hardware on the section of towers that were initially
11 going to be relocated.

12 I know most of these are helicopter access.
13 What I need is your best guess for replacing out all of
14 the existing insulators and hardware from 7/55 and 8/64.
15 When you can find the time, I need total man-hours and
16 the number of days you would need to utilize the
17 helicopter. This is so I can put a cost estimate
18 together for next year's plan."

19 Q. All right. So there's one I want to concentrate
20 on.

21 "In order to try and capture the 900,000 that
22 was spent for nothing, Asset Management decided that we
23 would just replace the insulators and hardware on that
24 section of towers."

25 Did I read that correctly?

26 A. That's what it says, yes.

1 Q. I thought you said that engineering determined
2 that you needed to replace those insulators?

3 A. Engineering is who came up with the punch list
4 of what needed to be done out there, yeah.

5 Q. Okay. But you specifically say right here "In
6 order to try and capture the 900,000 that was spent for
7 nothing, Asset Management decided we would just replace
8 the insulators."

9 That's your own words; correct?

10 A. Yes.

11 Q. In 2014?

12 A. Yes.

13 Q. And that's what you're telling the team or
14 the -- the people who are going to be doing the work is
15 that you need the estimate of the work; correct?

16 A. That's what I stated in here, yes.

17 Q. All right. So that makes it sound like the only
18 reason that you're doing this work is because you need
19 something tangible to show for the 900,000 that was spent
20 on this project.

21 A. I can see where you'd interpret it that way.
22 But one, we weren't trying to capture the whole \$900K.

23 Q. Right.

24 A. We're trying to capture work that could be
25 performed through capital asset, and that was required.
26 And I threw out management's name in there because if I

1 said engineering, (EMPLOYEE #16) wouldn't listen to it as
2 much if I said asset management.

3 Q. Why would (EMPLOYEE #16) not listen to
4 engineering?

5 A. It's just Asset Management made it sound like
6 more of a priority. "Let's get this scheduled and get it
7 done."

8 Q. Asset Management is the money people; right?

9 A. I'm not sure if they are or Business Finance is.

10 Q. Well, Business Finance is part of Asset
11 Management, isn't it?

12 A. I don't know.

13 Q. Well, Asset Management is the people who control
14 the money and engineering are the experts like Henry Ho
15 and the actual engineers who evaluate; correct?

16 A. Okay.

17 Q. So are you telling me that they're going to
18 listen to the money people before they listen to the
19 actual engineers?

20 A. Well, (EMPLOYEE #16) wasn't a normal supervisor.
21 So you're just trying to throw authority out there to
22 know that we need to get some of this work done.

23 Q. Okay. And nowhere in here do you say that it's
24 necessary to replace these insulators?

25 A. No, I don't say that.

26 Q. Okay. Now, apparently you sent some pictures of

1 each structure as part of this e-mail chain. Do you
2 remember what those pictures are?

3 A. The pictures, I believe, were of the insulator
4 strings on the towers.

5 Q. Do you know where those pictures are?

6 A. I do not.

7 Q. Where would we find those pictures?

8 A. I have no idea.

9 Q. Would those pictures include the cold-end
10 attachment points of those insulator strings?

11 A. Probably. If you zoomed way in, you might be
12 able to see some of that.

13 Q. Okay. So at some point in 2014 you realized
14 that there existed these pictures with cold-end
15 attachment points of these towers and they are somewhere?

16 A. Yeah. I think it was a bunch of scanned
17 pictures of a helicopter patrol showing what was there
18 existing. So engineering utilized those to review to
19 determine what their punch list would look like to bring
20 it up to today's standards.

21 Q. Okay. So the insulators on these -- on this
22 line weren't up to today's standards?

23 A. They don't have to be up to today's standards
24 until you touch them.

25 Q. Okay. So it's okay for them to be 100 years
26 old?

1 A. I'm not saying that they were 100 years old.

2 [Exhibit 1304 introduced
3 as evidence.]

4 BY MR. NOEL:

5 Q. All right. Let's move on to 1304. Do you
6 recognize 1304?

7 A. It looks like a continuation.

8 Q. It's a little bit different wording in the
9 subject. But again, you, (WITNESS #14), (EMPLOYEE #16).
10 Or actually, a little bit different compared to the BATE
11 stamp I guess is what it is.

12 A. Okay.

13 Q. And it looks to me -- am I reading this
14 right? -- that (WITNESS #14) is estimating that this job
15 is going to take 500 hours and four days of helicopter?

16 A. Yes.

17 Q. So 500 hours and four days would be 125 hours a
18 day. So how many people is that?

19 A. I don't know.

20 Q. Okay. And then you say "Thanks. I will work
21 with you with what you have and actually add a
22 contingency to that so we have enough funding for 2015.
23 We can always give monies back if we don't use it."

24 A. Right.

25 Q. So can you explain that to us.

26 A. Well, the contingency is the wind comes up

1 through the canyon or whatever and you need an extra day,
2 that's money to pay for the helicopter longer and more
3 hours if needed because the weather is so unpredictable
4 in that area.

5 Q. Okay. So we're going to ask for this much; and
6 if we don't spend it, we give it back?

7 A. Yeah. It's not real money anyhow. It's just
8 allocated in a plan. What they go by is what your
9 actuals are and then they readjust the targets in those
10 planning order buckets.

11 Q. Okay.

12 A. So it's not like they set aside all that money
13 for that job and then it just goes off into thin space.

14 [Exhibit 1305 introduced
15 as evidence.]

16 BY MR. NOEL:

17 Q. All right. 1305. Do you recognize 1305?

18 A. Somewhat.

19 Q. Okay. What do you remember about 1305?

20 A. I don't remember who Vijay is, but she was
21 looking for some justification on stuff.

22 Q. Okay. All right. Let's kind of start in the
23 middle here with your e-mail of November 3rd, 2014, to
24 Bangalore, Vijayraghavan --

25 MR. NOEL: Common spelling, Madam Reporter.

26 BY MR. NOEL:

1 Q. -- and Evan Geisert cced to a bunch of people.
2 It says "MWC 70 Caribou-Palermo relocation job that
3 originally started back in 2007 will be cancelled and
4 written off. There will be two new jobs created;
5 installing access roads and re-insulating 7/55 to 8/64."

6 Correct?

7 A. Yes.

8 Q. "The actual costs that have been spent since
9 inception in the original 30606109 --"

10 And that's that same order number we talked
11 about that was created back in 2012, correct, that we
12 looked at earlier?

13 "-- will be split amongst a total of three
14 orders; the original order plus 31088923 (roads) and
15 31088819 (insulators MWC 93)."

16 A. Correct.

17 Q. Then you go on to say "Those values have not yet
18 been fully determined. The remaining amount in the
19 original order will be written off. 31088923 would only
20 see charges that have been moved from the original job.
21 3108819 will see a portion of the original charges and
22 future charges in 2015 for replacing insulators under
23 MWC 93."

24 Can you explain what you're talking about to us.

25 A. It's just the start of coming up with a
26 different capital asset plans to split the costs spent to

1 date or unsettled costs from the original order into work
2 that was performed and can be capitalized.

3 Q. Okay. So again, looking at capitalized money
4 that has already been spent plus any additional money
5 that is spent; correct?

6 A. Yes.

7 Q. Now, "The original job has now been cancelled
8 and written off." What does that mean?

9 A. It means whatever money -- however much money is
10 left in the order after everything has been transferred
11 will be written off or will be expensed.

12 Q. Okay. And then it says "re-insulating 7/55 to
13 8/64." Correct?

14 A. That's what it says.

15 Q. And that's what the original was moving? 7/55
16 to 8/64 across the river; correct?

17 A. Correct.

18 Q. And then later on all of a sudden it went up to
19 13 insulators. And you told us that's what engineering
20 said needed to be done; correct?

21 A. Correct, independent of the line relocation.

22 Q. And now we're back to re-insulating just 7/55 to
23 8/64.

24 A. Because we're talking about the original order.

25 Q. Okay. And that those are going to be now under
26 this 3108819 number; correct? Actually, it's 88819.

1 A. Yes.

2 Q. And under Major Work Category 93?

3 A. Yes.

4 Q. And what was 93?

5 A. It's like -- it's like "other." It's
6 insulators, hardware, certain components of the tower
7 where as 70 is a complete tower.

8 Q. Okay. And then up above here there's an e-mail
9 from you to somebody named Clint Holsey, H-o-l-s-e-y.
10 Who is Clint Holsey?

11 A. He would have been the supervisor of Rich
12 Pettingill at the time.

13 Q. Okay. All right. It says -- the title is
14 "Caribou-Palermo \$750K." Correct?

15 A. That's what that title says, yeah.

16 Q. And you write "Clint, this is what I sent to
17 Vijay. I will eventually want to transfer this MWC 70 PO
18 5725534 to my 93-5510406 so that I can replace all of the
19 insulators in this line section like Asset Management
20 wants me to."

21 A. Okay.

22 Q. Did I read that correctly?

23 A. That's what I wrote, yes.

24 Q. Okay. So what is PO 5725534?

25 A. That's the -- it could be the pyramid that
26 resides above the order levels. And that's it down there

1 at the bottom.

2 Q. Okay. So down here on the very bottom line of
3 this --

4 A. It's a description of what planning order stands
5 for.

6 Q. Okay. All right. So and the Major Work
7 Category 70 you say is replacing steel structures?

8 A. Yes.

9 Q. So this has now been cancelled; right? This is
10 gone? It's disappeared; correct?

11 A. I don't know what you mean by "disappeared."

12 Q. There is no more project 5725543 relocate tower
13 7/55 to 8/64 in the Major Work Category 70?

14 A. Well, it's still there. They're just not moving
15 forward with the tower replacement.

16 Q. You say right here in your November 30th "It
17 will be cancelled and written off."

18 A. Yes.

19 Q. So it's not going forward?

20 A. Right.

21 Q. Okay. Now, again up here you say "So I can
22 replace all of the insulators in this line section like
23 Asset Management wants me to." Correct?

24 A. Okay.

25 Q. Why not engineering? That's what engineering
26 wants to do.

1 A. Because I'm dealing with Asset Management's side
2 of the house.

3 Q. Okay. So you're lying to the transmission line
4 people and telling them "Asset Management wants me to do
5 this instead of engineering because they don't understand
6 it." So you're lying to the asset management people?

7 A. No. It's asset management saying "Can we
8 replace insulators to capitalize this work? Any portions
9 of it?"

10 Engineering reviews it, looks at the pictures
11 and all that stuff, and says "Yeah. What is currently
12 there is not per today's standard. And since we have
13 touched those towers, we now have to bring them up to
14 today's standards. And here is the punch list of what
15 it's going to take to bring it up to today's standards."

16 Q. Okay. So let's back up and break that down.
17 Asset Management says "We want to replace these
18 insulators so that we can capitalize the money that's
19 already been spent"?

20 A. A portion of it, yes.

21 Q. And then engineering comes in and says "We've
22 touched these towers so we have to change the
23 insulators"?

24 A. Yes.

25 Q. So any time you touch one of these old towers,
26 you should have to change the insulators out?

1 A. I don't know the logistics of that.

2 Q. Well, you're telling us that's what you were
3 told.

4 A. Yes.

5 Q. If you touch these towers --

6 A. You said "every time." I can't answer that.

7 Q. Well, for instance, are you familiar with the
8 replace connectors project on the Caribou-Palermo?

9 A. No. I wasn't involved with that.

10 Q. But you're familiar with it though; right?

11 A. No, I'm not.

12 Q. Okay. And by the way, how at this point did
13 anybody even touch these towers? They didn't get
14 relocated; right?

15 A. Well, I know they were inspected. They were
16 climbed on. They took some samples out of the conductor
17 to have that tested for being annealed. I know that
18 there was -- I didn't follow that 100 percent all the way
19 through because it wasn't my job. I just know some
20 certain things that were done because people would cc me
21 on e-mails.

22 Q. Okay. But they have done no work in these
23 towers yet?

24 A. I just said what they did.

25 Q. Okay. But towers get inspected all the time,
26 towers get worked on all the time; correct?

1 A. You're asking me about an area that I'm not
2 familiar with on what the standards are.

3 Q. Okay. But you're telling us that engineering is
4 saying "We touched these towers so now we have to change
5 out these insulators"?

6 A. That is how it was presented, yes.

7 Q. Okay. So who presented that to you?

8 A. I don't recall.

9 [Exhibit 1306 introduced
10 as evidence.]

11 BY MR. NOEL:

12 Q. Okay. Let's move on to 1306. Do you recognize
13 this e-mail?

14 A. Yes.

15 Q. All right. Basically you're still working on
16 getting those insulators replaced in March of '15;
17 correct?

18 A. Yes.

19 Q. So now we're eight years into this project and
20 you haven't even changed the insulators; correct?

21 A. Well, they weren't deemed to be replaced for
22 eight years into the project.

23 [Exhibit 1307 introduced
24 as evidence.]

25 BY MR. NOEL:

26 Q. Okay. Now 1307. Can you tell us what 1307 is.

1 A. It looks like a list of line names that Table
2 Mountain T-line either would have been responsible for or
3 was just in their area of work being performed.

4 Q. Okay.

5 A. And they --

6 Q. And is it a schedule of work or --

7 A. It's a work forecast plan.

8 Q. Okay. Explain to us how to read it.

9 A. The top line got the order number that they'll
10 be charging the work to. They got the tag number from
11 when it was inspected in the field and they found
12 something wrong that needed attention. You got the tower
13 number and line name with the tag and numbers associated
14 with it and you have the month that the work is currently
15 forecasted and planned for in the work management flow
16 system.

17 Q. Okay. All right. So 3108819 -- that's to
18 replace insulators; correct? That's their project?
19 Caribou-Palermo replaced insulators?

20 A. Yes.

21 Q. It doesn't have a notification number. Does
22 that mean that nobody has issued a tag saying that they
23 found the insulators need to be replaced?

24 A. It means that since it's come from project
25 management, project management jobs do not have
26 notification numbers.

1 Q. Okay. And then there's no check. So this isn't
2 scheduled; correct?

3 A. It's currently not scheduled by T-line
4 maintenance, yes.

5 Q. And then up here in the body of the e-mail you
6 say "They are asking us to return dollars already for
7 jobs that are unplanned." Do you know who "they" is?

8 A. Would have been Asset Management.

9 Q. Okay. So does this mean that they're looking at
10 taking back the money for this project?

11 A. For just the current year.

12 Q. Okay. So the fact that there's no notification
13 number means that there is no tag number; correct?

14 A. Which again there was no tags generally for
15 project management work.

16 [Exhibit 1308 introduced
17 as evidence.]

18 BY MR. NOEL:

19 Q. Okay. All right. Now moving on to 1308. Do
20 you recognize 1308?

21 A. Yeah.

22 Q. This is an e-mail from May 20th of 2016 between
23 you and somebody named (EMPLOYEE #17).

24 A. She's the clerk for Table Mountain.

25 Q. Okay. All right. So on May 20, 2016, you wrote
26 "40691004 - 6/53 - install inverted." And then there's a

1 list of all of these with a number. Can you explain what
2 we're looking at.

3 A. That number is referred to as an equipment
4 number that identifies that particular structure within
5 the SAP Program.

6 Q. Okay. And then it starts off with an e-mail
7 from (EMPLOYEE #17) that says "(WITNESS #5), could you
8 please let me know how many notifications do I need to
9 create on this job." Correct?

10 A. Yeah. That's what she's asking.

11 Q. And that is job 31088819; correct?

12 A. Correct.

13 Q. All right. So are these -- these are structure
14 numbers or these are notification numbers?

15 A. Neither. It's called equipment numbers.

16 Q. Okay. All right.

17 A. Each tower has a unique equipment number as well
18 as the structure number.

19 Q. All right. So let's go back up to your final
20 e-mail in this chain May 20th, 2016 to (EMPLOYEE #17).
21 You say "I do not know. I have e-mails from and to
22 (EMPLOYEE #16), (WITNESS #14), and (WITNESS #19) asking
23 what was completed so far but never could get any
24 answers. As for (WITNESS #12), no e-mails, just phone
25 conversations. This started when (EMPLOYEE #16) was
26 running the area. So unfortunately I have no supporting

1 documents from (WITNESS #12).

2 This work was deemed by Manho in order not to
3 end up expensing \$800,000 that was spent by (WITNESS #15)
4 on an original job started by (EMPLOYEE #3)."

5 Did I read that correctly?

6 A. Yes.

7 Q. Who is Manho?

8 A. He's at the time pretty much the top of Asset
9 Management.

10 Q. That would be Manho Yeung?

11 A. Yes.

12 MR. NOEL: That is -- Yeung is Y-e-u-n-g.

13 BY MR. NOEL:

14 Q. So this is what you're telling (EMPLOYEE #17)
15 that Manho Yeung has deemed this work simply to avoid
16 expensing that \$800,000; correct?

17 A. Yeah. If you don't do any capital work, you
18 have to expense it.

19 Q. So the only reason you're doing this work is so
20 that you can capitalize it and you don't have to expense
21 that \$800,000?

22 A. That's not correct.

23 Q. Okay. So there's other reasons that you didn't
24 state in the e-mail?

25 A. I don't need to go into detail to (EMPLOYEE
26 #17).

1 Q. Well, why are you telling (EMPLOYEE #17) that
2 Manho deemed this work?

3 A. Because it's common for everybody to throw names
4 around to get -- to get stuff going.

5 Q. Right. But wouldn't it have been -- I mean, the
6 answer to her question -- her question is "Do you know
7 when this job was completed? Also, if you can forward
8 the e-mails that you send to (WITNESS #12) regarding
9 this."

10 And your response says "This work was deemed by
11 Manho in order to not end up expensing it."

12 If you were just throwing his name out, wouldn't
13 it be just to say "Manho says do it"?

14 A. No.

15 Q. Why are you going into detail to a clerk as to
16 why Manho wants you to do this work?

17 A. Because there was other conversations between
18 her and I besides an e-mail.

19 Q. Okay.

20 A. And she's pretty much the one that ran Table
21 Mountain even though she was a clerk.

22 [Exhibit 1309 introduced
23 as evidence.]

24 BY MR. NOEL:

25 Q. All right. Let's move on to 1309. And this is
26 a very brief one. Do you recognize it?

1 A. Yeah. It's my comments based on reviewing a
2 post estimate replacing the insulators on that tower
3 section.

4 Q. Okay.

5 A. (EMPLOYEE #1) did.

6 Q. First of all, who is (EMPLOYEE #1)?

7 A. She's the one who replaced me. She's an M&C
8 engineer.

9 Q. All right. And the subject is "Sign request for
10 review of 2017-08347 (PE Caribou-Palermo replace
11 insulators on 11 towers." So what is 2017-08347?

12 A. It's the EDRS routing number. And that's a
13 self-generated subject matter by E-fluence.

14 Q. And what is "PE Caribou replacement --"

15 A. Post estimate.

16 Q. What is a post estimate?

17 A. It means you follow up with the paperwork after
18 a job is completed.

19 Q. So the job has already been completed at this
20 point?

21 A. I don't know that. That is her post estimate.

22 Q. Okay. Why -- are you retired by this point or
23 are you still working?

24 A. I'm still working, but I'm already -- I moved
25 down south and she took over the north.

26 Q. Okay. And then your comment back to her

1 "Jefferson - not Jake." Can you explain that.

2 A. Because what you don't see on the routing is who
3 she has it going to people next after me or several after
4 me and she has the wrong name.

5 Q. Okay. Do you know who Jefferson is?

6 A. Jefferson Heidleberg.

7 Q. And who is Jefferson Heidleberg?

8 A. I don't know who -- I don't know currently, but
9 back then he was another Asset Management-type person.

10 Q. Okay. Was there somebody named Jake or did she
11 just have the wrong name?

12 A. No. Jake was our supervisor of the M&Cs at one
13 time.

14 [Exhibit 1310 introduced
15 as evidence.]

16 BY MR. NOEL:

17 Q. Okay. All right. 1310. Can you tell us what
18 1310 is.

19 A. It means I checked her document for any obvious
20 errors and said it's okay to route to the next person.

21 [Exhibit 1311 introduced
22 as evidence.]

23 BY MR. NOEL:

24 Q. All right. Now, moving on to 1311. This sets
25 the table for this. The relocate -- the Caribou-Palermo
26 relocate towers project that you nominated in 2007 had

1 trouble dying; is that correct?

2 A. Had what?

3 Q. Had trouble dying. It continued to haunt you
4 for many years. Is that true?

5 A. Just -- it's just how things happen sometimes
6 when a project managed job gets handed back down to an
7 M&C engineer.

8 Q. Okay. And at some point did (EMPLOYEE #1)
9 approach you and ask you about the history of the
10 project?

11 A. Yeah. She asked me to write what I know -- knew
12 about it, remembered about it.

13 Q. Okay. And we have here October 4th, 2017, an
14 e-mail from you to (EMPLOYEE #1). It says "(EMPLOYEE
15 #1), please forward to the appropriate parties that you
16 had the call with. Caribou-Palermo history for job
17 splitting justifications and write-off." Correct?

18 A. Yeah.

19 Q. All right. So it starts off "Is this your
20 written statement about the history of this project?"

21 A. Yeah. It was -- yeah. It was a quick thrown
22 together.

23 Q. All right. So it starts off with "Created
24 4/25/07 per request from project management (WITNESS #15)
25 for a study to replace."

26 That's what you wrote?

1 A. What's the last four digits of that order number
2 next to (WITNESS #15)?

3 Q. 30573184.

4 A. Yeah, I wrote that.

5 Q. Well, I thought you told us that this was a
6 project that was requested by (EMPLOYEE #3)?

7 A. Okay.

8 Q. And (WITNESS #15) didn't get involved in it
9 until after the AA had been approved?

10 A. That's correct.

11 Q. So was (WITNESS #15) -- is (WITNESS #15) the one
12 who requested this project?

13 A. No, but he's the project manager.

14 Q. Okay. But you say "4/25/07 per request from
15 Project Manager (WITNESS #15)." That would infer, based
16 upon your writing, that (WITNESS #15) actually requested
17 that this project happen.

18 A. I can see how this could be interpreted that
19 way.

20 Q. Now, in reality you said this was something that
21 was suggested by Keith Williams and nominated by
22 (EMPLOYEE #3); correct?

23 A. Correct.

24 Q. And (WITNESS #15) didn't get involved until
25 after the AA had been approved and it was shipped off to
26 project management?

1 A. Correct.

2 Q. And 4/25/07 that actually predates the day of
3 your Advance Authorization; correct? You're looking at
4 the authorization Exhibit 838?

5 A. 1298.

6 Q. 1298. Okay. 1298 is your original
7 authorization that you --

8 A. Yeah.

9 Q. That was changed. And that date is 5/7/07.

10 A. Okay.

11 Q. So this date predates even that date.

12 A. Okay.

13 Q. So somewhere is there a request from (WITNESS
14 #15) to do this project?

15 A. No.

16 Q. Okay. Let's see. It goes on "Replace ten
17 towers that are inaccessible and built in the early
18 1900s, MWC 70S. This was approved by AJE via EDRS with
19 numbers by Luther Dow for \$200,000." Correct?

20 A. Yeah.

21 Q. What is AJE?

22 A. Advance job estimate.

23 Q. Okay. Then it goes down something "created
24 11/7ish/07 by SAP-FR conversion and then 11/7/07 30606109
25 to replace the order number to coincide with the SAP
26 upgrade. Dollars from 30573184 and 30604541 were moved

1 to this new order."

2 So that's what you're talking about when the SAP
3 upgrade changed all the order numbers; correct?

4 A. Yes.

5 Q. All right. And then it says something "Created
6 7/15/14 - 31088819 to capture costs for replacing
7 insulators on the 10 towers that were originally studied
8 for fracture replacement. A portion of the costs from
9 order 30606109 would be transferred to this order for the
10 labor hours of field inspection on these 10 towers."

11 Reading that correctly?

12 A. Yes.

13 Q. And then "Created 7/15/14 31088923 to capture
14 the costs for the dollar amount to be wrote off for the
15 original 10 tower replacement project that ended up not
16 being approved by senior management. Only the dollars
17 that could not be justified by 30606109 and 31088819
18 would be transferred to this order and marked for write
19 off."

20 So what does that mean?

21 A. As I explained earlier, after coming up with the
22 capital improvement assets, the road and insulators,
23 whatever was left over, which the bulk of was engineering
24 costs, would be transferred to that other order number so
25 it could be wrote off, expensed.

26 MR. NOEL: Okay. All right. I think we've got

1 one more exhibit.

2 MS. DUPRE-TOKOS: Yes.

3 [Exhibit 1312 introduced
4 as evidence.]

5 BY MR. NOEL:

6 Q. All right. Exhibit 1312. And this is some
7 e-mails between you and Douglas Cannel again. This is in
8 2016. And it looks like on June 13, 2016, Doug Cannel
9 had sent you an e-mail or sent an e-mail and part of it
10 said "(WITNESS #5), you are one of the most knowledgeable
11 individuals on PG&E tower design and construction. Do
12 you have any additional concerns or thoughts?"

13 And the subject of this is "Comprehensive Plan
14 for Towers."

15 And so your response. You see that?

16 A. Yeah.

17 Q. It says "The only thing that --" oh. "The only
18 thing after reading the below that came to my mind would
19 be to also something life cycle expectancies on some of
20 the older lines that we purchased from other utilities.
21 Caribou-Palermo (old Caribou-Golden Gate) for example
22 built roughly in 1907. This line is in a very remote
23 area. Access is extremely limited. Conductor was deemed
24 annealed several years back. Line has tons of splices in
25 it. Some spans have five splices within said span. Most
26 of the upper line section is subject to rock slides that

1 have taken this line out in the past. Restoration time
2 is lengthy."

3 Did I read that correctly?

4 A. Yes.

5 Q. So what does it mean that the conductor is
6 annealed?

7 A. It's -- annealed usually means a little more
8 brittle. It's a copper conductor.

9 Q. What makes you think it's a copper conductor?

10 A. Because I know it's a copper conductor, the
11 majority of the upper section.

12 Q. Okay. Do you have any records to show that?

13 A. Do I?

14 Q. Yeah.

15 A. No.

16 Q. Okay. I'm just wondering because PG&E says it's
17 aluminum.

18 A. No, because we wouldn't put shunts on aluminum.

19 Q. Okay. And again, what are shunts?

20 A. Where I said there was bad splices -- well, not
21 bad but where infrared showed a possible leakage and they
22 wrapped the wire from one side of the wire over to the
23 splice and onto the next to reduce heat buildup.

24 Q. And I'm guessing based upon your language that
25 having five splices within a span is not a good thing?

26 A. Well, each splice has a potential for failure.

1 Q. And splicing is what you do basically to fix the
2 line instead of to replace the line; correct?

3 A. It's -- there's several uses for splicing.
4 You're splicing -- if the wire broke and it has good
5 clean ends, you can splice it back together. You have
6 multiple splices when you have to start cutting bad
7 sections out. You have multiple splices where maybe a
8 substation -- in this case where the fire is there used
9 to be a substation drop below with five splices. It's no
10 longer there. So the splices are utilized for putting
11 wire back together or piecing in new sections of wire.

12 Q. So it sounds from your description that the
13 Caribou-Palermo is in pretty bad shape.

14 A. I'm just giving them an example of one line
15 because it was fresh in my head because of all the
16 involvement with trying to get the job set up.

17 Q. All right. Is this again verbiage with no real
18 basis and fact or are you expressing actual knowledge?

19 A. Well, it's roughly built in 1907. I mean,
20 that's roughly. I'm not saying for a fact it is. It's
21 in a remote area all the way in the upper section.

22 Q. Right.

23 A. It is subject to rock slides. We've had rocks
24 come down and damage structures before that we had to go
25 up and repair. There are several splices in the line.
26 That's all factual. The annealed part is subject to

1 question because it's been deemed both ways by different
2 people.

3 Q. And then you go on to say "Just one example but
4 I feel we should identify lines or line sections that
5 meet this type of criteria and add them to our mitigation
6 plan or part of future complete structure replacements
7 while working with Transmission Planning and Operations
8 for future growth and conductor size needs?

9 A. Correct.

10 Q. Correct?

11 So am I reading that right or understanding that
12 right? It sounds like you're saying we need to look at
13 replacing these lines.

14 A. We need to look at the integrity of these older
15 lines that, one, aren't lines that PG&E built from
16 scratch. They're ones we picked up from other people,
17 and there are several other agencies that we bought
18 structures from.

19 Q. And so what is this group here, this
20 comprehensive plan for towers?

21 A. I don't recognize all the names, but I'm seeing
22 specialists, asset management, transmission planning,
23 project management, specialists, business finance. And
24 the ccs to me all look like they were going to directors
25 at the time.

26 Q. Manho Yeung, Jon Eric Thalman, John Parks, Jeff

1 Borders.

2 A. I think about that time they were all directors
3 of different groups.

4 Q. And down at the bottom it says "Goal: Develop a
5 comprehensive plan for tower risk without emphasis on
6 steel corrosion risks. Plans should include maintenance
7 plans, detail inspection specifications, repair versus
8 replace criteria, capital and expense cost estimates,
9 risk database, and update standards."

10 Did I read that correctly?

11 A. That's what I'm reading.

12 Q. So is this group doing comprehensive plans for
13 towers? Is that actually a group that's trying to put
14 together a comprehensive plan for replacing towers, older
15 towers? Or like the Deteriorating Transmission Asset
16 Replacement Fund is that just a name that has nothing to
17 do with what the work is doing?

18 A. I have no idea.

19 Q. Other than this e-mail, did you know you were
20 involved in that group at all?

21 A. On an individual basis but not related to the
22 e-mail.

23 Q. Okay. All right. So one last thing I wanted to
24 ask you about. Give me a second to switch up here.

25 All right. I've put up 678. And we didn't
26 really talk about this before.

1 Are you familiar with the RIBA process?

2 A. The what?

3 Q. RIBA process.

4 A. I'm not familiar with that acronym.

5 Q. Okay. Risk Informed Budget Analysis.

6 A. Okay.

7 Q. Do you know anything about this? This is a 2014
8 RIBA scoring sheet, your project number Caribou-Palermo
9 115 kV T-line relocate. That project number is 5725543.

10 This project had been cancelled by this time;
11 correct?

12 A. What's the date on that?

13 Q. That's in 2014. And I don't have a specific
14 date on this document.

15 A. So, yes, it had. But it was still falling under
16 Rich Pettingill's name because of the insulator work that
17 had yet to be done. And I don't think Rich updated his
18 pining order number. That's why it kept defaulting to
19 that.

20 Q. Okay. But what was Rich still working on? Was
21 that the insulator project?

22 A. Well, as far as project management saw, it was
23 still in his cue.

24 Q. Okay.

25 A. Because it wasn't a closed order. It wasn't a
26 closed job. It was a whole -- it hadn't settled out yet.

1 Q. But the only thing left to do on this
2 Caribou-Palermo 115 kV transmission line relocate project
3 was the insulators; correct?

4 A. The insulators and settling the cost.

5 Q. And settling the cost. Everything had already
6 been spent before. The cost -- you're talking about
7 settling the cost for installing the road to the Table
8 Mountain -- Caribou-Table Mountain line; correct?

9 A. Yeah, but I don't--

10 What did you say just before that? You said
11 everything had been and I missed the word.

12 Q. Basically, the only things left to do were
13 replace the insulators and settle the costs?

14 A. Settle the costs, yes.

15 Q. And to replace the insulators was not a hot
16 project that needed to be done immediately; correct?

17 A. No.

18 Q. Would it surprise you if that -- to hear that
19 project didn't get done until September of 2017?

20 A. No, that wouldn't surprise me.

21 Q. Okay. Basically, ten years after -- more than
22 ten years after this whole project started they finally
23 replaced the insulators apparently.

24 A. Okay.

25 Q. Okay. So can you explain on a RIBA score how
26 that project, the Caribou-Palermo 115 kV transmission

1 line relocate project on a risk or scored 400 points
2 higher than to the replace the towers that fell down in
3 2012? Can you think of any valid reason why that would
4 be so?

5 A. Nope, other than project management not having
6 the records updated.

7 MR. NOEL: Okay. I think that that's all I
8 have. I'm going to see if the jurors have some questions
9 for you, too.

10 So the jurors are allowed to ask questions.
11 They write them down, and we review them beforehand. And
12 once they are approved or if they're approved, then I
13 would read you the questions of the jurors.

14 THE WITNESS: So while you're reviewing that,
15 can I use the restroom?

16 MR. NOEL: It's just going to be real quick here
17 and then we'll be done for the day.

18 THE WITNESS: All right.

19 MR. NOEL: We'll be completely done with you.

20 BY MR. NOEL:

21 Q. All right. "If you're being told what to write
22 by Keith Williams and you have no experience writing an
23 AA, why would you attach your name to it?"

24 A. Because I'm the one that's writing it. It
25 starts off with -- the project manager field is not
26 really saying you're the project manager. When you're

1 first starting these, it's got to be a name and it's got
2 to be a lower level name like engineer or project
3 manager. It can't be a higher-up name.

4 Q. So why wouldn't Keith Williams just take
5 complete ownership of the AA?

6 A. I mean, I have not experienced that in my time
7 where a manager initiates an AA. It's always done at the
8 lower levels.

9 Q. Why wouldn't, say, (EMPLOYEE #3) write the AA?

10 A. Because it's not -- it's not in his -- it's not
11 typical. It's generally a project manager. And since
12 we're -- since M&C engineers are considered pseudo quasi
13 mini project managers, we're the next in line.

14 Q. But you said that you didn't generally write --

15 A. We don't generally write because --

16 Q. -- because you have no experience.

17 A. -- because everything is generally written by
18 the project managers or by the John Culbertsons
19 sometimes.

20 Q. What was your relationship with (EMPLOYEE #3)?

21 A. He was -- can you re-ask that.

22 Q. Are the two of you friends?

23 A. We're work-related friends. We don't associate
24 outside of work. It's just a normal work environment.

25 Q. And you said he's now retired?

26 A. When I -- when I left the company, that's how I

1 knew it is he was retired from PG&E.

2 Q. All right. Prior to retirement what was his
3 position with PG&E?

4 A. I don't know exactly prior to that.

5 Q. Well, at some point did he promote to
6 superintendent?

7 A. Now that you say that, yes, he did.

8 Q. So he promoted from T-line supervisor in Table
9 Mountain to superintendent for the north; correct?

10 A. Yes.

11 Q. Basically superintendent for the same area that
12 was your geographic area as the M&C engineer?

13 A. Yes, other than I don't know if that time was
14 the same or if I had already transitioned down south.

15 Q. How would an access road benefit deteriorating
16 assets? Wouldn't replacing deteriorating components in
17 towers themselves benefit the actual asset?

18 A. Well, the components were the insulator
19 replacement. So that was one of the alternative fixes
20 was to replace the insulators on the original section of
21 line that (EMPLOYEE #3) had concerns about to begin with.
22 The road was a requirement for the installation of the
23 new towers if they would have gone forward. But that
24 same corridor holds two other existing lines that had no
25 access to them at all. So that's how we were able to
26 transfer the money under those assets and capture that

1 road as a capital asset.

2 Q. So if that money -- if the money that was used
3 to complete the access road was later replenished from
4 another bucket, why not just complete the relocation
5 project?

6 A. Can't answer that. That's not -- it was cut.

7 Q. "What is the purpose of moving money from bucket
8 to bucket to bucket if it would just be replenished?"

9 A. I think the replenishment part is misleading a
10 little bit. It's more of -- it's not replenished.
11 You're taking it out of this bucket which is going to
12 allow you to do less work under that type of category
13 and -- because you did that type of work. And then you
14 put the money back in the bucket from that one to show
15 that no work was done under that replacement category.

16 Q. "In retrospect do you believe your description
17 of the Caribou-Palermo line as deteriorated and in danger
18 of imminent failure was in fact correct?"

19 A. Not after reading the inspection reports. I had
20 no -- nothing to base what the actual conditions of the
21 structures themselves were. And after the inspection
22 reports went through engineering for review, they came
23 back saying that the structures themselves are sound. So
24 that's what I've got to go by. I had no personal
25 knowledge or visuals of the structures themselves being
26 deteriorated or dilapidated.

1 Q. "Did the inspection reports say that the
2 components were sound?"

3 A. I did not see the inspection reports.

4 Q. So how do you know what they said?

5 A. I personally don't other than engineering came
6 back and Doug Cannel came back saying there wasn't
7 supporting evidence. It was not my job while it was
8 being inspected.

9 Q. So Doug Cannel or Cannel told you that there was
10 no supporting evidence for the fact that the towers were
11 deteriorating?

12 A. I said it had to have come from Doug or
13 engineering.

14 Q. Okay. But you can't tell us where you got that
15 information?

16 A. No.

17 Q. "Do you believe that should the project be
18 recommended had been authorized and conducted the events
19 of 11/8/18 might not have happened?"

20 A. No, I do not believe that.

21 Q. Do you know the meaning of the word
22 "deteriorated"?

23 A. Well, deteriorated for steel would be signs of
24 rust, fatigue from vibration, anything that degrades the
25 original intent when that structure was built new.

26 Q. Are you familiar with the term body-on-body

1 wear?

2 A. Not exactly as you just said that, no.

3 Q. Okay. Do you know what happens when two metal
4 items rub up against each other repeatedly?

5 A. Yes.

6 Q. Would that be something you would consider
7 deterioration?

8 A. Not in the PG&E world of deterioration, no.
9 It's more centered around the main structure, fatigue,
10 rust, bends.

11 So what you're referring to is insulator and
12 hardware issues that's a separate component from the
13 tower even though that tower suspension work and eye,
14 from what I've seen, had excessive wear on it.

15 Q. You're saying that based upon your 34-year
16 career with PG&E, that PG&E would not consider that type
17 of wear deterioration?

18 A. I don't know if that's the word they would use.

19 Q. Okay. You've obviously seen pictures of the
20 wear on Caribou-Palermo.

21 A. I've seen what I believe you or my lawyer showed
22 me.

23 Q. Seen pictures of worn C-hooks and worn hanger
24 holes?

25 A. I've seen the tower, yeah.

26 Q. Okay. Would you consider that deteriorated?

1 A. I would just consider it excessive wear to a
2 point that it probably should have been replaced.

3 Q. All right. "Do you know the meaning of the word
4 dilapidated"?

5 A. No.

6 Q. "Do you know the meaning of the word imminent"?

7 A. Usually means it's going to happen. That's how
8 I would interpret it.

9 Q. "At the time you put in the Advance
10 Authorization request were you personally actually
11 concerned about the condition of the Caribou-Palermo
12 line"?

13 A. I was not.

14 Q. When exactly did you retire from PG&E?

15 A. April 1st, 2017.

16 Q. When you retired, did you have to sign any
17 nondisclosure agreements or anything like that?

18 A. Not that I recall.

19 Q. Since you retired, have you been asked to sign
20 any nondisclosure agreements by PG&E?

21 A. Not by -- well, I know that my -- I don't want
22 to say current employer. The person I contacted back at
23 the time had me sign one, but I don't know.

24 Q. Who do you work for now?

25 A. N Consulting Engineers, I think.

26 Q. And what is that?

1 A. They're doing some sort of contract work for
2 PG&E. I don't know what aspect of that they encompass.

3 Q. Could you -- what's the name of the company?

4 A. I believe it's N Consulting. Just the letter
5 "N" Consulting Engineering or Inc. One of the two.

6 Q. And where is this company out of?

7 A. L.A., I believe.

8 Q. And do you have a boss with this company?

9 A. All I can recall is Andrew.

10 Q. What kind of work do you do for this company for
11 PG&E?

12 A. I review patrol -- not patrol, inspection tags
13 initiated by an outside party that's doing inspections of
14 all the lines for the steel side.

15 Q. So like PAR Engineering?

16 A. Not -- I don't know what PAR is doing. I'm not
17 affiliated with PAR.

18 Q. Okay. But you said you're reviewing
19 notification tags generated by somebody who is being --
20 another company being contracted to inspect the PG&E
21 lines?

22 A. Like the drawing inspection program.

23 Q. So you're talking about the WSIP?

24 A. One of those and there's one other acronym.

25 Q. So did this job start after the Camp Fire?

26 A. Yes. It started about somewhere in April I

1 think is when they approached me.

2 Q. Who approached you?

3 A. N Consulting.

4 Q. Who from N Consulting?

5 A. Well, Andrew is the only name that sticks with
6 me. That's my immediate contact.

7 Q. They approached you to come in and do what?

8 A. Review patrol tags.

9 Q. Okay. So you have reviewed patrol tags
10 generated during the WSIP; Wildfire Safety Inspection
11 Program?

12 A. After the fire, yes, I guess. I don't know when
13 that program started so . . .

14 Q. Okay. And you said they had you sign a
15 nondisclosure agreement?

16 A. Yes.

17 Q. All right. I'll try again. Do you know what
18 Andrew's last name is?

19 A. It's not coming to me. I just called him
20 "Boss."

21 Q. Well, how do you get in touch with him?

22 A. I e-mail him or call him.

23 MR. NOEL: All right. I think that's it. It's
24 almost -- it's after 1 o'clock. So if you wait, she's
25 going to have an admonishment for you and then you're
26 free to leave.

1 GRAND JURY FOREPERSON: (WITNESS #5), you are
2 admonished not to discuss or disclose at any time outside
3 of this jury room the questions that have been asked of
4 you or your answers until authorized by this grand jury
5 or the Court. A violation of these instructions on your
6 part may be the basis for a charge against you of
7 contempt of court. This does not preclude you from
8 discussing your legal rights with your own attorney.

9 (WITNESS #5), what I have just said is a warning
10 not to discuss this case with anyone except the Court,
11 your lawyer, or the district attorney.

12 Do you have any questions?

13 THE WITNESS: I do have one just for
14 clarification. How would I end up being notified by the
15 Court that I can start openly discussing this?

16 GRAND JURY FOREPERSON: I don't know.

17 [Counsel conferring off the record.]

18 MR. NOEL: Probably in the media when it becomes
19 public.

20 THE WITNESS: Really?

21 MR. NOEL: Yep.

22 All right. So you're free to go.

23 THE WITNESS: Okay. Thank you.

24 GRAND JURY FOREPERSON: Thank you.

25 THE WITNESS: I think it's Andrew Davis.

26 MR. NOEL: All right. Thank you.

1 [Witness exits the courtroom.]

2 MR. NOEL: All right. Move all the exhibits
3 from today in. I think it starts at 1272 and goes to
4 1312 into evidence.

5 [Exhibits 1272 through 1312
6 admitted into evidence.]

OROVILLE, BUTTE COUNTY, CALIFORNIA

FEBRUARY 14, 2020; 8:30 a.m.

(Confidential Special Grand Jury Hearing Proceedings)

[Confidential grand jury called into session at 8:42 a.m.
in Courtroom 9.]

[Grand jury role call omitted.]

GRAND JURY SECRETARY: Thank you. All members of the
jury are present.

[Discussions omitted.]

GRAND JURY FOREPERSON: Ready.

MS. DUPRE-TOKOS: Esther Carota.

[Witness enters the courtroom.]

GRAND JURY FOREPERSON: There's an extra one here.
Extra.

MR. NOEL: Thank you. I just needed the number off
of the exhibits.

GRAND JURY FOREPERSON: Ms. Carota, before you have a
seat, would you please raise your right hand to be sworn?

Ms. Carota, do you solemnly swear that the
evidence you shall give in this matter pending before the
grand jury shall be the truth, the whole truth and nothing

1 but the truth so help you God?

2 THE WITNESS: Yes, I do.

3 THE COURT: Thank you. Have a seat, please.

4

5

EXAMINATION

6 BY MS. DUPRE-TOKOS:

7 Q. And help yourself to water if you need it.

8 A. Thank you.

9 Q. So good morning.

10 A. Good morning.

11 Q. Could you please state your full name and spell
12 your last name for the record?

13 A. Esther Jean Carota, C-A-R-O-T-A.

14 Q. Do you know someone by the name of Vincent
15 Carota?

16 A. Yes.

17 Q. And did -- does he go by the name of Vinny?

18 A. Yes.

19 Q. When was the last time you spoke to him either
20 in-person or on the phone?

21 A. November 8, 2018.

22 Q. Was that in-person or on the phone?

23 A. On the phone.

24 Q. Was it a long phone call?

25 A. 13 minutes.

26 Q. And how do you know it was 13 minutes?

1 A. I checked my call log.

2 Q. And did you call him or did he call you?

3 A. I called him.

4 Q. Have you spoken to him on the phone in the past?

5 A. Oh, yes.

6 Q. Often?

7 A. 22 years, yes.

8 Q. Okay. Did you call him at the number that you

9 would normally call him to reach him?

10 A. Yes.

11 Q. And did you recognize the voice of the person

12 that you spoke to on the morning of November 8, 2018, as

13 that of Vinny?

14 A. Yes.

15 Q. Okay. Up on the board, we have got Exhibit 1275.

16 [Exhibit No. 1275 was identified.]

17 BY MS. DUPRE-TOKOS:

18 Q. Do you recognize the person in that photograph?

19 A. That's Vinny and Daphne.

20 Q. And Daphne is here with us today?

21 A. Yes.

22 Q. And so that was Vinny with your dog Daphne or

23 was --

24 A. Yes.

25 Q. Okay. Daphne wasn't his?

26 A. No, I was visiting and she liked him.

1 Q. Okay. And did you take that photograph?
2 A. Yes, I did.
3 Q. How did you know Vinny?
4 A. He's my brother-in-law. Was my brother-in-law.
5 Q. Okay. Where did he live on November 8, 2018, if
6 you know?

7 A. 5471 South Libby Road. I believe he was in space
8 37. It was Holly Hills Mobile Home Court.

9 Q. Did you live near him?

10 A. Seven houses away.

11 Q. Did Vinny -- did you evacuate the Camp fire on
12 November 8, 2018?

13 A. Yes, I did.

14 Q. Okay. Did Vinny evacuate with you?

15 A. No.

16 Q. Did Vinny survive the fire?

17 A. No.

18 Q. Did you do everything in your power to convince
19 him to leave with you?

20 A. Absolutely, I did.

21 MS. DUPRE-TOKOS: Okay. Does anyone have any
22 questions? Then madam foreperson will read you an
23 admonishment and you can get on the road.

24 THE WITNESS: Thank you.

25 GRAND JURY FOREPERSON: Ms. Carota, you are
26 admonished not to discussion or disclose at any time

1 outside of this jury room the questions that have been
2 asked of you or your answers until authorized by this
3 grand jury or the Court.

4 A violation of these instructions on your part
5 may be the basis for a charge against you of contempt of
6 court. This does not preclude you from discussing your
7 legal rights with your own attorney.

8 Ms. Corota, what I have just said is a warning
9 not to discuss this case with anyone except the Court,
10 your lawyer, or the district attorney.

11 Do you have any questions?

12 THE WITNESS: No, I don't. Thank you.

13 GRAND JURY FOREPERSON: Thank you for your time
14 today.

15 GRAND JURY SECRETARY: Thank you.

16 GRAND JUROR NUMBER SEVENTEEN: Sorry, it took a
17 minute there --

18 MR. NOEL: Okay.

19 GRAND JUROR NUMBER SEVENTEEN: -- out there. Daphne
20 wanted to meet me first.

21 [Witness enters the courtroom.]

22 GRAND JURY FOREPERSON: Who is this?

23 MR. NOEL: Investigation Patterson.

24 GRAND JURY FOREPERSON: Okay, sorry.

25 THE WITNESS: That's okay.

26 MR. NOEL: Oh, forgot to hand out the handouts.

1 GRAND JURY FOREPERSON: Investigator Patterson, if
2 you can raise your right hand to be sworn, please.

3	THE WITNESS: Sure.
---	--------------------

4 GRAND JURY FOREPERSON: Investigator Patterson, do
5 you solemnly swear that the evidence you shall give in
6 this matter pending before the grand jury shall be the
7 truth, the whole truth and nothing but the truth so help
8 you God?

9 THE WITNESS: I do.

10 GRAND JURY FOREPERSON: Thank you. Have a seat,
11 please.

12	MS. DUPRE-TOKOS: Two for Doug?
----	--------------------------------

13 MR. NOEL: Two.

14 MS. DUPRE-TOKOS: Aren't you special?

15 THE WITNESS: Excuse me?

16 MS. DUPRE-TOKOS: You've got two packets.

17 MR. NOEL: The second one is much more -- the first
18 one is boring, the second one is fun.

19 MS. DUPRE-TOKOS: Which one is the first one?

20 MR. NOEL: Are we ready?

21 GRAND JURY FOREPERSON: We are ready to proceed.

22

23 EXAMINATION

24 BY MR. NOEL:

25 Q. Investigator Patterson, could you please state
26 your full name, spelling your last name for the record?

1 A. Douglas Patterson, P-A-T-T-E-R-S-O-N.

2 Q. By whom are you employed?

3 A. The Butte County District Attorney's Office.

4 Q. In what capacity?

5 A. As a DA investigator.

6 Q. How long have you been in law enforcement?

7 A. 24 years.

8 Q. Can you walk us through your law enforcement
9 career?

10 A. Sure. Starting with the Riverside County
11 Sheriff' Office in 1996. Stayed there until 2003.
12 Lateraled over to the Butte County Sheriff's Office in
13 2003, and then lateraled over to the Butte County District
14 Attorney's Office three years ago.

15 Q. Do you have any specialized training or
16 experience in law enforcement?

17 A. Yes.

18 Q. Will you tell us about that?

19 A. Sure. Currently kind of doing two jobs. My
20 specialty is illegal hash oil labs and large scale cartel
21 marijuana grow investigations.

22 Q. How long have you been doing marijuana
23 investigations?

24 A. Officially, nine years and about -- I have
25 another five years to that before then. I was assigned to
26 the Butte County Sheriff's Office Special Enforcement Unit

1 as a deputy, and then -- or as a detective, and then
2 stayed there for about three years as a DA investigator as
3 well.

4 Q. All right. Do you have any experience with
5 helicopters?

6 A. Yes.

7 Q. What kind of experience with helicopters?

8 A. I'm a stable master. What that means is we know
9 all the safety features of the helicopter, we're observers
10 in the helicopter. I have gone to Air Ops school, which
11 is learning to spot marijuana from an aerial platform, be
12 it from a plane or a helicopter. Also we do long line.
13 Long line is when we're actually on about 100 -- 100 --
14 it's a 100 to 150-foot rope, where he hook into our
15 harness and get STABO'd from point A to point B while
16 dangling under the helicopter, so very boring.

17 And we also hang outside the helicopter on the
18 skids for various reasons.

19 Q. Why don't you explain what STABO is?

20 A. STABO is just -- it's a term that you use when
21 you're actually on -- on the long line, on that 100 to
22 150-foot rope and hooked into the harness. And what it is
23 is it's a very, very quick form to get from point A to
24 point B where a helicopter might not be able to land with
25 a heavy force. The pilots that we have are very good.
26 They can put us -- put me in an area about three-foot in

1 diameter just by dropping me in, I unhook, and the
2 helicopter takes off.

3 Q. So we talked about being hooked to a rope, you're
4 talking about hanging on a rope under a helicopter, and
5 flying into a location?

6 A. That is correct.

7 Q. All right. So you spend a lot of time in
8 helicopters, it sounds like?

9 A. Yes, about 15 years.

10 Q. Are there local law enforcement pilots?

11 A. Yes.

12 Q. And do you work with them often?

13 A. I do.

14 Q. Who are the pilots?

15 A. Jake Hancock, Scott Steele, Don McLean and James
16 Marshall.

17 Q. And who does Hancock work for?

18 A. The DA's office.

19 Q. Now, were you assigned to look into the
20 helicopter aspects of this case, this investigation?

21 A. Yes, I was.

22 Q. And did that include obtaining records from
23 helicopter companies doing work with PG&E?

24 A. Yes.

25 Q. And what were those helicopter companies?

26 A. A&P like Adam and Paul. And PJs, like Paul and

1 John.

2 Q. All right. So were grand jury subpoenas sent to
3 those two helicopter companies?

4 A. Yes.

5 Q. Did you have contact with PJ Helicopters?

6 A. Yes.

7 Q. And specifically, did talk you to the president
8 of PJ Helicopters, Mark Gonsauls?

9 A. Yes.

10 Q. And that's G-O-N-S-A-U-L-S. Were you able to
11 determine if PJ had any relevant records or any records
12 relevant to this investigation?

13 A. Yes.

14 Q. What did you determine?

15 A. That they did not.

16 Q. How about A&P?

17 A. Yes.

18 Q. All right. So let's move on to our next slide.
19 One more. One more. And there we have -- you have in
20 front of you Exhibit 1313.

21 [Exhibit No. 1313 was identified.]

22 BY MR. NOEL:

23 Q. Do you recognize Exhibit 1313?

24 A. I do.

25 Q. What is 1313?

26 A. This is a subpoena for A&P helicopters to produce

1 records for any and all policies pertaining to PG&E
2 transmission -- transmission lines and inspections of the
3 115 --

4 Q. Right.

5 A. -- lines.

6 Q. Specifically for flight logs, bills and invoices
7 for PG&E flights?

8 A. That is correct.

9 Q. All right. Based upon this subpoena, did A&P
10 send records?

11 A. Yes, they did.

12 Q. And did you go through those records and cull out
13 the relevant records?

14 A. Yes.

15 Q. All right. Let's move on to 1314.

16 [Exhibit No. 1314 was identified.]

17 BY MR. NOEL:

18 Q. And tell us what 1314 is.

19 A. 1314 is one of the records that they submitted.
20 The records included 20 -- beginning 2010 to 2019. And
21 what I did was, I ended up pulling everything that had to
22 do with the Caribou-Palermo 115kV line, and this was one
23 of them dated -- the invoice is dated 11/22 of 2010.

24 Q. All right. And so 1314 -- sorry -- consists of
25 three pages, correct?

26 A. That is correct.

1 Q. So we have the invoice, and then we can go on.
2 The helicopter patrol log sheet.

3 A. Correct.

4 Q. And what's the final page?

5 A. The time in.

6 Q. All right. The daily flight log.

7 A. Correct.

8 Q. And the daily flight log shows the actual TACH
9 readings for each flight, correct?

10 A. That is correct.

11 Q. And the -- explain to us what TACH readings are
12 and why they're relevant?

13 A. TACH readings are basically the -- it's like the
14 odometer of a vehicle, and it has -- it -- it, basically,
15 keeps track of the flight hours on a helicopter. So the
16 helicopter pilots know when to do scheduled maintenance
17 and -- and whatnot so just like your vehicle. You know,
18 every five thousand or ten thousand miles, you get a
19 change of oil so you keep track of your odometer, and it's
20 very similar to a helicopter. And then, of course, they
21 keep records. Any time they start up that ship, they're
22 supposed to put in their flight log who was on board, and
23 sometimes they'll put what it's for.

24 Q. Okay. And let's walk through this one just as an
25 example. Looks like it goes from Richvale to Chester.
26 Departure time, block out, 0900. Flight off, 130.0.

1 Do you have an idea of what those mean?

2 A. No. I -- no, I don't understand their -- their
3 logs. This is what I understand, the -- the hours that
4 they actually spent flying through the different lines.
5 That's what I am focusing on.

6 Q. All right. So for instance, Richvale to Chester
7 flight time, 1.3 hours. Chester to Richvale, flight time,
8 2.2 hours.

9 A. Correct. The flight times is -- is what I am
10 focusing on.

11 Q. And then the billing information on the top here,
12 2.2 Caribou-Palermo?

13 A. That is correct. That's 2.2 hours
14 Caribou-Palermo.

15 Q. So each of those records were received from A&P
16 via subpoenas sent out on behalf of this grand jury,
17 correct?

18 A. That is correct.

19 Q. Let's move on to 1315.

20 [Exhibit No. 1315 was identified.]

21 BY MR. NOEL:

22 Q. And if you can just walk us through 1315.

23 A. Sure. This one is dated -- invoice is dated 7/27
24 of 2011. It's very similar to the -- to the one previous.
25 I can see where it's -- what brought my attention to this
26 page, it clearly says "Caribou-Palermo, 115." It has the

1 hours of 3.2 hours. It gives the rate, and it gives the
2 dollar amount of what A&P charged.

3 Q. Okay. And the next page. Just if you can walk
4 us through each page of each different exhibit.

5 A. Sure. Again, transmission line helicopter patrol
6 log sheet. Second one down -- I am pointing to the --
7 right here [indicating] where it says "Caribou-Palermo."
8 It gives the TACH out, TACH in. And total hours 3.2.
9 Next page, again, it is the daily flight log. I'm looking
10 under the billing information on what they did. They had
11 a fuel truck for this one. No overnight stay for the
12 helicopter. No long line. That's, like, the stable line
13 that we talked about where they would be shuttling
14 equipment, and then they're just logging in their flight
15 times.

16 Q. All right. Let's move on to 1316.

17 [Exhibit No. 1316 was identified.]

18 THE WITNESS: Okay. This is an invoice dated 8/1 of
19 2011. Again, caught my attention because it has
20 Caribou-Palermo. Hours: .6. The rate \$700. The amount
21 is -- \$420 is what A&P charged. Again, transmission line
22 helicopter patrol log sheet, gives the TACH time and,
23 again, it matches .6 hours for the Caribou-Palermo. And
24 then, again, the daily flight log. No truck or overnight.
25 No long line. .2 hours of ferry time. So ferry time is
26 going from point A to point B.

1 Q. All right. And 1317.

2 [Exhibit No. 1317 was identified.]

3 THE WITNESS: Okay. 1317. Invoices dated 8/6/2012.
4 Routine patrol of Caribou-Palermo 115 line, and it's
5 2.5 hours. Again, helicopter patrol log sheet,
6 Caribou-Palermo. Looks like they've added a few lines at
7 Caribou-Palermo and a few other lines because now they've
8 broken it down to Caribou-Palermo. They spent .4 hours,
9 Caribou -- Caribou and I think it's Pease .5, and then
10 Glenn, 1.1, so that's how they got to the total of 2.5.
11 They broke it -- they broke the lines down, which is real
12 common.

13 Q. All right.

14 A. And then, again, daily flight log.

15 Q. And the daily flight log, unlike the others,
16 doesn't break anything down, just as one line showing a
17 total of 2.5 hours flight time?

18 A. That is correct.

19 Q. Okay. All right. And now we're onto 1317?

20 A. Okay. This one -- that's why the Feather River
21 --

22 Q. Sorry, 1318.

23 [Exhibit No. 1318 was identified.]

24 THE WITNESS: On Exhibit 1318, this one actually
25 didn't say Caribou-Palermo, but it did say Feather River
26 Canyon. So very, very generic because there's different

1 lines. But I did include it and I highlighted Feather
2 River Canyon on there.

3 Q. And then there's the daily flight log?

4 A. That is correct.

5 Q. And, again, it doesn't line out what lines were
6 done, it just shows two lines and, what, 7.8 hours?

7 A. Yes, 7.8 hours. Like I said, I included it just
8 cause our Caribou-Palermo line is in the Feather River,
9 and that's what they listed it as.

10 Q. All right. 1319.

11 [Exhibit No. 1319 was identified.]

12 THE WITNESS: Okay. 1319 is an invoice dated 4/28 of
13 2014. Again, it's just the -- the invoice. The next page
14 breaks it down. This one is -- I circled "nonroutine."
15 So it's not a routine parole, so they were doing some type
16 of work on the -- you see patrol items, asset line -- the
17 name: Caribou-Palermo.

18 Q. Okay. And let's back up one page, because we've
19 had a change now between 2012 and 2014 where we no longer
20 have the transmission line helicopter patrol sheet. Now
21 we have a request summary.

22 A. That is correct.

23 Q. All right. Go ahead.

24 A. And then this is the daily flight log where they
25 break it down. It looks like they have a flight time of
26 1.8. Doesn't explain what -- what they -- what they did,

1 but it was not -- nonroutine.

2 Q. Right. Up on -- up on the top under "customer,"
3 it says -- does it say PG&E, and then in parenthesis,
4 "NERC patrol"?

5 A. Yes, it does.

6 Q. All right. Let's move onto 1319. I'm sorry,
7 1320.

8 [Exhibit No. 1320 was identified.]

9 THE WITNESS: Okay. Invoice dated 8/11/2014. Again,
10 nonroutine. And it looks like they did two line -- that
11 was two different lines, one Hat Creek #1 and
12 Caribou-Palermo, and then they're breaking it down -- or
13 actually they total it up to 4.9 hours.

14 Q. And that was for how many lines?

15 A. That's for two. Hat Creek and Caribou-Palermo.

16 Q. Okay. Hat Creek, Westwood and Caribou-Palermo?

17 A. Correct.

18 Q. And does -- does that anywhere on -- on any of
19 that paperwork have ferry time?

20 A. Not that I see, unless I'm missing it. I just
21 see PG&E as a customer.

22 Q. I guess what I was asking is, do you know where
23 Hat Creek is?

24 A. Yeah, way above Highway 36, I believe.

25 Q. Do you know where Westwood is?

26 A. Yes, the other side. Well, east of Hat Creek.

1 Q. Right. Not real close to Caribou?

2 A. No, not at all.

3 Q. Okay. So nowhere then does it break down the
4 flight time from either Caribou-Palermo to Hat Creek
5 Westwood or Hat Creek Westwood to Caribou-Palermo?

6 A. That's is correct.

7 Q. That is just --

8 A. It does not break it down.

9 Q. -- 4.9-hours to do both of them with the ferry
10 time?

11 A. That is correct.

12 Q. All right. Let's go to 1322 -- or 1321.

13 [Exhibit No. 1321 was identified.]

14 THE WITNESS: Okay. 1321, invoice dated 7/21 of
15 2015. Request summary. This is actually -- patrol time
16 is listed as routine. This is when they start adding a
17 whole bunch of different lines together. Again, this one
18 caught my attention because the second one, up from the
19 bottom, says, "Caribou-Palermo." Then we have the daily
20 flight log, where it just gives total flight time of -- it
21 was 6.0, and then they crossed it out and put 6.4. So
22 again, it's not broken up on what they did. It's just
23 total time with all those different times added up.

24 Q. Okay.

25 A. But it is a routine, not a nonroutine like the
26 other ones.

1 Q. And there's a note in the right-hand column?

2 A. Where? Down at the bottom or something?

3 Q. The far right.

4 A. Oh, it says no ferry.

5 Q. Okay.

6 A. Yeah, no ferry.

7 Q. What is your understanding that means?

8 A. That means that they just basically -- if it was
9 me, I would just -- they're -- they're starting at point A
10 and doing all of these lines as they -- as they go along.
11 But, I mean, they don't talk about fuel trucks. They have
12 fuel truck as "no." But I -- I know our ships, we can't
13 be in the air for 6.4 hours without refueling at some
14 point, so that's a little odd.

15 Q. All right. So 1322.

16 [Exhibit No. 1322 was identified.]

17 THE WITNESS: Okay. 1322, invoice dated 12/17 of --
18 of 2015. This is another nonroutine. Listed as
19 Caribou-Palermo. It looks like that that is the -- the
20 only one. Down here it says pick-up location. Table
21 Mountain Substation. Estimated hours of use is 6.0, but
22 that's the estimated, and it looks like, I think, that is
23 only page we have own that one.

24 Q. Okay. All right. 1323.

25 [Exhibit No. 1323 was identified.]

26 THE WITNESS: 1323, invoice dated 8/11/2016. This

1 one is a -- is a routine. You can see that there is a lot
2 of line -- a lot of different power lines that they're
3 talking about here. One of them being the
4 Caribou-Palermo. It's the third one down from the top.
5 Talks about pickup location, A&P hanger. Pick-up time,
6 0700, and six hour estimated time of use. And now they
7 have included -- sometimes I have seen this; sometimes I
8 don't, they just kind of have a little date on scheduling.

9 Q. Right. Calendar page?

10 A. Yeah, exactly.

11 Q. And then they have their daily flight log.

12 Flight time went over the six hours, and it went to 7.4
13 with a standby time of 2.6.

14 Do you understand what the "standby time" means?

15 A. I -- I don't. The only -- if it was me, I would
16 think that they landed while somebody is doing work and
17 they're standing by for the work to be done, and then
18 they're getting back on the ship and taking off to go to
19 another line.

20 For us, you know, at the sheriff's office
21 helicopter, that's what it would mean to us.

22 Q. Okay. All right. 1324.

23 [Exhibit No. 1324 was identified.]

24 THE WITNESS: Okay. 1324, again, invoice dated
25 8/15/2016. This one is a routine. Caribou-Palermo is,
26 again, third one down from the top. Here we have the

1 daily flight log. 6.8 eight hours. Standby time of 2.7,
2 and doesn't explain what they did other than the fact that
3 it said it's a routine.

4 Q. All right. 1325.

5 [Exhibit No. 1325 was identified.]

6 THE WITNESS: 1325 is an invoice dated
7 January 31, 2017. Nonroutine. Caribou-Palermo. And
8 looks like they had a standby time of 4.0 hours, and then
9 they've broken it up, which I don't -- I don't understand
10 the break up, because it just says that they are just
11 doing a -- they're look -- working on one line,
12 Caribou-Palermo. So I'm not sure how they broke this up.
13 But you have a .2, and then you have 1.5/1.7, a .3/2.0 so
14 they broke it up somehow.

15 BY MR. NOEL:

16 Q. All right. 1326.

17 [Exhibit No. 1326 was identified.]

18 THE WITNESS: Okay. This one is dated 9/13/2017.
19 There's two invoices for the same date. This is going be
20 invoice number 7901, and this is a routine Caribou --
21 let's see, Caribou-Palermo is the third one up from the
22 bottom for patrol items. Picking up at the A&P hanger at
23 0730 hours. Estimated use is eight hours, and it looks
24 like they did 8.75 hours, and it says under the notes
25 "patrol."

26 ///

1 BY MR. NOEL:

2 Q. All right. And 1326?

3 A. 27.

4 Q. 27, I'm sorry.

5 [Exhibit No. 1327 was identified.]

6 THE WITNESS: 1327, again, same date, 9/13/2017, but
7 invoice number of 7898. This is going to be routine.
8 With Caribou-Palermo, the third one up from the bottom.
9 And looks like -- let's see, total flight time 4.9, 4.9
10 and 3.0 it looks like. Doesn't say -- actually, it just
11 says "patrol." But it's a patrol of multiple different
12 lines where they've combined it all.

13 BY MR. NOEL:

14 Q. All right. And finally on this section, 1328.

15 [Exhibit No. 1328 was identified.]

16 THE WITNESS: 1328, again, invoice dated 9/12/2018.
17 Another request summary. And Caribou-Palermo is kind of
18 right in the middle.

19 BY MR. NOEL:

20 Q. This page is kind of interesting.

21 A. Uh-huh.

22 Q. Do you see this page with in any other -- any
23 other patrol?

24 A. No, it's much more detailed.

25 Q. Go on.

26 A. And then the -- the flight hours that are broken

1 up: 2.8, 2.9, 5.7, and it's listed as patrol.

2 Q. All right. So all of those were records that
3 were provided pursuant to grand jury subpoena by A&P?

4 A. That is correct.

5 Q. And the records provided by A&P start in 2010?

6 A. Correct.

7 Q. And go all the way through to 2018?

8 A. That is correct.

9 Q. The records go through 2019, but the relevant
10 records go through 2018?

11 A. That is correct.

12 Q. And those records that we just looked at, 1320 --
13 1314 through 1328 are the -- the records relevant to the
14 Caribou-Palermo line?

15 A. Yes.

16 Q. Okay. All right. So now we're going to the fun
17 stuff.

18 As part of your looking at the helicopter
19 evidence, were you asked to take up the helicopter into
20 the Feather River Canyon and video segments of the
21 Caribou-Palermo line?

22 A. Yes.

23 Q. Why don't you explain to us what you did?

24 A. So Jake Hancock was our pilot. Nick Moore was in
25 the -- the back of the -- the sheriff's helicopter. He
26 was our navigator, so he directed us to our starting point

1 and our ending point. What I mean by that is, what tower
2 we wanted to start at and what tower we wanted to end at.
3 There was a total of 19 towers that we inspected. I am --
4 in a helicopter, the pilot typically sits on the right
5 side of the helicopter, I'm in the front left side of the
6 helicopter. And we had the doors on the ship, so I have a
7 little window that's open, that's all I have, and I'm
8 holding a GoPro camera on a stick and trying my best to
9 keep it from not shaking and take some good video.

10 And so what you see when we look at this video is
11 -- it's GoPro video. It looks like we're actually far
12 away from the power lines, but we're actually not. It's
13 just the way that the GoPro works. It -- it -- it's
14 almost kind of double the distance of what we actually
15 were. And what I was trying to do was, one, do a first
16 video. We were about -- between 40 and 50 knots going
17 from our starting tower to the end of that 19th tower, and
18 then when we got back to the office, we timed that flight.
19 Jake, who was the pilot, came back around and now we did a
20 more detailed inspection. Where, again, I'm using the
21 GoPro and we're getting nice and close to the power lines
22 to where we -- I -- I am looking out the window, and I can
23 see very good detail of -- of the lines. If I had
24 Gyro-stabilizing binoculars, I would be able to see an
25 awful lot, but in even just me visually looking at the
26 lines, I could see a lot.

1 So I am holding the camera steady and -- and just
2 filming the inspection -- a much more detailed inspection.
3 Jake then goes to the next tower, we do the same thing.
4 So the video is continuous. When we get back to the
5 office, I am looking at the video and I am starting a
6 stopwatch on the time that the tower goes into the frame
7 of the GoPro to the time that it's out of the frame of the
8 GoPro and those are my times.

9 In reality, I'm actually doing on inspection even
10 longer, because the GoPro is on the side of the ship, and
11 I -- I didn't want to fudge the time, so I wanted to start
12 it with when it's actually seen with the GoPro, but when
13 you're approaching the tower, I'm looking out the front,
14 so I can actually start my inspections a lot sooner, and I
15 can also start it a lot -- end it a lot later, because as
16 Jake is flying away, I can still see the -- still see the
17 tower. So the times are -- are actually even longer than
18 what I have actually documented on the GoPro.

19 Q. Can you explain what a knot is?

20 A. Yes. It's -- in helicopter terms, it's a speed.
21 It would be miles per hour for a car. And I have no clue
22 what a knot is, how -- how many -- one knot to a mile per
23 hour, so I did a conversion and I included it on the
24 screen.

25 Personally, as a passenger, I don't care how fast
26 Jake flies, I just don't want him to drop from the sky.

1 But I asked Jake -- because it is important on how he --
2 how fast are we flying if we're flying -- you know, doing
3 a very quick -- a quick inspection of the line, and he's,
4 like, "We are between 40 and 50 knots," and that's what he
5 stayed at on that first video. The next video is where
6 there is really no knots, because we're at a hover. We're
7 literally hovering around the tower, and there's a huge
8 fluctuation between the speed between -- okay, we've done
9 a hover, now we're going to the next tower so that speed
10 estimate fluctuates between the towers very close versus
11 the next one is far. Jake will accelerate a little faster
12 and get to the next one.

13 Q. Now, before you did this, you had lots of
14 information, correct?

15 A. Yes.

16 Q. You had already received all of the information
17 from A&P?

18 A. Yes.

19 Q. And you reviewed all of the flight logs and
20 everything else?

21 A. Yes.

22 Q. Correct? And so you had an idea of -- as to how
23 long the patrols in the Caribou-Palermo were taking the
24 last two years?

25 A. Somewhat. Because you saw the records are not --
26 are not the greatest but had a very good estimate.

1 Q. Right. You also had the benefit of having
2 interviewed or been present for interviews of many of the
3 troublemen in PG&E before?

4 A. That's -- correct. That's what I am -- I am
5 focusing on, what they actually said. The people that
6 were in the ship doing it.

7 Q. Right. One of those being Chuck Stinnett?

8 A. Correct.

9 Q. All right. So do you want to pull up that
10 PowerPoint?

11 A. Sure. This one will be more exciting than the
12 first one.

13 Q. All right. So let's go onto the -- now, can you
14 briefly explain this second slide for us.

15 A. Okay. So the date of our flight was
16 February 6, 2020. We inspected 19 towers during our fast
17 pass. We used Butte County Sheriff's Helicopter Nora 48
18 -- or 488 Bravo Charlie. The pilot is Jacob Hancock. He
19 works for DA's office. I am the observer and
20 videographer, and Nick Moore, who also works for the DA's
21 office is the observer/navigator.

22 Q. All right. And then the background is a -- is a
23 Camp fire photo, correct?

24 A. Correct.

25 Q. All right. So let's go onto the next slide and,
26 before we start the video, I want you to explain what this

1 is and explain to the jurors how you built this?

2 A. Okay. So what this is -- I used Google Earth,
3 dropped pins on the 19 towers that we in -- that we did
4 inspections. Right here. Everybody pretty much knows,
5 hopefully, where Highway 70 and the Pulga bridge is. So
6 that's where we started. This gives us a good reference
7 point. If I say, "Hey, we did inspections of 19 towers in
8 the Feather River," you're not going to know where --
9 like, which ones. So that's why I did a Google Earth
10 picture, dropped the pins on the tower names and, again,
11 this is the tower that is closest to the Pulga bridge.
12 This is the Caribou-Palermo 115kV line. That's what we're
13 focused on, and we're traveling upstream north on
14 Highway 70, ending at, it looks like, 025 -- I can't tell
15 if it's a 25 or 2 -- I think it's 26/218. And that's
16 where we -- that's where we ended, so when you see -- and
17 then the next slide, what it's going to show is on Google
18 Earth, you can actually do a -- kind of like a little
19 flight, and that's me doing the flight, and then I
20 converted it and downloaded it into the PowerPoint.

21 This draw right here, this is going to be the
22 town of Pulga, and I will explain it now, because when we
23 start the more detailed inspection, I can't stop that
24 PowerPoint or we're going to have to start over and --
25 when we go into Pulga, we actually do 17 detailed
26 inspections instead of 19, and the reason why is two of

1 the towers are right next to the residence that are there
2 and we didn't want to disrupt them. So you'll see Jake,
3 he kind of just skipped those -- those two towers so we
4 don't bother those folks, and we come up over here and
5 start on -- actually, I think it's on this side on a tower
6 that looks like we are close to Pulga. We are, but
7 there's a huge tree buffer, which kind of helps out versus
8 the other two that we skipped.

9 Q. All right. I forgot to ask that on this. This
10 is Exhibit 1329, correct?

11 A. Correct.

12 [Exhibit No. 1329 was identified.]

13 BY MR. NOEL:

14 Q. And just to make sure we understand it, we have
15 the pin that shows your starting tower where you began
16 your -- your inspection, and then each one of the pins is
17 marked with a tower number, correct?

18 A. That is correct.

19 Q. And those tower numbers are based upon PG&E
20 records?

21 A. That is correct.

22 Q. And as we've gone through, the -- the PG&E
23 inspection records include GPS coordinates for every
24 single one of the towers, correct?

25 A. Correct.

26 Q. So you're able to take those GPS coordinates,

1 plot them into Google Earth and that gives you the exact
2 location of the tower?

3 A. Correct. And using Google Earth, when you zoom
4 in, you can actually see the towers. And something else
5 to keep in mind, when I'm filming, I actually have my
6 Google Earth -- I have two computer screens -- so I have
7 Google Earth on the right-hand side, and as I'm videoing,
8 I'm matching up the image to what I see on Google Earth to
9 what I'm actually filming, so I know that if I say I'm on
10 that tower, that's correct because I've already matched it
11 to the Google Earth tower.

12 Q. All right. So why don't you go ahead and run the
13 video?

14 [Whereupon, a video was played for the grand jury.]

15 THE WITNESS: So we have the Pulga bridge, starting
16 tower is just above it. Town of Pulga is in that draw.
17 And we skipped 232, 231 and, again, resumed at 230, when
18 we do the detailed inspection.

19 BY MR. NOEL:

20 Q. All right. So that's the video that you put
21 together using Google Earth, correct?

22 A. Correct.

23 Q. That's Exhibit 1329, which is marked in -- on the
24 CD in front of you?

25 A. Correct.

26 ///

1 BY MR. NOEL:

2 Q. All right. So let's move on to 1330.

3 [Exhibit No. 1330 was identified.]

4 BY MR. NOEL:

5 Q. And if you can explain to us what 1330 is?

6 A. 1330 is going to be -- our first pass through the
7 canyon. This is at 40 to 50 knots. And it's, again,
8 starting from the starting point tower ending to the 19th
9 tower.

10 Q. And Exhibit Number 1330 is on the DVD, if I said
11 CD earlier on 1329, I was wrong. It should have been DVD.
12 This one is on a DVD sitting there in front of you,
13 correct?

14 A. Correct.

15 Q. Now, why don't you go ahead and play Exhibit 1330
16 for us.

17 [Whereupon, a video was played for the grand jury.]

18 THE WITNESS: So 40 to 50 knots, converted to miles
19 per hour is 46.03 to 57.5 miles per hour. That's a lot
20 easier to understand than knots.

21 It's the town of Pulga down there. So that was
22 3 minutes 16.57 seconds from our starting target to the
23 end.

24 BY MR. NOEL:

25 Q. And how did you pick altitude?

26 A. I think Nick was the one that kind of gave us the

1 altitude just to stay at to where we had a very good
2 visual of the lines, but we were still doing the 40 to 50
3 knots.

4 And, again, I -- I can't stress enough, it looks
5 like we're far away from the lines, but we're actually --
6 we're not too far away. It's just the way that the video
7 camera captures the image. I mean, I can't -- I'm not
8 hovering over the lines where I can see small minute
9 problems with the lines, but I would be able to see, like,
10 if a -- like, a tree was hanging over the line even at
11 that speed, but...

12 Q. You can see if all the insulators are actually
13 hanging?

14 A. Yes.

15 Q. But not much more detail at that?

16 A. That would be correct.

17 Q. All right. So let's move onto 1331.

18 [Exhibit No. 1331 was identified.]

19 BY MR. NOEL:

20 Q. Explain to us what 1331 is?

21 A. Okay, 1331 is going to be the much more detailed
22 inspection. This -- the air speed is going to be
23 basically a hover, because that's all we care about.
24 We're kind of hovering over each one of the towers and
25 just kind of looking for -- for problems with the towers
26 and, again, we're not, you know, PG&E experts. We're kind

1 of just -- you know, if we were doing it, this is how we
2 would do it.

3 We're trying -- we can't do a full 360 around the
4 towers either, because we do have -- if you can see, this
5 is the -- this is the lowest line is what we're focused
6 on. This is the Caribou-Palermo 115. If we -- obviously,
7 as the slope comes up, we can't get over here, because,
8 one, we have other towers and lines so we're -- we're kind
9 of hanging out on either this side of the line --
10 actually, starting from the back to the side to the front
11 and over the top. But because of the terrain and other
12 lines, we might not sometimes be able to get to that -- to
13 that backside.

14 Q. All right. And this is -- this CD marked Exhibit
15 1331?

16 A. The DVD.

17 Q. DVD. I'm showing my age. Marked 1331.

18 A. Yes.

19 Q. Go ahead and play it.

20 A. Okay. And remember, I can't pause it.

21 Q. Yeah, I know.

22 A. Okay.

23 [Whereupon, a video was played for the grand jury.]

24 THE WITNESS: So at the arrows, what I am saying is,
25 at this starting point tower from the time it came into
26 focus to the time we left it, I was able to do an

1 inspection for 41.5 seconds so when you see the arrow --
2 arrows that's what it means.

3 So these are the two towers that we skipped. As
4 you can see, we don't have a whole lot of buffer with
5 trees, and the Pulga folks are out there. This one, we
6 have a -- a good buffering with the trees, and so we start
7 focusing on the next tower.

8 BY MR. NOEL:

9 Q. All right. Go ahead and explain the next slide
10 to us.

11 A. Okay. So the flight speed, like I said, it's
12 going to be a hover because we're going doing a detailed
13 inspection. We expected 17 towers, instead of the 19
14 because we bypassed two at Pulga. So when I say "total
15 inspection time," that's just the -- the hover time over
16 the towers. It came to 10 minutes, 26 seconds for 17
17 towers.

18 The total time including going in between the
19 different towers came to 16 minutes and ten seconds.

20 Q. All right. And did you put together a -- a chart
21 showing the various times of -- for lack of a better term,
22 "times on target," on target for each of the towers you
23 inspected?

24 A. Yes.

25 Q. All right. That would be Exhibit 1332, you
26 should have that in front of you.

1 A. I don't. I -- I was looking for one. I don't
2 have one.

3 MS. DUPRE-TOKOS: I don't have one either. Are there
4 any extras of 1332?

5 THE WITNESS: I have extras in my bag if you need it.

6 GRAND JUROR NUMBER FOUR: Oh, that one sheet. The
7 one list.

8 GRAND JUROR NUMBER FIFTEEN: Oh, you got it.

9 MR. NOEL: We will slap a tag on that.

10 THE WITNESS: Okay.

11 BY MR. NOEL:

12 Q. So describe for us what 1332 is?

13 A. This is a -- basically, I took all the -- the
14 second arrows and put them on paper basically. This is
15 the detailed tower inspection times of just the hover. So
16 as you can see, I have towers -- let's see, 1 through 19,
17 and then at the very bottom, it has the total hover
18 inspection time and the total flight time.

19 Q. All right. Here, we have an exhibit sticker.

20 A. Let me just make sure I didn't miss it in here.

21 BY MR. NOEL:

22 Q. Stick that in the corner. Stick that in the --
23 all right.

24 [Exhibit No. 1332 was marked for identification.]

25 BY MR. NOEL:

26 Q. So this is the part where math comes in.

1 A. I was hoping you weren't going to say that.

2 Q. If you add all of these together, let's -- I am
3 going to unplug you and plug mine back in. Come on,
4 sucker. There we go. And there's 1332 up on the screen
5 now.

6 So if we take all of these times on target,
7 there's 17 of them, we add them all together and we divide
8 them by 17. That should give us 36.23 seconds per tower?

9 A. That is correct. Of hover time.

10 Q. Right. And extrapolated out over the -- all of
11 the towers, the 464 towers of the Caribou-Palermo line,
12 that would mean that the -- at 36.23 seconds per tower,
13 there would be 4 hours, 40 minutes time on target?

14 A. Correct. Just hover time.

15 Q. Just hover time?

16 A. Just hover time.

17 Q. And then, one of the other things you can do with
18 the video is not only tell the time on target, but you can
19 tell the time that it takes you to get from target to
20 target.

21 A. Correct.

22 Q. So it was 18.10 seconds of ferry time between
23 towers is the average ferry time, correct?

24 A. That is correct.

25 Q. And, again, extrapolated out over the length of
26 the Caribou-Palermo that would give us 2 hours 20 minutes,

1 approximately of ferry time between towers, correct?

2 A. That is correct.

3 Q. Which would give us a total inspection time the
4 way you guys did it at seven hours?

5 A. Correct.

6 Q. Approximately, seven hours?

7 A. Yes.

8 Q. All right.

9 A. Not including refueling. That's straight flight
10 time.

11 Q. Right. And then the first one, the shorter video
12 that you did, the inspection of nine towers in the --

13 A. 19.

14 Q. -- in 3 minutes, 16 and a half seconds. That was
15 nine towers?

16 A. 19.

17 Q. 19, I'm sorry. I can't read my own writing.

18 And that would extrapolate out, based -- if you
19 did the same math, to I think a little over two hours to
20 do the entire line, correct?

21 A. Correct. At 40 to 50 knots.

22 Q. All right. I don't think I have anything
23 further.

24 Jen, do you have any follow-up questions?

25 MS. DUPRE-TOKOS: I don't.

26 MR. NOEL: Ladies and gentlemen, any juror questions?

1 Oh, I was going to come to you.

2 GRAND JURY FOREPERSON: That's okay.

3 BY MR. NOEL:

4 Q. All right. Using your experience, do you think
5 that you had sufficient time and quality of visualization
6 to adequately inspect the condition both overall and in
7 detail of each tower you inspected?

8 A. In the hover, I can see a lot of detail, and if
9 it was me doing a more detailed inspection, I would use
10 gyro-stabilizing binoculars, which is something we
11 actually use on the ship, so I'm very familiar with them
12 and I would be able to see quite a bit of detail on those.

13 Q. You were just using the naked eye?

14 A. Naked eye and I can see -- I mean, if you want to
15 talk about, you know, C-hooks or insulator damage from how
16 close Jake got to -- got to the towers, I can see a lot of
17 detail.

18 Q. And you're talking about in the hover?

19 A. In the hover. In the hover only. The 40 to 50
20 knots, the only thing I would be able to see would be,
21 like, obvious significant damage, towers that have come
22 down. Landslides, large trees. You know, in the lines of
23 -- if that -- if that ever happened, but not -- not
24 detailed.

25 MR. NOEL: All right. Any follow-up. Anybody want
26 to watch any of the videos again? Everybody want a break

1 because it's a little after 10:00?

2 MS. DUPRE-TOKOS: Yeah, we can take a break.

3 MR. NOEL: All right. So madam foreperson is going
4 to read you an admonition, and then you are free to leave.

5 GRAND JURY FOREPERSON: Investigator Patterson, you
6 are admonished not to discussion or disclose at any time
7 outside of this jury room the questions that have been
8 asked of you or your answers until authorized by this
9 grand jury or the Court.

10 A violation of these instructions on your part
11 may be the basis for a charge against you of contempt of
12 court. This does not preclude you from discussing your
13 legal rights with your own attorney.

14 Investigator Patterson, what I have just said is
15 a warning not to discuss this case with anyone except the
16 Court, your lawyer, or the district attorney.

17 Do you have any questions?

18 THE WITNESS: I don't.

19 GRAND JURY FOREPERSON: Thank you.

20 THE WITNESS: You bet.

21 GRAND JURY FOREPERSON: Thank you for your time
22 today.

23 THE WITNESS: Thanks.

24 MR. NOEL: Ready for a morning break?

25 GRAND JURY FOREPERSON: Yes, 15 minutes.

26

1 [Recess taken from 10:04 until 10:26 a.m. whereupon the
2 grand jury comes to order in Courtroom 9.]

3

4 GRAND JURY FOREPERSON: All members of the grand jury
5 are back from break and ready to proceed.

6 [Witness enters the courtroom.]

7 GRAND JURY FOREPERSON: Captain Hollstrom, before you
8 have a seat, would you please raise your right hand to be
9 sworn?

10 Do you solemnly swear that the evidence you shall
11 give in this matter pending before the grand jury shall be
12 the truth, the whole truth and nothing but the truth so
13 help you God?

14 THE WITNESS: Yes.

15 GRAND JURY FOREPERSON: Thank you, have a seat,
16 please.

17

18 **EXAMINATION**

19 BY MS. DUPRE-TOKOS:

20 Q. Good morning.

21 A. Morning.

22 Q. Could you please state your full name and spell
23 your last name for the record?

24 A. Shane Brandon Hollstrom. Last name is
25 H-O-L-L-S-T-R-O-M.

26 Q. Can everyone hear him okay? Can you pull the

1 microphone up a little closer?

2 A. Sorry, I can't get my knees under the desk here.

3 Q. Okay. Could you tell us where you're employed
4 and in what capacity?

5 A. I'm employed with CAL FIRE in the town of
6 Paradise as a fire captain.

7 Q. Okay. And how long have you been a fire captain?

8 A. Since 2010.

9 Q. Could you just give us a brief summary of your
10 experience as a firefighter? Where and, you know, for how
11 long?

12 A. Okay. In '95, I started with the Forest Service.
13 Various areas in Utah and California. In '99, I believe,
14 I came to CDF, worked with them for three seasons, and
15 then in 2002, I got hired with the town of Paradise Fire
16 Department until December of 2012 when they contracted us
17 over to the state, and so I have been at CAL FIRE since.

18 Q. So about how many years is that total
19 firefighting experience?

20 A. 24, 25 years.

21 Q. Now, do you have any medical training?

22 A. I do.

23 Q. And what is that?

24 A. Basic EMT and first responder training.

25 Q. And what does that mean you can do?

26 A. BLS, basic life support. CPR, first responder.

1 I can't push medicine, drugs, but everything else to
2 assist people, we can do.

3 Q. Okay. And how long have you been an EMT?

4 A. Since 19 -- January of 1997.

5 Q. And have you had to do periodic trainings to keep
6 your certification?

7 A. All through.

8 Q. Do you use your EMT training very often?

9 A. Every day when I'm at work.

10 Q. I'm glad it's when you're at work and not in your
11 real life.

12 A. It happens in real life too.

13 Q. In your career, have you seen people who have
14 been burned?

15 A. Yes.

16 Q. Okay. More than once?

17 A. Yes.

18 Q. Okay. Can you give us a -- even a rough estimate
19 of how many burn injuries you've seen in your career?

20 A. A lot. Hundreds.

21 Q. And are you familiar with the difference between
22 second-degree and third-degree burns?

23 A. Yes.

24 Q. Can you just briefly explain the difference to
25 us?

26 A. Basically, a first-degree burn would be, like, a

1 sunburn, irritated skin, red, painful to the touch.

2 Second-degree burns: More irritated, blistering, more

3 painful to the touch. And third-degree is extreme.

4 Horrible blisters, sloughing of the skin, skin melting
5 off.

6 Q. In extremely -- so you said skin sloughing off,
7 that's basically just the skin coming off of a burn
8 victim?

9 A. Yes.

10 Q. And then is that considered a serious injury
11 based on your training and experience?

12 A. Extremely.

13 Q. Can it be life threatening?

14 A. Extremely.

15 Q. Now, when you're on a call to assist a victim of
16 fire, and there's still active fire burning around you,
17 that would be a fluid situation I take it?

18 A. Yes.

19 Q. What's your number one priority when dealing with
20 victims at that point?

21 A. Getting them to safety, to a place where they can
22 be given first aid in a healthier environment.

23 Q. So in a situation like that, you're not going to
24 stop in the middle of an active fire and try and give some
25 sort of first aid, you're going to get them out?

26 A. Correct.

1 Q. Now, on November 8, 2018, were you on duty?

2 A. I was.

3 Q. Were you officially on duty at first?

4 A. No.

5 Q. What were you doing on November 8, 2018?

6 A. I was on vacation. I had my dogs down in Chico.
7 Just outside enjoying the morning.

8 Q. Did you live in Paradise?

9 A. I did.

10 Q. Did you lose your house in the fire?

11 A. I did.

12 Q. So if you were not officially on duty at first on
13 November 8, 2018, how did you end up on duty?

14 A. I received a phone call from my fire fighter who
15 was on duty. It was a normal duty day for me, but I was
16 on vacation. He called me up and, of course, my first two
17 things out of my mouth is, "Why are you calling me? I'm
18 on vacation." And "Why are you calling me? It's really
19 early." But he -- I could heard it in his voice, and he
20 just said, "Look up," and so I looked out and saw the
21 flume above Paradise, and I said, "I'm on my way."

22 Q. So what did you do?

23 A. I found a groomer that was open, and she took my
24 dogs since I'm going to be here at some point to get them,
25 do what you need to do. She gracefully took them. And
26 then I headed up the hill, drove the shoulder the entire

1 way in, obviously from the evacuations coming down, and I
2 got to the station and met up with Paulie, my fire
3 fighter, and then we went to work.

4 Q. What type of vehicle did you go to work in?

5 A. We actually got on one of our squads.

6 Q. What's a squad?

7 A. So a squad is a vehicle that has no water. This
8 one specifically is a F550, I believe, four-door with a
9 build up on the back to carry all of our tools and
10 equipment for rescues both over-the-edge water rescue,
11 anything along those lines.

12 So specialty equipment that doesn't go out very
13 often, but when it does...

14 Q. It's pretty helpful?

15 A. It's pretty helpful.

16 Q. So you weren't on an engine?

17 A. No. At that point, we weren't going to be able
18 to do really any good an engine. We knew with a squad, we
19 would be able to get more places that the engines couldn't
20 go.

21 Q. Okay. So what were you trying to do? And it was
22 just the two of you, correct?

23 A. Yes.

24 Q. What were the two of you trying to do?

25 A. Just rescue people.

26 Q. Okay. You weren't trying to fight fire?

1 A. There was no fighting fire for us. There's
2 nothing we can do at that point, just wanted to get people
3 to safe zones.

4 Q. Were you able to rescue some folks?

5 A. Many.

6 Q. Well, thank you.

7 A. You're welcome.

8 Q. At some point, and was it -- it was an active
9 fire zone?

10 A. Yeah.

11 Q. When you were doing that?

12 A. Yeah.

13 Q. And at some point, were you dispatched to try and
14 locate and assist two burn victims of in area of Edgewood?

15 A. We were.

16 Q. Were you able to make it to Edgewood?

17 A. We did.

18 Q. And were you able to initially locate the injured
19 couple?

20 A. No.

21 Q. Did you encounter anyone in that area who gave
22 you some information about them?

23 A. We did. So going down into Edgewood, engines
24 couldn't get passed just off of Pearson onto Edgewood,
25 everything was blocked by power lines and trees across the
26 roadway, but we were able to make access for the squad by

1 cutting the line and going through people's yards, et
2 cetera.

3 I got all the way down to the bottom of Edgewood,
4 got out of the squad, searched for a while. We were
5 unable to locate anybody, contacted Oroville ECC and asked
6 if they had anything further. They did not. So we told
7 them we were not able to locate, and we were going to work
8 our way back out. And on the way back out, a gentleman on
9 a quad came out of the smoke and stopped us, flagged us
10 down, and told us that he knew where the couple was. That
11 he has taken them on his quad to a field down below South
12 Libby, and so we contacted Oroville and let them know we
13 had a possible location and to get some equipment
14 dispatched down that way.

15 Q. And then what did you do?

16 A. We were immediately dispatched as well, and --
17 well, before we left, we spoke with the gentlemen on the
18 quad and asked if he would ride with us so he can lead us
19 in, but he was more comfortable on his quad and wanted to
20 get back to the couple as soon as possible, so he said he
21 would meet us at the bottom of South Libby and lead us
22 into where they were. So we went ahead and did that,
23 drove around, made it down to South Libby. By the time we
24 got to bottom, there was already a battalion chief and
25 another engine down there awaiting us, and they were
26 awaiting the people on the quads to bring the folks back

1 up.

2 Q. So the -- the two victims weren't present when
3 you first got to the --

4 A. No.

5 Q. -- bottom of South Libby?

6 A. No, they weren't.

7 Q. When they arrived, did you actually have an
8 occasion to see them?

9 A. Yes. Yeah, they arrived on the quads, and we
10 were -- I transported out of there, so my partner and I
11 helped pick them up off the quads and put them into the
12 squad so that we can get them out.

13 Q. Okay. What were their genders?

14 A. Male and female, both elderly.

15 Q. Were they a couple?

16 A. Yes.

17 Q. And at some point, did you learn their last name?

18 A. I did.

19 Q. And do you recall what that is?

20 A. Ernest.

21 Q. Could you describe the condition of Mr. Ernest
22 for us to the best of your recollection?

23 A. He was in real bad shape. Most of his clothes
24 were burned off. Really bad third-degree burns, and
25 having a hard time staying conscious and speaking to us.

26 Q. But he was conscious and speaking with you, at

1 least part of the time?

2 A. He was, yeah.

3 Q. Could you describe the condition of Mrs. Ernest
4 for us to the best of your recollection?

5 A. She was also burned quite badly. Clothes burned
6 off as well. Not quite as bad as Mr. Ernest, but she was
7 not in good shape. Fortunately, she helped us out quite a
8 bit and was able to talk with her husband the entire way
9 to get them to an ambulance to get them out of there. She
10 was a lot of help, but struggling herself.

11 Q. Okay. Did you notice any of the skin sloughing
12 you told us about earlier on either of them?

13 A. Both of them.

14 Q. Just a little bit?

15 A. It was excessive.

16 Q. And you said you -- you were their transport, do
17 you recall where you took them?

18 A. Yeah. We were able to bring them down to around
19 Valley Ranch Road and Clark Road to meet up with a pair of
20 ambulances down there, and then they were going to shuttle
21 them down further to where the air ambulance was.

22 BY MR. NOEL:

23 Q. Briefly, you lost your house in the fire,
24 correct?

25 A. Yes, sir.

26 Q. Can you give us the address?

1 A. 460 Stacy Lane.

2 Q. And that's in Paradise?

3 A. Yes, across the street of Foster.

4 MS. DUPRE-TOKOS: Does anyone have any questions?

5 Okay. You just need an admonition from madam

6 foreperson, and then you'll be all set.

7 THE WITNESS: Okay. Thank you.

8 MR. NOEL: Oh, I do have one more.

9 BY MR. NOEL:

10 Q. Did you guys get the names of the heroes on the

11 quads?

12 A. I -- I don't have his name. I wish I did.

13 MS. DUPRE-TOKOS: Actually -- and I do have a follow

14 up.

15 BY MS. DUPRE-TOKOS:

16 Q. So there was the initial gentleman, who you spoke

17 with up on Edgewood, and then you said that the victims

18 were brought up on quads?

19 A. Yeah. They -- if I remember correctly, there

20 were two of them, and the two of the firefighters for the

21 engine were there and went down to assist with getting

22 them loaded and bringing them back up to us.

23 Q. Okay. Do you know what the other engine was?

24 A. I don't. I can't remember. I'm sorry.

25 Q. That's all right. Thank you.

26 MS. DUPRE-TOKOS: Madam Foreperson?

1 GRAND JURY FOREPERSON: Captain Hollstrom, you are
2 admonished not to discussion or disclose at any time
3 outside of this jury room the questions that have been
4 asked of you or your answers until authorized by this
5 grand jury or the Court.

6 A violation of these instructions on your part
7 may be the basis for a charge against you of contempt of
8 court. This does not preclude you from discussing your
9 legal rights with your own attorney.

10 Captain Hollstrom, what I have just said is a
11 warning not to discuss this case with anyone except the
12 Court, your lawyer, or the district attorney.

13 Do you have any questions?

14 THE WITNESS: I do not.

15 THE COURT: Thank you for your time.

16 THE WITNESS: Thank you.

17 MR. NOEL: All right.

18 MS. DUPRE-TOKOS: Oh, we do need to put one thing on
19 the record and that was when Ms. Carota was testifying, I
20 said that the picture of Vincent Carota was, I think,
21 1257, and I misspoke. It should be Exhibit 972. So we
22 might want to correct your PowerPoints too.

23 GRAND JURY FOREPERSON: Thank you.

24 [Discussions omitted.]

25 [Matter adjourned at 4:05 P.M.]

COURT REPORTER'S CERTIFICATE

THIS IS TO CERTIFY THAT I, ASHLEIGH BUTTON, A
CERTIFIED SHORTHAND REPORTER OF THE STATE OF CALIFORNIA,
WAS PRESENT AT THE TIME AND PLACE THE FOREGOING GRAND JURY
PROCEEDINGS WERE HAD AND TAKEN IN THE WITHIN MATTER; AND
THAT AS SUCH SHORTHAND REPORTER I DID TAKE DOWN IN
SHORTHAND WRITING THE AFOREMENTIONED PROCEEDINGS; AND
AFTERWARDS CAUSED MY SAID SHORTHAND WRITING TO BE
TRANSCRIBED INTO TYPEWRITING; AND THE FOREGOING PAGES,
BEGINNING AT THE TOP OF PAGE 1 TO AND INCLUDING PAGE 57
HEREOF, CONSTITUTE A FULL, TRUE, ACCURATE, AND COMPLETE
RECORD OF THE PROCEEDINGS.

WITNESS MY HAND THIS 17TH DAY OF JUNE, 2022.

ASHLEIGH BUTTON, CSR #14013

5 [PROCEEDING OMITTED.]

6
7 [ROLLCALL OMITTED.]

8
9 [DISCUSSION OMITTED.]

10
11 [Witness enters the courtroom.]

12 GRAND JURY FOREPERSON: Mr. Dow, before you have
13 a seat, would you please raise your right hand to be
14 sworn.

15 Mr. Dow, do you solemnly swear that the evidence
16 you shall give in this matter pending before the grand
17 jury shall be the truth, the whole truth, and nothing but
18 the truth so help you God?

19 THE WITNESS: I do.

20 GRAND JURY FOREPERSON: Thank you, have a seat,
21 please.

22 **EXAMINATION**

23 BY MR. NOEL:

24 Q. For the record, Mr. Dow, could you please state
25 your full name spelling your last name.

26 A. Luther Dow, Jr., D-o-w.

1 Q. Morning, Mr. Dow.

2 A. Morning.

3 Q. By whom are you currently employed?

4 A. I'm actually employed by two companies; by
5 Nexant and a company called Energy Experts International.

6 Q. Can I get you to talk into the microphone so
7 everyone can hear.

8 A. Okay.

9 Q. What are those companies?

10 A. They're both engineering and consulting firms.

11 Q. And as such are you presently doing work for
12 PG&E?

13 A. Yes.

14 Q. As a consultant?

15 A. Yes. I'm working as -- for -- I'm working with
16 EEI. EEI has a contract with PG&E, and I'm part of that
17 contract.

18 Q. Okay. As part of that, have you been asked to
19 sign a non-disclosure agreement or anything similar?

20 A. I don't think so. You know, I've signed
21 non-disclosure agreements for various projects so . . .
22 But I don't particularly remember.

23 Q. Anything related to the Camp Fire?

24 A. I have signed documents associated with the Camp
25 Fire, yes.

26 Q. Okay. And are those for your consulting work?

1 A. Yes.

2 Q. Okay. And so let's make sure we get one thing
3 perfectly straight. In your testimony today what we're
4 going to be talking about and what we need to concentrate
5 on and answer is your work with Quanta and then prior to
6 that PG&E and your career and we need to not mention
7 anything or discuss anything that you've done post-Camp
8 Fire as part of your consulting contracts.

9 A. Yes. I understand.

10 Q. Okay. And I know we talked about this last
11 night, and we just need to make sure that it's on the
12 record that you've been instructed. And we made it very
13 clear we're talking about pre-Camp Fire your career with
14 Quanta and your career with PG&E?

15 A. Yes, Sir.

16 Q. Okay. So prior to retiring and becoming a
17 consultant, did you at some point work for PG&E?

18 A. Yes, Sir.

19 Q. Can you walk us through your PG&E career?

20 A. Sure. So I started working for PG&E when I was
21 in college in the summertime. And when I graduated, I
22 got a job with PG&E.

23 Q. Did you give us an approximate date.

24 A. Sure. 1972. So I started with them in 1970
25 doing -- in the summertime doing work, engineering work
26 for two summers and then I got hired with PG&E in 1972.

1 And then --

2 Q. Where did you go to college?

3 A. Sacramento State.

4 Q. And what's your degree?

5 A. I have a Bachelor's in engineering and a MBA.

6 Q. So you have both a degree in engineering and a
7 Master's in Business Administration?

8 A. Yes, Sir.

9 Q. Okay. And are you a licensed engineer?

10 A. Yes, Sir.

11 Q. Electrical engineering?

12 A. Yes, Sir.

13 Q. Are you licensed in any other fields?

14 A. No.

15 Q. Okay. Sorry. Go ahead.

16 A. That's okay.

17 Okay. And so then I started working in '72. I
18 worked in Vacaville. And I went to basically what was
19 called a distribution planner. Pretty basic engineering
20 work for distribution. And then I moved to Eureka,
21 worked in Eureka doing similar tasks. And then I was
22 there for a year and a half or so. And I moved back to
23 Vacaville, and I was a district engineer. So I was
24 responsible for all the distribution engineering of all
25 types in the Vacaville area.

26 And then I went to corporate headquarters in

1 San Francisco and was on the staff -- engineering staff
2 but actually got pulled off into doing a lot of work with
3 PCB. That was the time when PCB was a big issue.

4 Q. If you could just, for the record, briefly
5 explain to us what PCBs are.

6 A. Polychlorinated biphenyls. I'm not sure I can
7 even remember the full name of that.

8 MR. NOEL: Common spelling.

9 BY MR. NOEL:

10 Q. We don't necessarily need to know what PCB
11 stands for, but if you can just remind us, I'm sure --
12 what they were.

13 A. Sure. It was insulating fluid. PCB is the
14 name. It's a commonly used insulator fluid that -- and
15 in some cases were believed to be cancerous. And so
16 there was -- there was a big concern about PCB being
17 spilled. And so for a series of several years the
18 industry went through changing out all of the insulator
19 fluids in transformers and replacing transformers and
20 other things like that.

21 So it was just a -- that's -- I think that issue
22 is behind us now, but that's what it was. And so I
23 was -- I worked on that -- on that task of how we're
24 going to manage and handle and replace all of the PCB
25 fluid.

26 And then I left that and got involved with

1 underground distribution engineering standards equipment.
2 So all that work was being done at the corporate
3 headquarters. And then I had an opportunity to go into
4 the field and get some field experience and went to
5 Oakland for a while and then went to Concord where I
6 managed all engineering and all of the construction and
7 maintenance folks.

8 It was at that time -- it was at that time the
9 company started to do -- to do reorganization work in
10 Concord and one other headquarters. It was a trial area
11 on how they could -- how they could combine management of
12 gas and electric personnel.

13 So that was -- I stayed there for a year and a
14 half or so. And then -- and during that time -- and
15 during that time the transmission -- the transmission and
16 distribution work was all mixed together. So if you're a
17 lineman, you could do distribution work, you could do
18 transmission work.

19 Now, it's true that an area would have
20 transmission people who did -- who were good at
21 transmission work and did transmission work, but there
22 was no separation of work folks' skill sets from a
23 contract perspective. A lineman was a lineman and you
24 could do distribution work or transmission work.

25 And about that time, about '84, '85, mid '80s
26 they decided to try to form local transmission

1 organizations. And they actually formed what they called
2 regional transmission organizations. And they formed six
3 of them and -- because there was six regions, they formed
4 six of those.

5 And so one of those positions in San Francisco,
6 a regional transmission manager -- that person got
7 promoted to another job. And so I got his job. So I
8 left Concord, which was doing basically distribution work
9 and transmission work, and moved to the position in San
10 Francisco doing transmission work.

11 Q. Let me interrupt you right there. So right
12 around '86 when transmission -- electrical transmission
13 and distribution got split, you went to electrical
14 transmission and you were the regional supervisor for San
15 Francisco?

16 A. Yes, Sir.

17 Q. You said that the person you replaced is someone
18 who got promoted; correct?

19 A. Yes, Sir.

20 Q. Do you remember who that person was?

21 A. I believe it was Robert Malahowski.

22 Q. Who was Robert Malahowski?

23 A. Who was he? I didn't understand the question.
24 He was an electrical engineer, and he had done a lot of
25 work in transmission and operations. And that's all I
26 can tell you.

1 Q. So you were one of the original six?

2 A. No. I was probably number seven.

3 Q. Okay.

4 A. Because I think Rob was one of the original six
5 and I was number seven.

6 Q. And then you quickly replaced him?

7 A. Yes.

8 [Exhibit 608 introduced
9 as evidence.]

10 BY MR. NOEL:

11 Q. I'm going to direct your attention here to this
12 Exhibit 608. Do you remember this document? Yes?

13 A. Yes.

14 Q. That's the 1987 Transmission and Distribution
15 Electric Operations Manual. What is it? TD --

16 A. TDEO.

17 Q. Yep. And that lays out the policies and
18 procedures for the troublemen program, the transmission
19 troublemen program in 1987; correct?

20 A. You're calling it the Transmission Troubleman
21 Program. I don't know if those are the right words. Let
22 me say that this laid out how the inspection should be
23 done. I'm not sure -- and I don't remember the date.
24 They could have had transmission troublemen, but that was
25 a classification -- if my memory serves me correctly,
26 that was a classification that was established after the

1 regional organizational reform. And I don't know if it
2 was before or after this bulletin.

3 But certainly this is a bulletin that would be
4 used for it. I just wouldn't know -- I don't know if
5 it's classified as a Transmission Troublemens Program.

6 Q. Okay. Just want to make sure that you remember
7 this. How long were you in charge of -- were the
8 regional supervisor in charge of transmission in San
9 Francisco?

10 A. I'm going to be approximate here. Approximately
11 three years.

12 Q. Okay. Do you remember a guy named (WITNESS
13 #17)?

14 A. Yes.

15 Q. Who was (WITNESS #17)?

16 A. (WITNESS #17) was a specialist, and he worked --
17 a specialist. He worked in Oakland. And so he was in
18 Oakland. He was in the East Bay region. And he was a
19 specialist who -- as I knew him, he was a specialist. He
20 may have been a supervisor at the time. But when I knew
21 him, he was a specialist and basically provided technical
22 guidance to the field crews.

23 And I say that with respect because he's -- he
24 knew what was going on. And so he was a person who would
25 provide them based on technical knowledge, not just
26 necessarily engineering skills.

1 Q. So somewhere in the '80s, the late '80s would
2 you agree that the troubleman position was created?

3 A. Yes.

4 Q. Prior to that, PG&E did not have specific
5 trained individuals assigned to do inspections and
6 patrols of the transmission lines?

7 A. I don't know if I can -- if I can say that they
8 were not trained, but they did have a classification. My
9 memory is that in that particular headquarters there was
10 somebody who did that work. It wasn't like Johnny did it
11 today and Mike did it tomorrow. There was one or two
12 people who did that work. And so I'm assuming they had
13 some skills, but whether there was any training there I'm
14 not familiar.

15 Q. Okay. Now, in those early years, in the late
16 '80s of the troublemen program, do you recall was there
17 training for the newly created troublemen?

18 A. I was not involved with that, but I believe
19 there was. It's my understanding there was training,
20 yes.

21 Q. Okay. For instance, was there scheduled
22 meetings for the troublemen to come together and talk
23 about issues that had been seen and share photographs?

24 A. That's my understanding, yes.

25 Q. All right. Now, sometime in the late '80s do
26 you remember (WITNESS #17) bringing up an issue with wear

1 to C-hooks?

2 A. I can't talk about that. Sorry.

3 [Exhibit 179 introduced
4 as evidence.]

5 BY MR. NOEL:

6 Q. Okay. Well, I was going to show you a
7 photograph Exhibit 179. Do you remember seeing this
8 photograph back in the late '80s?

9 A. No.

10 Q. This being passed around?

11 A. No.

12 Q. Okay. Do you remember discussions about a
13 checklist being developed for a systematic approach to
14 the inspection of transmission lines? Transmission
15 towers?

16 A. I think there has always been -- there's always
17 been some form of a list or checklist about how to
18 inspect towers, yes.

19 Q. Okay. And back in the late '80s there was
20 actually a checklist for the -- the troublemen to -- as
21 they went down and inspected a tower; correct?

22 A. I don't know. It doesn't surprise me that there
23 was. I would be surprised if there wasn't. But if you
24 were to lay three pieces of paper on the table and say
25 "Which one was it," I couldn't point it out.

26 Q. Okay. Well, we talked about this last night.

1 Remember?

2 A. Uh-huh.

3 Q. And at that time you told us that you thought
4 that that checklist was still being used.

5 A. Yes, but -- and if I said that checklist, then I
6 may have misspoken. A checklist.

7 Q. Okay.

8 A. Okay?

9 Q. So after you get promoted somewhere around 1990
10 or after you leave your position in San Francisco, where
11 do you go?

12 A. Oh, as regional electric. At that time they had
13 formed these six regional transmission organizations but
14 even -- and the intent was to focus more on transmission
15 and to provide greater uniformity. But even with that,
16 the six regional organizations still were independent.
17 And I might while we had these --

18 Whoops, you changed it.

19 Q. Which one do you want?

20 A. It doesn't matter. I was just going to point to
21 the guidelines. Even though we had guidelines -- we may
22 have followed these guidelines, but there are other
23 things that may or may not have been guidelines on --

24 Q. Let me interrupt you real quick. So when you
25 are referring to these guidelines, you're talking about
26 Exhibit 608?

1 A. Yes.

2 Q. The 1987 Malahowski policy?

3 A. Yes.

4 Q. Okay.

5 A. And so they were -- these were still a little
6 bit different. And so they were doing things slightly
7 different. And so the company decided they were going to
8 try to look at trying to maybe centralize the
9 transmission a little more. And the first step of doing
10 that was to form -- was to take the responsibility for
11 budgeting and policies of the 230 and 500 because that
12 was the highest voltage or high voltage.

13 And so they formed an organization called "Hydro
14 Transmission and Substation." And that organization had
15 the budgeting responsibilities, policy responsibilities,
16 and auditing responsibilities for the work that was done
17 on the 230/500. It was not -- they did not have the crew
18 responsibilities. The crew responsibilities still
19 remained with the regional managers.

20 And I got that job. I was -- I have always been
21 a transmission and substation manager. And I had a small
22 staff of eight plus some protection engineers. And our
23 job was to try to make sure that work was done on the 500
24 and 230 consistently and was being done correctly. So
25 that's the next step that I had.

26 Q. Why just the 230 and 500?

1 A. I don't know.

2 Q. One fifteens weren't part of that; correct?

3 A. That's correct.

4 Q. You were never given any justification as to why
5 the 115 lines were not included?

6 A. No.

7 Q. And you were basically administrating the budget
8 for, what, capital work on the 230?

9 A. And maintenance work.

10 Q. And maintenance work. Okay.

11 Was there at that point a difference in the
12 maintenance procedures and the inspection procedures
13 between the 115 and the 230 and 500?

14 A. Well, the maintenance procedures in the 230 and
15 500s, as you see in this, are different. So that stayed.
16 That continued. So the 500, the 230, the 115, and the 60
17 have different inspection and maintenance schedules. And
18 that continued. We did not change this bulletin. We
19 just made sure that was followed in that particular
20 study.

21 Q. All right. So how long were you in that
22 position?

23 A. Until about '94. I think '94. Again, I might
24 be off a year or two. And in that timeframe they had a
25 major reorganization of the company.

26 You probably heard that before; right?

1 They had a major reorganization of the company.
2 And they pulled -- as part of that reorganization, they
3 pulled all transmission responsibilities together under
4 one organization. It was called Group Maintenance and
5 Construction, now referred to as GMC. And so all
6 engineering, construction, maintenance of the
7 transmission system and substations were pulled into one
8 organization. And I got that responsibility to manage
9 that.

10 Q. All right. What kinds of people were you
11 managing at that position?

12 A. In that position we had all kinds. We had
13 engineers. We had linemen. We had substation folks. We
14 had production engineers, production technicians. So it
15 was both -- both management and craft personnel.

16 [Exhibit 825 introduced
17 as evidence.]

18 BY MR. NOEL:

19 Q. All right. So we have up here in front Exhibit
20 Number 825 "1995 Overhead Line Inspection."

21 Do you recall this?

22 A. Yes.

23 Q. This was a -- the signatory on this document was
24 somebody by the name of Richard Cashdollar.

25 A. Yes.

26 Q. Did you know Richard Cashdollar?

1 A. Yes.

2 Q. Who was Richard Cashdollar?

3 A. Richard Cashdollar was -- was previously one of
4 the regional ethic managers in Sacramento. And when we
5 consolidated the transmission into one organization, he
6 became the director of maintenance. I think that was his
7 title. Or the manager of maintenance.

8 But he was associated with assuring the
9 maintenance inspection programs for both transmission and
10 substation and protection where there were maintenance
11 practices put together and followed and funded and
12 staffed and all of that.

13 Q. Was Mr. Cashdollar in your chain of command?

14 A. Yes, Sir.

15 Q. Were you Mr. Cashdollar's boss --

16 A. Yes.

17 Q. -- at the time that this was issued in 1995?

18 A. Yes.

19 Q. Do you know why in 1995 PG&E chose to reduce the
20 inspection and patrol cycles for transmission lines?

21 A. The first part of that question -- I'm sorry. I
22 was listening to the last part. I didn't catch the first
23 part.

24 Q. Do you recall why?

25 A. Yes. Well, the purpose of pulling the
26 transmission organization together into one place was to

1 try to develop work practices that could be used crossly
2 that were -- it was an opportunity to become current with
3 the way things should be done because there had been some
4 time since it had been looked at before.

5 So the process -- if I remember the process for
6 this bulletin, Rich had a -- I'm going to call it, for
7 lack of better term, a task force or whatever, but it had
8 a group of individuals who were -- I had never climbed a
9 tower. I never inspected a tower. Rich had never
10 inspected a tower. We had people who had done that work
11 get together and say "What's the best way to do this?"

12 "Rich, this is how we do it."

13 "Is there another way we can do this that would
14 be just as good, better, better for the -- better for the
15 person doing the inspection?"

16 And the group came up with this approach of "We
17 don't have to climb all the time because we can see these
18 things with -- with binoculars and other devices. And we
19 don't have to climb."

20 So that's -- and so they developed these
21 procedures.

22 Q. So one of the differences between the '87
23 Malahowski policy and the '95 Cashdollar is Cashdollar
24 essentially eliminated climbing inspections; right?

25 A. Well, that's one of the things. I mean --

26 Q. Right. And we're going to go through them one

1 at a time. But one of the things was the elimination of
2 routine climbing inspections?

3 A. Yes.

4 Q. In 1987 they were supposed to be -- the
5 troublemen were supposed to be climbing 5 percent of
6 every transmission line every year.

7 A. They were supposed to be climbing. I've -- it's
8 been a long time since I looked at it, but there's
9 5 percent -- I don't know if it's every line or 5 percent
10 of every voltage level. I don't remember.

11 Q. I can tell you it's 5 percent of every line.

12 A. Every line. Fine. Okay.

13 Q. Every year.

14 A. Okay.

15 Q. In 1995 Mr. Cashdollar's memo completely
16 eliminated routine climbing inspections and went to an
17 "as triggered"?

18 A. Yes.

19 Q. Why?

20 A. I can tell you why I think it happened. I was
21 not on that. So you'll have to -- you'll have to take my
22 understanding is that it was done because that was the
23 recommendation of people who have inspected, done this
24 work, and they said "We can do it this way."

25 Q. Okay. By 1985 or -- 1995 -- I'm sorry -- do you
26 recall was there already an awareness of the -- that many

1 PG&E assets were aging?

2 A. I think that's -- I think that's fair, yes.

3 Q. Many -- especially the 115 lines were built in
4 the 1910s and 1920s?

5 A. Yes.

6 Q. Is that correct?

7 A. Yes.

8 Q. So by that time those lines were already 70 to
9 80 years old.

10 A. Okay.

11 Q. So it seems somewhat -- what's the word I was
12 looking for? It doesn't make sense that as you have an
13 aging infrastructure that you're reducing in 1995 the
14 patrols and inspections of that infrastructure.

15 A. I think all of the structures are not equal. A
16 tower that's in the -- in the center of the Sacramento
17 Valley that goes across the ag land is completely
18 different. It's in a different situation than a tower
19 that's in the water way, that's in the bay, that's
20 covered by -- it has -- it's flooded with water or a
21 tower that is adjacent to a chemical plant where the
22 chemicals are coming out.

23 We did not try to say you have to do every tower
24 the same way because the environment is what you need
25 to -- you have to pay attention to.

26 So I think the process -- and I haven't looked

1 at this recently. I think the process was we tried to
2 say how critical the towers were and what was the
3 environmental arena and what was the environment they
4 were in and try to do the maintenance work based on "Hey,
5 we need to pay -- we need to pay more attention to that
6 115kV tower that's in --" I'm going to use the
7 expression "that's in the corrosive area." Like whether
8 it's in the Bay Area is different from the work you need
9 to do for that tower that's in the Sacramento Valley
10 that's going across ag land.

11 So there is no need for every tower to be looked
12 at exactly the same.

13 Q. All right. So by the mid '90s there was already
14 being a distinction drawn between what are known as the
15 Bay Waters towers and the rest of the system?

16 A. Let's see. The answer is yes, at least in our
17 understanding. Whether it was documented, whether the
18 document says "Hey, that's the case" and that document
19 is -- I don't know. But certainly we were experiencing
20 problems with Bay Waters towers that we weren't
21 experiencing elsewhere. So, yes.

22 Q. And you worked down there for a while. Most of
23 the 115 lines that qualified as the Bay Waters towers,
24 can you give us an approximate age of those towers.

25 A. Oh, no.

26 Q. Or a year? Are those pre- or post-World War II

1 systems?

2 A. I don't know.

3 Q. Okay. And the Bay Waters doesn't just apply to
4 the towers that are actually in the bay itself in the
5 water? It also applies basically to everything in the
6 Bay Area?

7 A. Because you can have corrosive air coming in.
8 And so you can describe it being Bay Waters, but
9 certainly you'd have the air with the salt water, salt
10 air coming in to cause corrosion.

11 Q. You have all that fog and the salt air in that
12 fog.

13 A. Right.

14 Q. And I'm sorry I didn't ask you this last night.
15 And this just occurred to me. It's understandable why
16 the Bay Waters towers, why the Bay Area towers with that
17 corrosive environment would be treated so different.

18 Why aren't the other towers up and down the
19 California coast outside the Bay Area treated that way?

20 A. Well, I don't think they're being excluded. I
21 think there would be -- an idea of the Bay Waters was if
22 you were exposed to that type of -- if you were exposed
23 to that type of environment, you would follow those
24 practices.

25 Q. Right. I mean, they call it the Bay Waters
26 towers and they have the Bay Waters towers project. And

1 there's a huge amount of resources that are being
2 dedicated to the Bay Waters towers, but those aren't
3 going to, say, the Sonoma coast, the Mendocino coast, the
4 Humboldt coast, the Del Norte coast, or down to San Luis
5 Obispo, Monterey.

6 A. I'm sorry. I don't know. I believe you're
7 telling me the truth, but there's no reason -- there's no
8 reason they shouldn't be.

9 Q. When you were running this, was that the truth
10 then?

11 A. The intent was -- the intent was to -- if you
12 were in an area of corrosion, you should follow that type
13 of practice whatever their practice was at the time.

14 Q. So obviously there's a huge difference between
15 the corrosive environment of the bay waters and, like you
16 said, the central valley?

17 A. Yes.

18 Q. What about the mountains?

19 A. Yes.

20 Q. Was any special attention being paid to the
21 lines in the mountains? The snow towers?

22 A. Yes. The mountainous towers would be more
23 affected by wind, wind and, if you were in a snow area,
24 then the condition of snow. But primarily the mountain
25 towers are wind issues.

26 Q. Right. And the mountain towers are also

1 generally the oldest in the PG&E inventory; correct?

2 A. Yes, yeah, yeah. They were older.

3 Q. But there was special attention and special
4 resources being devoted to the Bay Waters towers and the
5 corrosion. Was there anything similar for the oldest
6 lines in the system up in the mountains exposed to wind?

7 A. When it comes -- let's see. When it comes to
8 inspection, I'm not sure. I don't think so, but
9 certainly there were special programs -- we had
10 experienced a different type of -- I'm going to use the
11 word failure here. We had this discussion about failure
12 last night. So I'm just going to use the word failure.

13 We had things that didn't work properly that we
14 had to go back and fix. And we did numerous wind studies
15 to determine what those fixes were.

16 So, yes, there were programs to enhance and
17 enforce towers and various mountain areas. Whether or
18 not the Feather River had that or not, I'm not sure. But
19 in the area we call mountainous, there certainly have
20 been a lot of wind studies done and work done to enforce
21 towers because of that.

22 Q. It's amazing how sometimes these conversations
23 go. I had no idea that you had anything to do with the
24 wind studies.

25 A. I guess -- I didn't have anything to do with the
26 wind study, but certainly the -- using the wind study

1 would have been part of that.

2 Q. Okay. And can you educate us very quickly
3 on what you mean by the wind studies.

4 A. Well, I'm trying to. So there were several wind
5 studies done to determine the velocity and what the
6 stresses were on towers that PG&E did. And they're
7 generally pretty site specific. And they would do those
8 studies and use those studies to look at whether they
9 need to modify the towers or not.

10 Q. Were those studies done by people working for
11 you?

12 A. No, no.

13 Q. Or commissioned by?

14 A. Probably commissioned by but they didn't work
15 for me. They were people from our research group that
16 would do the work.

17 Q. Okay. And how did you use those wind studies in
18 your group, in your position?

19 A. Well, those wind studies would be used to
20 determine if a tower needed to be reinforced. For
21 example, are the -- do we need to have a different set of
22 guides and do they need to beef up arms? That sort of
23 stuff. So it's reinforcement of the towers.

24 Q. Why was wind of such concern at that point?

25 A. Well, PG&E had experienced some -- some tower
26 problems because of wind. And so they wanted --

1 before -- they wanted to go back. Before you go back,
2 you do need to understand when you go backwards to the
3 same type of tower, you need to do something different.
4 So the studies were done to do something different.

5 Q. Okay. All right. We're back onto the '95. We
6 were talking about the elimination of climbing
7 inspections and also the reduction of detailed ground
8 inspections from every year to every other year.

9 Do you know why that occurred?

10 A. Again, it's based on what that team said they
11 thought was appropriate.

12 Q. And then the other major change here was the
13 reduction of air patrols from twice a year to once a
14 year. Again, can you educate us on why that occurred.

15 A. The same issue.

16 Q. The word I was looking for earlier was
17 counterintuitive. It seems counterintuitive that you've
18 got an aging infrastructure and now you're reducing the
19 resources to inspect that very infrastructure for
20 problems.

21 Does that make sense to you?

22 A. Yeah. I understand your question. I mean, I
23 understand your statement.

24 Q. Right. And do you have a response? Can you
25 explain why that wouldn't be right.

26 A. I guess we were counting -- we were counting on

1 people who do the work saying "This is what we need to do
2 to keep the towers inspected properly."

3 Q. And do you -- and you've mentioned several times
4 your team -- Cashdollar's team that was doing this.

5 Do you remember any of the persons who were
6 appointed to that team?

7 A. No.

8 Q. Sorry.

9 Now, we also talked about in the late '80s when
10 you were running the T-line team in San Francisco, the
11 region in San Francisco there being a checklist for the
12 inspectors to use to do a systemic check of every tower.

13 By 1995 was that checklist still in use?

14 A. I don't know.

15 Q. Did you ever see that checklist or hear about
16 that checklist again?

17 A. Again, I can't put the times to when -- it was
18 my understanding there was a checklist. If it went away,
19 I'm not familiar with when that was.

20 Q. Okay. All right. Now, let's move on from '95.
21 And we'll get to this in a second, sedgeway between
22 exhibits here.

23 And go through your career from 1995 until 2007.

24 A. Sure. So when -- excuse me. I left PG&E in
25 1997 and went to work for an engineering firm in Boston
26 and then we returned to California in 2000 and started

1 work for EPRI, which is Electric Power Research
2 Institute, in Palo Alto where I was the director of all
3 T&D research for the Electric Department Research
4 Institute.

5 And in 2005 I went back to PG&E as the -- as the
6 director of San Francisco reliability. At that
7 particular time, San Francisco had had -- had had a major
8 substation fire, major outage, and they wanted someone to
9 take a look at what could be done there. And so I was
10 brought back to look at that. And I looked at
11 substations, underground assets, both transmission and
12 distribution and both assets.

13 And so I stayed there in that position until the
14 start of the reorganization. They had the reorganization
15 and then I moved on to becoming the Electric Asset
16 Strategy director. The responsibility of that position
17 was I had transmission planning responsibilities,
18 distribution planning responsibilities, and I managed the
19 entire electric budget for PG&E non-generation.

20 So I was responsible to make sure that the
21 budget was operating, expended, used, and that it was
22 being used and that it was being used properly and that
23 the projects that were being asked to be done --

24 Large projects came through my -- my office.
25 Not to review them technically, that it's the right thing
26 to do, but more or less is it in the budget and is this

1 the type of work in the budget that is supposed to be
2 done? So that's where -- that's -- and then I retired in
3 2008.

4 Q. All right. It's often been said that in PG&E
5 your job is like the weather. If you don't like it, just
6 wait a couple hours and a re-org will come along and it
7 will change.

8 Has that been your experience?

9 A. There's -- there was a lot of reorganization
10 after '84. When I started in '72 to '84, the
11 structure -- people were being moved around. They
12 retired, they got promoted, or whatever but the structure
13 was pretty much the same.

14 And then starting in '84 the company started to
15 reorganize. They did things with the gas appropriation.
16 They did things with transmission. So if you say there
17 were a lot of reorganization, pretty each from the last
18 half of my career.

19 Q. All right. So you said that in '97 you left
20 PG&E and went to work for an engineering firm in Boston?

21 A. Yes, Sir.

22 Q. Do you remember which firm?

23 A. Doble Engineering.

24 Q. What type of engineering were you doing for
25 them?

26 A. They were an engineering manufacturing firm, and

1 Doble manufactured relay test equipment and breaker test
2 equipment. And I went there because they were starting
3 to work on online diagnostic substation equipment.
4 Basically how can we determine that this piece of
5 equipment is being operated properly online without
6 having to do testing?

7 So basically adding sensors and doing all that.
8 So I was very interested in that. So I went there to
9 help do that. And they weren't as successful as I would
10 have liked so we came back.

11 Q. Are they actually -- were they actually based in
12 Boston or --

13 A. Watertown.

14 Q. Okay. My partner here is from Boston.

15 A. I'm sorry. Yes, Watertown.

16 Q. All right. So somewhere around 2006 you become
17 the director of Electric Asset Strategy?

18 A. Yes.

19 Q. And you said that you were in charge of the
20 budget for all electrical other than generation?

21 A. Yes. I managed it. I wasn't in charge of it.

22 Q. Okay. Thank you.

23 What does it mean to manage the budget?

24 A. So I didn't allocate it. The budget process is
25 done normally in bottom-ups. People say "I need this
26 much money." And money is allocated, justifications

1 made, and then you're going to put an electric budget in
2 and the electric budget is compared to the gas budget.

3 And so the corporation develops a budget and
4 then the budget -- and they said "Okay. We want this
5 much, but we only have this much."

6 And so they have allocated the budget to each
7 one of the organizations depending upon what they would
8 ask for and what the corporate manager, corporate
9 officers thought would need to be done. And so then it's
10 allocated out and then it's given to organizations.

11 Every headquarters has a budget, and my job was
12 to make sure that these various organizations did not
13 overspend their budget. Well, first of all, make sure
14 they spend it because you didn't -- if the money -- if
15 they had money, it was there for a reason. They had to
16 spend it.

17 So one was to make sure it was being spent, make
18 sure it was being spent as they said they were going to
19 spend it, and to make sure that they didn't overextend
20 the budget.

21 That's sort of the management coordination
22 budget. We didn't say "Yes, you can" or -- "Yes, you can
23 or cannot have a new truck." That's not -- that was not
24 my job. But if they needed a new truck, there should
25 have been money in the budget. That's basically what I
26 was doing there.

1 Q. All right. Are we talking capital budget,
2 expense budget, or both?

3 A. Both.

4 Q. Okay. Both. And you said that you also had
5 some oversight on major projects.

6 A. Yes.

7 Q. So can you explain that to us.

8 A. Just referencing this?

9 Q. We'll get to this in a second but just in
10 general.

11 A. So with major projects, large projects were
12 coming up for approval. Often they would come through my
13 organization to make sure that, in fact, that project was
14 in the budget and that that amount was correct.

15 So if you had put in the budget -- if I had put
16 in the budget "I need \$1.5 million to build a
17 substation," I submitted the job for approval. It should
18 be around 1.5 million. If I come in with a project
19 that's 7.8 million, that's going to raise a bunch of
20 questions.

21 So I was the first stop at looking at it from a
22 financial perspective. So that's the oversight I had was
23 oversight from assuring it was within the corporate
24 budget level.

25 Q. And you said you weren't reviewing projects
26 technically. What does that mean?

1 A. Oh, "Is that correct? Oh, you said you wanted a
2 10 megawatt transformer, but you didn't justify it.
3 You've got only two megawatts with those."

4 That was not my responsibility to do those
5 technical assessments. It was -- that was someone else's
6 job to do that.

7 Q. All right. Were you familiar in your capacity
8 as the Electric Asset Strategy person managing the budget
9 with the Deteriorated Transmission Equipment Replacement
10 Program of 2007?

11 A. No.

12 Q. You had no idea what that program was?

13 A. Well, I mean, I heard the name. I know what it
14 is. I mean, I know what it is. But did I know that
15 there was a program there that said that? And I did not
16 know that. I'm not surprised that there is, but it's not
17 something I tracked.

18 Q. Okay. So you have no idea how much money was
19 put into that program or if there was actually a program
20 itself; correct?

21 A. No, that's correct.

22 [Exhibit 838 introduced
23 as evidence.]

24 BY MR. NOEL:

25 Q. All right. We have up on the board in front of
26 you Exhibit 838. Do you recognize Exhibit 838?

1 A. Yes.

2 Q. Can you tell us what 838 is.

3 A. It's an Advance -- so it's an Advance work order
4 or Advance GM. When large projects are being prepared,
5 oftentimes -- or they're being prepared, there's a lot of
6 engineering work that needs to be done. And that
7 engineering work needs to be captured and charged to the
8 project.

9 And so since the project is not approved yet,
10 the process is to develop an Advance GM or Advance Work
11 or Advance GM to capture those charges. And so someone
12 comes in and says "We have a plan to do a given project.
13 We expect this project to be sent for approval. We
14 already sent it for approval. In the meantime, we need a
15 certain amount of money to be able to do engineering
16 work, environment --" as we see in this case "environment
17 studies, land work." Because you can't get the job
18 approved unless you make sure you have the right-of-way,
19 be sure you can get the environmental list correct.

20 So we put together these Advance GMs. And when
21 the GM gets approved, the charges for this GM roll over
22 into the job and then it's approved. If the job is not
23 approved, then these charges then roll into expense, into
24 a non-capital budget.

25 Q. Really? Okay.

26 So 838 is a project. Do you remember this

1 project on the Caribou-Palermo line?

2 A. Generally.

3 Q. Okay. But this was a project -- and this is
4 quoting from it. "This project is part of PG&E's
5 Deteriorated Transmission Equipment Replacement Program."

6 But you don't recall any specific program with
7 that name?

8 A. No. I just don't.

9 Q. Okay. But by this time 2007 was there an
10 awareness at your level within PG&E that there was a
11 problem with aging infrastructure?

12 A. There was an awareness that there was an aging
13 infrastructure, yes.

14 Q. Okay. So this is the copy of the AA that you
15 approved for \$200,000?

16 A. Okay.

17 Q. Originally the request was for \$800,000. Do you
18 recall why that request was chopped?

19 A. The answer is no, I do not recall. But I could
20 give you a reasonable explanation about it.

21 Q. No. If you don't recall -- and we talked about
22 this.

23 A. Yeah. Okay. It would not have been -- okay.
24 That's fine.

25 Q. Right. Now, we talked about earlier that you
26 weren't making technical evaluations of the projects when

1 you were reviewing these Advance Authorizations. So that
2 had nothing to do with why you chopped the budget from
3 \$800,000 to 200,000; correct?

4 A. That's correct.

5 Q. And one of the things that is interesting as
6 you're talking about the capital versus expense
7 account --

8 And you have an MBA; correct? And you were
9 managing the budget; correct?

10 A. Yes.

11 Q. All right. And this is just to get your opinion
12 of somebody who has done this. Eventually, this
13 project -- this Advance Authorization ended up costing
14 almost \$800,000 and then the project was cancelled.

15 A. Okay. I don't know that.

16 Q. It wasn't approved. I know. I know you don't.
17 But after the project was cancelled, all of the expenses
18 on the project were capitalized. Is that --

19 A. I don't know.

20 Q. I mean, you said earlier that in your experience
21 as this -- as a director and with the budget and
22 everything, that if these things went through, they'd be
23 rolled into -- if the project got approved, they'd be
24 rolled into the overall budget. If they didn't, what
25 work had been done would just be charged off against the
26 expense budget; correct?

1 A. What I don't know is there may be some result of
2 this that was used and useful. And so if there was some
3 result of this work that is useful, then it would be
4 capitalized. I don't know where they went and so . . .

5 Q. Well, and I'm not going to pull them up here.
6 But we have some e-mails after the project gets cut
7 basically saying "Okay. Go out and do something useful.
8 Change out the insulators so that we can capitalize all
9 this money."

10 A. Oh, I don't know.

11 Q. In your experience is that proper procedure? Is
12 that proper budgeting?

13 A. I'm surprised they did that.

14 Q. Did you know someone named Manho Yeung?

15 A. Yes.

16 Q. Who was Manho Yeung?

17 A. Manho Yeung has worked for me a couple of times.
18 And when I was the -- when I was there in '97, he was the
19 director of engineering for me.

20 Q. Okay. And how about in 2007?

21 A. I don't know where he was in 2007 to be honest
22 with you.

23 Q. You retired in 2008?

24 A. Yes, Sir.

25 Q. Why did you retire in 2008?

26 A. I got reorganized out.

1 MR. NOEL: And, Madam Foreperson, it's a few
2 minutes after 10:00. Before we get into his
3 post-retirement career, this may be a good time to take a
4 break.

5 GRAND JURY FOREPERSON: Okay. Take a 15-minute
6 break, but I need to read you an admonishment prior to
7 doing that.

8 THE WITNESS: Yes, Ma'am.

9 GRAND JURY FOREPERSON: Okay. Mr. Dow, you are
10 admonished not to discuss or disclose at any time outside
11 of this jury room the questions that have been asked of
12 you or your answers until authorized by this grand jury
13 or the Court. A violation of these instructions on your
14 part may be the basis for a charge against you of
15 contempt of court. This does not preclude you from
16 discussing your legal rights with your own attorney.

17 Mr. Dow, what I have just said is a warning not
18 to discuss this case with anyone except the Court, your
19 lawyer, or the district attorney.

20 Do you have any questions?

21 THE WITNESS: No, Ma'am.

22 GRAND JURY FOREPERSON: Thank you.

23 [Recess taken from
24 10:04 until 10:50 a.m.]

25
26 [PROCEEDING OMITTED.]

1 GRAND JURY FOREPERSON: Okay. All members of
2 the grand jury have returned from break, and we're ready
3 to proceed.

4 MR. NOEL: Ask Mr. Dow to re-join us.

5 GRAND JURY FOREPERSON: Mr. Dow, I'd like to
6 remind you that you are still under oath.

7 THE WITNESS: Yes, Ma'am.

8 GRAND JURY FOREPERSON: Okay. Thank you.

9 **EXAMINATION CONTINUED**

10 BY MR. NOEL:

11 Q. All right. Before we move on here really
12 quickly just to make this clear, in your experience is it
13 common for expenses for projects that are just in the
14 planning stage are capitalized?

15 A. Let me clarify what you said. Is it the
16 projects that are not approved?

17 Q. Right.

18 A. No.

19 Q. So in this case an AA, an Advance Authorization,
20 is authorized to allow for the preliminary work being
21 done, the engineering and all of that, the study to
22 determine if this project is feasible. And then the
23 project gets cancelled and then for those expenses that
24 were spent up to that point to be capitalized?

25 A. No, they are not capitalized.

26 Q. Or for someone to do a much smaller project in

1 order to be able to capitalize everything?

2 A. Basically, you know, this engineering may --
3 this preliminary work -- maybe the project won't be done,
4 but maybe a smaller project could be done. And this
5 engineering work justified that and then it would be
6 capitalized. But normally, if a project like this is
7 cancelled, then those charges are expensed.

8 Q. So let me give you a hypothetical. And I know
9 you had left the company and everything. So you
10 authorize an AA for \$200,000 to do advanced engineering
11 PM and estimating work, land review, environmental
12 review, and all of that. A project manager's appointed
13 to assess the project and do all of the pre-engineering.
14 And for various reasons that project manager overruns
15 that \$200,000 budget that had been authorized and then
16 ultimately the project gets killed. It gets declined.
17 "We're not going to pursue this project."

18 And then an issue goes out, an order goes out to
19 basically find a small project to do under this number.
20 Let's say, for instance, hypothetically replace some
21 insulators. So the original project was to replace ten
22 towers. That went over budget hypothetically, and
23 hypothetically that project gets killed. And then
24 hypothetically somebody comes back and says "Okay. Go
25 out and replace the insulators on those towers so that we
26 can capitalize the money that you've already spent."

1 In your experience, is that common?

2 A. No.

3 Q. In your experience, in your opinion is that
4 honest and ethical?

5 A. The -- if in fact the insulators -- if in fact
6 the work that they did really did need to be done, you
7 could make the case that, you know, that is not the
8 purpose of the job.

9 So I guess I'd have to know what the condition
10 is, whether it's honest or ethnical. It's not something
11 I would normally --

12 Q. Let's assume that at least the person who was
13 ordered to do that felt and stated for the hypothetical
14 that the insulators did not need to be replaced and that
15 the sole reason that the insulators were being replaced
16 was to capitalize the money that had already been spent.

17 A. With that knowledge I would think that is not
18 appropriate.

19 Q. All right. So 2008 another re-org. And this
20 time you retired?

21 A. Yes.

22 Q. And how long did you stay retired?

23 A. Not long. A few days maybe.

24 Q. All right. And did you get another job?

25 A. Yes.

26 Q. With whom?

1 A. Quanta Technology.

2 Q. Can you explain for us briefly what Quanta
3 Technology is.

4 A. Quanta Technology is a consulting firm,
5 consulting firm that normally works primarily for
6 utilities. And they have -- they consult at basically
7 the full breath of the utility services, production,
8 transmission, distribution, sub-generation. All
9 technicals. No environmental, no health but just
10 technical electrical systems.

11 Q. Is Quanta Technology -- and forgive my lack of
12 understanding of the corporate world. But how is Quanta
13 Technology associated or affiliated with other Quanta
14 companies?

15 A. It's just that they are owned by the other --
16 they are a Quanta Company. So they are -- Quanta has
17 large primarily construction companies. They have PAR
18 Electric and they have several construction companies.
19 And they have a -- they have a communication consulting
20 company. And Quanta Technologies is probably the
21 smallest of their Quanta companies.

22 Q. Right. And does Quanta -- is one of the
23 sub-companies of Quanta an actual electrical utility?

24 A. They keep dying. There wasn't when I was there.
25 Not that I'm aware of.

26 Q. All right. And then construction companies.

1 Would that include PAR Electric?

2 A. Yes.

3 Q. That's all part of the Quanta --

4 A. Yes.

5 Q. -- kingdom?

6 A. Family of companies.

7 Q. Family of companies. That's a very good word
8 for it.

9 All right. So what is Quanta Technologies?

10 A. It's a consulting firm that -- I think I just
11 described it. A consulting firm that consults primarily
12 for electric utilities.

13 Q. What was your job with Quanta Technologies?

14 A. So Quanta Technologies is headquartered in
15 Raleigh. And they did a lot of work on the west coast,
16 but they had no facilities on the west coast. They had
17 nobody on the west coast. So I was hired to develop a
18 west coast office, which I did.

19 We developed an office in Oakland and to staff
20 that office so that there were -- they would have people
21 on the west coast. They were avoiding the time zone
22 issue and travel issues.

23 And so my first charge was to develop the office
24 on the west coast. And then I became the manager of
25 their transmission -- I mean, excuse me, of their
26 distribution business. And so I had the -- I managed all

1 the transmission -- I mean, all the distribution
2 consulting work.

3 And I was also the account rep for PG&E and
4 probably other utilities on the west coast but primarily
5 PG&E.

6 Q. All right. When you say Raleigh, are you
7 talking about Raleigh, North Carolina?

8 A. Yes, Sir.

9 Q. All right. So I'm specifically boring in on
10 your duties as the account rep to PG&E. If you could
11 explain to us what that position entailed.

12 A. Well, I was basically the contact. So if there
13 was a contact for PG&E if they wanted any work to be done
14 by Quanta or had a project that they wanted Quanta to bid
15 on. So basically I was just the local person they
16 contacted.

17 And then I would interface with the Raleigh
18 staff because that's where the staff was. And I would
19 help them maybe attend a meeting. For them rather than
20 have -- so they could have a conference call. And rather
21 then them come out here, I could be -- I could go to the
22 PG&E office and be the technical person that could be on
23 the call and Raleigh not have to come out.

24 So it was basically interfacing between the
25 Quanta Company itself and the technical staff that they
26 were going to work with at PG&E.

1 Q. Did -- after you were settled in Quanta as the
2 PG&E rep, was there a project initiated to have Quanta
3 review, critique, and report on certain PG&E processes?

4 A. That's a lot of questions. The answer to that
5 is yes.

6 Q. Okay. Can you explain to us exactly what this
7 project entailed.

8 A. Well, you said processes. So there may be -- so
9 you want to talk about this project here (indicating)?

10 Q. Yes.

11 A. Okay.

12 Q. And you're pointing at the exhibit in front of
13 you. There's a stack of exhibits starting with 13 --
14 1334 that's in front of you.

15 A. Okay. In this -- I can't remember exactly, you
16 know, when was the first time, what caused this
17 particular project to get started. But the general
18 process is either in discussion or they have -- that they
19 have an idea that they want to do some work, but they --
20 they generated this idea of taking a look at what --
21 trying to understand the lifecycle of transmission line
22 components. How long should we -- how long do we think
23 these components should last?

24 And they wanted -- they wanted a firm, which
25 Quanta was the selected firm, to look at the -- not doing
26 an assessment of the condition in the field but to take a

1 look at the age of the components. What are the
2 components? What are the age of the components? What's
3 the -- what's the -- based on knowledge, either research
4 or their own personal knowledge? What can be -- how long
5 can these devices be expected to last?

6 And we give them an overall review of components
7 and the lifecycle of the components and whether they're
8 near the end or they're in the middle but just sort of a
9 general description of what they thought the -- where the
10 various components were in the lifecycle.

11 Q. Was there a name given to this project?

12 A. Well, I called it the lifecycle project, but
13 there may be another name.

14 Q. Who were your counterparts at PG&E that
15 initiated this project?

16 A. My counterparts -- well, I wasn't with PG&E. So
17 you're talking about --

18 Q. Right. You were at Quanta at this part on the
19 other side, but the PG&E people who initiated this
20 project with you.

21 A. Raymond Thiery and Richard Stockand.

22 Q. Who were Raymond Thiery and Richard Stockand?

23 A. Okay. So they were involved with transmission
24 asset management. And so they were responsible for the
25 asset management of the transmission lines.

26 Q. Were Thiery and Stockand people that you knew

1 from your time at PG&E?

2 A. Only knew of. I knew them but didn't know --
3 yes, I knew them but not in -- I never worked with them.

4 Q. Right. You said they were with Transmission
5 Asset Management.

6 A. Yes.

7 Q. Was there a Transmission Asset Management
8 Division when you were in charge of the director of
9 Electrical Asset Strategy?

10 A. No. The person closest to that would be Richard
11 Cashdollar who would be closest. And we did not have an
12 asset management group at that time.

13 Q. So is the Asset Management -- the Transmission
14 Asset Management Group, was that formed as part of the
15 reorganization that caused you to retire?

16 A. It was formed after I left.

17 Q. But very quickly after you left. Now you have
18 the Transmission Asset Management Group coming to you and
19 wanting --

20 A. Excuse me. After I left the first time. It was
21 probably in place when I came back. So when I left. And
22 I'm referencing '97.

23 Q. Okay. And I'm talking about when you were the
24 electrical asset strategist, the director of Electrical
25 Asset Strategy, was there a Transmission Asset Management
26 Group?

1 A. Yes, there was.

2 Q. Oh, okay.

3 A. Yes.

4 Q. Sorry.

5 A. About the time which I was leaving there.

6 Q. All right. But you didn't know these two
7 Stockand and Thiery?

8 A. No.

9 Q. Did either or both indicate to you why they felt
10 it was important to do this asset lifecycle study?

11 A. Well, so their background was not electric.
12 Their background was gas. And they were brought over for
13 whatever reason, for training purposes, acknowledge,
14 expansion, whatever. And my sense is that they thought
15 the gas department had a new understanding of the assets
16 and the age of the assets and the life, how those assets
17 changed. And they did not see that in the transmission
18 whatever management it was.

19 And so they thought -- and rightfully so in my
20 opinion -- that they should do an assessment. What are
21 the various components we have? How long do they think
22 these components could live and/or last? And then a
23 sense of where PG&E was in that circle. And so I think
24 they just were -- they were just trying to do good. I
25 think they were trying to do some good asset management
26 work.

1 Q. Okay. All right. And at some point in 2009
2 Quanta took on this project for PG&E?

3 A. Yes.

4 Q. And ultimately, were there reports written by
5 Quanta personnel that were submitted to PG&E?

6 A. Yes.

7 Q. Now, did you have anything to do with the actual
8 research and reporting?

9 A. No.

10 [Exhibit 827 introduced
11 as evidence.]

12 BY MR. NOEL:

13 Q. All right. So I just want to show you the
14 reports themselves. We're not going to go through the
15 details of them. But we have on the board 827, which
16 references the Quanta Structures Report from May of 2010.

17 Do you recognize that report?

18 A. Yes.

19 Q. And that is one of the reports that Quanta
20 produced as part of the lifecycle -- the asset lifecycle
21 project?

22 A. Yes.

23 [Exhibit 1333 introduced
24 as evidence.]

25 BY MR. NOEL:

26 Q. And then there is Exhibit 1333 in front of you

1 which is known as the Transmission Line Component
2 Management Report of 2010. Do you recognize that report?

3 A. Yes.

4 Q. Is that also one of the reports that Quanta did
5 for PG&E as part of the lifecycle -- the asset lifecycle
6 project?

7 A. Yes.

8 [Exhibit 1334 introduced
9 as evidence.]

10 BY MR. NOEL:

11 Q. And 1334, the conductors and fittings report of
12 2010. Do you recognize that report?

13 A. Yes.

14 Q. Is this report number 1334 also a report that
15 was done by Quanta for PG&E as part of the Asset
16 Lifecycle Project?

17 A. Yes.

18 [Exhibit 1335 introduced
19 as evidence.]

20 BY MR. NOEL:

21 Q. 1335, the insulator report of 2010. Do you
22 recognize this?

23 A. Yes.

24 Q. And is that also -- Number 1335 also a report
25 produced by Quanta for PG&E as part of the asset
26 lifecycle project?

1 A. Yes.

2 [Exhibit 1336 introduced
3 as evidence.]

4 BY MR. NOEL:

5 Q. 1336, the Switches Report of 2010. Do you
6 recognize 1326?

7 A. Yes.

8 Q. Is 1336 -- was 1336 also produced by Quanta for
9 PG&E as part of the asset lifecycle project?

10 A. Yes.

11 [Exhibit 1337 introduced
12 as evidence.]

13 BY MR. NOEL:

14 Q. 1337. Do you recognize 1337, the Underground
15 Transmission Report of 2010?

16 A. Yes.

17 Q. And was 1337 also produced by Quanta for PG&E as
18 part of the asset lifecycle project?

19 A. Yes.

20 [Exhibit 1338 introduced
21 as evidence.]

22 BY MR. NOEL:

23 Q. 1338, the Minor Components: Aviation Markers
24 Boardwalks and Lighting -- lighting, not lightening --
25 Lighting of May 2010. Do you recognize 1338?

26 A. Yes.

1 Q. And was 1338 also produced by Quanta for PG&E as
2 part of the lifecycle -- the asset lifecycle project?

3 A. Yes.

4 Q. All right. Do you have any recollection of how
5 much money PG&E paid Quanta for these researching
6 reports?

7 A. No.

8 [Exhibit 1339 introduced
9 as evidence.]

10 BY MR. NOEL:

11 Q. All right. Next, we have 1339 which is -- you
12 also have the -- it's in the stack here, the original
13 print version. It's very difficult to read all of this
14 stuff. But this appears to me to be an e-mail.

15 Do you recognize 1339?

16 A. Yes.

17 Q. What is 1339?

18 A. So it looks like a conference call. This is
19 transmission line maintenance practices. So I think it's
20 following this that they wanted to take a look at the
21 maintenance practices of utilities and were asking us if
22 we could do that.

23 Q. Okay. So let's back up a little bit. What --
24 first, this appears to be an e-mail regarding setting up
25 a meeting; correct?

26 A. Yes.

1 Q. And the organizer of the meeting is who?

2 A. Me.

3 Q. All right. And then the required attendees, who
4 were the required attendees?

5 A. These are all PG&E folks. These are all PG&E
6 people.

7 Q. PG&E and Quanta also?

8 A. I don't see any Quanta folks on here. I think
9 this was sort of a -- you know, sort of the beginning
10 piece. And so it would be reasonable that I would just
11 go try to understand what they're trying to cover, find
12 out what they need, and get the right people involved
13 from our company.

14 This is what that appears to be. All these
15 people here are all PG&E folks.

16 [Exhibit 1340 introduced
17 as evidence.]

18 BY MR. NOEL:

19 Q. Okay. And then 1340. Take a look at that.
20 Tell me if you recognize that.

21 A. Well, I don't recognize it exactly, but I see
22 it. So this -- it looks like the same -- this looks like
23 the same meeting. Is it not? No.

24 This meeting -- let's see. I guess I -- I
25 understand the e-mails, but I can't put them in context
26 with one over the other. But basically it looks like

1 this 1340 I'm inviting Carl Watkins and Mike Marshal who
2 are Quanta folks to attend the meeting.

3 Q. All right. And based upon the e-mails, what was
4 the subject of the meeting?

5 A. Transmission line inspection practices.

6 Q. All right. So these are occurring in 2012?

7 A. Yes.

8 Q. The asset lifecycle project reports have already
9 been submitted in 2010; correct?

10 A. Yes.

11 Q. So is this another project --

12 A. Yes.

13 Q. -- between Quanta and PG&E?

14 A. Yes, Sir.

15 Q. And was PG&E again asking Quanta to review,
16 critique, and report on the PG&E process or activity?

17 A. Yes.

18 Q. All right. And what this time?

19 A. I'm sorry?

20 Q. What this time? What was PG&E asking you to do
21 this time?

22 A. Oh, based on this e-mail here they wanted us
23 to -- they wanted to review our transmission line
24 practices and wanted to identify best practices,
25 patrolling, inspection. And so this is basically a
26 benchmarking exercise.

1 Q. What is a benchmarking exercise?

2 A. A benchmarking exercise is basically taking a
3 question or a process and comparing that with how others
4 in the industry do that particular practice. And
5 benchmarking can be as simple as one question. How do
6 you do a task? Or it could be how do you do a whole
7 process?

8 And so this is a previous process because
9 they're looking at how the various utilities do their
10 maintenance and patrolling practices. And how do they do
11 it and then how does PG&E compare to how they do that?

12 [Exhibit 830 introduced
13 as evidence.]

14 BY MR. NOEL:

15 Q. All right. And next up we have Exhibit 830. Do
16 you recognize Exhibit 830.

17 A. Yes.

18 Q. And this is a Quanta Technology Transmission
19 Line Inspection Procedures final report June 14, 2012?

20 A. Yes.

21 Q. Is this the report that was produced by Quanta
22 for PG&E based upon the e-mails we have just discussed?

23 A. I believe so, yes.

24 Q. All right. Did you ever do any follow-up with
25 PG&E in regards to how any of the information was used by
26 PG&E from any of the reports in 2010 or 2012?

1 A. No.

2 Q. And again, do you know how much or can you
3 recall how much money PG&E spent on this report 830?

4 A. No, Sir.

5 [Exhibit 1341 introduced
6 as evidence.]

7 BY MR. NOEL:

8 Q. And finally, I didn't put a number on this.
9 This should be -- you should have an e-mail in front of
10 you marked as Exhibit 1341.

11 A. Okay.

12 Q. Have you had a chance to look at 1341?

13 A. Yes.

14 Q. Do you recognize 1341?

15 A. No, but I have seen it.

16 Q. You have seen it?

17 A. Yeah. There's nothing mysterious about it.

18 Q. It's an e-mail conversation between you and some
19 other people?

20 A. Yeah.

21 Q. And do you know who those other people are? Can
22 you identify them for us and tell us who they are.

23 A. We're talking about -- so Mary at that time was
24 in -- she was in -- I think she was -- I don't know where
25 she was. She was in asset management side. She bounced
26 around in various parts of the company or organization,

1 but I think she was asset management side. And she was
2 trying to get a copy of the -- she had a hard copy, but
3 they didn't have an electronic version of this lifecycle
4 report.

5 Q. All right. So let's back up a little bit. This
6 e-mail conversation is occurring in October of '13;
7 correct?

8 A. Yes.

9 Q. And the person you're referring to "Mary," that
10 would be Mary Hvistendahl.

11 MR. NOEL: Do you have that name?

12 THE COURT REPORTER: No.

13 MR. NOEL: H-v-i-s-t-e-n-d-a-h-l.

14 BY MR. NOEL:

15 Q. And to your knowledge, who was Mary Hvistendahl?

16 A. Well, I don't know where she was at the time,
17 but I thought she was in asset management. She may have
18 been some other place.

19 Q. Okay. And Ms. Hvistendahl contacts you wanting
20 soft copies of the lifecycle -- the asset lifecycle
21 reports; is that correct?

22 A. That is my understanding here. That's what I'm
23 reading here.

24 Q. The asset lifecycle reports, those are those
25 2010 reports?

26 A. Yes.

1 Q. All right. And did you eventually send those to
2 Ms. Hvistendahl?

3 A. It says I did, so I guess I did.

4 Q. All right. And did she -- you also in your
5 response to her you identify Richard Stockand as the
6 manager who requested this study.

7 A. Yes. That's what we talked about.

8 Q. All right. And then Randy Hopkins as the person
9 to whom you turned over the Quanta studies or to whom
10 these Quanta studies were provided at PG&E?

11 A. Yes. And I'm -- yes, that's correct.

12 Q. Okay. And did you know Randy Hopkins?

13 A. Yes.

14 Q. Who was Randy Hopkins?

15 A. Randy Hopkins was an engineer. When I knew him,
16 he was a transmission engineer and was heavily involved
17 with the maintenance and operation of transmission
18 structures.

19 MR. NOEL: All right. So, Mr. Dow, that is all
20 the questions I have for you.

21 THE WITNESS: Okay.

22 MR. NOEL: The jurors are allowed to ask you
23 questions. So it looks like they're writing down their
24 questions. The way they do it is they write their
25 questions down for you. Madam foreperson, myself, and
26 Ms. Dupre-Tokos review those questions and then decide if

1 we can ask them. And then decide -- I will -- if the
2 question can be asked and are relevant and admissible, I
3 will read you those questions.

4 So if you hang tight for a second and let us
5 review the questions.

6 [Conferring off the record.]

7 MR. NOEL: All right. These are the questions
8 from the jurors.

9 "When you say not all infrastructures are the
10 same in a simple at-risk versus not-at-risk situation or
11 evaluation of environmental factors, on which of these
12 would mountainous towers reside?"

13 THE WITNESS: Those would be -- we'd consider
14 that to be mountains.

15 BY MR. NOEL:

16 Q. Okay. But would those be at risk or not at
17 risk?

18 A. I don't think I identified anything at risk.
19 I'm not sure if I do risk or not at risk.

20 Q. I think the question comes from when we were
21 talking about the corrosive and being at risk because of
22 corrosion.

23 A. Oh, not at risk from corrosion.

24 Q. Okay. But at risk, period?

25 A. It would be at risk probably from wind.

26 Q. Okay. You stated that the inspection regimen in

1 Exhibit 825 was recommendations from a group who had
2 actually done inspections of maintenance. Was there
3 anyone in this group representing fiscal and fiduciary
4 aspects of the changes represented in the documents?

5 A. I'm not sure I understand the fiscal, what they
6 mean by fiscal. I'm not sure I understand.

7 Q. I think ultimately the question goes into how
8 much did money and cost play into the decision to lower
9 the standard for inspections and patrols?

10 A. I don't believe that -- that -- cost is
11 considered in everything, but I don't believe these
12 changes were made so that they could reduce costs a lot.
13 Cost may have been reduced as a result of those changes,
14 but that was not the impetus.

15 The impetus was is there a way we can do this
16 better where we can be more efficient? But there was
17 not. You have to reduce the cost by 10 percent or
18 5 percent or any percent. There was not a "you must
19 reduce."

20 If they had come up with -- if they had come up
21 with a process that cost more, we would have considered
22 that as well.

23 Q. Was there anyone from the financial side,
24 whether budgeting or finances, that was part of the
25 committee that was reviewing those and approving those
26 changes?

1 A. No.

2 Q. "Can you explain in simple lay terms the
3 difference between capital expense budgets and capital
4 and operating revenue." So let's start with capital
5 expense budgets.

6 A. Capital budget is -- is money you could spend
7 for -- for -- this is difficult. Let me think about this
8 for a second.

9 PG&E earns money -- earns money on its capital
10 assets. So if we have a rate case, the rates -- there's
11 an expense component or -- expense and MNO are the same
12 thing. There's the expense component.

13 And the company's commission says "You spend
14 this much money on expense. That's it. You spend any
15 more than that and you're -- it comes out of -- out of
16 shareholders." And so there's no earnings on it. That's
17 just a budget given to you. You spend it as you need.

18 Then there's the capital portion, and the
19 utility earns its money on the value of the capital
20 assets that's in service. So when you capitalize
21 something, you're putting it into the rate base and
22 you're earning on that.

23 So the difference between capital and expenses
24 is if you capitalize something, it goes into rate base
25 and the company can earn money on that. If you expense
26 something, there's no earning on that. That comes out of

1 the pot of money the commission says you can spend to run
2 your business.

3 And so that's the capital. So we're given in a
4 budget expense dollars and capital dollars. And you need
5 to be careful about where you put those dollars because
6 where you put those dollars depends on how much the
7 company will earn and the future rates and how much the
8 company is spending on the expenses. So those are
9 budgets.

10 Q. And you bring up a good point in there that we
11 haven't dealt with yet and will be delving into here in
12 the future. Are you familiar with the term "authorized
13 rate of return"?

14 A. Yes.

15 Q. What is the authorized rate of return?

16 A. Authorized rate of return says basically that
17 the company can earn a rate as authorized to earn a rate
18 of return, earn a rate on its capital investment.

19 So if you have a capital investment, you can
20 earn -- you are authorized to earn, whatever, X percent.
21 It doesn't say you're guaranteed to earn X percent. It
22 says you're authorized to earn X percent. You may earn X
23 minus percent.

24 So authorized rate of return is what the
25 commission says is okay for a company to earn against its
26 capital assets.

1 Q. And again, I'm horrible with numbers but tell me
2 if this is right. For every dollar that PG&E spends on
3 capital projects, PG&E is allowed to make a certain
4 percentage of profit on that dollar; correct?

5 A. Every dollar on capital, yes.

6 Q. And part of that has to do with the rate case
7 and how much the charges are; correct?

8 A. That's correct.

9 Q. So the capital projects going to the rate case
10 which determines how much the rate payors are paying for
11 their product from PG&E; correct?

12 A. Yes, Sir.

13 Q. And so if you're spending a dollar on capital,
14 that authorized rate of return allows you to actually
15 charge the rate payor something like, say, a dollar ten.
16 So PG&E profits off of the capital?

17 A. That's how utilities earn their money. They
18 earn their money off of the capital asset that they have
19 that's being used and useful.

20 Q. And then the other end of it is the capital
21 assets, the capital improvements are able to be
22 depreciated against taxes over a long period of time?

23 A. That's correct.

24 Q. So there are huge advantages to PG&E to
25 capitalize projects; correct?

26 A. Yes. There's also a disadvantage.

1 Q. Right. What is the disadvantage?

2 A. The disadvantage is that you also don't want
3 your rate payors' rates to go up. So you don't want
4 to -- you don't want to spend a lot of capital which will
5 unnecessarily cause a rate increase. So I mean, that's
6 another side of it.

7 Q. Right.

8 So going back to the hypothetical we talked
9 about earlier, that hypothetical where a project gets
10 approved for Advance Authorization for exploration,
11 exploration goes over budget, and ultimately the decision
12 is made to not green light the project, to kill the
13 project.

14 That difference between what was authorized and
15 what was actually spent, the idea of doing some actual
16 project so that there's something to show for that money
17 so that they can capitalize that money means that that
18 money can be charged back to the rate payors; correct?

19 A. Yes.

20 Q. That they make a profit on -- a percentage of
21 profit on each dollar that they spend on that project?

22 A. Yes.

23 Q. And they can depreciate that project and use
24 that as a tax write-off?

25 A. Yes, that's the process.

26 Q. "Under what circumstances would a project

1 designed to replace deteriorated infrastructure that --
2 under what --"

3 I'm stumbling with the wording here.

4 MS. DUPRE-TOKOS: "Under what circumstances
5 would a project designed to replace, quote, 'deteriorated
6 infrastructure' where that -- where such infrastructure
7 was in fact in danger of collapse be cancelled or delayed
8 indefinitely?"

9 THE WITNESS: I don't think they should.

10 BY MR. NOEL:

11 Q. "Do you know how many wind studies were done?"

12 A. No. You know, there -- no, I don't.

13 Q. If you don't know, that's fine.

14 A. I don't know.

15 Q. And do you know in what years they were done?

16 A. Varying years. They've been doing those for a
17 long time.

18 Q. "Are the studies still being -- to your
19 knowledge, are the studies still being done?"

20 A. I think if there's a reason to do it, they would
21 do them. But I don't know if there's any underway now.
22 I don't know.

23 Q. "To your knowledge are the wind studies done on
24 all towers or just ones in mountain areas"?

25 A. They're done in specific -- not for a tower
26 normally. They're done and usually in a specific area.

1 So there's a wind -- you know, the wind is bad in that
2 area and they would study this area and actually study to
3 determine what the geographic area is.

4 So oftentimes those -- wind studies are
5 generated by something. They found - they were doing an
6 inspection and they found it's windy and there's
7 something shaking or whatever. I just made that up so
8 don't hold me to that.

9 There's some reason that the wind study is done.
10 Something is wearing out fast or something is broken.
11 There's a reason for the study. You say wind and then we
12 ask for a study. And then the wind people or the study
13 people would come out and determine "Hey, this area has
14 this type of wind. It goes from here to here."

15 And they will often determine the area where the
16 wind study needs to be done. And so it's not for a
17 tower. It's for a location.

18 Q. All right. I'm only going to read part of this
19 and kind of backward.

20 First "Did you actually help with the
21 preparation and research for any of the Quanta reports?"

22 A. Not really. I mean, I participated, as I
23 mentioned. And I may have read one as it come in, but I
24 didn't do any -- I didn't do any of the research and did
25 not write the document.

26 Q. "Why would you not know how much Quanta charged

1 for or was charging PG&E for the report?"

2 A. It was ten years ago. I just don't remember.

3 Q. Can you kind of estimate or give us kind of an
4 idea. Are we talking about hundreds, thousands, hundreds
5 of thousands, millions of dollars?

6 A. Well, not millions. I don't know.

7 Q. Okay.

8 A. I'd be guessing. That's not fair.

9 Q. That's exactly right.

10 To your knowledge -- and this is back to your
11 career with PG&E -- was there a bonus or incentive
12 program if budgeting metrics were met?

13 A. Absolutely, yes.

14 Q. And did you ever receive a bonus from PG&E
15 because budgeting metrics were met?

16 A. Yes.

17 Q. Do you recall how much?

18 A. It's part of a formula. I don't know what the
19 percentage is.

20 Q. And I'm guessing that being met means that you
21 stayed within your budget?

22 A. Yes.

23 Q. Did you get more of a bonus if you came in under
24 budget?

25 A. Probably. I don't remember the details, but it
26 would be reasonable to expect that you would be exceeding

1 performance. So I would probably say that is probably
2 yes, but I don't know the values.

3 Q. When you were in the transmission division, were
4 there bonuses available to you for staying within budget
5 when you were the T-line original supervisor in San
6 Francisco?

7 A. Yeah. I -- I'm going to give you I think so. I
8 don't remember. I don't remember every component, you
9 know, in different jobs. You have different components,
10 but it's reasonable that that is the case, yes.

11 Q. You don't remember. Let's leave it at that.
12 We're talking about over 30 years ago.

13 A. Who said that? Has it been that long?

14 MR. NOEL: Any further questions? Any follow-up
15 to that?

16 All right. Thank you. Madam foreperson is
17 going to read you your admonition again and then you can
18 leave.

19 GRAND JURY FOREPERSON: Mr. Dow, you are
20 admonished not to discuss or disclose at any time outside
21 of this jury room the questions that have been asked of
22 you or your answers until authorized by this grand jury
23 or the Court. A violation of these instructions on your
24 part may be the basis for a charge against you of
25 contempt of court. This does not preclude you from
26 discussing your legal rights with your own attorney.

1 Mr. Dow, what I have just said is a warning not
2 to discuss this case with anyone except the Court, your
3 lawyer, or the district attorney.

4 Do you have any questions?

5 THE WITNESS: No, Ma'am.

6 GRAND JURY FOREPERSON: Thank you for your time
7 today.

8 THE WITNESS: Thank you.

9 [Witness exits the courtroom.]

10
11 [DISCUSSION OMITTED.]

12
13 [Break taken from
14 11:41 until 11:45.]

15 MR. NOEL: Hand-outs are right here.

16 [Witness enters the courtroom.]

17 GRAND JURY FOREPERSON: Mr. Gabbard, before you
18 have a seat, would you please raise your right hand to be
19 sworn.

20 THE WITNESS: Yes.

21 GRAND JURY FOREPERSON: Mr. Gabbard, you do
22 solemnly swear that the evidence you shall give in this
23 matter pending before the grand jury shall be the truth,
24 the whole truth, and nothing but the truth so help you
25 God?

26 THE WITNESS: I do.

1 GRAND JURY FOREPERSON: Thank you. Have a seat,
2 please.

3 MR. NOEL: I forgot to tell the witness you have
4 a bottle of water down there to your right. There's at
5 least some left over of the case of water for witnesses.
6 If you need water, feel free to grab a bottle.

7 THE WITNESS: Thank you.

8 **EXAMINATION**

9 BY MR. NOEL:

10 Q. Can you please state your full name for the
11 record spelling your last name.

12 A. My name is David Gabbard, last name is
13 G-a-b-b-a-r-d.

14 Q. Are you employed, Mr. Gabbard?

15 A. Yes, I am.

16 Q. By whom?

17 A. Pacific Gas & Electric Company.

18 Q. And what is your current position?

19 A. My current position is senior director of
20 Transmission Substation Project Management and
21 Engineering.

22 Q. That is a mouthful.

23 A. It is.

24 Q. How long have you been in that position?

25 A. I have been in that position since September of
26 last year.

1 Q. How long have you been with PG&E?

2 A. Approximately 15 years.

3 Q. Let's go back before PG&E. Why don't you tell
4 us your educational background.

5 A. Sure. So I received a Bachelor's of Science in
6 mechanical engineering from California State University
7 San Luis Obispo in 2006. I think I graduated in 2006.

8 Prior to graduation, I started at PG&E Diablo
9 Canyon Nuclear Power Plant on a rotational program while
10 at school at Cal Poly. From there started full time for
11 PG&E and have been working at PG&E since.

12 In my tenure at PG&E I also went back and got a
13 Masters of Business Administration from the Wharton
14 School of Business at the University of Pennsylvania.

15 Q. How were you able to get a degree from the --
16 from Wharton at the University of Pennsylvania while
17 working full-time at PG&E? Two different areas of the
18 country.

19 A. The Wharton school has an executive program set
20 up to accommodate folks trying to get their MBA on the
21 West Coast. That curriculum was set up to have class on
22 the Embarcadero in San Francisco for which the school
23 flies out their professors to the program so that we can
24 complete it without too significant of a burden from a
25 travel standpoint.

26 With that said, my classmates did come from all

1 over the country. So many did end up traveling from as
2 far as Beijing.

3 Q. You said Beijing?

4 A. Yeah.

5 Q. So they didn't only come from all over the
6 country, from all over the world.

7 A. All over the world, correct. Thank you for that
8 clarification.

9 Q. Walk us through your career at PG&E, if you
10 would work, please.

11 A. Absolutely. So as I mentioned, started with
12 PG&E at Diablo Canyon Nuclear Power Plant, held a few
13 different rotations during my time there. I also had the
14 opportunity to work one of the outages for the plant on a
15 special assignment.

16 There I transitioned into an entry engineer
17 rotation program where I moved through various functions
18 within the enterprise to get a diverse perspective on our
19 operation starting full-time as a project manager
20 managing capital projects to rebuild gas and electric
21 infrastructure mainly on the distribution side of our
22 business.

23 From there I transitioned into various levels of
24 leadership moving into a supervisor role and then
25 subsequently a manager role, through re-organizations had
26 the opportunity to shift focus into our generator

1 inner-connection space. So that's focused on
2 inner-connecting new generation most of which at that
3 time was focused on inner-connection new renewables,
4 large-scale solar projects all the way down to
5 inner-connection of rooftop solar for our customers.

6 I progressed through varying levels of
7 leadership within that organization ultimately reaching
8 the level of director for electric generation connection
9 and then subsequently took on the role of senior director
10 of Transmission Asset Management prior to transitioning
11 into my current role.

12 Q. All right. What were your duties as a senior
13 director of the Transmission Asset Management?

14 A. As a senior director of Transmission Asset
15 Management I was responsible for overseeing the
16 organizations within PG&E, responsible for asset
17 management of our transmission and substation
18 infrastructure as well as overseeing our risk management
19 governance group within the electric options.

20 At one point our electric generation
21 inner-connection organization was also moved under my
22 organization. So that role was re-added to my
23 responsibilities. And I was responsible for running the
24 organization and enabling employees within that
25 organization to be affective to deliver on their
26 objectives.

1 Specific to the asset management role I filled a
2 sponsor role for new capital projects to replace
3 infrastructure or enhanced infrastructure across PG&E's
4 transmission and substation systems.

5 Q. We're going to go back and we're going to break
6 that down probably after lunch because it's almost noon.
7 I guess we've got 10 minutes.

8 So first off, before you became the senior
9 director of the Transmission Asset Management, what
10 experience did you have with electrical transmission?

11 A. My experience with electrical transmission
12 before taking the transmission asset management role was
13 primarily focused on project managing replacement
14 projects associated with transmission substation
15 infrastructure for a short period of time as well as
16 managing generation inner-connection projects or managing
17 a portfolio of inner-connection projects that included
18 transmission and substation scope in order to connect
19 large scale renewables to PG&E's system.

20 Q. And if you could define for us what you mean
21 when you use the term "portfolio."

22 A. What I mean by portfolio is a collection of
23 projects that are occurring within a period of time
24 required to meet the objectives of the program. Those
25 objectives could include meeting customer requests as far
26 as timelines as well as meeting compliance obligations

1 set out by our regulators.

2 Q. All right. So when -- in the title Transmission
3 Asset Management, can you define for us what is the
4 assets you're managing.

5 A. The assets we're managing within the
6 Transmission Asset Management are any electrical assets
7 and infrastructure at voltages 60kV and above in terms of
8 transmission lines as well as substations which are the
9 fenced-in area that transform voltages from higher
10 voltages down to lower voltages. For that asset base
11 it's any component within that footprint.

12 I was responsible for both transmission voltage
13 and distribution voltage for substations. Those assets
14 included components like transmission structures,
15 transmission conductor, insulators, circuit breakers,
16 substation busses, and transformers. It would also
17 include voltage regulation, devices like regulators,
18 static bar compensators, and other similar pieces of
19 equipment.

20 The one limitation that I would say would
21 inhibit me from characterizing my responsibility as
22 governing all transmission voltage assets is that we do
23 have system protection-related assets and system
24 automation related assets the purview of which fell
25 within another work group.

26 Q. All right. And can you define for us how you

1 managed those assets.

2 A. My team's responsibility for managing those
3 assets would be to track performance of the operation of
4 the assets and ultimately make recommendations for
5 enhanced -- future enhancements for those assets,
6 investments that would occur over the next five to ten
7 years both to replace aging infrastructure, enhance
8 existing infrastructure for greater operational
9 flexibility as well as increased capacity to meet NERC
10 reliability plan and standards.

11 Q. Another term that you used in your initial
12 answer was that risk was also part of your organization.
13 If you could explain to us what is risk and how do you
14 manage that.

15 A. Absolutely. Risk showed up in my
16 responsibilities in two forms. Risk informs our
17 strategies. Risk I define as the probability and
18 consequence of an event occurring. Risk informs our
19 overall strategies to the way that we invest in our asset
20 base on the substation side, but I also was responsible
21 for overseeing a small team of risk managers that manage
22 the governance process from an electric operation
23 standpoint for highlighting enterprise level risks and
24 bringing visibility to those risks to our executive team
25 making sure that our integrated planning process was
26 informed by those risks.

1 Q. What do you mean by "enterprise risks"?

2 A. What I mean by enterprise risks are risks that
3 have been defined as such, the risks that can impact the
4 overall operation of our business. They're not project
5 specific risks that are very location specific or
6 individual asset specific but rather categories of risk
7 that could impact our business.

8 For example, one enterprise level risk would be
9 poor location of gas infrastructure with substations. We
10 have seen instances in the past where faults that occur
11 on a transmission system not truly are underground in
12 order to mitigate the safety exposure associated with
13 them have the potential to run along gas infrastructure
14 as a source of path of least resistance.

15 So we have an enterprise side identifying the
16 need to make sure there's enough space between our gas
17 infrastructure and our electric substations to avoid any
18 negative consequences associated with that exposure.

19 Q. Is another enterprise risk wildfire?

20 A. Yes, it is.

21 Q. And are the enterprise risks ranked?

22 A. Yes, they are.

23 Q. And what is the number one enterprise risk for
24 PG&E over the last few years?

25 A. The number one risk has been wildfire.

26 Q. And that's actually basically since about 2007.

1 Isn't that correct?

2 A. I don't know the original date when it was given
3 the high score. And that's across electric operations.
4 I can't speak to whether that is across the entire
5 enterprise.

6 Q. So when you talk about -- well, first of all,
7 let me define the term. When you use the term
8 "informed," can you explain to us what you mean.

9 A. Recite back to me what you're referencing.

10 Q. You said two different contexts. You used it in
11 terms of making informed decisions and you've also talked
12 about the risk management; that your risk managers
13 inform, for instance, the board of directors or the
14 officers of the company.

15 [Counsel conferring off the record.]

16 MR. NOEL: Oh, yeah.

17 BY MR. NOEL:

18 Q. And there's a third way we'll get to in a
19 second.

20 A. Okay. So I heard two examples specifically of
21 the informed that were just called out. I will speak to
22 the first one is making sure that we are informed in the
23 decisions we make on how to investigate our
24 infrastructure. By informed I mean collecting
25 information available regarding our assets both the
26 characteristics of the assets as well as the performance

1 of those assets.

2 So if there was an outage that occurred on the
3 line, we are tracking to understand what was the cause of
4 that outage and is there recurrence or what's the extent
5 of conditions associated with that performance? And
6 those will inform the decisions that we make for
7 investigating in our infrastructure.

8 We also are informed by the different
9 characteristics of our assets. Whether or not a line is
10 operating at full capacity or if it's underutilized will
11 inform whether or not we will need to upgrade it in order
12 to accommodate future load growth across the service
13 territory.

14 Q. I guess one of the problems is that in defining
15 the term, you're using the term. So you're -- so to
16 inform means to inform decisions. And what we kind of
17 need to know so we're all on the same basis is exactly
18 what that word means to you in the context that you're
19 using it.

20 A. I apologize. I don't know how to answer your
21 question.

22 **EXAMINATION**

23 BY MS. DUPRE-TOKOS:

24 Q. So, Mr. Gabbard, for example, you started to
25 give us a definition of being informed as gathering
26 information, but then you said that informed your

1 decision. So you're using informed in terms of it
2 informed your decision in your definition of what
3 informed means to you.

4 So we need you to decide what informed means to
5 you without using informed in a different way in the
6 definition. And then we're going to need you to define
7 your understanding of what informing a decision means.

8 A. Okay.

9 Q. Did that make sense?

10 A. I'll -- I'll -- I'm not sure yet, but I'll try
11 my best.

12 I think what you're asking for is I'm using the
13 term "informed" to mean make information available.
14 Information that is relevant to a decision would inform
15 the decision. That's what my definition would be.

16 Q. Okay. And then your other definition that you
17 provided us was the collection of information?

18 A. Correct.

19 Q. Where you're informing yourself by collecting
20 information and then you use that information to inform
21 your decision?

22 A. That is correct.

23 **EXAMINATION CONTINUED**

24 BY MR. NOEL:

25 Q. And then the other context in which you used it
26 was you said "risk informed." If you could explain to us

1 what that means.

2 A. You're talking about in terms of the role the
3 risk management team plays in informing our senior
4 executive team. Is that the question?

5 Q. No. You used it in terms of making risk
6 informed decisions, if that makes sense. That was the
7 note that I took was that you said something about
8 risk-informed decisions. And if you could define that
9 for us.

10 A. Okay. So following the same definition it would
11 be making sure that information was available for
12 decisions being made specific to risk. This goes back to
13 the definition that I used earlier. Is any information
14 relevant to quantifying the probability and consequence
15 of an event occurring?

16 Q. So -- and again, probability means what?

17 A. Probability means the likelihood of something
18 happening.

19 Q. And consequence means what?

20 A. The impact of that event occurring. In terms of
21 how PG&E quantifies consequences, we usually categorize
22 it in a number of areas focused on safety, impact
23 reliability, impact to the environment are some examples.

24 Q. And again, the standard you can define for us
25 when you use the term "quantifying" as in quantifying
26 risk, quantifying consequences, what does that term mean

1 to you?

2 A. To me quantifying means being able to represent
3 information in a numerical fashion. So if --

4 Again, I'm going to use quantifying in the --

5 Q. To assign a value?

6 A. If I could calculate a value, that would be
7 quantification.

8 Q. All right.

9 A. If I can only use subject matter expert or
10 anecdotal evidence, it would be more of a qualification
11 of information.

12 MR. NOEL: It is 12 o'clock. I'm seeing a lot
13 of movement.

14 Madam Foreperson, are you ready to take the
15 lunch break?

16 GRAND JURY FOREPERSON: Yes, we are.

17 MR. NOEL: All right. She is going to read you
18 an admonition and then we'll take a break until 1:30.

19 GRAND JURY FOREPERSON: Okay. Mr. Gabbard, you
20 are admonished not to discuss or disclose at any time
21 outside of this jury room the questions that have been
22 asked of you or your answers until authorized by this
23 grand jury or the Court. A violation of these
24 instructions on your part may be the basis for a charge
25 against you of contempt of court. This does not preclude
26 you from discussing your legal rights with your own

1 attorney.

2 Mr. Gabbard, what I have just said is a warning
3 not to discuss this case with anyone except the Court,
4 your lawyer, or the district attorney.

5 Do you have any questions?

6 THE WITNESS: I do not.

7 GRAND JURY FOREPERSON: Okay. Thank you.

8 THE WITNESS: Thank you.

9
10 [DISCUSSION OMITTED.]

11
12 [Whereupon the luncheon recess is
13 taken from 12:06 until 1:35 p.m.]

1 FEBRUARY 21, 2020

2 AFTERNOON SESSION

3
4 [ROLLCALL OMITTED.]

5
6 GRAND JURY FOREPERSON: Okay. Ready to proceed.

7 MR. NOEL: Ready?

8 [Witness enters the courtroom.]

9 GRAND JURY FOREPERSON: You can have a seat,
10 Mr. Gabbard. I'd just like to remind you that you're
11 still under oath.

12 THE WITNESS: Thank you. Understood.

13 MR. NOEL: Ready?

14 **EXAMINATION CONTINUED**

15 [Exhibit 1350 introduced
16 as evidence.]

17 BY MR. NOEL:

18 Q. All right. You should have in front of you
19 what's marked as Exhibit 1350. Ask you to take a look at
20 that exhibit. It's three pages. And tell me if you
21 recognize the information depicted in that exhibit.

22 A. Yes, this looks familiar.

23 Q. Okay. What is Exhibit 1315? 1350. I'm sorry.

24 A. It's a couple of pages of the org structure
25 effective December 31, 2018, for PG&E.

26 Q. All right. So can you kind of walk us through

1 Exhibit 1315 starting with your place -- 1350 starting
2 with your place in the organization.

3 A. Sure.

4 Q. Feel free -- you can stand up and use the big
5 board if you'd like.

6 A. Sure. So my position within the organization is
7 shown here (indicating) on the visual where my position
8 at the time is denoted as senior director of Transmission
9 Asset Management. In this role of reporting to the vice
10 president of Electric Asset Management at the time was
11 Kevin Dasso.

12 If we move to the next page, this page shows
13 Kevin Dasso's reporting structure up to Pat Hogan, Senior
14 Vice President of Electric Operations. And then the
15 subsequent slide shows Pat's reporting structure up to
16 the utility.

17 I don't recall whether this was the president
18 position or a chief executive officer position at the
19 time, but it's showing in this slide.

20 Q. Okay. And there's two spots that are vacant.
21 On the far left is a box that says "Officer president and
22 COO." And then up above there's a vacant box that says
23 "PG&E utility."

24 A. That's correct.

25 Q. First off, can you explain to us what your
26 understanding of what "PG&E utility" means.

1 A. PG&E utility is referencing the utility portion
2 of PG&E. Within our org structure in this system of
3 record we also have positions identified for PG&E
4 Corporation which are -- which operates independent of
5 the utility.

6 Q. Does the utility -- is the utility owned by the
7 corporation?

8 A. Yes.

9 Q. And then the office of president and COO that is
10 blank there. Do you know who the most recent occupant of
11 that office would have been?

12 A. I do not. And for clarification, that is
13 because I don't exactly know what is being referenced as
14 that vacant box.

15 Our structure as a utility has changed in this
16 time period from having a president and CEO to just the
17 president to having a president CEO. So I don't recall
18 which iteration of structure and whose role that vacant
19 box represents.

20 [Exhibit 1253 introduced
21 as evidence.]

22 BY MR. NOEL:

23 Q. Okay. All right. So let's on go to the next
24 one. This is Exhibit 1253.

25 And that is what we forgot. I'm sorry. I'm
26 going to have Madam Clerk -- she's going to pull 1253 out

1 of the box for us.

2 While she's doing that, we have the first 1253
3 up here on the board. Do you recognize Exhibit 1253?

4 A. I do.

5 Q. What is Exhibit 1253?

6 A. Exhibit 1253 --

7 Q. And Madam Clerk has the original full exhibit
8 there for you if you'd like to look at it.

9 A. Got it.

10 So to clarify five, I'm not familiar with the
11 cover page associated with Exhibit 1253. The associated
12 document reflects an asset strategy PowerPoint
13 presentation that summarizes the strategy from June 2017
14 for the electric transmission overhead steel structures.

15 Q. Okay. And this was written by someone named
16 Feven Mihretu?

17 A. That is correct.

18 Q. And who is Feven Mihretu?

19 A. Feven at the time was an asset strategy engineer
20 that reported up through the Transmission Asset
21 Management organization.

22 Q. Was Ms. Mihretu in your chain of command at the
23 time?

24 A. Yes, she was.

25 Q. And can you explain to us in general terms what
26 this strategy overview is.

1 A. This strategy overview is a summary of some of
2 the information and characteristics that we manage
3 associated with our transmission overhead infrastructure.
4 It also summarizes some of the information associated
5 with the infrastructure in service across our service
6 territory, and it speaks to some of the criteria used to
7 prioritize investments in subsets of that infrastructure
8 over time.

9 Q. All right. And you said you're not familiar
10 with the cover page; is that correct?

11 A. That is correct.

12 Q. All right. And that cover page starts with the
13 caption "United States of America Before the Federal
14 Energy Regulatory Commission, Pacific Gas & Electric
15 Company, docket number ER16-2320-000."

16 Am I reading that correctly?

17 A. It's 000.

18 Q. Zero, zero, zero?

19 A. That is correct.

20 Q. All right. And back in 2017, on December 4th of
21 2017, you were deposed as a part of a FERC proceeding;
22 correct?

23 A. I don't recall the date, but I believe that's
24 correct.

25 Q. Right. This document that we're looking at,
26 the -- and we have to switch this again. The Overhead

1 Steel Structure Strategy Overview was an exhibit that
2 came in as part of your testimony in that FERC
3 proceeding; correct?

4 A. It is an exhibit that came in as a response to
5 data requests associated with that proceeding. I do not
6 believe it was an exhibit in my testimony in that
7 proceeding.

8 Q. But you referred to this exhibit in your
9 testimony; correct?

10 A. Are you asking if I referred to it in my
11 testimony that was filed at FERC or in my deposition?

12 Q. In your deposition.

13 A. Yes, it was referred to in the deposition.

14 Q. All right. I'm sorry about having to rotate
15 this.

16 All right. So I'd like to walk through this
17 document with you. Oh, that's a good thing.

18 You were deposed as part of the proceedings by
19 FERC and then you said you compared that with your
20 testimony to FERC. Did you also testify?

21 A. Yes.

22 Q. And was that testimony live and in person like
23 today or was it written testimony in response to written
24 questions?

25 A. I believe both. And I say that with a little
26 reservation in that my recollection for that transmission

1 owner proceedings, since I had just started that role,
2 was that I had rebuttal testimony in written form and
3 then in-person testimony at FERC.

4 I also want to clarify that the deposition that
5 you're referencing is part of that proceeding, but the
6 deposition was performed by the CPUC and others.

7 Q. Right.

8 A. And it was not -- no FERC staff were involved in
9 that deposition.

10 Q. Okay. You were actually questioned by Traci
11 Bone of the CPUC as well as some attorneys on behalf of
12 what we generally refer to as stakeholders; correct?

13 A. Affirmative.

14 Q. All right. So we want to go through this
15 document. And once you get to the meat of it,
16 "Transmission Lines Steel Strategy: Transmission Lines
17 Steel Structure Strategy will manage the asset
18 lifecycle -- asset lifecycle, e.g., create, utilize,
19 maintain, renew, replace, and dispose based upon -- based
20 on risk. The renew asset lifecycle is based on proactive
21 cost replacements for high-risk assets. The medium risk
22 asset is based on reactive replacements following asset
23 failures." And then it goes through the major
24 objectives: Safety, reliability, and environmental.

25 Is that correct?

26 A. That's what the document says.

1 Q. And is that in truth how you make determinations
2 to repair/replace assets?

3 A. I would not say that that statement is
4 representative.

5 Q. Okay. Why not?

6 A. For two primary factors; one, decisions for
7 repair versus replace, which is, I believe, what you
8 referenced in your question, are informed by the most
9 cost-effective approach for our customers.

10 MS. DUPRE-TOKOS: I'm sorry. Can you either
11 speak up or speak into the microphone.

12 THE WITNESS: Sure.

13 MR. NOEL: You can pull the microphone over to
14 you. If you're facing the board, it's just -- thank you.

15 THE WITNESS: The second item is --I believe was
16 statement "reactive replacement following asset failures"
17 is misleading.

18 BY MR. NOEL:

19 Q. How so?

20 A. Medium risk assets being based on reactive
21 replacement is referring to replacement upon signs of
22 deteriorated condition. So that reference to failure can
23 mean a number of different things including failure to
24 pass an inspection, for example, or failure to operate as
25 designed or intended to operate.

26 Q. So you're familiar with the term "run to

1 failure"?

2 A. I have heard the term. I may have also used the
3 term in the past. I do not believe it is a term of art
4 with a defined definition.

5 Q. Okay. Basically, the stereotypical example of
6 run to failure would be a light bulb; correct?

7 A. I believe that's the example that I used when we
8 last discussed the topic.

9 Q. Right. Most people do not proactively replace
10 light bulbs -- is that correct -- in your experience?

11 A. That is correct.

12 Q. Do you proactively replace light bulbs?

13 A. At home I do not.

14 Q. All right. And so people allow the light bulb
15 to burn out or fail and then it is replaced.

16 So how does that strategy translate to PG&E's
17 strategy for repair or replacement?

18 A. Are you asking whether or not PG&E employs that
19 type of strategy?

20 Q. Well, PG&E does employ that type of strategy,
21 does it not?

22 A. Yes, it does.

23 Q. So explain to us how PG&E uses that strategy.

24 A. Okay. I'll give you an example. First, I'll
25 argue that PG&E has a lot of light bulbs as well. So it
26 would show up in that instance, but I would also say

1 there are many instances where even for light bulb
2 replacement we would proactively replace. If the
3 envisions associated with replacing all at one location
4 would outweigh the cost of, that could be extracted out
5 of running to failure. And there may be instances of
6 both.

7 Specific examples to assets that were under my
8 purview in the Transmission Assets Management space, one
9 example would be a back-up battery at a substation. We
10 have strings of batteries that are significantly
11 redundant to each other. So failure of a single battery
12 would have zero consequence in the operation at that
13 substation.

14 So that would be an example where we would not
15 replace it before it had stopped working because the
16 failure in service would not have a consequence.

17 Q. Okay. How about insulators? Do you employ
18 run-to-failure philosophy with insulators?

19 A. In terms of catastrophic failure I would argue
20 no. We inspect our facilities on a regular basis and
21 identify insulators that are degrading and identify those
22 for proactive replacement. So that would lend itself
23 towards the strategy of proactive replacement based on
24 information that's informed by our inspection processes.

25 Q. By catastrophic failure I'm getting you don't
26 mean cause -- an insulator causing a catastrophe.

1 A. No, I do not.

2 Q. You're talking about insulators flashing,
3 insulators cracking. Is that what you mean by
4 catastrophic failure?

5 A. Correct.

6 Q. So but when the insulators reach that point,
7 they fail.

8 A. That is correct. So we would identify them for
9 replacement prior to that point.

10 Q. Right. But there are times where you do
11 proactive insulator replacements; correct?

12 A. You mean not identified through inspection?

13 Q. Right.

14 A. Yes, we have done proactive replacement not due
15 to inspection findings, correct, yes.

16 Q. Right. Sometimes, for instance, if you have to
17 do other work on a line, you'll just change out the
18 insulators while the line is de-energized; correct?

19 A. That is correct.

20 Q. Have you ever heard the phrase "If it's brown,
21 take it down" with regard to insulators?

22 A. I have not.

23 Q. What goes into the decision of when to
24 proactively change insulators given the opportunity and
25 when not to?

26 A. Can you ask that question a different way. I'm

1 not sure I fully understand.

2 Q. Well, are there times -- well, I'll give you an
3 example. A transmission line called the Parkway-Moraga
4 line had an issue and likely had to be de-energized while
5 that issue was being fixed. While the line was
6 de-energized, the transmission crews took the opportunity
7 to replacement the insulators on that line. On other
8 occasions when lines are de-energized insulators and
9 other hardware haven't been replaced. So what's the
10 reasoning behind the difference?

11 A. Can you clarify what you mean by de-energized.
12 And the reason I ask that is that my original
13 interpretation was a line was being de-energized in order
14 to support performing planned work, but there are also
15 points in time when a line will be de-energized for
16 operational considerations.

17 Q. For instance, in the Parkway-Moraga line it was
18 de-energized because of a problem with a tower that
19 needed to be fixed that required -- so it was planned
20 work. It was emergency work, but it was planned.

21 So why in a case like that -- what would inform
22 the decision to replace the insulators in that situation
23 but in other situations where you have planned outages,
24 de-energization to the lines, you wouldn't replace
25 insulators?

26 A. I don't know the details of the decision that

1 occurred with that outage, and I would only be
2 speculating at this point.

3 Q. Okay. Well, it goes on in this page and it says
4 "Some of the major objectives associated are safety,
5 reliability, and environmental." Am I correct in that?

6 A. Yes.

7 Q. And we see those three things repeated over,
8 over, and over again in many different forms and many
9 different reasons. How do those three categories --
10 safety, reliability, and environmental -- inform the
11 decisions, for instance, for proactive replacement?

12 A. The -- those three areas of focus are categories
13 used to characterize the different consequences
14 associated with a potential worse-case failure that could
15 occur associated with the asset.

16 So as I spoke to earlier, when quantifying risk
17 we define that as both probability or likelihood of an
18 event and then the associated consequence. So any
19 potential consequence associated with misoperation or
20 failure of an asset or component would be quantified
21 with -- categorized in these three ways.

22 Q. So consequences either to safety, to
23 reliability, or to the environment; correct?

24 A. That is correct.

25 Q. So which of those three is the most important?

26 A. Safety.

1 Q. And you're saying safety is more important than
2 reliability?

3 A. Yes.

4 Q. So why would PG&E replace 46-year-old insulators
5 on a 230 line in the Bay Area because the line is down
6 but leave 100-year-old insulators up in a
7 drought-stricken, wind-ravaged canyon in the north state?

8 A. As I said before, I don't know the specifics of
9 the example you're providing.

10 Q. Okay. The Parkway-Moraga line was shut down
11 because the tower was damaged. We've heard and we've
12 seen in the records that because the line was shut down,
13 PG&E proactively replaced what they referred to as aged
14 insulators.

15 And I got that backwards. The insulators
16 weren't 46 years old. The insulators were installed in
17 1946.

18 So that happened in 2018 under your
19 organization. In 2012 five towers on the Caribou-Palermo
20 line collapsed. The entire line was de-energized for
21 over a month while a shoofly was being built despite the
22 fact that its hardware, its insulators, and its conductor
23 were almost 100 years old. None of it was replaced.
24 There was no proactive work done on that line while it
25 was down.

26 So how do you reconcile those two?

1 A. I don't. I don't know the details behind the
2 event in 2012. I wasn't a part of that interaction. So
3 I actually cannot speak to it.

4 Q. Well, you tell us and we hear over and over
5 again that safety is number one, but the actions seem to
6 show that reliability is the absolute most important.

7 How do you -- you know, how can you respond to
8 that allegation?

9 A. I can only attest to the fact that safety is the
10 number one priority for PG&E.

11 Q. Do you know what the Bay Waters towers projects
12 are?

13 A. Yes, I do.

14 Q. And do you know what the budget for the Bay
15 Waters towers project is?

16 A. I do not.

17 Q. Does \$500 million seem about correct?

18 A. I have no idea.

19 Q. Okay. Well, that's -- your job is -- you're the
20 one that is administering. You're basically managing the
21 budget; correct? The capital budget?

22 A. My job is to identify future work, future
23 planned capital work. Our process has a biased towards
24 identifying work approximately six years out. Management
25 of the current year budget -- and actually, let me take a
26 step back and clarify.

1 I assume your reference was to my previous role.

2 Q. Your previous role, yeah. And I was just about
3 to say that.

4 A. Thank you.

5 My previous role was responsible for nominating
6 and recommending new work primarily focused on six years
7 old in order to feed into our five-year planning horizon.
8 And those projects would then be developed, scoped out in
9 order to be executed on once we got to the point in time
10 where all pre-construction dependancies were cleared.

11 The execution of work in the current year is the
12 responsibility of my new role. So as I have a book of
13 work of identified projects, an authorized budget, my job
14 is to make sure that we coordinate the necessary
15 resources within PG&E in order to execute on that book of
16 work.

17 Q. So you left your prior position about six months
18 ago; right?

19 A. That's correct.

20 Q. So I want to go back, let's say, to November 8,
21 2018. You're the transmission asset manager and you're
22 planning out five and six years in advance. How many
23 non-mandated proactive programs were you planning out for
24 the Caribou-Palermo line?

25 A. Can you ask that question one more time, please.

26 Q. How many non-mandated preventative maintenance

1 proactive projects were on that five to six year
2 projected list for the Caribou-Palermo as of 2018?

3 A. As of 2018?

4 Q. Yes.

5 A. As of 2018 we had a project on the Caribou-Big
6 Bend line section of line and the project on the Big
7 Bend-Palermo line.

8 Q. Now, I said non --

9 A. It was originally --

10 Q. I said non-mandated because we're going to get
11 to those.

12 A. I understand. I understand.

13 Q. Those are the projects you're talking about that
14 were mandated by NERC requirements; correct?

15 A. That is correct. The original catalyst was a
16 NERC alert to mitigate ground-to-conductor clearance in
17 discrepancies. The reason I identify that is as PG&E has
18 seen a need to investigate more in its infrastructure, we
19 have continuously looked to drive efficiencies in the way
20 we execute work.

21 So our bias is to look to understand the scope
22 of work that is warranted when de-energizing a line is
23 previously referenced. And so as we were planning the
24 project to go out and mitigate those NERC discrepancies,
25 we were evaluating the need to expand the scope for
26 additional lifecycling of aging of the structure.

1 Q. We'll get to those projects here in a minute.
2 They're laid out in front of you in those packets. And
3 one of the questions will be what part of each one of
4 these projects is not mandated by the NERC and the CPUC
5 GO95 requirements?

6 A. Do you want me to answer that now or --

7 Q. No. Okay. Let's go on.

8 MS. DUPRE-TOKOS: No. I'd like him to answer
9 the question you've asked him.

10 MR. NOEL: Oh, that's correct.

11 BY MR. NOEL:

12 Q. Other than those projects, were there any other
13 proactive preventative maintenance program projects
14 planned for the Caribou-Palermo for the -- in the next
15 six years? So looking forward to 2024.

16 A. So when I hear "proactive preventative
17 maintenance," there are two categories that come into
18 mind, one of which is planned capital projects as I've
19 been speaking to that fell within my purview one of which
20 is capital maintenance tags that are created as a result
21 of inspection findings. Those originate from an
22 alternate organization within PG&E. I cannot speak
23 definitively to that subset of the portfolio.

24 Q. Okay.

25 A. In terms of transmission line capital projects
26 that fell within under my purview, I am only aware of

1 those two that I previously referenced.

2 Q. When you use the portfolio, you're talking about
3 the assets; correct? The money, the budget for the
4 assets?

5 A. Let me say this one more time. When I reference
6 portfolio, I mean the collection of projects that have
7 been identified and approved to enhance the assets that
8 are under my purview.

9 Q. So how do you build a portfolio?

10 A. How do I build a portfolio?

11 Q. No. Yeah. At PG&E how is a portfolio built?

12 A. So the portfolio with capital projects that I
13 referenced is developed in the integrated planning
14 process. And that originates from my team with specific
15 program managers or asset strategy engineers identifying
16 and nominating work in order to meet the objectives of
17 their programs which may be lifecycle of aging
18 infrastructure or it may be to meet a number of other
19 operational needs or regulatory obligations.

20 Those nominations are reviewed through our
21 integrated planning process and ultimately approved for
22 completion and completion in a given year within our
23 long-term planning horizon. Once approved that
24 collective book of work is what I'm considering the
25 portfolio.

26 Q. Okay. So in that portfolio as of November of

1 2018, there were no projects planned for the
2 Caribou-Palermo line due to proactive preventative
3 maintenance; is that correct?

4 A. I believe so.

5 Q. Why not?

6 A. Why were there no other projects than the
7 projects that were already planned for the line?

8 Q. Why were there no proactive preventative
9 maintenance program projects planned for the
10 Caribou-Palermo line?

11 A. As I previously stated, PG&E has continuously
12 looked to operate more efficiently. It would not be an
13 efficient approach to plan two projects on a single line.
14 As such, our approach has been to look for existing
15 projects on a facility and evaluate the need to modify or
16 expand the associated scope in order to perform the work
17 necessary in conjunction with a single mobilization,
18 single demobilization, single engineering effort, and
19 single permitting activity.

20 Q. All right. We'll come back to this.

21 All right. So now we're looking at page 4 of 17
22 in 1253. And it talks -- there's a list of short-term
23 items and a list of long-term items. Can you explain to
24 us what these are.

25 A. This is a summary of some actions that are
26 planned or underway for the asset strategy engineer or

1 the asset strategy team.

2 Q. Okay. So the very first one under short-term
3 "Continue to evaluate field input and repair, replace as
4 needed." Did I read that correctly?

5 A. That is correct.

6 Q. The field input -- would that be the tags that
7 you're talking about?

8 A. Yes, among other things.

9 Q. What are the other things?

10 A. In addition to notifications created from
11 inspections from field resources, my team also solicits
12 feedback from field personnel as well as our operation
13 personnel in order to maintain a diverse perspective on
14 the requirements and condition of our asset base.

15 Q. Field personnel. Are those the troubleshooters and
16 linemen who are actually working on the lines?

17 A. Yes, or their associated leadership. They would
18 also include engineers working on projects or responding
19 to maintenance activities in the field.

20 Q. So if your field input is garbage, then your
21 first category there "Continue to evaluate field input"
22 is garbage; correct?

23 A. I don't know what you mean by that statement.

24 Q. Well, let's say, for instance, that your field
25 personnel are not actually evaluating and inspecting your
26 transmission assets. So that would mean your evaluation

1 would be incorrect; correct?

2 A. I would say that the value of that first line,
3 the value of the field input would be proportional to the
4 amount and quality of that field input, yes.

5 Q. Okay. So right off the bat you're dependent
6 upon the quality of the input you're getting from the
7 troublemen, the T-line supervisors who are actually
8 hands-on with these assets; is that correct?

9 A. Yes. The input from the field, the quality of
10 that input has an impact on our overall asset strategy.

11 Q. And then it goes on "Continue to coordinate,
12 bundle asset replacement with reliability strategy and
13 systems operations."

14 Did I read that correctly?

15 A. Yes, you did.

16 Q. Is this what you were talking about earlier
17 about efficiencies and bundling things?

18 A. That is correct.

19 Q. All right. So it says "Continue to coordinate
20 bundle asset replacement with reliability strategy and
21 systems operations." Correct?

22 A. Yes.

23 Q. Where in this sentence does it say safety?

24 A. It does not say safety in that sentence.

25 Q. Right. So you're continuing to coordinate and
26 bundle asset replacement with reliability strategy;

1 correct?

2 A. That is correct.

3 Q. Can I interpret that to mean that you're making
4 these decisions asset replacement bundling based solely
5 upon reliability and asset strategy or systems
6 operations?

7 A. That is not correct.

8 Q. That's what it says right there; correct?

9 A. The reference here to reliability strategy, I
10 think, technically should have been capitalized.
11 Reliability strategy is a separate strategy equal --
12 similar to the steel structure strategy that's
13 recommending rebuild of transmission line infrastructure
14 in a consolidated manner from a different lens.

15 So the reference here is to make sure that the
16 work I identified under that program is coordinated with
17 the work identified under this program.

18 Q. Well, this document -- this is -- this came out
19 of your organization; correct?

20 A. That is correct.

21 Q. This is your organization steel structure
22 strategy plan; correct?

23 A. That is correct.

24 Q. This is a document that was filed with FERC
25 during federal proceedings; correct?

26 A. That is correct.

1 Q. And this document specifically says that you're
2 going to coordinate, bundle asset replacement with
3 reliability strategy and system operations. It doesn't
4 say there reliability strategy isn't capitalized as a
5 group, and safety is never mentioned. Correct?

6 A. Safety is not in that sentence, correct.

7 Q. And then it goes on "Complete assessment and
8 develop plan to repair and/or replacement towers in the
9 Bay Water, Delta Water, and Salt Pond Towers." Correct?

10 A. Correct.

11 Q. Can you tell us what constitutes the Bay Waters?

12 A. Bay Waters is a subset of towers around the San
13 Francisco -- greater San Francisco Bay that are exposed
14 to higher corrosion than other -- than a number of other
15 towers in our system.

16 Q. And what constitutes the Delta Water and Salt
17 Pond Towers?

18 A. Delta Water and Salt Pond Towers are similar in
19 nature but not on the San Francisco Bay but rather
20 slightly in on the Delta and adjacent waterways that are
21 salt water high corrosion locations.

22 Q. Basically, this assesses the entire Bay Area;
23 correct? That -- which is the corrosive area around the
24 bay where these towers are exposed to fog and saltwater.
25 Is that right?

26 A. So this does not assess the entire Bay Area. It

1 assesses all the structures adjacent to waterways within
2 the Bay Area.

3 Q. Okay. Why just the Bay Area?

4 A. The -- I actually don't know the origin of the
5 Bay Waters inspections that occurred predating me. So I
6 can't speak to that.

7 Q. Okay. Well, I'm guessing, you know, the Bay
8 Waters goes into the corrosive atmosphere of essentially
9 a salt water atmosphere; correct? Salt water and metal
10 do not go together very well.

11 A. That's correct.

12 Q. Okay. And I'm guessing you're a mechanical
13 engineer. You're qualified to give us that opinion;
14 right?

15 A. To an extent, yes.

16 Q. To an extent. You don't have to be a corrosion
17 engineer to figure out that saltwater and metal do not go
18 together. But my question is -- and this is the Bay
19 Waters around the bay, the Delta waters around the delta,
20 and the Salt Pond Towers. And, yes, those are in
21 corrosive salt water environments but so are Sonoma
22 County, Mendocino County, Humboldt County, and Del Norte
23 County as well as Monterey County, San Luis Obispo
24 County.

25 You've got transmission lines that are all along
26 the coast in salt water environments; correct?

1 A. That is correct.

2 Q. Why only do the Bay Area and Delta towers get
3 special protection and special treatment?

4 A. They do not. Those references were for finite
5 programs that had -- that originated from inspections
6 coming off of historical events that I am not intimately
7 familiar with that said if you look at the following
8 line, the steel structure replacement --

9 Q. We're going to get there. The question is why
10 do only the towers in the Bay Area and the delta area
11 that are obviously exposed to a corrosive environment
12 being next to the ocean and salt water environment, why
13 do they get special treatment that is not afforded to
14 other coastal towers all the way up and down the PG&E
15 system?

16 A. They do not. Our steel structure replacement
17 plan looks at corrosion zone across our service
18 territory.

19 Q. We're going to get to that. But, like, you have
20 the Bay Waters fund, which is a project of Feven Mihretu;
21 correct? And that's a very large fund solely to replace,
22 repair, and maintain the Bay Waters towers; correct?

23 A. That is not correct.

24 Q. Okay.

25 A. The funding for all tower replacement was
26 consolidated into a steel structure replacement plan --

1 Q. Okay.

2 A. -- that included the towers identified in the
3 Bay Waters program, Delta program, Salt Pond program as
4 well as looking at all of the towers across our asset
5 base.

6 Q. So now this document -- this is short-term 2017
7 goals. "Develop a steel structure replacement plan."
8 That's the next one; right?

9 Why is it 2017 and you don't have a steel
10 structure replacement plan?

11 A. So I have provided feedback to my team at this
12 time and subsequent to this time that the use of
13 descriptive language in these prospective documents can
14 be misleading. This would be to develop an enhanced
15 steel structure replacement plan.

16 Q. So what was the steel structure replacement plan
17 before this?

18 A. Previously the steel structure replacement plan
19 would be to replace structures as the need was identified
20 through inspection or as triggered by other projects or
21 other identified needs.

22 Q. So when this says "Develop a steel structure
23 replacement program," that's wrong?

24 A. It is correct, but I wanted to make sure that
25 it's clear. It's to develop an enhanced steel structure
26 placement plan.

1 The primary difference that I would highlight
2 from this plan that's been developed from its predecessor
3 was that we previously replaced towers on a transactional
4 basis. So as a tower was identified for needing
5 replacement, we would replace that tower.

6 As we identified more towers along a given line
7 that needed to be replaced in a similar timeframe, that
8 same mindset that I previously referenced about looking
9 for efficiencies that bundle work and execute larger
10 volumes of work more efficiently, that lent -- lead to
11 the development of a steel structure replacement plan
12 that is looking at replacing numerous structures across
13 the line all in one project as opposed to a project for
14 each individual structure that was identified for
15 replacement.

16 Q. So you now have one unified steel structure
17 replacement program plan; correct?

18 A. That is correct.

19 Q. So why do you still need the bay and delta steel
20 structures or why did they still need their own
21 designations and their own categories?

22 A. Can you define "need."

23 Q. Well, they do. You still have special programs
24 for the Bay Waters Towers. You still have special
25 programs for the Delta Water Towers. If you have a
26 unified enhanced steel structure replacement program at

1 this point in time, why would there be a need to treat
2 any structures differently?

3 A. So in terms of actual work to replace or funding
4 source, I would argue that those structures were not
5 treated differently. The one reason why I would expect
6 Bay Waters, Delta Water, and Salt Pond Towers to be --
7 continued to be specifically referenced is to make sure
8 that they are -- to highlight that they're continuing to
9 be on the radar and executed against and not, you know,
10 going incomplete and being superseded by an alternate
11 program.

12 Q. I mean, these two things are back to back on
13 this list. "Develop a plan to repair and/or replace
14 towers in the Bay Waters, Delta Waters, and Salt Pond
15 Towers and then develop and enhance according to steel
16 structure replacement plan that is uniformed for all of
17 the transmission assets.

18 So that seems to contradict what you're saying
19 about they're all treated the same.

20 A. I disagree with you.

21 **EXAMINATION**

22 BY MS. DUPRE-TOKOS:

23 Q. I guess I'm a little confused. And so I'm going
24 to shorthand and put into regular English what my
25 understanding of what you just said was.

26 A. Sure.

1 Q. That the complete assessments and developed plan
2 to repair and/or replace towers in Bay Waters, Delta
3 Water, and Salt Pond Towers, that that was being kept
4 separate to make sure that nothing was missed with those
5 towers and --

6 Right? Is that essentially what you just said?

7 A. No.

8 Q. Then what did you say?

9 A. It's not being kept separate. As I stated, it's
10 rolled into a single tower replacement program.

11 Q. Okay.

12 A. The reference to those structures and the fact
13 that they were part of those programs, which has a
14 history to it, specific external inspections and other
15 reports that have identified and quantified the condition
16 of those assets, that characterization will carry forward
17 with those towers until they're replaced.

18 But despite hearing reference to "this structure
19 was identified as needing replacement through the Bay
20 Waters Program or through the Delta Waters Program or
21 through the Salt Pond Towers assessment," that reference
22 does not reference a separate program any longer because
23 those programs were consolidated into a single program
24 for your transmission steel structures.

25 Q. Okay. So what I'm not understanding is if the
26 special inspections for those specific towers exposed to

1 corrosive elements have to make sure they stay with them
2 until they're replaced, why do they still need their own
3 separate names up there? Why can't you just have the one
4 entry? Why are they still being held separate?

5 By keeping it as a separate entry, how does that
6 keep the inspection program and everything else that you
7 just said needs to stay with it until those towers are
8 replaced? It doesn't need to be its own category on
9 there.

10 A. I don't disagree. I don't think there's a need
11 to have a separate line here, but the engineer elected to
12 put a separate line there.

13 Q. The engineer you supervise?

14 A. That is correct.

15 MS. DUPRE-TOKOS: Okay.

16 MR. NOEL: All right.

17 THE WITNESS: And also did not have a
18 consequencing result of development of a holistic program
19 across our territory.

20 **EXAMINATION**

21 BY MR. NOEL:

22 Q. All right. Now skip down a couple. "Develop a
23 corrosion management plan for new and existing
24 foundations." Did I read that correctly?

25 A. Yes, you do.

26 Q. The corrosion zone is the Bay Waters, Delta, and

1 Salt Pond Towers; correct?

2 A. The corrosion zone -- the entire service
3 territory in a corrosion zone is characterized in
4 different levels of corrosion zone.

5 Q. Okay.

6 A. The higher corrosion zones tend to encompass the
7 areas around the Bay Waters, Delta, Salt Ponds, and then
8 up and down the Pacific Coast.

9 Q. So again, now we're, you know, developing a plan
10 to replace and -- to repair and replace towers Delta, Bay
11 Waters, blah-blah-blah.

12 Now, if we have a unified enhanced steel
13 structure, then why is it necessary to develop a specific
14 corrosion management plan? Why isn't that covered in the
15 overall enhanced structure replacement plan?

16 A. Because they're two separate things.

17 Q. Okay. That was another of the projects from
18 Feven Mihretu; correct?

19 A. Can you clarify what you mean by "project."

20 Q. Looking at the effects of corrosion on the
21 foundations, the tower foundations.

22 A. That is part of her -- her job responsibility at
23 the time, yes.

24 Q. And her specific focus was on the Bay Waters
25 towers; correct?

26 A. Her specific focus was on foundations for towers

1 in higher corrosion zones.

2 Q. Right. So she wasn't up here in the mountains
3 looking at the effects or developing a corrosion
4 management plan for towers on the Caribou-Palermo or the
5 Pit River towers or any of those?

6 A. That is correct.

7 Q. And she wasn't doing that in the Central Valley
8 talking about Fresno, Bakersfield, Sacramento area
9 transmission lines; correct?

10 A. That is correct.

11 Q. She's doing this -- a corrosion management plan
12 for the Bay Waters, Delta Water, and Salt Pond towers,
13 those towers that are in the high-corrosion zone. That's
14 correct; right?

15 A. The initial effort was correct in the second
16 half of your statement which is for the towers in the
17 higher-corrosion areas that were experiencing issues with
18 degradation and the existing tower foundations.

19 My expectation is that overall plan would
20 encompass all of the assets but would likely only impact
21 those that were exposed to those types of most
22 degradation.

23 Q. All right. Next "Evaluate the effectiveness of
24 the design, maintenance, and inspection program and make
25 necessary recommendations for improvements."

26 Did I read that correctly?

1 A. Yes, you did.

2 Q. So evaluating among other things the maintenance
3 and inspection programs. And that is something that you
4 were looking at in 2017; correct?

5 A. That is correct.

6 Q. And there was actually a committee that was put
7 together to look at that very -- that very item to
8 evaluate the inspection and maintenance plans; correct?

9 A. I don't know.

10 Q. Okay. Well, that was a committee that was put
11 together to evaluate the maintenance an inspection
12 program and to determine if there were ways that it could
13 be minimized; that you could save more money on the
14 maintenance and inspection program. Is that correct?

15 A. I don't believe so.

16 Q. Okay. Well, you guys like to put things into
17 PowerPoint slides; correct?

18 A. That is correct.

19 Q. And there is a PowerPoint slide that talks about
20 a committee. And I think among the other people on there
21 was, what, Eric Back and Chuck Stinnett? Do you know who
22 those guys are?

23 A. I do.

24 Q. And it actually says in the summary that what
25 that committee was to do was to analyze the maintenance
26 and inspection program for budget reductions.

1 So were you aware of that?

2 A. I don't know.

3 Q. So how were you going to evaluate the
4 effectiveness of the design, maintenance, and inspection
5 program and make necessary improvements, necessary
6 recommendations for improvements?

7 A. At the time this document was written, these
8 statements were forward-looking.

9 Q. Okay.

10 A. So the intent was to drive improvements in our
11 design, maintenance, and inspection programs. The
12 details of how we were going to do that were still to be
13 developed.

14 Q. Okay. Well, if your documentation shows that
15 the intent of the evaluation of the maintenance and
16 inspection program was to reduce the patrol and
17 inspection cycles, how does that effect number one up
18 here we talked about continuing to evaluate the field
19 input and repair or replace as needed?

20 A. I'm not familiar with the reference that you're
21 making to the --

22 Q. Well, if you're getting less inspections, if
23 you're inspecting and patrolling your assets less, then
24 you're going to get less information from your subject
25 matter experts out in the field upon which to make your
26 decision, to inform your decision as to repair or

1 replace. Would you agree with that?

2 A. No, not necessarily.

3 Q. Okay. What does it mean to evaluate mean and
4 maximum asset life expectancy from other data sources?

5 A. Our team was looking to leverage our knowledge
6 based on industry experts and peer utilities to attempt
7 to define what the mean and max expected life were for a
8 given asset. In order for us to start planning long-term
9 replacements both to understand the amount of work that
10 was in the long-term planning horizon and also identify
11 any asymmetry of the condition of our asset base would
12 necessitate pulling forward more work to proactively
13 replace assets that were still healthy in condition but
14 would allow us to avoid a point in time where we had more
15 work to do than we have clearances or qualified
16 resources.

17 Q. Now, when you used the term leverage, you mean
18 to use that information; correct?

19 A. Correct.

20 Q. So you're going out and looking at other --
21 getting information from other experts in the field to
22 determine asset life expectancy; correct?

23 A. That was the intent.

24 Q. Okay. Wasn't that exactly what was done in 2010
25 by Quanta?

26 A. Unfortunately, no.

1 Q. And the title of the Quanta project was the --
2 all of a sudden I'm forgetting. The Lifecycle -- the
3 Asset Lifecycle --

4 MS. DUPRE-TOKOS: Lifespan.

5 BY MR. NOEL:

6 Q. -- Lifespan Project. So Quanta provided a bunch
7 of that information.

8 Why are you now in '17 saying "In the future
9 we're going to go out and do it again"?

10 A. Because we could not rely on the information in
11 the Quanta study.

12 Q. So you didn't like the Quanta study? Studies?

13 A. It did not meet the objective of this bullet
14 point.

15 Q. Okay. How did the Quanta studies, which
16 analyzed data from 103 separate utilities around the
17 world as to asset lifespans, not meet that bullet point?

18 A. The Quanta study did not look at asset data from
19 those utilities but rather business practices from those
20 utilities. The only age information and corresponding
21 failure data that was used in that study was associated
22 with the subset of assets that failed in a two-year
23 period within PG&E and made some assumptions that made
24 the statistical analysis incorrect.

25 So it wasn't sufficient for us to justify
26 significant amounts of investments in the future, and we

1 needed to do additional analysis in order to build the
2 case for our regulators to be able to justify requesting
3 authorization to be able to make additional investments
4 in the infrastructure based on the results of that bullet
5 point at a later date.

6 Q. So you didn't feel that Quanta did a good enough
7 job?

8 A. We did not believe that Quanta's work was
9 sufficient for our needs.

10 I apologize. Off the record can I have a break
11 real quick?

12 MR. NOEL: Madam Foreperson.

13 GRAND JURY FOREPERSON: A short break.

14 BY MR. NOEL:

15 Q. Can I ask one follow-up question really quick
16 before we break?

17 A. Sure.

18 Q. Who is "we"?

19 A. We? Can you remind me.

20 Q. You said "We determined. We determined." Who's
21 the we?

22 A. My apologies. The collective "we" that I was
23 referencing would have been myself, my team members, and
24 my boss at the time.

25 Q. And that was Kevin Dasso?

26 A. That is correct.

1 MR. NOEL: Okay.

2 GRAND JURY FOREPERSON: Five minutes?

3 THE WITNESS: Thank you.

4 MR. NOEL: Admonish him.

5 Before we can let you leave here, we have --
6 Madam Foreperson has to read you an admonition.

7 GRAND JURY FOREPERSON: Mr. Gabbard, you are
8 admonished not to discuss or disclose at any time outside
9 of this jury room the questions that have been asked of
10 you or your answers until authorized by this grand jury
11 or the Court. A violation of these instructions on your
12 part may be the basis for a charge against you of
13 contempt of court. This does not preclude you from
14 discussing your legal rights with your own attorney.

15 Mr. Gabbard, what I have just said is a warning
16 not to discuss this case with anyone except the Court,
17 your lawyer, or the district attorney.

18 THE WITNESS: Understood.

19 GRAND JURY FOREPERSON: Okay. Thank you.

20 MR. NOEL: And do you want to take a short one
21 or -- it's almost a quarter to 3:00. Do you want to take
22 our afternoon break right now?

23 GRAND JURY FOREPERSON: Okay. Yes. Let's do
24 fifteen.

25 MR. NOEL: Let's do fifteen.

26 [Recess taken from

1 2:41 until 3:05 p.m.]

2 GRAND JURY FOREPERSON: All members of the grand
3 jury are ready to proceed.

4 Mr. Gabbard, you're still under oath.

5 THE WITNESS: Understood. Thank you.

6 **EXAMINATION CONTINUED**

7 BY MR. NOEL:

8 Q. All right. Let's move on to the long term.
9 Number one, the first category out here "Develop a
10 corrosion standard procedure for corrosion management of
11 new and existing foundations."

12 Did I read that correctly?

13 A. Yes.

14 Q. And then "Develop a structure prioritization
15 criteria and replacement program that includes risk,
16 asset type and performance, asset lifecycle, asset
17 obsolesce, operational flexibility, and optimum
18 replacement approach."

19 Did I read that correctly?

20 A. Yes.

21 Q. That's a mouthful.

22 First, what is a structure prioritization
23 criteria and replacement program?

24 A. So in essence that would be referencing -- my
25 read of this would be that's referencing back to the
26 approach for prioritizing wood structures fed into the

1 structure replacement plan.

2 Q. Okay. So how is this different than developing
3 an enhanced steel structure replacement plan?

4 A. I don't know that it is completely. My
5 assumption is that they coincide. I think it's more of a
6 broader articulation of where that evolves over time.

7 One of the core principals for asset management
8 is continues improvement. I have given feedback to my
9 team specific to this document about qualifying these
10 statements as if they start from scratch. It's really a
11 continuation of what's occurred over many years.

12 This is laying out that the future objective
13 that having a best-in-class asset management strategy
14 that touches on all of these areas, that we likely had
15 efforts underway in each one of those areas but to take
16 them further and continuously improve.

17 Q. Okay. So this is a document that was put
18 together by your team; correct?

19 A. Correct.

20 Q. Your department, your -- one of your main duties
21 is the development of the asset strategy. And sometimes
22 that is an investment strategy; correct?

23 A. The asset strategy and investment strategy would
24 probably be different.

25 Q. Okay. How so?

26 A. Asset strategy would inform the investment

1 strategy or investment strategy would take into
2 consideration things beyond my purview.

3 Q. Okay. And when you're talking about defining
4 terms, investment in this case means putting money into
5 your infrastructure; correct?

6 A. That is correct.

7 Q. And you're not taking money and investing in the
8 stock market or buying shares of SoCal Edison or anything
9 like that; right?

10 A. Correct.

11 Q. Investment is putting money into your own
12 infrastructure?

13 A. Are you referencing the use of my term of
14 "investment" in the last answer?

15 Q. Well, yeah, because we were talking about --
16 well, actually you're right. I skipped it, this up here
17 above the last line. And I forgot. We skipped it.

18 "Develop and facilitate an annualized five-year
19 investment plan."

20 That's the last of the short-term goals;
21 correct?

22 A. That's correct.

23 Q. And I'm sorry. Thank you for pointing that out
24 to me.

25 So again, we're talking investment is money
26 spent on infrastructure?

1 A. For the most part, yes, with the caveat that we
2 may inform some very small portion of our investment
3 plan, investments in tools, investments in processes,
4 things of that nature. But for the most part your
5 characterization is correct.

6 Q. Okay. And any investment plan is informed by
7 profit; correct?

8 A. No. Our investment plan is -- on our side is
9 informed by meeting the objectives established, I
10 believe, on the proceeding slide, meeting the safety
11 reliability and affordability for our customers.

12 Q. Well, the definition of the word "investment"
13 means to put money into something expecting future
14 profits; correct?

15 A. I don't know where you're getting that
16 definition from.

17 Q. You have an MBA; correct?

18 A. I do.

19 Q. That's -- basically we can pull up the
20 definition. Let's see.

21 A. Over here (indicating).

22 Q. And we're pulling up a document. Definition of
23 investment Merriam Webster dictionary. "The outlay of
24 money usually for income or profits; a capital outlay."

25 Investment Cambridge dictionary. "The act of
26 putting money or effort into something to make a profit

1 or achieve a result."

2 The business dictionary. "Money committed or
3 property acquired for future income."

4 Those are the def -- those are the accepted
5 definitions of the term investment; correct?

6 A. Those are the definitions that you're reading
7 off of this Word document, correct.

8 Q. Well, those are verbatim from multiple
9 dictionaries.

10 A. Understood.

11 Q. So are you telling me that PG&E's definition of
12 the word investment is different from the general
13 definition that everybody else uses?

14 A. No. I'm saying that -- actually, PG&E's
15 definition in this context actually aligns quite well
16 with the Cambridge definition that you just provided
17 which is investment of capital in order to achieve a
18 result.

19 Q. Okay. And that is generally profit?

20 A. I think it's important to understand that PG&E
21 is a regulated utility. Our profit is structured
22 differently based on a rate filing. Our investments and
23 infrastructure and the strategy implemented under my team
24 are intended to meet objectives that are separate from
25 financial processes.

26 Q. You're a regulated utility, but you're also an

1 investor-owned utility; correct?

2 A. That is correct.

3 Q. Investor being similar to the word investment
4 meaning people that are putting money in and expecting a
5 profit; correct?

6 A. In that context that is correct.

7 Q. How much profit has PG&E paid to its investors
8 over the last five years?

9 A. I don't know that number.

10 Q. Okay. I think the number that's been thrown out
11 in the federal courts is \$5.8 billion. Does that sound
12 about right?

13 A. I don't know.

14 Q. Now, there's also profit in terms of what the
15 employees make; correct? In terms of -- I guess they're
16 looking at me. I probably didn't ask that question very
17 well. Bonuses. What the rest of us would consider
18 bonuses.

19 A. Can you restate the question.

20 Q. Well, I'm probably asking it badly.

21 In your position with PG&E, do you get bonuses?

22 A. Yes.

23 Q. And what do you get bonuses for?

24 A. Performance.

25 Q. What type of performance?

26 A. Performance against goals.

1 Q. And what are those goals?

2 A. Meeting safety metrics, reliability metrics
3 among other performing metrics.

4 Q. Okay. Did you get a bonus in 2017?

5 A. I believe so.

6 Q. Okay. So how does -- how do you get a bonus
7 that is tied to safety metrics in a year in which PG&E
8 equipment caused fires all over the state?

9 A. Are you asking me what the basis for --

10 Q. Yeah, I'm asking.

11 A. -- our incentive program is?

12 Q. If your incentive program -- if you're telling
13 me the first metric, the first goal that you're looking
14 at is safety, how do you -- anybody at PG&E get a bonus
15 in 2017 after the Wine County fires, the Butte County
16 fires, the Nevada County fires, the Yuba County fires,
17 billions of dollars of property loss, lost lives?

18 And Sonoma County especially? How do you -- how
19 could you in any way -- how could the company in any way
20 claim to have achieved safety metrics in that and give
21 bonuses?

22 A. I was not a part of the decision to provide
23 bonuses and compensate our employees for 2017.

24 Q. How about 2018? Did you get bonuses in 2018?

25 A. No, we did not.

26 Q. So you're not part of the process in determining

1 whether or not safety metrics are met for bonuses, bonus
2 purposes, or incentive purposes; correct?

3 A. I'm not part of the decision process for whether
4 or not to issue bonuses to employees.

5 Q. Okay. But the fact that you did get a bonus
6 would indicate somebody made the decision that your
7 safety metrics were met?

8 A. That is correct. Those that pertain to the
9 bonus, yes.

10 Q. Right. That's a good question. What metrics
11 pertain or what safety metrics pertain to the bonus and
12 what don't?

13 A. I don't recall.

14 Q. All right. So develop -- going back to this
15 "Develop a structure prioritization criteria and
16 replacement program that includes risk, asset type and
17 performance, asset lifecycle, asset obsolesce,
18 operational flexibility, and optimum replacement
19 approach." So what type of risk are we talking about
20 here?

21 A. I read that as a general statement referencing
22 risk. And I did not write that statement so I don't know
23 exactly what was being referenced.

24 Q. Okay. Asset type and performance. Well, what
25 asset type? What are we talking about?

26 A. In this instance we're referencing steel

1 structures.

2 Q. Okay. And what kind of performance is being
3 measured here or being used as a measurement here?

4 A. I don't know.

5 Q. All right. And then the final one there
6 "Develop a system-wide asset risk in a visual and tabular
7 format."

8 Did I read that correctly?

9 A. Yes, you did.

10 Q. Can you explain that statement to us.

11 A. I cannot.

12 Q. Any idea what a system-wide asset risk is?

13 A. I do not know.

14 Q. Okay. So have you signed any type of
15 non-disclosure agreement or any other type of agreement
16 that puts restrictions on or prohibits your disclosure of
17 certain types of information?

18 A. I have signed NDAs before, yes.

19 Q. Okay. And do you have one with PG&E?

20 A. I do not know. I don't think so.

21 Q. Okay. All right. Let's see. I think -- let's
22 go through here real quick.

23 Asset based. Your steel structures in service
24 as of December 2016. Familiar with these tables?

25 A. Yes.

26 Q. All right. Next, we have the table showing the

1 age of your steel structures. So are you familiar with
2 this table? This page?

3 A. Yes. I've seen this page before.

4 Q. All right. So your oldest structures are
5 108 years old as of when this was written in 2017. And
6 the average age is 68 years.

7 What does it mean when it says "the mean life
8 expectancy is 65 years"?

9 A. I believe that is a quote from the 2010 Quanta
10 Technology study.

11 Q. Okay. What is a mean life expectancy?

12 A. We need to go to the Quanta study. They define
13 their terms.

14 Q. Okay. And then it quotes down here "Structures
15 age, data life expectancy is from a year 2010 Quanta
16 Technology study."

17 Did I read that correctly?

18 A. Yes, you did.

19 Q. Okay. Now, the oldest structures in your
20 system, according to this chart, green are all 115
21 structures; correct?

22 A. That is correct.

23 Q. And you said earlier you don't know the age or
24 when the Bay structures -- the Bay Waters structures or
25 the Delta Water structures or the Salt Pond structures
26 were built; correct?

1 A. I don't believe I said that, but that is
2 correct.

3 Q. Do you know?

4 A. I do not.

5 Q. So skipping ahead here there's a bullet point
6 there that says "Over six years 2011 to 2016 outage
7 history one tower failure." And then it goes on "In 2015
8 Tower 61/268 collapsed. Tower 61/267 also failed as a
9 result of 61/268 failing at Moss Landing Power Plant that
10 carried Moss Landing Metcalf Number One and Number 2
11 230kV lines."

12 Did I read that correct?

13 A. That is correct.

14 Q. So in this period, according to this document,
15 we've had one tower failure?

16 A. That's correct.

17 Q. So why wouldn't the 2012 five tower collapse on
18 the Caribou-Palermo line appear in that list?

19 A. I don't know.

20 Q. Again, this is a document that was submitted as
21 an exhibit to FERC in a federal regulatory proceedings;
22 correct?

23 A. It's a document that was submitted as part of a
24 data response to the CPUC in the process that feeds into
25 the FERC proceeding.

26 Q. Okay. Well, CPUC is one of your regulatory

1 agencies; correct?

2 A. That's correct.

3 Q. This statement is patently false; correct?

4 A. I would need to speak to Feven to understand the
5 context for which this data was pulled.

6 Q. Well, the data -- it's says very simple "Over
7 six years one tower failure." And it talks about the
8 Moss Landing Power Plant, the tower at Moss Landing.

9 We know that in 2012 five towers on the
10 Caribou-Palermo collapsed during a wind storm and a sixth
11 was damaged to the extent it had to be replaced. So why
12 aren't those on that list?

13 A. I don't know.

14 Q. So do you know anything about the Moss Landing
15 tower collapse?

16 A. I don't know much about it.

17 Q. Have you read anything on it?

18 A. I have a vague recollection of its occurrence.

19 Q. Okay. Have you read any of the root cause
20 analysis, the failure analysis that were put together?

21 A. I have not.

22 Q. Okay. So as a senior director in charge of the
23 organization that puts this out, ultimately you're
24 responsible for this document; correct?

25 A. For this PowerPoint?

26 Q. Well, this document that was used in the FERC

1 proceedings.

2 A. I oversee the engineer that is responsible for
3 developing this document.

4 Q. And then again we go down over six years out of
5 67 LC notifications 2011 to 2016 under MAT Code 70S.

6 Do you know what MAT Code 70S is?

7 A. Steel structure replacement.

8 Q. Steel structure replacement.

9 "Sixty-three have been identified based upon a
10 wide array of issues but not limited to anchor
11 replacement, conductor clearance, raise or stabilize
12 tower, foundation repair."

13 Did I read that correctly?

14 A. Yes, you did.

15 Q. So over the six years, according to this, you've
16 replaced 63 towers for those listed four reasons.

17 A. I don't know if that's correct.

18 Q. Okay. Well, I notice that it doesn't list any
19 towers being replaced, any steel towers being replaced
20 proactively because of age; is that correct?

21 A. That is an irrelevant statement for this section
22 of the presentation.

23 Q. Okay.

24 A. In this section that you're referencing the LC
25 notifications stands for "line corrective."

26 Q. Okay.

1 A. This is referencing notifications that were
2 created as a result of inspections of towers. Those were
3 the characterizations that were included in the
4 notification that was created. I do not know whether or
5 not those towers were repaired or replaced as a result of
6 those line corrective notifications.

7 I would also highlight on the previous answer I
8 provided I failed to recognize that the outage history
9 was referenced in the first bullet. That may be a
10 reason -- this is just something that I'm recognizing. I
11 don't know for sure. It may be a reason why this subset
12 of data is not the entire data set.

13 Q. Okay. So are you saying that possibly because
14 it says "outage," that maybe that's why only that one
15 tower falling down is represented?

16 A. Possibly.

17 Q. Okay. Well, if the evidence showed that the
18 Caribou-Palermo was out from December 21st until, I
19 believe, January 30th, that would be an outage; right?

20 A. I would assume that this would reference a
21 customer outage. Again, now I'm getting into
22 speculating, but I would recommend that to understand
23 what the basis for this data was to go to the author of
24 the information.

25 Q. So why does it make a difference that it's
26 customer outage?

1 A. Can you clarify your statement.

2 Q. You said that outage would be customer outage
3 and maybe that's why the Caribou-Palermo wouldn't fit in
4 there.

5 A. My statement is referencing the fact that I'm
6 reading both of these major bullets --

7 Q. Right.

8 A. -- which are characterizing different data
9 sources. And my answer is attempting to infer what data
10 source is used for the data that's being shown here.
11 It's an assumption. And it may or may not be correct.

12 Q. Okay. But why would it make any difference, not
13 just in this context or in any context, whether customers
14 were affected or not?

15 A. In certain contexts they wouldn't make a
16 difference.

17 Q. But in certain context it does; correct?

18 A. If you wanted to know the number of customers
19 impacted, it would matter whether or not there were
20 customers impacted, yes.

21 Q. Okay. And one of the reasons -- one of the
22 places where that makes a difference is in your
23 reliability metrics; correct?

24 A. Potentially, yes.

25 Q. Things like --

26 A. Only in the -- in a subset of reliability

1 metrics.

2 Q. Things like CAIDI and SAIFI have to do with
3 customer interactions. Or interruptions. I'm sorry.
4 Right?

5 A. That is correct.

6 Q. And so if the Moss Landing tower goes down,
7 that's going to affect your reliability metrics because a
8 lot of people are going to be without power for a period
9 of time; correct?

10 A. To clarify, that will impact a subset of
11 reliability metrics. We also have reliability metrics
12 for our transmission system. It would be called ACOD and
13 ACOF. And they're independent of the number of
14 distribution customers impacted.

15 Q. Right. The biggest ones are CAIDI, SAIFI,
16 and -- all of a sudden I'm forgetting the term.

17 Is that correct?

18 A. Can you define what you mean by "the biggest
19 ones."

20 Q. Well, those seem to be the most quoted, most
21 relied upon metrics that we've seen.

22 A. Those metrics are used by both transmission and
23 distribution utilities. ACOD and ACOF are only used for
24 transmission utilities and they're reported to the
25 California ISO.

26 Q. And CAIDI or SAIFI and whatever the other one

1 is, those are reported to FERC; correct?

2 A. Negative. Those are reported to the CPUC.

3 Q. Well, actually they're reported to the CPUC.

4 Okay. All right. And now we have down here
5 again Bay Waters inspections. So special category for
6 the Bay Waters towers; correct?

7 A. You mean a special bullet?

8 Q. Yes, special bullet.

9 A. Or separate bullet. Yes, there's a separate
10 bullet for the Bay Waters inspection of towers.

11 Q. And then at the very bottom there's actually a
12 footnote that appears to go to where we started here with
13 the tower collapses that says "During a 2017 windstorm
14 two structures collapsed in Tesla-Salado-Manteca 115Kv
15 line and a double dead-end structure has fallen in West
16 Sacramento-Brighton and Rio Oso-West Sacramento 115kV
17 line."

18 See that?

19 A. Yes.

20 Q. So those would be '17. So they're outside the
21 scope of the bullet point above.

22 All right. I'm going to skip to the end to get
23 to the good stuff. And here we are final page "Asset
24 one-page Summary T-line Strategy and PAS 55 Framework."

25 What is PAS 55 framework?

26 A. PAS 55 framework is an asset management

1 framework that's been developed by industry. I believe
2 it was specifically developed in Europe in order to
3 establish a common framework for asset management
4 principles. It has subsequently been superceded by ISO
5 55001 as a certifiable asset management framework.

6 Q. What do you mean by "asset management
7 framework"?

8 A. A framework that provides consistency and
9 guidance in common terminology for approaches to asset
10 management.

11 Q. Okay. So we have a little chart up here that
12 says "Risk identification, risk management, investment
13 planning, risk monitoring" back to "risk."

14 Basically, it's a circular diagram. Can you
15 explain that to us, please.

16 A. This was a visualization created by a member of
17 my team to characterize several components of overall
18 risk management.

19 Q. All right. So risk identification. It says
20 "Circuit risks, asset risks, asset component risks."

21 What's the difference between those items?

22 A. I don't know what was intended by those
23 different characterizations.

24 Q. And risk management programs, plans, policies,
25 standards. What is risk management? Can you explain
26 that to us.

1 A. Risk management is an approach to managing risk.

2 Q. Okay. How do you manage risk?

3 A. What risk are you referencing?

4 Q. It's your chart. It says "Risk management," and
5 you said it's how you manage risk. I'm asking you:

6 Okay. How do you manage risk?

7 A. There are a number of ways that we manage risk
8 within PG&E. I don't know what was being referenced in
9 this slide. I did not develop it.

10 Q. Okay. Down below it says "Program plans,
11 policies, standards, procedures, jobs, and tables."

12 So, for instance, would inspection and patrol be
13 considered risk management?

14 A. Can you say that one more time.

15 Q. Would, for instance, inspection and patrol be
16 considered risk management?

17 A. Yes.

18 Q. How are inspection and patrols risk management?

19 A. Inspection and patrols are considered controls
20 to decrease the likelihood of occurrence or the impact of
21 occurrence of an event.

22 Q. Okay. And so how do inspection of patrols do
23 that?

24 A. An example of an event that could cause risk
25 would be a conductor -- energized conductor coming to the
26 ground and being a safety risk for the public. A way for

1 an inspection to be a control to mitigate the likelihood
2 of that occurrence happening would be for regular
3 inspections to occur. Qualified field personnel may be
4 able to identify an issue before it turns into a failure.

5 Q. What would you consider qualified field
6 personnel?

7 A. Depends on the nature of the task.

8 Q. Well, we're talking about inspections and
9 patrols.

10 A. For line inspections I would assume that it
11 would be a journeyman lineman.

12 Q. Okay. Are you familiar with the ETPM?

13 A. At a very high level.

14 Q. What does that mean?

15 A. I know of its existence and its purpose. I also
16 know that there are other organizations responsible for
17 managing it and the content within. I am not very
18 intimately familiar with the content of the manual.

19 Q. How about the TOMP?

20 A. Can you tell me what you're referencing with
21 TOMP.

22 Q. Transmission Owners Maintenance Practices.
23 That's a mandated filing with CAL ISO and CPUC.

24 A. Yes, I'm familiar with that document.

25 Q. All right. And that document actually
26 defines -- those documents actually define what a

1 qualified company representative is to do inspections;
2 correct?

3 A. I do not know.

4 Q. Okay. So you used a good example; risk
5 management. The risk is wires on the ground. The way
6 you manage that is you would inspect it. You have
7 qualified persons go out there and inspect that and look
8 for any symptomology, any signs that would indicate the
9 danger of those wires going down; correct?

10 A. That is one control.

11 Q. Okay. So I know, you know, you're not a
12 transmission structure and conductor expert, but you are
13 an engineer. And using your example of the wires down as
14 being the risk, how important to managing that risk would
15 it be to be inspecting and monitoring the condition of
16 the things that hold that conductor to the tower?

17 A. I have not seen an assessment on the
18 effectiveness of our inspection program.

19 Q. Okay. But I'm just asking you. You said you
20 used conductors on the ground as being the risk and the
21 examples of how you would manage those risks. Wouldn't
22 it be extremely important to managing that risk of
23 conductor being on the ground to look at the attachment
24 points, the things that are holding that conductor in the
25 air?

26 A. I consider our inspection program to be an

1 important part of our --

2 Q. Just answer the question, please. You're an
3 engineer. You're a mechanical engineer; correct?

4 A. I am.

5 Q. You have a degree from a very, very good
6 university in mechanical engineering; correct?

7 A. That is correct.

8 Q. You used the example for risk management of the
9 risk being conductor on the ground and said you would
10 want to manage that risk by having qualified people do
11 inspections and identify potential problems and do
12 preventative maintenance; correct?

13 A. I said that is one control that we employ.

14 Q. Right. No. But I'm asking you how important to
15 that risk is it that you actually have somebody looking
16 at the attachment points, the actual things that are
17 holding that conductor in the air so it doesn't fall on
18 the ground.

19 A. I apologize. I may be missing something. My
20 previous answer was I believe inspections are important
21 to our Asset Management Program.

22 Q. Right. But you're in asset management and as
23 part of that you also control -- or at the time you
24 controlled risk management too; right? That was part of
25 your chain of command risk management.

26 A. The risk management team that I referenced --

1 Q. Yeah.

2 A. -- is a team to facilitate processes within our
3 organization. I would like to clarify. And this ties
4 back to the PAS 55 framework that you're referencing. I
5 consider asset and risk management to be synonymous.
6 Risk management is a component of an overall asset
7 management approach.

8 Q. Okay.

9 A. And as I previously stated, I do believe that
10 inspections are an important part of our Asset Management
11 Program.

12 MR. NOEL: Go ahead.

13 **EXAMINATION**

14 BY MS. DUPRE-TOKOS:

15 Q. Okay. Again, maybe I'm just not understanding
16 what you're saying. But you used the example of a risk
17 being a conductor on the ground; correct?

18 A. Correct.

19 Q. What we want to know -- and that you would want
20 to prevent that from happening by doing inspections;
21 correct?

22 A. Correct.

23 Q. Wouldn't it be an important part of the
24 inspection to make sure that the stuff that holds the
25 conductor up in the air and off the ground is checked?

26 A. Sorry. I misunderstood. So your question is:

1 Is it important to inspect the hardware holding up
2 a conductor when inspecting the conductor itself?

3 Q. I'm asking don't you think that would be
4 something that you would want to inspect?

5 A. Yes. I believe -- my expectation would be when
6 we inspect our infrastructure, we would inspect our
7 infrastructure, yes.

8 Q. And that infrastructure would include the
9 attachment points for the conductor?

10 A. As well as steel structures and the conductor
11 itself.

12 **EXAMINATION**

13 BY MR. NOEL:

14 Q. Well, and as the person in charge of the asset
15 management and the person who is reviewing all of this
16 field input, why was that not being done prior to
17 November 8, 2018?

18 A. I don't know what you're referencing.

19 Q. There was no inspections of the -- what's
20 referred to as cold-end attachment points prior to
21 November 8, 2018.

22 A. I'm not familiar with that statement.

23 Q. You're familiar with the WSIP; correct?

24 A. At a very high level, yes.

25 Q. Okay. Are you familiar with the Exponent
26 report?

1 A. What Exponent report are you referencing?

2 Q. The Exponent report that was done at the request
3 of PG&E and the CPUC reviewing the WSIP results.

4 A. I have not seen that report.

5 Q. Okay. Well, if I told you that those qualified
6 company representatives, those trained people, the guys
7 that are doing those inspections, the field level input
8 that you're talking about repeatedly state "We do not
9 look prior to --" I'm sorry. "Prior to November 8, 2018,
10 we did not look at cold-end attachments hardware," aka
11 C-hooks.

12 A. Did I miss the question?

13 Q. Okay. Maybe. Maybe I lost my train of thought.

14 You've been telling us all day going on to this
15 "We look at three things. We look at safety. We look at
16 reliability. We look at environment. And safety is
17 number one."

18 So one of the most basic safety equations in an
19 electrical transmission utility or electro transmission
20 system is a wire falling down; correct?

21 A. I don't understand.

22 Q. Well, if a wire falls down, wires -- energized
23 wires hurt people; correct?

24 A. Energized wires can hurt people, yes. That is a
25 safety concern.

26 Q. Exactly. That is supposed to be the number one

1 concern; safety. Those wires that are hanging up there
2 are supposed to stay hanging up there and not come down
3 where they can make contact with people.

4 A. That is correct.

5 Q. Those wires are also a huge fire risk; correct?

6 A. In some instances, yes.

7 Q. If an energized wire makes contact with other
8 things, whether they be trees or they be metal, fire is a
9 result -- direct result of that; correct?

10 A. Can be, yes.

11 Q. So you told us earlier safety is number one.

12 A. Correct.

13 Q. Environment is also big in there. So wires
14 falling down on the ground create two huge issues with
15 safety and environment; correct?

16 A. They can, yes.

17 Q. So prior to November 8th, 2018, why was there no
18 inspection program looking at the attachment points
19 designed to keep those wires attached to the towers and
20 not down on the ground?

21 A. I don't know if I referenced this earlier -- my
22 description of my responsibilities and experience -- but
23 I do not have any responsibility over inspection
24 programs. I'm not familiar with the details of them.

25 I will take your statements as accurate, but I'm
26 not familiar with the details of your references to what

1 was in or not in our inspection program.

2 Q. But when you talk about the data that informs
3 your asset management decisions, number one on that list
4 was the field input from those very inspectors; correct?

5 A. That is correct.

6 Q. And I asked you at that time are you familiar
7 with garbage in, garbage out. Remember that?

8 A. I do.

9 Q. So if the information that you're getting is
10 garbage, then any decision informed by that garbage is
11 garbage. Is that correct?

12 A. I previously answered that question. Our asset
13 management plans are improved with more quantity and
14 quality of notification data from the field.

15 Q. Notification data comes from failure; correct?

16 A. Notification data comes from findings from
17 inspections.

18 Q. But if inspectors aren't looking at things, how
19 can they have findings?

20 A. Our inspectors are looking at things. And we do
21 have notifications when they come back to my team and
22 they are discovered to our asset strategy.

23 Q. If your inspectors are not looking at the
24 cold-end attachment points, then they are not making
25 notification on cold-end attachment points. Therefore,
26 you don't have that information to inform your decision

1 on asset strategies for cold-end attachment points;
2 correct?

3 A. If your statements are correct, your conclusion
4 would be correct.

5 Q. Did you ever try to look up how many
6 notifications pre-November 8th, 2018, were generated
7 within PG&E by the inspectors -- and their name -- their
8 title is troubleshooters -- for cold-end attachment points?

9 A. I am not familiar with a categorization within
10 our notification process that references cold-end
11 attachment points. I believe the category would be
12 considered hardware. And we have numerous notifications
13 that come through that are categorized as hardware.

14 Q. There's lots of different parts of the towers
15 that could be categorized as hardware; correct?

16 A. That is correct.

17 Q. We're talking about cold-end attachment points,
18 the things that hold that conductor up in the air. There
19 is no category for that; correct?

20 A. There's no dedicated category that I'm aware of.

21 Q. And one of the huge results of the WSIP was worn
22 cold-end attachment points all throughout the PG&E
23 system; is that correct?

24 A. I'm not familiar with the details of the WSIP.

25 Q. Okay.

26 MS. DUPRE-TOKOS: May I ask a question?

1 MR. NOEL: Sure.

2 **EXAMINATION**

3 BY MS. DUPRE-TOKOS:

4 Q. So again, here I am confused. You said that the
5 inspections are valid. That was your response when Marc
6 said "Garbage in, garbage out." If you're getting
7 garbage in from the field, then you're using garbage to
8 make -- to inform your decisions. Therefore, your
9 decisions are also garbage. And you said the inspections
10 are valid; correct?

11 A. No, I did not.

12 Q. What did you say about the inspections?

13 A. I said if the inspection information is -- the
14 greater the quantity and quality, the better our plans
15 are based on being informed by that information.

16 I do want to clarify that field input is only
17 one component of the input to our asset management plan.

18 Q. Understood. What you just repeated was your
19 first answer to the first time Marc tried to ask you that
20 question when Marc just stood there about three minutes
21 ago and said "Garbage in/garbage out."

22 If you're getting garbage information from the
23 field because they're not doing inspections that include
24 the cold-end attachment points, then you are using
25 garbage to inform your decisions because you're
26 getting -- that's one of the elements you're using,

1 right, is the field data which we have; right?

2 A. Can you define garbage.

3 Q. Are you serious?

4 A. Yes, I am.

5 Q. Faulty data.

6 A. If we are getting faulty data, that would
7 adversely impact our asset management plans.

8 Q. And if you're getting faulty data, then -- and
9 using that to inform your decisions, then your decisions
10 may well be quite faulty, might they? Yes or no?

11 A. I just answered that question, I believe.

12 Q. And I just asked it again to clarify. Yes or
13 no?

14 A. Can you please restate the question.

15 MR. NOEL: Madam Reporter, could you re-read
16 that question.

17 [Record read.]

18 THE WITNESS: If she said they might be faulty,
19 the answer would be yes.

20 BY MS. DUPRE-TOKOS:

21 Q. Okay. Now, you also said basically that you
22 stand by the field data and the inspections. When Marc
23 called it garbage, you said that you -- essentially that
24 you stand by the inspections.

25 A. I did not say that.

26 Q. No. I'm paraphrasing.

1 Do you agree that the inspections are faulty?

2 A. I do not know if the inspection data is faulty.

3 Q. Okay. Because you sat here within the last
4 15 minutes and said -- when Marc called it garbage, you
5 essentially said it wasn't garbage.

6 A. I did not say that the inspection data was not
7 garbage. I said I'm not responsible for the inspection
8 program and I'm not familiar with the processes and the
9 quality of the inspections that are performed.

10 Q. Right. And after you said that, Marc said
11 "Garbage in/garbage out."

12 If the field data you're getting includes
13 garbage, then you're relying on garbage to inform your
14 decision. And you said that it's not garbage. The field
15 data is not garbage. The inspections are not garbage.

16 A. I don't remember saying that. Maybe we can go
17 back to the record and clarify what I did say.

18 MS. DUPRE-TOKOS: Sure. Why don't we take a
19 break. That will give Madam Court Reporter some time to
20 find it.

21 If we could maybe take a five-minute break.

22 MR. NOEL: Sure.

23 GRAND JURY FOREPERSON: Okay. Five minutes.

24 THE WITNESS: Thank you.

25 MR. NOEL: Oh, yeah. We have to give him the
26 admonition.

1 GRAND JURY FOREPERSON: Again?

2 MS. DUPRE-TOKOS: Yes.

3 MR. NOEL: Yep. Any time we're going to let him
4 out of our sight, and he's free to go out of our sight.

5 GRAND JURY FOREPERSON: I wasn't going to. I
6 was going to go with him.

7 THE WITNESS: I'm going to the restroom.

8 GRAND JURY FOREPERSON: Oh, okay, okay.

9 Okay. Mr. Gabbard, you are admonished not to
10 discuss or disclose at any time outside of this jury room
11 the questions that have been asked of you or your answers
12 until authorized by this grand jury or the Court. A
13 violation of these instructions on your part may be the
14 basis for a charge against you of contempt of court.
15 This does not preclude you from discussing your legal
16 rights with your own attorney.

17 Mr. Gabbard, what I have just said is a warning
18 not to discuss this case with anyone except the Court,
19 your lawyer, or the district attorney.

20 THE WITNESS: Understood.

21 GRAND JURY FOREPERSON: Okay. Thank you.

22 [Recess taken from
23 3:58 until 4:12 p.m.]

24 MS. DUPRE-TOKOS: Okay. Are we back on the
25 record?

26 Okay. So I believe Madam Court Reporter found

1 the section that we wanted read back.

2 So if you could read that back to us, Madam
3 Court Reporter.

4 COURT REPORTER: "QUESTION: And I asked you at
5 that time are you familiar with garbage in, garbage out.
6 Remember that?

7 "ANSWER: I do.

8 "QUESTION: So if the information that you're
9 getting is garbage, then any decision informed by that
10 garbage is garbage. Is that correct?

11 "ANSWER: I previously answered that question.
12 Our asset management plans are improved with more
13 quantity and quality of notification data from the field.

14 "QUESTION: Notification data comes from
15 failure; correct?

16 "ANSWER: Notification data comes from findings
17 from inspections.

18 "QUESTION: But if inspectors aren't looking at
19 things, how can they have findings?

20 "ANSWER: Our inspectors are looking at things.
21 And we do have notifications when they come back to my
22 team and they are discovered to our asset strategy."

23 BY MS. DUPRE-TOKOS:

24 Q. So, Mr. Gabbard, we already talked about if the
25 inspection data is garbage and you're using garbage to
26 inform your decisions, then your decisions might be

1 garbage. And you agreed with me?

2 A. Yes.

3 Q. Now, you say that the inspectors are finding
4 things. We just heard that; right? But they're not
5 looking at cold-end attachment points; correct?

6 A. I don't know.

7 Q. Okay. What do you base your claim that the
8 inspectors are looking at things on?

9 A. My statement is based on the fact that I've been
10 informed that we have inspections that are being
11 completed and my team has seen notifications written that
12 are pulled out of our systems of record that have details
13 associated with the findings from those inspections.

14 Q. Okay. How do you know they're valid?

15 A. I don't.

16 Q. Okay. So you're assuming they're valid?

17 A. Correct.

18 Q. So you're assuming that the data you're getting
19 is good?

20 A. Yes. I put trust in other organizations within
21 PG&E in order to perform my responsibilities, yes.

22 Q. Okay. But you're not responsible for the
23 inspections; correct?

24 A. That is correct.

25 Q. So you really have absolutely no idea, in fact,
26 if the inspections are any good, do you?

A. I cannot guarantee that, no.

Q. You have no personal knowledge as to whether or not these inspections are any good, do you?

A. I do not.

MS. DUPRE-TOKOS: Okay. Do you want to ask your question now.

EXAMINATION

BY MR. NOEL:

Q. And those that you're making decisions on, for instance, the five-year plan, based upon data that you assume is valid?

A. In some instances, yes.

Q. Right. So I want to talk about it in a different way. You were with PG&E in 2010; correct?

A. Yes, I was.

Q. In 2010 a gas pipe blew up in San Bruno;
correct?

A. Yes.

Q. You weren't in the gas department?

A. No, I was not.

Q. Were any of the lessons of San Bruno transmitted to the electrical side?

A. I would say that the lessons in overall operation that pertain to electric -- sorry. Let me restate.

I am familiar with some lessons learned that

1 have been shared with the electric business that have
2 changed the way we perform business.

3 Q. Okay. And there was a big trial in federal
4 court in which PG&E was convicted of multiple felonies
5 for the issues that resulted in the San Bruno explosion;
6 correct?

7 A. Yes.

8 Q. And were -- on the electrical side did you look
9 at the evidence that came out in the federal court and
10 use that to better the way you were doing things?

11 A. I have personally not looked at all of the
12 evidence from the San Bruno proceeding.

13 Q. Okay.

14 A. Are you asking about have individuals within the
15 electric organization learned from the San Bruno?

16 Q. I'm talking specifically about you and your
17 position later in '17 as the director -- senior director
18 of transmission and asset management. Did you look at
19 any of the evidence that came out of San Bruno, use that
20 to inform, to educate changes in the Transmission Asset
21 Division in the way you did business?

22 A. I have not personally looked at the evidence
23 from the proceeding. I have received some of the
24 conclusions from external entities to change the way we
25 manage our business. And some of those show up even on
26 this slide with our move towards -- working toward

1 achieving -- getting PAS 55 and ISO 55001 certification
2 as a foundation for closing some of those gaps that were
3 identified.

4 Q. Okay. Is that going to close gaps in terms of
5 falsified inspection reports?

6 A. Falsified inspection reports are not associated
7 with my asset management organization so I can't speak to
8 how those will change PG&E's inspection processes as
9 they're not within my purview.

10 Q. Okay. But you're making decisions in asset
11 management based upon those inspection reports at least
12 in part; correct?

13 A. That is correct.

14 Q. And one of the big things that came out of San
15 Bruno was evidence that inspection reports were being
16 falsified; correct?

17 A. Correct.

18 Q. And another thing that came out of San Bruno
19 were the fact that the process of inspections were being
20 done for economic efficiency as opposed to safety,
21 reliability, and environment; correct?

22 A. I'm not familiar.

23 Q. Okay. Basically, that -- the gas transmission
24 division of PG&E was making inspection decisions based
25 upon the budget. So they were choosing the cheapest
26 possible inspection method.

1 Are you familiar with that?

2 A. I am not.

3 Q. Well, would that -- is that something that maybe
4 you could have and should have learned from on the
5 transmission side? On the electrical transmission side?

6 A. Are you asking if I should have learned from it
7 or the electric business should have learned from it?

8 Q. Both. Let's start with you.

9 A. So as I previously stated, I'm not responsible
10 for inspections. I would assume that any insight into
11 how to improve inspection programs would have been shared
12 across lines of business.

13 Q. You're not responsible for inspections, but
14 those inspections are a part in forming your decision as
15 to what investments you're going to make in the
16 transmission infrastructure over the next five years;
17 correct?

18 A. That is correct.

19 Q. So if you're not getting notified, if
20 notifications of tags are not being generated, you're not
21 finding out about problems. And that's going to affect
22 your ability to prevent problems in the future; correct?

23 A. It could, yes.

24 Q. And we talked about the Caribou-Palermo in terms
25 of your five-year plan. And as of 2018 the
26 Caribou-Palermo line other than -- we've already

1 discussed it, and we'll come back and discuss it later.
2 But other than regulatory required work, there was no
3 preventative maintenance work, no preventative
4 repair/replacement work scheduled on the Caribou-Palermo
5 despite the fact that it's one of the oldest lines in
6 your inventory; correct?

7 A. I believe what I stated earlier was that we had
8 a project planned for each section of that line and this
9 extended scope was under evaluation as part of the
10 implementation of those projects.

11 Q. Right. And we're going to talk about that
12 later. We're going to go into that in depth later on.
13 Those projects are sitting there in front of you when we
14 get to them.

15 All right. So just try and -- it's getting late
16 in the day. It's 4:25. We're going to have to call it a
17 day which means you're going to have to come back next
18 week. I'm sorry.

19 But just to try and end this, are you familiar
20 with the term siloing in business terms?

21 A. Like in terms of organizational siloing?

22 Q. Yes.

23 A. Yes.

24 Q. What does that term mean to you?

25 A. It means portions of an organization are
26 operating independent of each other.

1 Q. And is that true of gas and electric?

2 A. In some aspects, yes.

3 Q. For instance, San Bruno?

4 A. I cannot -- I do not know.

5 Q. Well, that was a big event. That was a big
6 explosion. It destroyed a lot of property. It killed
7 some people. But yet the lessons of San Bruno are not
8 being translated into the electric side; correct?

9 A. I cannot agree with that statement since I have
10 changed the operation within my work groups based on the
11 high level learnings of the San Bruno incident.

12 Q. What have you changed?

13 A. We have increased a greater focus on records
14 management as an asset itself. We've also moved
15 towards -- and I'm going to say this in a general term
16 because it is inclusive of many areas of focus which is a
17 move towards PAS 55, ISO 55001 framework which is a huge
18 learning and improvement that we saw coming out of the
19 horrible tragedy that is San Bruno on the gas side. And
20 we elected to proactively embark on that same journey to
21 learn from that event in the same way that gas had.

22 Q. But in the end the fatal flaw that caused the
23 San Bruno incident was an inspection method, an
24 inspection policy that valued economic efficiency over
25 safety and environment. And it doesn't sound like the
26 transmission side -- the electrical transmission side has

1 done anything to foreclose that possibility or to change
2 that on the electrical transmission side.

3 Is that correct?

4 A. I'm sorry. I can't say that I agree with that
5 statement. I heard something -- I'm going to
6 paraphrase -- that safety is not the number one priority.
7 And I can assure you that it is. It has been -- it was
8 preceding the San Bruno incident but even more so
9 following San Bruno has been the number one priority in
10 the way that we operate our business.

11 **EXAMINATION**

12 By MS. DUPRE-TOKOS:

13 Q. Okay. If that's the case in San Bruno, one of
14 the causes of that was falsified inspections. And yet
15 you're making decisions based on inspections on the
16 electrical side that you have no idea if they're true or
17 false. Isn't that right?

18 A. So I can't speak to the first half of your
19 statement. But, yes, I am making -- I am leveraging
20 inspection information to inform our decisions.

21 **EXAMINATION**

22 BY MR. NOEL:

23 Q. By "leveraging" you mean using?

24 A. Yes, Sir. I'm using the results of our
25 inspections in order to inform the decisions we are
26 making.

1 **EXAMINATION**

2 BY MS. DUPRE-TOKOS:

3 Q. And yet you've already admitted to us here in
4 court that you have no idea if those inspections are true
5 or false; correct?

6 A. I rely on others within PG&E in order to perform
7 my job, yes.

8 Q. You have no personal knowledge as to whether or
9 not those inspections are true or false, do you?

10 A. That is correct.

11 Q. And what have you done to find out if they're
12 true or false? Anything?

13 A. I have not -- I have not done anything to
14 understand our inspection processes within PG&E that's
15 outside of my responsibilities.

16 Q. You use inspections to inform your decisions;
17 correct?

18 A. That is correct.

19 Q. What have you done to insure that the
20 information that you're using to inform your decisions is
21 true and accurate?

22 A. I have not done anything to prove the accuracy
23 of our inspections.

24 MS. DUPRE-TOKOS: Okay. Thank you.

25 **EXAMINATION**

26 BY MR. NOEL:

1 Q. So we go back to your example when we were
2 talking about risk management and I asked you how -- if
3 inspections were in risk management and you brought up
4 the example of the conductors. Remember that?

5 A. Yes.

6 Q. So if you have no idea how the attachment points
7 are being inspected or if they're being inspected, how
8 can you rely upon that to make a decision as to a
9 five-year plan?

10 A. Can you ask that question one more time.

11 Q. Let me put it this way: Do you know how your
12 transmission towers, your structures and conductors are
13 inspected?

14 A. Generally, I have some familiarity with how they
15 are inspected.

16 Q. Okay. Please tell us.

17 A. We inspect our transmission structures by
18 multiple ways. We have leveraged LiDAR data to
19 understand field conditions around our assets. We have
20 also done aerial patrols to look for anomalies on our
21 system. We also have ground patrols where qualified
22 electric workers walk along our facilities or drive along
23 our facilities to look for any out-of-normal conditions.
24 We also have climbing inspections where linemen climb our
25 towers in order to look for any signs of degradation or
26 out-of-normal conditions.

1 Q. Okay. Well, let's start at the very beginning.
2 You left one out, by the way. Infrared.

3 A. Thank you. We also use -- we're piloting other
4 technologies as well.

5 Q. Okay. LiDar inspections are essentially, for
6 the most part, used for vegetation management; correct?

7 A. And for ground and conductor clearances.

8 Q. Okay. LiDAR inspections aren't going to look at
9 things like cold-end attachments points and corrosion.

10 [Deputy McDougal enters the
11 back of the courtroom.]

12 GRAND JURY FOREPERSON: Marc.

13 MR. NOEL: Are you teeing me up or something?
14 You want us to call it a day?

15 DEPUTY MCDUGAL: Yes.

16 MR. NOEL: Okay. Let me finish this question
17 and then we'll call it a day.

18 For the record, it is now after 4:30 on Friday,
19 and we've been informed by the Court that we're not going
20 to be able to go any longer today. And the bailiffs are
21 ready to escort us out.

22 [Deputy McDougal exits the
23 back of the courtroom.]

24 BY MR. NOEL:

25 Q. All right. So we were talking about LiDAR
26 inspections. And you said they're also used for

1 conductor-to-ground clearance. Then infrared are used to
2 look at hotspots on the conductor itself; correct?

3 A. That is correct.

4 Q. And then you said aerial patrols.

5 A. Correct.

6 Q. What is your understanding of the aerial
7 patrols?

8 A. My limited understanding as it stands today is
9 aerial patrols include a qualified lineman in a
10 helicopter flying along a line to look for anomalies. We
11 are --

12 Q. What are -- sorry.

13 A. We are piloting additional forms of aerial
14 inspections.

15 Q. Right. That's post-Camp Fire. I'm talking
16 about pre-Camp Fire.

17 A. Thank you for the clarification.

18 Q. Right.

19 So what type of anomalies do you think that your
20 inspectors are looking for out of a helicopter?

21 A. I'm not familiar with the inspection process or
22 what the linemen are looking for.

23 Q. You're talking about inspectors who are in a
24 helicopter flying 30 to 40 knots several hundred feet
25 above the line and essentially looking for gross and
26 obvious anomalies?

1 A. I don't know. I've never participated in an
2 aerial inspection.

3 Q. Okay. You talked about ground patrols. And
4 what is your definition of a ground -- ground patrol.
5 Ground inspection. What is your understanding of a
6 ground inspection?

7 A. My understanding of a ground inspection would
8 be, as I stated, a qualified electric worker walking
9 along our transmission infrastructure looking at our
10 infrastructure for any anomalies.

11 Q. All right. By "qualified electric worker" are
12 you talking about a qualified company representative or
13 QCR as defined in the ETPM?

14 A. I'm assuming it's a lineman. Actually, a
15 qualified electric worker is a defined term.

16 Q. True. But there's linemen and there's
17 troublemen. Do you understand the difference?

18 A. I do.

19 Q. Troublemen are the ones who are supposed to be
20 doing the inspections and patrols. Is that your
21 understanding?

22 A. I don't know the classifications for different
23 patrols.

24 Q. We talked about the ETPM, and the ETPM
25 specifically states that inspections and patrols are done
26 by qualified company representatives.

1 Is that your understanding?

2 A. I don't know.

3 Q. Okay. And then the last one you said are
4 climbing inspections. Other than the 500 lines, where
5 were climbing inspections being done?

6 A. I don't know.

7 Q. Were you aware that climbing inspections were
8 essentially eliminated for the non-500 lines in 1995?

9 A. I was not.

10 Q. So we're talking about those attachment points
11 and the things that are holding the conductor in the
12 structure, that are holding it up off of the ground. In
13 all of those patrol and inspection types that you just
14 talked about, how are those attachment points, in your
15 understanding, being inspected?

16 A. In infrared they would not be inspected.
17 Otherwise, there would have been a visual inspection.

18 Q. Right. LiDAR is not going to look at the
19 attachment points. Infrared is not going to look at
20 that.

21 If your troublemen, your people who are doing
22 the inspections are saying "We can't see those attachment
23 points from the helicopter and we can't see those
24 attachment points from the ground" so they're not being
25 inspected, so how are you making informed decisions as to
26 whether or not to repair or replace those items?

1 A. Can you clarify which decision you're
2 referencing.

3 Q. If there's no inspection taking place of the
4 attachment points, the cold-end attachment points, how
5 can you make an informed decision to repair or replace
6 the cold-end attachment points?

7 A. Based on what you're saying, if there was no
8 inspection of a component, then there would not be a
9 maintenance tag written for a component. Therefore, no
10 work would be performed on that component.

11 Q. So in essence, it's run to failure? It's "We
12 just leave it up there until it fails and then we repair
13 or replace."

14 A. Are you referencing hardware?

15 Q. I'm referencing the same thing we've been
16 referencing for the last hour; the cold-end attachment
17 points, the things that are holding the conductor to the
18 tower holding it up in the air.

19 A. Basically, you're saying there would be no
20 replacement solely for that cold-end attachment point
21 other than replacements that occurred with replacements
22 of insulators, replacements of structures, or
23 replacements of a conductor?

24 Q. So if at some point somebody took those --
25 the -- specifically the cold-end attachment points out of
26 the inspection and patrol checklist, somebody at some

1 point made a run-to-failure decision on those components;
2 correct?

3 A. If there was no inspection process for the
4 assets in the field?

5 Q. Right.

6 A. Then there wouldn't be a way to proactively
7 replace.

8 Q. Okay. And that -- if that was a decision that
9 was made by somebody within PG&E, then at that point PG&E
10 made a decision -- a conscious decision of run to failure
11 on those components; correct?

12 A. I don't know what the characterization of that
13 decision would be. That would be speculating at this
14 point.

15 Q. Well, if I told you that at one point there was
16 specific requirements to inspect the cold-end attachment
17 points, there was a checklist that listed those cold-end
18 attachment points for every inspection and patrol, and
19 that at some point somebody at PG&E took the cold-end
20 attachment points out of that checklist and if I were to
21 tell you that at some point in the past that the people
22 doing the inspections and patrols were specifically being
23 told to look at the cold-end attachment points and then
24 that was removed from the training and they were no
25 longer being trained to specifically look at those
26 points, that would indicate a conscious decision on PG&E

1 to ignore those components and run them to failure.

2 A. I apologize. I'm not familiar with any of this
3 background information you're providing.

4 Q. I'm asking your opinion. You do risk, all of
5 this. That decision -- let's just assume that decision
6 was made sometime prior to 1995. That doomed those parts
7 to run to failure; correct?

8 **EXAMINATION**

9 BY MS. DUPRE-TOKOS:

10 Q. Let me ask you. Assuming that what Marc has
11 said is true, would you agree that the only option left
12 is run to failure? If they're not being inspected so
13 there's never going to be any preemptive maintenance
14 done, that only leaves run to failure; correct?

15 A. I think I might have answered this already. So
16 let me try --

17 Q. Regardless of whether you did or not.

18 A. I know. Let me try again. If there was no
19 targeted maintenance for cold-end hardware other than
20 replacing with other components, there would be no other
21 mechanism for replacing that equipment.

22 Q. Other than run to failure?

23 A. I apologize for being hesitant to use the term
24 "run to failure" because it's used in many different
25 instances.

26 Q. But we talked about it earlier.

1 A. Run to failure is identifying degradation and
2 then writing a notification and creating some
3 replacement. So if you're saying there was just no
4 opportunity to replace other than with other components,
5 the answer would be yes.

6 Q. Okay. Then let me not use the phrase "run to
7 failure."

8 If it's not being inspected so there's not going
9 to be a tag so the only way it's ever going to get any
10 preventative maintenance is if some other component
11 nearby is being replaced and it gets noticed, that is the
12 only way anything is going to happen with this is if it
13 fails; correct?

14 A. Or it's replaced with the other component.

15 Q. I said that already.

16 A. Yes, that's correct.

17 MS. DUPRE-TOKOS: Thank you.

18 MR. NOEL: All right. It's now 4:45. I'm sure
19 that they're about to beat down the doors.

20 I'm sorry, Mr. Gabbard. We're going to have to
21 ask you to come back.

22 Madam Foreperson.

23 GRAND JURY FOREPERSON: Mr. Gabbard, you are
24 admonished not to discuss or disclose at any time outside
25 of this jury room the questions that have been asked of
26 you or your answers until authorized by this grand jury

1 or the Court. A violation of these instructions on your
2 part may be the basis for a charge against you of
3 contempt of court. This does not preclude you from
4 discussing your legal rights with your own attorney.

5 Mr. Gabbard, what I have just said is a warning
6 not to discuss this case with anyone except the Court,
7 your lawyer, or the district attorney.

8 THE WITNESS: Understood. Thank you.

9 GRAND JURY FOREPERSON: Thank you. Thank you
10 for your time today.

11 MR. NOEL: Hold on. We need -- you need to
12 order him back Tuesday, the 3rd.

13 GRAND JURY FOREPERSON: On Tuesday?

14 MR. NOEL: Yes, Ma'am.

15 GRAND JURY FOREPERSON: What time?

16 MR. NOEL: 8:30.

17 GRAND JURY FOREPERSON: Mr. Gabbard, can you
18 come back here on Tuesday at 8:30, please.

19 THE WITNESS: Do I have any discretion?

20 MS. DUPRE-TOKOS: No.

21 MR. NOEL: No.

22 THE WITNESS: I'm assuming no.

23 MS. DUPRE-TOKOS: That's why the "please" at the
24 end was a polite way of ordering.

25 THE WITNESS: I understand the order.

26 GRAND JURY FOREPERSON: Okay. Thank you.

1 MR. NOEL: And before we go off the record, I
2 forgot to do it earlier and that was moving the exhibits
3 from Luther Dow this morning into evidence.

4 GRAND JURY FOREPERSON: Okay. Thank you.

5 [Exhibits 1333 through 1341
6 received into evidence.]

7 [Matter adjourned at 4:45 p.m.]

OROVILLE, BUTTE COUNTY, CALIFORNIA

FEBRUARY 25, 2020; 8:30 a.m.

(Confidential Special Grand Jury Hearing Proceedings)

[Confidential grand jury called into session at 8:42 a.m.
in Courtroom 9.]

[Grand jury role call omitted.]

[Discussions omitted.]

[Witness enters the courtroom.]

GRAND JURY FOREPERSON: Good morning, Mr. Gabbard.

THE WITNESS: Good morning.

GRAND JURY FOREPERSON: I'd just like to remind you
that you are still under oath. If you can have a seat,
please.

THE WITNESS: Okay, thank you.

GRAND JURY FOREPERSON: Thank you.

EXAMINATION

BY MR. NOEL:

Q. Good morning, Mr. Gabbard.

A. Good morning.

Q. So before we dig into the next thing, see if we
can kind of summarize where we were at on Friday.

1 Am I correct that your asset strategy is in part
2 or in some part informed by the patrol and inspection
3 data?

4 A. Yes.

5 Q. And that would be the LC notifications or tags,
6 the problems that are found with the -- with the assets?

7 A. Correct.

8 Q. All right. Would you agree that the method of
9 inspection or patrol could potentially affect the
10 generation of LC notifications or tags?

11 A. Yes.

12 Q. The more thorough an inspection or patrol is, the
13 more problems you would expect that it finds; is that
14 correct?

15 A. Yes.

16 Q. By the same token, the less thorough, the less
17 you would find?

18 A. Yes.

19 Q. All right. Specifically -- well, so the -- now,
20 how much of -- of the inspection and patrol program are
21 you familiar with?

22 A. I'm only familiar with the program at a very high
23 level.

24 Q. Are you aware that the main form of inspection or
25 patrol for 115 line is helicopter patrol?

26 A. I am not.

1 Q. Okay. Would you agree that if the patrols are
2 cursory that would potentially affect the information that
3 is getting to your level for determining asset
4 managements?

5 A. Yes.

6 Q. Okay. And so if, for instance, helicopter
7 patrols are the main source and helicopters are flying
8 over the lines a couple hundred feet above the line, 30 to
9 40 knots where, basically, all a troublemen or qualified
10 company representative is looking for is major issues,
11 things that -- obvious issues. Things not hanging.
12 Things hanging -- you know, they're broken off.

13 MS. DUPRE-TOKOS: A tree in the line.

14 BY MR. NOEL:

15 Q. -- a tree in the line. Those things are going to
16 affect your management decisions down the line?

17 A. Potentially, yes.

18 Q. Okay. All right. So -- and that would fit into
19 this category we're talking about. This little chart
20 right here of risk identification, correct?

21 A. Yes, that is correct.

22 Q. Okay. And if I am reading this chart right, risk
23 identification, then it goes to risk management, then
24 basically, it goes to planning, to monitoring and it's an
25 ongoing cycle?

26 A. That is correct.

1 Q. Okay. So if the information at the risk
2 management or risk identification level is questionable
3 that is going to affect the rest of the process?

4 A. Yes.

5 Q. And if the inspection procedure is designed not
6 to find issues, that's going to affect the quality of the
7 information that is coming to your level upon which you're
8 making decisions, correct?

9 A. Correct.

10 Q. All right. So let's get to the -- the last chart
11 here. And we have three columns: Low risk, medium risk,
12 high risk, and then we have six rows, life cycle,
13 strategies, create, utilize, maintain, renew and dispose.
14 Are you familiar with this chart?

15 A. I have seen the chart, I wasn't involved with
16 creating the chart.

17 Q. Okay. What is considered low risk?

18 A. I do not see a definition on this. Actually, I'm
19 not aware of the definition for low risk.

20 Q. Okay. Same with medium risk?

21 A. Correct.

22 Q. Same with high risk?

23 A. Correct.

24 Q. So on strategy here for low-risk items, the
25 strategy is run to failure. For medium risk is run to
26 failure and cause evaluation, and for high risk it's

1 condition based and cause evaluation.

2 Am I reading that correctly?

3 A. Yes.

4 Q. Now, we've heard in the past that insulators
5 would generally be considered a low-risk asset on a tower.
6 Are you familiar with that thought?

7 A. No, I am not.

8 Q. Okay. Well, I guess -- get to the -- so let's
9 look at what we are if we're low risk. So if it's low
10 risk, run to failure, low -- and I'm not sure what ENG
11 stands for, do you know?

12 A. Engineering controls.

13 Q. Ah, what does that mean?

14 A. An engineering control would be a control
15 designed into the process. So less reliant on human
16 intervention.

17 Q. Okay. And then utilize minimum patrol to
18 continuously assess risk. Maintaining. You're not doing
19 any maintenance. Renew. Only replacement, no repairs.
20 And dispose, leave and do not maintain. That's for the
21 low risk.

22 On the other end, high risk, condition based
23 evaluation. High engineering controls, extensive patrol
24 with more frequency, minimum required maintenance,
25 replace, repair, cost benefit and remove.

26 Did I read that correctly?

1 A. Yes, you did.

2 Q. All right. So did the categories of low risk,
3 medium risk and high risk apply to certain assets within
4 the transmission system?

5 A. I believe this was put in as a framework. In
6 terms of how I have seen low risk, medium risk and high
7 risk, just relative quantifications of risk applied to
8 assets, it would not be categorical. What I mean by that
9 is we would define risk per specific asset at a specific
10 location, based on the characteristic of that asset. It
11 wouldn't be all towers are a -- one risk and all
12 transformers are another. It would be a differentiation
13 within that asset base.

14 Q. Okay. So when you're talking about assets,
15 you're talking ant individual components, correct?
16 Individual structures, conductor?

17 A. That is correct.

18 Q. All right. But doesn't the same apply, at least
19 in practice, to transmission lines themselves?

20 A. I would also say within transmission lines
21 themselves, we -- in some instances, we will categorize
22 the risk across an entire line, or we will also
23 differentiate risk across sections of line even down to a
24 given span.

25 Q. Okay.

26 A. It should be one structure to the next.

1 Q. Right. But just in general, for instance, under
2 the high risk category, this would be all of the 500
3 lines, wouldn't it?

4 A. Not necessarily.

5 Q. So you don't have elevated inspection and patrol,
6 you don't have elevated preventative maintenance, elevated
7 high engineering controls, more maintenance for the 500
8 lines than anything else?

9 A. I'd say in general that we do.

10 Q. Right. And this would also apply to some of the
11 230 lines and some of the important 115 lines, correct?

12 A. Yes.

13 Q. So, for instance, you know, we talked a lot about
14 the transmission lines in the Bay area, those lines that
15 power millions of people that, you know, if they go out,
16 lots of people go without power. Those would all be high
17 risk transmission lines, correct?

18 A. I would say not say -- I would say incorrect.

19 Q. Okay.

20 A. You said "all" of those lines?

21 Q. Not all of those lines, but the most important of
22 them.

23 A. The highest risk would be high risk, yes.

24 Q. Right. And you put a lot more patrols and
25 extensive patrols into those lines. You're putting a lot
26 more into your condition base. You're putting a lot more

1 into repair and replace because of their importance,
2 correct?

3 A. I can't say yes to that.

4 Q. Okay.

5 A. We -- we put -- we invest across our system, and
6 I don't have the information to support or counter your
7 statement there.

8 Q. Okay. On the other end of the spectrum, wouldn't
9 this be the Caribou-Palermo line: Low risk. Minimal
10 patrols. Very little maintenance, only replacing things
11 that break and essentially run to failure?

12 A. I have not seen Caribou-Palermo characterized as
13 low risk.

14 Q. Okay. But don't all of these different rows fit
15 what we know about how the Caribou-Palermo has been
16 treated for the last 20 or 30 years?

17 A. All of those characteristics do not apply to
18 Caribou-Palermo.

19 Q. Okay. Which ones don't apply?

20 A. For example, the statement no repairs. We have
21 done numerous --

22 Q. Okay.

23 A. -- repairs on Caribou-Palermo over time.

24 Q. Okay. But only in response to failures, correct?

25 A. I -- I cannot speak to that.

26 MS. DUPRE-TOKOS: Marc?

1 [Whereupon, counsel conferred off the record.]

2 BY MR. NOEL:

3 Q. But most importantly, minimal patrols to
4 continuously assess risk. That's definitely the case with
5 the Caribou-Palermo, is it not?

6 A. I'm not familiar with the patrol and inspection
7 history for Caribou-Palermo.

8 Q. Well, if I told you that the main way of
9 patrolling the Caribou-Palermo is to fly over it in a
10 helicopter, a couple of hundred feet in the air, going 30
11 to 40 miles an hour, would that be consistent in your mind
12 with the minimal patrol?

13 A. Yes, that could be.

14 Q. Thank you. All right. So switch screens here.

15 All right. Next, you should have in front of
16 you, Exhibit 1254. And -- not really, because we are
17 going to get right on it. I am going to -- it should be
18 in order. Actually, it looks like they're not in order.
19 There it is.

20 MS. DUPRE-TOKOS: Was that 1254?

21 MR. NOEL: 1254.

22 BY MR. NOEL:

23 Q. Do you recognize Exhibit 1254?

24 A. Yes, I do.

25 Q. What is 1254?

26 A. 1254 is TD 8101, Transmission Line Overhead Asset

1 Management Plan.

2 [Exhibit No. 1254 was identified.]

3 BY MR. NOEL:

4 Q. Can you explain to us what this document is?

5 A. This document is -- is a summary of our
6 transmission line overhead asset management plan that was
7 developed in 2017, 2018. Formally approved and published
8 in December of 2018. It's the first iteration of a formal
9 document representative of similar information to the
10 previous PowerPoint presentation that we just reviewed.

11 This is a formal document that is published in
12 our technical information library, and it is based on
13 learnings that we have had from our gas business and
14 implemented in alignment with best practice as defined by
15 PAS 55 ISO 55001 certification.

16 Q. Okay. You said "lessons learned from the gas
17 side," what do you mean by that?

18 A. When our gas business first went through PAS 55
19 ISO 5501 certification and implemented a similar framework
20 in order to document the asset management plans across
21 their different asset families, so we leveraged that
22 framework in order to stand up a similar structure within
23 electric operations.

24 Q. Okay. And you're marked here as the document
25 owner. If you can explain to us with what that means?

26 A. In our asset management construct, we've defined

1 single owners for asset families. We have numerous asset
2 families for transmission line overhead. I have been
3 identified as the asset family owner for the asset classes
4 that fall within -- within that family, which includes
5 overhead conductor, transmission steel structures,
6 insulators, and other components on our overhead
7 transmission facilities.

8 Q. And you were involved in the creation of this
9 document?

10 A. Yes, I was.

11 Q. So, ultimately, you are the person responsible
12 for setting the policy and correctly managing those assets
13 or you were at this time?

14 A. I -- I was responsible for creating the document
15 and owning the maintenance and implementation of the
16 document with approval from my vice president at the time,
17 which was Kevin Dasso as you can see here.

18 Q. Yep. And that's what I was going to ask you, the
19 next person on your document approver is Kevin Dasso and
20 his position at the time was vice president?

21 A. Correct. Vice president of electric asset
22 management.

23 Q. And if you can kind of explain to us Mr. Dasso's
24 position to your knowledge?

25 A. At the time?

26 Q. Yes.

1 A. Mr. Dasso was vice president of electric asset
2 management. He was responsible for overseeing several
3 organizations within electric operations. Reported to
4 senior vice president of electric operations, who, at the
5 time, was Pat Hogan. He was responsible for overseeing my
6 area of the business, which is transmission asset
7 management. He's also responsible for overseeing one of
8 my peers over distribution asset management, and then had
9 a number of different support organizations including our
10 GIS team, geographic -- Geospatial Information System.
11 Our ATS team, Applied Technology Services organization
12 and, at varying points in time, other support
13 organizations.

14 Q. Now, one of the things, I think, came up several
15 times on Friday -- various questions. Did you have a peer
16 that oversaw the inspection and patrol of transmission
17 lines?

18 A. Yes.

19 Q. Who was that?

20 A. My peer that oversaw inspection and patrol of
21 transmission lines, at this point in time, would have been
22 Eric Back, and he was similar level and I consider to be a
23 peer within the organization, but he reported to a
24 separate vice president.

25 Q. Which vice president did he report to?

26 A. At this time that would have been Greg Lemler, if

1 I'm not mistaken.

2 Q. All right. Let's kind of go through this
3 document a little bit.

4 All right. First we skip ahead to what's page
5 six. I don't know what the page number is on the bottom.
6 Yeah, page 6 of 77, the introduction.

7 "This Transmission Line Overhead Asset Management
8 Plan (AMP), provides an overview of the transmission line
9 overhead asset risk, performance, costs and efforts to
10 mitigate those risks. This plan presents the asset
11 inventory, an assessment of condition, performance
12 measures and overview of key risks with associated
13 programs and initiatives to effectively mitigate them and
14 optimize infrastructure including replacements and
15 upgrades among others. This is a roadmap for achieving
16 the asset management strategy and delivering the long-term
17 objectives for this asset family. The plan is developed
18 with a five-year plus planning horizon to align with the
19 electric operations (EO) five-year financial outlook and
20 is annually updated."

21 Am I reading that correctly?

22 A. Yes, that is correct.

23 Q. So that's the goal of this document; is that
24 correct?

25 A. Yes.

26 Q. And then "This AMP is consistent with the

1 electric strategy asset" -- "Electric Strategic Asset
2 Management Plan, which is the guidance document for
3 developing electric operations AMPs. It supports the
4 eight other AMPs in this series."

5 What are the other AMPs?

6 A. I'm sorry. I can't cite those off the top of my
7 head.

8 Q. Okay.

9 A. They're the various asset families. They include
10 transmission underground, distribution overhead,
11 substation asset management plan. Operational assets.
12 Distribution network. And distribution underground. I
13 may have missed one or two.

14 Q. Okay. Basically, each kind of division of the
15 company -- of the electrical side of the company is
16 supposed to be given an asset management plan; is that
17 correct?

18 A. There's an asset management plan for each similar
19 grouping of assets within electric operations.

20 Q. Right.

21 A. Yes.

22 Q. All right. So then talks about risks. 33 risks.
23 Each risk contains the risk name, description, status.
24 Again, the P95 scenario (worst-case), drivers, control and
25 consequences. And I don't think we ever quite got clear
26 on what exactly is a P95 scenario?

1 A. So a P95 worst-case scenario would be -- what
2 we've called a reasonably probable worse-case scenario.
3 If you look at the probability of potential outcomes, it
4 normally follows some sort of distribution, most common
5 would be a normal distribution.

6 With norm distribution, you can have a very long
7 tail. So there could be an extremely low likelihood of a
8 very, very, very, very high consequence event. We didn't
9 want to define our risk associated with events based on
10 very, very long tailed distributions and, instead, used
11 benchmarked against industry practice to anchor what the
12 high end and high exposure is at the 95 percentile.
13 Meaning, this event -- anything below this scale of event,
14 would represent 95 percent of potential occurrences.

15 Q. Okay. As part of -- as part of the -- the P95
16 scenarios being run, would you use or could you use other
17 tools to simulate risk scenarios?

18 A. Yes.

19 Q. Okay. Are you familiar with Reax Engineering?

20 A. Yes, I am.

21 Q. Okay. What is Reax Engineering?

22 A. Reax Engineering is a company that we work with
23 in partnership with the CPUC and Cal Fire to develop
24 modeling around potential fire spread given ignition.

25 Q. Reax is a fire modeling engineering firm; is that
26 correct?

1 A. Correct.

2 Q. And their specialty is running fire models to
3 anticipate fire threats, correct?

4 A. That is correct.

5 Q. So when you're running these P95 scenarios, are
6 you using the Reax -- as part of the wildfire threat, are
7 you using the Reax fire modeling capabilities to -- to
8 establish and evaluate worst-case scenarios for different
9 fire scenarios?

10 A. I don't believe Reax was used in the
11 quantification associated with threat.

12 Q. All right. So moving down to 1.2 Performance.
13 "Transmission line overhead asset performance is primarily
14 tracked through safety and reliability metrics discussed
15 in Chapter 2;" is that correct?

16 A. Yes.

17 Q. And it goes on, "PG&E's key metrics to measure
18 transition line overhead reliability performances are
19 System Average Interruption Duration Index, SAIDI. System
20 Average Interruption Frequency Index, SIAFI; and Customer
21 Average Interruption Duration Index, CAIDI."

22 Is that -- am I reading that correctly?

23 A. Yes, you are.

24 Q. "These metrics are helpful in identifying areas
25 where system reliability performance can be improved.

26 Outage data is evaluated for root causes and contributing

1 factors that can provide insightful information regarding
2 asset condition."

3 Did I read that correctly?

4 A. Yes.

5 Q. So if I am reading that last sentence, outage
6 data is one of the factors that is used to evaluate asset
7 condition?

8 A. That is correct.

9 Q. Okay. And then it goes on, the next paragraph,
10 "Two other metrics used to measure transmission system
11 line reliability in the utility industry are the Average
12 Circuit Outage Frequency (ACOF), and the Average Circuit
13 Outage Duration (ACOD)."

14 Did I read that correct?

15 A. Yes, you did.

16 Q. Says, "These metrics are particularly helpful in
17 assessing transmission system reliability performance
18 since because the transmission system design, many outages
19 do not result in outages to end-use customers; however,
20 they impact flows on the system and they can affect energy
21 markets or energy delivery transactions."

22 Correct?

23 A. That is correct.

24 Q. Oops, forgot to advance the page. So am I
25 understanding this correct that ACOF and ACOD are used
26 because some lines don't have direct customer loads on

1 them?

2 A. That is correct, or alternate sources.

3 Q. Okay. And if a -- if a line does not have a
4 customer load or if -- if because of redundancies, an
5 outage on that line does not affect any customers that
6 would not show up on your SAIDI, SAIFI or CAIDI metrics?

7 A. That is correct.

8 Q. Then we skip ahead to 1.5. This is page nine.
9 Identification and Prioritization Across the Company.

10 And you see the Figure 2 there?

11 A. Yes, I do.

12 Q. This seems to be a -- kind of, a different
13 appearing, but similar same chart that we just looked at,
14 I think, in 1253; is that correct?

15 A. That is correct.

16 Q. Where risk identification, leads to risk
17 management, leads to investment optimization and
18 sustainability planning, which leads to risk monitoring,
19 correct?

20 A. That is correct.

21 Q. Okay. And your part of this would be the
22 investment optimization and sustainability planning; is
23 that correct?

24 A. My responsibilities, at the time, would likely
25 span all of these four phases in some way or another.

26 Q. Okay. Well, as we talked about, risk

1 identification, you need somebody to identify that there's
2 a risk out there, then it goes to risk management, but
3 when you were -- at the time in 2017 and '18, was risk
4 management part of your organization?

5 A. Yes, it was.

6 Q. Okay. And then investment optimization and
7 sustainability planning that's putting together, for
8 instance, a five-year plan, correct?

9 A. That is correct.

10 Q. And then ultimately monitoring the risk after
11 it's been identified and planned for?

12 A. Correct.

13 Q. And then we move on to the next page in Table 2.
14 And this is a familiar looking table also.

15 Do you recognize Table 2?

16 A. Yes, I do.

17 Q. This is very similar to the final chart that we
18 looked at on Exhibit 1253, correct?

19 A. That is correct.

20 Q. But there have been a few changes. In the column
21 of low risk, the strategy is now changed to "run to
22 maintenance;" is that correct?

23 A. That is correct.

24 Q. Can you explain to us how run to maintenance is
25 different than from -- from run to failure?

26 A. Run to maintenance is a clarification that we

1 made because run to failure was misinterpreted by -- or
2 used in different context by different stakeholders. So
3 run to maintenance means when we identify potential
4 degradation, taking action and as you can see by this
5 table, the bias is towards repairing any maintenance
6 condition.

7 Q. Right. Okay. Then the next one is -- next row
8 down is create, which is different from what it was in the
9 previous chart. But still low engineering controls for
10 the low risk assets, correct?

11 A. That is correct.

12 Q. Utilize for the low risk assets, low degree of
13 patrol with minimal frequency to continuously assess risk;
14 is that correct?

15 A. Correct.

16 Q. And then under maintain, corrective maintenance.

17 A. Correct.

18 Q. And you go over to -- I'm sorry?

19 A. That is correct.

20 Q. Okay. So then you go over the high risk side.
21 Strategy, preventative maintenance and cause evaluation,
22 correct?

23 A. Correct.

24 Q. High engineering controls, correct?

25 A. Correct.

26 Q. High degree of patrol more frequently, correct?

1 A. Yes.

2 Q. And finally, preventative maintenance, correct?

3 A. Correct.

4 Q. And then there's a new column faded down at the
5 bottom -- or rows added: Reactive replacement versus
6 proactive replacement.

7 Do you see that?

8 A. Sorry, I'm not following you. Where are we at?

9 Q. Right here.

10 A. Oh, yeah. Yes, I see that.

11 Q. Can you explain to us the difference between
12 reactive replacement and proactive replacement?

13 A. An example of reactive replacement would be
14 seeing signs of deterioration or some other input that
15 would warrant replacement. Proactive replacement would be
16 replacement while asset is performing well, and there are
17 no signs of deterioration.

18 Q. So to put into a lifecycle context, proactive
19 replacement would be replacing items before they reach
20 their life -- the end of their lifecycle -- their asset
21 lifecycle, correct?

22 A. Well before.

23 Q. And reactive replacement would be waiting until
24 they're at the end of their lifecycle, correct?

25 A. That would be waiting until they were further
26 along in their lifecycle.

1 Q. Okay. And then under low risk, most repairs.

2 Under medium: Some replacements, partial line
3 replacements, proactive replacements for high correlation
4 failure indicators related to condition, material and
5 location; is that correct?

6 A. Yes.

7 Q. And then high risk: Proactive replacement, most
8 replacements, full line replacements, develop contingency
9 plans.

10 So what's that you do under replacement for -- or
11 renew for -- for high risk?

12 A. Yes.

13 Q. Correct?

14 A. Yes.

15 Q. And then ultimately the last new row that's added
16 is dispose: Leave and patrol.

17 Is what it has for low risk, correct?

18 A. Correct.

19 Q. What does it mean to "leave and patrol"?

20 A. In some instances, we have idle facilities that
21 are not used, so we will leave them in place and patrol
22 them on a regular basis until we have a chance to remove
23 them from service.

24 Q. All right. Now, there's also a Table 3 below
25 that. Risk and replacement strategy per asset, correct?

26 A. That is correct.

1 Q. It says overhead conductor, the asset risk is
2 high to medium, and the replacement strategy is
3 preventative -- preventative maintenance for high risk,
4 run to maintenance for medium risk.

5 Am I reading that correctly?

6 A. Yes, you are.

7 Q. Steel structures are listed as high risk with a
8 replacement strategy of preventative maintenance, correct?

9 A. Correct.

10 Q. Insulators are listed as high to low.
11 Preventative maintenance for high risk, run to maintenance
12 for medium and low risk.

13 Did I read that correctly?

14 A. Yes.

15 Q. All right. Let's move on, next page. And this
16 is Figure 4. Process of Involving Multiple Stakeholders
17 For Identifying and Prioritizing Work.

18 Do you see that chart?

19 A. Yes, I do.

20 Q. Can you explain this chart to us?

21 A. Yes. In order to build out an executable work
22 plan, we identify the need to engage multiple stakeholders
23 so that work plan can ultimately be informed and
24 executable. That involves taking folks from asset
25 strategy, who are identifying new work that need to come
26 into the portfolio. Also engaged folks from the field to

1 understand what it would take to execute given the scope.
2 Meaning, are there certain permit requirements, clearance
3 requirements or other considerations that need to be
4 accounted for in the allocation of resources in the work
5 plan for that work?

6 It also includes engaging oversight personnel for
7 existing in-flight work to understanding any
8 interdependencies. Our ability to engage that cross
9 functional group of stakeholders in developing a
10 multi-year work plan allows us to make sure that when we
11 make commitments for when work is going to occur, what
12 resources are going be required associated with that work,
13 and the capital requirements for that work plan that we
14 can be higher confident that we're going to be able to
15 execute on that work plan.

16 Q. Can you define for us what a stakeholder is?

17 A. In -- in terms of my previous answer, it would be
18 various representatives from PG&E, different employees and
19 different workers that have different functions in our --
20 across our line of business.

21 Q. Okay. So like we talked about earlier, you had
22 a -- a colleague or a peer that was in charge of the
23 transmission system itself, correct?

24 A. That is correct.

25 Q. And there are other people that are in charge of
26 different -- various other departments that are involved

1 with electrical transmission, correct?

2 A. Correct.

3 Q. That's going to include the reliability people
4 and the regulatory liaisons. All those people would be
5 considered stakeholders when you're putting together a
6 transmission asset management plan, correct?

7 A. Potentially, yes.

8 Q. Okay. So see if I can summarize this:
9 Basically, if -- are we reading this right that this means
10 we all have to come together and work together to come up
11 with a consistent plan?

12 A. Yes.

13 Q. And to do so, we have to share information and
14 ideas?

15 A. That is correct.

16 Q. Okay. So you recollect now, I want to drop down
17 the page 18. Section 2.3.2. Asset Investigation By Age.
18 And there are some charts on here and tables. We have
19 Figure 8, and I apologize, these things are very difficult
20 to read. This is the form that we get them from -- get
21 them in from the company.

22 But starting off with Transmission Overhead Lines
23 and Conductors. "Per Table 10 below, the estimated
24 lifespan of a conductor can vary, primary depending on
25 location of the circuit."

26 Am I reading that correctly?

1 A. Yes.

2 Q. And then the next bullet, "Per Quanta study,
3 approximately 2,000 miles of PG&E conductor is greater
4 than 80 years old. This represents 11 percent of the
5 total conductor population."

6 Did I read that correctly?

7 A. Yes.

8 Q. Yeah, over and over in this document, especially
9 in this section of the document, the Quanta study is being
10 quoted, correct?

11 A. That is correct.

12 Q. "For transmission steel structures, maximum
13 lifespan for a steel structure varies by region and is
14 based upon the 2010 Quanta Technology study. Mean life
15 expectancy is 65 years."

16 Did I read that correctly?

17 A. Yes, you are.

18 Q. Then down below, "Per Quanta study, approximately
19 13 percent of 7,000 coastal steel structures have reached
20 end of expected life."

21 Did I read that correctly?

22 A. Yes, you are.

23 Q. So on Friday, we talked a little bit about the
24 Quanta study and why the recommendations in the Quanta
25 study were not ever acted on at PG&E, and you said that
26 you -- there was some disagreement with how the study was

1 performed?

2 A. So to clarify, I don't think we talked anything
3 about "acting upon the Quanta study," --

4 Q. Right.

5 A. But we did talk in general about my perspective
6 on the value associated with the Quanta study. I believe
7 it was in context to an admit of perspective initiative
8 that was identified in the previous PowerPoint.

9 Q. Okay.

10 A. That talked about defining maximum and it's --
11 and mean expected life. And my characterization was that
12 I didn't have high confidence in the Quanta study so we
13 intended to do additional benchmarking and collaboration
14 in the industry in order to come up with more robust
15 information.

16 Q. Okay. But you're quoting the Quanta study here,
17 correct?

18 A. That is correct.

19 Q. Let see -- and then we go onto insulator age.
20 This would be on page 21. And insulator age spread per
21 ETGIS.

22 Can you explain to us how to read this -- this
23 chart, Figure 12?

24 A. Sure. Figure 12 shows the -- sorry, hold on.
25 Figure 12 shows the count of insulators against the number
26 of years old the insulator is. Ranging from one to nine,

1 it also includes a bucket for 24 and unknown, and the Y
2 access is structured in a log-rhythmic scale in order to
3 fit the range onto this single chart.

4 Q. Okay. And where I don't understand is age down
5 here. Where it says one, two, three, four, five, six --
6 eight, nine, is -- does this literally mean one year old?
7 These insulators on this -- in this column are one-year
8 old?

9 A. That is correct.

10 Q. And then it goes all the way up to 24 years old,
11 and then the biggest column, which is unknown.

12 A. That is correct.

13 Q. Correct? So anything -- well, what does
14 "unknown" mean?

15 A. Unknown means we do not have -- we do not have
16 age data for those assets.

17 Q. Why not?

18 A. I -- I don't -- I'm not intimately familiar with
19 this -- the history of this data field. But my
20 assumption, based on looking at the data, is that we
21 historically did not track insulator age separate from
22 other assets and begun logging in our system record the
23 actual age of a specific insulator approximately a decade
24 ago.

25 Q. So, basically, if an insulator has been changed
26 out in the last nine years, you know the age of the

1 insulator, but if it's older than that, there's a good
2 chance you don't know how old the insulator is?

3 A. That is correct.

4 Q. Now, insulators are an important component to the
5 transmission overhead system, correct?

6 A. Yes, they are.

7 Q. And insulators like everything else have a
8 lifespan, correct?

9 A. That is correct.

10 Q. But by 2018, it looks like the majority of your
11 insulators you don't know have any age documentation on
12 them.

13 A. That is correct.

14 Q. So were you aware that there are 100 year old
15 insulators that are still hanging in towers?

16 A. I was not.

17 Q. Would that have been something that you would
18 have liked to have known when -- when it was your job to
19 develop the asset management strategies for your five-year
20 plan?

21 A. I would always like to have more information,
22 absolutely.

23 Q. All right. So let's skip ahead to page 22 and
24 Section 2.4, Asset Performance.

25 It says, "Transmission line overhead reliability
26 performance is helpful in identifying areas where system

1 reliability performance can be improved. Outage data is
2 evaluated for root causes and contributing factors that
3 can provide insightful information regarding asset
4 conditions. See the next four figures of combined
5 reliability results."

6 Did I read that correctly?

7 A. Yes, you did.

8 Q. So trying to understand this, it's talking about
9 reliability performance as a indicator of asset condition;
10 is that correct?

11 A. Yes, it is.

12 Q. And am I correct in assuming that better
13 reliability would indicate better condition?

14 A. Can you restate that question?

15 Q. Am I correct in concluding that -- or assuming
16 that the higher the reliability of an asset, the inferred
17 conclusion would be that that asset was in better
18 condition?

19 A. I would say in aggregate, better system
20 reliability would be a potential indicator of better
21 overall system condition.

22 Q. Okay. All right. Thank you. And then, again,
23 we have the -- on the following page 23. We have the
24 SAIDI, SAIFI, CAIDI and a new chart, the ten-year
25 transmission system outage frequency, basically tracking
26 the reliability, correct?

1 A. That is correct.

2 Q. And to summarize this section, it would seem that
3 the -- in saying that our reliability numbers are getting
4 better so, therefore, we know that our system is in pretty
5 good shape? In layman's terms, of course.

6 A. Yes, that is correct.

7 Q. All right. And then down at the bottom here, it
8 goes on and says, you know, "Transmission line overhead
9 asset performance is primarily tracked through two
10 factors, historical line outages and maintenance and
11 inspection found notifications. Historical outages are
12 evaluated based on asset-failure outages and can include
13 momentary as well as customer outages contributing" --
14 "customer outages contributing outages. Notifications can
15 include both line corrective and line nomination actions
16 found by PG&E personnel."

17 Did I read that correctly?

18 A. Yes, you did.

19 Q. Basically when you're evaluating a transmission
20 line, you're looking at outages and notifications?

21 A. That is correct.

22 Q. And if an inspection program is designed to not
23 find problems, you're not going to have notifications,
24 correct?

25 A. That is correct.

26 Q. And if you're -- if you're -- if a transmission

1 line doesn't have a customer load on it, it's not going to
2 show up in your CAIDI, SAIDI, SAIFI metrics, correct?

3 A. That is correct. It would show up in Figure 16
4 and 17.

5 Q. Exactly. All right. I want to skip ahead here
6 to 25 -- page 25 and the Table is 11. And we -- we have
7 here, "Current state: Conductor or connector/hardware
8 failures account for 27 percent of all wire-down events."

9 Do I read that correctly?

10 A. Yes, you do.

11 Q. And then Table 11. We have different types of
12 wire-down events or at least their causes. The left
13 column is the equipment failure type, and then the column
14 for 2013, 2014, 2015, 2016, 2017, and then a total column,
15 correct?

16 A. That is correct.

17 Q. So in -- we have connector/hardware failures
18 accounting for a total of 26 over the four-year period --
19 five-year period -- I'm sorry -- correct?

20 A. That is correct.

21 Q. Connector failures accounting for 44 of the
22 wire-down events, correct?

23 A. Correct.

24 Q. And then we have insulators. That's a total of
25 eight over the course of this five years, accounting for
26 eight of the wire-down events, correct?

1 A. Yes.

2 Q. And then structures -- some type of structure
3 failure accounting for 25 of the wire-down events,
4 correct?

5 A. Yes.

6 Q. All right. I want to switch gears here real
7 quick.

8 MR. NOEL: We will take a break right after we do
9 this. It'll be a natural stopping point.

10 GRAND JURY FOREPERSON: Okay.

11 BY MR. NOEL:

12 Q. And I want to go to Exhibit 1351. It should
13 be -- I'm sorry, maybe I didn't put 1351 on there.

14 MR. NOEL: A new exhibit --

15 MS. DUPRE-TOKOS: Yes.

16 THE WITNESS: Here, it is.

17 BY MR. NOEL:

18 Q. Do you -- and it is very difficult to read.
19 Again, I'm sorry, this -- this is the form that we get it
20 and it may be easier to look at the big board. We have
21 the exhibit up on the big board where we can blow it up.

22 Do you recognize 1351?

23 A. I do not.

24 [Exhibit No. 1351 was identified.]

25 BY MR. NOEL:

26 Q. Okay. 1351 is a list of all fires started by

1 PG&E -- but all of a sudden, I dropped -- I forgot the
2 name. But basically, that PG&E equipment caused from 2014
3 through 2017. And of specific note, we were just talking
4 about in the 1254, the wire-down events, correct?

5 A. Correct.

6 Q. And hardware failures, and this document that was
7 provided by PG&E by a subpoena, it was also submitted by
8 PG&E to CPUC, as this is mandated reporting to the CPUC.
9 Am I correct with that?

10 A. Yes, you are.

11 Q. This was also filed in the United States Federal
12 Court of San Francisco as an attachment to a brief filed
13 with Judge Alsup in the federal proceedings. So this
14 outlines all of the fires caused by PG&E equipment from
15 2014 to 2017.

16 Going back where we were, we've got 70, by my
17 count, conductor failures as a result of
18 connector/hardware.

19 Am I -- am I adding that correctly?

20 A. Yes, you are.

21 Q. Okay. Now, according to that document, 1351,
22 during partially the same timeframe from 2014 to 2017,
23 there were 18 fires started by PG&E by -- by conductor
24 failures caused by equipment failures on transmission
25 towers between 2014 and 2017.

26 So my question is, based upon all of this

1 information, a fire from a conductor failure or wire-down
2 event is a high risk, well-known phenomenon, correct?

3 A. Correct.

4 Q. I mean, basically, all though the numbers don't
5 -- I mean, the years don't quite add up, if you take just
6 '14 and '15 on here, we have 12, 25, 40, looks like 49
7 connector/hardware conductor failure events 2014 to 2017.

8 Did I add that up correctly?

9 A. I don't know.

10 Q. Can you add them up for me, '14 through '17? The
11 top two rows, the connector/hardware failure and the
12 conductor failure.

13 A. Sure. 70 minus 21 from 2013 is 49.

14 Q. 49. Okay. 49 total events, 18 fires during that
15 period. So it sounds like, basically, there's a one in
16 three chance -- or a little less than a one in three
17 chance that a wire-down event is going result in a fire;
18 is that correct?

19 A. I don't know if that's correct. I would need to
20 see the -- in more details the data that you're
21 referencing from --

22 Q. Okay.

23 A. -- Exhibit 1351.

24 Q. Okay. We can -- we can take our break and you
25 can come back, and you can take a look at that 1351 if you
26 want and before we -- we go on. It's a good time for a

1 break.

2 GRAND JURY FOREPERSON: Okay.

3 Mr. Gabbard, you are admonished not to discuss or
4 disclose at any time outside of this jury room the
5 questions that have been asked of you or your answers
6 until authorized by this grand jury or the Court.

7 A violation of these instructions on your part
8 may be the basis for a charge against you of contempt of
9 court. This does not preclude you from discussing your
10 legal rights with your own attorney.

11 Mr. Gabbard, what I have just said is a warning
12 not to discuss this case with anyone except the Court,
13 your lawyer, or the district attorney.

14 Do you have any questions?

15 THE WITNESS: Understood.

16 GRAND JURY FOREPERSON: Okay. We will now take a
17 15-minute break.

18

19 [Recess taken at 9:54 a.m. until 10:19 a.m. whereupon the
20 grand jury comes to order in Courtroom 9.]

21

22 GRAND JURY FOREPERSON: All members of the grand jury
23 have returned from break, and we are ready to proceed.

24 [Witness enters the courtroom.]

25 GRAND JURY FOREPERSON: You're still under oath,
26 Mr. Gabbard.

1 THE WITNESS: Understood.

2 BY MR. NOEL:

3 Q. I am going to withdraw the last question and go
4 ahead.

5 I am going to skip onto page 27.

6 A. This is back to 1254?

7 Q. Yep, 1254. Going on the page 27. And we have a
8 chart here, Figure 21, Conductor Failures Per 100 Miles By
9 Voltage.

10 You see that?

11 A. Yes, I do.

12 Q. All right. And below it, you should transmission
13 steel structures, bullet point: Current State. Sub
14 point: Failure of steel structures appears to increase
15 with age; is that correct?

16 A. Yes.

17 Q. And then below that "Most of steel structure
18 failures occur due to earth movement, (landslides or
19 seismic activity), corrosion (structures within water),
20 and weather (heavy wind.)

21 Did I read that correctly?

22 A. Yes, you did.

23 Q. All right. And now to Figure 22 on page 28,
24 which is very, very difficult to read on the -- on the
25 screen. The age and cause -- age and cause of previously
26 failed structures, and then down below it, specifically,

1 it states, "Steel structure related notifications suggest
2 that ageing structures are more susceptible to needing
3 corrective maintenance work."

4 Did I read that correctly?

5 A. Yes.

6 Q. And in your experience, is that statement
7 correct?

8 A. As a general statement, yes.

9 Q. And that's based upon that statement steel
10 structure related notifications is based upon the
11 existing, at this time in 2017, 2018, patrol and
12 inspection generated notifications, correct?

13 A. Yes, that is correct.

14 Q. So if notifications were not being generated
15 because of the type of inspection or patrol that would
16 affect the validity of this statement, correct?

17 A. Potentially.

18 Q. And if -- if fewer notifications on ageing
19 structures are being generated than really exist, that
20 would further strengthen this statement, correct?

21 A. Can you say that one more time?

22 Q. I probably phrased it really bad.

23 If, as a result of the types of inspections or
24 patrols being done, fewer notifications are being
25 generated on ageing structures, that would indicate that
26 the reality of it would indicate -- would even further

1 strengthen this statement that ageing structures are more
2 susceptible to needing corrective maintenance work?

3 A. I would say with one qualification. If fewer
4 notifications were being written on ageing structures
5 only, and that data set was deflated, then that would
6 imply that this statement was understated.

7 Q. Thank you. You said that much better than I did,
8 and I tried.

9 All right. Let's skip ahead to page 33, and
10 Section 2.5 talks about the data sources. Currently
11 Available Condition Data.

12 "The availability of asset condition data varies
13 with the transmission line overhead asset family. Asset
14 related data is stored through SAP/ETGIS, and the
15 technical information library. Additional information
16 regarding asset data can be found in the information
17 management strategy AMP."

18 Did I read that correctly?

19 A. Yes, you did.

20 Q. And then it goes onto Table 15 and it talks about
21 the sources of information and it assigns a maturity
22 level, correct?

23 A. Correct.

24 Q. So for instance, under ETGIS, the desired data
25 fields would be geospatial information, asset age,
26 manufacturer, rating, configuration and type and it

1 assigns a maturity level of four, correct?

2 A. Correct.

3 Q. And then down below, all -- four is defined as
4 "All data collected in one place and data populated with
5 SAP/ETGIS with process for regular updates."

6 Did I read that correctly?

7 A. Yes, you did.

8 Q. And then for SAP, the designed data fields are
9 notification and the maturity level is, again, a four,
10 correct?

11 A. Correct.

12 Q. All right. So on ETGIS, for maturity level four,
13 all data is collected in one place, and that includes
14 asset age, manufacturer, rating, configuration and type.

15 So that would indicate that ETGIS has that
16 information for every asset in the system, correct?

17 A. I do not believe that is correct.

18 Q. Okay. How -- how should we interpret that?

19 A. My interpretation of this statement is that the
20 process for collecting and updating this type of
21 information is mature for ETGIS. It does not mean that it
22 has been mature for the last hundred years.

23 Q. Okay.

24 A. So if new information or updates to existing
25 information that -- those processes are more mature on
26 this spectrum.

1 Q. Okay. So this is the talking about prospective
2 that the ap -- that the data is being collected and being
3 put into one place?

4 A. Correct.

5 Q. Okay. So at this point in 2017, 2018, that
6 doesn't exist? There is no single place where you can go
7 to find all of that -- all of those data fields with
8 regard to every asset in the system?

9 A. So at this point in time, these data sources
10 would be the sources that would have all pieces of
11 information that are available in a single source. But
12 being that PG&E was a conglomerate of hundreds of
13 different utilities over time, some of these pieces of
14 information for subcomponents may not be available --

15 Q. Okay.

16 A. -- at present.

17 Q. Okay. So for instance, conductor on certain
18 transmission lines?

19 A. Potentially.

20 Q. Okay. But we have heard that essentially PG&E
21 doesn't know the make, model of the conduct on the
22 Caribou-Palermo line, specifically at tower number 27/222.
23 Were you aware of that?

24 A. I am not.

25 Q. Okay. Does that surprise you that the company
26 would have no data on something as important as a

1 conductor even after 70 years of owning that piece of
2 equipment?

3 A. It would surprise me if PG&E had no data. It
4 would not surprise me if PG&E had missing data.

5 Q. Okay. For instance -- give you the -- the
6 information that -- from requests for information on the
7 actual conductor that failed on 27/222. PG&E referred us
8 to an article in a engineering periodical from 1922,
9 because they had no other data with regard to that
10 conductor.

11 Does that surprise you?

12 A. No.

13 Q. As the person who is essentially in charge of
14 asset strategy in 2017 to 2018, would that kind of
15 information be important to you in generating a plan going
16 forward?

17 A. As I stated, I believe in an earlier answer,
18 additional information would be helpful in developing a
19 plan.

20 Q. Right. And what do you do when you don't have
21 that information?

22 A. When we don't have information?

23 Q. Right.

24 A. For a specific data field associated with an
25 asset, we would do a number of different things depending
26 on a data field or the asset. In some instances, we will

1 use, for example, age data associated with an adjacent
2 asset as a proxy for the age of the asset with the missing
3 data field.

4 Q. Okay.

5 A. Another example would be if we have a missing
6 data field, we may leverage an alternate data field to
7 inform our analysis.

8 Q. Is another term for that "assumed data"?

9 A. Sure.

10 Q. Okay. And then the last row on here, on Table
11 15, listed the 2010 Quanta study. Asset expected lifespan
12 and the maturity is listed as NA, not applicable or not
13 available?

14 A. Not available. Or, sorry, not applicable.

15 Q. All right. Really quick. The next section of
16 this is -- is risks, and I want to move onto page 34 and
17 Table 16. Electric Operations Risk Assessments.

18 Do you see that chart?

19 A. I do.

20 Q. And under enterprise risks the risk ID ENT1 is
21 listed as wildfire, correct?

22 A. Yes.

23 Q. Is there any significance to wildfire being
24 listed first?

25 A. I don't know.

26 Q. Let's move onto page 36, and the risk analysis

1 Section 3.2. And this states, "An analysis of applicable
2 risk assessment to transmission overhead line assets was
3 conducted by evaluating risk drivers and in consultation
4 with subject-matter experts."

5 The illustration on page 35 depicts the alignment
6 between risk assessment, drivers, control, corrective
7 actions with each asset family. Programs and investments
8 that are managed by the transmission overhead asset group
9 are explained in detail in Chapter 4, "Desired State."

10 Are you familiar with this analysis conducted by
11 evaluating risk drivers in consultation with
12 subject-matter experts?

13 A. Yes, I am.

14 Q. Can you explain to us, please?

15 A. This analysis was undertaken as part of our risk
16 management process. It may show up later in the document,
17 but the framework used for forming this analysis is often
18 called a bow-tie analysis. An analysis starts with
19 defining a risk event, and that's really defining what is
20 that event that we believe could have exposure from a
21 public safety reliability environmental standpoint, and
22 then quantifying the potential drivers for that event, and
23 the associated consequences for that event.

24 That framework also enables us to define various
25 controls that could mitigate both the likelihood of an
26 event occurring or the consequence associated with that

1 event occurring.

2 Q. Okay. And I think we will look -- take a look at
3 the couple of the bow-tie, I was going to ask you about
4 that anyway here in a second.

5 Let's skip onto page 41, Section 3.3. Risk
6 Drivers.

7 Now, can you briefly explain to us what is a risk
8 driver?

9 A. Would you like me to read the definition here?

10 Q. Sure.

11 A. "The risk driver is defined as a element, which
12 alone or in combination with other drivers has the
13 intrinsic potential to give rise to risk."

14 Q. So let's drop down to Table 20. Risk Drivers
15 related to transmission overhead. And in this case, ENT1
16 is -- the risk is wildfire.

17 Am I reading that correctly?

18 A. Yes, you are.

19 Q. And then the third column risk driver ID assigns
20 a name to each one of the individual risk drivers,
21 correct?

22 A. Yes.

23 Q. And then the far right column, the biggest column
24 is the potential associated risk drivers. I'm guessing
25 that the risk -- that means the events or the consequences
26 that give -- not consequences -- that give rise to the

1 risk itself, correct?

2 A. These would be the causes that would -- would
3 lead to the event itself.

4 Q. That was the word I have had looking for. I said
5 consequences. Thank you.

6 So the potential risk drivers, the potential
7 causes of wildfire would be vegetation, equipment failure
8 conductor, equipment failure connector/hardware, equipment
9 failure other, third-party contact, animal, fuse
10 operation, and then the final of unknown, correct?

11 A. That is correct.

12 Q. Each one of those is a potential cause --
13 identifying cause of wildfire?

14 A. Yes.

15 Q. And so how do you mitigate those risks?

16 A. Do you want me to go through all of the
17 mitigations that we have identified for each driver or
18 would you like just, say, a couple examples?

19 Q. Just a couple of examples are good.

20 A. Okay. An example for mitigating the likelihood
21 of vegetation coming in contact with our transmission
22 overhead facilities would be clearing our right-of-way of
23 vegetation, cutting down the dead or design -- dead,
24 diseased or dying trees could potentially reduce the --
25 that cause.

26 Another example for -- from an animal standpoint

1 would be insulating down guys so that raptors or large
2 birds don't have the ability to come into contact with the
3 energized facilities and a down guy that is tied to
4 ground.

5 Q. How about this: Are you familiar with what is
6 a -- a part known as a parallel groove connector?

7 A. I'm not sure.

8 Q. A parallel groove connector is a -- in this case,
9 a three-bolt connector is a type of a splice. It's a
10 mechanical method of joining two pieces of line together.

11 Does that make sense?

12 A. Yes, it does.

13 Q. At some point, prior to 2008, the commonly used
14 parallel prove connectors were determined to be a fire
15 hazard. That they were overheating. They were
16 malfunctioning because of age. And PG&E made a decision
17 to replace all of those parallel groove connectors on
18 trans -- both transmission and distribution.

19 Would that be considered a mitigation?

20 A. Yes, it would.

21 Q. And, specifically, that would be considered a
22 mitigation under the equipment failure connector hardware?

23 A. Yes, it would.

24 Q. Okay. And that's something that is being done to
25 prevent a known risk, that being fire?

26 A. Correct.

1 Q. Now -- no, let's go down to 44, and 3.4 Controls
2 to Mitigate Risks. And says, "For risk driving related to
3 transmission overhead line assets, PG&E has in place
4 several controls in the forms of programs and identified
5 mitigation opportunities."

6 Those are some of the things that we have talked
7 about before, correct? Is that correct?

8 A. Yes.

9 Q. All right. "These controls such as an
10 inspect" -- "such as inspection and maintenance, for
11 example, are critical in addressing the risk drivers and
12 eliminating or reducing the impact of risk consequences."

13 A. That is correct.

14 Q. Read that correctly? So --

15 A. Correct.

16 Q. -- if I am understanding that correctly,
17 inspection and maintenance are two important mitigations
18 to the risks -- to mitigate the risks on the transmission
19 lines?

20 A. That is correct.

21 Q. So I forgot to open it, sorry. So -- I lost my
22 train of thought.

23 MS. DUPRE-TOKOS: Inspection and maintenance.

24 BY MR. NOEL:

25 Q. So inspections themselves would play a large part
26 in mitigating fire risk?

1 A. Yes.

2 Q. And then we go to Table 23, which is overall
3 control status key and it gives us basically four types.
4 If I am reading this right, the color to the left of each
5 control status defines where -- where it's used in the
6 charts to come; is that right?

7 A. Yes, that is correct.

8 Q. So if the color in the -- in the control status
9 is black that means analysis is in progress, status is
10 unknown or under evaluation. All the way down to if it is
11 blank, no color, controls are being strengthened, further
12 risk reduction recommended?

13 A. Yes, except I don't believe that is blank. I
14 think that is an amber color.

15 Q. Oh, okay.

16 A. I could be mistaken, but I these are varying
17 levels of color --

18 Q. Right.

19 A. -- and then black for --

20 Q. Right. And, again, we talked about it, we talked
21 about it at break with regard to 1351, these documents
22 have gone through reformatting, reformatting as they've
23 passed through different hands and some of them are, you
24 know, barely legible. And don't maintain their -- their
25 original status. So it's hard to tell the colors, but we
26 go from dark to essentially no color on this -- the way

1 this black and white chart is laid out; is that correct?

2 A. Yes, it is.

3 Q. So that goes to the -- to the next -- the chart
4 that begins on table -- on Table 24 that begins on page
5 45, correct?

6 A. That is correct.

7 Q. And the first one -- the first risk assessment is
8 ENT1, the wildfire, correct?

9 A. Correct.

10 Q. And as far as control strengths for all of the
11 mitigation stuff, it states "unavailable;" is that
12 correct?

13 A. That is correct.

14 Q. What does that mean?

15 A. Per the asterisk, it says, "Unavailable control
16 strength measure not developed at the time of risk
17 assessment." I'm speaking off recollection, so I may be
18 mistaken, but I believe this was the first iteration of
19 reflecting these controls with the associated control ID
20 and, at this point in time, those -- the effectiveness of
21 those controls as defined in this context was under
22 review. Previous iterations of these controls had been
23 assessed in alternate formats with different definitions.
24 So unavailable was used until such time as those control
25 assessments were complete.

26 Q. Okay, Thank you. All right. We have a long

1 table here. Let's skip ahead to page 53. Specifically,
2 Section 4, Desired State, Asset Objectives, Programs, and
3 Risk Mitigations.

4 Have you found that?

5 A. Yes.

6 Q. And that's -- Section 4 begins, "The long-term
7 vision for the transmission line overhead asset family is
8 to improve the overall safety and reliability of the
9 assets through a combination of asset condition
10 understanding, infrastructure improvements and promotion
11 of a culture that focuses on the long-term safety and
12 reliability of the assets."

13 Did I read that correctly?

14 A. Yes, you did.

15 Q. And it goes on to say, "The transmission line
16 overhead asset family's strategic objectives are developed
17 to optimize asset lifecycle by maintaining and improving
18 asset condition and adequately mitigating risks."

19 Did I read that correctly?

20 A. Yes, you did.

21 Q. So it says, "Optimizing asset lifecycle by
22 maintaining and improving," that goes back to where we
23 started. That -- that was the heart of your job in asset
24 management, correct?

25 A. Yes, it is.

26 Q. And, again, a lot of that is dependent upon the

1 information that you are getting from other departments?

2 A. That is correct.

3 Q. For instance, inspection and patrol records and
4 specifically LC notifications generated by inspections and
5 patrols?

6 A. Correct.

7 Q. And so if those inspection and patrol records of
8 those LC notifications aren't being generated because of
9 the types of inspections and patrols that is going to
10 affect your ability to improve the asset condition and
11 adequately mitigate those risks?

12 A. Potentially, yes.

13 Q. Okay. All right. Now, let's move onto page 57
14 and Table 36. We start off with -- well, Program
15 Summaries, Desires State, and Risk Addressed. And
16 focusing on the second one down here. The program, MWC 70
17 Transmission Line Structure Replacement.

18 Do you see that?

19 A. Yes, I do.

20 Q. Can you remind us what major work category 70 is?

21 A. Major work category 70 is a capital major work
22 category. We -- it's associated with replacement of
23 transmission line structures.

24 Q. And under scope/program description, it says,
25 "The transmission line structure replacement program
26 manages the asset lifecycle of structures and replaces

1 assets as needed based on risk, concentrating on those
2 with the highest risk first," correct?

3 A. Yes.

4 Q. So explain to us that statement, the -- the
5 basis for the description of the program?

6 A. The program replaces transmission lines
7 structures. That includes both steel structures and wood
8 pole structures. It is solely focused on replacement of
9 structures and it prioritizes the replacement of those
10 structures based on the risk associated with the given
11 structure.

12 Q. And risk is in part informed by the LC
13 notifications, correct?

14 A. Yes.

15 Q. So if LC notifications aren't being generated,
16 risk isn't going to be identified?

17 A. That is correct.

18 Q. Now, we go down to the bottom, the metrics --
19 again, "SAIDI, SAIFI, ACOD, ACOF, NOV, On-Time Completion
20 of LCs and SAP, asset failures, wire-downs, CPUC/OSHA
21 recordables, Transmission Fire Ignitions."

22 Those are the metrics upon which risk is based,
23 correct?

24 A. Yes, sir.

25 Q. Okay. And can you explain to us just briefly
26 what NOV are?

1 A. Notice of Violation.

2 Q. And that would be something that would be issued
3 by, say, CPUC or CAL ISO or NERC?

4 A. Correct.

5 Q. Okay.

6 A. Actually, let me clarify. An NOV would be issued
7 by the CPUC or NERC or -- or FERC.

8 Q. Okay.

9 A. Not California ISO.

10 Q. Okay. Thank you. Let's skip ahead to page 59.
11 And a similar chart. I think it's all the same table.
12 Yep, it's all Table 38. Table 38 goes on for pages. And
13 this time the program is Major Work Category 93,
14 Transmission Line Preventative Work.

15 Do you see that?

16 A. Yes.

17 Q. And, again, "The Line Preventative Work Program
18 supports repair or replacement of overhead conductors and
19 devices on transmission structures of transmission lines
20 operating at voltages from 60 kV to 500 kV," correct?

21 A. Yes.

22 Q. And the Desired State: "Eliminate public and
23 employee safety hazards from conductor or component
24 failures. Protect the environment from conductor or
25 component failures resulting in fires. Maintain 2nd
26 quartile T&D reliability performance, and NERC complaint."

1 Did I read that correctly?

2 A. Yes, you did.

3 Q. Can you explain for us what it means to maintain
4 second quartile T&D liability performance?

5 A. It means when looking at some of the measurements
6 below, including SAIDI, SAIFI, ACOD, and ACOF, in
7 comparing PG&E performance for those metrics against the
8 performance of other similarly situated utilities, you
9 break up the range of performance across those compared
10 utilities, we are targeting to be above the -- the median
11 of that distribution targeting second quartile, which
12 would be the 50 to 75 percentile across all other
13 utilities. First quartile would be represented by the
14 75th percentile to the 100th percent tile.

15 Q. Okay. So you're above average, but not the best?

16 A. That is correct.

17 Q. All right. And then the mitigations down here.
18 "Anti-climbing guards, avian protection, conductor
19 replacement, switch replacement, insulator replacement,
20 and NERC compliant," correct?

21 A. Yes.

22 Q. And, again, the metrics are the reliability
23 metrics, references also to the LCs and the CAP, which
24 would be based upon inspection and patrol, again, right?

25 A. Yes. And CAPs can include other input streams.

26 Q. Okay. And then onto -- ah, I guess Table 38 does

1 end right there and goes onto Table 39, which is, again,
2 Program Summaries. And focus on this major work category
3 BF, Transmission Line Patrol and Inspection.

4 You see that?

5 A. Yes, I do.

6 Q. And that includes BFQ, BFT and BFZ?

7 A. I believe it includes BFQ and then BFT through
8 BFZ.

9 Q. Okay. And are you familiar with what those
10 initials are for or represent?

11 A. Yes. I believe those represent specific MAT
12 codes, which it stands for Maintenance Activity Type. And
13 those are just subsets of the overall major work category.

14 Q. All right.

15 A. Specific to the specific components. Some of
16 which are listed in the mitigations, for example.

17 Q. Right. And so scope/program description: "The
18 transmission line patrol and inspection program includes
19 patrol and inspection of overhead facilities, inspecting
20 and testing of equipment, performing special patrols and
21 other work associated with maintenance."

22 Did I read that correctly?

23 A. Yes, you did.

24 Q. Again, as you pointed out, the metrics would be
25 the "On-Time LC notifications and CAP completion, the
26 NOVs, air patrol timeliness, ground inspection

1 timeliness," correct?

2 A. Correct.

3 Q. And the mitigation, "Bay water foundation
4 inspection, climbing inspections, ground patrols, overhead
5 infrared and air patrols," correct?

6 A. Correct.

7 Q. Now, are you aware of any climbing inspections
8 other than the 500 lines?

9 A. I am not specifically aware of any climbing
10 inspections.

11 Q. Okay. And, finally, I want to skip ahead to page
12 65 and Table 44. And the Areas For Continuous
13 Improvement.

14 Have you found that?

15 A. Yes.

16 Q. All right. Can you explain to us this chart
17 briefly? Not how to read this chart. For one thing it's
18 broken down between data and Session D. Can you start
19 with explaining what that is, the difference or
20 distinction is?

21 A. Okay. So to clarify, I think -- I can't tell if
22 this is a formatting issue or if it's a result of the
23 document issue you referenced earlier.

24 Q. Uh-huh.

25 A. But I believe the entire table is areas of
26 continuous improvement, and it is broken down into

1 subcategories that identify areas of continuous
2 improvement focused on either data or Session D process,
3 or asset management plans, personnel implications, risk
4 analysis or performance metrics.

5 These are different areas identified as
6 opportunities for us to continue to improve in these
7 categories in order to continue to bolster the
8 effectiveness of our overall asset management plans.

9 Q. All right. So a few of the -- of the areas.
10 First, "Develop a repository of asset failure analysis
11 (2019)."

12 Now, what would be a repository of asset failure
13 analysis?

14 A. I'm sorry, I don't recall off the top of my head.

15 Q. Okay. Now, when assets fail, does PG&E generally
16 do a failure analysis to figure out why that asset failed?

17 A. In some instances, yes, in others, no.

18 Q. Okay.

19 A. More so on the transmission side and in general,
20 those asset failures analysis are either performed by an
21 external consultant or our internal ATS department, which
22 is Applied Technology Services.

23 Q. So at this point, prior to the development of a
24 repository of asset failure analysis, is there any
25 centralized location where somebody could go to look for,
26 A, failure of certain parts; and B, an analysis of why

1 those parts failed?

2 A. I can't -- I can't answer that question.

3 Q. All right. Then, down here, "Develop a
4 centralized data management repository, which includes
5 data quality validation, proper warehousing, and an asset
6 inventory process utilizing maintenance and inspection
7 records (5-7 years.)"

8 Did I read that correctly?

9 A. Yes, you did.

10 Q. So data management repository, which includes
11 data quality validation. What does that mean?

12 A. It's referencing development of more rigorous
13 protocol to -- to define where documents are kept, what
14 the source of record is, what the quality of that data is,
15 any manipulations that occur to data before it's used.
16 Sort of a cataloging and inventorying of data within our
17 systems in order for us to continuously improve the -- the
18 quantity and accuracy of our data sets.

19 Q. Okay. So as of 2017, 2018, PG&E had no such
20 repository and you were looking at the development of it 5
21 to 7 years out?

22 A. So I would not characterize this information that
23 way. This is a focus on perspective continuous
24 improvement to proceeding years including development of a
25 centralized inventory that is ETGIS, the Electric
26 Transmission Geospatial Information System, to aggregate

1 data as identified on the previous page of this document.

2 Q. Right.

3 A. This would be a continuation of some of those
4 improvement efforts to further mature our data management.

5 Q. Okay. But in part, that is based upon
6 maintenance and inspection records, correct?

7 A. In part, yes.

8 Q. So, again, the data management repository would
9 only be as good as the maintenance and inspection records
10 that is it based on?

11 A. That is correct.

12 Q. Okay. And then that goes also up there to the
13 very first one, which is "Continue improving visibility of
14 data quality issues to ensure data users understand the
15 quality of the data used for risk analyses, the downstream
16 effects of data quality, and the efforts underway to
17 address data quality issues."

18 Those two tie together, correct?

19 A. Yes, they do.

20 Q. And this first bullet point is basically a
21 complex way of saying make sure that the data we're
22 reliant on is correct or is reliable, correct?

23 A. So I think, actually, the first point is solely
24 intended to highlight where there is incorrect data to,
25 make sure that it is clear so that it is not incorrectly
26 used.

1 Q. Okay. And how do you do that if it's not that
2 the data isn't correct, it's just that the data isn't
3 being provided?

4 A. That would not fall under the first bullet point.

5 Q. Okay. Next bullet point, "Continue evaluating
6 mean and asset life expectancy from multiple data
7 sources."

8 Could you explain that for us?

9 A. Sure. That goes back to the previous discussion
10 we had about leveraging any industry data or data from our
11 peer utilities to understand what expected asset lifespans
12 are expected to be for different asset classes.
13 Unfortunately, there's limited literature and experience
14 quantifying those expected values, and they can range
15 significantly depending on a number of different factors.
16 So we had an intent to continue to focus on the -- in that
17 area to mature our understanding of the expected and range
18 of lifespans for different asset types.

19 Q. And then below that "Continue evaluating the
20 effectiveness of the design, maintenance and inspection
21 programs and make necessary recommendations for
22 improvements (annual.)"

23 Can you explain that to us?

24 A. Yeah. This ties back to the color coding
25 assessment that we previously referenced --

26 Q. Right.

1 A. -- associated with the effectiveness of giving
2 controls that tie back to our risk management framework
3 within our asset management plans. We work through our
4 support stakeholders in order to perform the effectiveness
5 of some of those controls on a regular basis to understand
6 where there are deficiencies and identify opportunities
7 for improvement.

8 Q. What is a transmission asset register?

9 A. Transmission asset register would be a database
10 that logs asset-related information. In this context,
11 it's specific to an -- PG&E developing an internal
12 repository for information that is equivalent to the
13 California ISO transmission registry. Today, we use the
14 CAISO register for line-rating information and other
15 asset-specific information. Our long-term plan includes
16 developing an internal database that is similar to CAISO,
17 but duplicative.

18 Q. And what are asset ratings?

19 A. Asset ratings are specific to the manufacturer
20 ratings defined for a given piece of equipment that define
21 the electrical characteristics that the asset can see and
22 still perform satisfactorily on.

23 So, for example, conductor rating would be the --
24 for example, the number of amps that can be carried along
25 a conductor without annealing or suboptimal performance.

26 Q. How would you validate those asset ratings?

1 A. In some instances we have those ratings collected
2 in our data bases. In others, we may need to refer to
3 engineering drawings, and then in some instances, we
4 actually do field verification to look at name plates on
5 pieces of equipment.

6 Q. Okay. How do you validate -- well, not even --
7 what happens when you don't have any type of asset
8 ratings?

9 A. So a different way, what happens if we are
10 missing an asset rating -- or a rating for an asset?

11 Q. Yes. Another way of saying it.

12 A. Okay. We will look for records to confirm the
13 rating for that component, or we may go back to the
14 manufacturer or I'm sure there's additional methods for
15 determining that rating. This is a bit outside of my --
16 my wheelhouse.

17 Q. Okay. And the ultimate question is, for
18 instance, if you have a 100-year old conductor where you
19 don't even know who manufactured the conductor, how are
20 you going to rate it and how are you going to validate it?

21 A. I'm -- I'm assuming the rating would be the CAISO
22 register, and that would be the data source that we would
23 leverage to quantify the rating for that facility.

24 Q. How would the CAISO have ratings for a 100-year
25 old conductor that PG&E doesn't have a rating for?

26 A. Sorry. So you're assuming that we don't have a

1 rating for a facility?

2 Q. Well, I'm -- I'm saying, you have the conductor
3 that is hanging in the Caribou-Palermo that is 100-years
4 old and when asked -- when PG&E was asked for information
5 -- manufacturer, specific information with regard to the
6 conductor, PG&E responded, "We don't know. We bought this
7 from Great Western Power, and the best we can do is cite
8 you to an article from an engineering publication from, I
9 think, 1922, that did an article on the long-distance
10 transmission line being built by Great Western Power." So
11 we know nothing about the conductor. How are we going to
12 rate it? How are we going to validate any ratings?

13 A. So knowing that the Caribou-Palermo line was in
14 operation under CAISO control, I'm confident that we have
15 a line rating for it -- for that facility.

16 Q. Okay.

17 A. That doesn't mean we knew of the manufacture or
18 the age of that facility.

19 Q. Okay. So you can rate it without knowing
20 manufacturer and manufacturer specs?

21 A. That is correct. All of these different data
22 fields are independent. In some instances, we will have
23 some pieces of data and not others. So it's really field
24 specific.

25 Q. So the ultimate question that this all leads up
26 to is, how is it that we have conductor hanging in

1 transmission lines conducting 115,000 kV -- 115kV that
2 PG&E essentially knows nothing about?

3 A. Can you at least split those statements in two so
4 that I can respond independently? Because the statement
5 that PG&E knows nothing about the infrastructure -- the
6 Caribou-Palermo infrastructure, I don't know that I can
7 say we know nothing about that infrastructure.

8 Q. Not the infrastructure, the conductor itself.
9 Like we've talked about, when asked for specific
10 information about the conductor on sections of the
11 Caribou-Palermo, specifically, tower 27/222 where the fire
12 started. The response from PG&E is, "We bought this from
13 Great Western Power, I think, in 1931. We don't know who
14 made the conductor, we don't know any of the specs for the
15 conductor. Here is a citation to a 1922 engineering
16 publication, an article about this, which identifies
17 the -- the possible manufacturers of the conductor as" --
18 I forget, it's like Oakland Iron Works or something.

19 How is it that PG&E is allowing a conductor that
20 is 100-years old that they have so little information on
21 to continue in use?

22 A. My perspective is that both PG&E and the
23 California ISO would have line-rating data associated with
24 that line and knowing the original manufacturer of -- of
25 that conduct would not -- did not impact the operational
26 considerations for that line.

1 Q. Okay. All right. Let's move back and let's go
2 on to some of the other documents and try to go through
3 quickly.

4 You should have in front of you, 1252, which is
5 an e-mail. Do you see that?

6 A. Yes, I do.

7 [Exhibit No. 1252 was identified.]

8 BY MR. NOEL:

9 Q. And this is a 6/15/17 e-mail from somebody named
10 Judy Lau, L-A-U. Can you tell who Judy Lau is or was?

11 A. Judy was an admin for one of the managers that
12 reported up to me.

13 Q. Okay. And then at the end, it says on "On behalf
14 of Gabbard, Dave, E-T." Is that correct?

15 A. Sorry, I'm not seeing that.

16 Q. It's at the end of the "from" line at the very
17 top. It says Judy Law -- Lau, Judy and then --

18 A. Oh, yes.

19 Q. And so this is an e-mail that you authorized?

20 A. This was a meeting request that she would have
21 sent out from my calendar --

22 Q. Okay.

23 A. -- for these participants.

24 Q. Okay. All right. And for whom was Ms. Lau the
25 administrator?

26 A. I do not recall at this time. She may have

1 supported Boris. She also supported Marco Rios. My
2 assumption is my admin who is showing on here as me. My
3 admin at the time, who is showing up here as an optional
4 attendee, Vangie Arcia, may have been on vacation so Judy
5 may have been backfilling.

6 Q. Okay. So let's go through required attendees:
7 First up is Boris Andino.

8 A. Boris Andino was and is the manager of
9 transmission asset management.

10 Q. Okay. And next up is Greg Gabbard?

11 A. Greg Gabbard is my twin brother, formerly the
12 director of transmission line project management.

13 Q. Okay. And is he still with the company?

14 A. Yes, he is.

15 Q. Okay. What's his position now?

16 A. He's currently director of electrical operations
17 continuous improvement.

18 Q. Next up, Max Tuttmann. Who is Max Tuttmann?

19 A. Max Tuttmann was a fellow -- an MBA fellow that
20 came on board to support a business emersion project from
21 MIT.

22 Q. Next up is Feven Mihretu. Who was is Feven
23 Mihretu?

24 A. Feven is an asset -- was an asset strategy
25 engineer responsible for transmission structures.

26 Q. Jefferson Heidelberg. Do you know who he is?

1 A. Jefferson was a transmission line employee --
2 sorry, let me correct that. Jefferson had numerous
3 positions over time, and actually no longer works for
4 PG&E. I believe, at this point in time, he was part of
5 our customer affordability PMO.

6 Q. Okay. And finally on the required attendees,
7 Jeffrey Lockwood, can you tell us who he is?

8 A. Jeff Lockwood was another front line employee on
9 Boris's team with field experience that was part of the
10 asset management team.

11 Q. All right. And then optional, in addition we
12 already talked about Evangeline Arcia, and Eric Back. Is
13 that the person that you described as your counterpart in
14 the transmission operations?

15 A. That is correct.

16 Q. All right. Now, the -- there's an attachment to
17 this that says it's an ageing infrastructure initiative.

18 Do you recall the ageing infrastructure
19 initiative?

20 A. Not specifically.

21 Q. Okay. Can you give us basically a general, high
22 level description of what the aging infrastructure was?

23 A. So I think it would be helpful to start at what
24 CAR stands for --

25 Q. Okay.

26 A. -- on the second file. So CAR stands for

1 Customer Affordability -- I don't recall what the R stands
2 for. But customer affordability initiative, and then I
3 have seen this -- a version of this meeting request
4 recently. My recollection is that the PowerPoint shown
5 here is a template under the initiative.

6 Q. Okay.

7 A. Customer affordability was -- was understanding
8 that departing loads associated with rooftop solar as well
9 as increasing costs on our customers associated with the
10 investments we needed to make in our -- in our
11 infrastructure were putting significant pressure on rates
12 for our customers, and so we were tasked with looking for
13 ways we can do business differently to decrease our
14 overall impact on customer rates. So it's a customer
15 affordability initiative.

16 The aging infrastructure reference was a
17 potential work stream identified that, I believe, this
18 meeting was intended to discussed -- to discuss. The
19 concept was can we do things differently in order to
20 decrease impact on overall customer rates? That could
21 potentially take the form of if we have a structure, per
22 se, that needed more regular maintenance because it's been
23 in service for longer. Do we have the opportunity to
24 replace it, and then thereby decreasing ongoing
25 operational costs for our customers.

26 So looking at those economic analyses from a net

1 present value standpoint for our customers and see if
2 there are things we can do different in our business.

3 My speculation is that this work stream
4 discussion did not translate into anything. I don't
5 recall it showing up any -- you know, beyond that point in
6 time. The opportunities to drive cost out of our business
7 existed in other work streams so this was -- did not, kind
8 of, bubble up to the top.

9 Q. And that is made -- you know, effort to keep
10 customer costs down to make changes in the way that you're
11 doing business without reducing profits, correct?

12 A. This -- this effort was independent of profits.

13 Q. Okay. But isn't that always a -- a big factor is
14 that -- as it's put in a previous PG&E document, that paid
15 on maximum dividend is priority number one?

16 A. Can you restate the question?

17 Q. Right. You're -- you're trying to reduce the
18 effect on your customers, but always keeping in mind that
19 profit, the dividends that are paid to the shareholders
20 cannot be reduced; is that correct?

21 A. The intent of this effort was to reduce cost to
22 our customers solely by reducing costs of operating the
23 business.

24 Q. All right. Let's go onto 1343, which is another
25 e-mail on the same topic. Do you see 1343 there?

26 GRAND JUROR NUMBER FOURTEEN: Marc, can you make that

1 bigger?

2 MR. NOEL: I cannot make that bigger.

3 THE WITNESS: Can we take another quick break?

4 MR. NOEL: Sure. Is that okay, Madam Foreperson?

5 GRAND JURY FOREPERSON: Yes.

6 MS. DUPRE-TOKOS: You need to get the admonishment,
7 though.

8 THE WITNESS: Okay.

9 GRAND JURY FOREPERSON: Five minutes? Ten minutes?

10 MS. DUPRE-TOKOS: Ten. Well, we say five and it'll
11 really be ten.

12 GRAND JURY FOREPERSON: Okay. Mr. Gabbard, you are
13 admonished not to discuss or disclose at any time outside
14 of this jury room the questions that have been asked of
15 you or your answers until authorized by this grand jury or
16 the Court.

17 A violation of these instructions on your part
18 may be the basis for a charge against you of contempt of
19 court. This does not preclude you from discussing your
20 legal rights with your own attorney.

21 Mr. Gabbard, what I have just said is a warning
22 not to discuss this case with anyone except the Court,
23 your lawyer, or the district attorney.

24 THE WITNESS: Understood.

25 GRAND JURY FOREPERSON: Okay.

26

1 [Recess was taken from 11:21 until 11:32 a.m. whereupon
2 the grand jury comes to order in Courtroom 9.]

3

4 GRAND JURY FOREPERSON: All members of the grand
5 jury are present and ready to proceed.

6 Can you please bring the -- the person in,
7 please?

8 Joe, can you get him, please? We're ready to
9 proceed.

10 MR. NOEL: All right.

11 BY MR. NOEL:

12 Q. Next up, we have Exhibit 1343, we will go through
13 this very quickly. Looks like another e-mail. Do you
14 recognize 1343?

15 A. Not out of memory, but it looks familiar.

16 Q. Right. It's an e-mail from you on June 12, 2017,
17 about the ageing infrastructure initiative and basically
18 setting up meetings. Am I correct?

19 A. That is correct.

20 [Exhibit No. 1343 was identified.]

21 BY MR. NOEL:

22 Q. All right. And then the first meeting is to
23 discuss large project bundling initiative. Do you recall
24 what -- what the large project bundling initiative was?

25 A. I'm working off of my memory, but I'm assuming
26 that it was similar in nature -- was to look at how we can

1 modify our processes in order to bundle work. Looking at
2 leveraging large projects, and then identifying other
3 maintenance or smaller repair projects associated with the
4 same motivation or the same assets and bundling that work
5 together to be done once and drive efficiency in the way
6 we operate our business.

7 So, for example, if we're mobilizing a crew of
8 linemen out to a location, we want them to do all of the
9 work at that location all at the same time as opposed to
10 going out to do one repair on one piece of equipment, and
11 then mobilizing a second time to work on the second piece.
12 That way we can reduce cost for our customers.

13 Q. All right. And then meeting to discuss the
14 ageing infrastructure initiative. And it says level set
15 on expectations for affordability initiative process and
16 ageing infrastructure initiative. Is that what you
17 explained to us earlier?

18 A. That's correct.

19 Q. All right.

20 A. This would have been the e-mail from my admin to
21 request setting up of the meeting that we previously
22 reviewed.

23 Q. All right. Next up is 1344. We're not going to
24 spend a whole lot of time on this. But 1342 referenced an
25 attached PowerPoint, correct?

26 A. That is correct.

1 Q. And 1344 is the attach -- is the PowerPoint?

2 A. Correct.

3 [Exhibit No. 1344 was identified.]

4 BY MR. NOEL:

5 Q. And that PowerPoint sets out some very generic
6 templates how to process stuff or how to report
7 information, correct?

8 A. That is correct.

9 Q. All right.

10 MS. DUPRE-TOKOS: Marc, you said 1342, you said it
11 was attached to 1342.

12 MR. NOEL: 1342. I'm sorry, 1252. Not 1342. It's
13 not -- it's referenced in 1252, right, or 1352 or 1252.

14 GRAND JURY SECRETARY: 12.

15 MR. NOEL: I'm sorry. I can't read my own
16 handwriting.

17 BY MR. NOEL:

18 Q. Going onto blow up the project charge -- charter,
19 and it lists the people who are assigned to this project,
20 correct?

21 A. Correct.

22 Q. All right. So onto the Quanta report. You
23 should have 827 there in front of you. See 827?

24 A. Yes, I do.

25 [Exhibit No. 827 was identified.]

26 ///

1 BY MR. NOEL:

2 Q. Are you familiar with 827?

3 A. Yes.

4 Q. And how are you familiar with 827?

5 A. I have previously reviewed this document.

6 Q. Now, touched on this document a few times earlier
7 and you said that you had some personal disagreement with
8 how this document was produced or the -- the research that
9 went into this document?

10 A. In -- I wouldn't say that holistically. I think
11 that there are -- there's a lot of information collected
12 and a lot of conclusions in here that I agree with, and I
13 believe are sound. There are some components of the data
14 analytics that I think are deficient or at least not
15 sufficient for my needs in my asset management role.

16 Q. Okay. So if you can identify for us, which are
17 the components of data analytics that you didn't feel were
18 sufficient for you to do your job or for your job?

19 A. Sure. Give me one minute.

20 Q. Okay. Just give us the page numbers, and I will
21 pull it up here.

22 A. Okay. In general, my reservation exists for the
23 analysis performed and summarized in section 10, starting
24 on page 37. Specific characterization of some of my
25 concerns can be found in the first paragraph. Halfway
26 down, it should be noted that this analysis is based only

1 on structure component failures reported in the 2004
2 through 2008 time period.

3 I also expressed concern with the
4 characterization of -- for the purpose of this review and
5 analysis, a "failure" is defined as assumed end of life of
6 a component thereby requiring significant maintenance or
7 replacement. It does not mean complete failure of a
8 structure.

9 Q. Okay. And why is it that -- that you have issue
10 with those statements?

11 A. I can highlight some additional things after, but
12 -- to give some context, but, in essence, what has been
13 done in a subset of time, four-year period of data was
14 first taken to represent all of history. Then the
15 analysis excluded survival data. So data associated with
16 assets that did not have a failure. So it's not looking
17 at both the failure data and -- and survival data, but
18 only a subset of the data, and I think that is
19 statistically flawed.

20 In addition, it quantifies any sort of
21 maintenance as a failure. To me, that is categorically
22 wrong. And then the last concern, I think is one that is
23 very impactful, is that it plots the -- the likelihood of
24 failure given age across the age range of the existing
25 data set. As you can imagine, at this point in time,
26 there are no assets that exceed 100 years of age. Instead

1 of leveraging the data to fit to a distribution that would
2 be representative of the expected performance of an asset
3 that degrades over time, they made assumptions to fix the
4 max age to fix to the max age of the data set, which says,
5 "Since there weren't any assets in service greater than a
6 hundred years, therefore, we're going to put a maximum to
7 it at 100 years and say the max life for an asset is a
8 hundred years," and that is statistically flawed.

9 Q. Okay.

10 BY MS. DUPRE-TOKOS:

11 Q. So, Mr. Gabbard, I understand your point of view
12 that view that a statistically flawed. Others would view
13 it as basing the statistics on real-life data, therefore,
14 increasing the data's voracity. What's your response to
15 that?

16 A. Well, I can't speak to what others would say, but
17 I can say that Quanta spoke to this specifically in the
18 report. If you look in the reference on page 38, in last
19 paragraph underneath figure 10-2. Their note says that
20 "The survival function approaches zero at age -- as age
21 increases to around 100. This is because we only analyzed
22 failed structures. There are many structures 100 years
23 old that have not failed or more likely have had component
24 replacements or significant maintenance prior to the
25 period in this data set. The oldest structure found in
26 the current notification database is 99." It goes on from

1 there.

2 It's their -- they're quantifying that their
3 data -- their limitation on their analysis is solely based
4 on the limitation of only using failure data in that time
5 period.

6 Q. So are you expecting them to project data because
7 there are no towers older than 100?

8 A. That would be what a sound statistical analysis
9 would have done.

10 Q. Under some circumstances, apparently that's your
11 belief under the scientific method. However, it's
12 generally considered perfectly statistically valid to base
13 information on the available data without doing a
14 projection.

15 Do you disagree with that? You're an engineer so
16 you should be familiar with that.

17 A. I don't understand. Can you please restate that
18 statement?

19 Q. Certainly. Under the scientific method, it is
20 perfectly statistically valid to do an analysis using
21 actual data without doing a projection. And you're saying
22 it's not valid because they did not do a projection that
23 makes it statistically invalid, and I'm pointing out that
24 under a commonly accepted scientific method and my
25 understanding from my engineering classes is it's also
26 acceptable -- accepted in the engineering world that not

1 protecting and actually relying on actual data is
2 statistically valid.

3 A. So my statement is truly based on fixing the max
4 age to the max age within a data set is arbitrarily
5 incorrect. That there is statistical methods to fit data
6 to allow the analysis to project what the right maximum
7 life would be. It doesn't mean that it necessarily has to
8 be outside of the data set, but if it is outside of the
9 data set, there are appropriate methods to calculate that
10 and they have not employed that in this data set.

11 Q. So are you disputing that there are statistically
12 valid methods that do not require projections then to fit
13 into the data set?

14 A. I'm not sure that I can answer that question. I
15 don't understand the statement.

16 Q. Well, you just said that it's statistically
17 invalid because it fixes the timeframe at 100 years, and
18 that there are methods to -- to fit in other data beyond
19 that, correct, essentially projections?

20 A. I'm saying that Quanta, as quoted, states that
21 they have arbitrarily fixed the max duration to a hundred
22 because of the limitations of the data set despite having
23 assets that are outside of the data set that have lived
24 beyond that fixed assumption. So that, by itself, says
25 that what they have done is arbitrarily fixed their --
26 their ultimate assessment without accounting for survival

1 data that is outside of that failure set.

2 Q. So what you're having an issue with is the fact
3 that they said the oldest structure found in the current
4 inventory database is 102 years old, so that's outside of
5 the fixed limit of 100. Is that your problem?

6 A. That is correct.

7 Q. Okay.

8 BY MR. NOEL:

9 Q. And also, maybe -- I kind of understood this,
10 your job with asset management is projecting into the
11 future, correct?

12 A. That is correct.

13 Q. And planning out five years or so in advance what
14 is going to need to be done, not necessarily what needs to
15 be done today, correct?

16 A. That is correct.

17 Q. So projection of asset life into the future would
18 be something that would be very important to you?

19 A. It would.

20 Q. Okay. And one of the things, as you can tell
21 since it's highlighted on the board. We might as well get
22 to it. There are many structures 100 years old that have
23 not failed or more likely have had components replaced or
24 significant maintenance prior to this period, correct?

25 A. That is correct.

26 Q. So that would assume that most hundred year old

1 structures have had significant work done on them --
2 replacement, repair, that kind of maintenance, correct?

3 A. That is correct.

4 Q. And that's another assumption that Quanta is
5 making is that these older structures are having component
6 replacement, component repair throughout their lifespan?

7 A. These are qualification that they're highlighting
8 as a potential reason for assets being able to live longer
9 is by increasing the expected life through maintenance.

10 Q. Okay.

11 A. I think that statement is made numerous times in
12 the report as an explanation for why age should not be the
13 sole piece of information used to determine whether or not
14 an asset should be replaced.

15 Q. Exactly. One of the -- one of the main focuses,
16 conclusions of the Quanta study is if you maintain these
17 structures, you can expand the lifecycle of the
18 structures, correct?

19 A. That is correct.

20 Q. And essentially proper maintenance can extend
21 them indefinitely as a matter of fact?

22 A. I don't recall if Quanta states that in the
23 report.

24 Q. Okay. But the precondition to all of that is
25 proper maintenance?

26 A. That is correct.

1 Q. All right. Executive -- go back to beginning of
2 page two, Executive Summary.

3 "Transmission line structures are critical system
4 assets that are highly reliable when constructed, loaded
5 and maintained within the original design parameters of
6 the structure and the materials employed. Structures are
7 subject" -- and I think this should say, "Structures are
8 subject to deterioration of the following types." The
9 first one being mechanical. "Deterioration of the
10 structure caused by some type of mechanical action."

11 Did I read that correctly?

12 A. Sorry, I lost you here.

13 Q. I'm sorry, it's page two. The very beginning,
14 section one of the executive summary.

15 A. I have a different page two. Oh, page double I,
16 I got it.

17 Q. Oh, I'm looking at the -- I'm look at the page
18 number on the PDF, not the page number on the bottom, I'm
19 sorry.

20 A. Oh, understood. So it's page single I.

21 Q. Page single I there.

22 A. Okay.

23 Q. So mechanical deterioration of the structure
24 caused by some type of mechanical action?

25 A. That's correct.

26 Q. Does that include body-on-body wear?

1 A. It could, yes.

2 Q. And then down below it says, "Of these
3 deterioration types mechanical and chemical are the two
4 primary concerns for steel structures;" is that correct?

5 A. That is correct.

6 Q. Mechanical deterioration can result from climatic
7 loading wind and ice. Mechanical -- that's metal fatigue due
8 to wind induced vibration, surface erosion from boring
9 particles and external forces such as vehicular or
10 ballistic impacts." And then "The primary form of
11 chemical deterioration is corrosion," correct?

12 A. That is correct.

13 Q. So the two biggest threats against these olds --
14 these old structures are mechanical deterioration and
15 chemical deterioration. Corrosion where?

16 A. Correct.

17 Q. In essence.

18 A. Correct.

19 Q. Okay. And then I'm not going to spend too much
20 time here with the Quanta report, but it goes through
21 inspection procedures based upon a -- an analysis of data
22 from, I think it says, 103 separate utilities around the
23 word, correct?

24 A. I believe so, yes.

25 Q. And the ultimate question on all of this is at
26 the end, Quanta makes recommendations about what PG&E can

1 do to extend the life of these assets, of these old
2 structures. And among those are enhanced inspections.
3 And they talk about cycles: Climbing, grounds inspections
4 and -- can you explain to us why PG&E did not ever adopt
5 any of those recommendations?

6 A. So this report was done well before my time. My
7 understanding is that this report was to look at the
8 overall asset management framework for our ageing asset
9 base and what it concluded is that age is not the -- the
10 primary driver for re -- and replacement meant, in many
11 instances, it's not the primary mitigation for effective
12 management of long-lived assets but rather highlights the
13 need for a robust inspection program, more so as assets
14 increase in age.

15 As a result of those conclusions, I understand
16 that PG&E commissioned Quanta at a later date to do a more
17 targeted analysis on its inspection program, and I have
18 not had a chance to review that report. That was done
19 under the oversight of what would have been my
20 counterpart's position tenure before to make sure that we
21 had a robust inspection program, and I can't speak to any
22 details of the findings or the actions taken.

23 Q. And when we talk about counterpart, you're
24 talking about Eric Back, correct?

25 A. His predecessor.

26 Q. His predecessor. And --

1 A. Or maybe several predecessors before.

2 Q. Right. And you've never read the 2012 inspection
3 procedures report, correct?

4 A. I have not.

5 Q. Okay. But I think you characterized this very
6 well. Age isn't necessarily the primary driver of
7 failure, correct?

8 A. Correct.

9 Q. Replacement doesn't have to be the primary
10 mitigation for these structures, correct?

11 A. Correct.

12 Q. And -- in final conclusion, what Quanta is saying
13 is the primary mitigation is a thorough, vigorous
14 inspection cycle to keep any on these old structures and
15 basically head off problems before they occur, correct?

16 A. That is correct.

17 Q. So I know it's before your time, but do you have
18 any idea of why PG&E has gone the opposite direction?

19 A. I don't know that I can agree with that
20 characterization or counter it. I'm not familiar with the
21 actions taken in this space.

22 Q. Okay. Well, let's say, for instance, in 1987,
23 PG&E policy required one detailed ground inspection
24 including climbing of five percent of every tower line and
25 two aerial patrols per year for every asset. In 1995,
26 that was reduced to one ground inspection, one aerial

1 patrol on alternating years and climbing inspections were
2 eliminated. In 2005, that was reduced further to four
3 aerial patrols and a ground inspection every fifth year.
4 So basically every five years you're doing a ground
5 inspection, and then in the in-between years, you're doing
6 an aerial patrol.

7 In addition, they've minimized the air patrols
8 from spending seven, eight or more hours inspecting or
9 patrolling a transmission line to doing it in two to three
10 hours, which means you'll fly higher and fly faster.

11 So my question is that at the time you were in
12 charge of transmission asset management and you were using
13 those -- that inspection data to inform future projects to
14 mitigate the risks that we have talked about. Can you
15 explain why PG&E is lessening the inspections of these
16 assets as they're ageing?

17 A. I cannot.

18 MR. NOEL: It is just about noon, before we go onto
19 the next, do you want to break for lunch?

20 GRAND JURY FOREPERSON: Yes.

21 MR. NOEL: What I am trying to say is this is the
22 perfect time to break for lunch recess.

23 GRAND JURY FOREPERSON: Yes.

24 Okay. Mr. Gabbard, you are admonished not to
25 discuss or disclose at any time outside of this jury room
26 the questions that have been asked of you or your answers

1 until authorized by this grand jury or the Court.

2 A violation of these instructions on your part
3 may be the basis for a charge against you of contempt of
4 court. This does not preclude you from discussing your
5 legal rights with your own attorney.

6 Mr. Gabbard, what I have just said is a warning
7 not to discuss this case with anyone except the Court,
8 your lawyer, or the district attorney.

9 THE WITNESS: Understood.

10 GRAND JURY FOREPERSON: And we will recess for lunch
11 and be back in an hour and a half. So 1:30?

12 MR. NOEL: Yes, ma'am.

13 GRAND JURY FOREPERSON: Okay. 1:30. See you then.

14 [Recess taken from 11:58 a.m. until 1:31 p.m. whereupon
15 the grand jury comes to order in Courtroom 9.]

16
17 THE COURT: All members of the grand jury are present
18 and ready the proceed. We will take the role now.

19 GRAND JURY SECRETARY: Juror number one?

20 GRAND JUROR NUMBER ONE: Here.

21 GRAND JURY SECRETARY: Juror number two?

22 GRAND JUROR NUMBER TWO: Here.

23 GRAND JURY SECRETARY: Juror number three?

24 GRAND JUROR NUMBER THREE: Here.

25 GRAND JURY SECRETARY: Juror number four?

26 GRAND JUROR NUMBER FOUR: Here.

1 GRAND JURY SECRETARY: Juror number five?
2 GRAND JUROR NUMBER FIVE: Here.
3 GRAND JURY SECRETARY: Juror number six?
4 GRAND JUROR NUMBER SIX: Here.
5 GRAND JURY SECRETARY: Juror number seven?
6 GRAND JUROR NUMBER SEVEN: Here.
7 GRAND JURY SECRETARY: Juror number eight?
8 GRAND JUROR NUMBER EIGHT: Here.
9 GRAND JURY SECRETARY: Juror number nine?
10 GRAND JUROR NUMBER NINE: Here.
11 GRAND JURY SECRETARY: Juror number ten?
12 GRAND JUROR NUMBER TEN: Yes.
13 GRAND JURY SECRETARY: Juror number eleven?
14 GRAND JUROR NUMBER ELEVEN: Here.
15 GRAND JURY SECRETARY: Juror number thirteen?
16 GRAND JUROR NUMBER THIRTEEN: Here.
17 GRAND JURY SECRETARY: Juror number fourteen?
18 GRAND JUROR NUMBER FOURTEEN: Here.
19 GRAND JURY SECRETARY: Juror number fifteen?
20 GRAND JUROR NUMBER FIFTEEN: Here.
21 GRAND JURY SECRETARY: Juror number seventeen?
22 GRAND JUROR NUMBER SEVENTEEN: Here.
23 GRAND JURY SECRETARY: Juror number eighteen?
24 GRAND JUROR NUMBER EIGHTEEN: Here.
25 GRAND JURY SECRETARY: All members of the grand jury
26 are present.

1 GRAND JURY FOREPERSON: Okay. Before we get started,
2 we have a task and that is to decide what we're going to
3 do when we deliberate. Show-up wise, are we going to
4 still do Mondays -- or Tuesdays, Fridays, or do you have
5 other things in mind? What are your thoughts?

6 GRAND JUROR NUMBER FOUR: I think Tuesday and Friday
7 is probably a pretty good schedule. I think we will
8 probably have the time we need.

9 GRAND JUROR NUMBER THREE: I'm kind of stuck with
10 that for work.

11 GRAND JUROR NUMBER FIFTEEN: Yes, I agree.

12 GRAND JUROR NUMBER THREE: They're already working
13 with me.

14 GRAND JUROR NUMBER NINE: We can decide -- can we
15 decide we go along if we need more time or not?

16 MR. NOEL: Yeah, yeah.

17 GRAND JURY FOREPERSON: I think that Marc said that
18 we could.

19 GRAND JUROR NUMBER FIFTEEN: Yeah, you can.

20 GRAND JURY FOREPERSON: He said we could request it.
21 So -- okay. So for now, I would just like to go down and
22 have each and every person let us know what you want to
23 do.

24 GRAND JUROR NUMBER TWO: Tuesday, the same schedule
25 is fine for me.

26 GRAND JUROR NUMBER THREE: Tuesday, Friday.

1 GRAND JUROR NUMBER FOUR: Tuesday, Friday.
2 GRAND JUROR NUMBER SIX: Tuesday and Friday is okay.
3 GRAND JUROR NUMBER SEVEN: Agree.
4 GRAND JUROR NUMBER EIGHT: Tuesday, Friday is fine.
5 GRAND JUROR NUMBER NINE: Tuesday, Friday.
6 GRAND JUROR NUMBER TEN: The current is fine.
7 GRAND JURY FOREPERSON: I'm sorry?
8 GRAND JUROR NUMBER TEN: The current is fine.
9 GRAND JUROR NUMBER FIFTEEN: Yes, agree.
10 GRAND JUROR NUMBER THIRTEEN: That's fine.
11 GRAND JUROR NUMBER FOURTEEN: Seven days a week.
12 What's the matter, Marc?
13 GRAND JURY FOREPERSON: I think -- I think you're out
14 numbered.
15 GRAND JUROR NUMBER FOURTEEN: The sooner the better.
16 GRAND JURY FOREPERSON: Tuesday and Friday?
17 GRAND JUROR NUMBER FOURTEEN: Tuesday and Friday.
18 GRAND JURY FOREPERSON: Okay.
19 GRAND JUROR NUMBER EIGHTEEN: Tuesday, Friday is
20 good.
21 GRAND JUROR NUMBER FIVE: I'm good.
22 GRAND JUROR NUMBER SEVENTEEN: Monday, Tuesday,
23 Friday.
24 GRAND JURY SECRETARY: I can't do Mondays, but
25 Tuesday and Friday still work fine for me.
26 GRAND JURY FOREPERSON: All right. Tuesday and

1 Friday it is.

2 MR. NOEL: Okay, so I will inform the clerk that at
3 least to start with, it'll be Tuesday, Friday, and then if
4 we start getting close to that 24th deadline, you may want
5 to increase that, for instance, a weekend or nights.
6 You'll be looking at, I think, it's -- what is it, the --
7 the 6th is a Friday, the 13th, so we'd be looking at
8 Saturday the 21st and Sunday the 22nd as being possible if
9 necessary.

10 GRAND JURY SECRETARY: Is it possible instead of
11 meeting on a weekends to meet longer during the week?

12 MR. NOEL: Again, that's --

13 MS. DUPRE-TOKOS: Yes.

14 MR. NOEL: -- up to you guys.

15 MS. DUPRE-TOKOS: Yes.

16 MR. NOEL: Just need to clear that. The court needs
17 to make -- make the arrangements for it.

18 GRAND JURY FOREPERSON: Okay. But, for now, we can
19 just leave it like it is until we start getting close.

20 MR. NOEL: Yeah. For now, Tuesday and Friday.

21 THE COURT: Okay. All right. That's all I wanted to
22 know. So we're ready the start.

23 GRAND JUROR NUMBER FOURTEEN: Do we need to really
24 listen to the rest of the witnesses? Can we go on to
25 deliberate or do we -- is it that important that we listen
26 to them?

1 MR. NOEL: It's always important to listen to them.

2 MS. DUPRE-TOKOS: Are you telling us you don't want
3 to hear anymore witnesses?

4 GRAND JURY FOREPERSON: Garbage in, garbage out.

5 MR. NOEL: Define "garbage."

6 MS. DUPRE-TOKOS: That was very good.

7 MR. NOEL: But also remember that we're not only
8 looking for inculpatory, but there's also the possibility
9 of exculpatory evidence that can come in through any of
10 these witnesses and that obviously needs to be considered
11 also.

12 So if I -- it sounds like what you're saying is
13 you think -- that you've got enough evidence at this
14 point?

15 GRAND JUROR NUMBER FOURTEEN: Well, my thinking is is
16 I don't want to be in a rush to make a decision.

17 MS. DUPRE-TOKOS: Right.

18 GRAND JUROR NUMBER FOURTEEN: That's my thing. If
19 we've pretty much listened to a lot of it, then let's get
20 on with it.

21 MS. DUPRE-TOKOS: Yep.

22 MR. NOEL: Well, assuming that you start
23 deliberations on the 10th, that is going to give you two
24 and a half weeks, or if you do five sessions at the very
25 least.

26 GRAND JUROR NUMBER FOUR: 40 hours.

1 MS. DUPRE-TOKOS: Right, at the very least. If you
2 need more, you'll have to plan ahead so that we can
3 increase it and work with the court to get you the -- you
4 know, keep the building open longer for evenings or
5 something if that's what you want to do as opposed to
6 weekends. Because I saw some of your reactions when
7 weekends were mentioned so I know that's not an option.

8 GRAND JUROR NUMBER EIGHTEEN: How are you going to
9 get the cops to be here at night, the sheriff's deputies?

10 MS. DUPRE-TOKOS: The --

11 GRAND JUROR NUMBER FOUR: They can do shift work.

12 GRAND JUROR NUMBER EIGHTEEN: They don't like us
13 being here after 4:30.

14 MS. DUPRE-TOKOS: Yeah, they'll --

15 GRAND JUROR NUMBER FOUR: They have night shifts.

16 MS. DUPRE-TOKOS: They'll bring someone else up.

17 MR. NOEL: Well, and -- and -- a part of that is, of
18 course, with the state and county budget that overtime
19 needs to be cleared first and -- you know, I know that if
20 need be Sheriff Honea will clear the overtime.

21 GRAND JUROR NUMBER FOUR: Is there any chance that we
22 will get the case before the 10th of March?

23 GRAND JUROR NUMBER EIGHTEEN: Not likely.

24 MS. DUPRE-TOKOS: The only way that will happen is if
25 we are able to do your summations on the 3rd, which is
26 next Tuesday, and finish them that day, you would start

1 the case on the 6th. And we can aim for that.

2 MR. NOEL: Yeah, we will try -- try our best to get
3 it to you sometime on the 6th.

4 GRAND JURY FOREPERSON: But we don't want to be
5 rushed either.

6 MR. NOEL: Right.

7 GRAND JUROR NUMBER NINE: No, we don't.

8 MS. DUPRE-TOKOS: Right.

9 GRAND JUROR NUMBER SIX: Can I ask a question about
10 the law. Let's -- assuming that jury wants to indict PG&E
11 for negligent homicide, okay?

12 MR. NOEL: Yeah.

13 GRAND JUROR NUMBER SIX: And so what -- what is it --
14 and let's assume that they are found guilty. What is the
15 consequences of that -- of that verdict to PG&E?

16 MR. NOEL: That will be up to a judge down the road.
17 You know, realistically, probation.

18 MS. DUPRE-TOKOS: But -- hang on, Marc. But, again,
19 I'm assuming as someone from a regular jury that is not to
20 be considered so we shouldn't go into that.

21 MR. NOEL: That's true.

22 GRAND JUROR NUMBER EIGHTEEN: Aren't they already on
23 probation?

24 MS. DUPRE-TOKOS: You're not supposed to factor in
25 punishment in any way, so we're not going to talk about
26 that.

1 GRAND JUROR NUMBER SIX: Okay.

2 MS. DUPRE-TOKOS: I'm no fun.

3 MR. NOEL: So forget about the issue of punishment.

4 GRAND JURY FOREPERSON: Okay.

5 MS. DUPRE-TOKOS: That's the judge's job.

6 MR. NOEL: Okay. Are we ready?

7 GRAND JURY FOREPERSON: Are we ready for the witness?

8 GRAND JUROR NUMBER SEVENTEEN: I just want to make a

9 comment. So I'm taking it the reason why we're keeping

10 these witnesses scheduled on the schedule is because

11 they're important to factor in in our decision?

12 MS. DUPRE-TOKOS: We believe they have information

13 that you should hear whether it's inculpatory or

14 exculpatory.

15 GRAND JUROR NUMBER SEVENTEEN: Okay.

16 MS. DUPRE-TOKOS: We're obligated to put on

17 exculpatory evidence as well as inculpatory evidence since

18 there's no defense attorney here.

19 MR. NOEL: And the final witnesses, like we said, on

20 Friday were not the final witnesses, but on Friday will be

21 on the experts.

22 MS. DUPRE-TOKOS: They might be final witnesses.

23 MR. NOEL: They might be final. And they'll be here

24 to explain what they've been working on.

25 GRAND JUROR NUMBER SEVENTEEN: Sounds good.

26 MS. DUPRE-TOKOS: Any other questions? Ready to get

1 back to Mr. Gabbard?

2 GRAND JUROR NUMBER NINE: We're so excited.

3 [Witness enters the courtroom.]

4 GRAND JURY FOREPERSON: Mr. Gabbard, you're still
5 under oath.

6 THE WITNESS: Thank you.

7 GRAND JURY FOREPERSON: Have a seat, please. Thank
8 you.

9 BY MR. NOEL:

10 Q. Earlier, and on -- on Friday, we had discussed
11 some your issues with the Quanta report that we just
12 clarified before lunch as being that it was not
13 prospective. It did not project out into the future,
14 correct?

15 A. To an extent, yes.

16 Q. Okay. And I think on Friday, you mentioned that
17 steps had been taken to do other research into that very
18 question, correct?

19 A. So I characterize our previous that although the
20 references were -- were forward-looking continuous
21 improvement statements that the intent was there. I can't
22 say that we actually made progress on that front.

23 Q. Okay. And you mentioned earlier Max Tuttmann.
24 And Max Tuttmann was a doctoral candidate from MIT that was
25 working for PG&E, correct?

26 A. Yes.

1 Q. And you have in front of you what's marked as
2 Exhibit 1345. Do you recognize 1345?

3 [Exhibit No. 1345 was identified.]

4 THE WITNESS: I believe I have seen this before.

5 BY MR. NOEL:

6 Q. Okay. And this document is entitled Development
7 of a Sustainable Transmission Structure Replacement and
8 Maintenance Strategy by Max Tuttmann, correct?

9 A. That is correct. And to clarify, I don't believe
10 he was a doctoral candidate. I think he was studying for
11 his masters --

12 Q. Oh, okay.

13 A. -- here.

14 Q. All right. Oops, all of a sudden our computer
15 just -- oh, forgot to plug it in. All right.

16 All right. I just wanted to go over a couple of
17 things in this with you. Oh, I already took the binder
18 out.

19 So first of all, this document, Mr. Tuttmann's
20 document deals with developing a strategy to prolong the
21 life of steel transmission structures; is that correct?

22 A. In part, yes.

23 Q. Okay. And the main focus on Mr. Tuttmann's
24 document is corrosion, correct?

25 A. That is correct.

26 Q. Okay. And it deals with developing a --

1 essentially a painting strategy to minimize corrosion and
2 extend the life of electric or steel transmission
3 structures; is that correct?

4 A. That is correct.

5 Q. All right. So just a couple of points I wanted
6 to ask you about on here first.

7 First one is going to be on page 15, and in
8 section 1.2, Industry Background and Motivation. And,
9 specifically, the sentence starting with The American
10 Society of Civil Engineers. And it states, "The American
11 Society of Civil Engineers estimates that the accumulative
12 investment gap for all electric" -- "electricity
13 infrastructures in the United States including generation
14 and T&D will be 177 billion between 2016 and 2025."

15 A. Can we pause for one second? I was looking at 17
16 of the document.

17 Q. Oh, sure.

18 A. You're on 17 in the PDF.

19 Q. Yeah.

20 A. So that's 1.2.

21 Q. Yeah, section 1.2.

22 A. Okay. Got it, thank you.

23 Q. All right. And then it goes on to state, "The
24 ASCE," which is the American Society of Civil Engineers,
25 "has subsequently given the energy sector as a whole, a
26 D-plus grade on their infrastructure report card

1 indicating that the system is in poor to fair condition
2 with many elements approaching the end of their service
3 life and exhibited significant deterioration."

4 Did I read that correctly?

5 A. You did.

6 Q. Are you familiar with the study by the American
7 Society of Civil Engineers?

8 A. I am not.

9 Q. All right. It goes on to state, "A similar
10 conclusion was reached in 2003 by the Department of
11 Energy, who pronounced the U.S. electricity grid, ageing
12 inefficient, congested and incapable of meeting the future
13 energy needs of the information economy without
14 significant operational changes and substantial public,
15 private and capital investment over the next several
16 decades."

17 Did I read that correctly?

18 A. Yes, you did.

19 Q. Are you familiar with the 2003 opinion of the
20 Department of Energy?

21 A. No, I have not read that citation.

22 Q. Okay. Would you agree with me that this concept
23 of an aging and deteriorating grid, utility
24 infrastructure, has been a known issue at least since the
25 early 2000s?

26 A. Yes.

1 Q. And based upon your knowledge of PG&E, what steps
2 has PG&E completed to this point to remedy the aging,
3 inefficient, congested infrastructure? Good point. The
4 -- and we're talking about the electro transmission
5 infrastructure here, if I didn't state that.

6 A. Okay. So my -- at a very high level, my answer
7 would be that our efforts to mitigate risk associated with
8 ageing infrastructure would be slightly different than the
9 actions taken to alleviate congestion issues.

10 Q. Okay.

11 A. We have, I'd say, multiple parallel processes,
12 work hand-in-hand with the California ISO to understand
13 the current existing constraints, and then future needs of
14 the transmission system in order to identify and get
15 approval for investments and modifications to our
16 transmission infrastructure to meet the continued needs of
17 the transmission system in the state of California.

18 So those would be more modifications to the
19 overall transmission ptychography, changes in capacity in
20 order to meet the change in generation mix as well as any
21 changes in the load characteristic on our system. In
22 parallel we've also invested in aging infrastructure, and
23 our investments in aging infrastructure have continued to
24 increase over time, and I can speak definitively to the
25 timeframe for which I have been involved in transmission,
26 our transmission investments and replacements of aging

1 infrastructure have increased on a regular -- continuously
2 over that time period. I can't speak definitively back to
3 2003, though.

4 Q. Okay. Of that -- of the investment in the aging
5 infrastructure, to your knowledge, how much has that been
6 invested in modernizing and preventative maintenance of
7 the oldest transmission lines in the PG&E inventory?

8 A. I don't know that answer.

9 Q. Okay. Does PG&E treat all of the aging
10 infrastructure equally across its inventory?

11 A. Can you define what you mean by "treats equally"?

12 Q. Go ahead.

13 BY MS. DUPRE-TOKOS:

14 Q. Well, we've -- we've heard from you and from
15 others that the towers in the Bay tend to be treated
16 differently than, say, towers in the Feather River Canyon.
17 But if you're talking about investing in aging
18 infrastructure, are you doing completely equal investments
19 in the aging infrastructure in the Feather River Canyon as
20 you're doing on the Bay area towers? Or basically, is --
21 are all of them -- if you have 20, 90-year old towers run
22 across your entire system, are they all getting the exact
23 same amount of investment in terms of repair, replacement,
24 inspection or are the ones in the Bay area getting a
25 little bit more attention?

26 A. -okay. I understand the question. So I will

1 answer it in two ways.

2 One, I would say, first, the level of investment
3 across our asset base is not equal across the entire
4 service territory. It's differentiated based on different
5 factors that are considered, either from a risk standpoint
6 where a risk is quantified or based on operational
7 characteristics on needs or other character -- other
8 criteria based on set programs whether it be based on
9 capacity needs or other -- other things of that nature.

10 So met -- the methodology that we have in place
11 for evaluating the diversity of risk across our system and
12 diversity of system needs will differentiate the
13 investments across our service territory.

14 On the other side of the answer, I will say that
15 that methodology is consistently applied across all of the
16 assets within our service territory. So if we prioritize
17 investment in structures that are in a higher corrosion
18 zone than lower, because we think the corrosive nature of
19 the environment around those assets may translate to a
20 higher probability of failure then that methodology or
21 approach would be applied consistently across the service
22 territory. And so we -- one -- one tower that may be
23 adjacent to the city of San Francisco that is in a higher
24 corrosion zone would be evaluated consistently with one
25 that is adjacent to the Delta inland, you know, closer to
26 the middle part of the state.

1 Q. Okay. Couple of follow-ups on that. So first of
2 all, you stated on Friday that your entire service area is
3 in a corrosion zone.

4 A. Some corrosion zone or another. We have
5 characterized our corrosion zones between high, all the
6 way down to low.

7 Q. Okay.

8 A. I think they're corrosion zone 1, 2 3, 4, 5, if
9 I'm not mistaken. So we have quantified the corrosion
10 zone. My last answer was referencing high corrosion.

11 Q. Okay.

12 A. Thank you for the clarification.

13 Q. Okay. Now, your first answer -- your first part
14 of the answer, you talked about, yeah, there may be
15 differentiation based on risk if risk has been quantified.
16 But that's keeping in mind that -- as we talked about on
17 Friday, risk in part is informed by the information you
18 receive from the field, correct?

19 A. That is correct.

20 Q. And so, again, if you're not getting good
21 information from the field, you're not necessarily having
22 well-informed risk decisions?

23 A. Potentially, yes.

24 Q. Okay. So using risk as a major motivator or
25 decision factor, does not necessarily take into account
26 everything that could be going on with aging

1 infrastructure. Would that be accurate?

2 A. Yes.

3 Q. Thank you.

4 BY MR. NOEL:

5 Q. Thank you. All right. Try to keep this quick.

6 Moving onto -- you should have the big binder in front
7 you, which is Exhibit 1349. Sorry, hitting the wrong
8 button. Do you see Exhibit 1349?

9 A. Yes, I do.

10 Q. What is Exhibit 1349?

11 A. This appears to be PG&E 2017 RAMP filing.

12 Q. Okay. Can you explain to us what a RAMP filing
13 is?

14 A. Sure thing. So under CPUC regulation, the state
15 of California initiated a proceeding to transform our rate
16 filing process. What has generally just been a general
17 rate case was restructured to take the form of three
18 subsequent proceedings. The first of which is the SMAP
19 proceeding. That will be the Safety Modeling Assessment
20 Proceeding. That proceeding would lay the framework for
21 consistent methodology for quantifying risk attributes and
22 measuring against that quantification with input from
23 external stakeholders, the utility, CPUC and others. That
24 proceeding was intended to complete prior to the next
25 phase, but in the initial iteration of this process or the
26 implementation of the profession, it did not. So it was

1 running in parallel with the RAMP phase, which is the Risk
2 Assessment Mitigation Phase.

3 The RAMP assessment was an effort to actually
4 model the risk across PG&E's infrastructure in alignment
5 with the methodologies that are established with within
6 the SMAP proceeding in order to have a consistent
7 framework for quantifying both risk associated with our
8 assets, and then the reduction in risk associated with our
9 proposed investments in our infrastructure.

10 So they modeled and quantified those
11 characteristics. The proposed mitigations that were --
12 that that risk reduction characteristic was modeled for,
13 those proposed investments were then shown in our general
14 rate case testimony, which says these are the things that
15 PG&E intended to do to reduce risk on our system and here
16 is the associated revenue requirement necessary for us to
17 make those prudent investments.

18 Q. Thank you. Okay. Go through this really quick.
19 Chapter 10, which starts on page 300 of the PDF. I don't
20 think there are page numbers. Yeah, it starts at Section
21 10.1, so they're not consecutive page numbers. If you
22 flip back to that. And this is the -- the section of the
23 RAMP dealing with risk assessment mitigation for
24 transmission overhead conductors, correct?

25 A. Yes.

26 Q. And this section deals with recognized risks and

1 how PG&E is addressing those risks with transmission
2 overhead conductors; is that correct?

3 A. That is correct.

4 Q. With one exception, correct, wildfire has its own
5 section?

6 A. That is correct.

7 Q. It keeps telling us throughout this document.
8 We're not talking about wildfire, go to Chapter 11.

9 All right. So executive summary starts off with
10 and it talks about the inherent risk associated with the
11 overhead transmission conductors. Do you see that?

12 A. Are you referencing the highlighted section?

13 Q. Yeah. Or just the -- the basics. It says,
14 "Because of these attributes, there are inherent risks
15 associated with overhead transmission conductors. Contact
16 with these conductors could result in injuries and
17 fatalities from shock and electrocution and failure to
18 these conductors could result in large outages or system
19 instability. The risk continues to be a top priority for
20 PG&E as demograted[sic]" -- "demonstrated," -- sorry -- "
21 through ongoing investments and conductor replacement
22 compliance and public safety programs."

23 That's the -- basically the -- the objective --
24 the executive summary here, correct?

25 A. Yes.

26 Q. And then it goes down again to qualify it, "Given

1 this backdrop, it's important to note that the scope on
2 this risk analysis specifically excludes wildfire, but the
3 Transmission Overhead Conductor is included as a risk
4 driver to wildfire risk analysis;" is that correct?

5 A. Yes, it is.

6 Q. All right. And then, "Risk assessments:
7 Overhead transmission lines that are energized to high
8 voltage are exposed to the public and form the backbone of
9 PG&E electrical system;" is that correct?

10 A. Yes.

11 Q. And that means that these transmission lines are
12 inherently dangerous, correct?

13 A. Yes.

14 Q. And -- ah hah. I believe this is figure 10-1.
15 It's where I was going, you talked to us earlier about
16 bow-tie methodology. And so, my understanding is this is
17 an example of the -- the risk bow-tie; is that correct?

18 A. Yes, it is.

19 Q. Can you kind of walk us through this and explain
20 to us how we should read and interpret the risk bow-ties?

21 A. So the very high level, the circles --

22 MS. DUPRE-TOKOS: And you can get up, if you want, if
23 --

24 MR. NOEL: Yeah.

25 MS. DUPRE-TOKOS: -- that's easier for you.

26 THE WITNESS: Okay. So at the high level, the center

1 of the risk bow-tie, which is represented here by multiple
2 potential events that could occur. This is the -- the
3 foundation for the risk bow-tie, which is the risk event
4 itself, which defines the -- it's really the foundation
5 that we can anchor off to understand what's the
6 probability of that event occurring and what's the
7 associated consequence.

8 So here we have defined an event in numerous
9 ways, which would be either energized wires down, which
10 means the wire comes out of the air, it's on the ground
11 and that could be a potential risk for the general public
12 walking by and potentially being electrocuted. We also
13 have contact with energized conductor. The reason that's
14 been highlighted is that there is an inherent risk around
15 our transmission facilities specifically that we've had
16 issues in the past with individuals climbing our towers in
17 order to either intentionally or unintentionally get --
18 you know, defining those potential events that -- that
19 we-- that have occurred or could occur, we quantify the
20 driver that we previously talked about as a potential
21 factor that could contribute to the likelihood of that
22 event occurring.

23 On the other side of the bow-tie, we quantify the
24 consequences that define if that event were to occur, what
25 sort of negative outcomes could result? And those show up
26 in a number of forms including safety, and we quantify

1 that in our RAMP filing in terms of injury or fatality,
2 environmental, reliability, and then we have a number of
3 other factors that have been included in the past. But in
4 different iterations of our modelling, we've excluded or
5 included them. I think in this -- in the RAMP filing or
6 the subsequent proceedings, some of these components
7 around compliance, implications and trust have been
8 excluded, and financial has purely been accounted for only
9 in the economic evaluations of proposed mitigations.

10 Q. Okay. And just to make sure we understand the
11 terms "compliance" would relate to the regulatory
12 agencies, correct?

13 A. Yeah.

14 Q. CPUC, ISO, NERC, FERC -- however you need to list
15 them out.

16 A. I think you did a pretty good job there. And,
17 though, in this context it would be specific to the
18 consequences associated with this. So if we were found to
19 be out of compliance with a regulation, would there be a
20 potential fine or impact to our operations that could
21 adversely impact PG&E as a whole.

22 Q. And "trust" would refer to public trust in the --
23 the company?

24 A. Correct.

25 Q. And then financial would be the ultimate
26 financial affect -- I kept thinking punishment, it's not

1 necessarily punishment, it would be the financial effect
2 on the company in terms of, say, civil suits. That would
3 be the biggest one, correct?

4 A. Financial can take multiple forms.

5 Q. Okay. Other than, say, civil suits, what else
6 would be included in there?

7 A. For example, I think financial would be inclusive
8 of even just operating costs. So, for example, if we were
9 to lose a line that would tie into Diablo Canyon Nuclear
10 Power Plant that could make the nuclear generation
11 unavailable to the market, could put upward pressure on
12 market pricing, adversely impacting rates for our
13 customers.

14 So it's not just about profits or below the line
15 costs, but also financial impacts to our overall
16 operation.

17 Q. Okay. All right. So let's skip down here. Come
18 on, sucker. There is stuff that is highlighted that we
19 don't necessary need to talk about. So skip onto section
20 5 of 10, which is the current mitigation plan. And the
21 items listed in here, I assume, are the items -- the
22 mitigations that PG&E has taken to address the risks of
23 the overhead technology; is that correct?

24 A. So in this context, I think what would be helpful
25 is the -- the terminology and the modeling framework was
26 structured so that any investments that had been

1 previously made or were being made in the previous general
2 cases were considered controls and those were set at a
3 baseline. And then mitigations were defined as any
4 proposed incremental assessment to those investments to
5 those historic investments in our various risk mitigation
6 activities.

7 So if we were regularly replacing a hundred miles
8 of conductor a year, if we were coming into this GRC, we
9 would say that was just an existing control. If we said
10 we're proposing to go to 200 miles a year, that would have
11 been listed as a specific mitigation for the 2017 to 2019
12 GRC period. These are categorizations of different areas
13 of incremental investments we intended to make in our 2017
14 through '19 GRC filing.

15 Q. Okay. And so that -- that's what I was going to
16 ask. It says, "This mitigation will be performed on
17 approximate average of 70 circuit miles per year between
18 2017 and 2019."

19 Did I read that correctly?

20 A. Can you point me to where you're reading?

21 Q. Yes. It's right down here at the bottom. "This
22 mitigation will be performed on approximate average of
23 seven circuit miles per year between 2017 and 2019,
24 targeting primarily 60 kilovolt and 115 kV circuits."

25 Is that seven total or seven more than you've
26 been previously doing?

1 A. I would have to verify.

2 Q. Okay. Next one is insulator replacement. And
3 down at the bottom, it says, "This mitigation will be
4 performed on approximate average of 59 miles per year
5 between 2017 and 2019;" is that correct?

6 A. That is correct.

7 Q. And, again, is that 59 miles total or 59 miles
8 more than you were doing, say, in 2016?

9 A. I believe all of these are incremental, but I
10 would have to check.

11 Q. Okay. And then, section 16 is the proposed
12 mitigation plan. It says, "PG&E performed an evaluation
13 of all mitigations considered and had how each relates to
14 the TOHC risk drivers. The mitigations included in the
15 proposed plan are listed below. The mileages referenced
16 are approximations and may change as project plans are
17 completed and finalized."

18 Did I read that correctly?

19 A. Yes, you did.

20 Q. And it says, "M1D, this mitigation represents an
21 increase to the conductor replacement work previously
22 described in a mitigations M1A and M1B. To further reduce
23 exposure related to equipment failure conductor and
24 equipment failure connector hardware, wire-down drivers.
25 It increases overhead transmission conductor replacements
26 from an average of seven miles per year in 2017 to an

1 approximate average of 26 miles per year, 2022. 2020
2 through 2022."

3 A. That is correct. And I am going to clarify my
4 previous statement. My reference to the previously
5 approved mitigation plan, and then the incremental.

6 Q. Yes.

7 A. It's actually the '17 through '19 was the
8 previous GRC. The '20 through '22 is what we were
9 proposing to increase too.

10 Q. Okay. So '17 through '19, averaging seven miles
11 of conductor replacement per year, and the plan was to up
12 that to 26 miles per year in 2020 to 2022?

13 A. That is correct.

14 Q. Okay. And how were the -- how was the decision
15 made on what conductor was going to be replaced?

16 A. So the methodology for identifying what conductor
17 to replace as part of a proactive replacement program is
18 done by evaluating, leveraging the criteria set in the
19 asset management plans in whatever iteration of -- of plan
20 criteria that we have in place at that time. When we
21 identify new work on the transmission system, we are
22 identifying it for year six in our five-year plan.

23 Q. Uh-huh.

24 A. So at any given year, we are identifying work to
25 be initiated for five to six years down the road so that
26 the necessary early-stage planning activities can be

1 completed to execute on the time scale that the
2 transmission requires with multiyear permitting
3 engineering and construction activities.

4 The conductor replacements that are proposed for
5 2020 through 2022 would have likely been identified in the
6 2015 to '17 timeframe. So depending on the iteration of
7 asset management strategy in that period of time, that
8 methodology would have been used to prioritize what
9 circuits required replacement before others based on the
10 risk of those associated circuits.

11 Q. Right. And then by 2018, you're pushing that out
12 to 2023 and 2024 in terms of plans; is that correct?

13 A. That is correct.

14 Q. So I guess the ultimate question is, we know that
15 Caribou-Palermo was not slated for the conductor
16 replacement, how is a 100-year old line, a 100-year old
17 conductor that the company doesn't even know what it is
18 really or who manufactured it, not get slated for
19 replacement under this program?

20 A. Are you asking in 2017?

21 Q. Yes.

22 A. So in 2017, the Caribou-Palermo line was
23 evaluated against the set criteria in our asset strategy,
24 which took into account a number of factors. Based on
25 that calculation, it fell in the medium to high medium
26 risk area. I would have to look back in our -- our asset

1 management plan results to know exactly where it fell.
2 The driver for that is, although we had significantly
3 modified our asset management strategy in 2017 and '18 in
4 the wake of the 2017 North Bay fires, our methodology
5 accounted for -- was not 100 percent focused on just fire
6 risk but also risk to public safety, impacts to
7 reliability and other characteristics. As all of those
8 factors came into play. Those lines, they were a high
9 fire threat district that also served a significant amount
10 of customers and had poor performance historically moved
11 to the top of the list as far as highest risk, and then
12 while Caribou-Palermo was categorized on the top end of
13 our thousand lines that we quantify the risk for, it was
14 not the top of that list compared to the other assets
15 within our asset base.

16 Q. Okay. So you bring up the 2017 wildfires, is
17 there a procedure in place if the mitigation or
18 maintenance plan needs to be changed suddenly?

19 A. Say that one more time.

20 Q. Is there a procedure in place if the mitigation
21 maintenance plan needs to be changed suddenly instead of
22 going out six years?

23 A. You mean -- okay. So let me -- let me ground
24 myself. So the timeline associated with six years is
25 anchored on the fact that we need to get significant
26 permitting under California Environmental Quality Act for

1 major instruction. So that's an acknowledgment that there
2 is a long duration to rebuild transmission lines. If we
3 find facilities that need immediate replacement, we do
4 have emergency programs. In those programs that we walked
5 through major work category 70, major work category 94,
6 major work cate -- there's major work category 59 among
7 others that are emergency programs that are funding
8 available for immediate actions that need to be taken.

9 More often than not, immediate actions that
10 cannot allow for the necessary time to go through CEWA and
11 other long duration permitting will result in immediate
12 emergency repair in order to buy sufficient time to be
13 able to go through the necessary legal and regulatory
14 steps necessary for a full rebuild.

15 Q. Okay. And that leads to the next question, which
16 is these mitigations replacing 26 miles of -- of overhead
17 conductor, replacing a 139 miles of insulators, those are
18 separate and apart from any emergency repairs and
19 replacements you would have to make, correct?

20 A. That is correct.

21 Q. So for instance, like I said, 2017, with the
22 North Bay fires, there were transmission lines that were
23 heavily damaged and needed to be replaced, correct?

24 A. That is correct.

25 Q. And that would not figure into those -- what --
26 those lines that needed to be replaced would not figure

1 into the 26 miles or -- I'm sorry, the seven miles per
2 year, say, in 2018?

3 A. I believe that is correct.

4 Q. Okay. All right. And now we get to Chapter 11,
5 which is the section dealing with wildfire. You there?

6 A. Yes.

7 Q. Okay. And this section deals with identifying
8 risk of wildfires and what mitigations PG&E has put in
9 place to deal with those risks.

10 A. Yes.

11 Q. So it starts off, "Extreme weather, extended
12 drought and shifting climate patterns have intensified the
13 challenges associated with wildfire management in
14 California. Environmental extremes such as drought
15 conditions followed by periods of wet weather can drive
16 additional vegetative growth and influence both the
17 likelihood and severity of extraordinary wildfire events."

18 Did I read that correctly?

19 A. Yes, you did.

20 Q. And then, "Over the past five years, as we have
21 seen across California, inconsistent and extreme
22 precipitation, coupled with more hot summer days have
23 increased the wildfire risk and made it increasingly more
24 difficult to manage."

25 Did I read that correctly?

26 A. Yes, you did.

1 Q. It goes on, "The risk posed by wildfires has
2 increased in PG&E's service areas as a result of extended
3 period of drought, bark beetle infestation to the
4 California forest, and wildfire fuel increases resulting
5 from record rain fall following the drought among other
6 environmental factors.

7 Other contributing factors include local land use
8 policies and historical forestry management practices.
9 The combined effects of extreme weather and climate change
10 also impact this risk."

11 Did I read that correctly?

12 A. Yes, you did.

13 Q. Okay. So now, the main drivers. Vegetation,
14 contact with conductors, equipment failure and third party
15 contact, right?

16 A. That is correct.

17 Q. It goes on to say, "Managing wildfire risk is a
18 top priority for PG&E," and it goes through how much PG&E
19 is spending on wildfire mitigation, correct?

20 A. Yes.

21 Q. So Section 2, Risk Assessment. It defines the
22 risk. That is "PG&E assets may initiate a wildland fire
23 that endangers the public, private property, sensitive
24 land and/or leads to long duration service outages;" is
25 that correct?

26 A. That is correct.

1 Q. And it is designated as an enterprise risk?

2 A. Correct.

3 Q. Now, here, we also talk about Reax Engineering
4 and their simulation technology. Do you see that?

5 A. Yes, I do.

6 Q. And what do you know about Reax's fire
7 stimulation technology?

8 A. At a very high level, Reax modeled in some of the
9 characteristics of our system, our service territory,
10 including the timber and structures from a density
11 standpoint across our service territory. Built a model
12 that allowed for simulation of ignition at any point along
13 a transmission or distribution facility, and then ran
14 thousands of iterations to quantify what the potential
15 spread and associated consequence would be of an ignition
16 if it were to occur at the location.

17 That information, while being relative in nature,
18 was used to differentiate across the service territory to
19 quantify what areas, if an ignition were to occur, would
20 be more likely to see a widespread wildfire, and what
21 areas were more likely to see a widespread wildfire that
22 would impact greater amounts of timber and greater amounts
23 of structures, structures being a proxy per population
24 density.

25 That allowed us to differentiate across the
26 service territory in partnership with CAL FIRE and the

1 CPUC in order to define different regions that had
2 different levels of fire threat, and that is now known as
3 our high fire threat district, Tier 3 being the highest,
4 Tier Two, and then one the lowest.

5 Q. To your knowledge, was the Reax simulation ever
6 applied to the Feather River Canyon?

7 A. Yes. Reax modeled spread potential across our
8 entire service territory.

9 Q. And in footnote 13, it discusses the state of
10 emergency declared as a result of the drought by the
11 Governor in 2015; is that correct?

12 A. That is correct.

13 Q. And then we get to figure 11.1, the risk bow-tie
14 for wildfire. And if you can, can you talk us through how
15 to read this risk bow-tie?

16 A. Sure. The structures are very similar to the
17 previous -- the previous statement that I made with the
18 event being a wildfire initiated by PG&E assets within
19 fire index area. So this is quantified to look at
20 wildfire events as opposed to being widespread. It's not
21 focused on any ignition, an ignition at a pole that goes
22 nowhere or in the middle of a densely populated urban area
23 is not accounted for in this risk. This risk is focused
24 on widespread wild fire. The drivers associated with it
25 are quantified. This quantification is across the
26 transmission and distribution facilities holistically, and

1 shows that the highest exposure from a driver standpoint
2 is associated with vegetation. Vegetation coming in
3 contact with facilities, and then subsequently equipment
4 failure, which have been further broken down between
5 conductor hardware, other and conductor -- or sorry,
6 connector hardware, conductor and other. And we also have
7 third-party contact -- - animal, fuse operation and
8 unknown as general categories. From consequence
9 standpoint, we also have a similar rubric that breaks down
10 from safety splitting between injury and fatality,
11 environmental reliability, compliance, trust and
12 financial.

13 Q. Okay. So something like third-party contact,
14 there's not a whole lot that you can do to mitigate this
15 risk, correct?

16 A. Yeah, mitigations are limited.

17 Q. Right. You know, that involves people running
18 into power poles and knocking down energized lines to
19 mylar balloons blowing into transmission lines and causing
20 a -- an arc, correct?

21 A. That is correct.

22 Q. But equipment failure together is the second
23 highest cause -- risk of -- of starting a fire, correct?

24 A. As a subcomponent --

25 Q. Yeah.

26 A. It's a specific subcomponent of equipment

1 failure, yes.

2 Q. Right. So wildfire is the number one enterprise
3 risk, correct, at this point in time?

4 A. That is correct.

5 Q. And it's well known that we're in drought
6 conditions 2012 through 2017 throughout the PG&E service
7 area, correct?

8 A. That is correct.

9 Q. And other factors such as -- well, I -- where I'm
10 going with this is, we know we're in drought, we know
11 we're in the forest, we know that the Feather River Canyon
12 is a high wind area. We know that this is one of the
13 oldest lines in the inventory with parts that are 100
14 years old. So how is it that none of the mitigations
15 apply to doing any work on the Feather River -- or on the
16 Caribou-Palermo line?

17 A. So working out of memory, bear with me, I do want
18 to highlight the intent of the RAMP, Risk Assessment
19 Mitigation Phase, was for us to model the risk based on
20 actual data to move away from subject matter expert
21 informed risk quantification towards a more quantitative
22 risk quantification. In doing so, we laid out this
23 framework, which became the foundation for the models
24 themselves, then took input associated with the actual
25 historic data of causes. These are categories shown here
26 on the risk bow-tie that are at a much higher level than

1 the quantifications performed with the RAMP models
2 themselves.

3 Within the RAMP models, we differentiated between
4 equipment types. We've also differentiated between
5 transmission and distribution among other factors. In
6 doing so, we have identified what areas had the highest
7 risk in terms of number of failures per mile and number of
8 ignitions per mile. And ignitions given a wires-down or
9 given a failure. In order to be able to identify those
10 opportunities, it would, be for lack of a better term, the
11 biggest bang for the buck. Also divided mitigations from
12 a risk reduction standpoint by the cost to implement those
13 associated mitigations. What we've seen in this analysis
14 and continue -- and have seen in other analyses that have
15 supplemented this is that the number of asset failures and
16 associated ignitions -- fire ignitions that have occurred
17 have been in order of magnitude higher on the distribution
18 facilities than on transmission facilities. We have also
19 seen within the transmission data specifically, equipment
20 failure is actually the third highest cause. First,
21 animal-caused ignitions first, and then vegetation
22 followed by equipment failure.

23 Being that equipment failure for transmission
24 overhead, at this point in time, was seen in the data as
25 far lower than distribution, a lot of these results
26 promoted the concept of our -- the capital dollars that we

1 are approved to deploy by the CPUC will have a higher risk
2 reduction value if they are focused towards distribution
3 facilities.

4 That said, we still have continued to make
5 investments in transmission mitigations as shown up in our
6 transmission overhead RAMP filing and, subsequently, as
7 part of the wildfire portion of the RAMP filing, but the
8 data itself promotes the concepts that we actually have a
9 greater risk reduction across the service territory, if we
10 focus on vegetation management on the distribution
11 facilities, as well as replacement of overhead conductor
12 for distribution voltages.

13 Q. Fair enough. And animal is another one of those
14 categories that there's not a whole lot of -- that you can
15 do to mitigate the chance of an animal making contact with
16 a energized line, correct?

17 A. We have limited mitigations that we can employ --

18 Q. Right.

19 A. Insulating down guys. Putting raptor guards on
20 structures that can minimize the likelihood that a bird
21 would contact a ground piece of facility and an energized
22 piece of facility. Our ability to effectively mitigate
23 risks in a cost-effective way is rooted in the ability to
24 identify those locations that are more prone to bird
25 migration and we have built out an avian protection
26 program to target that mitigation appropriately.

1 Q. And it sounds like, for the most part, where it
2 says "animal," we're talking about birds for transmission
3 lines, correct?

4 A. For the most part. In terms of the wildfire
5 risk, I would -- I think that would be a safe assumption
6 make.

7 Q. Okay. Going down the Subsection C, the Drivers
8 and Associated Frequency. It starts off, "There were 486
9 fire ignitions associated with PG&E facilities that
10 occurred within the fire index area within PG&E service
11 territory during the two year period 2015 to 2016. These
12 486 ignitions, or an average of 243 per year, were related
13 to eight top-level risk drivers."

14 Did I read that correctly?

15 A. Yes, you did.

16 Q. And number one, vegetation. And "vegetation risk
17 driver accounts for 27 percent of the 243 ignitions or 91
18 per year," correct?

19 A. That is correct.

20 Q. And then next is D2, Equipment Failure Conductor.
21 "Failure of conductor resulting in wire down and fire
22 ignitions. All three equipment failure categories may be
23 influenced by weather and other environmental factors,
24 e.g.; corrosive environment. The equipment failure
25 conductor risk drivers account for 12 percent of 243
26 ignitions or 29.5 per year."

1 So basically, 29 and a half fires per year are
2 caused by conductor down -- wire-down events, correct?

3 A. That is correct.

4 Q. And then next is D3, Failure of Connectors,
5 Splices Or Other Connecting Hardware Resulting in Wire
6 Down and Fire Ignition. "The equipment failure, connector
7 hardware risk driver accounts for 6 percent of 243
8 ignitions or 15.5 per year," correct?

9 A. Yes.

10 Q. So in grand total, 45 fires per year started by
11 equipment failure related to wires down, either conductor
12 failure or connector hardware?

13 A. Correct.

14 Q. All right. Third-party contact amounts to about
15 38.5 per year. Is that it what it says?

16 A. Yes.

17 Q. Animals, 21.5 per year?

18 A. Yes.

19 Q. Fuses, five per year and unknown four and a half
20 per year?

21 A. Correct.

22 Q. All right. Now, can you kind of educate us on
23 reading this figure 11.2, Consequence Attribute.

24 A. Can you scroll down to give me the page, please?

25 Q. It's on 11.9. Do you understand how to read this
26 table?

1 A. Yes, I do. And just familiarizing myself again,
2 so I can make sure I don't misspeak. So this table
3 summarizes a number of the assumptions -- modeling
4 assumptions that went into the RAMP model. And the
5 easiest way for me to articulate what is showing here is
6 that when you think about some of the -- the data that we
7 just talked about, that's average data. So we have an
8 average data point per year. Averages are very hard to
9 model because they take all of the asymmetry out of the
10 risk profile, out of the model and so they can really
11 water down the effectiveness of the model.

12 In this instance, we wanted to be more deliberate
13 in the way that we model the likely consequence associated
14 with an event occurring. So while we have data on what
15 the highest potential spread from an acreage standpoint
16 could reasonably be in a -- based on historic data as well
17 as a smaller end of the spectrum, and then the average, we
18 need to be able to define what the probabilistic
19 distribution looks like so when we model thousands of
20 iterations of simulations on our data, we can come up with
21 statistical resulting consequences.

22 In this table, we summarize some of those
23 assumptions which quantify safety, injuries and fatalities
24 as leveraging in Poisson distribution, which is a discrete
25 distribution taking into account that you can't have half
26 of a fatality, and it quantifies that the expected outcome

1 is approximately 5.89 in the overall distribution with --
2 which shows the -- the distribution that was modeled into
3 the RAMP. The Poisson is the -- and the characteristics
4 of them are reflected in the second column. In the third
5 column, we show both the -- the expected cost per acre.
6 As well as the average number of acres burned for a
7 wildfire event. You can see that the -- that the
8 environmental consequence for the average number of
9 acreage burned is represented by an exponential curve as
10 diminishing so it's much more likely to see a wildfire
11 with a smaller number of acres than it is to see the tail
12 end event, but there is material likelihood that you can
13 see a very large scale wildfire. That similar
14 distribution is used for the average number of customer
15 events impacts from a reliability standpoint. Again,
16 low -- low -- high frequency of low consequence events,
17 lower frequency of high consequence events, but instead of
18 modeling those as point assumptions, we built in the
19 distribution to reflect the entire spectrum and that goes
20 all the way down to -- the final example on the chart is a
21 lot normal distribution of potential claims associated
22 with those events occurring and the associated statistical
23 characteristics of each one of those curves.

24 Q. So ultimately down at the bottom in -- and it's
25 framed in heavy black, it says, "MARS totals 257.58."
26 What does that mean?

1 A. So reference to MARS ties back to the safety
2 frame -- quantification framework that was originally
3 intended to be defined through the SMAP proceeding.
4 Fortunately, that ran parallel with this map -- with this
5 RAMP proceeding. So PG&E used the current formula that
6 had been developed to date in the SMAP proceeding and used
7 that to inform its model in this RAMP. MARS stands for
8 Multi Attribute Risk Score. And it's a way to quantify in
9 a single score the aggregate risk across all of these
10 consequence dimensions. There's a methodology for doing
11 so. Taking a value and normalizing by the potential range
12 of that value, and then provided weightings in order to
13 weigh it differently across the different components but
14 ultimate getting -- getting to a consolidated number.

15 I will give you an example: one injury and one
16 fatality are not equivalent. What we've done in this mode
17 was leveraged industry literature to try and quantify the
18 relative number of injuries that would be approximately
19 equivalent to a fatality from a societal standpoint. I
20 don't remember the order of magnitude of the multiplier.
21 A similar quantification was done to try and normalize the
22 units across environmental impacts, tying those back to
23 the equivalent reliability impacts. So at the end of the
24 day, risk quantification can be done for an investment
25 that would have a greater risk reduction on the
26 environment comparing to one that would have a greater

1 risk reduction from a reliability standpoint so that those
2 can be compared apples to apples. That MARS framework is
3 defined in this filing, and I can't recall the exact
4 calculation at this point in time, but it has
5 subsequently evolved with stakeholder interaction through
6 the SMAP proceeding.

7 Q. So is 257.58, is that a big number or small
8 number, I guess?

9 A. I -- I --

10 Q. I'm not understanding a whole lot of how this is
11 done or what it means.

12 A. This one is just illustrative.

13 Q. Okay.

14 A. I don't recall the scale. I would say that the
15 intent is to become a unit list indices so it is relative
16 number looking at the risk reduction across different
17 mitigations. Those numbers were compared and a higher
18 number remember would be more risk than a lower number for
19 example.

20 I think this calculation was used to come up with
21 a before and after. We would run this calculation on the
22 -- the status quo risk. Run the calculation after the
23 proposed mitigation was complete. The difference between
24 the two is the reduction in risk. That was then put into
25 a risk spent efficiency calculation, which would take the
26 reduction in risks divided by the cost to achieve that

1 reduction of risk and that allowed us to identify what
2 investments we were proposing in our general rate case for
3 the biggest bang for their buck.

4 Q. Okay.

5 BY MS. DUPRE-TOKOS:

6 Q. So without a scale or without any of the other
7 information that you just explained to us, that MARS
8 number is essentially useless in terms of figuring out
9 anything right now?

10 A. That is correct. This is -- I think this was
11 intended to be illustrative, but the total number doesn't
12 represent anything on an absolute basis.

13 BY MR. NOEL:

14 Q. All right. And then we go into Section 3, The
15 Controls and Mitigation. And specifically what I want to
16 talk about is C-1. And it talks about the overhead
17 patrols and inspections and their role in mitigating the
18 wildfire threat or risk; is that correct?

19 A. That is correct.

20 Q. So it states, "PG&E patrols and inspects its
21 overhead electric facilities to identify damaged
22 facilities and other conditions that may pose a risk of
23 wildfire ignition. Patrols and inspections are performed
24 annually in high risk wildland, interface areas and
25 bi-annually in rural areas. Any corrective actions
26 required in wildland, interface areas receives priority

1 treatment and are scheduled and tracked to completion
2 prior to the fire season. Maintaining an auditable
3 documentation of patrol and inspection activity and
4 findings is another key program feature. This control
5 reduces exposure to all wildfire risk drivers."

6 Did I read that correctly?

7 A. Yes, you did.

8 Q. So, am I understanding this correct that
9 inspections and patrols play a huge role in mitigating the
10 wildfire risk?

11 A. You read that correctly.

12 Q. Okay. So if inspection and patrols aren't
13 actually being done to identify potential wildfire risks,
14 then you can't mitigate those risk, correct?

15 A. The effectiveness of inspection as a mitigation
16 would be reduced if the inspections are not performed,
17 yes.

18 Q. Okay.

19 A. And if I may, I do want to make one
20 clarification.

21 Q. Sure.

22 A. Just so it wasn't misleading. I did reference
23 that lever -- how we leveraged Reax to calculate the
24 different -- to quantify the different tiers from a high
25 fire threat district standpoint.

26 Q. Right.

1 A. I think that may have occurred and been approved
2 by the CPUC just subsequent to this RAMP filing so I
3 wanted to clarify that the time -- or definition of the
4 current high fire threat district as it's defined today,
5 may have occurred just subsequent to this filing.

6 Q. Okay. You're referring to the high fire threat
7 map that was adopted by the CPUC starting January 1, 2018,
8 correct?

9 A. That is correct.

10 Q. Okay. Make sure we got that clear. I think we
11 have handled just about everything in this.

12 All right. So next up, let's go own to 1346.
13 Should be in the stack here.

14 MS. DUPRE-TOKOS: Marc, I think we should take a
15 break now.

16 MR. NOEL: Let's finish up a couple of things and
17 then we will take our -- if it's okay, then we will take
18 a break.

19 GRAND JURY FOREPERSON: Yes.

20 BY MR. NOEL:

21 Q. All right. So you see 1346? Should be in the
22 stack right there in front of you.

23 A. Yep. Here it is.

24 Q. Do you recognize 1346?

25 A. Yes.

26 Q. What is 1346?

1 A. Exhibit 1346 is an advanced authorization for Big
2 Bend, Palermo 115kV NERC mitigation project.

3 [Exhibit No. 1346 was identified.]

4 BY MR. NOEL:

5 Q. Okay. Thank you. And what was the Big Bend
6 Palermo 115 NERC project?

7 A. The big bend Palermo 115kv NERC mitigation
8 project was a project developed to correct discrepancies
9 identified in response to -- I believe, it was 2010 NERC
10 alert requesting that all utilities, all transmission
11 operators in the nation, evaluate the as-installed
12 characteristics of their transmission facilities to make
13 sure that the ground to conductor clearance met the
14 original design criteria. And in many instances across
15 the nation, utilities found that for a number of different
16 reasons, conductor to ground clearances had been lower
17 than intended to maintain public safety, so NERC directed
18 each utility to develop a plan to work to clear all of
19 those discrepancies over time. This was one project of
20 many to increase ground to conductor clearances across
21 PG&E system. And it was specify to this line section.

22 Q. What I want to focus on most in this AA is
23 Section D, the cost recovery. I believe it's on the
24 second page. Have you found that?

25 A. Yes.

26 Q. It states, "The company expects to recover the

1 project cost through a future Federal Energy Regulatory
2 Commission (FERC), transmission owner's rate case."

3 Can you explain briefly what that means?

4 A. Yes. As I mentioned earlier, on the distribution
5 side, we filed a general rate case with the CPUC. That
6 rate case sets revenue requirements from our distribution
7 business and it occurs on a three-year cadence. The FERC
8 transmission owner rate case is an equivalent rate case
9 put on our transmission investment. The rate case is
10 filed on -- I guess, has historically been filed on an
11 annual basis, is filed with FERC, and give us -- gives
12 PG&E authorization to collect revenues necessary to make
13 investments such as this in our infrastructure.

14 Q. And it's essentially the money you get from the
15 transmission owners case rate, the capital budget through
16 transmission side?

17 A. Technically it would be the capital and expense
18 budget for the transmission side.

19 Q. This goes on to say, "And to earn the authorized
20 return on equity established in that proceeding."

21 Can you explain to us what that means?

22 A. Yes. There are two types of financial outlays
23 for PG&E as a regulated utility in our regulated decoupled
24 business model. An expense is identified under capital
25 accounting guidelines as investment in maintenance ongoing
26 operations and investments in full replacement of some

1 assets that don't meet criteria for being a unit of
2 property. Those expenses are incurred and recovered
3 through customer rates in the year they're incurred, so if
4 PG&E spends one dollar a year, the amount of revenue is
5 expected to be collected is one dollar to account for that
6 with no return on equity.

7 Capital is different. Capital is intended to be
8 focused on long-term investments in units of property that
9 are expected to have a useful life over a period of time.
10 So an example would be if I was going to build a new
11 transmission line, the cost of that new transmission line
12 would not be put into our revenue requirement and,
13 therefore, our customers would not pay for the entire cost
14 of that line in the year that it was placed in service,
15 but rather it would be placed in service and accounted for
16 in our rate base, and then customer rates would pay for
17 the portion of that asset that is depreciated on annual
18 basis over the expected accounting life of that asset,
19 plus a return on equity.

20 The return on equity represents the expected
21 return that an investor could expect to get from the
22 market given an investment in a -- an asset with a similar
23 risk profile. So if you were able to identify a utility
24 with the exact financial risk profile as PG&E, the
25 expected return of investing in a share of that company
26 would be the same as the expected return of investing in a

1 share of PG&E. That allows -- that framework allows PG&E
2 to go to the market to secure capital to make investments
3 in our infrastructure, and that expected return on equity
4 is equitable with the risk profile of the company's
5 outlays allows for that attraction at a lower cost. And
6 there's a more robust process at FERC define what the
7 actual risk profile of the company is and the associated
8 return on equity necessary for that risk level. That is
9 definitely outside of my purview.

10 Q. So if from a -- how do you figure from an
11 accounting standpoint the lifecycle of an asset?

12 A. We have industry experts, those that tend to
13 participate in these proceedings for multiple utilities
14 that will bring a variety of different pieces of
15 information to bear to quantify the expected timeline that
16 an asset remains in service. The -- that timeline is in
17 some instances called an "expected life." I do want to
18 quantify that it is solely representative of the time that
19 that asset is intended to be in service. That takes into
20 account assets that would be placed into service and only
21 removed from service when they are no longer functioning,
22 but it also accounts for assets that are placed in service
23 that are subsequently removed before getting to the point
24 of no longer functioning because of the need to modify. A
25 capacity increase, a need to relocate facilities because
26 of a road widening or freeway coming in. So it averages

1 across all of that based on industry specific information
2 to come up with an accounting expected life of an asset.

3 Q. All right. Let's move on to 1347. Do you have
4 1347 there in front of you?

5 A. Can we take a quick break or are we almost there?

6 Q. We still have a couple of more things to do. I
7 guess you're right, it is 3:00. We can take a break and
8 come back and try and finish up real quick.

9 GRAND JURY FOREPERSON: Okay. We will take a
10 15-minute break.

11
12 [Recess was taken from 2:57 p.m. until 3:33 p.m.
13 whereupon the grand jury comes to order in Courtroom 9.]
14

15 GRAND JURY FOREPERSON: Okay. All members of the
16 grand jury are present and ready to proceed after the
17 break. We can bring the witness in.

18 [Witness enters the courtroom.]

19 GRAND JURY FOREPERSON: Mr. Gabbard, you're still
20 under oath. Just a reminder.

21 THE WITNESS: Understood.

22 BY MR. NOEL:

23 Q. All right. Mr. Gabbard, you should have in front
24 of you exhibits 1347 and 48. We will start with 47 and
25 ask you if you recognize the document that is 1347?

26 A. Yes, I do.

1 Q. And same with 1348, do you recognize that
2 document?

3 A. Yes, I do.

4 Q. All right. And what is 1347?

5 A. 1347 is a gate one authorization for the
6 Caribou-Big Bend 115kV NERC project.

7 [Exhibit No. 1347 was identified.]

8 BY MR. NOEL:

9 Q. Okay. And what is a gate one authorization.

10 A. Gate one is an -- is a first authorization of two
11 authorizations to authorize initial work activities to
12 proceed associated with a given project. In this case,
13 author -- gate one authorization is for detailed
14 environmental and land planning including completing
15 cultural and biological evaluations and obtaining
16 pertinent permits including a notice to proceed and
17 procuring all long leave materials. That also includes
18 any engineering required to support those processes.

19 Q. Now, can you turn to page two of the document in
20 section entitled objection statement.

21 Do you have that?

22 A. Yes.

23 Q. All right. And reading from the objective
24 statement, it says, "Upgrade the big" -- "the
25 Caribend[sic]" -- it's getting late in the day. "Update
26 the Caribou-Bend Bend 115 kV line to comply with the NER

1 requirements by replacing 58 lattice steel towers with
2 tubular steel poles, H frames, retrenching 15 spans,
3 reconductoring 27 span and replacing hardware on 42 spans
4 releasing the operations in December 2019 and completing
5 the project by March 2020."

6 Did I read that correctly?

7 A. That is correct.

8 Q. And that -- of course, reading that without
9 including the parenthesis. Oh, I'm sorry, I said
10 "update," it should be "upgrade the Caribou-Big Bend 115
11 kV line," I'm told.

12 So on Friday, we talked about preventative
13 maintenance on the Caribou-Palermo line, the 115 kV line
14 and one of the things that we talked about was the NERC
15 project and that that was preventative maintenance.

16 Do you recall that?

17 A. I recall talking about the NERC project, I
18 don't -- I don't recall referencing preventative
19 maintenance.

20 Q. Okay. Basically, the Caribou-Big Bend 115 kV
21 NERC project solely by its own objective statement is to
22 meet compliance with NERC clearance standards, correct?

23 A. That is correct.

24 Q. And there was nothing additional being done for
25 safety or environment, correct?

26 A. There are safety and environmental benefits, but

1 that was the driver for the project was to meet the NERC
2 alert.

3 Q. Right. But when you're doing this, the -- the
4 work that's eventually going to be done -- we will get
5 into that in just a second -- is solely to make the line
6 compliant with the NERC clearance requirements, correct?

7 A. That is correct.

8 Q. No additional work was being scheduled as part of
9 that project solely for safety or environmental?

10 A. Not at this point in time, no.

11 Q. Okay. And then down below are the overview,
12 under background, it says, "The Caribou-Big Bend 115 kV
13 line was built in the 1940s and is approximately 37 miles
14 in length, running from Caribou powerhouse to the Big Bend
15 substation near Oregon City, California."

16 Do you have any idea where that information that
17 the line was built in the 1940s came from?

18 A. I do not.

19 Q. It goes on to say, "The Caribou-Big Bend NERC
20 project" -- "115 kV NERC project is required to meet
21 California Public Utilities Commission, (CPUC) G095" -- or
22 general order 95, "requirements of minimum allowable
23 vertical clearances." And then goes through the history,
24 correct?

25 A. That is correct.

26 Q. And then 1349 --

1 MS. DUPRE-TOKOS: 1348.

2 BY MR. NOEL:

3 Q. 1348, I'm sorry, is the project scope document,
4 correct?

5 A. That is correct.

6 [Exhibit No. 1348 was identified.]

7 BY MR. NOEL:

8 Q. And this document actually lays outs all of the
9 specific work that is going to be done within the project,
10 correct?

11 A. That is correct.

12 Q. So, for instance, on tower 27/222. If you skip
13 to -- oops, went the wrong way. Page 20. The bottom of
14 page 20, it talks about span 27/221 to 27/222, and says,
15 "Pedestrian access only, no mitigation required."

16 Do you see that?

17 A. Sorry, can you direct me, again, where you're
18 looking?

19 Q. The very bottom of page 20. It would be line
20 item 84.

21 A. Yes, I see that.

22 Q. So that would indicate that this project is not
23 going to include any work on 27/222, correct?

24 A. That is correct.

25 Q. And some of those towers, as you go through them
26 in these spans, it's indicated that the conductor is going

1 be replaced for that span. For instance, if you look at
2 item number 85, on the top of 21, span 27/224 to 27/225 to
3 27/226. And number six or "VI" below that, conductor
4 time, 5-- 452.3 kV MIL 30/7 APFR, would that indicate that
5 that span of conductor is being replaced?

6 A. I don't believe that that is referencing a
7 replacement conductor.

8 Q. Okay.

9 A. I think item 86 below that would be more
10 representative of a replacement of conductor.

11 Q. Okay.

12 A. You can see "replace conductor that is no longer
13 being manufactured," and then it clearly calls out the
14 existing conduct type and then the proposed new conductor
15 type.

16 Q. Okay. All right. Thank you.

17 MR. NOEL: I know it's hard to believe, but I think
18 that is finally it --

19 MS. DUPRE-TOKOS: Well, from us.

20 MR. NOEL: -- from me. Well, the jurors have a
21 chance to ask you questions, they're asked to write their
22 questions down in writing, submit them to myself and
23 Ms. Dupre-Tokos and madam foreperson. It looks like the
24 jurors have some questions. So if you can give us just a
25 second, we can get those together and review them, and
26 then I will read the juror's questions to you.

1 THE WITNESS: Okay.

2 MR. NOEL: Thank you.

3 Okay. The following are the questions from the
4 jurors themselves.

5 When did you first hear the phrase "dead-end
6 attachment hardware"?

7 THE WITNESS: Dead-end attachment hardware?

8 MR. NOEL: Yes.

9 THE WITNESS: I don't know.

10 MR. NOEL: Okay. When did your first learn that worn
11 C-hooks and worn suspension plates were significant risk
12 for catastrophic failure with transmissions structures?

13 THE WITNESS: I was familiar with C-hooks as a
14 component on the transmission infrastructure for some
15 period of time, but the focus on C-hooks as a failure
16 motive within our transmission infrastructure was
17 significantly heightened post the Camp fire event.

18 MR. NOEL: So would you say pre Camp fire, the
19 C-hooks and suspension -- the -- the hanger pulls were
20 essentially a run to failure component?

21 THE WITNESS: No. Pre Camp fire, the C-hooks were
22 considered one component as part of hardware
23 interconnecting our insulators and our structures.

24 MR. NOEL: Right. But essentially, was the policy
25 towards those -- that -- the hardware run to failure?

26 THE WITNESS: My assumption prior to was that it was

1 the -- the C-hooks were managed similar to the rest of
2 hardware, which was run to condition as informed by our
3 inspection program.

4 MR. NOEL: But if your inspection program wasn't
5 actually looking at the C-hooks that you've never
6 identified them as having a condition that needed
7 replacement, correct?

8 THE WITNESS: Potentially, yes.

9 MR. NOEL: And there was no preventative maintenance
10 program for replacement of -- of C-hooks?

11 THE WITNESS: Only for replacing when replacing
12 insulators or structures.

13 MR. NOEL: How many miles of overhead transmission
14 lines does PGE operate?

15 THE WITNESS: How many miles?

16 MR. NOEL: Yes, sir.

17 THE WITNESS: Transmission only?

18 MR. NOEL: Yes.

19 THE WITNESS: Just over 18,000 miles.

20 MR. NOEL: How long would it take to complete
21 insulator and associated hardware replacement at 56 miles
22 per year?

23 THE WITNESS: 3,600 years. I may be mistaken on
24 that.

25 MR. NOEL: All right. And if we took that up to the
26 139 miles per year in the RAMP? 139.

1 THE WITNESS: 139? Can I have a piece of paper?

2 MS. DUPRE-TOKOS: Do you want a calculator?

3 THE WITNESS: Please.

4 MS. DUPRE-TOKOS: It would be faster.

5 THE WITNESS: So you're saying 139 miles per year?

6 MR. NOEL: Yeah. I believe that was the figure out

7 of the RAMP. If we were replacing insulators at 139 miles

8 per year, how long would it take to replace all the

9 insulators?

10 THE WITNESS: Sorry. I locked it. My mistake. Long

11 day.

12 MR. NOEL: It is.

13 THE WITNESS: 130 years.

14 MR. NOEL: All right.

15 MS. DUPRE-TOKOS: Did you want to do the other one as

16 well, the first one?

17 THE WITNESS: Probably. What was the previous

18 question?

19 MR. NOEL: If we were doing at 56 miles per year.

20 THE WITNESS: 320 years. I added a zero.

21 MR. NOEL: Do you believe that such diffuse

22 decisionmaking does or should absolve everyone involved

23 from the responsibility for the decisions that and/or

24 consequences of those decisions as to the Camp fire?

25 THE WITNESS: Can you read that one more time?

26 MR. NOEL: Do you believe that such diffuse

1 decision-making does or should absolve everyone involved
2 from responsibility for decisions and/or consequences in
3 referring to the Camp fire?

4 THE WITNESS: I don't know if I can answer that
5 question.

6 MR. NOEL: Okay. Do you believe that managers on
7 your level should have more direct experience of patrol
8 and inspection procedures?

9 THE WITNESS: For my position?

10 MR. NOEL: Yes.

11 THE WITNESS: I do not.

12 MR. NOEL: Have you personally ever flown a detailed
13 aerial inspection along any electrical transmission line
14 or circuit?

15 THE WITNESS: I have not.

16 MR. NOEL: Do you believe that such experience might
17 accurately inform strategies based on those inspections?

18 THE WITNESS: Possibly.

19 MR. NOEL: If you have no information on which to
20 rate an asset and cannot obtain that information, would it
21 be recommended to actually replace that asset in order to
22 accomplish a validation baseline?

23 THE WITNESS: My recommendation would be to complete
24 an inspection to obtain information regarding the asset
25 before recommending replacement.

26 MR. NOEL: If, as you said on Friday, you do not know

1 if any of the information you're using to "inform your
2 asset management strategies is true," how can you support
3 a strategy based in a metric based on information that you
4 don't know is true?

5 THE WITNESS: So I know that a large portion of the
6 information that were relied upon to develop our asset
7 management plans is, in fact, correct. Where I have
8 reason to believe information is not correct, that is
9 taken into consideration. And in our business, in the
10 complexity of operating utility across the 70,000 square
11 miles of service territory that we operate, I am relying
12 on trust of my peers and the broader organization of north
13 of 20,000 employees in order to be able to successfully
14 operate. So there is a bit of trust that I need to have
15 in any counterparts, my subordinates and in my leaders in
16 order to be able to effectively perform in my job.

17 MR. NOEL: So are you saying that you're making
18 decisions involving life, death and extreme danger based
19 upon somebody else's simply saying "I said it so it must
20 be so"?

21 THE WITNESS: No, our -- the information relied upon
22 in our asset management plan is not just anecdotal. It's
23 collected by numerous processes sourced in systems of
24 record that are reviewed by many different individuals and
25 it's on that basis that I have a bias towards trusting the
26 information unless I have reason to believe otherwise.

1 MR. NOEL: Does it concern you that you are working
2 in a corporate structure that is so compartmentalized that
3 with few exceptions no one can say who is responsible for
4 making any given decision?

5 THE WITNESS: I don't believe that statement is
6 correct.

7 MR. NOEL: Do you believe that if a decision is made
8 by a group committee, decision tree, or protocol metric
9 that everyone involved in that group committee, et cetera,
10 should be equally responsible for that decision and its
11 consequences?

12 THE WITNESS: Potentially.

13 MR. NOEL: If it was not within your purview to
14 review and improve forward-looking preventative
15 maintenance, then whose management purview would that be
16 under?

17 THE WITNESS: That would have been under my
18 counterpart, senior director of transmission line
19 operations.

20 MR. NOEL: That's Mr. Back?

21 THE WITNESS: Or his predecessors.

22 MR. NOEL: Was Mr. Back and his predecessors.

23 In PGE steel structure strategy plan in the short
24 term 2017 plan, of the 11 bullet points shown, none
25 mention safety or wildfire safety.

26 Can you tell us why not?

1 THE WITNESS: Can you pull back up those bullet
2 points?

3 MR. NOEL: Sure. Let's see, I think that was 1253.
4 There we go.

5 THE WITNESS: So as I previously stated, I did not
6 write these bullet points so I don't know the intent or
7 the reasoning from the author, but any interpretation is
8 that safety and also wildfire risk is rooted in many of
9 these, if not all. But the actual callout of safety in
10 the -- each action item wasn't necessary to identify the
11 area of focus.

12 MR. NOEL: Do you personally hold yourself
13 responsible in any measure for the corporate or
14 operational culture that resulted in the Camp fire and its
15 consequential damage?

16 THE WITNESS: As a leader within PGE, I hold myself
17 responsible for making sure that we're continuously
18 improving the way that we safely and reliably operate our
19 transmission infrastructure.

20 MR. NOEL: Okay. We understand that, but do you
21 personally hold yourself responsible in any measure for
22 the culture, the operations that resulted in the Camp
23 fire?

24 THE WITNESS: I do not believe there is anything I
25 could have done within the context of my position to
26 change the outcome that occurred in 2018.

1 MR. NOEL: All right. You started in that position
2 in 2017, correct?

3 THE WITNESS: That is correct.

4 MR. NOEL: I think when we talked before, we compared
5 your position to being the first mate on the Titanic and
6 being handed the wheel with the iceberg in sight; is that
7 correct?

8 THE WITNESS: Correct.

9 MR. NOEL: So if there was anyone who would be
10 responsible, it would have been your predecessor?

11 THE WITNESS: I can't answer that.

12 MR. NOEL: And I guess I never did ask you that, who
13 was your predecessor?

14 THE WITNESS: My predecessor was Man Ho Yeung.

15 MR. NOEL: Do you need that spelling?

16 THE COURT REPORTER: Yes.

17 MR. NOEL: It's common spelling.

18 THE WITNESS: M-A-N, H-O, Y-E-U-N-G.

19 MR. NOEL: Have you participated in the development
20 of patrol and inspections training and procedures?

21 THE WITNESS: I have not.

22 MR. NOEL: We have some work charts, one of which is
23 labeled electric asset management and you're the senior
24 director of transmission asset management. Another is
25 labeled electric operations. Explain, please, in simple
26 language the difference between these two groups?

1 THE WITNESS: Electric asset management is
2 subordinate to electric operations. Electric operations
3 is defined as the senior vice president level.

4 Electric asset management starts at the vice
5 president level.

6 MR. NOEL: Did you ever in your position as senior
7 director of transmission asset management directly or
8 indirectly inform those management levels to whom you
9 reported of the prominent enterprise risks of wildfire and
10 their apparent relationship to deteriorated and
11 dilapidated infrastructure?

12 THE WITNESS: Yes.

13 MR. NOEL: And do you recall to whom you reported
14 that?

15 THE WITNESS: I was a part of our risk management
16 processes and had the opportunity to communicate the risk
17 and associated mitigations to many of our senior officers
18 through our integrated planning processes.

19 MR. NOEL: And which senior officers?

20 THE WITNESS: I don't recall all of the names.

21 MR. NOEL: Would one of them have been your direct
22 supervisor, Kevin Dasso?

23 THE WITNESS: Yes.

24 MR. NOEL: And would another have been Mr. Dasso's
25 direct supervisor Patrick Hogan?

26 THE WITNESS: Yes.

1 MR. NOEL: And would it also include the president
2 Geisha Williams?

3 THE WITNESS: Yes.

4 MR. NOEL: Do you recall what you told the senior
5 officers about the wildfire risk and the relationship with
6 deteriorated, dilapidated infrastructure?

7 THE WITNESS: Specifically, no. Generally, the
8 information that I would have communicated would be
9 consistent with our 2017 RAMP filing.

10 MR. NOEL: And do you remember when these briefings
11 occurred?

12 THE WITNESS: I do not.

13 MR. NOEL: Were you ever involved in any capacity in
14 PG&E deliberations regarding infrastructure project
15 proposals for replacing deteriorated and/or dilapidated
16 infrastructure that resulted in such project proposals
17 being canceled or not approved?

18 THE WITNESS: I don't believe so.

19 MR. NOEL: Does population density have anything to
20 do with the attention given to specific towers?

21 THE WITNESS: Yes.

22 MR. NOEL: Why is there specialized attention given
23 to towers in corrosion zones but no specialized attention
24 given to towers in high wind mountain areas?

25 THE WITNESS: So I can't categorically say that
26 special attention isn't provided to facilities in zones

1 susceptible to higher winds. We actually design to a
2 higher standard for facilities that are sited in high wind
3 areas. In terms of corrective actions, I would say that
4 my belief is that our industry, as well as PG&E in my
5 organization, are better informed in the impacts and the
6 visible degradation associated with corrosion. I believe
7 that our industry is not as mature in terms of
8 understanding the short and long term implications of wind
9 exposure.

10 MR. NOEL: Part of your job is to identify work for
11 six years out, why was there never any work scheduled for
12 assets approaching 100 years -- 100 years old as a
13 deteriorating asset?

14 THE WITNESS: Is that in reference to
15 Caribou-Palermo?

16 MR. NOEL: Yes. And, obviously, she put in the
17 caveat "other than mandated work such as the NERC
18 projects"?

19 THE WITNESS: Understood. Specific to Caribou --
20 Palermo, as I alluded to previously, we had in-flight in
21 our portfolio, the NERC alert projects from the
22 Caribou-Big Bend to Caribou-Palermo. Those projects were
23 originally scoped and initiated to comply with the NERC
24 alert in 2010.

25 Through the process of detailed engineering, the
26 project team did identify opportunity to potentially

1 expand scope, opportunity wasn't under evaluation. As a
2 result, the timeline for gate to authorization was
3 actually pushed out to do further assessment;
4 unfortunately, the line itself was put on a permanent
5 outage and retired in place prior to proceeding with those
6 activities. So too late for that work to be complete
7 prior to 2018.

8 MR. NOEL: Where would we find documents pertaining
9 to this proposed work that was going to be added to the
10 NERC projects?

11 THE WITNESS: I'm not sure.

12 MR. NOEL: As a senior director, upper-management
13 involved in assessing information from the field --
14 qualified-field experts, is one of the factors to
15 determining your risk to asset -- okay. Let me reread
16 that. I think I screwed it up.

17 As a senior director involved in assessing
18 information from the field, is one of the only factors to
19 determining your risk to assets -- I'm still having
20 trouble with it.

21 Are there processes in place to mitigate having
22 no data, falsified data or incomplete data from the field?

23 THE WITNESS: So as I previously noted, there are
24 processes in place to leverage existing data to supplement
25 missing data. Proxy data can be applicable in many
26 instances.

1 If data is missing or found insufficient, there
2 was no alternate data available to leverage in its place,
3 then we would initiate a field engagement in order to
4 collect additional information.

5 MR. NOEL: Have you or members of your team to your
6 knowledge authorized notification extensions that you
7 personally were informed about or were notified through
8 documents? So in other words, an LC notification has been
9 created, it sets a timeframe for when the work needs to be
10 done, have you personally ever done extensions on those
11 notifications or reviewed extensions done by people on
12 your team?

13 THE WITNESS: In my position, I was not a part of the
14 extension process for the LC notifications. So I have not
15 been a part of that approval process.

16 MR. NOEL: Finally, we've heard testimony about a
17 compensation formula for bonuses. Would you please
18 explain your compensation formula for bonuses?

19 THE WITNESS: Can you tell me what point in time?

20 MR. NOEL: When you were the transmission asset
21 management, the senior director, prior to the Camp fire.

22 THE WITNESS: So in general, bonuses are structured
23 to -- to be set on a target percentage depending on
24 position. For example, 15 percent of base salary would be
25 the target bonus. Those target values are then multiplied
26 by company multipliers that is calculated based on

1 performance against fixed metrics that are established at
2 the beginning of the year, and that can range from zero
3 to, I believe, upwards of 1.5 or 2, somewhere in there.
4 Then it's also multiplied by a personal multiplier based
5 on individual performance for the year, based on a review
6 process that occurs at the end of the year. Looking at
7 how an individual performs against their objectives. And
8 that, again, can range from anywhere from zero to 1.8, I
9 believe.

10 So those multipliers depending on individual
11 performance and company performance can translate to a
12 bonus that is somewhere between zero percent and somewhere
13 north of a target percentile for an individual position.

14 MR. NOEL: So for instance, if you're base salary was
15 100,000 then you start off with a target of 15,000,
16 correct?

17 THE WITNESS: That is correct.

18 MR. NOEL: And on that, what would be the maximum
19 bonus that you could get?

20 THE WITNESS: I don't know the answer to that
21 question.

22 MR. NOEL: And how much were those bonuses tied to
23 safety?

24 THE WITNESS: I don't know the answer to that
25 question. I'm varying the -- the metrics and the
26 percentage of those metrics under different categories

1 fluctuated year over year.

2 MR. NOEL: So, for instance, 2017 was a very bad year
3 in terms of safety metrics. Do you recall if you got a
4 bonus in 2017?

5 THE WITNESS: Yes, I previously answered that.
6 Bonuses were given out. I don't remember the amount.

7 MR. NOEL: You had a follow-up?

8 BY MS. DUPRE-TOKOS:

9 Q. Yeah, just a couple of quick follow-ups?

10 So you said that with regarding to communicating
11 to those higher up the food chain than you about the
12 dangers of wildfire. You said it would be consistent with
13 what was included in the 2017 RAMP filing. Did I get that
14 right?

15 A. That is correct.

16 Q. Okay. But you did not recall when you notified
17 them. Was it pre RAMP filing?

18 A. I don't know a hundred percent. I would assume
19 so. The notification I was referencing is part of the
20 integrated planning process. We didn't get a chance to
21 touch into that, but we have a session D, which is -- I
22 actually don't know why it's called Session D. It came
23 over with a previous chief executive officer from another
24 utility back east. And it's a framework for
25 systematically evaluating risks and laying the risk --
26 enterprise risk of the foundation for informing our

1 planning process for our future investment plans. In that
2 context, wildfire was regularly a topic that we brought as
3 electric operations to that forum in order to highlight
4 the current state of wildfire and the associated
5 mitigations being employed to help manage that growing
6 risk.

7 Q. Generally, what time of year was that meeting so
8 that you can have the -- the plan, you know, done by a
9 certain time?

10 A. I believe that was in the early part of the year.
11 Q1, usually.

12 Q. Okay.

13 A. We discontinued that methodology with change in
14 our executive leadership, so we haven't had one this year.

15 Q. Okay. So that just stopped this year? Well, in
16 2019 or 2020?

17 A. I believe it officially stopped in 2020. I think
18 there was still a session D in 2019, if I'm not mistaken.

19 Q. Okay. Be your recollection is that you probably
20 addressed the issue of severe wildfire risk with Kevin
21 Dasso and Hogan?

22 MR. NOEL: Patrick Hogan.

23 THE WITNESS: Pat Hogan.

24 BY MS. DUPRE-TOKOS:

25 Q. Yes. And then Geisha Williams, prior to the RAMP
26 filing in 2017?

1 A. Let me correct that statement. I actually don't
2 know whether it was before or after the filing of the 2017
3 RAMP.

4 Q. Okay. Do you know when the filing of the 2017
5 RAMP was?

6 A. No.

7 MS. DUPRE-TOKOS: Does it say on there, Marc?

8 MR. NOEL: It doesn't have a date on it, but it
9 refers to 2017 wildfires which occurred in October, so it
10 was sometime after that.

11 THE WITNESS: It's dated November 30, 2017.

12 MR. NOEL: Ah, does have a date.

13 BY MS. DUPRE-TOKOS:

14 Q. Okay. So you think it was probably somewhere
15 around then that you notified them?

16 A. Would have been either -- actually, I don't
17 recall. I apologize.

18 Q. Okay. But it was prior to, say, March of 2018,
19 in all likelihood?

20 A. I don't know for sure, but that's what I would
21 assume.

22 Q. Okay.

23 A. That timeframe.

24 Q. Okay. So then my last follow-up is -- and I know
25 we went over it, but this -- the question that was asked
26 by the jury kind of looked at it from a different angle so

1 I want to follow up.

2 You said that when you are coming up with your --
3 you're doing your planning and you're looking at the
4 different factors including risk, you assume that people
5 and the data you're getting are trustworthy. It's not
6 anecdotal. But do you just place blind trust in the
7 people who are giving you that information, say, the
8 people from the field? You don't know any of them, do
9 you? You've never worked with them, have you?

10 A. Many, no.

11 Q. Okay. So I understand that you have to have some
12 level of trust on -- in all the aspects, but have you ever
13 done anything to just kind of spot check to make sure
14 anything is right?

15 A. So I would say we have done assessments of our
16 programs and I think that was highlighted a bit in the
17 RAMP, or in the asset management plan where we highlighted
18 the -- what looked to be black to clear, but it's actually
19 color coding, so that's part of our risk assessment
20 process where we have evaluated the health and maturity of
21 the programs as a whole. Those are done outside of my
22 organization, but I have received presentation on
23 materials that have characterized on the -- on the level
24 of maturity how well functioning certain processes are.

25 But in terms of going out to the field and
26 witnessing certain tasks; unfortunately, I haven't had the

1 bandwidth to be able to do that in addition to the
2 responsibilities that I am -- that I am being trusted to
3 perform on behalf of the company.

4 Q. So are any of those programs that have been
5 assessed for their health, the inspection program?

6 A. Yes. That -- that part of that process is to
7 evaluate existing controls and inspection -- inspection
8 programs have been a regular control in that overall risk
9 framework.

10 Q. Okay. Did that change after San Bruno?

11 A. I don't recall.

12 MR. NOEL: A couple.

13 MS. DUPRE-TOKOS: We feed off each other, sorry.

14 BY MR. NOEL:

15 Q. Right. You mentioned that Session D was
16 initiated by former chief executive who came from another
17 utility, would that be Geisha Williams?

18 A. No.

19 Q. Was it in place before Geisha Williams?

20 A. I believe Geisha was with the company before it
21 was implemented, but I don't believe she was CEO --

22 Q. Okay.

23 A. -- until after it was implemented.

24 Q. Who was the CEO before Geisha, Tony Earley?

25 A. That is correct.

26 Q. And that also -- it just dawned on me, the RAMP.

1 That's a -- that's essentially a policy statement that is
2 being filed with the regulator, correct?

3 A. What do you mean by "policy statement"?

4 Q. It's setting out explaining what PG&E is doing as
5 a matter of policy to address these -- these risks --
6 identified risks, correct?

7 A. I would characterize it more as a summary of the
8 modeling that we did at the direction of the CPUC.

9 Q. Okay. Was the RAMP reviewed with the senior
10 officials -- Kevin Dasso, Patrick Hogan, Geisha Williams,
11 prior to being filed with the CPUC?

12 A. Yes.

13 MR. NOEL: Okay. Anymore further follow up? I think
14 you're finally done, Mr. Gabbard. We appreciate your --
15 Madam Foreperson is going to have another admonition for
16 you.

17 GRAND JURY FOREPERSON: Mr. Gabbard, you are
18 admonished not to discuss or disclose at any time outside
19 of this jury room the questions that have been asked of
20 you or your answers until authorized by this grand jury or
21 the Court.

22 A violation of these instructions on your part
23 may be the basis for a charge against you of contempt of
24 court. This does not preclude you from discussing your
25 legal rights with your own attorney.

26 Mr. Gabbard, what I have just said is a warning

1 not to discuss this case with anyone except the Court,
2 your lawyer, or the district attorney.

3 Do you have any questions?

4 THE WITNESS: No, I do not. Thank you.

5 GRAND JURY FOREPERSON: Thank you for your time.

6 MR. NOEL: Do you still have to go to Fresno?

7 THE WITNESS: Yes, I do.

8 MR. NOEL: I'm sorry.

9 MS. DUPRE-TOKOS: Hey, we timed it so you get to go
10 through Sacramento during prime rush-hour traffic.

11 THE WITNESS: I appreciate it.

12 GRAND JUROR NUMBER FOURTEEN: Drive careful.

13 MR. NOEL: Can we have a real quick break?

14 GRAND JURY FOREPERSON: Okay. Yes.

15 MR. NOEL: Yes, Madam Clerk, we would like to move
16 all the exhibits that have come through Mr. Gabbard into
17 evidence. Thank you.

18
19 [Whereupon, all previously identified exhibits were
20 admitted.]

21 [Recess was taken at 4:21 p.m.]

22
23 [Proceedings omitted.]

24
25 [Whereupon the grand jury comes to order in Courtroom 9 at
26 4:34 p.m.]

1 GRAND JURY FOREPERSON: We are ready.

2

3 [Witness enters the courtroom.]

4

5 MS. DUPRE-TOKOS: Do you want to move exhibits in?

6 MR. NOEL: I already did. I did it while you were
7 gone. Madam clerk reminded me so we went back on the
8 record to deal with it.

9 GRAND JURY FOREPERSON: (WITNESS #12), before you have
10 a seat, would you please raise your right hand to be
11 sworn?

12 (WITNESS #12), do you some solemnly swear the
13 evidence you shall give in the matter pending before the
14 grand jury will be the truth, the whole truth and nothing
15 but the truth so help you God?

16 THE WITNESS: Yes, ma'am.

17 GRAND JURY FOREPERSON: Thank you. Have a seat,
18 please.

19 THE WITNESS: Good afternoon.

20

21 **EXAMINATION**

22 BY MS. DUPRE-TOKOS:

23 Q. If you need it, there's water behind you.

24 A. I'm not that thirsty.

25 Q. Could you state and spell your name -- your last
26 name the record?

1 A. (WITNESS #12), [spelling redacted.]

2 Q. First name?

3 A. (WITNESS #12), [spelling redacted.]

4 Q. And just to get this out of the way, do you know
5 Mr. Noel?

6 A. I'm familiar with Mr. Noel, yes.

7 Q. And how are you familiar with him?

8 A. Been acquaintance -- friends for a long time. We
9 used to coach little league and participate on the board
10 of directors of little league and spent a lot of off-hours
11 with Mr. Noel.

12 Q. Okay. On the diamond and --

13 A. Raising our kids.

14 Q. Okay. So are you employed?

15 A. Currently, yes.

16 Q. And by whom?

17 A. Pacific Gas and Electricity.

18 Q. How long have you been employed by PG&E?

19 A. I'm on my 31st year.

20 Q. Could you briefly summarize your employment
21 history with PG&E for us?

22 A. The roles --

23 Q. Yeah.

24 A. -- I assume. Yeah, I started off in --

25 Q. And dates if you can remember them?

26 A. Oh, 1979, I got hired on with PG&E and started

1 off as a groundman, worked up to apprentice lineman,
2 lineman, crew foreman, all through the crew environment.

3 In 1997, I went to Livermore training center to
4 instruct apprentice linemen, and then I went back to being
5 a lineman in '98.

6 In '99, I went to pole asset management, which
7 was a program management group.

8 MS. DUPRE-TOKOS: Hang on one second. Can everyone
9 hear him?

10 BY MS. DUPRE-TOKOS:

11 Q. Okay, go ahead.

12 A. Sorry, the desk is a little short for us tall
13 guys.

14 Q. You may need to pull the mic a little bit closer,
15 or not.

16 A. Or not. I will just -- that is good. I can hear
17 me back there.

18 Where did I leave off? I went back to pole asset
19 management, at which time, I was responsible for all the
20 pole replacements in PG&Es service territory utilizing
21 outside line contractors. After that, I went to -- back
22 to the line crews, to transmission, at which time, I took
23 a job as a transmission line supervisor. And that was
24 2005 and I went to Eureka. I was there for three years.
25 In '08, I went -- came back home here to Chico and took a
26 troubleman supervisor -- distribution troubleman

1 supervisor jobs, was only in there for a few months before
2 they put me back in the transmission in Sacramento. I was
3 in Sacramento for a little over a year. They moved me to
4 Lakeville, which is Santa Rosa area, then I came back here
5 to Oroville in 2011. And then I got back to transmission
6 in 2012, at the Table Mountain jurisdiction.

7 Q. So when --

8 A. Currently -- oh.

9 Q. Keep going.

10 A. Currently, I'm a -- what they call a specialist.
11 Expert specialist for transmission line.

12 Q. Okay. When you came back to Oroville, what were
13 you doing?

14 A. Oroville distribution supervisor for 11 months.

15 Q. Now, you said that you were distribution
16 troubleman supervisor?

17 A. Yeah.

18 Q. Were you ever a transmission troubleman?

19 A. Was I a transmission troubleman?

20 Q. Officially?

21 A. No.

22 Q. Okay. Did you ever unofficially do the work of a
23 troubleman?

24 A. Yes.

25 Q. Why?

26 A. Relief efforts.

1 Q. Okay. To help --

2 A. Whenever you're short in permanent bodies, they
3 go on vacation, sick leave, whatever, you do a temporary
4 upgrade.

5 Q. Okay. Were you a journeyman lineman at the time
6 that you did that?

7 A. Yes.

8 Q. Okay. What type of training did troubleman
9 receive?

10 A. What type of troubleman?

11 Q. Transmission.

12 A. There is no formalized training.

13 Q. Okay. Is there optional training?

14 A. There are components. For example, switching --
15 transmission switching training. There is a -- 40-hour
16 switchman training, which they'll teach you to switch
17 inside of a substation. But there's no formalized course
18 coded type of training for troubleman.

19 Q. Okay. Do you know if there ever was?

20 A. Not that I'm aware of.

21 Q. Okay. So is there any formalized training for
22 inspections?

23 A. No.

24 Q. So how long total were you a transmission line
25 supervisor?

26 A. Since 2006 to present, minus two years. So --

1 Q. About 12 years?

2 A. Yeah.

3 Q. Okay. And how long were you the transmission

4 line supervisor for Table Mountain?

5 A. From 2012 to 2017.

6 Q. Okay. And were you there the whole time or did

7 you --

8 A. No, I was hardly there.

9 Q. You were hardly there?

10 A. Yeah.

11 Q. Why?

12 A. I was always on special assignments and doing

13 other projects.

14 Q. Okay. But you -- so as the T-line supervisor,

15 you supervised the troublemen; is that correct?

16 A. That is correct.

17 Q. Okay. What were you expectations of your

18 troublemen regarding inspections?

19 A. Can you clarify?

20 Q. Did you expect them to actually -- if they were

21 doing an inspection, actually go to each facility?

22 A. Absolutely.

23 Q. Did you actually expect them to assess each

24 facility?

25 A. Yes.

26 Q. Now, are you familiar with towermen?

1 A. Yes.

2 Q. And you're familiar with linemen?

3 A. Yes.

4 Q. What's the difference between a towerman and a
5 lineman?

6 A. One is considered a QEW or a qualified electrical
7 worker and one is not.

8 Q. Okay. Which was is QEW?

9 A. That is your troubleman.

10 Q. Okay. No, between towerman and lineman, what's
11 the difference?

12 A. It's the same definition. Lineman is a QEW and a
13 towerman is a -- what they consider QEP, a qualified
14 electrical person but they're not qualified to work on
15 electricity.

16 Q. Okay. What do that do that's different?

17 A. What do they do?

18 Q. In terms of job duties?

19 A. So I'm not that versed on the towerman, but they
20 are ground erection and dismantling of all the steel
21 towers, mono poles, foundation work.

22 Q. And then what about lineman?

23 A. The lineman is capable of doing it all. Steel,
24 foundations, and electrical work.

25 Q. So why would they have towerman then?

26 A. It's a cheaper rate.

1 Q. Okay. But isn't a troubleman kind of a cross
2 between the two, they have experience that a lineman
3 doesn't have with regard to the towers?

4 A. I'm not sure what you're asking. I mean, it's a
5 line progression, right, the lineman -- it's a step up
6 from the lineman.

7 Q. A troubleman is a step up from a lineman?

8 A. Yeah. There's a line of progression. There's
9 apprentice, and then the journeyman, and then the
10 troubleman, crew foreman.

11 Q. Okay. So then one would expect that a troubleman
12 has experience that the lineman man doesn't?

13 A. Yes.

14 Q. Okay. And we were saying "facility" earlier,
15 does that mean the towers?

16 A. Yes.

17 Q. Basically. Did you ever personally do a ground
18 inspection of the Caribou-Palermo line?

19 A. Not that I can recall, no.

20 Q. Okay. Why not?

21 A. I was not a troubleman assigned to that.

22 Q. Okay. Are you familiar with the ETPM?

23 A. Yes, I am.

24 Q. What is that?

25 A. That is our government's document for how we do
26 our preventative maintenance program.

1 Q. And what's your position on the ETPM in terms of
2 how PG&E rates in terms of industry standards?

3 A. Could you clarify that?

4 Q. Sure. Do you think that what's set forth in the
5 ETPM meets industry standards?

6 A. It -- it's a -- it's a document that outlines how
7 we do our business. They -- if you're -- I'm not sure if
8 you're asking how everybody else does it, but that's how I
9 know we do it.

10 Q. Okay. And does how you do business meet what is
11 generally considered the industry standard?

12 A. Well, I don't know what the industry standard is.

13 Q. Okay. Now, while you were transmission line
14 supervisor at Table Mountain, are you aware of any
15 preventative maintenance that was done on the
16 Caribou-Palermo line?

17 A. Preventative maintenance, yes. So I know we've
18 changed insulators on there that were flashed.

19 Q. Okay. Any other that you're aware of?

20 A. There was connectors replaced with a three-bolt
21 connectors.

22 Q. Okay. And that was system-wide, correct?

23 A. Yes.

24 Q. Now, are you familiar with the term "run to
25 failure"?

26 A. I may have heard it.

1 Q. You may have heard it?

2 A. Well, I mean --

3 Q. You have heard it?

4 A. Passing discussions, yes, I've heard it.

5 Q. Okay. Would it be accurate to say that the
6 preventative maintenance plan for the Caribou-Palermo line
7 was run to failure?

8 A. I wouldn't say that, no.

9 Q. Okay. What was -- what would you call the
10 preventative maintenance plan for the Caribou-Palermo
11 line?

12 A. Well, like any of our lines, preventative was to
13 stop it from failing. Obviously, if it fails, you
14 probably missed a spot, but that was not the plan for the
15 Caribou-Palermo, nor was it any other line.

16 Q. That was -- and, I guess, I should be a little
17 more clear. I'm not necessarily saying your plan or your
18 crew's plan, but the company plan. Does that change your
19 answer at all?

20 A. Well, I don't know what the company's plan was
21 for it. I wasn't given that directive.

22 Q. Okay. Were you given the money and manpower to
23 do any preventative maintenance that you felt was
24 necessary?

25 A. They gave me what they felt was necessary.

26 Q. Is it what you felt was necessary?

1 A. My opinion was not taken into account.

2 Q. Okay. We're asking for your opinion here.

3 A. I could have used more men, and I could have used
4 more money.

5 Q. To your knowledge, were aerial patrols used on
6 the Caribou-Palermo line?

7 A. Say that again.

8 Q. Do you know if aerial patrols were used on the
9 Caribou-Palermo line?

10 A. Yes.

11 Q. And can you tell us what an aerial patrol is,
12 what your understanding is?

13 A. It's a -- a cursory review of the -- for the
14 obvious. It's a flyover to observe any abnormality or
15 condition that would affect system reliability or safety.

16 Q. And when you say the obvious, like a tree in the
17 line or things like that?

18 A. Yeah. Broken arm, insulators flashed.

19 Q. About how fast are the aerial patrols done, do
20 you know?

21 A. Roughly 30 knots, 35 knots.

22 Q. Okay. And then what's an aerial inspection?

23 A. Aerial inspection -- well, we typically consider
24 an inspection a ground inspection. We don't have an
25 aerial inspection per se. If we cannot get to something,
26 we can substitute, with approval, an aerial inspection and

1 that will be for facilities that we couldn't get to for
2 whatever reason, and it had to get approval from the
3 superintendent to perform.

4 Q. Okay. While you were at Table Mountain, to your
5 knowledge, was an aerial inspection ever done of the
6 Caribou-Palermo line?

7 A. Not that I'm aware of.

8 Q. Okay. And are you aware if any was ever
9 requested of the superintendent?

10 A. No.

11 Q. No, they weren't, or, no, you're not aware?

12 A. I'm not aware of any.

13 Q. Okay. So what was the patrol or inspection
14 schedule for the Caribou-Palermo line while you were
15 there?

16 A. So our steel lines are a detailed ground
17 inspection once every five years, and then four years
18 after that -- or every year, an aerial for four years and
19 then the fifth year is detailed ground inspection.

20 Q. So when you say aerial that would be a patrol?

21 A. Correct.

22 Q. Okay. And about how long would an aerial patrol
23 of the entire Caribou-Palermo line take?

24 A. Three hours. Three, four hours.

25 Q. So if you were doing detailed ground inspections
26 once every five years, there's only one while you were

1 transmission line supervisor at Table Mountain then; is
2 that accurate --

3 A. More detailed?

4 Q. -- every five years? Yeah, one detailed ground.

5 A. Yeah, in my tenure, yeah.

6 Q. Okay. So is that the inspection and patrol
7 schedule that is set out in the ETPM?

8 A. Yes.

9 Q. And in your opinion, is that sufficient?

10 A. My opinion, no.

11 Q. Are you able to explain to us why it's not
12 sufficient or why you don't believe it is?

13 A. Not just that one line. We have several lines in
14 the Table Mountain jurisdiction that are -- are aging. In
15 the pit country, the high grow county, these facilities
16 have kind of out -- I don't want to say outlived their
17 lifespan, but there is no data in the industry that says a
18 pole will last "X" amount of years, a tower will last "X"
19 amount of years. There's suggestive, but there's no hard
20 data that says it will, and a lot of these facilities are
21 nearing their useful lifespan. So a little more rigor in
22 their inspection would help greatly.

23 Q. Help --

24 A. In (WITNESS #12)'s opinion.

25 Q. Help greatly in terms of, what, safety and
26 longevity?

1 A. Yeah.

2 MS. DUPRE-TOKOS: Now, it's probably out of order,
3 but can you flip to the allotment. It's probably the
4 second slide.

5 MR. NOEL: Okay, 577?

6 MS. DUPRE-TOKOS: Yeah.

7 BY MS. DUPRE-TOKOS:

8 Q. Looking at Exhibit 577.

9 [Exhibit No. 577 was identified.]

10 BY MS. DUPRE-TOKOS:

11 Q. And I have a black and white copy, I don't know
12 that will help you. And we can probably enlarge that, but
13 I believe you've seen this exhibit before, or we can just
14 make the whole screen go black.

15 A. Either way, it looks like the same to me.

16 Q. So are you familiar with the term allotments?

17 A. Not as well as I should be.

18 Q. What are allotments?

19 A. They're, I assume -- I shouldn't assume --
20 projected hours for a patrol.

21 Q. Okay. So would another way of saying that be
22 hours allotted to a certain task such as a patrol?

23 A. Okay.

24 Q. Is that accurate?

25 A. To my knowledge. I'm not as versed on allotment
26 as I should be.

1 Q. Okay. Is another way of saying that, you didn't
2 focus on allotments very much?

3 A. I didn't, no.

4 Q. Okay. To your knowledge, were allotments tied to
5 PM or job numbers?

6 A. I don't know.

7 Q. Now, did you get any input with regards to
8 allotments?

9 A. No.

10 Q. So nobody called you and said, "Hey, (WITNESS
11 #12), how long does it take to do X, Y and Z," and then
12 that's how many -- that's what the allotment became?

13 A. No, these were all derived long before I got
14 there.

15 Q. Okay. And they didn't change while you were
16 there significantly?

17 A. Not that I'm aware of.

18 Q. Now, what is a unit cost?

19 A. The price per unit. Hours charged or labor
20 dollars to the asset inspected.

21 Q. Okay. And well, let me follow up with allotment.
22 Does this list allotments on there to the extent that you
23 can read it?

24 A. What was the question, I'm sorry? The screen is
25 not a great picture. This is not an HD screen.

26 MR. NOEL: It's an HD screen, it's not an HD

1 document. And feel free to stand up and approach the
2 board if you need to or want to.

3 THE WITNESS: Okay. So which one? Doesn't get that
4 much better. So what was the question, I'm sorry.

5 BY MS. DUPRE-TOKOS:

6 Q. Are allotments listed on that document?

7 A. Doesn't appear to be.

8 Q. Okay. Are unit costs?

9 MR. NOEL: Let me see if I can get this going. This
10 line that's highlighted in yellow here is for the
11 Caribou-Palermo, correct?

12 THE WITNESS: Correct.

13 MR. NOEL: And as you go across here to the right,
14 there's a column, "work" and it lists 89 hours. Would
15 that have been the allotment in 2014 for the detailed
16 inspection of Caribou-Palermo line?

17 THE WITNESS: I couldn't tell you. I don't derive
18 these charts.

19 BY MS. DUPRE-TOKOS:

20 Q. Okay. And you don't pay attention to the
21 allotments?

22 A. No.

23 Q. Okay. So we also mentioned unit costs.

24 A. Yes.

25 Q. Were those tracked in any way?

26 A. Yes.

1 Q. How?

2 A. Monthly, we had a report on those unit costs and,
3 again, from my understanding it was derived from the units
4 captured by closed notifications of the circuits being
5 patrolled versus the times or labor charges to those
6 circuits.

7 Q. Okay. And you said it was a monthly e-mail. Is
8 that also known as the red green report?

9 A. Yes, it is.

10 Q. And looking at Exhibit 1228, which is up on the
11 board, is that an example of one of the red green reports?

12 A. It's not the typical one, but that was an e-mail
13 sent out that came with it, yes.

14 [Exhibit No. 1228 was identified.]

15 BY MS. DUPRE-TOKOS:

16 Q. Okay. And looking at that, I am going to have to
17 get up so I can read it. And the colors aren't showing up
18 real great, but here where it says summary, it says "P&I,"
19 is that patrol and inspection?

20 A. Correct.

21 Q. "Unit cost, performing close to DET target, year
22 to date, across the majority of MAT."

23 Did I read that correctly?

24 A. Yes.

25 Q. Okay. "Net financial impact of minus 0.0
26 million," is that -- you can't tell, but is that sort of

1 green. So is that good?

2 A. That's good.

3 Q. And then under preventative maintenance, it says,
4 "unit cost performing close to DET," what's DET, do you
5 know?

6 A. No.

7 Q. "Close to DET target, year to date," which is the
8 same as what it said up for patrol and inspection, "across
9 majority of MAT, slight unfavorable financial impact of
10 minus 0.0 million." And that's in red; is that accurate?

11 A. Yes.

12 Q. Okay. So would it be accurate, then, to
13 understand that because it's in red it's bad?

14 A. At my level, yeah. Red is bad. Green is good.

15 Q. So then it's good that patrol and inspection is
16 zero, but it's bad that preventative maintenance is zero.
17 Is that what that's telling us?

18 A. That's how I perceive it, yes.

19 Q. Okay. So for it to be green, it would have had
20 to be below target; is that accurate?

21 A. I would assume so, yes.

22 Q. Now, while you were transmission line supervisor
23 of Table Mountain, did you receive bonuses?

24 A. Yeah.

25 Q. And what were the bonuses based on?

26 A. It was a -- a culmination of, I think, safety.

1 It was -- the overall company goals. Not just Table
2 Mountains. Table Mountain was just a fraction of the
3 criteria that made up for those bonuses.

4 Q. Okay. And was one of those elements your
5 adherence to the unit costs?

6 A. Yes.

7 Q. And were you also evaluated in some way with
8 regards to inspection and patrols and when they got done?

9 A. Yes.

10 Q. And so when I -- when I say "when they got done,"
11 what does that mean to you?

12 A. It means to me that they were completed in the
13 months they were assigned, and that's how they measured
14 it.

15 Q. And did you have input on what months things were
16 assigned to be done?

17 A. Once a year, we were given some latitude to make
18 adjustment.

19 Q. Okay. But otherwise, you were given a schedule
20 and then given a small chance to adjust things?

21 A. Yes.

22 Q. Okay. So would it be accurate to say, then, that
23 you were just expected to execute the plan sent to you
24 from asset management?

25 A. Yes.

26 Q. Now, you're familiar with the job of troubleman

1 today, and you're at least somewhat familiar with the job
2 that troublemen did in the past. Do you believe that
3 troublemen today can perform their jobs in the same way as
4 troublemen in the past could?

5 A. Specifically, what are you referring to?

6 Q. Well, do they have the same tools and equipment
7 to do the job?

8 A. So -- so the troublemen in the past did not have
9 the same tools required to do the job that troublemen do
10 today, specifically to climb a tower, right. In the past,
11 we did not have to have any fall protection. We just
12 climbed them and did whatever we wanted to do. Today's
13 environment, we are a full belted climbing process.

14 Q. Okay. So there are increased regulations?

15 A. Yes. Doesn't mean they can't do the job any
16 differently, just takes a lot longer. It's more skill
17 set, or less depending on how you look at it. But there's
18 different tools to be used.

19 Q. Okay.

20 MS. DUPRE-TOKOS: Any questions, Marc?

21 MR. NOEL: Yeah, a few follow-up for you.

22 BY MR. NOEL:

23 Q. On that, has the nature of the troubleman
24 position itself changed over the years?

25 A. The job hasn't changed. The personnel has
26 changed.

1 Q. How so?

2 A. Our -- our -- the experience level in that
3 position as significantly changed. We have less senior
4 people doing the job than we did in the past.

5 Q. We have heard that in the past, in the '80s and
6 the '90s that troublemen were basically considered to be
7 the most experienced of the linemen, and that's why they
8 were given that job. Was that your experience?

9 A. Yes.

10 Q. But, yet, in the 2000s and the last ten years,
11 that's not necessarily true anymore, is it?

12 A. No. We're -- they're a little less senior now.

13 Q. And sometimes they really -- they may be
14 journeyman lineman, but they really have no experience
15 working on the transmission lines, correct?

16 A. Correct.

17 Q. And in your time as the supervisor at Table
18 Mountain, you actually had two such troublemen, correct?

19 A. One.

20 Q. Well, (WITNESS #6) had no prior transmission
21 experience before becoming a transmission troubleman,
22 correct?

23 A. Correct.

24 Q. And neither did (WITNESS #20)?

25 A. He was there before I got there, so he was --

26 Q. Okay. All right.

1 A. Yes, so two to your...

2 Q. Right. Now, a term came up earlier, you talked
3 about back when you were doing climbing inspections, if
4 you wanted to, you could go climb towers, right?

5 A. Uh-huh.

6 Q. Now, remember, you have to answer verbally so
7 that the lady at the funny-looking typewriter can take
8 down with what you say.

9 A. Okay.

10 Q. Nowadays, climbing inspections don't occur very
11 often, correct?

12 A. It's rare.

13 Q. The official term in the ETPM is the climbing
14 inspections, can -- are done as triggered by certain
15 events, correct?

16 A. Yes.

17 Q. In your experience as a T-line supervisor, are
18 climbing inspections ever triggered?

19 A. Yes.

20 Q. By what?

21 A. I have called for -- for several of them, but
22 they were initiated by a failure.

23 Q. Okay. What kinds of failures?

24 A. Collapsed arm. I had one from a -- flashed
25 insulators that -- separated the insulators from the
26 tower, and I wanted to make sure that the adjacent

1 structures were sound before I got the crews up on the
2 steel to put the wire back up.

3 Q. Okay. Couple more. The allocations we talked
4 about.

5 MS. DUPRE-TOKOS: The allotments.

6 BY MR. NOEL:

7 Q. I'm sorry, the allotments. It's been a long day.
8 Did you have any input into how many hours would be
9 allotted for an individual inspection or patrol?

10 A. No.

11 Q. Did anybody from transmission asset strategy or
12 business finance ever seek your opinion as to the
13 reasonableness of the proposed allotments?

14 A. Not that I ever recall.

15 Q. And then, when Ms. Dupre-Tokos asked you about
16 preventative maintenance and you used two -- two examples
17 of preventative maintenance in your experience at Table
18 Mountain, one was the three-bolt connector and the other
19 was insulators that were flashed?

20 A. Uh-huh.

21 Q. Insulators that were flashed are actually
22 considered failed, right?

23 A. Not necessarily.

24 Q. They have to be replaced?

25 A. Well, yes.

26 Q. Right. They're a danger. You have to replace

1 them?

2 A. They're subject at that point.

3 Q. Right. So that's not really preventative
4 maintenance. Preventative maintenance would be going out
5 and doing something before -- replacing insulators before
6 they flashed or cracked or -- or whatever. Other than the
7 three-bolt connectors, was there ever any preventative --
8 truly preventative maintenance where crews went out and
9 replaced items on Caribou-Palermo before they broke?

10 A. Not that I can think of off of the top of my
11 head, but I'd have to look at the log report completed to
12 tell you.

13 Q. Okay. And you brought up the three-bolt
14 connectors. Do you recall why three-bolt correctors were
15 replaced?

16 A. 'Cause there was a period of time that there were
17 some three-bolt connectors, not necessarily on this line
18 that were discovered in the transmission system that were
19 not approved for transmission use. They were distribution
20 connector so the leadership at that time said they wanted
21 to know where all these three-bolt connectors were in the
22 system. So unless you got up close and personal, you
23 couldn't tell whether they were the right transmission
24 connector or the distribution connector so we wrote them
25 all up.

26 Q. And why having distribution connectors on a

1 transmission line is that -- is a problem?

2 A. The material composition is not the correct for
3 the high voltage electricity.

4 Q. And ultimately it creates a fire danger, correct?

5 A. Could possibly, yes.

6 Q. Now, that -- the identification of the three-bolt
7 connectors predated you in 2009?

8 A. Yes.

9 Q. You took over in 2012 or 2011, correct?

10 A. 2012.

11 Q. Why did it take seven years to replace the
12 three-bolt connectors on Caribou-Palermo?

13 A. Yeah, I can't answer that. I -- I don't know.

14 Q. Was it understood that the Caribou-Palermo was in
15 a high fire threat district, a high wind district in the
16 middle of a drought?

17 A. I don't think that was taken into consideration.

18 Q. Finally, you talked about industry standards and
19 benchmarking studies. After you left Caribou-Palermo as
20 the T-line supervisor, did you go to work for someone
21 named Eric Back?

22 A. Yes.

23 Q. And Mr. Back was the senior director of
24 operations, I believe?

25 A. Yes.

26 Q. And what did Mr. Back have you doing?

1 A. He had me corresponding with other utilities and
2 benchmarking what they do versus what we do.

3 Q. Did you ever review the Quanta reports?

4 A. No, that was not given to me.

5 Q. Did you ever ask Mr. Back why he was having you
6 look at inspection and patrol policies of other utilities?

7 A. How he instructed me was to go visit these
8 utilities, find out what they were doing. We had to have,
9 what we called, a summit with his leadership and determine
10 if we were doing the right inspections at the right time.
11 He was looking to change our inspections to prescriptive
12 base inspection cycle. What that means? I don't know.

13 Q. And do you recall who was Mr. Back's predecessor?

14 A. John Parks.

15 Q. Now, under Mr. Parks, was there under
16 consideration a move to actually lessen the inspection and
17 patrol cycles?

18 A. Not that I'm aware of.

19 MR. NOEL: Okay. I think that's all that I have. Do
20 you have anything further?

21 Any questions from the jurors? We have some
22 questions. The jurors are allowed to ask you questions.
23 They write them down, give them to us. We review them and
24 make a determination.

25 All right. When a tag or an LC notification case
26 is produced from an inspection, whose responsibility is it

1 to make sure that the problem is addressed and corrected
2 in a timely manner?

3 THE WITNESS: One more time?

4 MR. NOEL: When a tag or LC notification is produced
5 from an inspection, whose responsibility is it to make
6 sure that the problem is addressed and corrected in a
7 timely manner?

8 THE WITNESS: So the LC has only been in existence
9 for about four years, five years. It was an EC tag before
10 that.

11 MR. NOEL: Okay.

12 THE WITNESS: So we will just call it a tag.

13 MR. NOEL: Just a tag.

14 THE WITNESS: And when a tag is generated, it was
15 reviewed by the supervisor, and then input into our SAP
16 database. Our SAP database based on the criteria for
17 which it was submitted would dictate how soon that tag
18 would be addressed.

19 For example, prior to 2013, we could go out to
20 two years. After 2013, it was changed. We could only go
21 out to a year. If it was a raptor tag, it had 90 days.
22 If it was an immediate response, you had to -- an
23 immediate response to address the hazard and within 30
24 days to close it out. So it was supervisor and oversight,
25 I guess, to make sure that it all got done.

26 MS. DUPRE-TOKOS: So supervisor made sure it was done

1 timely?

2 THE WITNESS: Yes.

3 MR. NOEL: Assuming that the troublemen were truthful
4 in saying that they were not trained to inspect C-hooks,
5 would you agree with their assertions?

6 THE WITNESS: Yes.

7 MR. NOEL: To your knowledge, how far up the
8 management chain did this knowledge or the lack of
9 knowledge go?

10 THE WITNESS: Specifically when we...

11 MR. NOEL: Let me -- let's ask it a better way. Did
12 you ever have a discussion with any of your superiors
13 about the lack of knowledge and training for troublemen as
14 to what to look for in inspections?

15 THE WITNESS: There were several conversations
16 through the years. You get to a certain point where
17 you -- it falls on deaf ears, right, so you just don't --
18 you don't beat it on a daily basis, you know.

19 MR. NOEL: Do you remember having any specific
20 discussions about the lack of training and experience with
21 regard to cold-end attachment points?

22 THE WITNESS: Was there any discussion over it? No.

23 MR. NOEL: Yeah. Okay.

24 THE WITNESS: But if I can elaborate on -- on the
25 experience and training, though. I think I shared with
26 you, these people coming in to do the job, in the case of

1 (WITNESS #6), I -- I did not put him in the role for six
2 months because he had no transmission experience. Right,
3 so I made him work on the crews for six months just to get
4 some experience. But that's all the union or the -- well,
5 the union wouldn't let me hold him any longer, and I could
6 not bypass him for any overtime. I could not change his
7 pay scale. He still got paid the troubleman rate, but
8 that was the only thing I could do to help progress his
9 understanding in the transmission system.

10 MR. NOEL: Final question: In your experience, and
11 you've been all over the PG&E territory, is there a
12 difference in the way transmission lines are inspected and
13 maintained based upon population base?

14 THE WITNESS: In my opinion?

15 MR. NOEL: That's what we want, your opinion.

16 THE WITNESS: Yes.

17 MR. NOEL: For instance?

18 THE WITNESS: We're kind of out-of-sight, out-of-mind
19 up there.

20 MR. NOEL: Right.

21 THE WITNESS: We're always fighting the political
22 battle.

23 MR. NOEL: As opposed to, say, the Bay area where you
24 have --

25 THE WITNESS: Something flips the screen down there,
26 they get a lot of attention.

1 MR. NOEL: Thank you, (WITNESS #12).

2 MS. DUPRE-TOKOS: So you need an admonition from
3 madam foreperson before you get to leave.

4 THE WITNESS: What's that?

5 MS. DUPRE-TOKOS: You have to listen to madam
6 foreperson before you get to leave.

7 THE WITNESS: Got it.

8 GRAND JURY FOREPERSON: (WITNESS #12)?

9 THE WITNESS: Yes, ma'am.

10 GRAND JURY FOREPERSON: You are admonished not to
11 discuss or disclose at any time outside of this jury room
12 the questions that have been asked of you or your answers
13 until authorized by this grand jury or the Court.

14 A violation of these instructions on your part
15 may be the basis for a charge against you of contempt of
16 court. This does not preclude you from discussing your
17 legal rights with your own attorney.

18 (WITNESS #12), what I have just said is a warning
19 not to discuss this case with anyone except the Court,
20 your lawyer, or the district attorney.

21 Do you have any questions?

22 THE WITNESS: No, that's pretty clear.

23 GRAND JURY FOREPERSON: Okay. Thank you for your
24 time today.

25 THE WITNESS: Thank you.

26 MR. NOEL: All right. You're free to go. Get out of

1 here.

2 MS. DUPRE-TOKOS: Thanks, (WITNESS #12).

3 THE WITNESS: Thank you.

4 GRAND JURY FOREPERSON: 8:30 Friday.

5 [Confidential grand jury called into session at 8:38 a.m.
6 in Courtroom 9.]

7
8 [Grand jury role call omitted.]

9 [Discussions omitted.]

10
11 MR. NOEL: All right. Morning. A little update on
12 the schedule here. Today, we have three witnesses. We
13 have the failure engineer Jon McGormley, who will be going
14 through his PowerPoint and basically all of the scientific
15 analysis and lots of Algebra. It should be very
16 interesting and very enlightening. He will talk to y'all
17 about what he's been doing. After that, we have Kris
18 Kuyper, the meteorologist, in here to talk to you about
19 weather, and not only the weather specifically on
20 November 8, 2018, but historical weather patterns and also
21 the drought. And talk some about that.

22 Finally this morning, we will have Lieutenant
23 Barkley back to simply lay the foundation for a public
24 record, what's called the fire -- fire-threat map in the
25 state of California. CPUC fire threat that was issued
26 January 19, 2018.

1 Hopefully, we will be done before -- for the day
2 before lunch. It'll be a half day. I have assured the
3 court that we will be out of here by 2:30 at the latest.
4 And the reason is today is the swearing in ceremony for a
5 new judge, and that's in the Chico courthouse.

6 MS. DUPRE-TOKOS: Not a judge.

7 MR. NOEL: Well, yeah, commissioner.

8 MS. DUPRE-TOKOS: Commissioner.

9 MR. NOEL: Yeah. And one of our former colleagues
10 and one of my actual personal closest friends, and so they
11 want us out of here by 2:30 so that all of the staff and
12 everything can go to Chico for the big ceremony. So we
13 promised them that we would be out of here by then.

14 So that means on Tuesday morning, we're probably
15 going to have some clean-up stuff. We may have a few
16 witnesses like Lieutenant Barkley just coming in and
17 laying foundation for various documents, either obtained
18 from public sources or that you have subpoenaed.

19 MS. DUPRE-TOKOS: He won't lay foundation for
20 anything subpoenaed.

21 MR. NOEL: So we will get in the last few documents,
22 anything we've missed. That kind of stuff.

23 MS. DUPRE-TOKOS: Are you talking on Tuesday?

24 MR. NOEL: Yeah.

25 MS. DUPRE-TOKOS: And we may have an air-quality
26 witness.

1 MR. NOEL: Yes, and we -- we may have a witness to
2 come in here. One of the charges -- one of the proposed
3 charges that we really haven't talked much about is the
4 environmental charge. For the environmental damage that
5 the Camp fire did and we've been working to get an expert
6 from the State Air Quality Control, right?

7 MS. DUPRE-TOKOS: It'll either be state or county,
8 but the county uses the state data.

9 MR. NOEL: Yep. To come in here and talk to you
10 about what the Camp fire did in terms of the air quality
11 up here. The pollution that it released. The destructive
12 nature. You've already heard a lot of it without even
13 knowing it, and that was all of our victims who died from
14 inhalation. And so we will talk, hopefully, a little bit
15 about that.

16 MS. DUPRE-TOKOS: If you recall, it wasn't just
17 inhalation of smoke. It's -- it was inhalation of, I
18 think the language was, combustible products.

19 MR. NOEL: Yes.

20 MS. DUPRE-TOKOS: And Dr. Tovar mentioned that, while
21 generally they call it smoke inhalation, there's all these
22 toxins that they -- so many they don't normally test for
23 them, but those are all included in the inhalation of
24 combustible products.

25 MR. NOEL: The plan right now is to spend Tuesday
26 morning doing that clean-up evidence, hopefully hearing

1 from air -- the air quality control people, and then
2 Tuesday afternoon we will spend with the formal
3 instructions and walking through reading the instructions
4 to you.

5 And then Friday...

6 MS. DUPRE-TOKOS: Friday, we may submit one last
7 piece of evidence.

8 MR. NOEL: Right. Well, the plan is right now is by
9 Friday we will be in summation. There is one other thing
10 that has popped up that we may not be able to do on
11 Tuesday that may come on Friday. If that happens, we will
12 deal with it, but the plan is that Friday is going to be
13 about the summation.

14 GRAND JUROR NUMBER FOUR: Can we know what this one
15 thing is?

16 MR. NOEL: What?

17 GRAND JUROR NUMBER FOUR: Can we know what that one
18 thing is?

19 MS. DUPRE-TOKOS: We're trying to get one last set of
20 medical records for one additional enhancement, but we
21 have trouble finding the -- the victim and/or even getting
22 that person's name. We have the person's name, so we are
23 starting today sending out a subpoena on their behalf to
24 get the medical records of that victim, who was injured
25 and then we will submit the medical records without
26 putting on a witness. Unless we manage to actually find

1 that victim and that person wants to come in on Friday
2 morning, which I am thinking is not likely.

3 MR. NOEL: One of the things that we have found
4 through all of this is dispute all of your power and,
5 specifically, that -- your subpoena power, HIPPA trumps
6 and trying to get medical -- any medical information
7 specifically about people who were injured in the fire is
8 very, very difficult. And we have one person we know was
9 injured in the fire -- very badly injured, but all we've
10 got is his name.

11 MS. DUPRE-TOKOS: Well, and that took literally --

12 MR. NOEL: Yep.

13 MS. DUPRE-TOKOS: -- since December to get the
14 name --

15 MR. NOEL: Yep.

16 MS. DUPRE-TOKOS: -- because people don't understand
17 HIPPA so they freak out and won't give any information at
18 all.

19 MR. NOEL: So we literally had to subpoena the agency
20 to -- just to get the guy's name and now again to get the
21 guy's date of birth and what hospital he was treated at.
22 And I think we finally have enough that we can subpoena
23 the hospital records to show that.

24 MS. DUPRE-TOKOS: Yeah, we're guessing.

25 MR. NOEL: Yeah, we're guessing.

26 MS. DUPRE-TOKOS: We're pretty sure we know what

1 hospital.

2 MR. NOEL: Yes, we're taking an educated guess and
3 that hopefully we will have those records before next
4 Friday, so we will deal with that.

5 MS. DUPRE-TOKOS: If by some miracle, we have them by
6 Tuesday, we will deal with it Tuesday.

7 GRAND JUROR NUMBER FIFTEEN: I understand you're
8 doing indictments for the people that lost their lives,
9 correct?

10 MR. NOEL: Yes. Well, we're going to ask -- you're
11 going to be doing the indictment.

12 GRAND JUROR NUMBER FIFTEEN: Is it -- right.

13 MR. NOEL: We're going to ask you do that.

14 GRAND JUROR NUMBER FIFTEEN: Is there any way to
15 encompass that to all -- everybody else that didn't die
16 but was affected?

17 MS. DUPRE-TOKOS: Not --

18 MR. NOEL: Not really.

19 MS. DUPRE-TOKOS: Well, for the people who died,
20 we're going to be asking that you indict on manslaughter
21 charges, so obviously if they didn't die, it can't be
22 manslaughter.

23 GRAND JUROR NUMBER FIFTEEN: Sure.

24 GRAND JUROR NUMBER FOUR: Can I ask a question?

25 MS. DUPRE-TOKOS: Some --

26 MR. NOEL: Just a second.

1 MS. DUPRE-TOKOS: -- of the other charges may
2 indirectly encompass other people based on the language of
3 the statute.

4 MR. NOEL: So one of the other charges that -- that
5 we will be presenting to you and -- and asking you to
6 indict on is the 452 we've talked about from the
7 beginning, which is unlawfully causing a fire. That will
8 encompass all the victims. All 13,992 residences --

9 GRAND JUROR NUMBER FIFTEEN: Well --

10 MR. NOEL: -- 5,000 businesses.

11 GRAND JUROR NUMBER FIFTEEN: Yeah, I --

12 MR. NOEL: All of that.

13 GRAND JUROR NUMBER FIFTEEN: There's got to be
14 something.

15 MR. NOEL: Yeah.

16 GRAND JUROR NUMBER FIFTEEN: Okay.

17 MS. DUPRE-TOKOS: Because it -- it encomp -- it
18 provides for multiple residences.

19 GRAND JUROR NUMBER FIFTEEN: Okay. Thank you.

20 MS. DUPRE-TOKOS: -- or structures, so all the
21 structures that were destroyed or damaged would fall under
22 that, so potentially if they -- if an indictment was
23 handed down on that charge, then all of those victims
24 would be eligible for restitution.

25 MR. NOEL: And services, and then there's also --

26 MS. DUPRE-TOKOS: Yeah.

1 MR. NOEL: -- what's called an enhancements on that
2 for various things including great bodily injury or death,
3 which you'll get defined for you next week. Number of --
4 of houses or, you know, inhabited structures that were
5 damaged or destroyed and firefighters.

6 MS. DUPRE-TOKOS: Well, that's GBI.

7 MR. NOEL: Well, there's a separate enhancement for
8 if the firefighters are badly injured in this, and so
9 hopefully we will be trying to get that from you.
10 Unfortunately, like we said, the state agencies, medical
11 records, HIPPA, we can't talk about it. Not even a
12 subpoena. You know, you have to -- you have to know who
13 it is to subpoena it. Great, well, tell us who it is. We
14 can't tell you HIPPA. So it's been a lengthy and --

15 MS. DUPRE-TOKOS: I tried fighting with the state
16 trying to explain to them, no, that's not how HIPPA works,
17 but...

18 MR. NOEL: And, fortunately, she has been the one
19 that has been fighting that battle for the last three
20 months.

21 GRAND JUROR NUMBER FOUR: That kind of leads into a
22 question I have and that is -- I mean, you hear about it.
23 I don't know what the real law is on it, but can we name
24 unindicted co-conspirators?

25 MR. NOEL: You could. If we had any. I mean, if
26 this was a conspiracy case, absolutely. And -- but we

1 don't have a conspiracy case. So that -- that's -- and
2 honestly, I -- I have --

3 GRAND JUROR NUMBER FOUR: Well, if we believe that
4 in -- from the top down, a culture of neglect was
5 interned, couldn't we use that as a foundation for the
6 charge of unindicted co-conspiracy?

7 MR. NOEL: No.

8 MS. DUPRE-TOKOS: You could use that to indict
9 individuals in addition to the company, but like Marc
10 says, we -- there is -- we have not gone into the
11 necessary obnoxious, tricky evidence for a conspiracy
12 case. So that wouldn't -- you don't have what you need
13 for that.

14 But, certainly, if there is someone that you feel
15 there's probable cause to indict, you absolutely can do
16 that, even if it's not someone that we're requesting that
17 you indict.

18 MR. NOEL: Right. I guess the ultimate answer to
19 your question is, you've seen the jury instructions
20 already a couple of times for manslaughter. You've seen
21 the jury instructions for -- for the unlawfully causing a
22 fire, 452; they're a bit complex, and they tell you how
23 the elements and everything that need to be proven.
24 Conspiracy is a very, very difficult thing to charge. The
25 jury instructions for conspiracy are about three-pages
26 long full of elements. We don't have enough right now.

1 That doesn't mean that down the road we won't, but at
2 least for your purposes, there is not enough to show a
3 conspiracy, and so that would not be something we would be
4 asking to indict on.

5 Like I said, that doesn't mean if you guys finish
6 your business and you decide to indict, that is not the
7 end of the investigation for us. We keep -- we keep
8 going. And you know, maybe we can do that somewhere down
9 the road, but -- but we will see.

10 Let's see, did we have anymore --

11 GRAND JUROR NUMBER SEVENTEEN: Hearing the
12 environmental one that you're bringing up, will that --
13 the scope of that effect the air quality that extended all
14 the way from that region all the way to, like, the coast,
15 because the air quality was affected that far.

16 MS. DUPRE-TOKOS: The air quality was awful.

17 GRAND JUROR NUMBER SEVENTEEN: Hundreds of miles were
18 affected by that.

19 MS. DUPRE-TOKOS: Right. We do not have jurisdiction
20 in any other county. You guys don't have jurisdiction in
21 any other county. We will just be putting on evidence,
22 hopefully, of the effects here in Butte County. And
23 asking for indictment on that charge or charges for the
24 air quality here in Butte.

25 Yeah, we know the -- Sutter County was, what,
26 just 15 points lower than Oroville and Paradise, and the

1 Bay area was, like, 30 points lower in terms of being in
2 the dangerous level. But we are just going to be asking
3 based on the air quality here in Butte.

4 GRAND JUROR NUMBER SEVEN: So just air quality, not
5 the contaminated water?

6 MS. DUPRE-TOKOS: Not at this time.

7 MR. NOEL: Right. All right. Anything else?

8 All right. Before we -- we get to the witness,
9 we need to discuss the events that occurred at the end of
10 our last session on Tuesday, and make a good record on it
11 just in case we didn't at the time.

12 I think we were all tired and --

13 MS. DUPRE-TOKOS: Trying to get done.

14 MR. NOEL: -- trying to get done. Trying to get you
15 guys out of here before 5:00. As you probably noticed
16 that sometimes when we go past 4:30, somewhere around
17 4:30, 5:00, there's a knock at our door and a bailiff will
18 stick his head in and give us the signal, you know, it's
19 4:30, 5:00, and, you know, you need to wrap it up.

20 On Tuesday, the bailiff came, stuck his head in,
21 about 4:30, 5:00, and brought the rest of his body with
22 him. And, apparently, was very much insistent that we
23 were going to stop right away and would not leave. And I
24 know the sergeant-at-arms was at the back of the courtroom
25 talking to the bailiff. I know madam foreperson briefly
26 addressed it and we went on. He stayed in the back of the

1 courtroom until we finished, which is a violation of the
2 law. And it's an issue.

3 We have spent way too much time over the last
4 couple of days investigating it and, you know, basically,
5 it was a miscommunication within the court, and it won't
6 happen again. And he subsequently has signed a -- a
7 nondisclosure statement that anything he heard while he
8 was in here, he will not disclose anywhere else. He was
9 only in here for a few minutes, but he did hear the tail
10 end of the testimony, and that will never happen again.
11 And it -- it's been dealt with between our bosses, the
12 bosses of the court and the sheriff, and it was simply a
13 misunderstanding.

14 He didn't want to be here. He -- he was very
15 uncomfortable, but as his orders -- as the orders filter
16 down from the --

17 MS. DUPRE-TOKOS: The COO.

18 MR. NOEL: The COO, the chief operating officer of
19 the court and the presiding judge, by the time they got
20 down to him -- if any of you have played the telephone
21 game, apparently, those orders had gone from "Go see how
22 long they're going to be," to "Go drag them out of here."
23 And --

24 MS. DUPRE-TOKOS: And "Don't leave until they're
25 done."

26 MR. NOEL: And "Don't leave until they're done." So

1 he was doing what he thought were his orders and -- yeah,
2 like I said, that's -- that's been dealt with. It's been
3 taken care of, and if they have any more issues, you know,
4 we try not to go past 4:30. Sometimes we have to go past
5 4:30. Technically, the court is open until 5:00. We --
6 we've been out of here by 5:00 all but one day in a year,
7 and we stayed until 5:15 one day, but we have let them
8 know we will be out of here by 5:00.

9 So -- and then also on that, as part of the
10 meetings on that with the presiding judge, also
11 discussions of your potential deliberation schedule, and
12 the presiding judge has assured us that she will be make
13 whatever time available to you guys that you want or need
14 especially at the end. And what we told her is what we
15 talked about the other day is that, in the beginning,
16 you're going to stay with your Tuesday, Friday schedule,
17 8:30 to 4:30. If you don't have a decision by February
18 20th, then you may want to add some extra --

19 MS. DUPRE-TOKOS: March 20th.

20 MR. NOEL: Oh, March 20th. You're right.

21 March 20th, you may want to add some extra time
22 in there. You may want to come in on Monday. You may
23 want to stay late, whatever. So -- and the presiding
24 judge said as soon as she knows, you have madam foreperson
25 let the clerk know, and that the court will do everything
26 to accommodate you, so.

1 GRAND JURY FOREPERSON: Okay.

2 MR. NOEL: Are we ready to start?

3 GRAND JURY FOREPERSON: We are ready.

4 MS. DUPRE-TOKOS: Is the TV on?

5 MR. NOEL: Mr. McGormley.

6 GRAND JURY FOREPERSON: What's his --

7 GRAND JURY SECRETARY: McGormley.

8 MR. NOEL: McGormley. M-C-G-O-R-M-L-E-Y.

9 GRAND JURY FOREPERSON: McGormley.

10 MS. DUPRE-TOKOS: Yeah, he doesn't have that on the

11 PowerPoint.

12 MR. NOEL: Oh, that's right.

13 MS. DUPRE-TOKOS: You'll note that he doesn't have

14 his name on the PowerPoint so if you need to write it on

15 there, if you want it on there.

16 [Witness enters the courtroom.]

17 MR. NOEL: I have not touched this PowerPoint. If

18 anything goes wrong, it's not my fault. Mr. McGormley

19 made the PowerPoint and put it all together, and our

20 support printed it all out, so.

21 GRAND JUROR NUMBER NINE: Sure.

22 THE WITNESS: Can I get set up?

23 MR. NOEL: Yep, go ahead and get set up. I am also

24 relinquishing control of the smart TV this morning.

25 MS. DUPRE-TOKOS: Which is very hard for him to do.

26 Very.

1 MR. NOEL: You know the stereotype where the dad on
2 TV that has to have the remote control? That's me.

3 MS. DUPRE-TOKOS: Swear in.

4 MR. NOEL: All right.

5 THE WITNESS: All right.

6 MR. NOEL: All right. Once you're ready to go here.

7 THE COURT: Mr. McGormley, before you get started,
8 would you please stand and raise your right hand to be
9 sworn? Thank you.

10 Do you solemnly swear that the evidence you shall
11 give in this matter pending before the grand jury shall be
12 the truth, the whole truth and nothing but the truth so
13 help you God.

14 THE WITNESS: I do.

15 GRAND JURY FOREPERSON: Thank you.

16

17 **EXAMINATION**

18 BY MR. NOEL:

19 Q. For the record, can you please state your full
20 name spelling your last name?

21 A. My name is Jonathan Carl McGormley. Last name,
22 M-C-G-O-R-M-L-E-Y.

23 Q. Mr. McGormley, are you employed?

24 A. I didn't hear the question.

25 Q. Are you employed?

26 A. Yes, I'm employed.

1 Q. By whom are you employed?

2 A. I'm employed by Wiss, Janney, Elstner Associates.

3 Q. What is Wiss, Janney, Elstner Associates?

4 A. We're a structural materials and architectural
5 engineering firm that specializes in evaluating structural
6 performance and behavior.

7 Q. What do you do for Wiss, Janney, Elstner
8 Associates?

9 A. I'm a principal engineer, evaluating all sorts of
10 structural systems.

11 Q. Are you a licensed engineer?

12 A. Yes, I am.

13 Q. What type of engineering are you licensed?

14 A. I'm licensed as a professional engineer and a
15 structural engineer in several states.

16 Q. Can you walk us through your educational
17 background that qualifies you as a licensed engineer?

18 A. Sure. So I graduated from the University of
19 Cincinnati with a Bachelors Degree in Civil Engineering.
20 I then went onto Purdue University and received a Masters
21 Degree the Civil Engineering. After a certain amount of
22 time required for experience, I received a structural and
23 professional engineering license.

24 Q. How long have you been an engineer?

25 A. For 26 years.

26 Q. Now, do you have a specialty?

1 A. Yeah, I focus on -- on failures and fatigue and
2 fracture of -- of metals.

3 Q. How did you get into focusing on failure?

4 A. Well, that's one of the predominant activities
5 that our company works on, and I worked under a engineer
6 who was -- that was his specialty as well.

7 Q. How long have you been doing failure engineering?

8 A. Since I started for about almost 26 years now.

9 Q. Any big projects that -- that you've done?

10 A. Sure. So I have worked on several large -- large
11 failures. Notably one, maybe you recall, back in 2007 was
12 the collapse of the I-35W Bridge in Minneapolis. I worked
13 with the state of Minnesota and the NTSB to evaluate that
14 failure.

15 Most recently, I was engaged to look at the
16 failure for that building that collapsed in New Orleans in
17 October. I've covered a lot of failures in between.

18 Q. Do you commonly work for governmental agencies?

19 A. A lot of my work is for transportation agencies.
20 I work a lot of the transportation field.

21 Q. Federal and state?

22 A. Yes, for both.

23 Q. So you were retained by CAL Fire in the state of
24 California to look into why the hook broke on 27/222,
25 correct?

26 A. That's correct.

1 Q. And so you're under contract with the state of
2 California?

3 A. We are.

4 Q. And you're being paid for your services by the
5 state of California?

6 A. That is correct and this investigation.

7 Q. And being paid for your testimony here today by
8 my office, correct?

9 A. That is correct.

10 Q. So why don't you walk us through your involvement
11 with the Camp fire investigation?

12 A. Sure. Approximately a little more than a year
13 ago, we were asked to look at the failure of the hook
14 that, you know, caused the conductor wires to come in
15 contact with the tower. I came out in the beginning of
16 February or mid-February and toured the various
17 transposition towers along the line there, including the
18 tower that had the hook failure. I looked at a bunch
19 of -- all the documents that were provided, which I am
20 sure most of you have also seen a lot of those documents,
21 and then subsequently received the FBI report and looked
22 at that, and then began an analysis after CAL Fire asked
23 us to do an engineering evaluation of the hook.

24 Q. All right. Just briefly give us an introduction
25 as to what goes into your analysis and reporting?

26 A. Sure. So for this project, what we were asked to

1 do is -- we were asked to see if, through engineering
2 principles and properties, we could check the plausibility
3 -- or see if it was plausible that the hook had failed and
4 exhibited a certain amount of wear prior to its failure
5 was consistent with long-term wear, so something around
6 the order of a hundred years. So that was the -- the
7 concept. We wanted to see was it -- if -- was it -- was
8 it plausible. Was it -- was it likely? We can't say with
9 certainty, but we can say whether it was plausible or not
10 and using our engineering knowledge and technique to do
11 that.

12 And so we used some analytical modeling, some
13 computer modeling, and then we used some known principles
14 about wear to render that opinion.

15 Q. You said that you've reviewed some documents as
16 part of your investigation analysis, can you tell us what
17 documents?

18 A. Wow, there's quite a few.

19 Q. Just pretty much in general.

20 A. In general, we looked at the components that made
21 up the tower, the insulator strings. The -- the hooks.
22 The tower design itself. We looked at information about
23 the tower locations within the Feather River Canyon, and
24 then we looked at some general maintenance documents that
25 were put together by PG&E. We looked at a report
26 associated with some earlier wear on a PG&E component and,

1 as I noted before, we looked at the FBI report -- lab
2 report. Those are the bigger --

3 Q. Okay.

4 MS. DUPRE-TOKOS: Marc?

5 THE WITNESS: -- the bigger items.

6 BY MR. NOEL:

7 Q. So first of all --

8 MS. DUPRE-TOKOS: Marc? Weather data.

9 BY MR. NOEL:

10 Q. So first of all, you talked the historical
11 documents. You're talking about the blueprints and
12 schematics from the 19...

13 A. 1919.

14 Q. 1919, 1920 era that were provided by PG&E
15 pursuant to subpoena, correct?

16 A. Correct.

17 Q. And then you talked about maintenance documents,
18 those are always things that were provided by PG&E through
19 subpoena. You've talked about reports. You're talking
20 about the 1987 and 2018 PG&E applied technology services
21 lab reports on the hooks and the -- and the hanger holes,
22 correct?

23 A. Correct.

24 Q. And then the FBI reports, the things that were
25 put together by Sue Marvin, correct?

26 A. Correct.

1 Q. And that includes her raw notes, correct?

2 A. Correct. That was all in her information.

3 Q. Yep. And, finally, did you also use
4 meteorological data?

5 A. Sure. So we didn't have any documents, but we
6 had a lot of data that we were able to collect from a
7 weather station that was nearby, so that we used that
8 information, and I will talk about that as we go further,
9 how we used the information to help us analysis -- you
10 know, or help us in the evaluation.

11 Q. And as part of that, were you in contact with the
12 local meteorologist Kris Kuyper?

13 A. We were.

14 Q. Yep.

15 A. And he helped provide us some of the data that
16 was used.

17 Q. Thank you. All right. With that, why didn't you
18 walk us through your -- your presentation and your
19 analysis and, ultimately, what results you got.

20 A. Sure.

21 Q. We will jump in with questions as you go through.

22 A. Okay.

23 Q. But kind of let you have -- oh, I forgot.

24 A. Oh.

25 Q. You have Exhibit 1352 here in front of you,
26 correct?

1 A. That is correct.

2 Q. And that is the -- that is the presentation that
3 you're about to give us?

4 MS. DUPRE-TOKOS: On a thumb drive.

5 MR. NOEL: On a thumb drive.

6 [Exhibit No. 1342 was identified.]

7 THE WITNESS: Well, good morning. I am glad to spend
8 my morning with you guys. I understand that you're well
9 versed in this material now. So this should make my job
10 really easy.

11 So as we talked out -- talked at the beginning of
12 my testimony here, we were retained to evaluate the hook
13 that failed and see if there was plausibility if its
14 failure was as a result of long-term wear on the
15 component. And so what we did was an analysis, and I will
16 describe that analysis here in my testimony.

17 The important thing to remember is this is we're
18 -- we're looking at this somewhat at a high level, and
19 that the values were giving and I will give in this
20 presentation are -- are a value. They're not necessarily
21 the exact value. What we do is we provide some ranges and
22 we will see, does our number fall within those ranges? If
23 it does, then it suggests that it's plausible. We're not
24 providing certainty. Hopefully, with additional analysis
25 of data, we can refine that number, which fall closer to
26 the -- the numbers we have, but fall within that range.

1 So the idea of this approach was to see do the numbers
2 that we get seem reasonable? We know for a fact that the
3 hook failed, and that there's a certain amount of wear on
4 the hook and from that information, we see is it because
5 of long-term wear.

6 BY MR. NOEL:

7 Q. Let me interrupt you right there. Can you define
8 for us, for your purposes, the scientific purposes, the
9 difference between plausibility and certainty?

10 A. Sure. So as we do engineering, we try to
11 identify levels of confidence and percentages against
12 failures. So I want something to -- when I design
13 something, it's going to be 99.99 percent that it would
14 not fail, for example. We have certain designs that we --
15 or design philosophies that give us a confidence level.

16 When we're dealing with information at this
17 level -- and we will talk about when I say "level," what
18 it means is the preciseness of the data. We may not be as
19 confident that the data can fall in, so that there's a
20 range of that data. So what we're saying is it's
21 plausible if it falls within the range, and that is one
22 thing; and then as we were to improve our understanding of
23 the information, we may be able to approach more
24 certainty, higher confidence level that the answer we're
25 providing is as accurate as we can define it. And you'll
26 see that, as I talk -- I mean, this involves both analysis

1 of data plus somebody making a model to -- to try to
2 represent the real word behavior. Those can be very
3 complex. So we're just trying to -- do we fit within
4 this? If it does, then we know, okay, this makes sense.
5 If we fall way outside, then the suggestion is, at least
6 the assumptions we've made to get that answer which falls
7 outside of the range may be wrong or that the -- the
8 behavior that we've looked at or the -- the time that we
9 considered may be -- may not be accurate.

10 So that is our -- our intent is do we -- do we
11 fall? If it does, we say it's engineering -- through
12 engineering principles, it seems like a plausible answer
13 or solution.

14 Q. So do you have specialized computer software or
15 anything that you use to do these analyses?

16 A. We do. There's both a specialized computer and
17 specialized statistical evaluation of the data, plus our
18 understanding of materials to be able to render those
19 opinions.

20 Q. All right. Go on.

21 A. Okay. So speaking software, we have this
22 software package that we use. It's commercially available
23 called SAP 2000. It has a lot of capabilities. We use it
24 all the time, so this isn't the first time we used it. We
25 use it every day. And the nice thing is, it's well suited
26 for both non-linear and linear behaviors. When I say,

1 "nonlinear" -- or "linear," just assume something moving
2 back and forth that behaves the same every time. So when
3 we go "nonlinear," it means it changes given the
4 conditions on it. And so as you can imagine, the
5 insulators and the conductor wire, and the -- the -- and
6 the tie between them, all are complex behaviors to try
7 to -- to do mathematically. And so what we're trying to
8 do is represent that complex behavior in a computer model.

9 So, in general, what our procedure was, was
10 really to complete a computer model and that includes all
11 the properties, so it includes the weight, the stiffness,
12 it includes the -- the various friction conditions that
13 happened, right, we have a hook. It's going to have a
14 friction. It's going to be in contact with the hole in
15 the arm, then we have the various insulator components or
16 the insulators themselves are made up of a stack of
17 insulators. And so those are able to -- think like a inch
18 worm that kind of moves all around relative to each other,
19 so all of that has to be -- to be modeled. Then we're
20 going to take that model and we're going to excite it with
21 some wind, and then it's going to move around, and from
22 that information, we will collect how much it moves and
23 use that information to calculate some -- some results
24 that we can use to apply to wear.

25 And then we take that and, again, extend it as a
26 late step to this. Okay, now we have how much travel or

1 rotation that this hook moved, and we add that all up over
2 the life of the hook and we say, given some more certain
3 wear assumptions, does it add up to the material that was
4 removed prior to its failure.

5 So it's kind of the -- makes three -- three
6 steps. Seems really simple.

7 Q. All right. I want to step back real quick. The
8 title of the prior slide -- and -- and you used the term
9 "finite element analysis." If you can define that and
10 explain to us what it is?

11 A. Sure. Finite element analysis is a -- is a --
12 it's a method. And, essentially, makes your -- you make
13 all of the components -- and we will show some examples in
14 the discrete little elements. That -- that is the element
15 part of it. And those elements, through mathematical
16 properties and principles, have to interact with each
17 other. So if you were to take, you know, this desk and
18 make it up into a bunch of little -- little squares, then
19 this little square next to that square has to -- to have
20 to behave, and we have to tell him how we need them to
21 behave whether that's they need to behave exactly the
22 same, because this glass top is one piece of unit, or
23 if -- you know, if I put my bottle on top of the desk, the
24 fact that it's moving around, it will come in contact with
25 my desk, but it's not going to go through the desk. It's
26 not going to stick to the desk. So we can adjust all

1 those various behave -- interactions between the elements,
2 and then we run the software and it basically puts on
3 output that says here is what this structure does or
4 this -- this element does together.

5 So they can be very powerful, and they are used
6 to really model and analyze very complex systems.

7 Q. All right. So let's talk about the overview of
8 your analytic model.

9 A. Sure.

10 Q. Go through the basics with us.

11 A. So, again, as I said, we -- we had the model in
12 geometry. So we represented using drawings and everything
13 that we had available to us, the various components. For
14 this case, we did not model the tower, because we're
15 really not interested in the tower. We're interested in
16 the behavior of the components that are associated with
17 the left jumper cable -- making the jumper, and on the
18 left insulator string. So we modeled the insulator
19 string, the jumper cable -- essentially everything shown
20 there in the red -- in the red as well as the connecting
21 pipe, and then the three insulator strings. So that's
22 really the -- the area that we focused on, and there's a
23 hook on each one of those insulator strings. We did not,
24 as I said, look at the tower because, at this point, the
25 tower is probably not influencing the behavior of the --
26 on the wear on the hook. And then we used photographs and

1 measurements, as I said, from the FBI and some of the data
2 received from photographs from the district attorney's
3 office and CAL Fire.

4 So what you see is a representation of that
5 model. Now, it's -- our finite element -- our -- these
6 are just graphical representations for the purposes of
7 explaining what we're doing, but the model is essentially,
8 those insulator strings, the red conductor cable, and then
9 the blue -- bluish purple tie, or whatever you want to
10 call it, the conduit between them, kind of represents a
11 similar view of another transposition tower along the same
12 transmission line.

13 So as I said the -- this is -- if you think about
14 it, there's -- there's some friction that is going on.
15 There's a hook on the -- in the hole, and then there's the
16 various insulator units that themselves are able to move
17 relative to each other. So there's a ball and socket
18 between the insulators and the connectors, and so those
19 were all we considered, and we have to consider friction
20 because that's -- that's what is causing the wear that we
21 know observed -- was observed in the hook.

22 So then -- that's a -- that's -- friction is a
23 difficult thing to model so you have to use some known
24 engineering behaviors on that, and --

25 Q. Before we go onto that, I know this is a basic
26 question for you.

1 A. Uh-huh.

2 Q. But if you can just briefly explain to us, what
3 is friction from an engineering standpoint?

4 A. Sure. So friction is a result of -- of a normal
5 force or a force pushing down, and then there's a
6 coefficient of friction, so it's the -- the amount -- the
7 force would be the amount to slide, if we're going to say,
8 or move an element relative to another one that has normal
9 force on it and has some amount of friction and that
10 coefficient or friction depends on the surface of the
11 material so that coefficient can be very slippery if it's
12 lubricated, or it can be very coarse if the material the
13 interlocked together. If you can think about that. Take
14 something -- a piece of sandpaper and you try to put two
15 pieces of sandpaper together and try to push them, you're
16 going to get high friction. If you were to put, you know,
17 two wood blocks together and put some oil in between them,
18 they're going to slide, you know, relative to each other,
19 pretty easy. And so what we try to define is -- is that
20 stick and slip. So we're -- where it sticks together and
21 then it slips, so we're trying to model that. So as
22 this -- in the representation of the hook, the hook is
23 going to be sitting there, bearing. So it's got force,
24 and then there's some coefficient of friction between it
25 and the hole of the angle, and then we're going to try to
26 move it, and it's going to have to overcome that friction

1 between the two pieces in order for it to move. If it
2 doesn't overcome it, then it just sits there. If it does
3 done move then it -- then it moves. And what we're going
4 to see as it starts to move, because it can overcome that
5 friction, the wind blows are such that they can make that
6 hook relative to the angle move. But that's friction. So
7 that -- that's a know -- very well-known behavior. Now
8 the coefficient of friction depends really on the
9 material. For this case, we don't know that for sure, but
10 we can, from interfering behaviors, we can pretty well
11 identify what it should be, and we know for two steels on
12 steel that aren't necessarily lubricated -- because nobody
13 was going up there squirted oil in between the -- so we
14 know the coefficient of friction is somewhere in the order
15 of about .57. If it was -- if it was really stiff, it
16 would be closer to one, if it was zero, then there would
17 be no friction. It would just be able to slide and never
18 stop, because it would never slow -- slow down. We're
19 somewhere between those ranges.

20 Q. Are you familiar with the term body-on-body wear?

21 A. Yes.

22 Q. How does body on body wear relate to friction?

23 A. So we will discuss, at the end, all of the
24 details about wear, but the idea is that two materials
25 that -- that touch each other and depending on the force
26 that is in their contact, they're going to -- little bits

1 and pieces of that material one or the other, depending on
2 the hardness of the material -- we will talk a little bit
3 about hardness as well -- will start to remove -- so just
4 think about, if you took a piece of sandpaper and you're
5 sanding the wood, you're obviously removing pieces of wood
6 that you're using with your sandpaper. So that's
7 body-on-body wear. It's starting to remove some of that
8 wood. And so -- 'cause the wood is much softer than the
9 granite -- or the garnet or whatever sandpaper you're
10 using.

11 So this is similar, but this just happens to be
12 two metals that are in contact with each other as opposed
13 to a piece of wood and a piece of sandpaper.

14 Q. All right. If you can explain to us joints with
15 friction?

16 A. Sure. So, again, here is examples when we talk
17 about the joints. We have the hook in the -- in the
18 bracket hole, and then we have the -- kind of, the ball
19 and socket joint of the insulator in the string of
20 insulator, so there's a stack of insulators and those are
21 all as, I said, are able to kind of jingle around.

22 So we model, mathematically, the friction. And
23 so what we do is -- shown here is a typical output from
24 a -- from a friction behavior. So as the -- as the force
25 goes up, or deformation, then it -- it goes to a certain
26 point, and then it'll slip and then it'll stop and build

1 up force and slip. And that's what you're seeing on
2 the -- the various arrows there, the -- the vertical ones
3 are really the sticking point. So the material is trying
4 to slide, and it can't slide until it gets to a certain
5 force, and then it slips and then it slides and then slips
6 and sticks and so forth. And that's the process by which
7 we model. We apply this type of behavior to our -- to our
8 hinges. And I know it makes -- you know, like, well, how
9 do I model? But this is -- the idea is you try to put
10 these -- everything gets expressed in terms of a
11 mathematical equation, and that then gets parts of the
12 software that outputs the results.

13 Q. Can you explain, very quickly before we move on,
14 there's the term -- I don't know how you pronounce this,
15 hysteresis?

16 A. Yeah, hysteresis. So --

17 Q. Hysteresis.

18 A. -- is the -- if you were to follow a -- the same
19 line, it would go up and down. If you apply a load, it
20 might go, but what we have is if we apply a load and it
21 slips and apply a load and it slips, and so it can repeat
22 itself over and over again. And so it's just a hysteretic
23 move is -- is the idea that it follows a known pattern and
24 just repeats itself. Sometimes that -- it can go up and
25 down, if it's purely elastic and just stays in the same
26 line, but because we're -- we're going up and we're

1 slipping, we don't end up in the same spot each time. So
2 that's why the line comes back down and goes up, because
3 we're -- we're advancing along. We're moving the block,
4 if you want to say, or moving our sandpaper along the
5 wood. And so as it does that, then it repeats it, keeps
6 going along the line.

7 If -- if nothing was -- was moving, we would be
8 apply a force and then go back, apply a force and go back.
9 It would just stay on the same line moving back and forth.

10 Q. And then we probably have already done this, but
11 just to be safe, what is an isotropic hysteresis model?

12 A. So isotropic is one -- one dimension and then,
13 again, where this is the -- the -- the definition of what
14 we apply to in our models, so this has got a mathematical
15 formula that is represented in the SAP model for this
16 behavior.

17 So what we're telling the -- the model is we want
18 it to behave like this. We apply a load, and we want it
19 to build to a certain point, and then have it slip and
20 then build to a certain point and have it slip. So that's
21 the model -- that's the mathematical formula that we put
22 into the model and say that's the behavior that we want to
23 it to do. So it's highly dependent on what I pick as the
24 variable believe of when it slips, right, and I said we're
25 going to use -- based off of the understanding of the
26 material, we're going to use .57 of the coefficient. If I

1 were to change that coefficient, then this model could
2 change in terms of how much force it takes and how much
3 deformation you get before you see it slip.

4 Q. All right.

5 A. Okay.

6 Q. Thank you.

7 A. So part of the model we looked at is -- well,
8 it's a very complex, right, we have three dimensions. It
9 can do things in all dimensions, but what we saw when we
10 looked at the hook, we can see the wear. This is a hook
11 from a picture from the FBI lab of a different
12 transposition tower. What we said is, well, if you look
13 at the angle, if this was the bracket and my hook is going
14 around it, it's -- it's not doing this, which is what I am
15 depicting in this animation here.

16 Q. Right. On the -- on the left, we have a -- we
17 have an animation showing -- the arms, the holes, the
18 hooks, the insulators and the pipe.

19 A. Right. So they're moving with the hook trying to
20 go around inside the hook. If everybody understands the
21 direction of that. And so that's not consistent with the
22 wear. So the wear itself looks like the hook is rotating
23 sideways. And so I can show you -- jump ahead to that.
24 So it's more looking like the wear from this. So as
25 this -- as these hooks, which shown here, are swinging
26 together side to side, they're grinding their way through

1 the angle. In this case, the bracket, so --

2 Q. By "here," we're talking about the 2D together
3 animation on page 12 of the presentation, correct?

4 A. Correct.

5 Q. Okay.

6 A. And so if I go back to the original animation on
7 page 10 and we show -- we were able to eliminate some of
8 the behavior based on the evidence of what we saw. And so
9 we said, the behavior is two dimensional meaning it's only
10 going in one direction. It's not necessarily going in two
11 directions at the same time. So that simplified our
12 modeling and made -- made the behavior a little easier to
13 evaluate. So -- and I will explain that a little bit
14 further in the next slide.

15 So, again, we're idealizing something that, in
16 real life, is a complex little system. It may not seem
17 complex, but try to mathematically model it. It is rather
18 complex. So we use what we call a lower-bound solution,
19 and we constrained it to do two dimensions, so as I showed
20 in this -- this slide on page 12, that's two dimensions.
21 It's just rotating in this direction. So that's when I
22 say, "two-dimensional movement," moving just in this
23 direction, all the hooks, and they happen to be moving
24 together. We constrained it, so we say left -- swing
25 left/right is restricted. So we -- we let our model form
26 -- we're not going to let it go like the photo in -- or

1 the animation on page 10. Because the animation in page
2 10 is not consistent with the wear of the hook in -- on --
3 shown on the same photo on page 10.

4 So that's fine. We can do that two dimensional.
5 But we realize that's -- that's a lower bound. That's
6 kind of a lower estimate of what we think that behavior
7 would be. It's kind of conservative in the sense that it
8 only captures that two dimensional behavior.

9 Now, if we were to eliminate the -- and which is
10 what we did. We eliminate the -- the right -- eliminate
11 the right insulator, just for modeling simplicity 'cause,
12 again, these models sometimes took a day to run each, so
13 they can take a lot of time. So to eliminate that we just
14 said, what happens if we took the subject insulator -- the
15 one on the left. We disconnected it from everything. We
16 let it move in a three-dimensional behavior, because maybe
17 the effects of the wind on the -- on the jumper cables and
18 everything make its -- even though it wants to
19 predominantly move in that, you know, two-dimensional
20 direction, maybe it wants to do a little bit of twisting.
21 And so we call that an upper bound solution because it's
22 -- it's totally unconstrained from the other insulator
23 and, by doing that, it kind of gives the most -- the most
24 movement you can get in essence. So it's the upper bound.
25 So we say -- for the first one, we're going to say, well,
26 we may be underestimating the capacity of -- or how many

1 rotations we're getting by simplistically modeling it as a
2 2D, then we disconnect the one and we make it a 3D and
3 that gives upper bound. So the idea is that at the
4 beginning, we're just trying to see if we're -- it's going
5 to work. Are we -- are we plausible in this situation?
6 So we try to pick a number, or pick a -- try to pick a
7 model that kind of represents the -- the most it can be
8 and one that realistically is the lowest it can be, and if
9 our number falls in between then that suggests that my --
10 my system is some combination of that. We just don't know
11 exactly what that combination is.

12 So as I said, this -- this is the behavior that
13 we modeled, so think of it as a trapeze swinging on the
14 hook back and forth. The hook rocking side to side. And
15 then we -- this is another possible behavior where
16 they're -- where they're not in phase, the two ones, so
17 this is pretty complex behavior so to simply that, we just
18 remove we just remove the insulator on the right. This is
19 an animation showing opposite behavior on page 15 of the
20 presentation.

21 So if you -- as you can see the -- right now this
22 behavior is -- there is that conduit that is tying them
23 together. This -- this -- at least that picture. If I
24 were to remove that conduit or remove the insulator that
25 is attached at the -- at the far right end, then it's
26 likely it would move a little bit more, the insulator that

1 we're most interested in. The one that had the hook that
2 failed.

3 So, again, when I talk about -- this is a -- is
4 operating in a 2D behavior, but if I remove the one --
5 what we did in our model is we removed the right insulator
6 and we let it go 3D so it can move however it wanted, and
7 you can see that it -- that's why we say it's the upper
8 bound, because it -- the right insulator is no longer
9 involved in it whereas it would normally help stiffen it
10 or maybe contribute to the behavior of the left insulator.

11 So, again, we're trying to simplify it, but at
12 the same time, try to provide a window that which we want
13 to see if our engineering numbers fall within.

14 So, the last section was really associated with
15 developing appropriate models that try to represent the
16 behavior of the -- these insulator components, the jumper
17 cable and the conduit relative with the hook and the
18 angle. So that's -- that is that first effort that we
19 did. So we tried to come up with a computer model that
20 represented that and that's what we talked about.

21 So now, I have got this model sitting in my
22 computer, and now I need to make it move. Because in
23 order for the components to wear, it's got to be moving.
24 So one of the mechanisms that seem the most logical is
25 that is the wind that's driving it. Nobody is out there
26 moving it around, and -- and normal behavior of the

1 insulator doesn't necessarily make it move to the degree
2 that you get any type of long-term wear. It needs
3 something that's generally getting this -- these
4 insulators excited and wind is the most obvious. So this
5 is where we start to talk a little bit about what kind of
6 loads we're going to put on the -- on the model. And
7 as -- we discussed, we were in contact with a
8 meteorologist familiar with winds in this area, of
9 particularly this area of the state, and with the Feather
10 River Canyon winds themselves. And so there happens to be
11 a weather station that was put in a mile or so down canyon
12 from the subject tower, the transposition tower, and so
13 "TT" represents transposition tower, and then the "WS" is
14 the weather station. So pretty close. It's pretty good.
15 Some places, you have to go miles and miles to find an
16 adjacent whether station. So we had, I think, good data
17 and in particular in -- in the canyon, the -- I can't use
18 data out -- somewhere out here in Oroville, because the
19 behaviors are way different. We are going to explain that
20 a little bit.

21 So that's the weather station shown on the -- on
22 the right. It's on a ridge. It collects all the -- the
23 data and reports that as collected data. Now, as you can
24 see in the -- kind of the figure -- and hopefully you can
25 see this -- there's a little red line. And so that
26 generally represents the canyon direction, thus the winds

1 coming down the canyon would be generally in that -- it
2 would be that way, so that's the general direction of the
3 canyon. So it's about 30 or so degrees from -- from north
4 is the orientation of the canyon. When you get down to
5 the weather station, if -- the blue line kind of
6 represents the up canyon. It's a slightly different -- so
7 it's coming out of there at about 200 degrees, so if this
8 is 180 and that's 360, my winds are coming down canyon
9 this way, and then at the weather station they kind of
10 come a little past 180 going back up this way. That's
11 because the canyon is a little less well defined once you
12 get south of the weather station. But the idea is it
13 looks -- to get a red line, both experience very similar
14 wind directions generally.

15 So what do we do? How do we use the information?
16 Well it's, like anything, we just can only get what the
17 data is -- that's collected. And at the Jarbo weather
18 station, they give hourly mean values and max values, and
19 then the direction of those winds -- where they come from.
20 That is all the data is. It's an hourly point, every day
21 of the year, collected data point that says here is my
22 mean wind, here is my max gust wind and what direction are
23 they coming from. So that's a little challenge if I am
24 going to apply winds to my model because all I would have
25 is one hour of data, and it just tells me one data point
26 that the winds were coming out of the -- out of the

1 northeast with a gust speed of 25 miles an hour. Well,
2 that's -- I can't really apply that to my model. That's
3 just one data point. So I can't get my model to even
4 move, other than if I apply the force equivalent to
5 25 miles an hour and my -- my trapeze, if you want to
6 say -- my system would move but it would just sit there
7 because I'm -- and then I would turn it off and then it
8 would now isolate. That is not really how structures
9 behave. If you go outside and you feel the wind, as you
10 can see from this graph, the wind is -- is a -- is a
11 fluctuating value, right? It's -- it's blowing on you,
12 you can feel the -- the pressure, and then it goes off and
13 then there's a little bit less and then it goes back and
14 forth. So that's really what we to represent. That's not
15 collected necessarily in the hourly data, so we have to do
16 some statistical work to get that to represent something
17 that can be useful for our evaluation. So what is
18 presented on the slot there is the hourly points for every
19 day of the month -- this happened to be January of 2018.
20 Every day of the month, and you can see areas that are
21 clouded, three areas. And what's interesting about those
22 is those, if you're a wind engineer, they -- they
23 represent what they call well-behaved winds. They --
24 they're -- they're traditional turbulent-type winds that,
25 as you can see, they're kind of not necessarily constant,
26 but they're not all a zigzagging behavior. So that tells

1 us, okay, we can use that information, those well-behaving
2 winds. We know a lot of about those. We've studied
3 those, we can apply that information. We know about
4 well-behaved winds to this particular model. And also, if
5 you look at the -- the lower graph, that's a direction.
6 So the bottom line means down canyon, so the winds are
7 coming down the canyon. Whereas in the other direction,
8 almost opposite that. It would be up canyon.

9 You can see that the winds, where I've circle
10 above, correspond nicely with -- they're always a down
11 canyon winds, so the flat lines there that you see
12 represent -- it's a direction. So it's nearly a constant
13 direction from the down canyon direction.

14 So again, that helps us, kind of quantify where
15 the winds are -- in this area are very directional. If
16 you're not -- you know, if you were to stand down here,
17 you would get winds kind of coming from all over the
18 place, from different directions, and you would be able to
19 see that. We will talk a little bit more about it in a
20 couple of slides, but the idea is that we have for
21 down-canyon winds. We have well-defined winds so they're
22 kind of nearly constant, and they come in one direction,
23 and we don't have them all the time. But the point is is
24 where we do have them, we can define those; and then the
25 other locations, we have to make some assumptions about --
26 about that wind.

1 Q. So all of this wind data that is reflected on
2 page 16, that's all coming from the Jarbo gap RAW station?

3 A. Correct. So we did -- there's a -- there's a
4 graph. There's a gray line, it says "G equals 1.6," so we
5 did some mathematical -- where we take the -- the max
6 value over the -- the gust value over the mean value and
7 we see 1.6. And "well-behaved" means that those values
8 are nearly constant. So you can see the gray line with
9 the "G" right here. There's a lot of variability in that
10 gray line if you go to the left, but in those areas where
11 the -- where are circles then that line is merely a flat
12 line relative for all the other data.

13 So that's where we described -- "well-behavior"
14 means that gust factor the dividing gust -- peak gust by
15 the -- by the mean value is nearly a constant value. So
16 that tells us, well, that is well-behaved value. I can
17 pick any time during that wind event, and I essentially
18 have the same wind structure throughout that.

19 MS. DUPRE-TOKOS: Mr. McGormley, any time you need to
20 stand up and point and stuff feel free.

21 THE WITNESS: Okay. I wasn't sure if you needed me
22 to sit --

23 BY MR. NOEL:

24 Q. Something else that --

25 A. -- near the mic.

26 Q. No. On -- here on the left side of the upper

1 chart, says "mile" -- or MPH, which I assume means miles
2 per hour, correct?

3 A. That's correct.

4 Q. Factor and ratio?

5 A. Right.

6 Q. Can you explain to us what that means?

7 A. Right. So that's -- it represents multiple
8 values. So we have the wind in miles per hour in terms of
9 a -- presented in the blue and the -- so you see the dark
10 blue is the mean. They have as the average value that we
11 get for the weather station data once an hour, then we
12 have V max, which is -- which is the gust, so we get that
13 from the -- from the weather station once an hour; and
14 then we have the gust factor, which is the ratio of the
15 mean and the -- and the max, and then below is the
16 intensity and that helps us, again, because that's a --
17 it's a variable that helps us tell kind of the overall
18 behavior of the wind. So this is just plied with -- with
19 a mathematical division of -- of gust factor by mean, it's
20 essentially just a whole bunch of the data points that
21 have been connected by lines to represent the -- the wind
22 data that came out of Jarbo weather station over the month
23 of January 2018.

24 Q. Okay. And then down here at the bottom of this
25 top chart, we have zero through 31. It says "days of the
26 month," I'm assuming that that is representing January 1st

1 through January 31st?

2 A. Correct. And then the -- here this is comparable
3 data for February and so forth every month.

4 Q. Okay, right. And then the bottom chart says
5 "wind direction. 0, 90, 180, 270, 360" can you briefly
6 explain that for us?

7 A. Sure. So you got a weather vane and it's in the
8 weather station, and so it tells you which direction the
9 wind is coming out of. And so for every data point, it'll
10 say what direction that wind came from predominant out of
11 that hour worth of the data. And so you plot all this
12 data and you can see that sometimes the wind comes out of
13 -- well, so 360 would be out of the north, zero would,
14 again, be out of the north. And so, as we go around the
15 clock, if the letter, which we said was 30 degrees or so,
16 is coming down canyon, you would look at all those areas
17 right at the red and you would see that it's
18 approximately, you know, coming out of -- out of there
19 somewhere in that rough direction. If you get up to the 2
20 -- 270 or a little bit less than that, because we said it
21 was 200 degrees or so coming out -- out of canyon that you
22 see that direction, and then everything in between. But
23 you can see long periods where the wind is comings just
24 solely out of the northeast.

25 Q. Okay.

26 A. So these -- this is -- this is the data that we

1 didn't -- other than divide the data and calculate the
2 intensity factor, this is data that we got for -- for
3 about nine years' worth of data out of this weather
4 station. So every month, every hour for nine years is
5 data.

6 Now, there's -- it's there a little bit longer,
7 but prior to that, according to our meteorologist, some of
8 the data wasn't consistent, so that may mean that the --
9 for a while, the weather station might have been broken.
10 The weather vane might have been -- who knows what is
11 going on. So we -- we don't have that. We're relying on
12 the nine years that is going to be defined as the best
13 range of data. We took all the data for nine years --
14 every month, every day, every year and looked at that
15 data, and then extrapolate it.

16 Q. All right. So if you can move on to page 17 and
17 you could explain to us the hourly wind data chart.

18 A. Right. So this is -- this is, again, a series of
19 -- of taking that wind data and applying it a little bit
20 differently. So now we have wind direction from gust
21 speed, which is -- you know, the previous chart was the V
22 max, and then you had the turbulent range, which is the
23 mean wind speed, and then -- and wind direction. And you
24 can see that, if I plot all of those, you start seeing a
25 stack of -- of wind data that says, well, when I get wind,
26 it's kind of concentrated on that 30 to 60 to a little

1 more kind of range. So this is further evidence that --
2 that the -- particularly some of the higher level winds
3 are coming down canyon, and if you were to go to the
4 opposite end, closer to the 270, you see -- you don't see
5 quite as much peek winds coming up canyon.

6 So this is, again -- further kind of describes,
7 well, what is the behavior? The dominating behavior, we
8 believe, is down canyon-type winds that are driving this,
9 which makes sense. The cool air up in the mountains comes
10 down the valley, and that causes the wind.

11 Q. Why is that important?

12 A. Well, for this analysis, it -- it allowed us to
13 focus our efforts in a -- in a single direction. That
14 simplified the analysis and gave us an opportunity to not
15 have to worry about -- which was fairly well defined --
16 not have to worry about the 360-degree direction of the
17 winds coming from everywhere. Obviously, over the life of
18 this structure, it saw winds coming from different
19 directions, but they're very low and we will talk about,
20 well, what's the impact of those low winds on -- on ration
21 of the hook. They don't -- they're not dominated by --
22 the higher winds help dominate that motion, which makes
23 sense, right, I've -- you know, the heavy -- each
24 insulator string weighs about 225 pounds with its
25 attachments and forth. So I have to get something 270 --
26 225 pounds moving so it's got to be something more than

1 just a little calm breeze.

2 Q. All right. So talk to us about the turbulence.

3 A. Yes. This is a little more complex.

4 Q. This is stuff that's scary for us non-math
5 majors.

6 A. Yeah. So this is where wind engineering
7 really -- you know, the statistics of wind engineering.
8 So, as I said from the beginning, we have hourly data
9 points and what we want to do is turn that into a
10 function -- a forcing function. Something that I can
11 apply to my model. A mathematical equation that I can
12 apply to my model that represents what we think the wind
13 is. And, as I said, wind is not a constant pushing on
14 this structure for a continuous amount. It has a
15 behavior. It has a certain type of -- of peaks and
16 valleys that you would expect when you walk outside and
17 feel that wind.

18 So there's -- wind engineers have studied this
19 and they've determined that there's a way to represent
20 this and determine the behaviors of this, and they -- and
21 what the graph really shows is if I -- on the structure
22 response, which is the dash line shown right here. If I
23 took a structure and it had every -- every structure has
24 what it's called is its natural frequency. It -- it has a
25 natural vibration to it. And, since we're in California,
26 you can see that happens with earthquakes. If you have an

1 earthquake and your structure has a frequency that matches
2 or are very similar to the period of the earthquake, you
3 get a lot of damage, because it excites the structure a
4 lot more. Same thing happens with wind. If I were to put
5 wind down there, it would be at the nature frequency of a
6 structure, you get it to excite a lot.

7 So in this -- this is an example of what we call
8 a power spectral density, which is a statistical way of
9 defining a -- a non-uniform frequency. In this case,
10 we're using wind. You can use it for electrical current.
11 There's a lot of different things. A signal. A not of
12 non-uniform ways can be defined by this. So it's really
13 just a way of defining the wind and defining in terms of
14 its frequency. How many -- how many -- how -- what's
15 the -- what's the density or how often is a particular
16 frequency found? So the units are a little screwed up,
17 because we use it to represent non-dimensional, but what
18 we're saying here is, for this kind of frequency, I have
19 -- a lot of frequency falls in this band here, and then
20 less frequencies fall down here. So it's like a summation
21 of all the frequencies of that particular wave form. So
22 if I were to apply wind, when we analyze that wind, we can
23 break it up into a whole bunch of -- how much frequencies
24 fall here and how much there and it kind of creates this
25 curve.

26 What we want to -- what I am looking at here is

1 is -- well, does this line up with this? Well, it
2 doesn't. So we know that the frequencies tend to be, in
3 this case, the power of the -- of the winds are less than
4 the frequencies of structure. This is just an example to
5 kind of explain the process that we have taken a whole
6 bunch of data points, and we -- we can say this -- this
7 data or this -- these individual one hour things will
8 behave as a power spectral, and so -- I am going to skip
9 to the next slide.

10 Q. Well, let me ask one thing before we go on.

11 A. Sure.

12 Q. You said -- remember, we have to get all of this
13 on the -- on the record nice and clear. You said, "We
14 need to see how this relates to that," and you were
15 pointing at the screen. Just for the record --

16 A. The wind spectrum.

17 Q. Yeah, the wind spectrum. I guess, this -- is
18 this a bell curve? Is that what this is?

19 A. Well, it's -- it's -- it's just a power spectrum.

20 Q. Okay.

21 A. So the -- the -- that blue represents the
22 frequencies of the particular wind, and how they relate to
23 the frequency of the structure.

24 Q. Right. And that's -- that's what I want to --

25 A. And this is just purely shown as a discussion
26 point to the next slide, which says as -- as wind

1 engineers, they have defined -- they've studied all of
2 this, and they say, hey, there's standard wind behaviors
3 that we know for certain characteristics -- exposure
4 characteristics. And those exposure characteristics are
5 based on the surface roughness of the -- the service
6 roughness of the ground in front of -- prior to you
7 getting to the structure that you're looking at.

8 So -- and I will tie that back to the figure here
9 in a second. So what happens is is we have wind blowing
10 across the surface. If the surface is really rough,
11 there's trees or obstructions or buildings, then that
12 changes the way the wind behaves, because it kind of gets
13 interrupted. It gets focused, if you can think about
14 that. If I have got more broad, open areas, then the wind
15 is kind of able to go unobstructed. It doesn't get all
16 turbulent and gets all riled up, it kind of just flows
17 along. So those exposures have been well defined as well
18 and so this area would be considered exposure. See,
19 there's trees and valleys, but the point is is coming down
20 the valley, down the canyon, there's really not anything
21 obstructing it. That's why that wind gets moving along,
22 and so we would call that exposure C. There's a defined
23 behavior of the wind that engineers have developed that
24 matches exposure C. There's also ones for exposure B and
25 D, and A used to be involved and people still use it, but
26 it's not really recognized anymore.

1 So just imagine somebody has developed a
2 mathematical spectrum of wind -- behavior of wind for
3 exposure C. And so that's what we talked about, a
4 mathematical definition of the spectrum is used to
5 generate a time history of the winds, so --

6 Q. Okay. Let me -- let me interrupt you one thing
7 real quick here. Just to -- as a mechanical or structural
8 engineer, is it common for you to work with wind
9 engineers?

10 A. Well, wind engineers are oftentimes structural
11 engineers.

12 Q. Right.

13 A. Yeah.

14 Q. Is it -- it's important especially if you're
15 building a -- for instance, a tall building --

16 A. Absolutely.

17 Q. -- or a bridge, wind is going to play a huge
18 factor in that, correct?

19 A. Correct.

20 Q. Is it accepted if the engineering community
21 for -- you know, to rely wind engineers?

22 A. Well, absolutely. If you're -- for specialized
23 structures.

24 Q. Yep.

25 A. So we use -- we have a wind engineer on our --
26 works for us and he's specializes in this ability to -- to

1 look at wind and define it. So what I -- this slide is --
2 is the ending of this slide. So if you would imagine,
3 there's a spectral, a plot or a frequencies function that
4 says, for exposure C, we're going to develop this spectrum
5 and they know what that spectrum is. So this is just --
6 when I talk about spectrum, this is when we're talking
7 about statistical representation of the wind. That's what
8 it is, but there is one that has already been kind of --
9 the wind engineers have defined for a category C. And so
10 that's -- that's what we're able to use, because -- we're
11 able to see that because, again, if we double back to the
12 -- to slide 16. We're able to look at those areas and say
13 the area circled in red behaves like a C exposure wind.
14 And so we can say, okay, they -- they behave like a C
15 exposure wind so now we can take the mathematical model
16 that we currently have for exposure C and use that to help
17 generate winds that we can then apply.

18 And so this is a -- is an example of that.
19 That's a time history of -- of a wind. So this -- if you
20 can imagine, if you start at the end of the graph, at time
21 zero, and then this goes through time two minutes. Just
22 think of feeling -- this is wind blowing, this would feel
23 like winds, right? It would be kind of blowing on you.
24 It's a little higher, a little lower. It goes down. It's
25 kind of -- it's not an even constant value. So this is
26 what we would -- for a -- this happens to be for a 37 mile

1 an hour wind, this is what would feel or this is the -- he
2 time history of the wind. So what we do is take for a
3 particular spectral density, we take that information --
4 in this case for exposure C data -- and we know the -- we
5 pick a wind speed and we put it into the formula and here
6 is what we're going to apply to our model and we're going
7 to do it at 37 miles an hour for two -- two minutes.

8 Q. Right. So when you refer to "this," you're
9 referring to the -- the graph on page 20, correct?

10 A. That's correct.

11 Q. And the blue line moving left to right on the
12 graph, that represents the -- the wind?

13 A. That represents the wind speed in miles per hour
14 over time.

15 Q. And after applying the various wind engineering
16 models, correct?

17 A. Right. So this is developed out of the wind
18 engineering. So we take that spectral density, that
19 spectral plot, and we say -- we make some assumptions.
20 Like we said, this -- this is particular wind. We can
21 pick a particular wind and that one was 37, this one shows
22 40, and then we pick a distance of that wind approaching,
23 so we're saying 500 feet here, and this would be a
24 response. If we take that formula, and we plug in what we
25 know about -- we take that category C or exposure C
26 formula, we can then plug in a particular wind speed -- in

1 this case, 37 miles an hour -- we will get this varied
2 ability 'cause if I were to take that, I can add up all
3 the frequencies, and they would all kind of stack up. So
4 the frequency in the middle -- I am pointing to the blue
5 line on the graph of page 18. The -- the -- also this is
6 made up of a whole bunch of frequencies and -- and the
7 number of frequencies of the same frequency. So in this
8 case, this -- this frequency down here is the most common
9 frequency, if you want to say. If I look at the graph
10 then, shown on page 20, I would find that there's -- there
11 is a common frequency if I were to kind of average all
12 this out that would be that peak in the graph. But in
13 reality, this is representative of what we would feel in
14 the wind. So what we then do is we take this graph, on
15 page 20, and that's mathematically derived so I have an
16 equation that represents that, and I put that on the
17 model, and so the model -- as you'll see in a couple of
18 illustrations -- will then see that wind pushing against
19 it representing this variation in winds. So that's -- out
20 of a couple of hourly data points, we can use wind
21 engineering to create this, which is really what we think
22 is, you know, how the structure is behaving from the
23 winds. It's blowing on the variability peaking and so
24 forth. So we can use statistics with -- with confidence
25 of knowing that I take those points, because of the
26 behavior of the wind, I can get to a point where I can

1 actually create known wind time histories that I can apply
2 to my model.

3 So a couple of data points can -- if you know
4 what you're doing can actually give you something that is
5 pretty meaningful.

6 MR. NOEL: All right. Before we move in -- move on,
7 Madam Foreperson, it's 10:00, we have been going about an
8 hour and a half.

9 GRAND JURY FOREPERSON: Yes.

10 MR. NOEL: We can go ahead and take the morning
11 break.

12 GRAND JURY FOREPERSON: 15 minutes, please.

13 MS. DUPRE-TOKOS: And, Mr. McGormley, you'll need an
14 admonition from madam foreperson.

15 MR. NOEL: Oh, that's right.

16 GRAND JURY FOREPERSON: Just reaching for my paper.

17 GRAND JURY SECRETARY: She's getting it.

18 GRAND JURY FOREPERSON: Mr. McGormley, you are
19 admonished not to discussion or disclose at any time
20 outside of this jury room the questions that have been
21 asked of you or your answers until authorized by this
22 grand jury or the Court.

23 A violation of these instructions on your part
24 may be the basis for a charge against you of contempt of
25 court. This does not preclude you from discussing your
26 legal rights with your own attorney.

1 Mr. McGormley, what I have just said is a warning
2 not to discuss this case with anyone except the Court,
3 your lawyer, or the district attorney.

4 Do you have any questions?

5 THE WITNESS: I have no questions. Thank you.

6 MR. NOEL: In recess?

7 GRAND JURY FOREPERSON: Recess for 15 minutes.

8
9 [A recess was taken from 10:00 a.m. until 10:18 a.m.
10 whereupon, the grand jury reconvenes in courtroom 9.]

11
12 GRAND JURY FOREPERSON: All members of the grand jury
13 are present and ready to proceed.

14 Mr. McGormley, you're still under oath. Just a
15 reminder.

16 THE WITNESS: Yes, ma'am.

17 BY MR. NOEL:

18 Q. All right. When we took the break, we were
19 talking about wind loads jumpers -- the jumper wire
20 systems. Let's go on to slide number -- page number 21
21 and if you can start with that one, explaining it.

22 A. Sure. So we just got done saying how we
23 developed out of the data from the Jarbo wind -- weather
24 -- or the Jarbo Gap weather station, the wind -- the time
25 history of the winds. We then looked at various wind
26 speeds, and so listed are nine wind speeds that we

1 applied, so if I back up to the previous slide 20, this
2 one was for 37 miles an hour, we would have something
3 looking relatively similar for a -- for a -- to half mile
4 an hour wind or 17 mile an hour wind, 32, et cetera. So
5 each one of those functions, each one of those squiggly
6 lines representing the -- the winds would then apply to
7 our model as a time history, and then it was run. And
8 what we tracked were the placements and rotation of the --
9 the hooks at this point. That's what we were interested
10 in.

11 So here is an example shown on the -- the photo
12 on page 20 -- the -- the illustration on page 22 that
13 shows the application of the wind. So you can see the
14 blue and the red representing the way the wind was applied
15 to both the cable, and so the cable itself does -- it
16 attracts some wind, you can blow on the cable, and then
17 the insulator strings and then the connector type. And so
18 that wind was applied and then that variable time history
19 was run through the computer and that was one for one wind
20 speed and we did that nine times for the various nine wind
21 speeds for the previous slide.

22 Q. How did you pick the nine wind speeds?

23 A. So those nine wind speeds represent the -- the
24 ranges of winds that were measured -- and I will show an
25 example of how we get that data, but it was -- there's
26 ranges of wind that were collected at the Jarbo wind gap.

1 So when we do talk about a wind rose, it creates ranges of
2 wind and so these are the averages -- these nine values
3 are the averages of the ranges. So we will explain that,
4 if you want me to jump up to the --

5 Q. Yep.

6 A. -- spot. Do you want me to jump up to that?

7 Q. No, go ahead and finish up with 22.

8 A. Okay. So I explained why we picked these nine.
9 It'll be a little more obvious, but the idea is that these
10 nine represented the whole wind profile instead of doing
11 it at every increment, we have ranges that we use.

12 So when we do that, we start to get the behavior
13 of the model under that wind. So in this animation, which
14 is shown on the screen, you're going to see -- if I can
15 get it to work here.

16 Q. And we're on page 23, correct?

17 A. There we go. It's -- it's -- you can see it's
18 moving. It's not the screen shaking, but you can see here
19 the -- the winds going through. You can kind of see how
20 the variability of peaks are coming and pushing on the --
21 on the insulator and so that is that squiggly line that we
22 showed on the previous slide. That's basically -- if you
23 were to plot the squiggly lines with time as this thing is
24 moving along -- I will replay it again. The squiggly line
25 goes up and then you see the peak. That's the peak of one
26 of those values that represented that line. So you can

1 see the cables getting excited up there. It's shaking in
2 the wind. So what we're monitoring is at these locations
3 where the hook is.

4 Q. And we talk about "the squiggly line," you're
5 talking about the --

6 A. I'm talking about --

7 Q. -- the -- the wind blows on the jumper cables as
8 some squiggly line on the chart --

9 A. Yeah.

10 Q. -- on page 20?

11 A. I'm using squiggly line as a very non-technical
12 term. But it's the wind time history that was shown on
13 the date.

14 Q. All right. Before we move on, going back to 22,
15 and it says the blue arrows represent wind loads. I'm
16 trying to figure out the blue arrows. What you --

17 A. Yeah. That would be -- we're calling
18 these arrows -- this -- if you were to zoom in, there's
19 arrows that are pushing on the -- exciting the insulators
20 and there's allows exciting the -- the cables.

21 Q. Okay. So the blue arrows are they -- these dark
22 blue, almost looking like, columns?

23 A. Right.

24 Q. There's three of them on this diagram.

25 A. This is the insulator and then there's little
26 arrows that are represents the, kind of, a uniform load

1 that is applied there, and that load will change as you
2 follow the time history function. This is a snapshot, if
3 you want to say, in time of -- of one of these loads.

4 MS. DUPRE-TOKOS: So the things that look like
5 crosshatches are actually arrows?

6 THE WITNESS: Yeah. They're little tiny arrows that
7 represent the wind being applied to each one of those
8 insulator elements.

9 GRAND JUROR NUMBER FIFTEEN: Where are the arrows?
10 I'm sorry, I don't see them.

11 THE WITNESS: Yeah.

12 MS. DUPRE-TOKOS: Is it just on those stacks?

13 THE WITNESS: There's little -- there's little arrows
14 that are pointed here that represent by -- all these lines
15 is an arrow.

16 GRAND JUROR NUMBER FIFTEEN: Oh, thank you.

17 THE WITNESS: It's a little arrow that points.
18 Wherever you see blue lines, that's a little arrow pushing
19 against the red, which is the conductor wire.

20 GRAND JUROR NUMBER FOUR: Just barely see them.

21 THE WITNESS: Yeah. It just -- it says "arrows," but
22 it's -- it's really the -- kind of the -- however you want
23 to describe it.

24 MS. DUPRE-TOKOS: The horizontal line crosshatches
25 are all arrows.

26 THE WITNESS: The blue -- the blue elements of the --

1 blue elements generally are all of the wind pushing on the
2 various elements.

3 BY MR. NOEL:

4 Q. All right. So sorry. We ran into a snag. Do
5 you want to talk about the results?

6 A. Yeah. So that -- yeah, so that is -- that is --
7 those winds being applied against those little arrows are
8 pushing on every one of those cables or the conduit and
9 the -- and the insulator stacks.

10 So what are -- what do our results show? So, as
11 we said, we were interested in the rotation of the hook.
12 So much is that hook rotating because that's what's
13 relevant to the wear of the hook. And, as you can see in
14 the example shown on the 20 -- slide 25, for that 37 mile
15 an hour time history wind time history, this is -- so
16 there's 120 seconds, two minutes of time history, you can
17 see there was various winds that -- that -- the wind
18 speed, if you remember, was variable and you can see the
19 behavior of the rotation of the hook so this is rotation
20 and degrees of the hook as it's rotating back and forth;
21 and you can see, sometimes it's -- it's able to -- it
22 sticks because the wind isn't strong enough to -- to move
23 it and, at other times, it slips so it's able to move.
24 And so you see that behavior exhibited on the -- in the
25 graph there as it's subjected to the various winds through
26 the two minutes of time. So this is -- this is looking at

1 rotations that show, you know, zero rotation. It's
2 sitting there and when I -- you know, apply the -- oops,
3 when I click on this -- there it goes. When I click on it
4 now that -- that green or the hooks that starts to rotate,
5 right? We start to rotate like this on the hook, and so,
6 if I go back down here, this is -- we see it starts at
7 zero, no rotation, and then it goes up from the gust of
8 wind that hits it; and then depending on how that
9 magnitude of that wind, it may not overcome friction or it
10 does and then it rotates. It slips, as we say.

11 Q. All right. So first, before we go on, can you
12 describe for us what it means by displacement?

13 A. So displacement is the amount of movement that
14 you would get. So it's either -- it's sliding or it's
15 rotating, it can be doing both. The hook may -- may kind
16 of push over, because -- a little bit, and then it may
17 rotate.

18 Q. All right. And then the vertical lines on the --
19 on the chart would represent the slip rotation, correct?

20 A. No, it's the degree of rotation.

21 Q. The degree?

22 A. So how much the hook is relative to its axis is
23 rotating. So it's -- it's sitting in here going back and
24 forth like this. So this is -- you know there's three
25 degrees of rotation --

26 Q. Right.

1 A. -- at some point.

2 Q. Okay. But I am talking about the -- the angle.
3 So for instance, over here at the end where the red arrows
4 are, when it's going up or down, when the degree of
5 rotation is either going up or down in the vertical line
6 that would be the slip, correct?

7 A. What -- no. When it's going in the vertical
8 line, it's sticking.

9 Q. Okay.

10 A. And then it -- it -- so what -- what's happening
11 is the -- the rotation is kind of constant. So it's
12 sitting there, it's -- over time it stays, and then
13 changes. So these are wherever it's changing rotation.
14 It drops whenever the rotation stays constant.

15 So let's say the wind is blowing on it for a
16 couple of seconds, the rotation goes up to three degrees
17 and it hangs out there, and then it comes back. It may be
18 that it -- it can't come back because the wind is the same
19 or the -- or the friction is not allowing it to come back
20 or -- so it's -- and then when it wants to come back, you
21 know, it'll change to a new -- new position.

22 Q. All right.

23 A. So -- so what we're doing is we're watching that
24 look do this with the wind exposure and as the winds, you
25 know, pick up, then it may be -- does a little bit, and
26 then it picks up and then it does a little bit. And then

1 maybe it's not enough and then it just sits there and
2 doesn't overcome that friction.

3 Q. When you say it "does this," you know, just for
4 the record --

5 A. Yeah.

6 Q. -- you're using your hands --

7 A. To represent the hook.

8 Q. -- to represent the rotation of the hook?

9 A. Right.

10 Q. Okay. Go ahead.

11 A. And then that's either sticking or the fact that
12 it rotates a certain amount based on the magnitude of the
13 wind at that point. Again, it's time history, so it's
14 changing every second along the way.

15 So as we -- as we would anticipate the -- if I
16 plot on the -- on page 26 -- the baseline wind speed, the
17 higher the wind speeds that I'm applying in that time
18 history, the greater the -- the degree of rotation I get,
19 right? So total rotation during analysis. So this is
20 not -- this is like a cumulative degrees. Meaning, we're
21 adding up all of the degrees that happened, and you get a
22 lot more degrees that add up when you're at 40 miles an
23 hour winds than when you are at the two miles an hour
24 winds, which seems intuitive that the -- the stronger the
25 wind, the more you're going to get a rotation on that
26 hook. So, again, just kind of a verification that it all

1 makes sense, right? We want the -- we want the behavior
2 that we are modeling to represent what is in reality. If
3 we were seeing behaviors if we applied a little wind, we
4 get a big rotation and then we apply a stronger wind and
5 we don't get much, some would say we maybe don't have our
6 model correctly, mathematically right.

7 So this is kind of just showing that if I add up
8 all my -- my winds, the full hook rotation during a two
9 minute time history would add up to 50 degrees of
10 rotation. If I add up all the times that the wind is at
11 40 miles an hour, and add up whatever rotation that is,
12 we'll see that it produces a lot more rotation.

13 Q. All right. So what is the wind rose?

14 A. Yeah. So -- so this is information that we
15 collect -- we're able to obtain from the weather station,
16 and it's -- it's an interesting -- it's more climate --
17 climate than it is to the individual data points. But
18 what -- what it's saying is, this is a wind rose. We can
19 see it's shaped like a north south, like a -- like a
20 compass. And what you see then is percentages in -- of --
21 in the various concentric circles. So there's 7 percent
22 up to 42 percent in various -- in various ranges. Then up
23 at the upper right-hand corner of the -- of the weather
24 rose, you'll see miles per hour. So 1.3 miles to 5, 5 to
25 10, 10 to 15, 15 to 20, 20 to 25, 35 and 30, all the way
26 up to 40 and greater than 40. If you were to average

1 those, that's where you were get the nine values that we
2 tested so the average of 1.3 and 5 is 2.65. The average
3 of 10 and, you know, 15 is the 12.5. So that where we got
4 the nine values. That correlates the nine wind -- wind
5 speeds, if you want to say. We took the mean value, the
6 middle of those two values, so that's where I ended up
7 previously those couple of slides ago. That's where you
8 choose those winds. Then what -- then the weather -- or
9 the wind rose is showing is is that -- again,
10 percentage-wise, if I go and look at -- coming out of the
11 northeast, coming down canyon, you can see that 40 percent
12 of the time, this is the wind for a whole year. So they
13 take that data from all of the year and they produce
14 this -- this plot. They say 40 percent of the time, the
15 wind is coming down canyon, and you can see -- it's hard
16 to look -- see from that distance, but there's a --
17 there's a red section, a yellow, gold, green, dark green
18 and then a little blue. And that's the quantity of the --
19 or the amount of time that the wind -- for example, red --
20 is within 5 to 10 miles an hour. And you can see way out
21 here the -- that's the blue and that's the time it's
22 between 30 and 35. So there's a far greater percentage of
23 wind coming out of the northeast between 5 and 10 miles an
24 hour than it is there. So you add that all up, because
25 it's all coming from that direction. So that's where we
26 get the 40 -- approximately 40 percent just shy of the 42.

1 If you look at the next dominating wind is coming
2 out of up canyon, but it's much smaller and represents --
3 you know, like 1 -- 1.3 to 5 miles an hour is a bulk of
4 it, and a little bit is 5 to 10. So much smaller wind
5 speeds. And then we see the rest of the winds scattered
6 out of the wind -- weather station, but you can see what's
7 dominating is that northeast down canyon wind, and
8 40 percent of the winds that we're talking about come from
9 that the direction.

10 So when we do this, we're only really looking at
11 the 40 percent of winds. The rest of the time, it's --
12 either it's calm or it's coming out of a different
13 direction.

14 Q. All right. One basic question: You said this
15 was -- that the rose represents one year of winds. Down
16 in the bottom left of the chart, it says, "Start date:
17 November 1, 2009; end date: October 31, 2018," --

18 A. That's right.

19 Q. -- if you can briefly explain.

20 A. Yeah, I'm sorry. They can do -- they do annually
21 but this one happens to really represent the 10 years of
22 data that we were able to get from the whole system.

23 Q. Okay.

24 A. Good -- good -- good catch. Yeah, so this goes
25 from November 1, 2009, to October 31, 2018. So this is
26 saying for that period of time, the wind was coming down

1 canyon at 40 percent. We can look at these -- generally
2 they're every year. Thanks for the correction.

3 Q. All right. So let's move on to slide 28.

4 A. So then, as we -- as we said, we can -- we can
5 put these in ranges. So this is the nine ranges that we
6 use to apply those time histories of winds to our models.
7 So 2.65, 7, 12, 17 until we get the -- and as I said,
8 during the remaining time, it's either calm or the wind
9 was coming out of a different direction.

10 So this kind of shows you that -- you know, the
11 seven mile an hour range that includes the average of
12 seven miles an hour is the most predominant wind range
13 over the -- over the decade. Approximately, just about
14 17 percent of the wind is coming out of the northeast at
15 about seven miles an hour. And that there's very
16 isolated, but much less -- you know, somewhere less than
17 one percent of the time is the wind coming out in the
18 40 mile an hour greater range.

19 Q. Okay. You told us in the beginning that you used
20 a SAP2000 computing system. Were you able to plug all
21 these numbers into the SAP system and plot results?

22 A. Right. So we have applied the winds, the nine
23 wind time histories, we come up with a rotation of the
24 hook for that whole time history. We then add up all
25 those rotations. This -- this plot, the pie-chart plot
26 shows the -- similar to what that previous chart -- bar

1 chart showed, this is more of a flat chart. It says, out
2 of the winds -- as I said, we have different wind speeds
3 that -- that look at hook swing rotation. So if I back
4 up. Here, we have our greatest wind speeds over the last
5 ten years, the -- the average wind speeds. But then you
6 look at and say, well, what contributes to the hook --
7 most hook rotation? And you can see that the 17 miles an
8 hour had the most contribution of the total hook.

9 So we applied all these winds over these nine
10 time wind histories, we -- for every rotation of that
11 hook, we -- we added that up. We kept summing them all
12 up, kept collecting them, and now we have a total number
13 of rotations that happened for the life of that hook, and
14 we can test our -- attribute that rotation to certain wind
15 speeds. So 42 miles per hour was just -- there wasn't
16 much wind at 42 miles an hour, but it does cause some
17 amount of rotation. You can see the 17 miles an hour,
18 even though it's so small, the wind does get that going
19 because it's more -- much more frequent, you know,
20 approaching six percent of the time, than the 42 mile an
21 hour, which was less than -- less than one percent.

22 So the -- the idea is once we add that up over
23 the -- the time that we're looking at, it's equivalent in
24 a year of making 300 circles. So if added it up, it would
25 come up with 300 times 360 degrees of rotation. Just to
26 kind of give you a -- an idea that in a given year that

1 hook would have traveled around in a circle, if you gave
2 it a circle, 300 times. You know, if you just let it spin
3 around, it would do that; or if you added up that arc of
4 it rotating, it would add up to about a -- travel distance
5 of about 140 feet per year. So that hook, from all those
6 winds, even though there is small rotations to some larger
7 rotations -- but if you add that up over a year, it's
8 going to equivalently travel about 140 feet in a year.

9 Now, if we, again, look at that over the 99-year
10 history of this hook -- we believe that hook was original
11 to the instillation when it was put in. A hundred years
12 cause it was -- it's around 1919 and the hook failed in
13 2019, we -- we think that's close to -- or approximates --
14 if we run with our numbers, it approximates to about 2.6
15 miles of movement.

16 Now, as I said at the beginning, we're looking
17 for, kind of, are we in there? Is it plausible? So
18 there's a lot of variability that we talked about in our
19 modeling, right? We could have -- a conductor wire can be
20 slicker than we thought or it can be more flexible. That
21 will affect how much the -- everything is swinging.
22 The -- how much the -- the friction value, I said we're
23 using that .57. Well, what about that value is less or
24 more? And then also, as we talked about, the -- the 2D
25 versus the 3D, right? We have the 2D is what we were
26 using, but then we removed the one and allowed the one

1 behaving -- 3D as a -- as the upper bound. So all that
2 kind of gives you some variability that we have to
3 consider. We're -- we're -- as I said, the values that we
4 just gave with these previous charts are -- are values but
5 they're not the value, because they're -- we don't know
6 everything precisely at this point.

7 So if you look at the range, you're saying
8 somewhere between 1 and 11 miles is how much those -- that
9 hook has rotated over that 99-year history. So, you know,
10 if everything was very stiff, then it would rotate a lot
11 less. If it's a lot more flexible, then it could rotate a
12 lot more. So that's kind of the bounding, right? We want
13 to see, do we -- if -- somewhere between 1 and 11 miles
14 does that makes sense for what we see on our wear side.
15 If we wanted to pick a number, and we said, well, the 2.6
16 miles seems like the value that we -- we came up with if
17 we used all of our original values. If we start playing
18 around with the variability, then we end up with just 1 to
19 11 on the --

20 MS. DUPRE-TOKOS: And, Mr. McGormley, that seems like
21 a really wide range, 140 feet per year.

22 THE WITNESS: Right. So 140 feet is if I used 2.6
23 miles divide that by 100-year history of that, so
24 that's -- again, what we're doing is we're -- we show a
25 value.

26 MS DUPRE-TOKOS: Right.

1 THE WITNESS: If I play around with, as I said, the
2 stiffness, the -- the friction or the -- just the modeling
3 efforts, then you get variations of 1 to 11. So if you
4 had one mile, obviously you divide that over 100 years,
5 you're going to get varied -- you're not going to get a
6 140 feet of -- of wear, you're going to get something much
7 smaller. If I go 11 miles, you're going to get way
8 greater than, you know, approximately 1400 feet per year,
9 so -- so that's, again, what we want to make sure you
10 understand is that there's -- we're trying to see if the
11 value that we get for this wear sit within a plausible
12 engineering range. So this is the -- kind of the range we
13 defined based off our knowledge of the winds and our
14 knowledge of behavior of the hooks and our ability to
15 model that mathematically. See there's all these
16 mathematical equations that get used in this model, so
17 there -- there is some variability that we would expect.

18 So that seems like a lot, but we will show you,
19 as we look at wear, how that -- how that falls. But you
20 have to expect at this point that we're not going to be
21 able to precisely say it goes, you know, 1.375 miles,
22 which is not where we're at.

23 BY MR. NOEL:

24 Q. All right. So let's move on to the component
25 wear section for the presentation.

26 A. Right. So on page 32, there was a table provided

1 in the -- from the FBI in their lab report. They went
2 through and they tested various components and they tested
3 the hardness of those, and they presented them in a -- in
4 a couple of different values or charts. If you would --
5 if you look at hardness values, there is different ones
6 depending on how hardness values results are.

7 So for the material, the hook was -- was slightly
8 harder. They used the superficial Rockwell test, the HR
9 30 T test, and results to interpret their hardness
10 readings. Whereas for the angled material and the bracket
11 material, they used the Rockwell Hardness B. So you do
12 the test and you come up with a value based off of that
13 and that scale that they -- that you do the test with. So
14 that was what was presented. So the problem is we want to
15 -- we want to talk apples and apples. So there's a way to
16 convert those two different test results into a common
17 language.

18 For this case, we used -- there's other ones --
19 but we used, what we call, the Vickers hardness value. We
20 want to be able to use it in our wear equations so that's
21 what we converted it to. So that's what Vickers are, and
22 then we took Vickers -- and we will show in some other
23 values. We -- we took it times gravity, which is just a
24 units thing to change the units from kilograms per
25 millimeter squared to newtons per millimeter squared so,
26 again, so we can use it in the formulas. You know, you

1 don't have to memorize all the -- the numbers, but the
2 idea is that they're now better comparable to each other.
3 So we can look at -- for example, the color coding
4 represents the component. So the yellow represents the
5 failed hook, and then the two yellow items on the bottom,
6 item 10, represent the -- the angle and then the bracket
7 that it was in when it failed. And then hook number two
8 is -- is another hook, it's that -- the blue represents
9 that, and then hook -- item number one, which is another
10 hook in the green. So what you can see -- and it's
11 interesting, and we will show some photos that represent
12 that though -- is that there is definitely variability in
13 the hardness value. If you look at the failed hook, for
14 example, so it -- if I just look at the -- the Vickers
15 number -- the first column on the left. It has a -- a
16 value of 114 versus the angle on the bracket have higher
17 values, 134 and 152 respectively. So that would tell me
18 that the hook would be expected to wear more than the
19 angles. If for example, you look at item number two, its
20 hook is 222, and you look at the angles and the bracket
21 and you see that they are less so that would tell me that
22 took hook on -- for item number two would wear less. And
23 then if you look at hook number one and it's comparable
24 with the bracket being slightly -- slightly harder.

25 Q. So let me -- let me make sure we got this right
26 first. Going to the FBI report, the lab report, when

1 we're talking the -- the Rockwell HR 30 TW versus the HRB
2 test, that's where we're talking the apples to oranges in
3 comparison?

4 A. Correct. The value, for example, of 61 on the HR
5 30 T is not the same -- same scale, if you want to say, as
6 67.4 for item number 7. It's kind of like saying Celsius
7 and Fahrenheit. You know, 32 and 32 where the scales are
8 different. So those are two different scales, so we got
9 to get them on the same chart.

10 Q. Right. So the -- the chart to the right with the
11 Vickers numbers, you've applied the Vickers
12 calculations --

13 A. We did a conversion --

14 Q. Right.

15 A. -- using a known standard.

16 Q. To make it so it's apples versus apples now?

17 A. Correct.

18 Q. All right. So make sure I'm correct in
19 understanding what you're saying. The -- the higher the
20 number, the harder the metal is, correct?

21 A. That is correct.

22 Q. All right. And then what -- I know when you said
23 you applied the Vickers plus gravity to get a neutron?

24 A. A newton.

25 Q. Newton. Okay.

26 A. A newton is a measure of -- these are in SI

1 units. The idea is that I need to have -- when I run the
2 equations for wear, they have to have all your units. You
3 can't have feet and meters and everything. You have to
4 have all your units in the same equation, and so we're --
5 just converted that over and, as I show in the next slide,
6 the value that I will be showing is the value on the
7 right, just because that's what we use -- that's the value
8 we used in our calculations.

9 Q. Right. And as we're going through the two, the
10 Vickers and the Vickers plus gravity, we're comparing up
11 and down the chart, not side to side, correct?

12 A. Correct. The values are relative to each other
13 vertically.

14 Q. Right. So for instance --

15 A. 222 --

16 Q. The yellow 114, down here below, yellow 134, and
17 yellow 152?

18 A. Right. You can compare any value.

19 Q. Right.

20 A. You can say hook number two versus the failed
21 hook, there's a significant difference between those in
22 terms of hardness. The -- the color coding just ties the
23 components together --

24 Q. Right.

25 A. -- just that you know which -- which sample the
26 FBI had that relates to itself in the field, which one was

1 actually matched. That's what we're -- we will talk -- so
2 the next slide, for example, shows the -- this would be
3 the number one that we just had up on the table. That's a
4 hook. And that's for a transposition towers 24/199. And,
5 again, I presented -- these are the values we included.
6 So these would be the Vickers times gravity value that I
7 just showed on a previous table. 167, for example, for
8 the -- for the hook, and that's the 167.

9 So that's the -- that the angle with the bracket,
10 the -- the supplemental repair bracket, and then that's
11 the hook, and you can see there's substantial amount of
12 wear in that hook, right? And if I go to the next slide,
13 you can look at the holes and how they're worn. So this
14 is the angle hole and the supplement of that with the
15 bracket, which is the bracket shown right here. The
16 bolted on bracket and that would be the bolted on bracket.
17 So what you can tell is, one, there's a substantial amount
18 of wear that's occurred and you can see where the
19 galvanizing has worn off the lower part of the hole, and
20 then more so you can see it very active. So this hole
21 was -- was -- had worked its way through the hook, and
22 then it definitely appears that that same hook was put on
23 the hole and allowed to -- to wear or continue to wear.
24 And you can see to the level, at which time, it was pulled
25 off. You can see all the area of galvanizing is due to --
26 due to the -- so the hook is essentially going back and

1 forth of these photos -- right to left of the photo,
2 rotating right to left for the last, you know, 100 years.

3 Q. So let me ask you one thing on here. Looking at
4 the numbers, the bracket hole on the left, the Vickers
5 plus gravity shows 1349.

6 A. Huh-uh.

7 Q. And the original hole on the arm itself appears,
8 to me, to be significantly lower at 1175.

9 A. Right.

10 Q. Is that a significant figure?

11 A. Well, so what it says is that, initially, the
12 hook and the -- the angle, which is the photo on the
13 right, were approximately wearing about at the same rate
14 so we could say we have comparable hardnesses, and then
15 when they switched over, the hook continued to wear, but
16 at a slightly slower rate because this bracket was a
17 little bit harder. And we -- and we see that even more
18 so, if you go to the next hook.

19 So this is hook number two, and you can see that
20 it has substantially less wear that hook number one did,
21 And you can see, as we talked about, that has the value of
22 about 21, 2200 newton per millimeter squared and a much
23 softer angle and -- and bracket. So if you go to go look
24 at those, you can see at the time, the angle is almost
25 worn all the way through. So in this case, had they had
26 allowed that to stay in the same place, you probably

1 wouldn't have had a hook failure, you would have had an
2 angle failure and then the hook would have fallen out of
3 the hole. In this -- in the bracket hole, you can see how
4 much it started to wear, but it's wearing faster than --
5 than the hook, because the hook is significantly harder.
6 So this demonstrate that the hardness of the material
7 affects the wear, and that material that is different in
8 hardness will wear differently than a more comparable will
9 wear in a similar manner given the load that's applied to
10 it. You need a load on it. This is -- this is the 225
11 pounds that we say is hanging from it. If you didn't have
12 any load, you wouldn't be wearing anything. That's the
13 pressure you apply when you're sanding the wood, you got
14 to apply some pressure.

15 So the then the last series of these slides shows
16 the actual failed end of the hook. And so at the far left
17 picture, the upper portion is the remaining amount of
18 material that was left at the time the hook failed. So
19 it's approximately a little more than an eighth of an
20 inch, 3/16ths of an inch material across. About a one --
21 one-inch tall cross section, so not much material left.
22 If you can see that its hardness, out of all the values,
23 the hook was the least hard. And if we were to look at
24 the holes you can see -- again, so it wore but didn't wear
25 as severe as the one on two because, remember hook two was
26 a very hard hook compared to the one in -- in -- this is

1 five, the failed hook. You can see that's a relative
2 distance. But you can see, again, particularly on the --
3 on the bracket, how much is worn. So this hook has been
4 sitting there for quite a while. It's worn out the hole,
5 but it also shows that the hook depth has been eaten away
6 because it starts to rub the paint off the -- or the
7 galvanize off the -- the bracket metal. So it had to be
8 in its slot, not just sitting on the edge of the hole.

9 So let's just talk a little briefly about --
10 about wear. So there's a lot of different ways wear can
11 occur. And less than three of them are applicable to --
12 to potentially this situation. There's other ones such as
13 chemical wear and corrosion wear. We don't see evidence
14 of chemical interaction here and we don't see any evidence
15 of corrosion. We know there's a little light rust. That
16 may be something else other than just corrosion.

17 So adhesive wear, represented by B, is if I were
18 to take two surfaces -- and we talked about this at the
19 beginning of my testimony today -- we take those two
20 surfaces and we squish them together, then as you slide --
21 try to slide one over the other one, depending on the
22 various hardnesses -- so let's say I have a very soft
23 metal and a very hard metal, if I put them together, I am
24 going to -- I am going to strip some of that soft metal
25 off the piece, kind of smear it to the other one. And so
26 that is kind of the behavior of where you actually stick

1 one metal to the other metal. If I get to the abrasion
2 wear, that's my -- kind of my sandpaper wear. That's
3 where I put two things and I slide one hard surface over
4 the other one and, in doing so, it's wearing away the
5 other surface, the soft -- the softer surface.

6 And lastly is fretting. It's kind of a
7 combination. But what it is, it's -- again, where two
8 surfaces are tightly held together, there's -- there's
9 movement in them and what you can get is you can get same
10 as abrasion but more so in fretting, you get the little
11 particles that break off the surfaces, and we're talking
12 now -- kind of this is at the microscopic level of the
13 seal. And those particles become, like, ball bearings or,
14 in this case, like shards of glass that are between your
15 two services and they cause it to wear away.

16 So there's a couple examples of this. Now, the
17 PG&E had a report that was put out in '18 that looked at
18 some wear of some holes, and they had some microscopic and
19 SEM-type work that was done on their wear of their holes,
20 so they didn't have -- this wasn't about the hooks, it was
21 more about the wear of holes comparable to these. And
22 they looked at it, and they said -- in all of the
23 evidence, they started to see pieces of metal being
24 stripped off, or -- or kind of adhered to one another. So
25 they -- they believe the abrasion was adhesive wear in
26 their holes, and so that seems consistent with what --

1 what we've seen done, but there's also a potential of
2 abrasion and fretting is -- is how -- as a wear method.

3 So, again, the D would be the fretting wear. You
4 kind of have a particle in there that is kind of wearing
5 away potentially both surfaces especially if they're
6 comparable in hardness. C is where you have -- you have
7 something sharp that maybe, again, like, the -- the piece
8 of garnet on sandpaper that is plowing away the softer
9 material; and then the other one is where you have
10 adhesive where you actually to -- in tight contact and
11 potentially some of that material is able to transfer from
12 one kind of to the other and strip it away, and then once
13 it gets passed, you know that piece falls out, if you want
14 to say and it keeps going.

15 So there's a lot of study evidence and then the
16 effects of -- of lubrication on this. So relativity
17 straight forward equation. That's the --

18 Q. Easy for you to say.

19 A. This is multiplication. So there's -- F
20 represents the -- the normal force, how hard. So in this
21 case, it's -- 225 pounds is more force. L is -- is my
22 travel distance. So in the case we're using is the -- how
23 long did this go, and what we're saying is over the life
24 of this was 2.6 miles so we put that in there. Three is a
25 -- is a factor associated with the wear, and the H is
26 hardness. So this is where hardness played a role. In

1 this case, we're using the soft wear of the materials
2 because that would be the material that wears the
3 quickest.

4 MS. DUPRE-TOKOS: And I am going to jump in real
5 quick. On the 2.6 miles, you converted it to millimeters?

6 THE WITNESS: Well, I'll -- I'll -- yes.

7 MS. DUPRE-TOKOS: Okay.

8 THE WITNESS: You have to convert it to millimeters
9 exactly.

10 And then K is what we call the wear coefficient,
11 and that's a variable. And that really depends on what --
12 on a whole bunch of things. So in this case, for
13 simplicity, I've shown the 225 pounds, the 2.6 miles, and
14 the -- my Vickers multiplied by gravity that I use. So as
15 I put in that small. All those have to get the units
16 right. So you just can't do that multiplication and get a
17 result, you have to convert everything but that the
18 variables that we used. So we put those in.

19 So here is various K values that you can use. So
20 there's, again, great variability in the -- to the value
21 you can use. You see, 10 to the minus 3. So that's -- if
22 take a -- a decimal point that is 000 -- so that's a small
23 value. 10 to the minus 3 is a small value. And you see
24 10 to the minus 2 is one of the values so that's only .00,
25 so you see right there, your factor of 10 different, and
26 then you can go as much as 10 to the minus 5. So there's

1 a big range, again, depending on what K value you select.
2 So 10 to the minus 3, if we use an adhesive-type failure,
3 which, again, we -- we think was the appropriate means, at
4 least the -- the other report had looked at it. And
5 unlubricated, we don't -- we weren't lubricating the
6 joint, we have something about 5 times 10 to the minus 3.
7 But we can also look it as poor lubrication, meaning that
8 it occasionally gets rained on so that helps. So it means
9 during those winds, there's some rain so that helps
10 lubricate a little bit. Then we have abrasive where we
11 have two bodies pushing against each other in a sandpaper
12 action. You could see that minus two would mean that it's
13 probably much more aggressive type removal because it's a
14 smaller decimal number.

15 But three body could be another method and so in
16 between those is the little particles of -- let's say, of
17 broken off, so those help wear stuff. And then there's
18 high and low lubrication, meaning there's -- it's high or
19 low abrasiveness, I should say. So you can go from 10 to
20 minus 3 to 8 times 10 to the minus 5. So it's a factor of
21 100 different. So there's a lot of variability with it.
22 And then the last one is potentially -- is an example of
23 fretting unlubricated, one times 10 to the minus 4.

24 So if I take those -- or use that equation,
25 convert it all to the right units and I use the various --
26 various Ks that I have listed here, then I end up in a --

1 V is a volume of material that is removed from wear. So I
2 go from -- anywhere from .006 cubic inches to .76 cubic
3 inches of material. And kind of the range that using
4 these various Ks tell us.

5 So I said, well, what don't I actually lose? So
6 looking at this, again, with some amount of not complete
7 certainly. We don't know exactly where it -- we think we
8 know where it broke off but how much was -- the broke --
9 somewhere -- we say we're somewhere between a volume of
10 .236 to .322 cubic inches of material that was removed
11 before it failed.

12 BY MR. NOEL:

13 Q. Let me stop you right there. Can you explain to
14 us what is cubic inches of material?

15 A. Sure. So what you see there is the cross section
16 that if you looked at the other hooks that were -- had not
17 failed, there was a slot, right? And so we ground that
18 slot and so that material has been removed. It's no
19 longer part -- it's not in the -- not the hook anymore.
20 So there's a thickness, and then there's a cross section
21 of removal so all of this area right here times a
22 thickness of a slot gives me a volume of steel that was
23 removed through wear over time. And what that suggests,
24 again, we're somewhere in the .2 to .3 range of what we
25 think was removed on that hook that failed.

26 So I go down to here and you can see, again, what

1 I just repeated from the previous side, and depending on
2 the K value you select, you're somewhere from .006 to .76,
3 so our number seems to fall within that range.

4 If we look at and we use -- if I go to next
5 equation, if I use the 2.6 miles and I use it -- use it as
6 unlubricated, which adds that value of 5 times 10 to the
7 minus 3, I'm about .38 cubic inches. Right in the
8 vicinity of where we are when we know how much is lost,
9 right? If I play around with my distance, right, my one
10 mile because -- remember we had variability on our travel
11 length depending on -- we played around with all of those
12 variables. We had 1 mile to 11 miles. If I look at it as
13 1 mile, then I'm about 0.15 inches of material that --
14 cubic inches that has been removed, and if I go to
15 11 miles, then I am at, like, 1.61.

16 So, again, does my actual volume that was removed
17 fall between those? It looks like it does. So that,
18 again, tells me that this is very plausible that over a
19 hundred years, this material was removed through the winds
20 that were present from the values we get out of the Jarbo
21 Gap and show that this was very consistent with that.

22 So out of engineering -- using all of our
23 engineering and mathematics that I walked you through
24 today, it shows where -- where -- there's a -- there is a
25 definite plausibility that this material was a result of
26 long-term wear in a hundred years.

1 So, briefly, we just look at the hook failure
2 because does it make sense that what we're looking at was
3 the hook failed as a result of this? So we know the hook
4 failed, but if it failed for some other reason. So one of
5 the ways we look at it is, we look at our 225 pound
6 demand, we look at the slot, and that can be a minimum --
7 because what we -- we don't have the value of the slot
8 anymore, because our hook -- we only had one piece and we
9 only have the one surface, right, but we can look at the
10 measurements taken by the FBI and all of those other hooks
11 on the bracket, and you can see there's a relatively
12 consistent width. And so there's a minimum width of about
13 .4, and a maximum width -- oops, that should say
14 "maximum," on the width maximum on the seconds bullet from
15 the bottom there. That's .552.

16 Q. Right here?

17 A. That should say maximum, yeah.

18 Q. All right.

19 A. You're just waiting for me to have something to
20 change. So as you can see, there's a little difference in
21 width, so if I -- again, using variability, we consider
22 that. So when I say "moment," so there's a couple of
23 different ways material can fail or be loaded. It can be
24 pulled, a tension. Pulling something apart and tearing it
25 apart. You can fail at a compression. You can push on it
26 and weed it together. You can take two elements and you

1 can sheer them. You can bring one relative to the other,
2 slide it against the other. And the other one is -- is
3 moment or bending, so you assume you just break something
4 like a -- take a board and just snap it. You're not
5 pulling the board apart, you're -- you're bending the
6 board so the top of the board gets pushed, tension, and
7 then the bottom of the board gets pushed, depression, and
8 it breaks. So what we're saying is that the -- the demand
9 that's in the units of inch pounds, so it's -- it's a
10 force that is applied from the distance, so that's why you
11 get units of that. What we're saying is that the -- the
12 moment of bend that hook, the last -- that last little
13 remaining eighth inch or so of ligament is 46-inch pounds.
14 If you use the minimum width of that slot, because we're
15 essentially going into the slot, picking the middle of the
16 slot, and saying I am going to bend that piece of metal
17 that is left and see if it can withhold that, or I look at
18 62. So those are kind of the variables.

19 If I go over my hook, we believe, based off of
20 its hardness values, we can again go to a conversion table
21 and say that's estimated to be somewhere around
22 56,000 pounds in -- in tension. And so that should be
23 pounds per square inch, PSI. So plastic moment capacity
24 is -- is what's the capacity if it has 56,000 tense -- or
25 strength to resist that bending. And that's 58.7-inch
26 pounds. And if you look at the sheering, which is -- if I

1 wanted to sheer that piece off, you can see that's
2 significantly greater. So we think it's failed in bending
3 and, again, from the numbers, we're right in the middle
4 of, you know, 46 to 62 or 58. So everything suggests that
5 that hook wore away over the last hundred years until
6 there was a little bit of material left, and that material
7 at that day was not strong enough to handle the 225 pounds
8 and just bent, and then fractured and fell off and -- and
9 fell down.

10 With that, I'm done. That presents the --
11 presents our findings.

12 Q. All right. So to summarize my understanding to
13 make sure we -- we understand this.

14 At this point, we can't say how long that hook
15 took to wear to failure, but you can say it's plausible
16 that it was almost a hundred years?

17 A. Yeah. The wear and the amount of wear -- the
18 wear material was consistent with a hundred years of
19 rotation due to the winds up there.

20 MR. NOEL: Do you have anything?

21 MS. DUPRE-TOKOS: I do not.

22 MR. NOEL: Jurors?

23 MS. DUPRE-TOKOS: Wow.

24 MR. NOEL: Y'all understand this? Y'all going to be
25 going home this weekend and figuring out the coefficient
26 of friction on --

1 GRAND JUROR NUMBER TWO: Doing math equations.

2 MR. NOEL: All right. Doesn't look like we have any
3 more questions.

4 MS. DUPRE-TOKOS: You did a good job.

5 MR. NOEL: Nice to meet you, McGormley.

6 THE WITNESS: So I'm done?

7 MR. NOEL: Madam foreperson needs to give you to
8 admonition again.

9 GRAND JURY FOREPERSON: Mr. McGormley, you are
10 admonished not to discuss or disclose at any time outside
11 of this jury room the questions that have been asked of
12 you or your answers until authorized by this grand jury or
13 the Court.

14 A violation of these instructions on your part
15 may be the basis for a charge against you of contempt of
16 court. This does not preclude you from discussing your
17 legal rights with your own attorney.

18 Mr. McGormley, what I have just said is a warning
19 not to discuss this case with anyone except the Court,
20 your lawyer, or the district attorney.

21 Do you have any questions?

22 THE WITNESS: I do not.

23 GRAND JURY FOREPERSON: Thank you for your time
24 today.

25

26 [Proceedings omitted.]

1 [Recess was taken from 11:09 a.m. until 11:25 a.m.
2 whereupon the grand jury reconvenes in courtroom 9.]
3

4 GRAND JURY FOREPERSON: All members of the grand jury
5 are present, ready to proceed, and you can bring the
6 witness in.

7 [Witness enters the courtroom.]

8 GRAND JURY FOREPERSON: Mr. Kuyper, before you have a
9 seat, please raise your right hand to be sworn.

10 Do you solemnly swear that the evidence you shall
11 give in this matter pending before the grand jury shall be
12 the truth, the whole truth and nothing but the truth so
13 help you God?

14 THE WITNESS: Yes, I do.

15 GRAND JURY FOREPERSON: Thank you. Have a seat,
16 please.
17

18 **EXAMINATION**

19 BY MR. NOEL:

20 Q. Mr. Kuyper, for the record, could you please
21 state your full name, spelling your last name.

22 A. My name is Kris Kuyper. Last name is spelled
23 K-U-Y-P-E-R.

24 Q. What is your profession, Mr. Kuyper?

25 A. I'm a meteorologist. A broadcast meteorologist.

26 Q. What is a meteorologist?

1 A. Meteorologist is someone who studies, talks about
2 weather, meteorology. What's going to happen tomorrow.
3 Is it going to rain? Is it going to be snowy? Is it
4 going to be windy?

5 Q. Do you have an educational background that
6 qualifies you as a meteorologist?

7 A. I do. I went to UC Davis. My major is
8 atmospheric science, which is meteorology plus all the
9 calculus so extra fun. Minor area in climates as well.

10 Q. What does it mean to have a minor in climate?

11 A. It's not an official -- it was not an official
12 minor, but it was -- you had to pick a -- an area that you
13 had to focus on in addition to -- to meteorology. Some
14 people -- some folks chose geography, some other folks
15 chose a few other things. I chose climate, which meant I
16 took a couple extra classes in climate and studied that.

17 Q. All right. And I should have, before we even
18 started -- you have in front of you, a thumb drive marked
19 as Exhibit Number 1353.

20 Do you recognize that?

21 A. I do.

22 [Exhibit No. 1353 was identified.]

23 BY MR. NOEL:

24 Q. What is on that thumb drive marked as 1353?

25 A. A little presentation I am going to show
26 everybody about winds and fuels that will be entertaining.

1 Q. All right. So we now have the presentation up
2 here. First off, we have your resume. If you can walk us
3 through your resume?

4 A. Sure. My latest and greatest job was at Action
5 News Now, which is in Chico, for 12 years. No longer with
6 them, but it was -- for the 12 years, I was with them, and
7 we had a 4:00 show, a 5:00 show, both shows for an hour.
8 We had a 6:00 show for a half hour. We had a 10:00 show.
9 We had an 11:00 show. It's a lot of shows Monday through
10 Friday.

11 There for 12 years. And what I would do is -- my
12 day consisted of me going in in the afternoon, about 2:30
13 or 3:00, look at all the computer models. I would look at
14 the all the information, the data out there. Is it windy
15 in Redding? Is it hot in Redding? Is it raining in
16 Chico? Is it -- what's going on in Marysville? Is it
17 cloudy or foggy there and whatnot. I look at all that,
18 then I look at these commuter models, a bunch of them, and
19 ascertain what's going on, look at what's going to happen
20 in the future, make my forecasts, and then after that was
21 done, make my graphics, like a seven-day forecast graphic,
22 and then at 4:00, it would be -- try to keep y'all
23 entertained with the boring meteorology. Try to make it a
24 little bit fun.

25 So that was here in Chico. Before that, I was in
26 beautiful Anchorage, Alaska doing the same thing. There

1 was stuff to talk about up there, it's not just cold. It
2 was fun at times as well.

3 Before that, I was here in Chico again. Before
4 12 and 24 merged together, it was just 24, and I was the
5 evening weather guy for Channel 24 for three years.

6 Before that, I was in Bakersfield, and before
7 that, I was at Channel 7 in Redding doing the morning
8 shows. Although, the morning gig requires you being there
9 about 3:30 in the morning. So that was -- that was not
10 tremendous.

11 And my first job on the TV out of college was in
12 Grand Junction, Colorado. Beautiful area.

13 Q. What does it mean to be a chief meteorologist?

14 A. Chief meteorologist is just usually the evening
15 person. So if -- if -- if, say, the morning person has a
16 question about the forecast or something like that, he
17 will usually run it -- or her will usually run it by me to
18 get my thoughts and get my opinions on it in that case, or
19 the weekend person may do the same thing.

20 Q. And, finally, down at the bottom, it talks about
21 SEALS. What does it mean to have a -- be a certified
22 broadcast meteorologist?

23 A. So those are to separate entities. The National
24 Weather Association is -- is a fine entity where you --
25 you have to pass a written exam so you understand
26 meteorology, and then you have to send them three shows of

1 consecutive nights, and they have other meteorologists
2 watch them, grade them, are you talking about meteorology
3 or are you just talking about your dog walking up to the
4 end of the street, or are you talking about true
5 meteorology with an understanding of what is going on?
6 They grade it and, if they like it, then you earn the
7 SEAL.

8 The American Meteorologic -- The American
9 Meteorological Society, their certified broadcasting
10 meteorologist program is more stringent. So their test is
11 really in the atmospheric sciences and the physics of it,
12 so you really have to understand that one, and then they
13 also do a grading process where you submit shows from
14 three consecutive nights and they evaluate them and see if
15 you were meeting their higher standard of understanding
16 meteorology.

17 Q. So it looks like in your history, you have spent
18 about, what, 18 years as a meteorologist here in the north
19 valley, correct?

20 A. Yes, sir.

21 Q. And you were the chief meteorologist for the --
22 the 12 and 24 on November 8, 2018, and the next couple of
23 weeks behind that, correct?

24 A. Absolutely.

25 Q. And tell us about your experience with the Camp
26 fire?

1 A. We had been having gusty winds through that fall.
2 This wasn't the only night that it was windy. It had --
3 it had been windy a few times in October. It had been
4 windy November 7th. It was windy -- November 8th it was
5 windy, obviously. We had a good handle on the winds. We
6 forecasted them, I thought, rather accurately. And so it
7 wasn't a -- a big surprise that they were happening. They
8 were in the forecast.

9 My personal recollection was I dropped my son off
10 at Marsh Junior High School on that morning -- 8:00 in the
11 morning, saw the big mushroom cloud over Paradise, said
12 that is not good, and I knew not to go make any plans, I
13 knew not to go to the gym or anything like that, and sure
14 enough about 10:30 or so, got the call from my boss, "Get
15 in here now," and I was in there now. And for the next
16 week, eight, nine days, we were -- on Action News Now, we
17 were on air 24 hours a day. We knew -- we canceled
18 regular programing, went to straight news, and since it
19 was, at that time, we were down a meteorologist in the
20 department, it was just Cort Klopping and myself, and so I
21 handled the noon to midnight shift and Cort handled the
22 midnight to noon shift. So we ran 12-hour shifts there
23 for those eight or nine days or whatever it was, and the
24 news would take up a good chunk of the time, but we would
25 get -- oh, in the course of an hour, we would get maybe
26 four break-ins in the news, and we would get anywhere from

1 5 to 10 minutes to do our little breakdown of what's going
2 on, weather-wise, meteorologically with regards to the
3 fire.

4 Q. Now, I understand you're kind of the -- the
5 person that coined the term, "Jarbo Gap Winds" or the
6 Jarbo Winds; is that the correct?

7 A. Yeah, yeah. I noticed back in my first stint
8 there at Action News Now, back in 2003, there were really
9 -- not very many weather stations, anemometers out in that
10 area. It's a very data sparse area. They put one up in
11 2003, I came back to the station in about 2007, and I
12 noticed that little station there and I noticed Paradise
13 wouldn't report much wind. Magalia wouldn't have much
14 wind. Oroville wasn't reporting much wind. Whoa, Jarbo
15 Gap, 45 mile an hour gust last night. Where did that come
16 from? I thought it was just a bad instrument. I -- I
17 attributed it to that because nobody else in the area was
18 reported anything, and then I started getting a few calls.
19 "Boy, it was windy last night at my place," and I put
20 those two together and, from that, I kind of -- I pieced
21 out what was going on there basically. Because those
22 winds, they only impact the Feather River Canyon. They
23 don't blow out over the Feather River Canyon. They're
24 like -- they're like a river in a channel. They stay in
25 the channel. They don't flow out of the channel for the
26 most part. And so people in Paradise that would be

1 impacted by them would be the folks that lived on Pence
2 Road, right up against the Feather River Canyon, Feather
3 River Hospital, that area. You get more than a block away
4 from Pence Road, the winds really hardly did anything. So
5 they didn't impact a tremendous amount of people, so they
6 kind of stayed under the radar there a little bit, no pun
7 intended for a while but that Jarbo Gap weather station
8 really helps pinpoint exactly what was going on in the
9 Feather River Canyon.

10 Q. Sounds like you started studying the Feather
11 River Canyon, the Jarbo winds well before the Camp fire?

12 A. Well before, yes. And I started including them
13 on my forecast. I remember a few people -- many people
14 didn't quite understand it. I guess it was my fault for
15 not explaining it properly. When I would go into Costco
16 on Saturdays, "Hey, Weather Guy, how about those Jarbo Gap
17 winds? It wasn't windy at all at my house last night,
18 Kris." The Chico stuff, you know. And Feather River
19 Canyon have a 50 mile an hour gust, people are kind of,
20 like, well, the Jarbo Gap is -- you know, is not really a
21 thing. But it was a thing. And the people who lived
22 there on Pence Road or other areas around, like, Oroville
23 impacted by the winds, they -- they would absolutely say,
24 hey, you know, right on, so.

25 Q. So we're, again, talking about the Feather River
26 Canyon winds and fuels. And how about start with -- just

1 give us a basic explanation of how and why the Feather
2 River Canyon is windier than anywhere else in the area?

3 A. The basic breakdown is that you have higher
4 pressure over Nevada, Great Basin, in that area and lower
5 pressure over California or the Pacific Ocean. Sometimes
6 Mother Nature doesn't like that difference. She wants to
7 push the air from high to low. Pretty simple. You have
8 the Sierra Nevada there. That's a big mountain range.
9 It's a big brick wall that doesn't want to let that
10 happen. So that air is looking for any little nook,
11 cranny, gap, pass into the Sierra Nevada where it can get
12 from Nevada to the ocean.

13 Feather River Canyon is a beautiful gap into the
14 Sierra Nevada. It's a nice long straight and narrow deep
15 canyon. There are other canyons in the Sierra Nevada,
16 absolutely. But some of them wiggle a little bit too
17 much. Some of them are not broad enough. Some of them do
18 not allow enough air on in. Feather River Canyon, nice
19 straight shot to get that all that wind further along.
20 Think of a river. As it goes from a nice broad stretch,
21 and then it gets funneled into a -- a gap, funneled into a
22 channel or so, the river gets turbulent. It's choppy.
23 It's really moving. Same thing with the air. We're
24 talking fluid dynamics here.

25 Think of the air as a fluid and the exact same
26 principles go on, it's getting channeled in the Feather

1 River Canyon, it accelerates and creates those gusty
2 winds.

3 Q. All right. Let's move on to the next slide. How
4 do our northeast -- north northeast winds develop? If you
5 can explain what we're looking at here and how this
6 occurs?

7 A. Sure. This is -- we will talk about it in three
8 different parts here. This is a surface pressure map of
9 -- a computer model. The star here the Butte County.
10 This is California right here. There's Oregon. There's
11 Washington. There's Nevada.

12 And on day one of the process, this is when we
13 have a storm moving into the Pacific Northwest. So we
14 have rain going on here. These are lines of equal
15 pressure, the black lines here. So they're called
16 isobars. And so the wind is generally going to push from
17 higher pressure to lower pressure. It's generally going
18 to push perpendicular, usually. Not always, but usually
19 perpendicular to these lines. This is a surface pressure
20 map. This is not upper level. This is right down here
21 where we are living and breathing, all that kind of good
22 stuff.

23 So this is -- this is day one. So right now in
24 Chico, if I am looking at this, I see a light south
25 breeze, nothing too dramatic. We got some rain in the
26 Pacific Northwest, it's probably cloudy and a little bit

1 drizzly around here, won't end up with too much with this.
2 This is day one of the process.

3 Next.

4 Q. Ready to go to the next one?

5 A. This is day two of the process, and the front has
6 moved inland. It's long gone. We're back to sunshine
7 here in California. There we are. Surface high pressure,
8 many times, follows a storm system in the Pacific
9 Northwest. It'll also build in the Pacific Northwest. So
10 we have more air up here than we do down here, and Mother
11 Nature doesn't like that. So she's going to push that
12 extra air up here down to Southern California. These
13 lines of equal pressure, they -- they tell me that. And
14 just looking at that, off the top of my head, that looks
15 like a 30 to 40 mile an hour north wind in the Sacramento
16 valley. The Jarbo Gap -- look at this. This won't do
17 much for Jarbo Gap. But this is just kind of step two in
18 the process. That happens rather frequently. I will show
19 you later on.

20 So this is the north wind blowing down in the
21 valley here. These north winds happen during the day,
22 typically, for us in the Sacramento valley.

23 Q. All right. Next slide?

24 A. This is some -- some guy on TV talking about
25 pretty much the same thing.

26 THE COURT REPORTER: Do you guys want me to write

1 that?

2 MS. DUPRE-TOKOS: No, you can...

3 THE COURT REPORTER: Okay.

4 MR. NOEL: Yeah, you don't have to.

5 Okay. Let's start this all over because we had
6 the volume turned off.

7 MS. DUPRE-TOKOS: If you can turn it up, it would be
8 helpful.

9 GRAND JURY FOREPERSON: Yeah.

10 [Whereupon, a video was played in the open courtroom for
11 the grand jury.]

12 BY MR. NOEL:

13 Q. All right. Says date on that was
14 September 23, 2019; is that correct?

15 A. Yes, sir.

16 Q. All right. So an explanation of what we've been
17 talking about.

18 All right. Now, let's go onto the --

19 MS. DUPRE-TOKOS: Can I ask a question?

20 MR. NOEL: Sure.

21 THE WITNESS: Yeah.

22 MS. DUPRE-TOKOS: So looking at the first two slides
23 --

24 THE WITNESS: Uh-huh.

25 MS. DUPRE-TOKOS: So in the first one, how do our
26 north northeast winds develop, the isobars go basically

1 north south.

2 THE WITNESS: Yeah.

3 MS. DUPRE-TOKOS: And then after the front passes, it
4 seems like they're going east west?

5 THE WITNESS: Yes.

6 MS. DUPRE-TOKOS: What does that signify?

7 THE WITNESS: That's telling me that surface high
8 pressure is now in Oregon and, therefore, we're going to
9 have a healthy north wind in the Sacramento valley.

10 MS. DUPRE-TOKOS: So when they go sideways that's an
11 indicator of coming wind?

12 A. When they're tight packed. When they're -- see,
13 like, right here. Boom, boom, boom. It's tightly packed.
14 That's going to be a stronger wind. So here, here, to
15 here, that's not a whole lot going on right here, so it's
16 going to be lighter winds in that region.

17 Generally, they go perpendicular to the other
18 line but, again, this is at the surface. So we have a lot
19 of mountains here in California and the west, so the
20 mountains play a big role in the wind direction.

21 MS. DUPRE-TOKOS: So -- but do the -- the isobars,
22 are they indicative of the direction of the wind? Like,
23 Marc, go back.

24 THE WITNESS: They will -- so the winds will -- so if
25 we have higher pressure here and lower pressure here,
26 the-- the air is going to typically -- at the surface,

1 it's going to typically go perpendicular to the direction.

2 MS. DUPRE-TOKOS: So Marc is going to go back to the
3 first slide.

4 THE WITNESS: Uh-huh.

5 MS. DUPRE-TOKOS: So that one, for the most part,
6 they're more up and down.

7 THE WITNESS: Yep.

8 MS. DUPRE-TOKOS: And then go to next one, Marc.

9 MR. NOEL: Okay.

10 THE WITNESS: The --

11 MS. DUPRE-TOKOS: They're more horizontal.

12 THE WITNESS: The problem with the Sacramento valley,
13 it's a long north south valley, and not a very broad east
14 west valley. So it's hard for us in the valley -- in the
15 Sacramento valley to get an east wind or a west wind
16 because the mountains here are why. It's easy for us to
17 get a north wind or a south wind, because we have that
18 long stretch of flat.

19 MS. DUPRE-TOKOS: But do the directions of the -- of
20 the black lines -- does that mean anything?

21 THE WITNESS: Um --

22 MS. DUPRE-TOKOS: Up and down versus more sideways?

23 THE WITNESS: Well --

24 MS. DUPRE-TOKOS: Or is that going to be a really
25 complicated explanation?

26 THE WITNESS: Well, what they're showing is -- is a

1 -- lines of equal pressure here, so these -- these numbers
2 here, 1,022; 1,028 inches of millibars. So every four
3 millibars you'll have another line, and so 1,028 here;
4 this one is 1,024; this would be a 1,020 so that shows
5 it's lower pressure here and higher pressure here.

6 So think of your bathtub, when it drains it's
7 going to have lower pressure, and the tub is going to have
8 higher pressure as the water is going down the drain.

9 MS. DUPRE-TOKOS: Okay.

10 THE WITNESS: Did I answer that?

11 MS. DUPRE-TOKOS: Yep.

12 BY MR. NOEL:

13 Q. All right. So let's go back here to surface high
14 moving east?

15 A. So we -- we talked about day one. The storm
16 going through the Pacific Northwest. We talked about day
17 two, the north winds developing in the Sacramento valley,
18 but not much happening in the mountains.

19 This is night two. This is after the north winds
20 in the valley have died down, but the Jarbo Gap winds,
21 they get going. The Jarbo Gap winds through -- through
22 the mountains there, through the Feather River Canyon,
23 they're a nocturnal wind. They're a nighttime wind. They
24 pick up usually around midnight, peak around sunrise and
25 then it will diminish in the afternoon the following day.

26 Surface high pressure now moves well on the east,

1 it's trying to push air to the coastline here because, you
2 know, we have more air here. We have less air here. It's
3 trying to bully its way to the coast. We -- it can't get
4 there because the Sierra Nevada is blocking it. So it's
5 looking for nooks and crannies in the mountains. So you
6 see these lines kind of parallel to the mountain range.
7 That's what you look for for a Jarbo Gap wind. This is
8 not a tremendous wind. Maybe a 30, 40 mile an hour wind
9 through the Jarbo Gap, but it's -- but it's a wind -- a
10 wind nevertheless.

11 Next slide just will show another example. This
12 is also what I'm looking for if I'm forecasting the Jarbo
13 Gap wind, I'd also look at the 30 or 40 mile an hour wind
14 here. If we had, say, another one of these black lines,
15 one of these isobars -- and if we had one there then that
16 would be a more significant north wind because the more
17 pressure difference you have, the greater the wind is
18 going to be. So if we had, say, a third line there, then
19 I would think about 50, 60 mile an hour gusts, something
20 like that.

21 So -- but, again, these -- these lines parallel
22 in the mountains that's what you look for when you're
23 looking at this kind of stuff.

24 Q. All right. So --

25 A. So another way to look at it. Let's -- let's
26 look back to just last Tuesday night. It was windy there

1 last Tuesday night. This is Jarbo Gap. This is just a --
2 last Tuesday, I think that's Wednesday, but this is
3 Tuesday night we're looking at. The winds gusts here,
4 59 miles an hour. 10:13 in the evening or so. 41 at 9:13
5 in the evening.

6 Next slide.

7 Q. All right. Before we get on to that --

8 A. Sorry.

9 Q. -- this is the -- you're talking about reading
10 from the Jarbo Gap RAW station, correct?

11 A. Yes, sir.

12 Q. Can you give us a brief explanation of what a RAW
13 station is?

14 A. RAW stands for Remote Automated Weather Station.
15 It's just a station out in the sticks where nobody has to
16 be there, just operated by remote computer. It's just all
17 on its own. It's a station that measures rain, wind,
18 temperature. The wind is -- you can't just stick an
19 anemometer out in your backyard and hope for the best
20 reading. You have to have it mounted correctly. I see so
21 many people with a backyard weather station mounted under
22 a tree or something like that. You got to put your
23 anemometer -- it has to be 33 feet above grounds level,
24 has to have a nice open spot so wind can come in. So it
25 has to be -- there are rules for these stations to submit
26 accurate data. This station is official. It meets all

1 the official guidelines that -- that nerds in meteorology
2 have established for good weather data to come our way.

3 Q. What is an anemometer?

4 A. An anemometer is a wind measuring Device. It's
5 just big thing out there with -- there are a couple, but
6 probably the most common kind has three cups, and it spins
7 around and it measures wind.

8 My daughter, when she was two years old, she used
9 to call it "Daddy's fan," on the chimney because it was
10 spinning up there, so just something that spins and
11 captures the winds.

12 Q. All right. And who -- who does the Jarbo Gap
13 weather station belong to?

14 A. Western Region Climate Center.

15 Q. And what is that?

16 A. They're an agency in Reno and they -- they run
17 it. They -- they disseminate data to the public, National
18 Weather Service. This is -- this from the National
19 Weather Service site. If those nerds are sanctioning it
20 and -- and okay with it, it's -- it's an accurate and
21 verified station.

22 My weather station in my backyard, I believe it
23 sounded pretty good, but it's not official.

24 THE COURT REPORTER: I'm sorry, did you say "merit"?

25 THE WITNESS: Probably.

26 THE COURT REPORTER: Okay. I thought you said

1 "nerds," I'm sorry.

2 THE WITNESS: Oh, no, I did say nerds. I did say
3 nerd.

4 THE COURT REPORTER: Okay.

5 THE WITNESS: I'm a nerd so I can call them nerds.

6 MR. NOEL: Exactly. Nerd is used -- you use that as
7 a term of endearment for your fellow meteorologists.

8 THE WITNESS: Exactly. Exactly. It was not okay in
9 high school, but it's okay now.

10 BY MR. NOEL:

11 Q. All right. So let's go on and talk about high
12 pressure in the Great Basin.

13 A. So this is yet another way of looking at that.
14 First off, I apologize, we're talking about a -- we are
15 going to mix the metric system and America is empirical
16 system or whatever. So the numbers are a little bit
17 different here, but one kilometer is still six tenths of a
18 mile. It's the same distance. It's just a different way
19 of saying it basically.

20 So these numbers are millibars. I broke this one
21 out here of Ukiah, just to show you the timestamp. At
22 night -- 25th at night, at 9:00 at night, about the same
23 time the Jarbo Gap winds were gusting 40 to 50 miles an
24 hour. Just want to show that. And also the American way
25 of doing it, inches of mercury, 30.27. The metric way of
26 doing it is with millibars, but measuring the same thing,

1 air pressure.

2 So in Nevada, what do we got in air pressure?
3 The blue numbers is what we're looking at. 1024.9, 1024.8
4 millibars. 1024.8 millibars. So around about 1024, 1025
5 millibars in the Sacramento valley.

6 Look up to Alturas, 1032. Reno, 1031. Tahoe,
7 1032. So what is that? 8 millibars roughly difference.
8 Not a great span. So there is higher pressure here, more
9 air here. There's lower pressure here. Same thing we're
10 looking at on the -- on the charts a little bit ago. So
11 we're trying to send all this higher pressure air here to
12 the valley, trying to flood it into the valley somehow.
13 It's trying to get from a higher place to a lower place
14 basically.

15 But, again, Sierra Nevada, big brick wall. I
16 mean, there's -- what, Alturas is, what, 4500 feet. Same
17 with Reno, in that area. And then these mountain peaks
18 are, what, 6, 7,000, 8,000 feet or so. So it does not
19 like to climb these mountain ranges. It's colder air.
20 It's heavier air. It's -- cold air is heavy, it's dense.
21 It sinks down to the ground basically. It's not like
22 summertime air which flies all over the place. Cold air
23 is heavy and dense and sinks down to the ground. It does
24 not want to climb these mountains. It's looking for a
25 little gap, and a little pass, a little nook and cranny in
26 the Sierra Nevada. Sure before the -- you have several

1 points there. Yuba River has a few canyons there.
2 American River Canyon is a canyon, but the Feather River
3 Canyon, just a beautiful long stretch running right
4 there -- boom -- and really is effective way of
5 draining -- actually, I didn't want that -- right there
6 draining the air from the higher pressure to the lower
7 pressure. Again, whether you take a -- water from a lake,
8 and it flows out of the lake and it flows into a little
9 narrow skiddy channel then it's going to really pick up
10 momentum, it's going to accelerate, get a little choppy
11 and whatnot. Same thing is happening with the atmosphere
12 when that air goes from a -- from a broad area and is
13 forced into the Feather River Canyon, it's going to pick
14 up momentum, and it's going to pick up speed and it's
15 going to accelerate, and you're going to get those 40, 50,
16 60, 70 mile an hour winds at Jarbo Gap.

17 Q. Does the altitude difference affect that at all
18 also?

19 A. Not tremendously in my opinion. I think we're
20 just pushing air from higher pressure to lower pressure.

21 Q. All right. All right. Let's move on. Here we
22 are talking about the Jarbo Gap RAW station.

23 A. So this station is important here for -- for what
24 we're going to talk about today. This is the Jarbo Gap
25 weather station. Again, way up there, fenced off so
26 nobody can do anything to it. This is the Feather River

1 Canyon, which I labeled here. Here is the station. It
2 does sit a little above the Feather River Canyon but,
3 again, this is not downtown Chico. This is not downtown
4 Sacramento. It's out in the middle of the sticks here, so
5 data is rather sparse in this area. There is not a lot of
6 wind stations out in the boondocks here. This is good one
7 that has been out there since 2003. PG&E has put up a few
8 in the past year or two on some of these ridge tops. Flea
9 Mountain has one. Rim Road in Concow has one. They
10 measure some -- some wind. They've only been there for a
11 year, year and a half, two years. Before the fire, there
12 wasn't much out there. And so this -- this one was pretty
13 much it as far as good accurate weather numbers from the
14 area. If you're familiar with that area, you know,
15 Highway 70, if you all know where Scooter's Cafe is there,
16 at the top of that little ridge, before you drop down into
17 the Feather River Canyon, it's real close to that. But
18 it's kind of at the bottom of the Feather River Canyon and
19 measures the winds very nicely.

20 Q. All right. Did I skip one here? We seem to be
21 missing a slide, but we will go on.

22 A. Again --

23 Q. Next up.

24 A. -- here is just a little more on the Jarbo Gap
25 station. Here is the Feather River Canyon. It's a huge
26 channel, the mountains are nice and high. There's a

1 nice chasm right there through the -- through the Sierra
2 Nevada. There's tower 27/222, so it's about six miles
3 away from -- from the tower itself. Elevation is a little
4 bit higher than the tower, but not by a whole lot
5 basically. And some of the data between 2003 and 2013 --
6 some to the wind data was a little bit -- a little bit off
7 so I did not use that data and calculations as you'll see
8 later on. Starting about 2013, the data got really good
9 and has been really good ever since then, and those number
10 are the only numbers I used in any kind of calculations
11 going forward.

12 Q. What makes you think that the data from 2003 to
13 2013 is -- is off?

14 A. There were some gusts in there up to 180 miles an
15 hour that's just not -- that's not likely. And also there
16 were a number of gusts to exactly 100 miles an hour.
17 Finding a gust to an exact number often would be very
18 difficult to do. You can get a gust of 52, a gust of 54
19 and a gust of 56, you know, right in the same area. But
20 to have a gust of 55, 55, 55, 55, seven days in a row
21 would really be highly unlikely, and I saw some of that
22 between 2003 and 2013, and I reached out to the folks that
23 were running it, and I never heard back from them yet, as
24 to what they say. I -- I imagine it might be a software
25 issue of some kind. But until that's confirmed, I don't
26 feel we can use that data, so I didn't.

1 Q. All right. So all of your calculations on the
2 wind data are based on 2014 to the present, correct?

3 A. Correct, correct.

4 Q. All right. So let's talk about those. First up,
5 we have a chart entitled Jarbo Gap wind gust greater than
6 or equal to 45 miles per hour.

7 A. Yes.

8 Q. So explain this chart to us.

9 A. Well, PG&E put 45 mile an hour gusts as their
10 criteria for windy conditions, I believe. So it shows
11 that number. And what I did is I basically just looked at
12 all the data from now, the 25th all the way back until --
13 2014 or so. So a six-year period there of all the wind
14 gusts at Jarbo Gap station, greater than or equal to 45
15 miles an hour. And you see a bunch of them. You see back
16 last October, 70 miles an hour on October 27th. October
17 26th, 70 miles an hour as well.

18 This is the monthly break down. So last month,
19 there were two days that we had 45 mile an hour gusts or
20 greater. Last November, four days of 45 mile an hour
21 gusts or greater. Last October, 14 days of 45 mile an
22 hour gusts or greater.

23 Q. Now, we keep going and now we're back into --

24 A. Yeah.

25 Q. -- 2018.

26 A. There's November 8th, 52 mile an hour gust that

1 morning. That wasn't the only time it was windy that
2 fall. The day before, 45 mile an hour gust. Halloween,
3 46. Middle of October, 48. That October, we had five
4 days of 45 mile an hour or greater wind gusts, and we had
5 one other one in November. September, we had two. So,
6 boy, before the Camp fire started, we had, what, seven --
7 eight days -- eight other days of 45 mile an hour or
8 stronger winds at that same Jarbo Gap location. So it
9 wasn't just the winds on November 8th that were
10 tremendously strong. There were eight other times just
11 that fall that we had winds that strong as well.

12 Q. All right. And if we take this all the way back
13 here to 2013. December of '13, it looks like seven days
14 with gusts over 45?

15 A. Uh-huh.

16 Q. All right. Now, we're onto the wind break down
17 itself.

18 A. So just to kind of summarize here. Over the past
19 six years, which we have good reliable data from the Jarbo
20 Gap wind station, the winds have gusted at our above 45
21 miles an hour there at Jarbo Gap 118 times. So it happens
22 a lot. That averages about 20 times per year, 19.6 if you
23 want to do the math. But about 20 times a year, we got
24 45 mile an hour gusts or greater at Jarbo Gap. That is a
25 windy location. That is a windy location. 50 mile an
26 hour gusts happen about 11 times per year at this Jarbo

1 Gap location.

2 Strongest gusts, we talked about that, 70 miles
3 an hour on the 26th and 27th. Remember that 70 mile an
4 hour, we will address that in a moment -- in a little bit.
5 Most often they're going to happen in the fall and the
6 winter. Fall is our -- summer and fall are our fire
7 seasons. Fall is when the vegetation is just bone dry
8 there in September and October and -- and that's when this
9 is very common.

10 You see the monthly break down. So 18 times in
11 January in those six years between 2014 until now, we had
12 45 mile an hour winds or greater. February, 16 times. So
13 forth and so on. Notice they did not happen in July or
14 August, because these winds most often happen behind the
15 passage of cold fronts. I can't remember the last cold
16 front we had in July or August around here. It just
17 doesn't happen. So there's no winds. We don't have them
18 then.

19 Strong -- the month of it happening the most,
20 October. 32 times in the past six years, we had 42 mile
21 an hour gusts or greater. December, also, the second
22 active month -- most active month at 23. We have a little
23 bit, but overall, you see fall a very active time for
24 these Jarbo Gap winds in that year.

25 Q. And, again, the note on bottom about the issues
26 with the data from 2003 to 2013.

1 A. Yes. Yeah, so the good data goes back until
2 2013. I opted to use the periods of March 2014 up until
3 now, so -- and not include, say, January 2013, so we
4 didn't have seven Januarys and six Augusts or whatever, so
5 I keep it six years exactly, so the monthly breakdown
6 would work.

7 Q. All right. Next up. Talk about the conditions
8 according to RAWS on November 8th.

9 A. So at that station, they were greatest, the
10 morning of the Camp fire. It was windy. That night
11 before there, we were gusting 52 miles an hour there at
12 4:00 in the morning, fire started around 6:30 in the
13 mornings. 6:13 on the station, gusting at 40 miles an
14 hour. So it was windy that morning.

15 Also the second number here, humidity. Humidity
16 is low, 23 percent here. So it's very dry and it's windy
17 in that area at the time that the fire started and
18 following as well.

19 Q. So basically, the fire started at 6:15 a.m. so
20 two minutes before that 48 degrees. What's the 12?

21 A. Dew point. That's the dew point. That's a very
22 low number.

23 Q. That's the --

24 A. Very dry air.

25 Q. What does the dew point mean?

26 A. The measure of how much moisture is in the air.

1 You have to cool the air down to what temperature to get
2 the dew on the grass? You have to cool it down to 12
3 degrees to get dew on the grass. That is a very low
4 number. That's a very dry air we have there.

5 Q. So 23 being the relative humidity?

6 A. Uh-huh, yes.

7 Q. And you said that's very low?

8 A. Very low.

9 Q. And then we have our north by northeast winds.

10 A. Uh-huh.

11 Q. Sustained at 18 with gusts of up to 40 right at
12 the time the fire started.

13 A. Yes, sir.

14 Q. All right. Next, we a picture of the Camp fire
15 smoke plume.

16 A. Yes. This is a visible picture of the Camp fire
17 smoke plume. You can see the fire outline nicely. You
18 can see the smoke plume rather nicely as well. Notice the
19 smoke plume is, there's no smoke down here towards Lake
20 Oroville. There's no smoke over here. There's no smoke
21 over here. It's all -- boom -- being pushed by the wind.
22 The wind is moving the smoke plume, therefore, it's moving
23 the fire as well. Remember back -- remember we had the
24 Carr fire back just -- not long before the Camp fire, and
25 the smoke plume of the Carr fire -- it was everywhere. We
26 had a big mushroom cloud in Redding. Pyrocumulus was

1 towering 40,000 feet. This -- that was a summertime fire
2 with light winds, but tremendous heat. This one, the --
3 the heat wasn't tremendous, but the winds were tremendous.
4 You see the wind really pushing this smoke plume -- boom
5 -- in one direction into that northwest wind.

6 Q. All right.

7 A. Here is just another graphical representation of
8 the smoke plume from the Camp fire. You can see it not
9 ascending -- not rising vertically much. It got up to
10 about 10,000 feet or so, which for a big fire is not
11 really that tall. Again, the Carr fire, back just July of
12 2018, that smoke plume I remember pegging that thing at
13 37, 38 thousand feet or so, and I think it got almost to
14 about 40,000 feet. So that smoke plume really dominated
15 the skyline. The Mendocino complex fire, that smoke plume
16 was also really dominant and tall. This fire, the Camp
17 fire did not let that happen, because the winds would not
18 let that happen. The Camp fire -- the Carr fire winds not
19 much. There was a little bit, but not much so the smoke
20 plume was allowed to rise vertically. Mendocino Complex
21 allowed to rise vertically. Delta fire, which we had also
22 that summer, the smoke -- boom -- going up tall, because
23 the winds were not that strong. This smoke plume did not
24 get tall because the winds wouldn't allow it. The winds
25 -- whoosh -- pushed it away. Think of, if you're a camper
26 or so, and you have your camp fire going, if there's any

1 kind of wind out there, it's going to blow the smoke away.
2 If there's no wind, the fire from the campsite is going to
3 go straight up. Wind pushes fire and pushes that smoke
4 plum.

5 Q. And then down at the bottom, you credit your
6 source here: Neil Lareau, UNR physics professor?

7 A. Yes.

8 Q. Can you explain to us who -- who Mr. Lareau is?

9 A. He's a physics professor at University Nevada
10 Reno. He does a lot of work also on fires, on fire
11 behavior, on smoke plume behavior. He is an expert in the
12 area. He works, I believe, with the San Jose State
13 University, their fire lab, which they have as well. So
14 he definitely knows what he is talking about with all of
15 this stuff.

16 Q. All right. Climate change?

17 A. Yes. And so the Jarbo Gap station goes back to
18 2003. Again, it's a very data sparse area. We don't have
19 a lot of data from the area, unfortunately.

20 Let's go back to 1984, 1985. We have one year of
21 data here for PG&E. This is at Rock Creek Reservoir,
22 which is -- boom -- right there on the bottom of the
23 Feather River Canyon, just a little bit above canyon --
24 just a little bit above stream -- above stream of where
25 the fire started, and so a good representation of the
26 winds. And remember the peak wind gusts at Jarbo Gap?

1 The strongest we had in the past six years, 70 miles per
2 hour. We will keep it fair. Peak wind gust here at Rock
3 Creek Reservoir, 73 miles an hour. So they agree.
4 They're saying the same -- they're not -- this one is not
5 having some number that is wildly outrageous compared to
6 the Jarbo Gap, or this one doesn't have much lesser winds.
7 They are both suggesting winds that are topping out around
8 70 miles per hour at their strongest in that area.

9 This happened back, again, 30, 35, years ago. So
10 there's been very little change in the strength of the
11 wind in the past 35 years. So I am a believer in climate
12 change, but this -- this -- this to me is proving that the
13 winds have not changed in the past 35 years, so I don't
14 believe we can attribute these Jarbo Gap winds getting
15 worse due to climate change for the most part. This is
16 one example here at Rock Creek. I believe we have another
17 example.

18 Q. Yep. And before we even get to that --

19 A. Sorry.

20 Q. -- we talked about -- actually, we will go on to
21 the next one, and then we will get to the base of that.

22 A. This is Cresta Reservoir, which is pretty -- also
23 at the bottom of the Feather River Canyon, not too far
24 from Rock Creek, not too far from tower 27/222. Peak wind
25 gust here is 66. There's -- so in this same ballpark.
26 This is going to 70 there. So the difference between

1 these numbers, by the way, this one is averaged out over a
2 three-minute period and this one is averaged out over a
3 four or five-second period, so you get bigger numbers on
4 this one.

5 Q. You're talking about the chart on the right
6 compared to the chart on the left?

7 A. Yes. They're both the same station. Both say
8 Cresta. Again, this one is averaged out over a longer
9 period of time, a couple of minutes compared to just a few
10 seconds here. So you can get -- it's like if you're
11 driving on the freeway. You can -- well, it -- it's
12 easier for -- to measure higher winds gusts if you have a
13 shorter amount of time in doing it.

14 Q. All right. So you said that this comes from PG&E
15 records, correct?

16 A. Yes.

17 Q. How did you get PG&E records?

18 A. From the Exponent report, I believe.

19 Q. Okay. Well, first of all, we hired you some time
20 ago to meteorological expert for this investigation,
21 correct?

22 A. Yes.

23 Q. And some of the resource materials that we gave
24 you to start off with --

25 A. Yes.

26 Q. -- do you remember who those were?

1 A. The Exponent reports.

2 Q. The Exponent report, and then didn't we also give
3 you the PG&E wind reports?

4 A. Yes, yes, yes.

5 Q. All right.

6 A. That's what I --

7 Q. That's what we're going to go to next. In front
8 of you on the desk is Exhibit 1354.

9 Do you see that?

10 A. Yes.

11 Q. And do you recognize 1354?

12 A. I do, I do.

13 [Exhibit No. 1354 was identified.]

14 BY MR. NOEL:

15 Q. What is 1354?

16 A. It's a lot of data here. This -- this almost put
17 me to sleep a few nights. But there are a lot of -- of
18 observation sites here -- Martinez, San Luis Obispo, San
19 Jose, Los Banos. They are literally a hundreds, if not
20 more, observation sites reporting their wind and mostly
21 wind data in these areas.

22 Q. Now, let's get more even more basic than that.

23 A. Okay.

24 Q. If you can look at page two of that. This is the
25 1990 PG&E Extreme Wind Estimates Along the PG&E
26 Transmission Line Quarterly Report, correct?

1 A. Yes.

2 Q. An internal PG&E document?

3 A. Yes.

4 Q. And as you mentioned, this is something that is--
5 that is -- that was discussed and cited in the Exponent
6 report, correct?

7 A. Yes.

8 Q. All right. So let's move on to 1355, that big
9 black binder in front of you.

10 Do you recognize Exhibit 1355 is?

11 A. Yes.

12 [Exhibit No. 1355 was identified.]

13 BY MR. NOEL:

14 Q. And what is 1355?

15 A. More numbers, more data in other areas as well,
16 Mather Air Force Base. Just talking wind speeds, gusts,
17 things like that.

18 Q. Specifically, this is the 1999 PG&E technical --
19 Technical and Ecological Services Extreme Wind Speed
20 Estimates along the PG&E Transmission Line Corridor
21 Report, correct?

22 A. Huh-uh, yes, sir.

23 Q. And then finally 1356. Do you recognize 1356?

24 A. Yes.

25 [Exhibit No. 1356 was identified.]

26 ///

1 BY MR. NOEL:

2 Q. What is 1356?

3 A. More fun wind stuff.

4 Q. Okay. This time the 2015 PG&E Extreme Wind Speed
5 Estimates Across The PG&E Service Territory, correct?

6 A. Yes.

7 Q. So you've been able to mine the data from PG&E
8 internal winds -- wind reports, correct?

9 A. Yes. And so there was a lot of -- a lot of data
10 in there that didn't pertain to us -- Martinez, San
11 Jose -- really not pertinent in this case. But Cresta and
12 Rock Creek and Feather River Canyon, I felt were very
13 valuable and very useful numbers to have.

14 Q. All right. And showed high winds in the Feather
15 River Canyon, correct?

16 A. Yes, they did, which aligned very nicely with
17 Jarbo Gap wind station.

18 Q. All right. And, finally, let's talk about
19 drought.

20 Now in 2018, were we in a drought?

21 A. Officially, no. We had been in a drought for a
22 while, but because of the winter of 2016 and '17, which
23 was a very wet winter. That one broke us out of the
24 drought. We had the spillway disaster there with Lake
25 Oroville because it rained so much. 2017, '18, that
26 winter was a dry winter. Because the previous winter was

1 so wet, we weren't officially in a drought in Butte
2 County. It was abnormally dry, but not officially in
3 drought for us at that time.

4 Q. Now, let's talk about when we were in drought.

5 A. So, again, we had just gone through a very
6 significant drought for us. I'm sure a lot of you noticed
7 people taking the lawns out of their yards and putting in
8 drought tolerant landscaping and things like that back in
9 2015 or so.

10 This is from the U.S. Drought Monitor showing the
11 progression of the drought the California. It began in
12 2012. It continued in 2013, 2014. I remember we were
13 talking about 70s in January and no rain, and that's when
14 the drought became exceptional across most of our area,
15 including us in Butte County. That exceptional drought
16 continued in 2015 here, and then it was finally the really
17 wet winter in 2016 that broke us out of it. But we were
18 in exceptional drought, the -- the greatest category. We
19 were in that in Butte County for at least two years and
20 that really is going to stress your plants, your trees,
21 things like that. That is going to kill some trees and
22 vegetation and things like that in some of the hardy
23 manzanita and whatever out there. And so, again, we had
24 just gotten out of a very significant drought.

25 Q. All right. So let's talk about how bad that
26 drought was historically?

1 A. As far as California droughts go -- and we all
2 know California droughts are not uncommon. We -- we get
3 them. But this particular drought was one of the worst
4 that we had here of the six worst droughts in California's
5 history, and this one pretty much equal with the worst of
6 them, basically. So we can't say it was in the worst, but
7 we can certainly say it was right on par with one of this
8 worst. And, again, the blue line is state-wide
9 precipitation over the -- California kind of averaged out
10 basically. You notice the number here for this drought is
11 similar to the number of the drought back to -- the last
12 big drought we had, another big drought we had, and these
13 numbers are all very similar. The run off for the
14 mountains -- that's the black line here -- also rather
15 similar to these other -- well, one, two, three, four
16 significant droughts as well.

17 So it stands out as a very significant drought in
18 the past 100 years for us in California.

19 Q. And this was right on the heels of another
20 significant drought from 2007 to 2009, correct?

21 A. Yes, it was. Absolutely, absolutely. And then
22 this is what was happening in Paradise in 2018. A lot of
23 numbers here. But this is rain fall in Paradise, and a
24 lot of seasons here. So we will look at 2018, which is
25 highlighted in blue. And let's see here, this is June of
26 2018, Paradise. No rain. Not too surprising. So was

1 July of 2018, Paradise. No rain. August of 2018,
2 Paradise, no rain. September, no rain. October, 14
3 hundredths of an inch of rain. November, no rain as well.

4 So we had 14-hundredths of an inch of rain since,
5 basically, Memorial Day up until the time of the Camp
6 fire. 14-hundredths of an inch of rain. That is nothing.
7 That is very, very little. Average -- that is what we're
8 looking at here now, average numbers look like that.

9 October, averages over three inches of rain. November --
10 okay, average fall over seven -- but the fire happened on
11 the 8th there, so we can only say average for day one
12 through the 8th of November is probably about an in and
13 half or something like that in that ballpark. Up there,
14 we have nothing.

15 So between about Memorial Day and the time the
16 Camp fire started, we had 14-hundredths of an inch of
17 rain, whereas normally in Paradise -- or on average in
18 Paradise, we should have had over five inches of rain,
19 even closer to six or so. So it was a very dry start to
20 2018, and it had been a very hot summer as well. So
21 plants, trees were dry.

22 Q. All right. Let's go on to the effect of that
23 cycle.

24 A. So the winter of 2017, 2018, it was dry. For the
25 whole of the season, it was dry. But not every month
26 through the season was dry. There were two months in

1 2017 -- in that -- in that winter that were above normal
2 with rain. Those two months? March and April. Grasses,
3 you're traditional grass which grows in the valley and
4 foothills or whatever, that rose and really it's growing
5 in a two-month period. Want to guess what period? March
6 and April. So even though the winter was dry, those two
7 months, March and April, were wet. That's when the grass
8 needs the rain. That's when the grass got the rain, and
9 so the grass went bananas in that time, even though it had
10 been a dry winter.

11 UC Davis, my alma mater, they have a station down
12 in Browns Valley, which is in between Marysville and Grass
13 Valley, and they grow grass, and they measure that grass.
14 They don't water it or anything, they just let it go and
15 they're measuring it and seeing the effects on the
16 weather, everything on that grass. They harvested almost
17 double what they normally get because that March and April
18 was so wet. It really caused the grasses to go nuts. So
19 there was a lot of grass out there that had been very dry
20 from the summer and the fall. So that grass, a lot of the
21 buffer crop of grass got to be very, very dry by the time
22 the fire started.

23 Q. All right. Let's move on and talk about
24 evaporative demand and how the drought plays into that.

25 A. This is -- yeah. Environmental Demand Drought
26 Index, EDDI. What it basically is talking about is if the

1 air is very dry, it's going to start to take moisture from
2 the plants. If the air is really -- even if humidity is
3 down to 12 percent or 10 percent, something like that,
4 that's going to start to take some of the moisture from
5 the plants. This EDDI index measures that a little bit,
6 basically.

7 Q. All right.

8 A. This is a three-month look at the EDDI index
9 prior to the Camp fire. Extreme conditions are in this
10 darkest shade, which happen to right here over Butte
11 County. So this index is suggesting that the -- the
12 dryness of the air that we had that fall was -- was taking
13 moisture from the plants, draining the plants of their
14 moisture, making them even drier than they should have
15 been had the weather been nicer.

16 You can all call it negative rainfall, because
17 rainfall is the -- obviously it's going to green up the
18 grass or green up the trees or whatever. This is almost
19 negative rainfall because it's taking water from the
20 plants.

21 Q. All right. And let's talk about what that all
22 means in energy release.

23 A. This is something that I talked about a little
24 bit on air sometimes. The energy release component. This
25 is basically an index just to talk about how -- how -- how
26 flammable the fuels are. How ready to go they are. If

1 you go out there right now, and try to start a grass fire,
2 you might have not a whole lot of success. The grass is
3 green right now. If you to that in December or October,
4 it's going to get going.

5 This basically measures that. Just how ready to
6 go in a fire these fuels and trees, brushes shrub and the
7 grasses are basically.

8 Q. And, finally, the chart of the energy release
9 components for this area in November of '18.

10 A. Yes. And so what we're looking at here, again,
11 the -- the gray line is what it -- what average for this
12 area would look like. The red line is the maximum, the
13 most, the greatest number it sees, basically. The blue
14 line is the current. So got a fall of an average, got a
15 fall of an average, and then right about the time the Camp
16 fire started, it's now going to territory not seen before
17 for November 8th. So the fuels were bone dry. They were
18 ready to basically explode, basically. Energy release
19 component, this is what the firefighters use and it shows
20 and try the vegetation wuss in early November.

21 Q. Basically wind, dryness, the perfect storm for a
22 fire, correct?

23 A. Yes.

24 MR. NOEL: I have nothing further. Do any of the
25 jurors have any questions?

26 MS. DUPRE-TOKOS: While they gather them, Kris, did

1 you just say that CAL fire uses this data as well?

2 THE WITNESS: Yes.

3 MS. DUPRE-TOKOS: Okay.

4 MR. NOEL: Okay. All right. Now, this is -- the
5 first question is referring to the -- the wind reports you
6 have. And the question is:

7 How far back was it potentially understood by
8 PG&E that high winds existed in the Feather River Canyon?

9 THE WITNESS: I -- I don't know if I can speak for
10 PG&E, but they have their Cresta -- I mean, the reports of
11 Cresta and Rock Creek from the middle 1980s showing gusts
12 of 70 miles an hour there. Seems pretty obvious that that
13 is a windy location. That's not just -- they have two --
14 two data points there, Cresta and Rock Creek. If they
15 have two data points, both showing gusts of 70 miles per
16 hours.

17 In my opinion, I would think they should know
18 that the Feather River Canyon is a very windy place, at
19 least back to 80s. At least.

20 MR. NOEL: How do you explain the speed in which the
21 fire spread in Paradise, was there anything unique about
22 the wind direction?

23 A. Wind direction was steady to the northeast. That
24 would push it. The winds were strong. The fuels were
25 bone dry. And so I imagine a fire right now would not
26 spread very fast. The fuels are moist and wet. The grass

1 is green. But at that time, the fuels were exceptionally
2 dry. I mean, just absolutely dry. So I mean, if you've
3 ever tried to start a fire in -- in -- you know, in your
4 -- in your fireplace or if you're camping and try to start
5 a fire or something like that, you don't get the wet
6 grass, you get the really dry grass to get that fire first
7 started. That's what we have. That very dry grass. You
8 don't use the wet wood, you use the driest wood possible
9 if you're going to try to get a little campfire started or
10 whatnot. We had very dry wood because of that.

11 MR. NOEL: Any follow up? No?

12 Madam Foreperson is going to have an admonishment
13 for you, and then you are done.

14 THE WITNESS: Okay.

15 GRAND JURY FOREPERSON: Mr. Kuyper, you are
16 admonished not to discuss or disclose at any time outside
17 of this jury room the questions that have been asked of
18 you or your answers until authorized by this grand jury or
19 the Court.

20 A violation of these instructions on your part
21 may be the basis for a charge against you of contempt of
22 court. This does not preclude you from discussing your
23 legal rights with your own attorney.

24 Mr. Kuyper, what I have just said is a warning
25 not to discuss this case with anyone except the Court,
26 your lawyer, or the district attorney.

1 Do you have any questions?

2 THE WITNESS: No questions.

3 GRAND JURY FOREPERSON: Thank you for your time

4 today.

5 THE WITNESS: Certainly. Thank you for having me.

6 MR. NOEL: All right. Kris, you can get out of here.

7 THE WITNESS: All right.

8 MR. NOEL: All right. Move all of these. In if I

9 didn't do so earlier, I would also move Mr. McGormley's

10 presentation.

11 [Whereupon, all previously identified exhibits were

12 admitted.]

13 MS. DUPRE-TOKOS: We have handouts for him.

14 [Witness enters the courtroom.]

15 MR. NOEL: All right. Go ahead and pass these out.

16 THE DEFENSE: This is a lengthy PowerPoint, so get

17 comfortable.

18 Whenever you guys are ready, we have Mr. Barkley

19 standing by.

20 GRAND JURY FOREPERSON: Lieutenant Barkley, would

21 like to come up and have a --

22 MR. NOEL: Yes, ma'am.

23 GRAND JURY FOREPERSON: And before you have a seat,

24 would you please raise your right hand?

25 MR. NOEL: Yeah.

26 GRAND JURY FOREPERSON: Lieutenant Barkley, do you

1 solemnly swear that the evidence you shall give in this
2 matter pending before the grand jury shall be the truth,
3 the whole truth and nothing but the truth so help you God?

4 THE WITNESS: I do.

5 GRAND JURY FOREPERSON: Thank you, have a seat.
6

7 **EXAMINATION**

8 BY MR. NOEL:

9 Q. Just, again, for the record, could you state your
10 name, spelling your last name?

11 A. My name is Jason Barkley, B-A-R-K-L-E-Y.

12 Q. And remind us how you're employed?

13 A. I am an Investigative Lieutenant with the Butte
14 County District Attorney's Office.

15 Q. And how long have you been a peace officer?

16 A. 19 years, 11 months.

17 Q. All right. You have in front of you what's
18 marked as Exhibit 1357.

19 A. Yes, sir.

20 Q. See that item?

21 A. Yes.

22 Q. Recognize that item?

23 A. I do.

24 [Exhibit No. 1357 was identified.]

25 BY MR. NOEL:

26 Q. What is that item, number 1357?

1 A. It is a fire-threat map from the CPUC.

2 Q. Did you obtain this map?

3 A. Yes.

4 Q. And can you explain to us how you got this map?

5 A. Yes, I conducted a -- a search for CPUC through
6 Google, and I went to their government web site and I
7 located a press release dated January 19th of 2018.
8 Embedded within the press release was a link that took me
9 to a page that contained this map.

10 Q. All right. So this is a publicly available
11 document put out by a governmental agency, correct?

12 A. Yes, sir.

13 Q. And it's a -- a document that's been adopted by
14 the CPUC and CAL fire for use in the state of California?

15 A. Yes.

16 Q. All right. And then real briefly on here,
17 because we can't really see it, but we have Butte County
18 on here, right in this area right there, right?

19 A. Yes.

20 Q. And we can't really blow it up, and we have the
21 Tier 3 fire area in red and Tier 3 yellow --

22 A. Tier 2, yellow.

23 Q. Tier 2, I'm sorry.

24 A. Yes.

25 Q. Were you able to tell what the demarcation is
26 between Tier 2 and tier 3 in that area?

1 A. Yeah, so I blew the map up, and it appears that
2 demarcation line is Feather River.

3 Q. Okay. So to the southeast of the Feather River
4 is Tier 3 to the north and northwest of the Feather River
5 is Tier 2, correct?

6 A. Yes.

7 Q. Thank you.

8 MR. NOEL: That is all I have. Do you have any
9 questions?

10 GRAND JUROR NUMBER FOUR: What -- what distinction in
11 terms of severity would Tier 2, Tier 3 be?

12 MR. NOEL: Don't know. We have to have somebody else
13 come in and address that. So what's important is just the
14 map itself.

15 All right. Anything else? Madame Foreperson?

16 GRAND JURY FOREPERSON: Lieutenant Barkley, you are
17 admonished not to discuss or disclose at any time outside
18 of this jury room the questions that have been asked of
19 you or your answers un authorized by this grand jury or
20 the Court.

21 A violation of these instructions on your part
22 may be the basis for a charge against you of contempt of
23 court. This does not preclude from discussing your legal
24 rights with your own attorney.

25 Lieutenant Barkley, what I have just said is a
26 warning not to discuss this case with anyone except the

1 Court, your lawyer, or the district attorney.

2 Do you have any questions?

3 THE WITNESS: No, ma'am. Thank you.

4 GRAND JURY FOREPERSON: Thank you for your time.

5 MR. NOEL: One more question. Did you bring what I
6 e-mailed you about an hour ago?

7 THE WITNESS: No, I didn't check my e-mail. What was
8 it?

9 MR. NOEL: We had another exhibit that we had to
10 print out. I e-mailed it to you to bring it -- bring it
11 with you.

12 THE WITNESS: I can print it and walk it over if
13 you'd like, or are you done for the day?

14 MR. NOEL: We're done for the day. If -- if you
15 could, real briefly, grab it -- if you could grab it,
16 print it and bring it over, so that it can get put in the
17 record for today.

18 Thank you.

19 GRAND JURY FOREPERSON: Is he good?

20 MS. DUPRE-TOKOS: He's good.

21 MR. NOEL: All right. That is all we have for today.
22 Woo hoo. 1:35. The court will be very happy with me that
23 we're going to be done and out of here, and they all get
24 to go to the swearing in in Chico, so.

25 All right. Do you have a question?

26 GRAND JURY SECRETARY: Are we admitting Exhibit 1357?

1 MR. NOEL: Yes, ma'am.

2 GRAND JURY SECRETARY: Okay.

3 [Exhibit No. 1357 was admitted.]

4 MR. NOEL: And if I haven't done it before, I move
5 all the exhibits from today in.

6 All right. So we're done.

7

COURT REPORTER'S CERTIFICATE

THIS IS TO CERTIFY THAT I, ASHLEIGH BUTTON, A
CERTIFIED SHORTHAND REPORTER OF THE STATE OF CALIFORNIA,
WAS PRESENT AT THE TIME AND PLACE THE FOREGOING GRAND JURY
PROCEEDINGS WERE HAD AND TAKEN IN THE WITHIN MATTER; AND
THAT AS SUCH SHORTHAND REPORTER I DID TAKE DOWN IN
SHORTHAND WRITING THE AFOREMENTIONED PROCEEDINGS; AND
AFTERWARDS CAUSED MY SAID SHORTHAND WRITING TO BE
TRANSCRIBED INTO TYPEWRITING; AND THE FOREGOING PAGES,
BEGINNING AT THE TOP OF PAGE 1 TO AND INCLUDING PAGE 145
HEREOF, CONSTITUTE A FULL, TRUE, ACCURATE, AND COMPLETE
RECORD OF THE PROCEEDINGS.

WITNESS MY HAND THIS 17TH DAY OF JUNE, 2022.

ASHLEIGH BUTTON, CSR #14013

IN THE SUPERIOR COURT OF THE STATE OF CALIFORNIA

IN AND FOR THE COUNTY OF BUTTE

5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 GRAND JURY FOREPERSON: Anything else? Ready to
10 get started for the morning.

11 [Witness enters the courtroom.]

12 THE COURT: Mr. Mandly, before you have a seat,
13 would you please raise your right hand to be sworn.

14 Mr. Mandly, do you solemnly swear that the
15 evidence you shall give in this matter pending before the
16 grand jury shall be the truth, the whole truth, and
17 nothing but the truth so help you God?

18 THE WITNESS: I do.

19 GRAND JURY FOREPERSON: Thank you. Have a seat,
20 please.

21 **EXAMINATION**

22 BY MS. DUPRE-TOKOS:

23 Q. Morning.

24 A. Good morning.

25 Q. Could you state your full name and spell your
26 last name for the record.

A. My name full name is Jason Mandly, M-a-n-d-l-y.

Q. Are you employed right now?

A. I am.

Q. Could you tell us where and in what capacity.

A. I work with the Butte County Air Quality Management District. I am the senior air quality planner for the district.

Q. You said "the." So you're the only senior?

A. I am the only one with the title air quality planner.

Q. Okay. Could you go through a little bit about -- or a little bit on your education and training.

A. Okay. I'm --

[Exhibit 1358 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. Oh, and you have Exhibit 1358 in front of you which is your CV if that makes things a little easier.

A. Great. Thanks.

So I received an education at Florida Tech in Melbourne, Florida with a degree in environmental science with met -- focusing on meteorology. I started my air quality career with the Morongo Band of mission Indians doing air quality monitoring, public outreach. I worked with the Morongo Band of mission Indians from 2008 to 2011.

1 Q. I am going to ask you to slow down a little bit
2 because she does have to type it all.

3 A. Okay. My apologies.

4 I started here with the district in 2011. My
5 first position was an air quality compliance specialist.
6 Duties included doing daily air quality forecasts, permit
7 determinations, permit inspections, compliance, and
8 enforcement.

9 I moved to the planning position in 2015, and
10 that position includes further air quality forecasting,
11 modeling, air quality analysis as well as planning
12 activities and environmental review and public outreach.

13 Q. It looks like you work with the state and
14 federal agencies as well in your current position.

15 A. Yes. We work with the California Air Resources
16 Board and also the Environmental Protection Agency
17 specifically their region nine office in San Francisco.

18 Q. Okay. So Environmental Protection Agency. Most
19 people know that as the EPA?

20 A. Correct.

21 Q. And the California Air Resources Board. You
22 guys call it CARB?

23 A. Correct. CARB is their acronym, and usually
24 it's CARB in a lot of materials. So that's the state air
25 quality agency.

26 Q. So walk us through -- as a senior air quality

1 planner, walk us through what you normally do at least in
2 the morning, the start of your day when you get to work.

3 A. Okay. And so would this just be specific to my
4 position or the district at large including the others on
5 duty?

6 Q. Let's include the other on-duty folks.

7 A. Okay. Generally our office opens at 7:30 in the
8 morning and staff -- either myself or we also have three
9 rotating on-duty inspectors. They're compliance
10 specialist.

11 The first thing we do is take a look at the air
12 quality data which is available on a publically
13 accessible website. We have several air monitoring
14 stations throughout Butte County and also other locations
15 in California.

16 Five monitoring stations are operated by the
17 state air quality agency through the California Air
18 Resources Board. We will take a look at their data and
19 we will assess if it's -- you know, if it's good air
20 quality, if it's moderate air quality.

21 Our goal for that morning is to create an air
22 quality forecast for that day as well as anticipate the
23 air quality for the next day based on conditions, based
24 on current air quality as well as meteorological
25 conditions, if there's any storms coming in, or also
26 based on any other factors such as existing wildfires.

1 [Exhibit 1359 introduced
2 as evidence.]

3 BY MS. DUPRE-TOKOS:

4 Q. Okay. I'm going to jump in. You mentioned
5 based on the air quality.

6 And you should have 1359 in front of you and
7 also up on the board. Can you tell us what that is.

8 A. Okay. So these air monitoring stations, they
9 are measuring the mass of the particulates in the air.
10 Specifically for particulates it's broken up into
11 different sizes. And the one that we are most concerned
12 with is called PM2.5. These are particulates less than
13 2.5 microns in size. And with these particulates these
14 air monitoring stations measure it in micrograms per
15 cubic meter.

16 At the national level the US EPA has developed
17 an air quality index to make it a more manageable zero to
18 50, 50 to 100, et cetera, scale for public outreach
19 purposes. So this breaks out --

20 Q. We're going to try and enlarge it and then you
21 can point at things.

22 A. So what this is demonstrating is that from
23 zero -- right here (indicating). So from zero to 12
24 micrograms per cubic meter, that will equate zero --

25 Q. And you can stand up.

26 A. Okay. That will -- from zero to 50 AQI, that is

1 our good range. We'd advertise good air quality.
2 Usually green is the color associated with good air
3 quality.

4 So zero to 50 on this AQI scale, it's kind of a
5 unitless scale for public outreach purposes. But as a --
6 for a specific measure of mass, that equates zero to 12
7 micrograms per cubic meter and so forth.

8 For moderate we have 12 to 35. The federal
9 standard per PM2.5 as a 24-hour average is 35 micrograms
10 per cubic meter. That's the level at which the EPA sets
11 standards to be protective for health specifically for
12 the most sensitive population including children, the
13 elderly, and those with pre-existing conditions.

14 And so that's why at 35 the AQI scale goes from
15 moderate to unhealthy for sensitive groups as a 24-hour
16 average.

17 And then we have further AQI break points for
18 unhealthy, very unhealthy, and then hazardous. And so if
19 a 24-hour average is over 50 micrograms per cubic meters,
20 that's when we'd advertise hazardous conditions for the
21 AQI scale.

22 Q. And it has a high break point of 360.4, but it
23 can go higher than that; correct?

24 A. Correct, yes.

25 Q. Okay. So I had interrupted you. You said that
26 you or whoever is the person on duty that day, the first

1 thing they do is look at the air quality readings;
2 correct?

3 A. Yes.

4 Q. Okay. And then what?

5 A. And then we also make a burn day determination.
6 And that's also based on the air quality. We have -- we
7 have processes. If air quality is at a certain level, we
8 may call a no burn day. Also we receive communication
9 from Cal Fire. If there's heavy -- if there's strong
10 winds, even if air quality is good, we may still call a
11 no burn day if Cal Fire requests that. And we have a
12 burn day determination for agriculture and for
13 residential burning.

14 Q. And just out of curiosity, in Butte County you
15 need a burn permit; is that correct?

16 A. For agriculture burning you do need a burn
17 permit. During critical -- during the summer months
18 there's usually a burn ban so there's no burning. On the
19 shoulder months residential burning sometimes requires a
20 permit from Cal Fire.

21 Q. Okay.

22 A. So we don't require residential burn permits.

23 Q. Okay. Now, you said that you have monitors
24 around the county?

25 A. Correct.

26 Q. And so is that just Butte County has the

1 monitors or do any of the state or federal agencies have
2 monitors? And let's focus on just up to November 8,
3 2018, because I'm sure that some may have been installed
4 since.

5 A. Okay. So there are three permanent particulate
6 monitoring stations in Butte County. All three are
7 operated by the State California Air Resources Board.
8 And we can look at the data. However, we're not in
9 charge of the maintenance or the operation of those
10 monitors. We just take a look at the data that's
11 developed by them.

12 We do have a portable air monitoring station
13 that we can deploy. It does have satellite telemetry,
14 and we did deploy it during November 8th.

15 We also have smaller air quality sensors which
16 are -- which we deployed around the county. These are
17 smaller. They're low-cost sensors, and they're more just
18 for public information.

19 Q. Where are the three dedicated monitors?

20 A. We have one in Chico off of East Avenue next to
21 McManus Elementary School. And that is our PM2.5 monitor
22 for record meaning that it is calibrated. And it's
23 co-located with several particulate monitors. So that is
24 the official monitoring station for this planning area.

25 And so this is the data that would be sent to
26 the EPA to determine if we are in attainment with the

1 state or the National Ambient Air Quality Standards.

2 Q. And attainment means compliant?

3 A. Correct.

4 We also have a stationary PM2.5 monitoring
5 station in Gridley as well as in Paradise on top of the
6 theatre.

7 Q. Okay. So once you get the air quality data, you
8 put out the air quality forecast for the day and the next
9 day you said based on conditions?

10 A. Correct.

11 Q. So is that what you did on November 8, 2018?

12 A. Yes.

13 Q. About what time do you normally get the readings
14 or get the forecast out?

15 A. So just to clarify, the initial air quality
16 forecast was sent out by our on-duty inspector for that
17 day. It was Ursula Parker in this case. So I did not
18 physically send out the forecast for that day. However,
19 I was evaluating air quality.

20 Q. Okay. And about what time was it sent out -- or
21 is it normally sent out by a certain time?

22 A. Our goal is to send it out generally around
23 before 10 o'clock, but in practice it is generally
24 published before 8:45 because our burn day determination
25 is usually out by 8:45.

26 Q. So on November 8, 2018, did you put out --

1 Well, before we go there, do you keep track of
2 all of the -- the PM2.5 readings over time?

3 A. Yes. We do track them and we do report to our
4 board. We have semiannual reports to our board on air
5 quality. We also create an annual air quality report
6 where we take a look at the air quality over the last
7 year. And we do look at trends to see if air quality in
8 general is improving or deteriorating over time.

9 Q. And does CARB either generate or keep track of
10 readings on a weekly basis at all?

11 A. The data from the air monitoring stations are
12 available on a publicly-accessible website.

13 Q. Is that iADAM?

14 A. The acronym is AQMIS. That's all the hourly
15 data as well as daily data as well as special reports
16 that the user can request are available through AQMIS.
17 Once the data becomes official, there's another website
18 for California's official air quality data, and that is
19 referred to iADAM.

20 Q. When does data become official?

21 A. Data is certified, and normally there's a
22 deadline. I believe it's May 1st. There's a deadline
23 for air quality data certified official by the reporting
24 agency.

25 So in this case it would be the California Air
26 Resources Board declaring their data official to the U.S.

1 EPA. And from what I'm familiar with that is basically
2 the process of saying: This is the data that we intend
3 to submit to you. So this is -- that's their process of
4 certifying the data. It's already gone through a quality
5 control process.

6 [Exhibit 1360 introduced
7 as evidence.]

8 BY MS. DUPRE-TOKOS:

9 Q. Okay. You should have Exhibit 1360 in front of
10 you and it's up on the board. And that's the weekly
11 listing state 24-hour PM2.5 averages. Is that correct?

12 A. Correct.

13 Q. Okay. And it looks like it shows the Chico East
14 Avenue monitor; is that right?

15 A. Yes.

16 Q. And it looks like they start the week on the
17 Sunday. So for Sunday, November 4th they had readings
18 for Sunday, Monday, Tuesday, Wednesday, and Thursday.
19 And then Friday there is no reading. There's an astrict
20 for Friday, Saturday, and then the following Sunday,
21 Monday, and Tuesday. Why is that?

22 A. The -- I do not know the exact reason, but it's
23 likely it did not meet the quality control measures or
24 the completeness measures that the California Air
25 Resources Board set for their monitoring for that
26 particular monitor.

1 Q. Now, the Chico monitoring station actually got
2 overwhelmed and overloaded November 8th for several days,
3 didn't it?

4 A. That's likely what happened.

5 Q. Okay. But it's your understanding that it did
6 get overwhelmed or overloaded?

7 A. It's my understanding that the volume of smoke
8 impacted the quality control results.

9 Q. Okay. So Thursday, which was November 8th, it
10 shows a reading of 6.6. That seems a little odd given
11 the huge fire. Why would it be as low as 6.6?

12 A. On the very first day of the Camp Fire it was --
13 meteorologically it was very -- it was bizarre in that --
14 as far as air quality, conditions were good on the valley
15 floor on that first day because of the winds as well as
16 the inversion that was in place at the time. Smoke went
17 over the valley floor.

18 It did impact, of course, areas immediately
19 adjacent to the fire, but it did go over the Sacramento
20 Valley leaving conditions in the good range for most
21 Sacramento Valley locations on the first day. It did
22 impact other communities; Mendocino County, Lake County,
23 the Bay Area, et cetera. However, for the first day we
24 did have good air quality in Chico on November 8th
25 because we were underneath the cloud deck or the smoke
26 deck.

Q. Okay. And then just looking at this real quick, looking at the Wednesday and Thursday where it looks like the readings are back up and actually the next Friday, they're, you know, 197, 299.9, 411.7. So those are drastically higher than the 6.6 we had the day of November 8th.

A. Correct.

MS. DUPRE-TOKOS: Okay. Marc, do you want to jump forward.

[Exhibit 1361 introduced
as evidence.]

BY MS. DUPRE-TOKOS:

Q. So then you should have 1361 in front of you.
And this is what?

A. This is a -- just a printout of our website that we publish daily. On a daily basis we up -- when we do our morning air quality forecast, we will send out an e-mail to the media and other interested parties. We also update our AQI on our website. And this is for a 24-hour average. We also put any other information for the public in our news and information section with links to current air quality data, any advisories, or any other information for the public.

Q. So in this case this is the website from November 8, 2018; correct?

A. Correct.

1 Q. Okay. And under current news and information it
2 says "Smoke from the Camp Fire near Paradise and Concow
3 will impact areas near and downwind of the fire.
4 Residents near the fire should heed evacuation orders
5 from local officials." And then you give the link for
6 updates.

7 "Those in a safe location still being impacted
8 by smoke should take action to reduce their exposure.
9 Inside a building close all windows and doors and use the
10 recirculate setting if available. If driving through
11 smoke-impacted areas, keep windows closed and run the air
12 conditioner on recirculate."

13 Did I read that correctly?

14 A. Yes.

15 Q. And that's what you were talking about. You
16 give tips and guidance. Is that correct?

17 A. Correct.

18 Q. And then looking over at today's air quality,
19 again Chico is good. Paradise is unhealthy. Gridley is
20 good. Is that accurate?

21 A. That was our forecast that morning, correct.

22 Q. And again, the categories are the ones that you
23 just talked about with the different levels on
24 Exhibit 1359 with the break points?

25 A. Correct.

26 Q. You're still following those categories and

1 those limits; correct?

2 A. Yes.

3 [Exhibit 1362 introduced
4 as evidence.]

5 BY MS. DUPRE-TOKOS:

6 Q. And then 1362 should be the December 6, 2018,
7 Biannual Air Quality Report. Is that correct?

8 A. Yes.

9 Q. Okay. And that is one of the reports you just
10 were telling us you'd given to the board?

11 A. Yes.

12 Q. Okay. And then if you look at page 32 of 44 we
13 have -- at the top we have a chart. The highest 24
14 average per year of PM2.5; is that correct?

15 A. Yes.

16 Q. And then it looks like Chico is in blue, Gridley
17 is in green, and Paradise is in orange; is that right?

18 A. Yes.

19 Q. And it goes -- on the left axis it's micrograms
20 per cubic meter and on the bottom axis is years?

21 A. Yes.

22 Q. So 2008 looks like Paradise was all the way up
23 to 350 for the PM2.5. Is that accurate?

24 A. Yes, at the 24-hour average.

25 Q. Okay. Why was it so high in 2008?

26 A. In 2008 Butte County had the Humboldt Fire as

1 well as the Butte Lighting Complex Fires. There were
2 also wildfires all around Northern California that
3 summer. And so it was wildfire impacts.

4 Q. Okay. And then in 2018 Chico is up above 400,
5 Gridley is a little over 250, but Paradise is just
6 slightly above -- it looks like 50 or maybe that's 75.

7 Why is that?

8 A. The Paradise air monitoring station went down
9 very early on the 8th. It lost power, and it remained
10 down for the duration of the Camp Fire. So it did not --
11 we did not have measurements at that monitoring station.
12 The last data point read in the 200s and then the power
13 went off.

14 Q. And 200s. That's in the hazardous range?

15 A. It was in the low 200s. So that hourly reading
16 would have -- for a 24-hour average would have been in
17 the very unhealthy range.

18 Q. Okay.

19 A. But that was just -- that was right before it
20 went offline.

21 Q. And then what is the table below, the chart we
22 were looking at?

23 A. So this is after the fire based on preliminary
24 air quality data. We categorized how many days -- and
25 this is at a 24-hour average how many days each
26 monitoring location spent in each air quality index

1 category.

2 For example, for the hazardous air quality --
3 for the hazardous AQI there were three days in Chico
4 where the 24-hour average was in the hazardous range.
5 Two days in Gridley. Again, unfortunately Paradise
6 monitoring station was offline so we didn't have data for
7 that.

8 And we did have portable monitoring stations
9 that we brought in. We deployed one at Tuscan Ridge
10 which is going up on the Skyway halfway up to Paradise,
11 one in Palermo, and also one at Butte College. So this
12 shows the number of days that location spent in each AQI
13 category.

14 Q. And that is November 8th or November 22nd;
15 correct?

16 A. Correct.

17 Q. Of 2018.

18 Okay. And I'm still on Exhibit 1362. Can you
19 tell us what we're looking at here.

20 A. This is a product of U.S. Forest Service. And
21 they have -- they were able to bring in some air quality
22 data analysis tools during the fire. And so we have the
23 various air monitoring stations, the Chico monitoring
24 station.

25 This is the Tuscan Ridge location where we
26 brought in a portable air monitor. You can see the date,

1 the time that we brought it in. Or the date we brought
2 it in. Gridley, which is a permanent air monitoring
3 station, and then our two other portable locations; Butte
4 College and then Palermo.

5 The small lines are hourly values. And so this
6 is showing hourly values. You know, a lot of them
7 fluctuated during the day. And then the wider bars at
8 the bottom is a 24-hour average.

9 Q. So looking at the Tuscan Ridge one, at some
10 point it was over 1500?

11 A. Correct.

12 Q. Micrograms?

13 A. For hourly readings, correct.

14 Q. But the average was about 1,000?

15 A. Yes, the 24-hour average.

16 Q. And then the colors also tell us what range
17 they're in. So most of these are in the hazardous range;
18 is that --

19 A. Right. The maroon color would be hazardous.

20 Q. And then also in 1362 this is page 35 of 44.
21 What are we looking at here?

22 A. So this is just a zoomed-in chart of the same
23 chart that you just saw but just specific to our two
24 stationary monitoring stations in Gridley and Chico. And
25 so this is showing the same information, the hourly
26 values. And here are the dates of the fire and then the

1 24-hour averages are represented by the solid bars.

2 [Exhibit 1363 introduced
3 as evidence.]

4 BY MS. DUPRE-TOKOS:

5 Q. And then Exhibit 1363, which is from the Annual
6 Air Quality report dated 4/18/19.

7 So this looks to be a map of Butte County; is
8 that correct?

9 A. Correct.

10 MS. DUPRE-TOKOS: Kind of hard to see, Marc.
11 Can you blow that up a little so we can see the circles.

12 BY MS. DUPRE-TOKOS:

13 Q. So what are the circles that we see on the map?

14 A. These are the stationary air monitoring
15 locations in our county. All four of these are operated
16 by the California Air Resources Board.

17 This is the location of the Chico East Avenue
18 monitoring station, the Gridley monitoring station. And
19 we have this one up here near the theatre was our PM2.5,
20 our particulate monitoring station. And th fourth
21 station here at the Paradise Airport which only measures
22 for ozone which is a summertime smog pollutant that we
23 monitor.

24 Q. And then looking at page 7 of 1363, can you tell
25 us what that is.

26 A. This is a summary of our 24-hour average PM2.5

1 measurements for Chico, Paradise, and Gridley throughout
2 2018. And it does show -- we did have smoke impact that
3 summer too from the Car Fire and the Mendocino Complex
4 Fires. And this shows a comparison to the smoke impacts
5 that we received during that fire episode where we did
6 get into the unhealthy range in Chico and then it showed
7 the comparison with the Camp Fire.

8 Q. And so -- and this shows Chico, Paradise, and
9 Gridley depending on the color of the line; correct?

10 A. Correct.

11 Q. Okay. And then page 8 of 1363. What are -- it
12 says at the top "Average PM10 measurements." What are
13 PM10 measurements?

14 A. Generally, for smoke we're measuring PM2.5, and
15 these are microns that are less than 2.5 microns in size.
16 They're extremely small. And they can bypass or violate
17 bodily defenses and penetrate deeper in the lungs which
18 is why we're concerned about them.

19 Somewhat larger particulates PM10 are also known
20 as course particulates. These are slightly larger
21 particulates. They still can be -- especially at high
22 volume. High levels can also be a respiratory issue.
23 However, these are the 2.5 to 10 microns.

24 Normally, this is -- we're talking about dust or
25 slightly larger particulates. However, with the Camp
26 Fire we did have extremely high levels of PM10 as well as

1 PM2.5. So there are very small particles, but there are
2 also slightly larger particles measured.

3 Q. And they follow the same categories of good,
4 moderate, unhealthy for sensitive groups all the way up
5 to hazardous; is that correct?

6 A. Yes. There is an AQI range for PM10. The
7 breakpoints are different from the 2.5, but there are AQI
8 categories for PM10.

9 Q. And then looking at the charts then it looks
10 like even the PM10 at least at one point was touching
11 into the hazardous range?

12 A. Yes.

13 Q. Okay. Otherwise it was in the unhealthy or very
14 unhealthy range for the most part?

15 A. Yes.

16 Q. Okay. Now, you just touched on it a little.
17 I'm going to ask you this. Why do we care about tracking
18 particulate matters especially the smaller particulates?
19 Why do we care?

20 A. The smaller particulates can penetrate, like I
21 said, you know, beyond mucous membranes in your nose and
22 beyond your natural defenses and penetrate deep into the
23 lungs and --

24 Q. Does that cause breathing problems?

25 A. It can exacerbate breathing problems for those
26 with respiratory issues such as asthma and COPD and also

those with cardiovascular disease. It does also -- each particulate are so small that it can interfere with the blood oxygen interface. So those that would -- have cardiovascular issues can also be susceptible to poor air quality conditions.

Q. And so the blood not getting oxygen, then that can cause all sorts of health conditions. Heart attacks, stroke, whatever. Is that your understanding?

A. It's my understanding. I'm not a medical official though.

Q. But that's your understanding as to why you're caring about this and why you're tracking it?

A. Yes.

Q. Okay. And when you're up in the hazardous range, that's also true even for healthy people; isn't that correct? That's why it's no longer just unhealthy for sensitive groups. It's all the way up in the hazardous because it's dangerous to everyone. Is that correct?

A. Yes. At the very least it could create irritation, but it could also be difficult -- make breathing difficult and exacerbate asthma and make it hard to breath.

q. If you can't breath, can you live?

A. You can't live if you can't breath.

[Exhibit 1364 introduced

as evidence.]

BY MS. DUPRE-TOKOS:

Q. So going on to Exhibit 1364, and we have several pages of this. What is Exhibit 1364?

A. This is a report developed by an air resources advisor from the United States Forest Service. These area resource advisors are deployed to large wildfires, primarily those fires on federal lands.

And so on the 13th -- I'm sorry. On the 15th an area was assigned to the Camp Fire and began to develop these air quality snapshots for not just Chico but for the surrounding region. And it included a discussion of the fire activity, the smoke that would be generated by that fire activity as well as current conditions, yesterday's air quality conditions, and an outlook for today for the current forecast date and then for tomorrow based on fire and meteorological conditions.

Q. And then down at the bottom it says "Air Quality Index AQI" and then "Actions to protect yourself."

And for green, which is good, it says "None." For moderate it says "Unusually sensitive individuals should consider limiting prolonged or heavy exertion for USG," which I'm assuming is unhealthy for sensitive groups.

A. Correct.

Q. It says "People within sensitive groups should

1 reduce prolonged or heavy outdoor exertion."

2 Under "Unhealthy: People within sensitive
3 groups should avoid all physical outdoor activity, very
4 unhealthy. Everyone should avoid prolonged or heavy
5 exertion." And then "Hazardous" it says "Everyone should
6 avoid any outdoor activity."

7 Did I read that correctly?

8 A. Correct.

9 Q. Okay. And so this first one that we're looking
10 at is for Thursday, November 15th; is that right?

11 A. Correct.

12 Q. And then the next slide is for Sunday,
13 November 18th; is that correct?

14 A. Yes.

15 Q. And it looks like Chico, Palermo, and Yuba City
16 are all still in the hazardous areas judging by the color
17 of the dot by the city?

18 A. Yes.

19 Q. And then going to the next slide that's for
20 Monday, November 19th. And it looks like things have
21 improved a little. It looks like Chico, Palermo, and
22 Yuba City are in the unhealthy range?

23 A. Yes.

24 Q. And it looks like there's a forecast for them to
25 go to -- either remain unhealthy or go to unhealthy for
26 sensitive groups?

1 than up in Paradise?

2 A. I do not know for certain.

3 Q. Okay. Why was this put out?

4 A. This was put out to give guidance to schools on
5 ways that they could track air quality, provide resources
6 on how to have a better idea of what air quality is there
7 in their community as well as giving the breakpoints for
8 the different air quality categories and also breaking it
9 out based on different activities such as PE, recess,
10 scheduled outdoor sporting events. And this was provided
11 to give guidance.

12 Q. And was this actually given to the schools?

13 A. This was given to schools through the Butte
14 County Office of Education once it was developed. And it
15 was published on our website.

16 Q. And it looks like it's dated 11/13/18.

17 A. Yes.

18 Q. Okay. And so just so I can make sure I
19 understand it, so looking at hazardous -- because that's
20 at the very far end and it's easy to follow -- it gives
21 the AQI of 301 or higher; correct?

22 A. Yes.

23 Q. And then it includes -- on all of these it
24 includes viability. And why was visibility included?

25 A. This is a general scale developed by the US EPA
26 when developing their AQI scale as kind of a yardstick to

1 gauge what air quality is based upon visibility. It's an
2 estimate. But for those that are not near an air quality
3 monitoring station, it's a way to provide an estimate on
4 what air quality may be, what the values may be.

5 Q. So if you can't get to a computer to pull up the
6 readings, if you can't see, you know, more than a mile in
7 front of you, you can take an educated guess that your
8 air quality is probably hazardous?

9 A. That's the guidance.

10 Q. And we're not talking fog? We're talking other
11 things other than fog?

12 A. Correct.

13 Q. Okay. And then going down it says "Recess. A
14 15-minute recess." It says under hazardous "Keep
15 students indoors and activity levels light."

16 So they're even recommending the indoors so that
17 there's not a lot of exertion. Am I understanding that?

18 A. Yes.

19 Q. Okay. For PE it's the same. "Keep students
20 indoors and activity levels light."

21 And then scheduled outdoor sporting events and
22 practices it says "Consider cancelling or rescheduling
23 the event." Is that correct?

24 A. Yes.

25 MS. DUPRE-TOKOS: Okay. Do you have any
26 questions?

1 MR. NOEL: Yeah, I got a couple.

2 MS. DUPRE-TOKOS: Okay. I think that's all I
3 have, but Marc has a few questions and then the jurors
4 may have some questions for you.

5 THE WITNESS: Okay.

6 MR. NOEL: Yep. I'm just going to go back and
7 follow up on a few things.

8 **EXAMINATION**

9 BY MR. NOEL:

10 Q. Going back to 1358 and your credentials, it says
11 "Qualified Environmental Professional."

12 A. Yes.

13 Q. What is a qualified environmental professional?

14 A. It is a -- this is a credential developed by the
15 Professional Environmental Practice. It is -- it was a
16 tested credential that bases your experience in the
17 field, your education, knowledge of a variety of air
18 quality topics as well as an emphasis on being an
19 ethnical professional.

20 Q. Okay. What is the Institute of Professional
21 Environmental Practice?

22 A. They are an international credentialing agency.
23 They're now part of the -- I believe it's the
24 Environmental Industrial Health. They have since merged
25 with another institute, but they credential environmental
26 professionals in air quality, water quality as well as

1 solid waste.

2 Q. Is there an educational component of the
3 institute?

4 A. Yes. I believe that they require a scientific
5 degree.

6 Q. Okay. Do they do any training themselves?

7 A. They do do trainings. I have not participated
8 in training through them.

9 Q. How do you get qualified certificated by the
10 institute?

11 A. This process happened in 2013. So I'm a little
12 foggy on some of the exact -- there is an application
13 process. There's an in-person interview process as well
14 as a testing process.

15 Q. Okay. And you are certificated by the Institute
16 of Professional Environmental Practice?

17 A. Yes.

18 Q. All right. What's the connection between being
19 an educationally-trained meteorologist and a qualified
20 environmental professional?

21 A. Being able to -- the background in meteorology
22 and environmental science, you know, an emphasis on data,
23 an emphasis on data quality, and understanding what the
24 data means and being able to present the data clearly so
25 that it means something so that the units are explained
26 and any graphic or charts that are produced based on that

1 data mean what they're supposed to mean.

2 **EXAMINATION**

3 BY MS. DUPRE-TOKOS:

4 Q. And I'm going to jump in real quick. Your
5 meteorology background, does that help you in your air
6 quality forecasting? Because you said you look at
7 weather conditions and things like that when you're
8 talking about potential air quality for the following
9 day.

10 A. Yes, it does. Air quality is very
11 meteorologically driven with wind speed and direction, if
12 there's an inversion, if there's a storm incoming.
13 There's a lot of meteorological factors when it comes to
14 wildfire smoke and air quality in general.

15 **EXAMINATION**

16 BY MR. NOEL:

17 Q. All right. A couple of things. We talked a lot
18 about it, but I didn't catch the -- it was never defined.
19 Can you tell us what a particulate actually is.

20 A. It could be any sort of substance. It's often
21 solid, but sometimes it could even be liquid. It could
22 be any particulate. We're just measuring the mass of any
23 particulates.

24 There are -- the state does have a method of
25 speciating or figuring out what are in the particles or
26 what is the particle made out of. But for our purposes

1 we really get the math of the total particulates. And it
2 could have been moisture. It could have been liquid
3 particulates. It could be solid particulates from
4 combustion. So what the particulate is it could be
5 different. It could be solid or liquid.

6 Q. Okay. So how do you define -- how does
7 something become a particulate or is defined as a
8 particulate?

9 A. If it has mass.

10 Q. If it has mass?

11 A. If it has mass that is measurable upon
12 filtering.

13 Q. To a certain degree or to a certain weight?

14 A. So these air monitoring stations, they take in
15 air and they have -- they have hardware that will knock
16 out any particulates over 10 microns in size. And then
17 they have another cyclone that will knock out any
18 particulates larger than 2.5 microns in size. They have
19 a heater that will evaporate moisture so that fog or
20 other moistures are not a factor, and it will deposit
21 those.

22 For our federal reference method monitor -- that
23 is the monitor that the EPA uses to assess our
24 attainments -- they will deposit the particulate upon a
25 filter. They will dry the filter and weigh the filter
26 before they -- well, first, they weigh the filter before

1 it goes into the cartridge. They deposit the
2 particulates. And these particulates will measure mass
3 and then they will weigh it after they deposit the
4 particulates on the filter.

5 And so what they're measuring is the weight of
6 the particulates that were deposited upon this filter for
7 a 24-hour period.

8 **EXAMINATION**

9 BY MS. DUPRE-TOKOS:

10 Q. So is a particulate basically just any small
11 piece of something --

12 A. Yes.

13 Q. -- that you can weigh?

14 A. Yes.

15 Q. Okay. So it can be, you know, little pieces of
16 wood, little pieces of chemicals? It could be little
17 pieces of anything. Leaves or whatever.

18 A. Yes.

19 MS. DUPRE-TOKOS: Okay.

20 **EXAMINATION**

21 BY MR. NOEL:

22 Q. All right. Some more terms that you used.
23 Microns. Can you define for us what a micron is.

24 A. It is -- so we have a -- a micron is very --
25 there's a -- it is very -- I would think the best way to
26 think about it is PM10. So ten microns in size. They --

1 you can line up about six or so of those across the human
2 hair. And then the PM2.5 you can -- you can do about --
3 about four of those across the length of what some of
4 those PM10 particles are. So they're much smaller than
5 even the width of a human hair.

6 A micron would be about a scale of 1,000 less
7 than a millimeter or -- yeah, a millimeter. So you have
8 1,000 millimeters --

9 I'm doing math.

10 MS. DUPRE-TOKOS: So 001 -- or 0001 of a
11 millimeter?

12 THE WITNESS: Yes. Whereas a millimeter would
13 be with .001 of a meter.

14 BY MR. NOEL:

15 Q. So in layman's terms it's a really, really small
16 increment of measurement?

17 A. Yes.

18 Q. All right. And you'd also used a term
19 "micrograms per cubic meter." If you could explain that
20 for us.

21 A. Okay. So that would be also a unit of very
22 small weight measure. Also .001 grams. So it's a mass
23 per a meter cubed. So if you had one meter by one meter
24 by one meter, what would be the weight of the
25 particulates in that cubic meter?

26 Q. All right. We have 1360 here back in front of

1 you, specifically we talked a lot about what these things
2 mean in terms of hazardous. But what actually do these
3 scores represent? Like 197, 299, 411. What does that
4 score mean or how do you get that score?

5 A. That's the 24-hour average of the -- in
6 micrograms per cubic feet measured.

7 Q. Okay. All right. So, for instance, on Friday,
8 November 16th there were 411.7 micrograms per cubic meter
9 of PM2.5 particulate?

10 A. Yes.

11 Q. Is that correct?

12 Okay. On 1361 it keeps using this term
13 "recirculate."

14 "Inside a building close all the windows and use
15 the recirculate setting. Air conditioning on
16 recirculate."

17 What does it mean to recirculate and why would
18 that be advisable?

19 A. You don't want to draw air from the outside. If
20 it's hazardous or poor air quality outside, you don't
21 want to draw any air from the outside.

22 In vehicles, you know, you have the air
23 conditioning button and the arrows going like that
24 (indicating). Instead of drawing in fresh air, you're
25 just recirculating the air inside of your cabin through
26 your air filter.

1 And so basically the message is don't draw any
2 air from the outside if you can help it.

3 **EXAMINATION**

4 BY MS. DUPRE-TOKOS:

5 Q. I'm going to interrupt. Looking at 1361, is
6 that a picture from your office down at the bottom of the
7 page?

8 A. That's from our -- we have a webcam at Butte
9 College.

10 Q. Okay.

11 A. That was from Butte College.

12 Q. Taken on November 8th?

13 A. Yes.

14 **EXAMINATION**

15 BY MR. NOEL:

16 Q. All right. And on to 1362 on the chart here on
17 the top. And I just want to -- I know we talked a lot
18 about 2008 and that the spikes were the Humboldt Fire and
19 the Lighting Complex Fires.

20 The spikes in 2018, the highest 24-hour averages
21 for the year, are those the Camp Fire?

22 A. Yes.

23 Q. Okay. I think we skipped over that earlier.
24 You started going there and then didn't finish it.

25 MS. DUPRE-TOKOS: Because I interrupted.

26 MR. NOEL: And I think --

1 **EXAMINATION**

2 BY MS. DUPRE-TOKOS:

3 Q. And would that be true for all of the spikes for
4 2018 in the different graphs? Not just this graph but,
5 for example, and -- well, the ones in 1363 as well as the
6 table in 1362, the big spikes for 2018 were based on the
7 Camp Fire?

8 A. Yes. There were some impacts in the summer from
9 the Carr and Mendocino Complex Fires. I can show you.
10 You can see the scale of magnitude between those two
11 different impacts.

12 **EXAMINATION**

13 BY MR. NOEL:

14 Q. You ever testify before?

15 A. I have not.

16 Q. How nervous were you when you came in here this
17 morning?

18 A. I'd say three out of ten.

19 **EXAMINATION**

20 BY MS. DUPRE-TOKOS:

21 Q. Very good. How nervous are you now?

22 A. Four out of ten.

23 MS. DUPRE-TOKOS: Are there any questions from
24 the jurors?

25 GRAND JUROR NUMBER FOUR: By the way, a micron
26 is one one-millionth of a meter.

1 THE WITNESS: One one-millionth. I'll remember
2 that so I can give a much better answer than I gave
3 before. Thank you.

4 MR. NOEL: We have some questions from the
5 jurors that Jennifer is going to read you.

6 Remember, if you don't know the answer or if
7 it's outside of your expertise, just let us know.

8 THE WITNESS: Okay.

9 MS. DUPRE-TOKOS: "Can the particles that are
10 breathed into the lungs may cause problems over a long
11 period of time?"

12 THE WITNESS: That would be best for a medical
13 professional. Guidances that I have read says yes, but
14 that's best for a medical professional.

15 MS. DUPRE-TOKOS: And then "Do the particles
16 stay in the lungs?"

17 THE WITNESS: That again is best for a
18 professional, a medical professional.

19 MS. DUPRE-TOKOS: Any other questions?

20 MR. NOEL: Any follow up?

21 MS. DUPRE-TOKOS: All right. You just need to
22 get an admonition from madam foreperson and you survived.

23 THE WITNESS: Thank you.

24 MS. DUPRE-TOKOS: Hang on one second.

25 GRAND JURY FOREPERSON: Mr. Mandly, you are
26 admonished not to discuss or disclose at any time outside

1 of this jury room the questions that have been asked of
2 you or your answers until authorized by this grand jury
3 or the Court. A violation of these instructions on your
4 part may be the basis for a charge against you of
5 contempt of court. This does not preclude you from
6 discussing your legal rights with your own attorney.

7 Mr. Mandly, what I have just said is a warning
8 not to discuss this case with anyone except the Court,
9 your lawyer, or the district attorney.

10 Do you have any questions?

11 THE WITNESS: I don't.

12 GRAND JURY FOREPERSON: Okay. Thank you for
13 your time today.

14 THE WITNESS: Okay. Thank you.

15 [Witness exits the courtroom.]

16
17 [DISCUSSION OMITTED.]

18
19 [Recess taken from
20 10:05 until 10:52 a.m.]

21
22 [DISCUSSION OMITTED.]

23
24 [Matter adjourned at 12:00 p.m.]

(Confidential Grand Jury Proceedings)

-oOo-

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

(Grand Jury Exhibit 1377 was admitted into evidence.)

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: To Captain Carothers,
if you would raise your right hand to be sworn, please.

CHAD CAROTHERS
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: Yes, I do.

GRAND JURY FOREPERSON: Thank you.

EXAMINATION

BY MS. DUPRE-TOKOS

1 Q. Could you please state your full name and spell
2 your last name.

3 A. Do I need to talk into this thing?

4 MR. RAMSEY: Just use your --

5 THE WITNESS: My full name is Chad Joshua
6 Carothers, C-H-A-D J-O-S-H-U-A C-A-R-O-T-H-E-R-S.

7 Q. (By MS. DUPRE-TOKOS) And are you employed?

8 A. Yeah, currently I work for Cal Fire as a fire
9 captain.

10 Q. And where are you currently assigned?

11 A. My current assignment right now is at the
12 Sacramento Command Center in Sacramento.

13 Q. Were you employed by Cal Fire on November 8th,
14 2018?

15 A. Yes, I was.

16 Q. And where were you assigned at that point?

17 A. At that time, I was assigned to Delta Camp,
18 running inmate hand crews for Cal Fire.

19 Q. And how long have you been a firefighter?

20 A. I started back in 2001 working for Cal Fire;
21 5/14 of 2001. My actual time on the books, because I was
22 seasonal for six years, I think right now I'm sitting at
23 17 or 18 years, but I've been in the fire service since
24 2001.

25 Q. All right. So you didn't have any fire service
26 experience prior to joining Cal fire?

1 A. The only thing I had was as a volunteer for
2 Shasta County Fire Department in Jones Valley. And I did
3 that for, oh, man, from 2000 until -- 2000 -- until I got
4 hired. And then whenever I was off in the winters, I
5 would go back and volunteer for I think four -- three or
6 four years. So I had a little bit.

7 Q. Now, do you have any medical training?

8 A. Yeah. I'm an EMT. I've been an EMT since
9 2000. Yeah.

10 Q. And you've kept your certifications up all this
11 time?

12 A. Yes.

13 Q. Where is Delta Camp?

14 A. So Delta Camp is 20 miles south of Dixon along
15 the 80. It's essentially out in the Delta, the San
16 Francisco kind of Delta that goes in there.

17 Q. What were your assignments prior to working at
18 Delta Camp?

19 A. So when I first started in 2001, I worked as a
20 Firefighter 1, a seasonal for Cal Fire out of Whitmore
21 Forest Fire Station. And that was my 2001-2002 fire
22 seasons.

23 Then in 2003, I got a, I guess kind of a
24 transfer, and I worked at Vina Helitack, which is just
25 north of Chico I think 10, 15 miles. And that was 2003,
26 2004, 2005. And at Vina, the only thing we did was go to

1 wildland fires and do rescues. That was it.

2 After that, 2006, I went back to the Shasta
3 Trinity Unit. I worked as an engineer, I got promoted
4 that summer as an engineer and worked at Station 43.

5 At the end of that summer, I got offered a
6 permanent engineering job, and I turned it down because I
7 was only 20 -- I was in my early 20s. I think I was 24.
8 And I just wasn't, I didn't feel like I was ready really
9 to be an officer yet. So I went down to Riverside,
10 California -- or Riverside County and got a job down
11 there working as a Firefighter 2 in February. I worked
12 at Station 77 for a number of months. I don't think
13 quite a year. Then I got a job at the HAZMAT Station
14 down there.

15 I worked at HAZMAT for two years approximately.
16 I became permanent with the state at that point. I went
17 to Ione and got six more weeks of training.

18 I came back, and shortly after that the HAZMAT
19 team was going through kind of a, I guess contraction and
20 so they were moving people, so I took a pretty much
21 lateral transfer to Palm Desert and started working on
22 the truck company there, Truck 33. And I worked on that
23 for four years, until I finally decided to promote again.

24 I promoted and stayed in that battalion, which
25 was Battalion 12, as an engineer, working the case from
26 relief, taking on more responsibilities.

1 And then I ended up going back to the truck and
2 worked on the truck for another year, until I transferred
3 up to LNU.

4 Whenever I transferred to LNU --

5 Q. What is LNU?

6 A. Sonoma-Lake-Napa unit. Acronym is LNU.

7 I transferred to there, and I got assigned to
8 Yountville, Station 12, working on the Schedule A ride
9 there, running calls into the Yountville Veterans' Home.
10 I did that for approximately a year and some change. I'm
11 not exactly positive.

12 Then in 2016, I got promoted to a fire captain
13 at Delta Camp. So I've been at Delta Camp from 2016
14 until I got injured.

15 Q. And what did your job duties at Delta Camp
16 entail?

17 A. So at Delta Camp, you run an inmate hand crew.
18 So when you get to Delta Camp, you have to have extensive
19 training when you get there with just the dealing with
20 inmates, because it's not a normal entity that fire
21 captains do.

22 They come to you trained with, I think about
23 six weeks of basic training. And Delta Camp is supplied
24 by Susanville Corrections Center. That's where our
25 inmates got trained. They would have a basic
26 understanding. But then you, as a captain that has had

1 multiple years of working for the fire department, would
2 then expand on that training that they have.

3 You would also get a "swamper," as they would
4 call it, and they would be the person that would ride in
5 the right-hand seat of the bus with you. And they would
6 also be kind of your right-hand man with running that
7 crew. They would have a radio. I would be at the very
8 front, leading everyone; they would be at the very back
9 with a radio, herding everybody along.

10 Q. Was that an inmate as well?

11 A. Yes, that was an inmate. The crews ranged from
12 10 or 12, all the way up to 17. Seventeen was the max
13 load that we could put on a bus.

14 So when I first got there at Delta Camp, you
15 helped shook out, as I was a relief captain, so that
16 meant that I would work on one crew one day, and the next
17 day I could work on another crew, and I'd bounce around.
18 So instead of having one crew that you had to figure out,
19 you had to figure out all the inmates.

20 Eventually, I got assigned a crew. I had Crew
21 4 for approximately a year and a half. In that time, I
22 think the whole crew had rotated through. There was no
23 one that when I started the crew I finished with. Yeah.

24 After that, I, I became a relief captain, I
25 gave my crew up.

26 And then right after that, probably a couple

1 months, I became the operational captain at the camp, so
2 my job duties kind of shifted. I still was in charge of
3 running hand crews. And that's what I would do all
4 summer. But when I was back at the camp, my job was to
5 do maintenance around the camp, take care of if a toilet
6 broke, take care of getting buildings painted, taking
7 care of building buildings, taking care of the warehouse
8 and ordering stuff. Kind of a more behind-the-scenes
9 making sure that when those fire captains came in from a
10 fire from duty, that they could have the supplies that
11 they needed to continue doing their job.

12 Q. So the 2017 fire season was pretty busy. Did
13 you go out on a lot of fires?

14 A. Yeah. So 2017 started off with a bang, and we
15 ran a lot of fires in 2017. I ended up -- so
16 Sonoma-Lake-Napa Unit, we also had the Lake Fire and the
17 -- I can't remember the names of all of them. But we
18 were the closest camp, so after the fires went out, we
19 were still assigned to do vegetation reduction and clear
20 up all the dead brush and stuff and brush roads to
21 critical infrastructures.

22 So from the time that fire went out I think
23 sometime in November until the end of November, we were
24 still working 24 hours a day, 7 days week. There was
25 really no slowing down for us.

26 Approximately somewhere in the end of November,

1 start of December, it was after Thanksgiving I know, but
2 I don't know how far into December it was --

3 Q. This is 2017 still?

4 A. This is 2017. We got assigned to the fire in
5 Santa Barbara that year. And I didn't have any vacation,
6 so I, luckily, got to go and spend all the way until
7 Christmas Eve working. My wife had actually flown down.
8 The plan was on whatever my 24 off was, we were going to
9 celebrate Christmas in Santa Barbara. And literally she
10 was on the plane down, and I was driving back. So I got
11 to drive down the next day.

12 So, yeah, that summer had been super busy.
13 Normally fire season, October starts winding down, and
14 that year it went all the way until Christmas, the day
15 before Christmas Eve.

16 So needless to say, 2018, I was not -- to even
17 start the season, I wasn't super excited. I was like,
18 I'm going to take some time and just relax for a little
19 bit.

20 Q. How did that work out for you?

21 A. Not so well.

22 So with the crews, we do a readiness drill in I
23 think April sometime. What a crew readiness drill is, is
24 all the crews in the state have to get certified that
25 they are competent in some basic things: The Ten
26 Standard Fire Orders; the 18 situations that -- shot

1 watch out; being able to get out of the bus -- they call
2 it a "tool out" -- where all the inmates get out of the
3 bus with all their tools and they line up. It should be
4 completed in I'm pretty sure 90 seconds or a minute, I'm
5 not positive on that.

6 Then once they do that, the proctors go down
7 and ask the inmates, "Hey, what's a standard fire order?
8 What's a look-out situation?"

9 After that, there's a simulated fire shelter
10 deployment, where you have your crew and you simulate,
11 "Okay, the fire's coming from here, hey, let's go here
12 and then let's get in our fire shelters."

13 After that, there is a timed hike that they
14 have to complete. Everyone has the same hike to spend
15 time. The captains pretty much lay it out and get it all
16 ready.

17 And then the last thing is a line cut. So for
18 every inmate, and I'm not, I'm not exactly solid on this,
19 you have to cut 20 feet of line. So if you have 10
20 inmates, that means you have to cut 200 feet of line in
21 an hour. It takes lots of work and practice to get crews
22 dialed in on how to get that done.

23 If you fail any of those assignments that I
24 said with the readiness drill, then you have to then come
25 back and you have to do the timed hike again no matter
26 what, and you have to do the line cut, you have to do

1 that. Usually, those are the two that people fail on.

2 That year, my crew passed. And I don't -- I
3 think at that point, I gave up my crew right before
4 Christmas, technically what I call the summer.

5 Q. So do you mean by "cut a line"?

6 A. So the inmate hand crews, our number one job is
7 to clear vegetation brush. And if you think about this,
8 if you have dirt, dirt doesn't burn, so if you have
9 vegetation on one side and vegetation on the other and
10 you want to stop the fire, you go along where it burns
11 and you cut a line.

12 So for this, it's eight feet of canopy is what
13 we like to call it, so the brush will be cut out eight
14 feet. In the center of that eight feet, you'll clear
15 four feet of dirt. So it takes quite a bit of work.

16 Then also that four feet of dirt is our path
17 out of there. So it's not like you can leave stobs and
18 stuff to trip on, you have to take and get all of those
19 out, you have to cut everything out. Yeah.

20 And then, also, if the brush is thick, you
21 don't really want to stack all the brush on one side.
22 You actually are going to end up cutting pockets in it to
23 push the brush in there and keep it out of your way.
24 It's a pretty labor-intensive process.

25 And the other expectation is that we will work
26 for 24 hours, because that is our shift.

1 Q. Okay. So you gave up your crew the beginning
2 of the summer?

3 A. Yep.

4 Q. And then did you go out on any fires that
5 summer?

6 A. Yeah. So 2018, if you guys don't remember, was
7 the year of the Carr Fire in Shasta County. We got
8 assigned to that and went up there. Right -- we actually
9 got there before it really kind of blew up. I also lived
10 in Redding, so I had extensive knowledge of where it was
11 and the fire environment. Like I said, that's where I
12 started was the Shasta Trinity Unit.

13 After we were on that for I think a week, they
14 sent us to the largest fire that was known in the state
15 of California at this point, the Mendocino Complex,
16 because the Mendocino Complex was on terrain that was
17 part of Sonoma-Lake-Napa's Unit. So the expectation was
18 that we're the experts on that terrain and we know the
19 most about it.

20 So we went to the Mendocino Complex. In that
21 month, I blocked out a pay period, which means I worked
22 all 28 days for a pay period.

23 We got done with that -- I'm trying to think
24 where we went after the Mendocino -- we were on the
25 Mendocino Complex for a long time. I think I went up to
26 a fire in, outside of Mt. Shasta. And we were there for

1 a while, but it was on forest service land, so then all
2 the Cal Fire resources got cut out I think a week or two
3 later.

4 Then I went up to the Tahoe, next to Imigrant
5 Gap, when they were on fire up there.

6 And then I think there were a couple of little
7 fires, but it kind of slowed down. And the thought was,
8 "Hey, maybe fire season is winding down." That was
9 always the hope. The reality is, and that we all know
10 and I can attribute from first-hand experience, is that
11 the deadliest time of fire season is the very end. If
12 you look at catastrophic fires, deaths, buildings being
13 burned, it's that last little bit that's the worst.
14 Wherever that falls. Whether it be in December, like
15 when I went to Santa Barbara, or in the Camp Fire in
16 November.

17 So, yeah, we -- so then we ended up going to
18 the Camp Fire.

19 Q. So before we get there, you thought the fire
20 season was winding down. Did you make plans for
21 vacation?

22 A. Yeah. So the weekend after I got burned, we
23 were supposed to -- my wife and my kids and I were
24 supposed to go to Yosemite and meet up with a whole bunch
25 our family friends, and we were sharing a cabin together.

26 So the morning of the 8th was my last day, it

1 was a Thursday, and I usually got off work at 5:00
2 o'clock on Thursdays unless you get held over, there's a
3 fire and stuff. So I was kind of like, "Hey, man, I'm
4 going to make it, I'm going to get out of here." So when
5 I went into work, I thought, "Oh, man, I just got to do
6 my couple hours." And, like I said, I had switched to
7 ops captain, so my job wasn't to take crews out on a
8 daily basis. If there were fires burning, yes, that was
9 my job, but on a daily basis, like I said, I stayed at
10 the camp and worked on other stuff.

11 Q. So tell us about November 8th. The -- how did
12 that start? You show up at work about what time?

13 A. So I show up at work -- we have to be at work
14 at 7:30, so I probably was there 7:25, 7:30-ish, right
15 there. I showed up to work, and we were kind of watching
16 the news. "Oh, man, this fire doesn't look good." We're
17 looking at some of the weather and stuff, and we're
18 thinking maybe we're going to go, maybe we'll skate out
19 this one, they won't send us. It didn't quite work out
20 that way.

21 So we got the call to form up as a strike team.
22 Which a strike is one strike team leader on a pickup
23 truck, two crew busses each with one fire captain and a
24 crew assigned to them. There's also a CDCR component.
25 There's a CDCR supervisor, which is a lieutenant or
26 sergeant, then there's two CDCR officers also in a pickup

1 truck with each CDCR officer being assigned a crew that
2 they kind of deal with and manager.

3 Q. And do those CDCR folks have any fire fighting
4 training at all?

5 A. Yes, but very minimal. The expectation is that
6 we're going to take and put them somewhere that is a safe
7 environment, that the fire can burn all around them and
8 nothing will happen to them. So that's one of our jobs
9 -- it's one of the jobs of the strike team leader is to
10 make sure the CDCR are in a safe spot to be and have
11 anything they need.

12 The thing is, if someone gets hurt, then the
13 CDCR needs to be there to respond to that injured inmate,
14 if there's going to be a change of custody or any of that
15 stuff. Because when you get to camp, like on a normal
16 day at 9:00 o'clock, we would check out the inmates and
17 do a transfer of custody from CDCR to the Cal Fire
18 captain, then you have custody until you turn them in at
19 5:00 o'clock at night.

20 Q. What is CDCR?

21 A. CDCR is the California Department of
22 Corrections and rehabilitation.

23 Q. Okay.

24 A. If you look at the camp structure, there's a
25 Cal Fire component, then there's a CDCR component. CDCR,
26 I guess, for lack of a better term, "own" -- I don't know

1 if "own" --

2 Q. They have custody?

3 A. They have custody of the inmates. They are in
4 charge of it. We get transfer of custody, we kind of
5 rent them out for the day, and at the end of the day, we
6 turn them back in to CDC. On fires, it was a 24-hour
7 shift that we would take custody of them. So I would
8 have them for a full 24 hours, then the next morning I
9 would turn them back in. And when, when CDCR took
10 custody of them, the Cal Fire employees would then go to
11 our lodging and eat and sleep and get rest and get ready
12 for another 24-hour shift.

13 Q. I forgot to ask you this, so I'm going to take
14 a step back. You said that you have EMT training, you're
15 an EMT. In your job experience, have you, in addition to
16 your medical training, have you become familiar with
17 second- and third-degree burns?

18 A. Yeah. So Cal Fire has a very extensive burn
19 policy due to our employees have got burned in the past.
20 So every year we have to do a safety stand down, and
21 almost every year part of that safety stand down is going
22 back through the burn policy. Every Cal Fire vehicle
23 also has a burn kit on it. And that burn kit is not to
24 be used for the public. That is to be used for our
25 employees. We have medical kits to use for the public,
26 but that burn kit is very specifically to be used for the

1 employees.

2 So every year you're getting re-trained on
3 burns, and you're going back through it. And you watch
4 videos. I can tell you, I've watched the Kelly York
5 video a number times. I've had extensive training in
6 burns -- recognition, treatment, all the pre-hospital
7 stuff.

8 Q. Okay. So you know the difference between a
9 second and third degree?

10 A. Yes.

11 Q. Can you just, very briefly, tell us the
12 difference.

13 A. So a third-degree burn is a full-thickness
14 burn. So with that -- I can use my hand -- it's a full
15 thickness. Whereas a second degree is a partial
16 thickness. So full-thickness burns, it will kill all the
17 nerves, pretty much kills all that skin, and there's not
18 really a whole lot. The second-degree is a partial
19 thickness, where it only burns kind of the outerly of the
20 dermis. It doesn't really get down all the way.

21 I guess the easiest way to describe it, if you
22 guys look at my face, you can see kind of the marks on
23 it. Those are third-degree burns. The second-degree
24 burn would be more like my forehead, how the pigmentation
25 has changed, and on the sides of my face. But where
26 there's that bulky scar, those are going to be

1 third-degree burns because it was a full-thickness burn.

2 Q. Sorry to have interrupted.

3 A. Nope.

4 Q. So you were telling us about the morning of the
5 8th.

6 A. Oh. So I show up to work, kind of watching the
7 news. I think there were six fire captains on duty, and
8 at that point, we only have four crews. So I was like,
9 well, this is easy math: Six people, four crews, there's
10 two crews that are going to go out of county and they're
11 going to need strike team leaders, so that's five people
12 -- three people that are going and three people that are
13 going to stay. I'm like, "My odds are pretty good I'm
14 not going."

15 Then, as it happens, if people have vacation
16 coming up or other things, which I didn't have an
17 approved vacation, I just had a plan to go on vacation, I
18 quickly realized that I was actually going to go. And I
19 was pretty irritated, I'll say that. Me and the admin
20 captain had a quick conversation, and I kind of stormed
21 out of the office because I was just like, you know, if I
22 got to go, I got to go, I just want to get my stuff and
23 get on the road and go.

24 So I found out I was going. I found out one of
25 the other captains that I had been with a lot that summer
26 was going, then another experienced captain who was

1 getting ready to retire was going. All three of us were
2 kind of in the same mindset, like, "Hey, we've got to go,
3 this is our job, get the bus crew, and let's get up there
4 and get to work."

5 So I always would get in the back of the bus,
6 and I would usually talk to the inmates when we were
7 going to a fire, like, "Hey, make sure you guys drink
8 water, make sure you're hydrated, make sure you eat
9 something." That day I actually got in the back of the
10 bus and my talk was, "It is the end of fire season. This
11 is the most deadliest time of fire season. So I need you
12 guys to pay attention to me today. If I tell you guys to
13 do something, you need to react with -- speed is of the
14 essence." And I told them it's the most likely time for
15 someone to get seriously hurt, injured, or die. I
16 remember giving that speech. And I didn't think I was
17 actually going to be an exclamation point on that speech.

18 So we get loaded up in the bus, my time on this
19 is a little hazy, 8:30, maybe 9:00. And we get the CDCR
20 component, and all five vehicles start making our way in
21 strike team formation up to Butte College.

22 Q. So about what time did you get to Butte
23 College?

24 A. I think it was right around noon. I have a
25 photo that I took out the bus that I sent to my wife that
26 I think was time stamped at 11:44. So I think it was

1 right around noon. And at that time, our, our assignment
2 was to report up to Butte College. And then you were
3 going to get an assignment from there.

4 So we got there, we got the inmates out, let
5 them go to the bathroom, let them eat some of their
6 lunches, and we just kind of hung out for a little bit.
7 Maybe an hour later, we finally got an assignment.

8 Also, I want you guys to remember, this is the
9 first day of a massive fire, so everything's,
10 everything's swarming in, and so it's a little hectic,
11 and the radio traffic is a little hectic, and they're
12 trying to expand the structure, but it takes time to
13 catch up.

14 So our first assignment was to go protect the
15 heavy equipment grounds at Butte College. Heavy
16 equipment being bulldozers, graders, all that stuff. So
17 what does heavy equipment do? They push dirt. What's
18 our job? To clear stuff to dirt.

19 So we got there, and we're like, someone didn't
20 quite think this assignment all the way through. So in
21 lack of assignment -- or in lack of orders, we go and
22 find work. So our strike team leader said, "Hey, we're
23 going to drive up Clark Road, let's cruise up there and
24 see what we can find."

25 So we drove up to -- I'm not positive what
26 street, couple above Rattlesnake Flat. We stopped. And

1 our strike team leader in his pickup truck said, "Hey,
2 I'll back, I'm going to drive down this road to see what
3 I can see."

4 He drives down there, comes back. He said
5 there's three houses down there, but they're well
6 protected, so we don't need to go in there, there's
7 really nothing to do; plus, the fire is right there. So
8 we back, back down, coming towards Butte College. So the
9 next --

10 Does -- everyone has a copy of this?

11 Q. Yeah. Do you want to --

12 A. If you want to load it up.

13 Okay. So we back down to this house right
14 here, and we came in this road, and this house kind of
15 sits on a knob above this whole valley right here. And
16 we got in there, we said, "Oh, this is the perfect place,
17 one, for CDCR to be, because we want to put them in very
18 safe places." Then two, we looked across the valley and
19 there was a house on this other side. At this point, the
20 fire was burning way -- still quite a ways up here. It
21 was out in the Butte over here.

22 Q. I'm going to interrupt you for a second,
23 because the court reporter has to take everything down.

24 So you were pointing at a house a little ways
25 off of Clark Road that's up on a little bit of a hill.
26 That was the first house you were pointing at?

1 A. Yes.

2 Q. Okay. And then you said there's another house
3 over here, that was slightly off the picture to the east,
4 and you said the fire was burning up there; is that
5 accurate?

6 A. Yeah. It was, it was burning -- in
7 relationship to the Butte that was over here, because
8 this is a Butte on this side, it was on top of the Butte,
9 because the wind that day, and it was pushing along the
10 Butte. But it wasn't in this valley. There was no wind
11 in there. It was super calm.

12

13 (Grand Jury Exhibit 1376 was marked for identification.)

14

15 Q. Then, Chad, we're looking at Exhibit 1376; is
16 that correct?

17 A. Yes.

18 Q. Okay.

19 A. So where was I? So we meet here, we pull all
20 the busses out.

21 Q. "Here" being the house on the hill?

22 A. The house on the hill. And we tell CDCR to
23 stage there, we're going to take and go across -- and
24 Rattlesnake Flat is actually down here. The line is up
25 there. But we're going to go down to this road right
26 here that cuts across the whole valley.

1 Q. Which is Rattlesnake Flat.

2 A. Which is Rattlesnake Flat. Off the screen,
3 what you can't see, is there's a train car bridge right
4 here that we didn't feel was safe enough to drive the
5 busses across. So we drove all the way across, then we
6 stopped right there, and then the strike team leader
7 drove up to that house that would be off to the east side
8 of this picture.

9 He got up there, he shot some video, took some
10 pictures, came back down, and the three of us got
11 together and we kind of looked at it. And he was like,
12 "Man, we could do something, but the problem is there's
13 no easy way for us to get out. It's not -- it's a huge
14 risk for not a lot of gain." So we decided let's not do
15 that, let's come up with another plan.

16 So the plan that we had come up with -- and,
17 like I said, there was barely any wind down here. If
18 anything, the wind was blowing to the north. We said,
19 "Okay, we'll fire this road right here."

20 Q. What does it mean by "fire"?

21 A. We'll light a backfire.

22 So one of the things that we can do to, besides
23 cutting line, is also to burn fuel. If we already have a
24 road or a line or something there that we can hold the
25 fire against and we can light with that and have the fire
26 burn back into itself -- like I said, the wind was

1 actually, at this point, was blowing or sucking back into
2 the fire. So if we lit a fire here, it would burn that
3 way. That would, that would create what we like to call
4 "black," pretty much burned fuel. Where once the fire
5 hits that black, it's going to go out, because there's
6 nothing there for it to burn. And it was a great spot to
7 do it because this is all grass.

8 You see there was some brush up here, but where
9 we were going to burn was pretty much all grass. And so
10 it's super receptive fuel bed and very easy to do if the
11 conditions are right.

12 Q. Were the conditions right?

13 A. Yes. At that point, up to until I got burned,
14 everything was going as planned.

15 So we came up with this plan to construct line
16 off Rattlesnake Flat Road. At this corner, we were going
17 to get a dozer. And, as you can see, there's kind of a
18 riparian zone or dry creek bed right here. We were going
19 to get a dozer to start punching line there, going to
20 punch it all the way around the Butte, and just keep
21 going, lighting fire, and just save as much as we can.
22 There were a number of houses down south of here and off
23 to the corner.

24 You know, and that's what we get paid to do is
25 to formulate these plans and to execute these plans and
26 to do the best good that we can with what we're dealt

1 with.

2 Q. Now, you said this was a plan that you and the
3 other captains came up with?

4 A. Yes.

5 Q. Have you ever calculated about how much
6 experience the three of you had?

7 A. So I think between the three of us, I had 17
8 years, Badie (phonetic) had 17 years, and the other
9 captain had probably close to 30 years. So just between
10 the three of us, let's say that's, let's call it 60 for
11 ease of math. But when we came up -- that was when we
12 came up with the initial plan. Then, when we were going
13 to actually do this firing operation, we had a battalion
14 chief that had another 30 years, then an engineer that
15 had another probably 10 years. So we had over a hundred
16 years of fire experience when we had our briefing right
17 here, leaning into the battalion chief's truck with all
18 fire.

19 Q. Where were the CDCR busses?

20 A. The CDCR busses were parked -- I know you can't
21 really see right here, but there's kind of a dirt path
22 right here. And the CDCR busses were parked right here.

23 Q. So that's right before the turn on Rattlesnake?

24 A. Yeah. Right before the turn on Rattlesnake.
25 When you come to that turn, there's a telephone pole, you
26 can barely see it right here. Right off that, there's a

1 little dirt path. And we parked the busses right on the
2 dirt path.

3 Q. We're going to see if we can zoom in at all.

4 Okay. So are you able to see the --

5 A. Yeah, it's, it's right here. You guys can
6 barely see it.

7 MS. DUPRE-TOKOS: Marc, can you set it up so he
8 can circle it?

9 MR. NOEL: Yep.

10 Q. (By MS. DUPRE-TOKOS) We're going to have you
11 -- it's a touch screen TV, so we're going to let you
12 circle --

13 A. Okay.

14 Q. -- where things are.

15 MR. NOEL: Best pen to use is the plunger end
16 of this. And let me get this going.

17 Q. (By MS. DUPRE-TOKOS) So injury site is already
18 marked?

19 A. Yep. It's hard to -- it's right in there.

20 Q. Okay.

21 MR. NOEL: Okay. So just go ahead.

22 THE WITNESS: So you want to know where the
23 busses were parked?

24 Q. (By MS. DUPRE-TOKOS) Yes. If you can circle
25 where the busses were, and write "bus."

26 A. Okay.

1 Q. And then if you could circle where the
2 telephone pole was, or is.

3 A. Telephone pole. Okay.

4 Q. And is the injury site not quite accurate? If
5 you want to put an X where you feel it might be more
6 accurate.

7 A. I feel it's probably closer to there.

8 Q. Okay.

9 A. But -- okay.

10 Q. So seems from what you said that you met with
11 the battalion chief somewhere around the telephone pole?

12 A. Yeah. So the battalion chief was parked right
13 here, because --

14 Q. "Right here," being right by the telephone
15 pole?

16 A. Right by the telephone pole. Just to the west
17 of the telephone pole, we cut the fence right there, when
18 we had got the crews up to the road. So I remember we
19 cut the fence, and then I told my crew to wait there, and
20 then I walked up and we had this quick pre-fire,
21 pre-operational briefing I would call it. So where
22 everybody talks about, is it a go? No go? What are we
23 looking at? What are we going to do? Who is doing what?
24 Kind of all those important things. Where we're
25 starting, where we're stopping. Yeah.

26 Q. So where was the fire at this point?

1 A. So the fire at this point was still to the
2 north of us, and it was back quite a ways. I would say
3 it was a half mile. It was closer than when we first got
4 in this valley, but it was still up there. And the wind
5 was still in our favor when we had that briefing. The
6 wind was still pushing back this way. Not really good,
7 but it was still going the direction we wanted it. It
8 hadn't changed. And that was one of the things I
9 remember we had in that conversation was the wind hadn't
10 changed the whole time we had been there. At this point,
11 we had been there for a while. Like I said, we drove
12 across, we looked at the other house on the hill, we came
13 back. It takes a while to get a bulldozer to come. We
14 had been there for an hour, two hours. So -- and in that
15 whole time, we even said, "Hey, the wind's been in our
16 favor the whole time, this is a solid operation, we can
17 do some good work."

18 Q. So once you had your plan of attack, what did
19 you do?

20 A. So the strike team leader loaded up -- the
21 strike team leader was at the telephone pole also with
22 his pickup truck. He loaded up I want to say two, maybe
23 four inmates with him. He took them off to the west. He
24 was going to start firing at Clark Road and where
25 Rattlesnake Flat starts. He was going to bring fire from
26 there headed to the east.

1 The other crew was going to be kind of in the
2 middle there, and they were going to, they were going to
3 take fire from when they, when the strike team brought it
4 to them, and then continue on.

5 Then my job was, I was going to be here, and I
6 was going to take the fire from here, and we were going
7 to go up this road and kind of keep it in check. What we
8 didn't want to do was this thing to take off to the races
9 and get around us. So my job was more to kind of keep it
10 in check when it got here and not let it go super fast
11 up.

12 Q. And "here" being --

13 A. At the --

14 Q. -- injury site, right around where the road
15 curves?

16 A. Yeah.

17 So when we parked the busses, I loaded up the
18 crews, I got to this fence. I remember cutting the
19 fence, because the fence was brand new. When I cut it
20 with my Leatherman tool, I remember the strands of barbed
21 wire popping. And normally you don't have that with a
22 lot of barbed wire fences that have been there for a
23 while. But this one was fairly new. So I just wanted to
24 add that in.

25 So we have our briefing, the strike team leader
26 takes off to the west, the other crew takes off to the

1 west, and I kind of sit there for a second, and I'm just
2 kind of checking everything out. Then I took my crew and
3 I walked them past the injury site and then turned back
4 around and walked them back.

5 The reason why I did that is the swamper has
6 the radio. I want the swamper at the other end of the
7 line from me. I don't want to line them up like this and
8 me stand right next to the swamper. Plus, the people
9 that use the drip torches are right behind the saw teams.
10 The saw teams are right in the front, right behind the
11 captain, then I had the drip torches right behind them.

12 The rest of the crew, their job is to make sure
13 that when we burn this and it goes to the north, that
14 nothing gets to the south. If something gets on the
15 south, their job is to, one or two of them, get over
16 there as quickly as they can, stomp it out or put it out.
17 Because we don't want to stop burning, and we want to
18 catch anything that gets on that side, because that's
19 what we don't want burned.

20 So I walked down, and I did a U-turn with my
21 crew, and I walked back. And they made a remark about
22 the cows. There were cows out here in this field. And I
23 probably used some expletives, like "I don't really care
24 about the cows." I was worried about doing this firing
25 operation.

26 Firing operations are also -- they're intense.

1 You're laying fire on the ground, you're watching the
2 environment around you, and things can change very
3 quickly. So it's a very intense operation. And all
4 summer -- we had been burning a lot that summer, and I
5 remember that was one of the things that the guys said,
6 "I can't believe Chad got burned, because he's the --" I
7 had a motto: "It's just grass, it's just going to grow
8 back next year, it's not worth one of us dying over." So
9 a lot of times this summer I turned down operations that
10 I felt like were unsafe.

11 I even -- like if we were out doing a burning
12 operation, the other captain will sit there and tell
13 jokes and stuff, I was just like, you know, I don't have
14 time to talk about it, I'm focusing on the 16 inmates
15 that I have and the operation that we're doing.

16 So I probably said, "I really don't care about
17 the cows, and we just need to focus on what we're doing."

18 So sometime after that, I think from the time
19 that we had the briefing at the telephone pole to the
20 time I got burned was probably five minutes or less.

21 So I had my whole crew lined out, and I was
22 kind of walking back and forth just kind of checking
23 things out. I, I, I had one other critical piece of
24 information. When I was walking over there -- my gloves
25 hang right here on my shoulder strap. And I looked at
26 them and said, "Oh, put your gloves on." I was like,

1 "Wait a second, let's wait until the torches get lit,"
2 because assembling a drip torch, there's a couple
3 critical things you have to do. If you forget one of
4 those things, you have to take the whole thing apart,
5 start over. There's a nut on the bottom that has to be
6 moved from one place to another. If you don't do that,
7 then you have to take it apart.

8 Well, like I said, we burned a lot that summer
9 and there were multiple times where I would walk up,
10 forget I had my gloves on, now I have my gloves in
11 gasoline and diesel, then it's like you just made your
12 gloves flammable. So I didn't have my gloves on, and
13 that was my reasoning.

14 Normally what I'd do, I'd help with the drip
15 torches, I'd rub my hands in a whole bunch of dirt to
16 take as much of that fuel off as possible, then I would
17 put on my gloves. Then the lighting of the torches
18 sometimes is difficult, too. So, yeah, that was -- I
19 didn't have my gloves on.

20 So I'm standing here, I have my crew, and at
21 some point I turn toward the west and I see fire racing
22 past the road. At this point, I think this day's not
23 going quite as well. I turn to the east, and right kind
24 of north of the injury site, as I remember, there was a
25 little rise there. Not a lot, just a little. And the
26 plan was, "Hey, if this goes south, all we're going to do

1 is we're going to walk back through that fence and walk
2 down to the busses. You want to park the busses
3 somewhere it's not going to burn, because it looks really
4 bad if you burn up a bus.

5 Wherever you'd park the busses, we'd also cut
6 scratch line, clearing the dirt down to bare mineral
7 soil. Not a four-foot scrape, but just enough, maybe a
8 foot or two, to where if a fire comes, it won't burn the
9 bus up.

10 So the plan was -- so I saw the fire cross to
11 the west, I turned back to the east, and the fire was
12 already burning through that area. At this point --

13 Q. And "that area" being the little hill?

14 A. Right where the telephone pole was. Right
15 where our escape route was going to be.

16 At this point, I'm starting to freak out a
17 little bit, not too bad. I turned to the barbed wire
18 fence. All summer I had stepped over barbed wire fences.
19 I turned around, watched all the inmates in orange
20 struggle to get over this fence. I was last. I'm 6'2, I
21 can step over things pretty easy. Plus, that's part of
22 my job. I've been doing it for a long time.

23 I go to the fence, and it's a five-strand
24 barbed wire fence, so it's taller, as I recall, right
25 around five feet, maybe four and a half. And I kicked
26 the fence, and the fence didn't move one iota. I, then I

1 really started ramping it up. I turned and looked at the
2 road and noticed just all the hot gases going across it.

3 And the thing that kills you when you get in a
4 fire shelter is not heat, it's you take one breath of hot
5 gas, hot air, and that's what kills you. Everything
6 could burn around you, but if you, if you take one breath
7 of that, you're dead.

8 And I remember just seeing it just pumping
9 across the road and just thinking "Fuck, like we cannot
10 -- we can't do that." I'm yelling at the drip torches to
11 get lit, because the other plan is the drip torches will
12 light some of the grass on fire, and it will be enough
13 buffer to where we can step into that and let everything
14 burn around us. I'm screaming at them to get there. And
15 it was so windy, they literally couldn't get them to
16 light.

17 So at this point, I think we got to get over
18 the fence and we got to get back to the bus. I think one
19 inmate was already kind of on the fence, and he was
20 struggling to get over it, because it was a tall barbed
21 wire fence, and it was hard.

22 I had the thought in my head, two men are in a
23 fox hole, a grenade comes in, somebody's got to jump on
24 that grenade. So I walked over to the fence, I put my
25 foot on the third piece of barbed wire up, I grabbed them
26 strands above it, and I created an opening for 16 men to

1 crawl through. And I stood there burning while they all
2 got through.

3 I know I was burning because later on I ran
4 into the crew in Davis where I live, and I was dropping
5 my kids off at school, and I saw the bus, and it was Crew
6 2. I said, "Man, I haven't seen those guys, I'm in an
7 all right place, like I've been going to therapy. I want
8 to go see them and see how they're doing." And so we got
9 to talking, and they were really excited to see me. And
10 one of the things they said -- I finally asked them, I
11 said, "Hey, man, how are you guys doing?"

12 One of the guys said, "Man, I'm messed up,
13 Cap."

14 I said, "Why?"

15 He said, "I can't get those screams out of my
16 head."

17 I said, "What screaming? What are you talking
18 about?"

19 He said, "You were screaming. You were
20 screaming in the fence that you were burning."

21 When you go through something that traumatic,
22 your brain shuts it off. And I didn't even remember
23 that. I still don't remember. There's bits and pieces
24 in there that I don't remember. I know it happened, but
25 my brain won't let me access it yet. I don't know if it
26 ever will. And some days I don't know if I ever care to

1 access it.

2 Q. Chad, we're going to take a short break.

3 A. Okay.

4 MS. DUPRE-TOKOS: Madam Foreperson, about ten
5 minutes?

6 GRAND JURY FOREPERSON: Yes. Fifteen minutes.
7 Should we do the admonition?

8 MR. NOEL: Yep.

9 MS. DUPRE-TOKOS: Yes, please.

10 GRAND JURY FOREPERSON: Captain Carothers, you
11 are admonished not to discuss or disclose at any time
12 outside of this jury room the questions that have been
13 asked of you or your answers until authorized by this
14 Grand Jury or the Court. A violation of these
15 instructions on your part may be the basis for a charge
16 against you of contempt of court. This does not preclude
17 you from discussing your legal rights with your own
18 attorney.

19 Captain Carothers, what I have just said is a
20 warning not to discuss this case with anyone except the
21 Court, your lawyer, or the district attorney. Do you
22 have any questions?

23 THE WITNESS: No, I do not.

24 GRAND JURY FOREPERSON: Thank you. We'll take
25 a 15-minute break.

(Break taken.)

GRAND JURY FOREPERSON: All members of the
Grand Jury are present and ready to proceed after break.

Captain Carothers, I'd like to remind you that
you still are under oath.

THE WITNESS: Yes, ma'am.

Q. (By MS. DUPRE-TOKOS) Okay. So I think where
we left off --

MR. NOEL: Oh, let me make a record first.

The 1376 that's up on the board, the copy up on
the Smartboard he's been writing on is annotated has been
saved, and we will have that marked as 1376A. It's
actually being printed right now. It will be carried
across the street for us in a few minutes, but just so
it's clear.

(Grand Jury Exhibit 1376A was marked for
identification.)

Q. (By MS. DUPRE-TOKOS) So basically where we
left off was you were stepping on the third strand of
barbed wire, holding up the fourth strand.

A. So I'm there, I'm holding the barbed wire, I'm
yelling at -- there's still one guy with the drip torch
that's trying to get it lit, and he was the last guy
through. And I'm screaming at him, and I remember

1 looking back and, I mean, it's just coming at us, it's a
2 wall of fire literally coming at us.

3 He finally goes through, and I thought at that
4 point, it was like, "Man, I'm going to, I'm going to
5 dodge this bullet, I'm going to make it out of this thing
6 unscathed." I stepped, I kind of get low, crawl through
7 the barbed wire. And when I get through, I pull my other
8 leg up, and I go to go, well, my web gear that I was
9 wearing was caught on a piece of barbed wire. And so at
10 this point, I just start fighting like a caged animal.
11 And I am fighting to get out of this barbed wire and
12 fighting. Finally, my helmet falls off. It falls
13 approximately five, six feet in front of me.

14 I got that red helmet when I became a captain,
15 and spent a lot of time in the summer wearing that
16 helmet. And the most important thing to me is my family.
17 So I put pictures of my kids on the brim. And that
18 helmet just melted. And I finally said, "Chad, you've
19 got to stop, you're going to fall down, you're going to
20 breathe in some hot gases, and you're going to die."

21 So I stopped and I stood up, and I took my arms
22 from here, and I brought them up like this. As soon as I
23 did that, I could see the white patches where the
24 third-degree burns were on my forearms. That was the
25 first point that I knew that I was actually burned, when
26 I saw those white patches.

1 I look out, the bus is maybe a hundred feet
2 from me, maybe 200 feet. Inmates are kind of scattered
3 everywhere. And I just stood there and I let the fire
4 just kind of burn past me.

5
6 (Grand Jury Exhibit 1373 was marked for identification.)

7
8 (Grand Jury Exhibit 1374 was marked for identification.)

9
10 Q. And up on the --

11 Actually, go back one more, I'm sorry.

12 On the board we have 1373. Do you recognize
13 that photograph?

14 A. This is my fire helmet from that day.

15 Q. Then 1374, what is that picture of?

16 A. This is a picture looking in the bottom side of
17 my helmet on the brim, and you can see both my kids.
18 There's one right here, and here's the other.

19 Q. So after the -- and those are photographs of
20 your kids; correct?

21 A. Yeah, we got photos I think in 2017 of both of
22 them from the school. And they're just kind of little,
23 little like stick-on photos. And somehow they made it
24 for two summers.

25 Q. How old are your kids at the time?

26 A. One and three.

1 Q. So you stopped fighting, you saw the bus about
2 a hundred yards away. You made it to the bus?

3 A. No. No.

4 Q. So what happened? You stopped fighting?

5 A. So my helmet fell off, I'm watching my helmet
6 melting, I finally stop fighting, I'm holding my arms, I
7 see the white char on both my forearms, realize I'm
8 burned. And I just stop, and I stand there, and I let
9 everything just burn past me. I remember looking down at
10 my pant legs, and they were just getting charred by all
11 the fire.

12 And, finally, everything burns past me, and I,
13 I said, "Okay, it's time to get out of this fence." So I
14 stick my right leg back through, I turn, I get low. And
15 when, when I stand up, one of those cows charges right at
16 me. And I thought to myself, "They're going to find this
17 dead, burned-up fire captain that got trampled by a
18 bull." I'm like, "My day cannot get any worse at this
19 point." It stopped, we had a moment. I guess it's
20 sacred land or something, I don't know. And it went to
21 its left.

22 And at that point, I saw the one inmate that
23 hadn't gone through the fence that had run through the
24 fire, and he was off maybe 200 feet to the left. So I
25 went to, to go get him. And when I got him, he had
26 first- and kind of second-degree burns on his face, and

1 the skin on his face had peeled down. And I thought,
2 "Oh, man, he looks kind of messed up, I wonder what I
3 look like."

4 So I got him, and I walked back to the bus. I
5 walked through the opening in the fence, and I walked
6 back to the bus. And I started to try and triage the
7 inmates and find out who was burned. At this point, I
8 really wasn't worried about myself. I was more worried
9 about I have these men that I'm in charge of, and I need
10 to make sure they're taken care of.

11 So we start triaging. There was the guy that
12 had the burns on his face, and there was another guy that
13 had facial burns. And that was it. There was two that
14 came up. And so I'm trying to get them treated with the
15 Cal Fire burn kit. And I see the other fire captain with
16 other crew come walking up. So I kind of have given my
17 crew some direction, "Hey, start taking care of these
18 guys, cool with this water." And another captain comes
19 walking up.

20 At this point, I hadn't called on the radio
21 yet, because I was still trying to assess and see if it
22 was more than two. The crew was, for lack of a better
23 term, very shell-shocked. It was -- yeah.

24 So the other fire captain comes walking up, I
25 said, "Hey, I got burned."

26 And first question he asked, "Hey, have you

1 done the radio traffic?"

2 I said, "No, I have not. If you can handle
3 that, I'll take care of my guys that are burned." I
4 asked him, "Are any of your guys burned?"

5 He goes, "I don't think so."

6 And that was the conversation. He kind of
7 walked off a little bit. The other crew assisted with my
8 two guys. And at this point, I started getting my Nomex
9 cut off me.

10 Q. What is Nomex?

11 A. So Nomex is our outer layer. With Cal Fire, at
12 that point, you wore two layers. You had a regular layer
13 of fire-resistant pants, and then you had a hundred
14 percent cotton shirt that you wore, and then on top of
15 that, you wore yellow Nomex, what is a flame-resistive
16 clothing, I want to say. Resistive, I think.

17 Q. That's the yellow suits that we see Cal Fire
18 people wearing?

19 A. Yeah. We're yellow; the inmates have orange
20 suits. Yeah, same stuff.

21 So the other fire captain starts doing the
22 radio traffic. And, like I said earlier, it's the first
23 day of a big fire, so the radio was kind of been just
24 chattering all day, and it's hard to even get in. It's
25 hard to get people to respond back to you.

26 So he does -- I'm lost for what the term is,

1 but pretty much broadcasting emergency, and it's supposed
2 to clear the channel. It just didn't really happen. But
3 what did happen was our strike team leader heard it, and
4 he got in his truck and beat feet down there. And he
5 shows up.

6 And I remember at this point I had my Nomex, I
7 had my web gear off, because someone had to help get that
8 off, and I had my Nomex off. And I walked up to him, I
9 said, "Hey, man, I'm sorry --" and, like I said, I had
10 been with this guy all summer, we had fought a lot of
11 fire. And he's still the same rank as me, but in the
12 confines of a strike team, he's kind of the supervisor.
13 And I felt really bad telling him, "Hey, man, I got
14 burned, I'm sorry."

15 And he's like, "No big deal. No big deal."
16 Like, "Have you got treated yet?"

17 And at that point, I hadn't had any treatment
18 yet. And he instantly, he's like, "Get to the inmates."
19 I remember, they came over, and the look on their face
20 was kind of -- wasn't a normal look. It was -- I don't
21 know if it was sadness or scaredness or something. And
22 they started pouring water on me. They -- it didn't feel
23 good, didn't feel bad, didn't feel anything, but I'll
24 tell you what, when they ran out of water, I felt like I
25 was on fire. My hands and face felt like they were on
26 fire.

1 It was at that point I realized I was burned
2 pretty bad. My hands were starting to swell up. And I
3 remember I was like, "I got to call my wife. I have to
4 call my wife." My hands still worked. I was able to use
5 my phone. I walked away from everyone, and I had a very
6 short conversation with my wife. And when something --
7 she answered. I said, "Hey, I got burned."

8 "What do you mean?"

9 "Hey, I got burned. I'm on fire, I got
10 burned."

11 She said, "Well, are you all right?"

12 And I was super calm, and I -- "No, I'm fucking
13 not all right. I got stuck in the fence."

14 And she asked me, "Okay, what do I need to do?"

15 I said, "You need to call your mom, have her
16 come get the kids, and meet me at the hospital."

17 She said, "What hospital?"

18 "I don't know. So I'll call you when I get
19 more info."

20 So I, I instantly hang up, and I call her mom.
21 She's like a rock in our family. I tell her, "Jodi, I
22 got burned, I need you to be super calm. Lacy's going to
23 call you, you need to come get the kids. And Lacy's
24 going to be at the hospital."

25 She said, "Okay, no problem."

26 I think I reiterated to her, "Just make sure

1 Lacy, keep her calm."

2 "No problem."

3 So I went back and I started getting more
4 treatment. And I don't know how long we were there,
5 maybe 15 minutes, maybe half an hour. I could have -- I
6 have no idea. They loaded me into one of the fire
7 engines from one of the guys who had been there at the
8 briefing at the telephone pole from earlier, and we drive
9 down to Clark Road.

10 At Clark Road, there were two ambulances
11 waiting, one for the inmates and one for me. We parked
12 the engine. And at this point, my hands are so swollen
13 up that they don't work anymore. Everyone else gets out
14 of the fire engine, and I'm sitting there. And they're
15 all looking at me like I'm crazy, like get out of the
16 fire engine, open the door. And I'm like shaking my
17 hands like this. And, finally, someone realizes I can't
18 use my hands to open the door.

19 Door opens, I climb out, I walked up to the
20 ambulance. And I think one of the medics was kind of
21 surprised because I was still walking and -- and yeah.
22 And he asked me, "Hey, can you climb on the gurney?"

23 "Yeah."

24 I climb on the gurney, and he kind of asked me,
25 "How's your pain?"

26 And it wasn't that bad, because they hadn't

1 been putting water on me for a while. And when they
2 weren't putting the water on me, it burned, but it got
3 tolerable. I said -- they gave me some pain meds, and I
4 said, "Hey, where am I going?"

5 They said, "We're going to fly you to UC
6 Davis."

7 I said, "Okay." And I told him, "I have to
8 call my wife."

9 I couldn't, I couldn't use my hands, so I had
10 him unlock my phone and dial my wife. And I told her, I
11 said, "Hey, I'm going to UC Davis." You know, "Is your
12 mom there?" I can't remember if her mom was there or
13 not. I -- yeah.

14 She said, "Okay, I'll meet you there." That
15 was it.

16 The ambulance takes me to Butte College. The
17 helicopter is sitting there waiting. The flight nurse, I
18 think, sticks her head in, the paramedic and her have a
19 quick conversation. She asked me, she said, "Hey, can
20 you walk to the gurney?"

21 "Yeah, my legs still work, I can walk." I go
22 over, I sit down on the gurney, and at this point my
23 hands were really swollen up.

24 My grandfather made it through life with seven
25 and a half fingers, flew planes, he did all sorts of
26 stuff. And I had this crazy thought: You know, if

1 you're going to lose your fingers, it's all right,
2 because if your grandfather can make it through life, you
3 can.

4 So I get on the gurney, and they loaded me in
5 the helicopter. Said, "Hey, if you have any trouble
6 breathing, we're going to have to intubate you, just let
7 me know."

8 I said, "No, I'm fine."

9 I didn't really know how bad my face was
10 burned. I couldn't see it, it hurt, I didn't know.

11 We're flying to UC Davis in Sacramento, and I
12 remember about halfway down there I started getting
13 tired. I think the adrenaline was finally wearing off.
14 And I just wanted to go to sleep. And I told myself, "Do
15 not go to sleep, do not go to sleep."

16 I lived in Sacramento for a while, and the UC
17 Davis campus is right next to the freeway, so I've seen
18 helicopters flying in there. That day was super windy,
19 and I thought to myself, having worked on a helicopter
20 before and being in this one, I'm going to crash when we
21 go in to land. I'm having this thought. And I'm like,
22 "Really, this is how my day -- this is how it's going to
23 end?"

24 We didn't. We made it. I get in. And then
25 there's only really two more things I remember. I
26 remember the burn doctor that did my skin grafts. She

1 said, "Chad, we're going to intubate you."

2 "Okay. Whatever you guys need to do, but I got
3 to call my wife first."

4 I called my wife, I said, "Hey, I'm here.
5 They're going to stick a tube down my throat." She
6 didn't know what intubation was, so I gave her a quick
7 explanation. And then they tubed me.

8 The last thing I really remember before I got
9 skin grafts was when my wife finally got there. We have
10 a song. We squeeze each other's hands three times, say
11 "I love you." She squeezed my hand once and blisters
12 popped, fluid went everywhere.

13 So I got intubated. There were two other
14 things that happened.

15 Q. I'm going to interrupt, I'm sorry. What
16 exactly is intubation?

17 A. So I can give you a couple things. They stick
18 a tube down your throat into your lungs. And it is --
19 the reason they do it with burn victims is because what
20 will happen is if you've inhaled any hot gases, that
21 tissue in your throat will swell up and you will
22 suffocate. So to prevent that, they stick an intubation
23 tube, a plastic tube with a bulb at one end. They stick
24 it in, they blow up that bulb, now they have this airway
25 that they can continue giving you air on. They can hook
26 you to a machine. They can do it with a bag valve, all

1 that stuff. A bag valve mask.

2 Yeah. So, yeah, the burn, the burn doctor,
3 Palmieri, had looked at me, and my face was starting to
4 swell at this point, and that's why she made the
5 decision, yes, we're going to intubate.

6 Q. Okay. You said there were two other things?

7 A. Yeah, so it's the day of the Camp Fire, so
8 there's a lot of people already burned. UC Davis is the
9 predominant burn center in the area. The UC Davis Burn
10 Center is actually started by the Fire Firefighters Burn
11 Institute and started to help firemen.

12 Well, they were already full when I got burned.
13 And the Firefighters Burns, who got involved, and
14 actually they moved a patient, a tall patient, never
15 happened before, to Shriners to make room for me.

16 The next thing that happened was they told my
17 wife, said, "Hey, we don't know if we're going to do the
18 skin graft surgery today or tomorrow. We normally only
19 do three surgeries." Then they ended up doing a fourth
20 surgery that day so I could get my skin grafts.

21

22 (Grand Jury Exhibit 1375 was marked for identification.)

23

24 Q. So, Chad, I have Exhibit 1375 up on the board.
25 Can you tell us what that's a picture of?

26 A. This is a picture of my left arm. You can see

1 my face a little bit. You can see -- this is before I
2 got my graft. You can see the third-degree, full
3 thickness burn right here where there's the white
4 charring. It's -- this is debrided a little bit.
5 Debriding means they've taken some of the dead skin and
6 they've scraped it off. That's what you have to do with
7 burns, you have to get all that dead skin out to let new
8 skin grow to put the graft on.

9 Yeah, you can see the palm of my hand is -- the
10 palm, the palms on both my hands, one thing about palms
11 and burns, is they don't graft palms because the skin is
12 so thick. Also, if you think about both my hands are
13 like this on a barbed wire fence, so the palms didn't get
14 burned too bad, but everything that was exposed, got
15 burned.

16 And you can also see my face. I'm not blowing
17 my cheeks out in that picture. Your face swells up.
18 They call me "Pumpkinhead." Of course, while I'm in they
19 like to joke. They call me "Pumpkinhead" because my face
20 was as big as a pumpkin.

21 This isn't too late. This is -- I don't know
22 the time on this picture, but it's not too late after I
23 got there. And my head continued to swell I think for
24 the next day. Eventually looked like my ears were tiny
25 and just my whole face was so swollen.

26 Q. So this was taken on November 8th, shortly

1 after you got there?

2 A. Yeah, should have been shortly after I got
3 there on the 8th.

4 Q. Then the hose that we see, is that the
5 intubation?

6 A. Yeah. They actually have me intubated and have
7 me hooked up to a breathing machine so that I can
8 breathe.

9 Q. Were you conscious at this point? Or do you
10 remember this?

11 A. So, I don't remember any of this. I don't
12 remember any of it. Part of the reason is the cocktail
13 of drugs that they give you. One, you don't want to
14 remember it because it's so painful; and, two, it just
15 doesn't, it doesn't do you any good. So the drugs that
16 they give you for pain management, everything else, kind
17 of forget.

18 The next thing I remember was I finally got
19 cleared to get out of bed. And I think it was like a
20 week later. And in the burn center they had set up a
21 conference room. And that's where the family was. So
22 they didn't have to go in and out of the burn doors every
23 time, they were just in a conference room.

24 So I -- they told me, "Hey, it's time to get up
25 and walk."

26 I said, "I want to go to the conference room,"

1 and see if my mom was in there. My mother-in-law that
2 had came and picked up the kids was there. Someone from
3 the Firefighters Burn Institute was there. And my wife
4 took a picture of me walking down that hallway --
5 hospital gown, IV thing, my arms are all bandaged, both
6 sides. I remember when I turned and looked in that room,
7 the faces that looked back at me, they didn't know what
8 to think, because I was burned so bad. One hand, I think
9 they were happy because I was out of my bed, but it was
10 also the realization I was really messed up.

11 Q. So how many surgeries have you had?

12 A. So I had the one surgery for my skin grafts
13 that are from the bottom of my forearms all on the
14 outside of my hands and fingers on both hands.

15 Q. Where did that skin come from?

16 A. That skin comes off your leg. So the best
17 thing -- one of the other things they don't tell you
18 about being burned is they're going to take a cheese
19 grater and take skin off you. When you take all that
20 skin off, then you have nice, cool, red legs, and super
21 easy-to-tear skin.

22 If you look right here, it's been a year and a
23 couple months.

24 Q. And you're pointing to a spot on your right
25 thigh?

26 A. Yeah. I was coming out of the shower, and I

1 just happened to catch this on the door, and it just
2 peeled all the way back.

3 So those skin grafts, like, "Cool, you've got
4 skin grafts on your hands." But where they take it from
5 is almost like a whole nother injury and trying to deal
6 with that.

7 The worst day I had in the hospital, and -- I
8 talked to another fireman that got burned, he told me,
9 "When I saw you, I didn't want to tell you this." The
10 worst day is they take and put this stuff called Mepiplex
11 (phonetic) over your skin grafts. And they leave it on a
12 couple days to hope that that, where they've shaved all
13 that skin off heals. Then you go in the shower, like you
14 do every day, and they scrub your wounds. And they say,
15 "Hey, today's the day we're going to take the stuff off
16 your skin grafts."

17 "Okay."

18 On the burn floor, there are a lot more pain
19 meds than other floors because the injuries hurt so bad.
20 So 500 units of morphine, I think -- or Dilaudid. I
21 can't -- it was a pain med.

22 Get in the shower, they start pulling one off,
23 they're giving me more pain meds. We ran out of pain
24 meds.

25 I told the nurse, I said, "Hey, give me a
26 towel." I remember my wife was sitting right across from

1 me. She knew when I was in pain, because I would tap my
2 foot, because that was all I could move. There was a
3 nurse on each arm, nurse working everywhere, nurse
4 working on my face. I took that towel and I bit on that
5 towel. And they pulled that stuff off, and I almost
6 passed out from pain.

7 To say -- yeah, it sucks I got, my hands got
8 burned, but those grafts that you get are just as
9 painful. Because the other thing you have to remember,
10 my hands got burned so bad that I don't have nerve
11 feeling in this -- where it got grafted. I don't feel
12 any of that. So you don't feel pain. But where they
13 took those grafts off, I still had all those nerves, so
14 it hurt. And it's the same thing; you have to change
15 those dressings multiple times a day.

16 My face. You had to get shaved, usually twice
17 a day. Ended up finding a guy, one of the male nurses
18 that was really good at shaving, and he would come in and
19 shave me. And a theory with burns is, if there's blood,
20 it's good. The reason why, if you shave all that scar
21 tissue away and it starts bleeding, that means the tissue
22 is alive. If there's no blood, that tissue is dead and
23 it's probably not going to come back.

24 So, yeah, say that the burn unit is painful
25 would be the understatement of decades.

26 Q. How long were you in the burn unit?

1 A. I'm almost positive it was 20 days. It was
2 right, just right around three weeks.

3 Q. And did you go home from the burn unit, or did
4 you step down to another unit?

5 A. No. I saw multiple people get moved to other
6 units, and they kept me there the whole time, which was
7 really nice. Like I said, the Firefighters Burn
8 Institute is very big into that. It's actually called
9 the Firefighters Burn Institute Burn Center. So that's
10 why I stayed.

11 But when you go home, it's not like you're
12 healed up. You guys saw my leg, it's still not healed.
13 You can see my face, my face still. When you go home,
14 your significant other, my wife, got the joy of doing
15 showers every day with me and peeling scabs off and
16 making sure I didn't get infected and doing dressing
17 changes. And we did that for two months after I was
18 home. And I remember the big thing was when I finally
19 didn't have any more open wounds on my hands. And I want
20 to say that took until the summer.

21 My face, when they went in to do my, the graft
22 on my hands, they told my wife, they said, "We might
23 graft his face, we don't know, we got to wait until we
24 get in there." Like I said, they have to debride it, get
25 all the dead skin off, kind of get a look. It's hard to
26 assess your face. And -- yeah. So a couple months ago,

1 they said, "Hey, we might have to go back in and graft
2 your face because it's burned so bad."

3 When you get your hands grafted, you get to
4 wear -- you have to wear compression gloves. So I wore
5 compression sleeves up to here because my elbows also
6 burned, because when I was holding the fence, the fabric
7 right there was tight. You have to wear compression
8 garments. If they do a face graft, you have to wear a
9 plexiglas or UV mask for up to two years.

10 I actually wore one for a while. The problem
11 with them are, you can't have any open wounds on your
12 face because it's lined with silicone. You can't eat
13 with it. You can't drink anything with it. You can't
14 sweat with it. You literally just have to sit there with
15 it. So I'd wear it at night. But sometime in the night,
16 almost every night, I would tear it off. I don't even
17 remember. I'd wake up in the morning and it would be
18 laying there on the floor.

19 How do I not remember that? Because I don't
20 sleep. I don't sleep unless I take a sleeping pill. And
21 I've tried -- I'm on my third one now. Because my brain
22 -- my burn injuries that you can see are bad, but what
23 you can't see is how messed up my head still is. You
24 can't see. And these injuries pale in comparison to my
25 head.

26 Firemen are praised for being calm in stressful

1 situations. That's what we look for. Whole house could
2 be burning down, people could be hanging out windows, and
3 we have to make these calm, calculated decisions on who
4 to save, what to safe. When I first got home, I couldn't
5 make any decisions. I still struggle with decisions
6 every day. And stress, I can't -- I don't do stress. I
7 can't do it. Like it just -- I just, I just lose it.

8 One day I put all these yard piles out, and
9 they came to pick them up. And I had my son with me,
10 Owen, and -- because he was sick that day. I said, "Oh,
11 we'll sit out here and we'll watch them pick up the
12 piles." Big claw, kind of cool, he's one, he's going to
13 want to see it.

14 They came up and the guy said, "We can't pick
15 up your piles, they're too big." And I lost it. I -- a
16 normal person would be like, "Okay, I will take care of
17 it." I lost it. And I screamed at this guy. I called
18 him every name. I told him, "Send your supervisor out
19 because -- F him." And I lost it. And it wasn't until
20 later I realized the whole time I was losing it and
21 screaming at this man, I had my kid right here.

22 So hospital, burn.

23 So you finally go home. They don't start you
24 on depression meds right away, because they kind of want
25 to see where you fall. And then finally, I think in
26 March, finally I just hit rock bottom. My wife didn't

1 show up to my burn appointment. Normally she showed up
2 to each one of them. And it was a cry for help.

3 I had already at that point been going to
4 therapy. I started going to therapy immediately after I
5 got out, because I said -- I have PTSD, there's no -- or
6 PTSI, whatever you want to call it, there's no way you
7 can make it through this without that.

8 So I started therapy, but at a certain point
9 therapy can only do so much. So then I started taking
10 medications and doing therapy. And I had a year, yes.
11 If you told me, "Hey, man, you should go stand on your
12 head in the corner and it will make you do better," I
13 would go stand on my head in the corner. We tried
14 everything. Some stuff helped, some stuff didn't work.
15 But still, at the end of that year, your head still's
16 messed up.

17 Depression for me looks like angry outbursts,
18 just like I did to the guy that wouldn't pick up the
19 piles. And to say that my kids and wife have weathered
20 the storm is an understatement. The whole three weeks I
21 was in the hospital, I don't remember a lot of it, but I
22 know one person who does and who was there the whole
23 time. And that's my wife.

24 When you get married, you say better or worse.
25 She saw me at the absolute worst. I couldn't wipe my
26 butt for weeks because my hands were numb. I would have

1 angry outbursts about stupid things because of the
2 depression. You take this fireman, climbs up ladders,
3 saves people, does all this stuff, and you whittle him
4 down to I couldn't do anything because my hands were
5 bandaged. I couldn't do anything. I know that it's
6 probably taken a toll on her.

7 Q. So, Chad, I want to go back and just ask a
8 follow-up question real quick.

9 You said just before you got to the fence to go
10 through it, you said the wind had changed?

11 A. So what happens with fires, all this heat, hot
12 gases, smoke, and stuff goes up and it forms a column.
13 And this huge smoke column. If it gets big enough, it
14 makes this big cloud and can make a thunderhead. If it
15 gets so big, at a certain point, it can actually
16 collapse. And what happens is it takes and sends all
17 that energy that's gone up, straight down. So then what
18 happens on the fire, wind at super erratic speeds come
19 out every direction, and it pushes the fire in every
20 direction.

21 So if you look, there's -- you don't have the
22 picture of the --

23 Q. I don't have nothing.

24 A. There's a picture, and I think it was taken at
25 the same time that I got burned over. And the fire
26 literally goes over -- like I said, where we had been all

1 day in that valley, nice kind of backing fire with wind
2 barely blowing, to I don't even know how windy it was --
3 40, 50 miles an hour, instantly. And then with the
4 receptive fuel bed of grass, it can spread really
5 quickly.

6 So that's how we think, part of the reason I
7 got burned over is because it happened, it went from zero
8 to 10 million in a matter of seconds.

9 Q. So then one last thing. If you can just re-cap
10 for us what your injuries were and are.

11 A. So I have first-, second-, and third-degree
12 burns to my face from right kind of where my hairline is,
13 all the way down to where my chin, with the predominant
14 injuries being along my chin line.

15 I also have a couple in my neck. These
16 actually got removed when I had surgery. They used to be
17 worse.

18 I have second-degree and third-degree burns to
19 my hands and my forearms. Also my elbows. And I got
20 skin grafts on everything but my palm.

21 Q. And then you have where they took the grafts
22 from?

23 A. Yeah, and then the graft sites.

24 Q. Now, you said that you had the skin graft. Was
25 that the only surgery you had?

26 A. No. That's the other thing. I remember the

1 first burn thing I went and did, people were like, "Oh,
2 how many surgeries you've been in? Got one, you got skin
3 grafts, that's good."

4 No, that's not the case for skin burns. You
5 have to go in and have other surgeries. You have to, as
6 you can see, they cut so many scars out of my neck, cut a
7 huge scar out back here.

8 Q. "Here" being?

9 A. I'm sorry, behind my left ear. There was a
10 huge scar. I think because I was holding the fence,
11 turned that way yelling, giving encouragement to my crew
12 to move.

13 And then they also had to come in and do a
14 surgery on my hands. My hands actually work pretty well,
15 but I have some complaints, because, like I said, I used
16 them a lot before I got burned, so I want them back to a
17 hundred percent. I don't know if they're going to get
18 there. My thumbs won't rotate out. What does that
19 matter? Well, I've rebuilt my houses, and I can't pick
20 up a piece of plywood anymore. And it's a minor thing,
21 but it's a big thing to me.

22 So we went and had a surgery here. And they
23 cut through all this skin and cut a big Z in here.
24 Called a "Z-plasty." They did that there, on this pinky
25 on this hand.

26 Q. So on both your thumbs and both your pinkies?

1 A. No. My right thumb, my right pinky, and my
2 left pinky.

3 So I had surgery on both my hands in December.
4 When you come out of the hospital from surgery on both
5 your hands again, do you know how much of a tailspin it
6 puts you in when you go home and, once again, you can't
7 do anything? So depression kicks back in. We have to
8 climb out. Luckily, it didn't take me as long to climb
9 out, but it still took its toll. And who is there? My
10 wife, taking care of me.

11 So that's the -- the second surgery they're
12 talking about either grafting my whole face or grafting
13 part of it right here, because it pulls down my lip.

14 And another problem is, when you get burned,
15 all the skin tightens. So a lot of the people that came
16 in and talked to me while I was in the hospital that were
17 burned, they have first-degree burns on their face, and
18 when they got done, they didn't have any wrinkles on
19 their face, looked like their face was amazing, because
20 it tightens that skin. With me, because of how the burns
21 are, at night when I sleep, sometimes my eyelids don't
22 close. They're talking about going and cutting my face
23 to put more skin in it so that can help.

24 I'll probably have another surgery to get some
25 of these other scars out.

26 They're talking about doing hair removal,

1 because what happens with all this scar tissue I have on
2 my chin is the spots where the hairs still grow, it gets
3 infected, becomes ingrown hair. Talking about removing
4 that.

5 Talking about doing laser surgery on my face to
6 get color back and to soften up some of that scar tissue.

7 And I think my hands are kind of where they
8 are. They -- I have put a lot of time, energy, and
9 effort into them to get them as good as they are. And
10 they're decent. They're not like my old hands. They --
11 the skin is like baby skin, and I'm a 38-year-old man
12 that worked with my hands my whole life. So now anytime
13 I go to do anything, I have to wear gloves. I already
14 have a set of my own skin gloves that I got to put on
15 with the grafts, but now I have to wear gloves all the
16 time, because this skin just, just isn't tough. And it's
17 really bad to, to get an injury where you have a skin
18 graft, because if it gets under the graft, it could be
19 bad. It just is a bad, bad combination.

20 MS. DUPRE-TOKOS: I don't have any further
21 questions.

22 Do any of the jurors have questions?

23 Yes.

24 THE WITNESS: I'm open to anything. I'm an
25 open book.

26 (Counsel and Grand Jury Forepreson confer.)

1 MR. NOEL: All right, Captain. The jurors are
2 allowed to ask questions. They write them down, we go
3 over them, make sure they're okay.

4 THE WITNESS: Okay.

5 MR. NOEL: So the first question from the juror
6 is why did you want to stand for your testimony?

7 THE WITNESS: You know, my wife asked me that
8 the other day in the car, because it's definitely brought
9 up a lot of emotions with her. And I kind of told her,
10 "I have nothing to hide." I did the best I could that
11 day with what I had, and if, if somebody wants to hear
12 it, I'm going to tell them. I figured I was going to get
13 subpoenaed either way, so I -- my department would have
14 made me come here or the county would have made me come
15 here, so I figured, "Hey, you know what, it's a lot
16 easier just coming on your own. Come, show up." And,
17 like I said, I don't, I don't think I have anything to
18 hide.

19 I -- part of it, also, I think it's also good
20 for me. I haven't told this story in a while. I live a
21 very private life. So I haven't said it in a while, and
22 sometimes I think it's good for me to tell the story.

23 MS. DUPRE-TOKOS: And why did you want to
24 physically stand while you testified?

25 THE WITNESS: You know, I'm a very active guy,
26 and I've never had a desk job, so you put me behind a

1 desk, I feel like I'm contained and in a cage. Let me
2 stand. I can move around a little bit. I like talking
3 with my hands. I also wore shorts today because I wanted
4 you guys to see those skin grafts, where they came from.

5 It's important to me to not cover up my burns.
6 It's -- they're my story. I have to walk this life with
7 them. I know I've done a lot of reading about, about
8 injuries, and I told someone this, you know, when you
9 talk to people in the military, if they lose a leg, you
10 know what they get? They get another leg. If they lose
11 an arm, they're going to get an arm. If you burn your
12 face, there's nothing they can do. And there's no way to
13 hide it. And it's one of the worst injuries.

14 MR. NOEL: Did it surprise you how quickly the
15 fire reached your positions?

16 THE WITNESS: Yeah. I think when we were
17 having the briefing, it was beyond where Rattlesnake Road
18 comes -- goes north and then hangs a right again. And I
19 recall this distance being almost a half mile.

20 I've been a fireman for a long time, and I've
21 -- I even said, when I worked at Vina on the helicopter,
22 we probably came and I probably fought fire in this same
23 land. And so for all of us to sit here and have this
24 briefing right here -- and this is the only solace I
25 really get, because I question this decision a lot. I
26 still haven't accepted it. I'm still working on that.

1 But the solace I have is, like I said, we had a hundred
2 years of experience, we have some of the best people I've
3 ever worked with were standing there with me, and we all
4 made that decision together. And I, I've asked them, I
5 said, "Did we make the wrong decision?"

6 They said, "No. At that time, it was textbook.
7 It was exactly what we get paid to do."

8 So, yeah, to say -- when I, when I saw the fire
9 run across the road to the west of us, I instantly was
10 like, "That's not good. Let's get out of here." And
11 when I turned back east and it was already there, yes, I
12 -- and the only thing I have to explain for that is the
13 crazy weather.

14 MS. DUPRE-TOKOS: Marc, can I have one second?
15 We've got one more question.

16 Do you want to see it?

17 MR. NOEL: On November 8th, 2018, with several
18 experienced fire crew members, why was there not a safe
19 plan in place for escape established for everyone?

20 THE WITNESS: So that was our -- you know, a
21 part of, part of everything we do is we build in that
22 escape route. And that was our escape route. Like I
23 said, we were only a hundred feet to this fence and back
24 through. That was my plan, was to go back, walk through
25 that, and stand there and watch it all kind of burn
26 around us. And that was the plan. And then when that

1 fire went across that way -- or, I'm sorry, came from the
2 north down and cut that route off, that's when I went and
3 quickly reassessed and tried to figure out a different
4 plan.

5 MR. NOEL: And, just briefly, a follow-up on
6 something earlier, you said that your one inmate
7 firefighter would -- gone off, that he also had burns?

8 THE WITNESS: Yeah. So there was one inmate --
9 the other injuries that happened that day from this
10 event, one inmate fell when he was climbing through the
11 fence, and he sustained burns to his face; the other
12 inmate ran through the fire. But what happened was on
13 this --

14 MS. DUPRE-TOKOS: You pointed north when you
15 said "up."

16 THE WITNESS: He ran north.

17 The other problem, this road had barbed wire
18 fences on both the north and south sides of it, so he ran
19 north. He hit the barbed wire fence on the north side.
20 Luckily, that fence wasn't nearly as stout as the one we
21 were going through, but he still fell down. Then he -- I
22 don't -- I'm sorry, I don't know if he fell down or what
23 had happened, but I know he said he had a problem with
24 the fence and that his face was burned.

25 MR. NOEL: Second- or third-degree?

26 THE WITNESS: I think his was second. It might

1 have been first.

2 MR. NOEL: Okay.

3 THE WITNESS: Both the two inmates got released
4 -- they both went to the burn center, but they both got
5 released from the burn center that night.

6 MR. NOEL: Okay. And these were inmate
7 firefighters; correct?

8 THE WITNESS: Yes.

9 MR. NOEL: And, finally, this isn't really a
10 question, just a statement from the jurors. It says,
11 "Thank you for your heroism that probably saved the lives
12 of several of your crew that day."

13 THE WITNESS: You know, that's something I
14 really struggle with still. I'm -- like I said, I
15 haven't told this story in a while, and every time people
16 say that I'm a hero. And I have a really hard time with
17 that, because we wouldn't have been there that day
18 without me making those decisions. And maybe I did
19 something wrong.

20 And, also, I didn't become a fireman to be a
21 hero. I became a fireman to help people. Help people
22 that are sick, help people out of burning building, help
23 whatever. I didn't do it for metals. I didn't do it for
24 honor. I did it to help.

25 So people call me a hero, I still have a hard
26 time with. I still think, "Man, maybe I missed something

1 that day. Maybe if I was on top of my game or thought
2 something or was sharper that day nobody would have got
3 burned."

4 The other, the other three guys or four guys
5 that were there at that briefing, they all said they were
6 expecting to come back to dead bodies laying on the
7 ground. And they've told me they don't know how we all
8 lived through it, but we did.

9 MR. NOEL: I don't believe we have anything
10 further for the captain.

11 Madam Foreperson.

12 GRAND JURY FOREPERSON: Captain Carothers, you
13 are admonished not to discuss or disclose at any time
14 outside of this jury room the questions that have been
15 asked of you or your answers until authorized by this
16 Grand Jury or the Court. A violation of these
17 instructions on your part may be the basis for a charge
18 against you of contempt of court. This does not preclude
19 you from discussing your legal rights with your own
20 attorney.

21 Captain Carothers, what I have just said is a
22 warning not to discuss this case with anyone except the
23 Court, your lawyer, or the district attorney. Do you
24 have any questions?

25 THE WITNESS: No, ma'am.

26 GRAND JURY FOREPERSON: Thank you for your time

1 today. And you are amazing.

2 THE WITNESS: Thank you.

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: Would you, please,
raise your right hand to be sworn, Ms. Celentano.

JENNIFER CELENTANO
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MS. DUPRE-TOKOS

Q. Good morning.

A. Morning.

Q. And could you, please, state your full name,
spell your last name for the record?

1 A. Sure. Jennifer Celentano, spelled
2 C-E-L-E-N-T-A-N-O.

3 Q. And we've already gone through your
4 qualifications --

5 A. Yes.

6 Q. -- so we're not going to do that again. We are
7 just going to jump right into it.

8 A. Okay.

9 Q. Are you familiar with the name Joyce Acheson?

10 A. Yes.

11 Q. And why are you familiar with that name?

12 A. We consider her a Camp Fire victim.

13 Q. And was there a case number associate -- so
14 when you say a "Camp Fire victim," did she die in the
15 Camp Fire?

16 A. Yes.

17 Q. Or as a result of it?

18 A. Yes.

19 Q. Was a case number assigned to her death?

20 A. Yes.

21 Q. And is that case number 18, dash, 19805?

22 A. Yes.

23

24 (Grand Jury 1378 offered for identification.)

25

26 Q. And I'm showing you Exhibit 1378, which you

1 should also have in front of you. Do you recognize that
2 photograph?

3 A. Yes. That's Joyce Acheson.

4 Q. Okay. Now, did Ms. Acheson, or Acheson, live
5 up within the burn zone of the Camp Fire?

6 A. Yes.

7 Q. Did she live in an area that was restricted?
8 And by that I mean no one was allowed in, no one was
9 allowed out except for certain First Responders?

10 A. Yes.

11 Q. Did Ms. Acheson have some severe health
12 problems, to your knowledge?

13 A. She did.

14 Q. Was she ambulatory, meaning could she easily
15 move around?

16 A. No, she could not.

17 Q. And she was very ill?

18 A. Yes.

19 Q. Would a caregiver have been able to get to
20 Ms. Acheson in the first -- the day of the Camp Fire and
21 the first few days afterwards, based on where she lived?

22 A. No.

23

24 (Grand Jury 1379 offered for identification.)

25

26 Q. I'm going to show you what's been marked as

1 Exhibit 1379, which you should also have in front of you?

2 A. Yes.

3 Q. And do you recognize that?

4 A. Yes. It's the Death Certificate for Joyce

5 Acheson.

6 Q. And what day was she found?

7 A. She was found on November 19th, 2018.

8 Q. And she was found deceased?

9 A. Yes.

10 Q. And, again, we don't know what day she died, do

11 we?

12 A. Correct.

13 Q. And what is the cause of death that is listed

14 on that death certificate?

15 A. Pending.

16 Q. Okay. Is there the amendment or the

17 supplemental page?

18 A. Yes.

19 Q. And does that list a cause of death?

20 A. Yes.

21 Q. And what is the cause of death that's listed?

22 A. Progressive inanition.

23 Q. What is progressive inanition, do you know?

24 A. To be honest with you, I'm not going -- yeah.

25 Q. Not going to go --

26 A. Not positive.

1 Q. And is there a list of associated causes?

2 A. Yes. Vascular dementia; ischemic cerebral
3 infarction, right frontal lobe; low rectal prolapse;
4 protein calorie malnutrition; squamous -- squamous cell
5 carcinoma, left shoulder; severe anemia and dehydration.

6 Q. And based on your training and your work as a
7 coroner's investigator, some of those things, such as
8 the dehydration, would that be consistent with someone
9 who was essentially bedridden and unable to get to food
10 and water?

11 A. Yes.

12 Q. And, as I recall, you told us that the list of
13 causes of death, things like accident, things like that,
14 what's checked off for Ms. Acheson?

15 A. Let's see. Natural.

16 Q. Okay.

17 Nothing further at this time.

18 Do the jurors have any questions?

19 Okay. I believe you need to get the
20 admonition.

21 THE WITNESS: Okay.

22 GRAND JURY FOREPERSON: Investigator Celentano,
23 you are admonished not to discuss or disclose at any time
24 outside of this jury room the questions that have been
25 asked of you or your answers until authorized by this
26 Grand Jury or the Court. A violation of these

1 instructions on your part may be the basis for a charge
2 against you of contempt of court. This does not preclude
3 you from discussing your legal rights with your own
4 attorney.

5 Investigator Celentano, what I have just said
6 is a warning not to discuss this case with anyone except
7 the Court, your lawyer, or the district attorney. Do you
8 have any questions?

9 THE WITNESS: No.

10 GRAND JURY FOREPERSON: Thank you for your time
11 today.

12 THE WITNESS: I just wanted to say, really
13 quickly, thank you to all of you for being here. It
14 really means a lot that you stuck through it and stayed
15 here for these victims of fires. Well, thank you.

16 And everybody else.

17 GRAND JURY FOREPERSON: Thank you.

18 [DISCUSSION OMITTED.]

19

20 (Grand Jury 1378, 1379 admitted into evidence.)

21

11
12 (ROLLCALL OMITTED.)

13
14 MR. RAMSEY: And so . . .

15 GRAND JURY FOREPERSON: We asked to have you
16 come over because we have come to an agreement on our
17 decision. Our decision is to indict on all counts.

18 MR. RAMSEY: All righty. Thank you, Madam
19 Foreperson.

20 It's at this time that we will then go ahead and
21 get the judge to come in, and we'll have that judge come
22 in and take the formal Indictment from the foreperson.

23 GRAND JURY SECRETARY: Should we clear off the
24 bench?

25 MR. RAMSEY: A little bit, yes. That would be
26 good.

1 MS. DUPRE-TOKOS: Off the record for a second.

2 [Whereupon Judge Merrifield takes
3 the bench at 11:29 a.m.]

4 HONORABLE JUDGE MERRIFIELD: All right. Good
5 morning, Ladies and Gentlemen.

6 Will the clerk please call the roll of the grand
7 jury.

8 THE COURT CLERK: After your name, please answer
9 with "present."

10 Grand juror number one Ms. [Name redacted]?

11 GRAND JUROR NUMBER ONE: Present.

12 MR. NOEL: It should just be the numbers.

13 MS. DUPRE-TOKOS: It's confidential.

14 MR. NOEL: Not the names.

15 THE COURT CLERK: Okay.

16 Grand juror number one?

17 GRAND JUROR NUMBER ONE: Present.

18 THE COURT CLERK: Grand juror number two?

19 GRAND JUROR NUMBER TWO: Present.

20 THE COURT CLERK: Grand juror number three?

21 GRAND JUROR NUMBER THREE: Here.

22 THE COURT CLERK: Grand juror number four?

23 GRAND JUROR NUMBER FOUR: Here.

24 THE COURT CLERK: Grand juror number five?

25 GRAND JUROR NUMBER FIVE: Here.

26 THE COURT CLERK: Grand juror number six?

1 GRAND JUROR NUMBER SIX: Here.
2 THE COURT CLERK: Grand juror number seven?
3 GRAND JUROR NUMBER SEVEN: Present.
4 THE COURT CLERK: Grand juror number eight?
5 GRAND JUROR NUMBER EIGHT: Present.
6 THE COURT CLERK: Grand juror number nine?
7 GRAND JUROR NUMBER NINE: Here.
8 THE COURT CLERK: Grand juror number ten?
9 GRAND JUROR NUMBER TEN: Present.
10 THE COURT CLERK: Grand juror number eleven?
11 GRAND JUROR NUMBER ELEVEN: Present.
12 THE COURT CLERK: Grand juror number thirteen?
13 GRAND JUROR NUMBER THIRTEEN: Present.
14 THE COURT CLERK: Grand juror number fourteen?
15 GRAND JUROR NUMBER FOURTEEN: Present.
16 THE COURT CLERK: Grand juror number fifteen?
17 GRAND JUROR NUMBER FIFTEEN: Here.
18 THE COURT CLERK: Grand juror number seventeen?
19 GRAND JUROR NUMBER SEVENTEEN: Present.
20 THE COURT CLERK: Grand juror number eighteen?
21 GRAND JUROR NUMBER EIGHTEEN: Yes.
22 HONORABLE JUDGE MERRIFIELD: All right. Thank
23 you. It does appear that a quorum of the grand jury is
24 present. I note 16 jurors.
25 Ms. Foreperson, does the grand jury have an
26 Indictment to present to the Court at this time?

1 GRAND JURY FOREPERSON: Yes, Your Honor.

2 HONORABLE JUDGE MERRIFIELD: All right. Thank
3 you.

4 All right. Ms. Foreperson, the Court would
5 inquire of you as foreperson of the grand jury of this
6 county four questions. First, did all of the grand
7 jurors present now hear all the testimony taken?

8 GRAND JURY FOREPERSON: Yes, Your Honor.

9 HONORABLE JUDGE MERRIFIELD: Second, was this --
10 the Indictment found and returned by the concurrence of
11 at least 12 grand jurors?

12 GRAND JURY FOREPERSON: Yes, Your Honor.

13 HONORABLE JUDGE MERRIFIELD: Thank you.

14 Third, are the names of all the witnesses
15 examined before the grand jury endorsed on the
16 Indictment?

17 GRAND JURY FOREPERSON: Yes, Your Honor.

18 HONORABLE JUDGE MERRIFIELD: And lastly, did you
19 personally sign the Indictment endorsed therein a true
20 bill?

21 GRAND JURY FOREPERSON: Yes, Your Honor.

22 HONORABLE JUDGE MERRIFIELD: All right. And for
23 the record on behalf of the district attorney's office
24 appearances.

25 MR. RAMSEY: Appearances. Mike Ramsey, district
26 attorney.

1 MR. NOEL: Marc Noel, supervising deputy
2 district attorney.

3 MS. DUPRE-TOKOS: Jennifer Dupre-Tokos, deputy
4 district attorney.

5 HONORABLE JUDGE MERRIFIELD: All right. Thank
6 you.

7 It does appear that the Indictment has been
8 properly found and returned by the grand jury and
9 presented to the Court all in the form and matter
10 required by law. Therefore, the Indictment is ordered to
11 be filed with the clerk now in the presence of the grand
12 jury.

13 And, Mr. Ramsey, as to appearance of the
14 defendant.

15 MR. RAMSEY: Your Honor, before we get to the
16 appearance of the defendant, there is a number of items
17 of evidence that have been submitted before the grand
18 jurors. We have a list of those items, and Mr. Noel will
19 present that to the clerk. And we will also present to
20 the clerk the -- the items themselves so that they may be
21 kept in a secured and confidential place as grand jury
22 exhibits.

23 HONORABLE JUDGE MERRIFIELD: All right.

24 MR. NOEL: Madam Clerk, the grand jury's
25 original exhibit list of 1,379 exhibits plus for some of
26 those exhibits there are A copies, B copies, C copies.

1 And the exhibits are all organized by folder.

2 THE BAILIFF: Just leave them on the cart,
3 please.

4 HONORABLE JUDGE MERRIFIELD: All right. And for
5 the record, I see there's six boxes.

6 MR. NOEL: There are three complete boxes of
7 exhibits.

8 HONORABLE JUDGE MERRIFIELD: All right. And
9 you're presenting those to the clerk to be received into
10 evidence?

11 MR. NOEL: Yes, Your Honor.

12 HONORABLE JUDGE MERRIFIELD: All right. The
13 Court will allow that and note that for the record that
14 they have been delivered to the clerk of this court all
15 of the exhibits that were received in evidence upon which
16 the grand jury returned this Indictment.

17 Is that correct?

18 MR. NOEL: Yes, Your Honor.

19 HONORABLE JUDGE MERRIFIELD: All right. So
20 again, as to the Court has properly found and returned
21 and accepted the Indictment. And I am handing that to
22 Madam Clerk at this time for her to file.

23 MR. RAMSEY: And, Your Honor, at this point the
24 defendant -- that would be the Pacific Gas & Electric
25 Company -- is not in custody. It is our request that the
26 Court issue a summons for that corporation to be summoned

1 to appear in the North Butte County Courthouse, 1775
2 Concord Avenue, Chico, California, on March 27th, 2020,
3 at 8:30 a.m. to answer the accusatory pleading, i.e., the
4 Indictment, for one count of unlawfully causing a fire, a
5 violation of Penal Code Section 452 with special
6 allegations under Penal Code Sections 451.1(a) (2),
7 (a) (3), and (a) (4), and for 84 counts of involuntary
8 manslaughter in violation of Penal Code Section 192(b).

9 And we will present a copy of that to the Court
10 and ask that it be signed so that we may -- and get a
11 conformed copy. We will take it upon ourselves to get
12 the defendant corporation here at that date and time.

13 HONORABLE JUDGE MERRIFIELD: All right. Thank
14 you. The Court will sign that summons and ask that that
15 also be processed by the clerk.

16 The Court is ordering the Indictment to be
17 sealed as well as any transcripts will also be ordered
18 sealed.

19 MR. NOEL: Pending arraignment?

20 HONORABLE JUDGE MERRIFIELD: Yes, pending
21 arraignment. Thank you.

22 And, Ms. Foreperson, do you have any further
23 business with this court?

24 GRAND JURY FOREPERSON: I do not.

25 HONORABLE JUDGE MERRIFIELD: Thank you.

26 MS. DUPRE-TOKOS: And I'm sorry, Your Honor.

1 There's one other matter. I believe that the court
2 reporters will need to file their transcripts with the
3 Court within ten days. And if they need additional time,
4 they would need to request that.

5 HONORABLE JUDGE MERRIFIELD: All right.

6 MS. DUPRE-TOKOS: And that they would be sealed.

7 HONORABLE JUDGE MERRIFIELD: Yes. They are
8 ordered all to be sealed.

9 Anything further?

10 MR. RAMSEY: No, Your Honor.

11 HONORABLE JUDGE MERRIFIELD: All right. Ladies
12 and Gentlemen, I know that you worked for a long time and
13 very hard. I thank you all for that and your service to
14 our community. I can't express enough how much the Court
15 appreciates the civic duty that you've all taken on. D
16 you are excused. Thank you.

17 MR. RAMSEY: And we'll go off the record at this
18 juncture. And we will just be speaking with the grand
19 jurors about ministerial matters.

20 HONORABLE JUDGE MERRIFIELD: Okay. That's fine.
21 Thank you.

22 MS. DUPRE-TOKOS: Thank you, Your Honor.

23 MR. NOEL: Thank you, Your Honor.

24 HONORABLE JUDGE MERRIFIELD: Thank you.

25 [Off the record from 11:37 a.m.
26 until 11:41 a.m.]

1 HONORABLE JUDGE MERRIFIELD: All right. Going
2 back on the record. My understanding is the Court needs
3 to order that all of the grand jurors' binders be
4 received and destroyed.

5 MR. NOEL: Yes. Collected and destroyed, Your
6 Honor.

7 HONORABLE JUDGE MERRIFIELD: All right. And I
8 see them piled around.

9 And those are all the binders that we need to
10 collect and destroy?

11 MR. RAMSEY: And we will take responsibility for
12 that, Your Honor.

13 HONORABLE JUDGE MERRIFIELD: All right. Thank
14 you so much. Thank you, Ladies and Gentlemen.

15 [Matter adjourned at 11:42 a.m.]

THE CAMP FIRE PUBLIC REPORT

A SUMMARY OF THE CAMP FIRE INVESTIGATION

June 16, 2020

PREFACE

During the early morning hours of Thursday, November 8, 2018, the Cal Fire Captain in charge of the Jarbo Gap station in the Feather River Canyon could hear the “Jarbo Winds” as they were known locally begin to howl as he got up to fix breakfast for his crew. As he fixed that breakfast he started to hear what he thought was rain begin to hit the roof and sides of the fire station. He started to look outside when the wind took the door from his hand. He discovered it wasn’t rain he was hearing, but pine needles from the surrounding forest forcibly pelting the outside of the station. He went back inside to continue fixing breakfast, but was interrupted as the station’s dispatch radio feed went off alerting him to a possible fire in the Canyon.

The Cal Fire crew immediately rolled out of the station up Highway 70 and the Canyon, past the small enclave of Pulga and up river to the Poe Dam. Arriving above PG&E’s Poe Dam just before sunrise, the Captain and crew saw the beginnings of a conflagration under the PG&E high voltage power line on the ridge top across the river from them. The sight sent a chill through the Captain and crew because they could see the fire was already exploding toward the south and west riding the Jarbo Winds, which were so high the Captain struggled to remain upright. The Captain radioed into his headquarters with urgency in his voice – his crew would never be able to get in front of this fire to control it and in a prophetic understatement he told dispatchers: “This has the potential of a major incident.”

In less than an hour, the fire had torn through Pulga and the mountain hamlet of Concow and reached the eastern outskirts of Paradise – throwing softball-sized embers ahead to the north into Magalia and over the town into the Butte Creek Canyon on the west side. Paradise and its residents were hit from three side by massive walls of fire. Chaos and confusion reigned. Thousands of homes and businesses were lost in the matter of a couple of hours. A town of some 26,000 people was utterly destroyed.

Eight-four souls were lost in the most horrific way imaginable – burned to death.

Within a few hours of the fire, Cal Fire arson investigators began to make their way to where the responding Captain had seen the start of the fire. Traveling up Camp Creek Road (from which the Camp Fire took its quirky name), the investigators came to what appeared to be the fire’s beginning. The ground under what was PG&E’s transmission tower #27/222 showed clear signs of the fire’s beginning and a burnt path toward the southwest. Looking up, the investigators saw a detached line hanging down into the steel superstructure of the high-voltage transmission tower.

Something had broken - and sent the live 115 kilovolt (kV) power line (also known as a conductor) to arc against the steel tower and shower molten steel and aluminum metal onto the grass and brush below. A painstakingly detailed arson investigation began.

Within a few hours, the Cal Fire investigators had begun to reach their preliminary conclusions that the Camp Fire was started by the failure of a suspension hook holding up an insulator string which in turn held up the highly energized line. The investigators had found the broken iron

hook, also known as a “C hook”, and it appeared to have not just broken, but had worn through after a great deal of time hanging in the windy environs of the Feather River Canyon.

The investigators reached out to the Butte County District Attorney’s Office on November 9, 2018 and discussed their initial findings with the office – including their concern that a PG&E helicopter had been seen hovering above the suspect tower.

The Butte County District Attorney’s Office had had past dealings with PG&E and its criminal violations of failing to clear vegetation from its lines which sparked fires. The office also knew PG&E was a federal felon for its criminal actions leading to the San Bruno gas line explosion.

A directive was given the Cal Fire arson investigators that the DA’s office was opening a joint investigation with them and to treat the fire origin site as a crime scene and to prevent anyone, including PG&E, from entering. (The Cal Fire investigators had already started the process of securing the scene with private security.)

And so began the Camp Fire Investigation. . .

The next week Cal Fire arson investigators directed PG&E linemen under their close scrutiny to begin the dismantling of tower 27/222 and seized relevant portions for evidence. Later, Butte County District Attorney investigators teamed with Cal Fire arson investigators to examine other power lines in the vicinity of the suspect tower. Evidence from those surrounding towers was seized with the assistance of experienced linemen from PG&E under the close scrutiny of a loaned Federal Bureau of Investigation (FBI) Evidence Team.

Prosecutors were taken from normal day-to-day business in the office and assigned to oversee the investigation. Thus began the arduous task of gathering information from PG&E and others to determine the who, what, how and why of the Camp Fire.

Early into the investigation it became clear that as we began to collect terabytes of data from a facially cooperative PG&E that more broad based and intrusive subpoenas would be needed to dig out data from the extensive PG&E files including its vendor files. Additionally as PG&E witnesses, past and present, were being contacted for interviews, we found PG&E has hired attorneys to represent them and encourage silence.

We partnered with the California Attorney General who assigned experienced prosecutors to assist in the investigation and it was decided a special investigative criminal grand jury should be sworn to subpoena evidence and examine reluctant witnesses under oath. This grand jury was in addition to the regular “watchdog grand jury” that is sworn in every June in Butte County. This special grand jury of 19 ordinary Butte County citizens was selected from 100 summoned potential jurors and sworn in on March 25, 2019.

As an investigatory grand jury, it was the duty of the jurors to sift through all the evidence, hear the witnesses and keep an open mind as to whether there truly was any criminal liability on the part of anyone for causing the Camp Fire. This dedicated group of citizens then meet in secrecy for the next year and heard nearly 100 witnesses, reviewed approximately 1600 exhibits, and produced some 6000 pages of transcript. It cannot be overemphasized the patience and sacrifice

of these citizens, meeting once to twice a week for almost a year. And since they were sworn to secrecy, they were not even able to tell their employers, friends and family what they were so diligently working on. Even more amazing was their dedication to their important work to seek justice. Such was their dedication that only three grand jurors were unable to finish their term.

The remaining 16, after their months of hard work and review of all matters, returned an Indictment finding sufficient evidence to charge the Pacific Gas and Electric Company with 85 felony counts – one count of unlawfully and recklessly causing the Camp Fire as a result of its gross negligence in maintaining its power line, and 84 individual counts of involuntary manslaughter naming each of the persons directly killed in the Camp Fire by PG&E's criminal negligence. The Indictment also included three special allegations for PG&E's causing great bodily injury to a firefighter; causing great bodily injury to more than one surviving victim; and causing multiple structures to burn (listed as approximately 18,804 structures). ([See attached Indictment.](#))

PG&E, who had been represented by criminal defense attorneys during the investigation and Grand Jury proceedings, was informed of the Indictment and decided to plead guilty "as charged" to all counts – thereby agreeing the evidence of its criminal negligence has been established beyond a reasonable doubt.

The following Camp Fire Public Report is a summary of the massive undertaking to determine if there was sufficient evidence to convict PG&E of its criminal behavior which lead to the Camp Fire and the awful destruction that followed. The Report also forms the core of legal documents filed with the Butte County Superior Court today to establish the Factual Basis for the pleas by PG&E to the Indictment and the People's Statement in Aggravation for the sentencing of the defendant corporation.

INTRODUCTION

On November 8, 2018, a fire started underneath a PG&E transmission tower near Camp Creek Road, not far from the town of Pulga in Butte County, California. The fire quickly raged out of control, travelled to the town of Concow within an hour, and to Paradise – seven miles from the point of ignition – in less than 1.5 hours. Seventeen days later, on November 25, 2018, what had become known as the Camp Fire was finally declared 100% contained. It had burned 153,336 acres and destroyed approximately 18,800 structures.¹ Some 589 structures were damaged.² A total of 84 lives were lost as a direct result of the fire and at least two civilians and one firefighter suffered great bodily injury. {[Attachment – Camp Fire Presentation](#)}

I. INITIAL TIME LINE

On November 8, 2018 at 6:15 a.m., the PG&E Grid Control Center (GCC)³ in Vacaville documented an “interruption” on the energized Caribou-Palermo 115kV transmission line in the Feather River Canyon.

At approximately 6:20 a.m. on November 8, 2018, a PG&E Hydro Division employee⁴ driving eastbound on Highway 70 observed a “bright light” above a ridgeline as he approached the Pulga Bridge. Initially the employee believed the bright light to be the sun rising behind the ridgeline; however, as he continued driving, he realized the source of the bright light was a fire underneath the PG&E transmission lines on a ridge on the north side of the Feather River. The employee noted the fire appeared to be at the base of a transmission tower. In that area of the Feather River Canyon cell phone service is not available. The employee used his PG&E radio to contact PG&E employees at the Rock Creek Powerhouse and reported the fire. These employees then called 911 and were transferred to the Cal Fire Emergency Communications Center (ECC) in Oroville. The 911 call from the Rock Creek Switching Station was received by Cal Fire ECC at 6:25:19 a.m.

At approximately 6:30 a.m., an employee of the California Department of Transportation (Cal Trans) arrived at the Cal Trans Pulga Station for work. While in the parking lot of the Pulga Station he observed a fire under a PG&E transmission tower northeast of the Pulga Station and took a photograph of it. The photograph {[Attachment 001](#)} showed a fire emanating out from

¹13,696 single family residences, 276 multi-family residences, 528 commercial structures, and 4,293 other structures were destroyed according to Cal Fire.

² 462 single family residences, 25 multi-family residences, and 102 commercial structures were damaged according to Cal Fire.

³ The GCC is the consolidated hub for all transmission operations for PG&E. GCC monitors the Supervisor Control and Data Acquisition (SCADA) for all transmission lines at all times. Any problem on any PG&E transmission line triggers an immediate alert in the GCC.

⁴ Throughout this report the names of local current/ former PG&E employees are not used. The Butte County District Attorney’s Office believes, based upon anger and frustration within the community, that disclosure of the identity of involved PG&E personnel living and/or working in the area may expose those personnel to harassment, threats or violence.

under transmission Tower :027/222⁵ (Tower 27/222) of the Caribou-Palermo 115kV transmission line (Caribou-Palermo line).

At 6:29:55 a.m., the initial Cal Fire notification went out to Captain Matt McKenzie at the Concow/Jarbo Gap Station. By 6:35 a.m., two Cal Fire engines from the Concow/Jarbo Gap Station were on Highway 70 headed eastbound toward Pulga. Captain McKenzie and his firefighters first observed the fire just before reaching the Pulga Bridge. The two engines continued on Highway 70 to the Poe Dam to assess the fire and formulate a plan of attack. From above the Poe Dam on the south side of the Feather River, at 6:44 a.m., Captain McKenzie observed that the fire was burning under the electric transmission lines on the ridge on the north side of the Feather River. Based upon the location of the fire { [Google Earth map of 27/222 area and Pulga](#) } as well as the high wind speed and direction, Captain McKenzie concluded there was no available route to attack the fire. Captain McKenzie immediately realized that the community of Pulga was in danger and dispatched his second engine to evacuate the residents of that community. From his position on Highway 70, Captain McKenzie took measure of the fire (and a photograph { [Attachment 002](#) }) and requested additional resources be deployed to the west to stop the fire at Concow Road. During his initial report to the ECC, based upon his observations of the fire, the topography, and the wind, Captain McKenzie warned, “this has the potential of a major incident.” (An hour later, at 7:44 a.m., the fire reached the Town of Paradise, a distance of approximately seven miles.)

At approximately 6:38 a.m., PG&E employees at the Rock Creek Powerhouse informed the GCC of the fire burning near the Poe Dam in the vicinity of the transmission lines. At approximately 6:40 a.m., the GCC notified the Transmission Line Supervisor for the Table Mountain District⁶ of the fire. The Transmission Line Supervisor dispatched a troubleman to immediately perform an emergency air patrol of the Caribou-Palermo line. The troubleman located and documented damage on Caribou-Palermo line Tower 27/222 at 12:00 p.m. on November 8, 2018.⁷

At approximately 6:48 a.m. fire watch cameras on Flea Mountain and Bloomer Hill { [Attachment – Google Earth map](#) } recorded a plume of smoke east of Concow and west of Pulga. { [Fire](#)

⁵ According to PG&E naming convention, a transmission line name is based upon the starting point and ending point of the line. The Caribou-Palermo line starts at the Caribou Powerhouse and ends at the Palermo substation. Tower numbers are determined by the distance from the start of the line in miles and the sequential number of towers. The Caribou-Palermo line is divided into two segments; Caribou-Big Bend and Palermo-Big Bend. The inclusion of a colon (:) before the tower number denotes the Caribou-Big Bend segment. On the Caribou-Big Bend segment the tower numbering starts at the first tower coming out of the Caribou Powerhouse (:000/001) and ends with the last tower before the Big Bend Substation (:037/303). Tower 27/222 is located in the 27th mile away from the Caribou Powerhouse and is the 222nd structure in the line. On the Palermo-Big Bend segment the tower numbers begin with the last tower before the Palermo Substation (000/001) and ends with the first tower after the Big Bend Substation (016/130). { [Attachment – Google Earth Map of C-P](#) }

⁶ PG&E’s electrical transmission grid is divided into geographic districts. Each district is supervised by a Transmission Line Supervisor. The transmission lines in the Feather River Canyon are within the Table Mountain District.

⁷ At 12:01 p.m. a Cal Fire investigator spotted and photographed a helicopter from a local charter helicopter firm hovering above tower 27/222. Based upon the tail number of the helicopter it was confirmed this was the helicopter performing the emergency inspection of the Caribou-Palermo line.

[Watch Camera Bloomer](#), [Fire Watch Camera Flea](#)} Cal Fire monitors initially attributed the plume of smoke to the Camp Fire. Later Cal Fire monitors and investigators determined the smoke plume was not associated with the Camp Fire and was caused by a separate and unrelated fire. Utilizing mapping tools Cal Fire investigators determined the plume of smoke had arisen from an area near the intersection of Concow Road and Rim Road in eastern Concow. The fire was named the Camp B Fire.

II. ORIGIN AND CAUSE INVESTIGATIONS

Cal Fire assigned a team of highly trained and experienced “Origin and Cause” investigators from around California to assist the local Butte Unit investigators. Cal Fire also retained and assigned subject matter experts to assist with the investigation. The investigators were divided into two teams. One team was assigned to investigate the Camp Fire. The second team was assigned to investigate the Camp B Fire.

Cal Fire investigators determined the origin of the Camp Fire was the dry brush below Tower 27/222 of the Caribou-Palermo line, an electrical transmission line owned and operated by PG&E. Tower 27/222 was determined to be a “Transposition” tower⁸ {[Attachment – Krelle 3D model](#)}. With the assistance of a licensed electrical engineer, Cal Fire investigators determined the cause of the Camp Fire was electrical arcing between an energized “jumper” conductor (power line) and the steel tower structure. {[Attachment - Framework of transposition tower](#)} Investigators determined a “C hook” that linked an insulator string connected to the jumper conductor to the transposition arm of the tower failed, allowing the energized jumper conductor to make contact with the steel tower structure. {[Attachment 004](#)} The ensuing electrical arcing between the jumper conductor and steel tower structure caused the aluminum strands of the conductor to melt as well as a portion of the steel tower structure.⁹ The molten aluminum and steel fell to the brush covered ground at the base of the steel tower structure. {[Attachment 005](#)} This molten metal ignited the dry brush.

Cal Fire investigators determined the Camp B Fire originated to the west of Concow Road south of the intersection of Concow Road and Rim Road in a geographical bowl. The area of origin was under the right of way of the Big Bend 1101 12kV distribution line. The area of origin was approximately 2.6 miles west of the origin of the Camp Fire. At the area of origin investigators located a broken conductor from the Big Bend 1101 12kV distribution line and a fallen Ponderosa pine tree. Burn patterns on the Ponderosa pine indicated the tree had contacted a live electrical line. {[Attachment 006](#)} PG&E records show a documented outage on the Big Bend 1101 12kV circuit at 6:45 a.m. on November 8, 2018. Investigators determined the Camp B Fire was ignited when the Ponderosa pine tree toppled over onto and broke the energized Big Bend 1101 12kV distribution line. The Ponderosa pine and its stump were examined and analyzed by a certified arborist¹⁰ retained by Cal Fire. The arborist determined that the Ponderosa pine was

⁸ A transposition tower is a transmission tower that changes the relative positions of the conductors (power lines) to each other to maintain electrical balance. Transposition towers are placed at intervals along the transmission line.

⁹ Aluminum melts at approximately 1200 degrees Fahrenheit, steel melts at approximately 2700 degrees Fahrenheit. The electrical engineer estimated the temperature of the electrical arc between the conductor and the steel structure between 5,000 and 10,000 degrees Fahrenheit.

¹⁰ International Society of Arboriculture Board Certified Master Arborist.

diseased and dying prior to November 8, 2018.¹¹ However, the arborist determined the disease was internal and likely would not have been visible to PG&E tree inspectors during their vegetation management inspections. According to the arborist the disease likely only would have been discoverable by an advanced inspection.¹²

Before the Camp B Fire grew large enough to escape its geographical bowl, it was passed over and consumed by the Camp Fire. Based upon fire indicators and patterns within the Camp B Fire and recordings from the fire watch cameras, Cal Fire investigators determined that the Camp B Fire had little, or no, effect on the Camp Fire.

III. INJURIES AND LOST LIVES

In support of the great bodily injury enhancements, evidence was presented of two civilians and one fire fighter who were severely burned during the Camp Fire.

Victim 1, an adult female, was located in Concow by a Cal Fire crew in the area trying to locate another reportedly trapped victim. As the engine was trying to leave the area, visibility was near or at zero, when suddenly the smoke cleared briefly. In that moment, the Captain of the fire crew saw an arm appear from between two vehicles. The Captain and his crew stopped and located the badly burned female victim. Lying beside the female victim was a deceased male. The deceased male was later identified as the female victim's roommate. The Captain described how he and his crew repeatedly checked the male roommate futilely hoping to find signs of life. The Cal Fire crew rescued the female victim. According to the Captain, when Victim 1 was lifted into the engine, her skin sloughed off due to the severity of her severe burns. She was taken to a medical evacuation area for transport to a hospital.

Victim 2, an adult female, was located in Paradise with her husband. Victim 2 and her husband had been trying to flee the fire but were overtaken. Victim 2 and her husband took shelter behind a boulder but both were severely burned. Victim 2 and her husband were rescued by Cal Fire and taken to a medical evacuation area for transport to a hospital. According to the Cal Fire Captain, who supervised that rescue and evacuation, Victim 2 also had skin sloughing off as she was taken from an engine and placed into an ambulance. Both Victim 2 and her husband were transported to the UC Davis Medical Center Burn Unit. Victim 2's husband ultimately succumbed to his burn injuries.

Victim 3, an adult male, was a Cal Fire Captain. The Captain described that as he and his crew were preparing to do a back fire operation to create a fire break east of Clark Road and south of Rattlesnake Flats Road, northeast of Butte College, the fire changed direction and, fueled by high winds, "exploded." As the fire came rushing towards them, the Captain held strands of barbed wire up to allow his crew to quickly escape into the safety of a clearing. After his crew was safely through the fence, the Captain attempted to go through the fence. As he was going

¹¹ The arborist also consulted with a professor of Dendrochronology at the Indiana State University Dendro Lab.

¹² An advanced inspection would entail use of diagnostic tools such as a mallet, a resistograph or a sonic tomogram and generally only occurs when anomalies or outward signs of disease or decay are observed during the visual inspection.

through the fence the Captain's gear caught on the barbed wire. As a result, the fire overran his position and the Captain was severely burned. The Captain was medically evacuated to UC Davis Medical Center Burn Unit. All members of his crew survived with only minor injuries.

The Camp Fire also directly¹³ caused the deaths of the following 84 persons: {[Attachment – Camp Fire Victim Locations download and open with Google Earth Pro](#)}

Joyce Acheson – Ms. Acheson, who was 78 years old, was found deceased in her home at 1250 Elliot Road, Unit 17, in the Town of Paradise. Ms. Acheson was of limited mobility, and lived in an area that was closed off to public access, thereby preventing any caregiver from getting to her.

Herbert Alderman – Mr. Alderman was 80 years old and was found deceased inside his home at 5775 Deanna Way in the Town of Paradise. A severely sprained ankle prevented his mobility at the time of the fire, and he made several phone calls to friends seeking rescue before he perished.

Teresa Ammons – Ms. Ammons was 82 years old. She was found deceased outside her home at 6674 Pentz Road, Unit 112, in the Town of Paradise. The evidence indicated Ms. Ammons died while attempting to flee the fire as she was found just outside her trailer with her purse nearby.

Rafaela Andrade – Ms. Andrade was 84 years old and was found deceased inside her home at 6664 Moore Road in the Town of Paradise. She could not walk without the assistance of a walker, and did not have the ability to evacuate on her own.

Carol Arrington – Ms. Arrington was 88 years old. Ms. Arrington was found deceased inside her home at 1866 Stark Lane in the Town of Paradise.

Julian Binstock – Mr. Binstock was 88 years old. The remains of Mr. Binstock and his dog were located in the shower of his residence at 5900 Canyon View Drive in the Town of Paradise.

David Bradburd – Mr. Bradburd was 70 years old. Mr. Bradburd was found near 6028 Dubarry Lane, in the Town of Paradise. Mr. Bradburd was found within 400 feet of his residence on Pentz Road, near a power line knocked down by the fire. Based upon the evidence, Mr. Bradburd was fleeing the fire when he died.

Cheryl Brown – Ms. Brown was 75 years old. Ms. Brown was found deceased in her home at 1387 N-B Lane in the Town of Paradise. Ms. Brown was found seated in a recliner next to her husband, Larry Brown.

Larry Brown – Mr. Brown was 72 years old. Mr. Brown was found deceased in his home at 1387 N-B Lane in the Town of Paradise. Mr. Brown was found seated in a recliner next to his wife, Cheryl Brown.

¹³ Only persons who died within the Camp Fire footprint on November 8, 2018 from fire-related injuries; or who were medically evacuated from within the Camp Fire footprint on November 8, 2018 to medical facilities and subsequently died as a result of fire-related injuries were counted as direct victims.

Richard Brown – Mr. Brown was 74 years old. Mr. Brown was found deceased under his pickup truck outside his residence at 13377 Eleran Lane in the community of Concow. Based upon the physical evidence, Mr. Brown tried to hide from the fire under his truck.

Andrew Burt – Mr. Burt was 36 years old. Mr. Burt was found deceased just outside of the front passenger side door of a minivan. The minivan was located facing north in the 5000 Block of Edgewood Road, approximately .3 miles south of Mr. Burt's residence at 5236 Edgewood Lane in the Town of Paradise. The remains of Mr. Burt's dog were found next to Mr. Burt. Based upon the evidence, Mr. Burt had been in the minivan attempting to escape the fire when the minivan was overcome by the fire. There were three other vehicles containing the remains of four other victims near the minivan.

Joanne Caddy – Ms. Caddy was 75 years old. Ms. Caddy was found deceased inside her home at 13812 West Park Drive in the community of Magalia.

Barbara Carlson – Ms. Carlson was 71 years old. Ms. Carlson was found deceased in her residence at 5577 Heavenly Place in the Town of Paradise. Ms. Carlson's remains were comingled with those of her sister, Shirley Haley.

Vincent Carota – Mr. Carota was 65 years old and found deceased inside his residence at 5471 South Libby Road in the Town of Paradise. Mr. Carota was a partial leg amputee without a vehicle.

Dennis Clark, Jr. – Mr. Clark was 49 years old. Mr. Clark was found deceased in the passenger seat of a car with his mother Joy Porter deceased in the driver's seat. Their vehicle was in a line of three other vehicles found facing north in the 5000 block of Edgewood Lane in the Town of Paradise. The vehicle was located approximately .3 miles south of Mr. Clark and Ms. Porter's residence on Sunny Acres Road, off of Edgewood Lane.

Evelyn Cline – Ms. Cline was 81 years old. Ms. Cline was found deceased in her residence at 578 Roberts Drive in the Town of Paradise. She was physically immobile and unable to leave her home without assistance.

John Digby – Mr. Digby was 78 years old and found deceased inside his residence at 6920 Clark Road, Unit #3, in the Town of Paradise.

Gordon Dise – Mr. Dise was 66 years old and was found deceased inside his home at 2735 Eskin Maidu Trail in Chico (Butte Creek Canyon.). According to his daughter, who fled the house with her father, he went back in their home for something and never made it back out.

Paula Dodge – Ms. Dodge was 70 years old. Ms. Dodge was found deceased between two cars in the carport of her residence at 5152 Pentz Road in the Town of Paradise. Ms. Dodge's husband, Randall Dodge, was found deceased next to her. Based upon the evidence, Mr. and Ms. Dodge were attempting to flee the fire.

Randall Dodge – Mr. Dodge was 66 years old. Mr. Dodge was found deceased between two cars in the driveway of his residence at 5152 Pentz Road in the Town of Paradise. Mr. Dodge's

wife, Paula Dodge, was found deceased next to him. Based upon the evidence, Mr. and Ms. Dodge were attempting to flee the fire.

Andrew Downer – Mr. Downer was 54 years old. Mr. Downer was found deceased outside the front door of his residence at 8030 Skyway, Unit A, in the Town of Paradise. Based upon the evidence, it appears Mr. Downer died while attempting to flee the fire. He was a wheelchair bound amputee and was unable to drive.

Robert Duvall – Mr. Duvall was 76 years old. Mr. Duvall was found deceased in the passenger seat of his truck. No one else was located in the truck. The truck was in a line of three vehicles found facing north in the 5000 block of Edgewood Lane in the Town of Paradise. The vehicle was located approximately .3 mile north of Mr. Duvall's residence on Sunny Acres Road, off of Edgewood Lane. A second vehicle registered to Mr. Duvall and containing the remains of Mr. Duvall's girlfriend, Beverly Powers, was located nearby.

Paul Ernest – Mr. Ernest was 72 years old. Mr. Ernest and his wife attempted to escape the fire by driving quads¹⁴ off road through a canyon. When their escape route was blocked by a rock formation, Mr. Ernest and his wife were overtaken by the fire. Both were severely burned, and airlifted to UC Davis Medical Center Burn Unit in Sacramento. Mr. Ernest passed away from his injuries on August 5, 2019, nearly 9 months after the fire. He never left the extended care medical facility in Sacramento, after being transferred there from the UC Davis Burn Unit.

Rose Farrell – Ms. Farrell was 99 years old. Ms. Farrell was found deceased on the front porch of her residence at 1378 Herman Way in the Town of Paradise. Her wheelchair was found near Ms. Farrell.

Jesus Fernandez – Mr. Fernandez was 48 years old. Mr. Fernandez was found on the ground between two vehicles on Broken Glass Circle near Vista Ridge Road in Concow. Mr. Fernandez was the roommate of burn Victim 1 (above). Victim 1 believed Mr. Fernandez died shortly before her rescue.

Jean Forsman – Ms. Forsman was 83 years old and found deceased inside her residence at 13747 Andover Drive in the community of Magalia.

Ernest Foss, Jr. – Mr. Foss was 63 years old. Mr. Foss was found deceased outside of his residence at 5236 Edgewood Lane in the Town of Paradise. Mr. Foss was found with his oxygen tank. The evidence indicates Mr. Foss, who had limited mobility, was attempting to flee the fire at the time of his death.

Elizabeth Gaal – Ms. Gaal was 80 years old and found deceased inside her residence at 5393 Sawmill Road, Unit # 27 in the Town of Paradise.

Sally Gamboa – Ms. Gamboa was 69 years old. Ms. Gamboa was located deceased in a field/clearing behind her residence at 1560 Sunny Acres Road in the Town of Paradise. Based upon the evidence, Ms. Gamboa died while attempting to flee the oncoming flames.

¹⁴ All terrain sport utility vehicles

James Garner – Mr. Garner was 63 years old. Mr. Garner was found deceased inside his residence at 6284 Woodbury Drive in the community of Magalia. Earlier on the morning of November 8, 2018, Mr. Garner had engaged in multiple telephone calls with his sister and nephew.

Richard Garrett – Mr. Garrett was 58 years old. Mr. Garrett was found deceased among trees not far from a residence at 4238 Schwyhart Lane in the community of Concow. Based upon the physical evidence Mr. Garrett was actively running from the fire when he was overtaken and killed by the flames.

William Godbout – Mr. Godbout was 79 years old and found deceased inside his residence at 3831 Camelot Lane in the community of Concow.

Shirley Haley – Ms. Haley was 67 years old. Ms. Haley was found deceased at 5577 Heavenly Place in the Town of Paradise. Ms. Haley's remains were found comingled with the remains of her sister, Barbara Carlson.

Dennis Hanko – Mr. Hanko was 56 years old and found deceased inside his residence at 5081 Wilderness Way, Unit 3A, in the Town of Paradise.

Anna Hastings – Ms. Hastings was 67 years old. Ms. Hastings was found deceased in her residence at 8391 Montna Drive in the Town of Paradise. She was disabled, with severe scoliosis, and unable to drive.

Jennifer Hayes – Ms. Hayes was 53 years old. Ms. Hayes was found deceased in her residence at 5683 Scotty Lake Drive, in the Town of Paradise.

Christina Heffern, Ishka Heffern and Matilde Heffern – Christina Heffern was 40 years old. Ishka Heffern, the daughter of Christina, was 20 years old. Matilde Heffern, the mother of Christina Heffern, was 68 years old. All three were located in their residence at 1865 Norwood Drive in the Town of Paradise. Their remains were located comingled in the bathtub of their residence. The Hefferns placed a 911 call as the fire approached their home. Somehow the phone line remained open as the house, and the three women, burned as helpless Cal Fire ECC dispatchers listened to their screams.

Louis Herrera – Mr. Herrera was 86 years old and found deceased inside of his home at 2376 Clearview Drive in the Town of Paradise. The remains of Mr. Herrera's wife, Dorothy Lee-Herrera, were also found in the residence.

Evva Holt – Ms. Holt was 85 years old and was found deceased in a burned vehicle near the intersection of Pearson Road and Stearns Road in the Town of Paradise, approximately 1.8 miles from Ms. Holt's residence.

TK Huff – Mr. Huff was 71 years old. Mr. Huff was located deceased outside of his residence at 13471 Green Forest Lane in the community of Concow. Mr. Huff only had one leg and generally used a wheelchair. Mr. Huff's wheelchair was found approximately 10 feet away from Mr. Huff. The physical evidence indicated Mr. Huff tried to escape the flames by dragging himself along the ground.

Gary Hunter – Mr. Hunter was 67 years old. Mr. Hunter was located deceased inside of his residence at 13554 Andover Drive in the community of Magalia. He had limited mobility, due to a stroke, and could not walk without assistance.

James Kinner – Mr. Kinner was 83 years old. Mr. Kinner was located deceased inside his residence at 5237 Black Olive Drive in the Town of Paradise.

Dorothy Lee-Herrera – Ms. Lee-Herrera was 93 years old. Ms. Lee-Herrera was found deceased in her residence at 2376 Clearview Drive in the Town of Paradise. The remains of Ms. Lee-Herrera's husband, Louis Herrera, were also found in the residence.

Warren Lessard – Mr. Lessard was 68 years old. Mr. Lessard was found deceased on the front porch of his residence at Athens Way and South Park Drive in the community of Magalia.

Dorothy Mack – Ms. Mack was 88 years old and found deceased inside her residence at 6674 Pentz Road, Unit 19, in the Town of Paradise.

Sara Magnuson – Ms. Magnuson was 75 years old. Ms. Magnuson was found deceased inside her residence at 1812 Drendel Circle in the Town of Paradise. Based upon the physical evidence it appears Ms. Magnuson wrapped herself in a wet carpet and sheltered in the bathtub in an attempt to save herself.

Dolores Joanne Malarkey – Ms. Malarkey was 90 years old. Ms. Malarkey was found deceased in her residence at 432 Plantation Drive in the Town of Paradise. The remains of Ms. Malarkey's husband, John Malarkey, were also found in the residence.

John Malarkey – Mr. Malarkey was 89 years old and was found deceased in his residence at 432 Plantation Drive in the Town of Paradise. The remains of Mr. Malarkey's wife, Joanne Malarkey, were also found in the residence.

Christopher Maltby – Mr. Maltby was 69 years old. Mr. Maltby was found deceased in his residence at 1040 Buschmann Road in the Town of Paradise.

David Marbury – Mr. Marbury was 66 years old. Mr. Marbury was found deceased inside his residence at 1481 Sun Manor, Unit A, in the Town of Paradise.

Deborah Morningstar - Ms. Morningstar was 65 years old and found deceased inside of her residence at 5848 Black Olive Drive, Unit 3, in the Town of Paradise. She was unable to drive, which prevented her from being able to flee.

Helen Pace – Ms. Pace was 84 years old. Ms. Pace was found deceased inside her residence at 6674 Pentz Road in the Town of Paradise. She had medical issues, which limited her ability to leave her home.

Joy Porter – Ms. Porter was 72 years old. Ms. Porter was found deceased in the driver's seat of her car with her son, Dennis Clark Jr., in the passenger seat. Their vehicle was in a line of three other vehicles found facing north in the 5000 block of Edgewood Lane in the Town of Paradise. The vehicle was located approximately .3 miles south of Mr. Clark and Ms. Porter's residence on Sunny Acres Road, off of Edgewood Lane.

Beverly Powers – Ms. Powers was 64 years old. Ms. Powers was found deceased in the driver's seat of a pickup truck registered to her boyfriend, Robert Duvall. The vehicle was in a line of three other vehicles found facing north in the 5000 block of Edgewood Lane, approximately .3 miles south of Mr. Duvall and Ms. Powers residence on Sunny Acres Road. One of the other two vehicles contained the remains of Mr. Duvall.

Robert Quinn – Mr. Quinn was 74 years old and found deceased in his residence at 5684 Clara Lane in the Town of Paradise.

Joseph Rabetoy – Mr. Rabetoy was 39 years old and found deceased in his residence at 5580 Angel Drive in the Town of Paradise. He had no means of escape as he didn't have a vehicle.

Forrest Rea - Mr. Rea was 89 years old and found deceased in his residence at 1909 Dean Road in the Town of Paradise.

Vernice Regan – Ms. Regan was 95 years old. Ms. Regan was found deceased outside of her home at 102 Magnolia Drive in the Town of Paradise.

Ethel Riggs – Ms. Riggs was 96 years old. Ms. Riggs was located deceased inside of her residence at 220 Berry Creek Drive in the Town of Paradise. Ms. Riggs spoke with her grandson via phone at least twice on the day of the fire and told him because the power was out she was unable to get her car out of the garage. Ms. Riggs told the grandson she could not reach the manual release for the garage door, and even if she could, she was not strong enough to raise the door.

Lolene Rios – Ms. Rios was 56 years old. Ms. Rios was found deceased in the basement of her home at 750 Meyers Lane in the Town of Paradise, along with the remains of her four dogs and two cats.

Gerald Rodrigues – Mr. Rodrigues was 74 years old and found deceased inside of his residence at 5436 Clark Road, Unit 14, in the Town of Paradise.

Frederick Salazar, Jr. – Mr. Salazar was 76 years old. Mr. Salazar was found deceased in his residence at 5303 Sawmill Road in the Town of Paradise. The remains of Mr. Salazar's wife, Phyllis Salazar, were also found in the residence.

Phyllis Salazar – Ms. Salazar was 72 years old. Ms. Salazar was found deceased in her residence at 5303 Sawmill Road in the Town of Paradise. The remains of Ms. Salazar's husband, Frederick Salazar, Jr., were also found in the residence.

Sheila Santos – Ms. Santos was 64 years old and found deceased in her home at 5471 S. Libby Road, Unit 34, in the Town of Paradise.

Ronald Schenk – Mr. Schenk was 74 years old. Mr. Schenk was found deceased in his home at 5471 S. Libby Road, Unit 33, in the Town of Paradise.

Berniece Schmidt – Ms. Schmidt was 93 years old. Ms. Schmidt was found deceased inside of her residence at 14175 Citadel Way in the community of Magalia with the remains of her cat and a kitten.

John Sedwick – Mr. Sedwick was 82 years old. Mr. Sedwick was found deceased on the front porch of his residence at 13816 Glover Lane in the community of Magalia.

Don Shores - Mr. Shores was 70 years old. Mr. Shores was found deceased in a recliner in his residence at 6778 Ishi Drive in the community of Magalia. The remains of Mr. Shores' wife, Kathy Shores, were found in an adjacent recliner. Also located with Mr. and Ms. Shores were the remains of two dogs and two cats.

Kathy Shores – Ms. Shores was 65 years old. Ms. Shores was found deceased seated in a recliner in her residence at 6778 Ishi Drive in the community of Magalia. The remains of Ms. Shores' husband, Don Shores, were found in an adjacent recliner. Also located with Mr. and Ms. Shores were the remains of two dogs and two cats.

Judith Sipher – Ms. Sipher was 68 years old. Ms. Sipher was found deceased in her residence at 1005 Village Parkway in the Town of Paradise.

Larry Smith – Mr. Smith was found severely burned in the driveway of his home at 6428 Rocky Lane in the Town of Paradise. Mr. Smith was rescued and transported to the UC Davis Medical Burn Center. Mr. Smith succumbed to his injuries while still in the hospital 17 days later. Mr. Smith was 80 years old.

Russell Stewart – Mr. Stewart was 63 years old and found deceased inside of his home at 6884 Pentz Road in the Town of Paradise.

Victoria Taft – Ms. Taft was 67 years old and found deceased inside of her home at 5883 Copeland Road in the Town of Paradise.

Shirlee Teays - Ms. Teays was 90 years old. Ms. Teays was found deceased inside of her residence at 9289 Skyway Road, Unit 15, in the Town of Paradise. She appears to have been holding or hugging a framed photograph.

Joan Tracy – Ms. Tracy was 82 years old. Ms. Tracy was found deceased inside of her home at 5326 Sawmill Road in the Town of Paradise.

Unknown – The remains of this unknown victim were found comingled with the remains of another victim in Concow. Attempts at identification are still being made.

Ellen Walker – Ms. Walker was 72 years old and found deceased inside of her home at 4220 Schwyhart Lane in the community of Concow.

Donna Ware – Ms. Ware was 86 years old and found deceased inside her home at 5783 Waco Lane in the Town of Paradise.

Isabel Webb – Ms. Webb was 68 years old. Ms. Webb was found deceased inside her home at 1449 Sleepy Hollow Lane in the Town of Paradise.

Marie Wehe – Ms. Wehe was 78 years old. Ms. Wehe was found deceased inside a burned truck on the side of Windermere Lane in the community of Concow approximately .3 mile east of Ms. Wehe's residence on Windermere Lane.

Kimber Wehr – Ms. Wehr was 53 years old and found deceased inside her residence at 5908 Del Mar Avenue in the Town of Paradise. She was unable to drive due to a neurological disability, and was unable to flee the fire on her own.

David Young – Mr. Young was 69 years old. Mr. Young was found deceased with two unidentified animals inside his mini-van. The mini-van was found crashed into a tree near the intersection of Hoffman Road and Jordan Hill Road in the community of Concow. The vehicle was located approximately 1.5 miles west of Mr. Young’s residence on Hog Ranch Road in the community of Concow. Based upon the evidence, Mr. Young crashed while fleeing the oncoming fire. Mr. Young and the two animals were found in the cargo area of the mini-van. The autopsy determined Mr. Young survived the crash, but was killed by the fire.

IV. BACKGROUND OF THE FAILED COMPONENT

a. History of the Caribou-Palermo 115kV Transmission Line

According to historical reports¹⁵ provided by PG&E, the section of the Caribou-Palermo line that runs in the Feather River Canyon from the Caribou Powerhouse to the Big Bend Substation, was built between 1919 and 1921 by the Great Western Power Company. What is now known as the Caribou-Palermo line was originally part of a 165kV transmission line that carried electricity from the Caribou Powerhouse to the Valona Substation in Contra Costa County.¹⁶ PG&E acquired the Caribou Powerhouse and the entire Caribou-Valona 165kV transmission line (Caribou-Valona line) when it purchased Great Western Power Company in 1930. According to the reports, sometime during the 1960s the Caribou-Palermo line was converted to 115kV. According to the reports, there were eleven segments¹⁷, including the Caribou-Big Bend segment, of the original Caribou-Valona transmission line still in service in 2018.

Despite the fact that PG&E has owned the Caribou-Big Bend portion of the Caribou-Palermo line since 1930, the evidence established PG&E did not catalogue or replace the original

¹⁵ In April 2017 cultural resources specialists from PG&E produced a document entitled “National Register of Historic Places Inventory and Evaluation of Eleven Transmission Lines Associated with the Historic Alignment of the Caribou-Valona Transmission Corridor (NRHP Inventory and Evaluation). The NRHP Inventory and Evaluation was updated in October, 2018 by Cardno Inc. The NRHP Inventory and Evaluation includes a 2018 report entitled “DPR 523 Form” produced by the California Department of Parks and Recreation (DPR Report).

¹⁶ Using a current map, the original Caribou-Valona line ran parallel to the Feather River from Caribou-Road through the Feather River Canyon, passing to the east of Oroville to Palermo. South of Palermo the line ran parallel to State Route 70 thru Sacramento. From south of Sacramento the line ran parallel to Interstate 80 to Vallejo. The line crossed the bay from Vallejo to Valona parallel to the current Carquinez Bridge on Interstate 80. The total length of the line was 1368 steel towers and 186 miles.

¹⁷ As the electrical transmission grid has grown and substations were added the original Caribou-Valona line was divided into segments (sometimes referred to as circuits in PG&E historical documents) corresponding to the substations. The eleven segments still in use in 2018 were the Caribou-Palermo line, Paradise-Table Mountain, Palermo Pease, Pease-Rio Oso, Rio Oso-West Sacramento, Brighton-Davis, Brighton-Davis (idle), Vaca-Suisun-Jamison, Ignacio-Mare Island #1, Oleum-G #1 and Oleum-G #2.

conductors,¹⁸ insulators or attachment hardware¹⁹ on many of the towers in the original Caribou-Big Bend section of the transmission line.

Many components on Tower 27/222 were identified by PG&E as original Great Western Power components because they matched components included in the original Great Western Power Company schematic drawings for construction of the transmission line. Among those components were the insulators hung from C hooks²⁰. The records provided by PG&E clearly established the insulator string hanging from the C hook that broke on November 8, 2018 was an original 1921 insulator. Other components, such as the C hooks and the conductor, either did not completely match the original records²¹ or PG&E did not possess original records.²²

Evidence established that, with the exception of add-on hanger brackets which were added to the ends of the transposition arms to replace worn hanger holes, the transposition components on Tower 27/222, including the transposition arms, C hooks, insulator strings and jumper conductor, were original components in service since 1921. The evidence further established that despite owning Tower 27/222 since 1930, PG&E had little or no information about the 97-year-old conductor and the hooks, original hanger holes and bolted-on hanger hole plates supporting that conductor.

b. C Hook and Hanger Hole Wear

The broken C hook{[Attachment 7](#)} and the transposition arm {[Attachment 8](#)} on which it had been hung were collected as evidence by Cal Fire investigators²³. The transposition arm was identified as the left “phase” arm of Tower 27/222 {[Attachment – 3D model w/ left phase highlighted](#)}. This left phase arm had a bolted-on hanger hole plate which showed substantial wear where the broken hook had hung.

Cal Fire investigators also collected as evidence the right phase transposition arm and its still-connected (hung) C hook from Tower 27/222. .{[Attachment 9](#)} While examining the right phase C hook, Cal Fire investigators observed a “channel” had been worn into that hook where it hung from the bolted-on hanger plate hole of that transposition arm. {[Attachment 10](#)} The wear channel was similar to the channel cut into the broken left phase C hook. Similarly the right

¹⁸ In layman’s terms, a “conductor” is known as a power line or wire.

¹⁹ Hot end attachment hardware attaches the insulators to the conductor. Cold end attachment hardware attaches the insulators to the tower/structure/pole. {[Attachment – illustrative photo](#)}

²⁰ Also known as “Suspension hooks.” C hooks are part of the cold end attachment hardware.

²¹ The plans for the original Great Western Power transposition towers included a schematic, dated October 11, 1912, of an Ohio Brass suspension hook with a raised B on the right face of the hook. The relevant hook from Tower 27/222 matched the schematic except the raised B was on the left face of the hook.

²² PG&E responded to questions about the make, model and manufacturer of the conductor on Tower 27/222 by referring to an April 1922 article written by W. A. Scott in Engineering World entitled “Great Western Power Co.’s 165,000-Volt Transmission Line”.

²³ The front portion of the C hook that broke off was never recovered. Cal Fire personnel spent several days meticulously searching the area below Tower 27/222 and could not locate that broken piece. It was noted however that area was on a steep rocky slope which ran off toward the Feather River Canyon.

phase hanger hole showed substantial wear where the hole and hook connected. {[Attachment 11](#)}

Investigators also noted there were original hanger holes on both the left and right transposition arms that showed extensive wear. It was obvious the bolted-on hanger plates with their holes were replacements for these original hanger holes indicating that PG&E was aware that the hooks and holes were rubbing on each other causing wear. The wear patterns observed on the hanger holes is described as “keyholing.”

As a result of the observations of the Cal Fire investigators, an inspection of other transposition towers²⁴ on the Caribou-Palermo line was initiated by the Butte County District Attorney. Based upon the historical records and the C hooks and hanger holes from Tower 27/222, investigators from Cal Fire and the Butte County District Attorney’s Office concluded that any more than 3/16” space between top of the C hook and top of the hole indicated wear to either the C hook or the hanger hole, or both²⁵. In January 2019, investigators from the Butte County District Attorney’s Office flew the Caribou-Palermo line in a county helicopter and documented transposition towers on which the gap between the top of the C hook and the top of the hanger hole were substantially larger than 3/16.”

From the helicopter, investigators located wear to C hooks and hanger holes on three other transposition towers on the Caribou-Palermo line between the Caribou Powerhouse and the Big Bend Substation. The towers were identified as tower numbers 20/160, {[attachment – 20/160 wear](#)} 24/199 {[Attachment – 24/199 wear](#)} and 35/281. {[Attachment – 35/281 wear](#)} This wear was similar to that found on the C hooks and hanger holes on Tower 27/222. Subsequently, Butte County District Attorney investigators and Cal Fire investigators, along with Jon McGormley - an engineer and failure analysis expert,²⁶ further inspected each of these three towers. Investigators and Mr. McGormley also identified a fourth transposition tower, tower number 32/260, {[attachment – 32/260 wear](#)} on which there appeared to be very little wear between the C hooks and hanger holes. Tower numbers 20/160, 24/199, 27/222 and 35/281 were all located on ridgelines and exposed to the wind. Tower 32/260 was located in a valley where it was protected from the wind.

During the inspection of one of the four towers - Tower 24/199 - investigators noted that, similar to Tower 27/222, bolted-on hanger plate holes had been added to the transposition arms and the C hooks were hanging from those hanger holes instead of the original hanger holes of the transposition arm. This again indicates that PG&E was aware of the wear on C hooks and

²⁴ Because transposition towers have unique physical characteristics, investigators focused only on transposition towers. Transposition towers on the Caribou-Big Bend section are distinguished from other towers by the T mast atop the tower and the transposition arms on the source side of the tower. Towers 20/160, 24/199, 32/260 and 35/281 were transposition towers identical to Tower 27/222.

²⁵ According to the original schematics of the transposition towers the C hooks were 15/16” thick at the point of contact and the hanger holes were 1 1/8” in diameter. The hooks were intended to fit snugly into the holes.

²⁶ Jon McGormley was retained by Cal Fire and is an engineer and failure analysis expert with Wiss, Janney, Elstner Associates (WJE). WJE is a global firm of engineers, architects and materials scientists with a division focused on failure analysis.

hanger holes. It appeared to investigators that, at some previous time, the jumper conductor on Tower 24/199 { [Attachment – 24/199 jumper](#) } had been shortened and spliced together using a parallel groove connector. PG&E has no records of when or why this work was done. Investigators further observed the right phase²⁷ insulator string appeared to be less aged than the left phase insulator string and, as a result of the shorter jumper conductor, was not hanging plumb. From the ground, investigators also observed black marks on the tower leg nearest the right phase insulator string. This was indicative of arcing due to faulty or broken equipment. On the ground below Tower 24/199, investigators found an old insulator string.²⁸

With the assistance of PG&E²⁹, investigators seized C hooks and transposition arms from two of the three towers³⁰ with obvious wear and the tower without obvious wear. Seizure of all of the C hooks and transposition arms was catalogued and documented by a Federal Bureau of Investigation (FBI) Evidence team. Of the four towers, Tower 24/199 was found to be the most similar to Tower 27/222 in terms of topography, meteorology and wear. The right phase C hook from Tower 24/199 was the most worn C hook found on any of the towers.

The C hooks, transposition arms, and hanger plate holes from Towers 27/222 and 24/199 were sent to the Metallurgy Unit of the FBI Laboratory at Quantico, Virginia for metallurgical analysis by their recognized metallurgical experts. The C hooks were examined for defects. No defects were found. The broken left phase C hook from Tower 27/222 and the most worn right phase C hook from Tower 24/199 were determined to be malleable cast iron. The least worn C hooks from Towers 27/222 and 24/199 were determined to be forged, plain carbon steel. The broken C hook from Tower 27/222, the most worn hook from Tower 24/199, and a less worn hook were tested for hardness.³¹ The testing determined there was a significant difference in hardness between the most worn malleable cast iron hooks, and the least worn forged plain carbon steel hook. The transposition arms were also examined and analyzed, and all four transposition arms and the bolted on hanger brackets were found to be made of galvanized plain carbon steel.³²

²⁷ The term phase relates to the connection between the tower structure and the conductors. The Caribou-Big Bend section has three conductors and three phases; left, center and right.

²⁸ This was not unusual. Under numerous towers on the Caribou-Palermo line investigators found discarded insulator strings, insulator bells, conductor line and steel members.

²⁹ Any work on an electrical transmission tower requires special training and equipment. Investigators were unable to identify any qualified persons to perform the work. As a result, investigators had to rely on PG&E personnel to remove the relevant components from Tower 27/222 in November, 2018 and Towers 20/160, 24/199 and 32/260 in March, 2019.

³⁰ The C hooks and transposition arms from the fourth tower, 35/281, were replaced by PG&E in February, 2019. Those C hooks and transposition arms were seized by Cal Fire and BCDA investigators from a PG&E evidence storage facility.

³¹ The Superficial Rockwell HR30TW hardness test was used to determine hardness.

³² All of the transposition arms and hanger brackets were tested for hardness utilizing the Rockwell HRBW hardness test.

The FBI Lab scanned all of the hooks and transposition arms. The scans were used to build 3D models of each of the components. {[Attachment – 3D models download and open with Adobe Acrobat Pro](#)}

The metallurgist at the FBI Lab also analyzed the wear patterns on the C hooks and hanger holes (both original holes and the added brackets). The metallurgist determined that as a result of rotational body on body wear, the edge of the hanger holes had cut a channel into the C hooks and the C hooks had worn away the bottom of the hanger holes elongating the holes³³.

{[Attachment – Camp Fire Presentation 3:29-3:46](#)} On the broken C hook from Tower 27/222 it was determined the channel had cut approximately 14/16” {[Attachment – FBI lab photo of break](#)} into the hook before the remaining metal broke under the weight of the insulator string and jumper conductor.³⁴ On the most worn C hook from Tower 24/199 it was determined that the channel had cut approximately 12/16” channel into the hook.

Under microscopic analysis, the FBI Metallurgist also observed the channeling of the right phase C hook from Tower 24/199 showed a distinct change in angle. The metallurgist testified it was her opinion the distinct change in angle could have been caused by shortening of the jumper conductor which changed the position and angle of the insulator string attached to the C hook.

The FBI data, along with LIDAR scans³⁵ of Towers 27/222 and 24/199, was forwarded to Jon McGormley. Using this information, Mr. McGormley was able to build a computer model of Tower 27/222. The model took into account the differing hardness of the C hooks and hanger holes.³⁶ Working with meteorologist Kris Kuyper³⁷, Mr. McGormley and his team created a wind load model of the Feather River canyon, enabling them to calculate that the wear on the broken C hook from Tower 27/222, as well as the most worn C hook from Tower 24/199, was consistent with approximately **97 years of rotational body on body wear**.³⁸ {[Attachment – Camp Fire Presentation 3:52-3:54](#)}

³³ Known as keyhole wear or “keyholing.”

³⁴ According to PG&E written response to CPUC data request SED-007 question 2 each suspension hook supports approximately 142.8 pounds.

³⁵ Lidar scans were performed by the Cal Fire Lidar Team.

³⁶ The hardness of the individual metals involved plays a significant role in body on body wear. Metallurgical data from the FBI Laboratory was provided and fed into the model. The Superficial Rockwell HR30TW results for the C hooks and the Rockwell HRC results for the transposition arms were converted using ASTM E140 for comparison purposes. On the Vickers Kg/mm2 the broken hook from 27/222 scored 114 for hardness, the most worn hook from 24/199 scored 119 for hardness and the least worn hook scored 222, the transposition arm and bracket from 27/222 scored 134 and 152 for hardness, the transposition arm and bracket associated to the most worn hook on 24/199 scored 120 and 138 for hardness and the transposition arm and bracket associated to the least worn hook scored 118 and 152 for hardness.

³⁷ Kris Kuyper is the former Chief Meteorologist for Action News in Chico. Kuyper was retained as an expert by the Butte County DA.

³⁸ The transposition arms metal (around the original hanger holes) was less hard than the bolted-on hanger plate hole metal. The original hanger holes showed significantly more keyhole wear than the bracket holes.

V. INSPECTION AND PATROL POLICIES

State and federal regulatory requirements dictate PG&E must establish and follow set guidelines for patrol, inspection and maintenance of its overhead electric transmission lines. The 2012 Quanta Technology “Transmission Line Inspection Procedures Final Report”³⁹ outlined the various regulatory requirements. Among these requirements is CPUC General Order (GO) 165. Section IV of this General Order states “[e]ach utility shall prepare and follow procedures for conducting inspections and maintenance activities for transmission lines.”⁴⁰

Since 2005, PG&E electric transmission inspection, patrol, and maintenance policies have been set forth in the “Electric Transmission Preventative Maintenance Manual” (ETPM). According to the ETPM: “Inspection and patrol procedures are a key element of the preventive maintenance program. The actions recommended in this manual reduce the potential for component failure and facility damage and facilitate a proactive approach to repairing or replacing identified, abnormal components.”

a. 1987 Inspection and Patrol Bulletin

Prior to the implementation of the ETPM in 2005, inspection and patrol policies were documented in “bulletins”. The oldest bulletin provided by PG&E was dated November 1, 1987⁴¹, and entitled “Routine Patrolling and Inspection of Transmission Lines.” This bulletin stated patrols are performed “to ensure that the transmission facilities are in good repair in order to maintain a high standard of service, reliability, and safety, and the patrol policy is consistent with GO95.”⁴² In this 1987 bulletin, the terms “patrol” and “inspection” were used interchangeably.

The 1987 policy divided PG&E’s electrical transmission system into 4 parts: Class A circuits, Class B circuits, Class C circuits, and Underground. For overhead circuits,⁴³ the patrol or inspection cycles were determined by the class designation of the circuit. A PG&E troubleman,⁴⁴ who worked in the Feather River Canyon between 1987 and 1995, established the Caribou-Palermo line was considered a “Class B Circuit.” As such, under the 1987 policy the Caribou-Palermo line was required to be patrolled three times each year: one ground patrol and two aerial patrols. In addition, the 1987 policy required climbing inspections of five percent of the tower structures per year; and an infrared patrol⁴⁵ every five years. According to the 1987 policy bulletin, all patrols of transmission lines were to be completed by a “Transmission Troublemán.” This policy ensured that every overhead transmission structure would be climbed

³⁹ Quanta Technologies is a multi-national electrical utility consulting company. Quanta Technologies was retained by PG&E in 2011 to review the ETPM. This report was commissioned by, and paid for by, PG&E.

⁴⁰ The California Independent System Operator (CAISO) “Transmission Control Agreement” and Western Electricity Coordinating Council (WECC) standard FAC-501 also require PG&E to have and follow written policies for inspection and maintenance of electrical transmission lines.

⁴¹ The 1987 bulletin was the sixth revision of an existing policy bulletin and replaced the fifth revision which was published December 1, 1984 according to the face page of the 1987 bulletin. Based upon interviews with PG&E linemen from the 1970s and 1980s it is believed that the original policy bulletin was published 1972-75.

⁴² GO95 is General Order of the CPUC number 95. GO95 establishes building, maintenance and replacement regulations for electrical transmission.

⁴³ A circuit is the path electrical current flows. In the 1980s PG&E referred to transmission lines as circuits. Distribution lines are still referred to as circuits. Transmission lines are now referred to as lines.

⁴⁴ See Section VII “Troublemén and Training” below for the definition of the position of Troublemén.

⁴⁵ An infrared patrol uses infrared, thermal cameras to identify hot spots on the line. Hot spots may indicate a defect or weakness on the line.

at least once every 20 years. Because PG&E inspection/patrol records prior to 2000 are not available, it is unknown if Tower 27/222 was one of the towers subjected to a climbing inspection between 1987 and 1994.

Appendix A to the 1987 policy bulletin contained a checklist of “Conditions to be noted when patrolling lines.” One of the conditions to be noted was “Worn hardware and connectors.” Through interviews with transmission lineman, troublemen, and engineers, it was established the C hooks were technically part of the “cold end attachment hardware.”

Former PG&E Transmission Line Supervisors from 1987 noted the checklist inclusion of “worn hardware” was a result of a 1987 PG&E Laboratory Test Report⁴⁶ documenting a worn C hook and hanger hole from a Bay Area transmission tower⁴⁷. Photos of the worn C hooks and holes were distributed to troublemen in all of the PG&E regions for training purposes, and inspection of C hooks and hanger holes was made a specific priority during inspections/ patrol.

b. 1995 Inspection and Patrol Policy

The 1987 policy remained in effect until it was replaced by the “ES Guideline” in 1995. The 1995 ES Guideline made substantial changes, specifically separating out patrols from inspections. Inspection frequency was determined by a transmission line score on an “Inspection Frequency Checklist” and drastically reduced the frequency and thoroughness of inspections. The Caribou-Palermo line was reduced from three patrol/inspections (one ground/two aerial) per year to one ground inspection every 24 months and one aerial inspection every 24 months. Required routine climbing inspections were eliminated. Climbing inspections would only occur if “triggered” by one or more specific findings listed as triggers.

c. 2005 ETPM Inspection and Patrol Procedures

The 1995 policies remained in effect until they were replaced by the ETPM in 2005. According to the ETPM section entitled General Inspection and Patrol Procedures, “[t]hese inspection and patrol procedures were developed as a key element of the preventative maintenance program. The recommended actions were selected to reduce the potential for component failures and facility damage and to facilitate a proactive approach to repairing or replacing identified, abnormal components.”

The ETPM differentiated between inspections and patrols, and established definitions for each. According to the 2005 ETPM in the Detailed Overhead (OH) Inspections section:

“A detailed ground, aerial or climbing inspection of the asset⁴⁸ looks for abnormalities or circumstances that will negatively impact safety, reliability, or asset life. Individual elements and components are carefully examined through visual and/or routine diagnostic tests and the abnormal conditions of each are graded and/or recorded.

Overhead line facilities are to be inspected in accordance with the provisions in Section 2.0 of this manual. The inspections are to include detailed visual observations,

⁴⁶ The Laboratory Test Report was published approximately nine months before the Inspection and Patrol Bulletin. This Laboratory Test Report is described more fully in Section XVII “Knowledge of Risk/Consequence.”

⁴⁷ Based upon historical records it is believed that the tower was part of the original Caribou-Valona line built 1918-1921.

⁴⁸ An asset is a structure, pole or tower.

operational readings, and component testing to identify abnormalities or circumstances that will negatively impact safety, reliability or asset life.”

The 2005 ETPM **Patrols** of overhead transmission assets section states that:

“The QCR’s⁴⁹ primary responsibility in an overhead electric facility is to visually observe the electric facilities, looking for obvious structural problems or hazards without the use of measuring devices, tools, or diagnostic tests, and to record that the facilities have been patrolled.”⁵⁰

The ETPM adopted verbatim the 1995 policy on climbing inspections and triggers. According to section 3.4:

“A climbing inspection is a detailed, supporting structure based observation of the facilities installed to determine if there are any abnormal or hazardous conditions that adversely impact safety, service reliability or asset life, and to evaluate when each identified abnormal condition warrants maintenance.”

Climbing inspections may also be required for specific structures or components to properly assess a condition found during a ground or aerial inspection or patrol that could not be adequately assessed during the inspection of patrol.”

As of the 2005 ETPM, the Caribou-Palermo line was reduced to only being inspected once every five years and patrolled once per year in non-inspection years. (This reduction again is from the three patrol/inspections per year prior to 1995.)

The 2006 revision of the ETPM appears identical to section 2 of the 2005 ETPM and identifies the “Best View Position” for individual components on a transmission structure.⁵¹ According to Table 2.3-1 the best position to view insulators and hardware is aerial inspection (not patrol), ground inspection above 10’, and climbing inspection. The terms “aerial inspection” and “ground inspections above 10’” were not specifically defined in the ETPM. According to former PG&E personnel, an “aerial inspection” is significantly more detailed than an “aerial patrol” and requires a helicopter to fly 360 degrees around each structure at an altitude and speed which allows for detailed inspection of the structure components. A ground inspection above 10’ involves the use of a bucket truck to lift the QCR to allow for close inspection of the top part of the structure.

d. Patrol and Inspections Subsequent to the 2005 ETPM

Since 2005 the ETPM has been revised on multiple occasions⁵². The revisions have not changed the inspection or patrol cycles or the requirements for inspections and patrols. At the time of the Camp Fire, the third revision of the ETPM, issued May 12, 2016 was in use. Shortly after the Camp Fire, on November 20, 2018, the 4th revision of the ETPM⁵³ was published. Among other changes, the fourth revision of the ETPM incorporated new requirements for the prioritization and correction of safety hazards in Tier 2 and Tier 3 high fire threat areas identified in the 2018

⁴⁹ QCR is Qualified Company Representative. See section VII-“Troublemens and Training” for more information.

⁵⁰ See Section VII “Troublemens and Training” below for the definition of the position of QCR.

⁵¹ Copies of the 2005 ETPM provided by PG&E were missing page 2-4.

⁵² Revised editions of the ETPM were published in October 2006, April 2009, January 2011, December 2014, May 2015, May 2016 and November 2018

⁵³ Although the May 2016 revision was the sixth revision of the ETPM, PG&E did not start numbering revisions until the December 2014 edition, which was designated revision one.

CPUC Fire Threat Map.⁵⁴ These changes were required by amendments to GO95 by the CPUC, which took effect in January 2018.⁵⁵

e. The 2012 Quanta Report

The 2012 Quanta Technologies “Transmission Line Inspection Procedures Final Report” was a “comprehensive review of Pacific Gas and Electric’s (PG&E) current standards and practices used for ground patrol inspection of overhead transmission lines.”⁵⁶ According to the report, the ETPM was “found to be a comprehensive, well written document that adhered to its purpose to “ensure uniform and consistent required procedures for patrols, inspections, equipment testing, and condition assessment of electric transmission line facilities.” Quanta did not, and the report did not, evaluate the actual use, or non-use, of the ETPM by PG&E.

The evidence clearly established that PG&E did not, in fact, follow the procedures and requirements established in the ETPM. Based upon the evidence, it is reasonable to conclude that sections of the ETPM relating to inspections and patrols of overhead electric transmission lines were simply a façade created to meet the requirements of the regulators and the CAISO⁵⁷.

VI. REDUCTION OF UNIT COSTS FOR INSPECTIONS AND PATROLS

Although there were no changes to the frequency of inspections and patrols between the 2005 and 2018 ETPMs, the evidence established PG&E considered further reducing the frequency of inspections and patrols. According to 2013 internal PG&E PowerPoint, a committee was formed to explore opportunities to reduce costs by reducing the frequency of inspections and patrols and examine said “unit costs.” According to the “Problem Statement:”

“Tline⁵⁸ patrols/inspection have not been modified in approximately 10 years relative to frequency and work methods. There may be opportunities to reduce costs by 1) changing frequency of patrols/inspections or 2) finding more efficient work practices. Benchmarking PG&E’s practices against other utilities may identify potential opportunities for efficiency savings.”

Under the heading “Business Objectives:”

⁵⁴ On January 19, 2018, the CPUC adopted and published the CPUC Fire-Threat Map. The Fire-Threat Map identified elevated (Tier 2) and extreme (Tier 3) fire threat areas in the State of California.

⁵⁵ In conjunction with the Fire-Threat Map, the CPUC amended GO 95 to add regulations to enhance fire safety in Tier 2 and Tier 3 fire threat areas.

⁵⁷ California Independent System Operator Corporation. CA ISO is a private, non-profit corporation that manages the high voltage power grid and the wholesale energy market for most of California. CA ISO was created in 1997 as part of an effort to restructure the wholesale electric industry in California. CA ISO is not a regulator. CA ISO’s power over electric transmission utilities derives from the Transmission Control Agreement entered into between CA ISO and the utilities. In the Transmission Control Agreement the utilities agree to, among other things, properly maintain electric transmission lines, provide CA ISO with all current maintenance policies (referred to as a Transmission Owner Maintenance Practices (TOMP)). Failure to comply with the terms of the Transmission Control Agreement could be a breach of contract.

⁵⁸ PG&E abbreviation for Transmission line

Define improvements in our frequency, tools or processes to find efficiencies in the patrols/inspections.

Perform benchmarking and analysis to measure current practices

Determine frequency of patrols/inspections (are we doing more than industry standard)

Analyze current patrols/inspections work methods (i.e. crew size)

Under the heading “Scope”

Patrols and Inspections for Transmission Lines

Frequency of patrols/inspections

Work methods/practices (tools, crew size, processes)

Unit costs measurement

Emails obtained from PG&E established committee members subsequently met with other electrical utilities for the purpose of benchmarking inspection and patrol practices of those utilities and submitted to a national electrical utilities association a patrol and inspection survey to be distributed to and completed by its members. This was done despite the fact the 2010 Quanta Technologies “Structures” Report⁵⁹ included data on patrol and inspection frequency gathered from a survey of 104 electrical utilities worldwide conducted in 2003 by the International Council on Large Electrical Systems, also known as Cigre’⁶⁰. According to the Cigre’ study 74% of the companies utilized “Walking” inspections, 63% utilized “Climbing” inspections and 66% utilized “Helicopter” inspections. The average inspection period for each type of inspection was 1.4 years for walking, 1.5 years for helicopter and 4.2 years for climbing.

The lack of change in inspection and patrol frequency in subsequent revisions of the ETPM indicates that reduction of inspection and patrol frequency was not approved. The committee was also exploring opportunities to reduce costs by finding more efficient work practices. A key component of this inquiry was “Unit cost measurement.” The evidence indicates that PG&E reduced costs by reducing the unit cost for each inspection and patrol. The evidence shows that this was accomplished by reducing the thoroughness of the inspections and patrols.

Review of internal PG&E documents, including emails, and interviews with PG&E personnel determined that the unit cost for inspection and patrol is calculated based upon the time that a troubleman spends inspecting an individual structure. Based upon interviews it was established that each year PG&E determines an average unit cost for each type of inspection or patrol. The unit cost would be translated into time and multiplied by the total number of structures on an individual line. The result would be the time allotted for the inspection or patrol of that transmission line. Prior to the start of each calendar year each transmission region headquarters was provided a list of inspections and patrols, including the allotted time, scheduled for the following year. The inspection and patrol budgets for each transmission region headquarters was based upon the total allotted time for all scheduled inspections and patrols. The evidence established that the Business Finance Department of the Electric Transmission Division sent monthly budget reports tracking spending, both monthly and year to date, for inspection and patrol against budget allocations. The reports were color-coded - red for over budget and green

⁵⁹ In 2009 PG&E hired Quanta to evaluate its electrical transmission system. In 2010 Quanta submitted to PG&E the Transmission Line Component Management Report which included the Structures Report.

⁶⁰ Cigre is an international association of electrical transmission companies located in Paris, France. Cigre was established in 1921 and claims 1250 member organizations from 90 countries.

for under budget. The evidence also established that salary incentives (bonuses) of Transmission Line Supervisors and Transmission Superintendents was, at least partially, based upon compliance with the inspection and patrol budget.

Based upon the evidence, PG&E reduced costs of inspection and patrol by reducing the amount of time budgeted for the inspections and patrols. As expected, the result of these reductions was less thorough and less complete inspections and patrols.

VII. TROUBLEMEN AND TRAINING

a. Creation of the Troubleman Program

The evidence established the inspection and patrol of the transmission lines is done by the “Troublemen.” Similar to the inspection and patrol policy, the position of Troubleman has evolved and changed. Based upon interviews with former PG&E employees from the 1980s, the evidence established the position of Transmission Troubleman was created in the mid-1980s. The earliest reference to troublemen in documents provided by PG&E is found in the 1987 “Routine Patrolling and Inspection of Transmission Lines” policy bulletin.

According to the original Transmission Line Supervisors interviewed, the Transmission Troubleman position was initially intended to be a qualified and experienced transmission line expert. According to one of the original Transmission Lines Supervisors the “intent here was to have people that knew exactly what to look for, how to establish priorities on repairs, and would, would keep it operating.” In addition to the physical demands and climbing requirements of the position, the Troublemen were also expected to take ownership of individual transmission lines and be accountable for the continued safe and reliable operation of that line.

b. Troubleman Training

The 1987 “Routine Patrolling and Inspection of Transmission Lines” policy memo established training requirements for the new Transmission Troublemen⁶¹. In the late 1980s, training for Transmission Troublemen included periodic meetings of all of the Transmission Line Supervisors and Troublemen. At these meetings issues and problems were shared and discussed. According to one of the original Transmission Line Supervisors, a supervisor was designated to document and/or collect all of the examples presented at the meetings in order to compile a training manual for future Transmission Troublemen. According to several of the original Transmission Line Supervisors and Troublemen, an inspection checklist was developed based in part on the information being shared at these meetings. Appendix A to the 1987 “Routine

⁶¹ “It is the responsibility of each Region to ensure proper training of personnel conducting line patrols. This is to be accomplished through use of periodic training classes for all transmission troublemen and any other personnel who may be called upon to patrol. The training should include a review of this bulletin, other T&D bulletins as appropriate, patrol safety, Engineering Drawing 022168, and G.O. 95 requirements. The use of available videotapes (spacer damage, infrared patrolling, etc.) is encouraged. Particular attention should be given to the specific items listed on the code sheet that is provided with this bulletin. The Transmission and Distribution Department will assist the Regions in setting up and conducting the training classes.”

Patrolling and Inspection of Transmission Lines” policy memo appears to be the earliest form of the checklist.

In addition to eliminating routine climbing inspections, reducing the frequency of inspections, and creating an Inspection Frequency Checklist, the 1995 ES Guideline eliminated the training requirement for troublemen. Notwithstanding that, the training requirement was dropped from the ES Guideline, the evidence does show that PG&E had created a Troubleman training program. According to one of the former PG&E employees involved in the creation of the 1995 ES Guideline, one of his duties from 1995 until 2005, was to provide direct annual training on inspection and patrol policies and requirements to all Troublemens. According to this former employee, a decision was made in 2005 to eliminate direct training of Troublemens. Instead, the Transmission Line Supervisors were provided training and expected to train the Troublemens under their supervision.

In December 1997, PG&E filed its first “Transmission Owner Maintenance Practice (TOMP) with the CA ISO⁶². In the TOMP the term “Troubleman” was replaced with the term “Inspector”. According to the definition of terms, an Inspector is a “PG&E employed inspector commonly referred to as “troubleman.”

In the 2002 “Transmission Owner Maintenance Practice” (TOMP) the term Inspector was replaced with “Qualified Company Representative (QCR). According to the Definition of Terms, a QCR is “a person, who by reason of training and work experience is able to complete an accurate assessment of the electric transmission facilities that he/she is asked to inspect.” The required training and work experience necessary to be considered a QCR was never defined.

In the first version of the ETPM (2005), the term Troubleman does not appear. Instead, the ETPM continues the use of the term QCR. The 2005 ETPM definition of a QCR differed from the definition in the TOMP – “A Company representative who, by knowledge, required training, and/or work experience, is able to prepare an accurate and complete assessment of electric transmission facilities.” The definition of a QCR continued to evolve through each revision of the ETPM. According to the 2018 ETPM a QCR is “A company representative, who, by knowledge, required training and/or work experience, is able and allowed to perform a specific job. For the purposes of this manual, QCR refers to an employee qualified to prepare an accurate and complete assessment of electrical transmission facilities.” The ETPM does not define the knowledge, training or work experience required of a QCR.

Every QCR who has inspected or patrolled the Caribou-Palermo line since the publication of the ETPM in 2005 was interviewed. All of the QCRs denied having receiving any formal training on how to perform an inspection or patrol. According to all of the QCRs, any inspection and patrol training was limited to filling out reporting forms and notifications for any issues

⁶² California Independent System Operator Corporation. CA ISO is a private corporation that operates the high voltage grid in California. CA ISO monitors the flow of power in transmission lines that providers use, operate wholesale electricity markets for energy and ancillary services, and maintain transmission maintenance standards. Transmission owners (TO’s) mutually agree to contract with them. CA ISO was created by the State of California in 1997 in an effort to restructure the wholesale electric industry in California.

identified during an inspection or patrol. All of the QCRs asserted that the only training on how to perform an inspection or patrol was via informal mentoring by other, more experienced, Troublemens.

The evidence also established that some of the QCRs performing inspections and patrols of the transmission lines in the Feather River Canyon had little or no transmission line experience before becoming a Troubleman.⁶³

Although PG&E documents and management personnel assert that troublemen receive training on the requirements of the position, the troublemen themselves unanimously denied having received any formal training on conducting inspections and patrols and assessing wear. The troublemen also denied being provided with any records (for example tower schematics) specific to the transmission lines being inspected. The lack of specific training and records was especially significant for troublemen inspecting the Caribou-Palermo line. The hanger holes, according to the original schematics, were 1 1/8" in diameter and the C hooks were 15/16" thick at the contact point. On other Feather River Canyon transmission lines the C hooks were the same size but the hanger holes were significantly larger. The evidence established that the Troublemens' lack of knowledge of the different sized hanger holes contributed greatly to the failure of PG&E to recognize the degree of wear on the C hook on Tower 27/222.

The evidence established that, despite the lofty goals of the originators of the troubleman position, and the designation of QCR by PG&E, by 2007 the inspections and patrols of the Caribou-Palermo line were being conducted by inexperienced, untrained and unqualified troublemen. Both of the "Detailed Ground Inspections (2009 and 2014) and seven of the ten Annual Air Patrols on the Caribou Palermo were completed by troubleman who had little or no prior transmission experience, and no formal training on performing inspections and patrols. This is contrary to the third Revision of the ETPM which requires that the "QCRs must be thoroughly familiar with all of the facilities, equipment, safety rules and procedures associated with the facilities and equipment." Under the ETPM the QCRs are supposed to be looking at components and estimating wear by percentage of material lost. In order to judge material loss a troubleman would have to know what a component looked like at 100%. The majority of the troubleman sent to inspect and patrol the Caribou-Palermo line had no idea what the C hooks and hanger holes were supposed to look like. Because of their lack of knowledge, experience, and training, the troubleman could not have been expected to identify the wear. The overwhelming

⁶³ One former troubleman assigned to the Caribou-Palermo line admitted that although he was a journeyman lineman, he worked in distribution (almost 30 years) and had never worked as a transmission lineman prior to becoming a transmission troubleman. Another troubleman assigned to the Caribou-Palermo line was also a distribution lineman prior to becoming a transmission troubleman and admitted his only experience with transmission lines above 60kV was during his apprenticeship. According to a former Table Mountain HQ Transmission Line Supervisor, this Troubleman had so little experience with transmission lines that he was assigned to work with the transmission lineman until the Supervisor was forced by the union to allow the troubleman to conduct inspections and patrols. Another former troubleman assigned to the Caribou-Palermo line had worked on transmission lines as a journeyman lineman until PG&E split distribution and transmission in the mid-80s. The former troubleman worked in distribution exclusively for over twenty years before becoming a transmission troubleman.

evidence clearly established that troublemen and linemen inspecting and patrolling the Caribou-Palermo line did not meet the standards established in the ETPM.

VIII. FAILURES IN MAINTENANCE, REPAIR AND REPLACEMENT RECORD KEEPING ON THE CARIBOU-PALERMO LINE

As part of the Camp Fire Investigation, all maintenance/repair/replacement records for the Caribou-Palermo line were requested and obtained from PG&E. Any and all records received from PG&E pertaining to Towers 27/222 and 24/199 were reviewed in depth. The only records of any maintenance/repair/replacement located for these towers related to the replacement of parallel groove connectors⁶⁴ { [Attachment – parallel groove connector](#) } on each tower in 2016.

a. Hanger Brackets

During the investigation it was observed that “hanger brackets” (bolted add-on brackets for hanger plates for the hole that the C hooks hung from) { [Attachment – add-on hanger bracket](#) } had been added to the transposition arms of towers 27/222 and 24/199. Similar hanger brackets were not found on other transposition towers and the brackets were not shown on the original plans for the transposition arms. After being removed from the towers, the transposition arms were examined. Some of the original hanger holes displayed significant “keyhole” wear. { [Attachment – significant keyhole wear](#) } PG&E was unable to produce any records of when, why, and by whom the hanger brackets had been added. Based upon the keyhole wear observed on the original hanger holes, the only reasonable conclusion to be drawn was someone at PG&E at some time in the past had noticed the keyhole wear and was concerned enough to take action.

b. Parallel Groove Connectors

As previously mentioned, during the inspection of Tower 24/199 investigators noticed a parallel groove connector on the jumper conductor. { [Attachment – parallel groove connector on 24/199 jumper](#) } It appeared to investigators that, at some previous time the jumper conductor had been shortened and spliced together using the parallel groove connector. Investigators also observed that the right phase insulator string appeared to be less aged than the left phase insulator and, as a result of the shorter jumper conductor, was not hanging plumb. From the ground, investigators also observed black marks on the tower leg nearest the right phase insulator string. On the ground below Tower 24/199, investigators found an old insulator string. The old insulator string was complete except for the C hook.

PG&E was unable to produce any records of when, why, and by whom the parallel groove connector had been added to the jumper. No explanation was provided as to why the parallel groove connector on the jumper conductor was not replaced when all of the other parallel groove connectors in the tower were replaced in 2016. PG&E was also unable to produce any records as to the replacement of the insulator. Based upon the observations of investigators, the only reasonable conclusion that could be drawn is that at some time in the past the jumper conductor made contact with the tower leg, causing the blackening observed on the tower leg. This damaged the jumper conductor, necessitating the removal of a portion and replacement of the

⁶⁴ Parallel groove connectors are used to connect two parallel pieces of power line (conductor).

insulator. It was also clear, based upon the change in the wear pattern on the C hook observed by the FBI metallurgist, the C hook was not replaced when the jumper conductor was shortened and the insulator changed.⁶⁵

Although no records were found to explain why, the evidence established that as part of a scheduled Detailed Ground Inspection in 2009, the troubleman assigned to complete the inspection of the Caribou-Palermo line was instructed to document all towers with parallel groove connectors and create work orders for replacement of the parallel groove connectors. In total, the “Transmission Line Inspection Datasheet” completed by the troubleman as part of the report of the 2009 Detailed Ground Inspection, lists 85 towers for “Rpl Connectors.” For each tower, a notification number was assigned and a “Corrective Work Form” was generated. Copies of these Corrective Work Forms for towers 24/199 and 27/222 were obtained during the investigation. Replacement of the parallel groove connectors was designated, according to the Corrective Work Forms as “Priority F – Schd Compl Yr 1+.”⁶⁶ At the time the Corrective Work Forms were created, the April 2009 revision of the ETPM was in effect. The priority code F did not exist in the 2009 ETPM. The priority codes listed in the 2009 ETPM were A, C, G and P. Prior to the April 2009 revision of the ETPM, numerical (as opposed to letter) priority codes were used. The priority code F did not come into existence until the 2011 revision of the ETPM. According to the 2011 version of the ETPM, Priority Code F is defined as “Corrective action is recommended within 24 months from the date the condition is identified, except for nominations notifications or system wide initiatives identified by Asset Strategy (e.g., bridge bonding, shunt splicing), which can have due dates beyond 24 months.”

According to the Corrective Work Forms for Towers 27/222 and 24/199, the parallel groove connectors were re-assessed during the 2011 Annual Air Patrol. A note dated August 16, 2011, states “per (troubleman) on 8/1/11 during patrol OK to move out 2 yrs.” On November 10, 2009,⁶⁷ PG&E Applied Technology Services (ATS)⁶⁸ published a Lab Test Report entitled “Analysis of bolted aluminum transmission connectors from various PG&E sites.” Based upon the ATS Lab Test Report the problems identified were internal to the connector. There is nothing in the report documenting any outward signs of the interior wear. The question of how a troubleman flying in a helicopter could assess the wear inside the bolted connectors was never answered⁶⁹.

A note on both Corrective Work Forms dated January 10, 2012, states “move required end date to 11/30/2015.” No explanation is given as to why the required end date was moved back three

⁶⁵ According to PG&E and all transmission lineman interviewed, it was standard practice to replace the used C hook when replacing an insulator string. While inspecting the Caribou-Palermo line in February and March 2019 investigators noted another tower in which the insulator strings had recently (post Camp Fire) been changed but the C hooks were re-used.

⁶⁶ In a written response to a CPUC data request PG&E wrote “Between 10:41 a.m. and 10:42 a.m. on October 4, 2009, all 85 notifications were changed from Priority Code G to Priority Code B conditions by {name redacted}, the same PG&E contractor who changed the Priority Code on LC Notification 103995542. Between 5:38 p.m. and 5:39 p.m. on October 27, 2009, all 85 notifications were changed from Priority Code B to Priority Code F conditions by {name redacted}.”

⁶⁷ Approximately three months after the completion of the 2009 Detailed Ground Inspection of the Caribou-Palermo line.

⁶⁸ Applied Technology Services is PG&E’s internal engineering and scientific research lab. ATS was previously known as the PG&E Department of Engineering Research.

⁶⁹ Interior wear on parallel groove connectors may cause the connector to show excessive heat in an infrared inspection. None of the Annual Air Patrols included infrared inspections.

years. PG&E addressed this issue in a Data Response to CPUC. According to PG&E's written explanation, the Corrective Work Forms were initially assigned priority code G – required repair/replacement within 12 months. On October 4, 2009, the priority code was changed to Priority B – required repair/replacement within three months in the PG&E SAP system. According to PG&E, the priority code was changed again on October 27, 2009, to Priority F. Also according to PG&E's written response to the CPUC, because the replacement of the connectors was a Priority F and was “for nominations[,] notifications[,] or systemwide initiatives identified by Asset Strategy (e.g., bridge bonding, shunt splicing), which can have due dates beyond 24 months” no documentation or reason was required for re-assessment. The quoted language is from the 2011 version of the ETPM. The 2009 version of the ETPM stated “Any reassessment must have sound business or technical supporting reasons and documentation on file and recorded in SAP.” No explanation was ever provided as to how and why a priority code and exception which did not come into existence until January 2011, was being applied in October 2009.

This raised serious questions as to the accuracy of the few maintenance/repair/replace records PG&E was able to locate. The final note on the Corrective Work Form is dated June 29, 2016, and reads that the connectors were replaced on June 18, 2016. There is no record as to why the parallel groove connector on the jumper conductor of Tower 24/199 was not replaced.

In total, almost seven years elapsed between the identification of the defective parallel groove connectors on the Caribou-Palermo line and the replacement of those connectors. At least ten years elapsed from the time replacement of parallel groove connectors were identified as a fire⁷⁰ mitigation. No valid explanation for the extended amount of time was ever provided.

c. The “Deteriorated Transmission Equipment Replacement Program.”

In 2007, PG&E introduced the “Deteriorated Transmission Equipment Replacement Program.” According to internal documents, the Deteriorated Transmission Equipment Replacement Program was included in PG&E's capital spending five-year plan and was funded through 2015.

PG&E was unable to produce any documentation as to the budget or eligibility requirements for the Deteriorated Transmission Equipment Replacement Program. Although the name of the program implied that the program was established to replace deteriorated equipment, no records of funding or eligibility requirements for the program were found. During interviews and testimony of PG&E employees familiar with the program, it was simply a “bucket” of money available to fund capital improvements on transmission lines regardless of the condition of the line or its components. Based upon the evidence the name Deteriorated Transmission Equipment Replacement Program did not accurately depict the true nature of the program.

⁷⁰ Parallel groove connectors were identified as a fire risk in the October 2006 Risk Analysis of Urban Wild Land Fires. See section XVII – “Knowledge of Risk/Consequence” for details re: the 2006 Risk Analysis.

d. The Caribou-Palermo 7/55-8/64 Replacement Towers project

A portion of the Caribou-Palermo line was nominated for replacement through this program by the Maintenance and Construction Engineer⁷¹ (M&C Engineer) assigned to the North Area⁷². According to a PG&E internal budget document “Request for Advance Authorization of Expenditures in Accordance with Capital Expenditures Policy,” \$800,000 was initially requested “for preliminary engineering and purchase of long lead-time material to replace conductor and tower structures on a section of the Caribou-Palermo line between structures 7/55 and 8/64.”⁷³ { [Attachment – Google Earth Map showing 7/55-8/64](#) } The initial Advance Authorization specifically stated:

“There have been multiple conductor failures on this line due to conductor being annealed⁷⁴ and parting.⁷⁵ Since 2002 there have been 8 event reports created on this line. 5 of which was equipment related failures.”

“It is very time consuming and costly to correct any failures that occur in this dilapidated line section, especially during the winter months when failures are more likely.”

“The probability of that failure is imminent due to the age of both the towers and the conductor.”

“The intent of this project is to be pro-active and replace this deteriorated line section in a controlled and planned manner instead of under emergency conditions.”

The initial Advance Authorization for \$800,000 was not approved by PG&E’s Electric Asset Strategy Division, and instead, upon re-writing and re-submission, was reduced to \$200,000 by the then Director of the Electric Asset Strategy Division. The second Advance Authorization did not include the descriptor “dilapidated” or the prediction of imminent failure but did state: “Replace deteriorated structures, conductor, insulators, and hardware between structures 7/55 and 8/64.” The second Advanced Authorization was approved. The project was named the “Caribou-Palermo 7/55-8/64 RPL Towers” project.

A “Project Manager”⁷⁶ was assigned to this project. According to internal PG&E documents, between 2007 and 2009 the Project Manager spent almost \$800,000 conducting engineering studies of the proposed new tower sites and preparatory work, including building a road to allow access to the proposed new tower sites. In 2009, the project was canceled as, according to internal emails, “this project fell below the cut line for 2010 approved projects.” According to a 2014 email from a member of PG&E’s Capital Accounting Department the project “was canceled due to Asset Management’s reprioritization and is not expected to be resumed.” During an email chain, starting on November 2, 2009 and ending on January 22, 2010, the Project

⁷¹ Although the job title was Engineer this person was not an engineer and had no engineering education or experience. This person described his position as “You’re kind of a liason between the field crews and both civil and electrical engineers.”

⁷² Includes Sacramento District, Table Mountain District, Eureka District and Lakeville District

⁷³ On the southside of the Feather River between Caribou Road and Beldon.

⁷⁴ According to the M&C Engineer “annealed usually means a little more brittle.”

⁷⁵ The M&C Engineer also identified the conductor as copper and not aluminum because “we wouldn’t put shunts on aluminum.”

⁷⁶ A project manager is a person assigned to supervise a specific project.

Manager made the following arguments for continuing and completing the Caribou-Palermo 7/55-8/64 RPL Towers project to the Program Manager⁷⁷ assigned to that major work category:

“If it is not funded for permitting etc., we could be picking up these towers out of the Feather River Canyon when they fall over.”

“We have already notified FERC⁷⁸ of the project and it will not look good if towers we have identified as deteriorated fall over in the canyon because we did not perform the work due to funding.”

Despite the representations of the Project Manager the project was not reinstated by the Program Manager.

During interviews with investigators and testimony, the author of the Advance Authorizations⁷⁹ and the Project Manager separately asserted they had no factual basis for the statements about the condition of the Caribou-Palermo line towers and downplayed the statements as exaggerations made while advocating for a project.

e. The Rock Fire

A Corrective Work form⁸⁰ was located for replacement of a failed connector on Tower 11/87 in September of 2008. The Corrective Work Form was generated based upon a non-routine patrol of the Caribou-Palermo line generated by a power interruption on the line on September 30, 2008.

On September 30, 2008, at approximately 2:30 p.m., the Plumas National Forest Headquarters received a report of a fire near the Rock Creek Dam. {[Attachment – Google Earth map of Rock Creek Dam](#)} The fire was named the Rock Fire. This fire burned approximately five acres in the Plumas National Forest. Origin and Cause investigators from the United States Forest Service (USFS) investigated the fire and determined the origin to be directly below Tower 11/87 of the Caribou-Palermo line. The Rock Fire was determined to have been caused by an equipment failure, specifically the failure of a connector on a jumper line, on Tower 11/87. PG&E records obtained by the USFS investigators showed PG&E experienced an interruption on the Caribou-Palermo line at approximately 2:02 p.m. on September 30, 2008. No records of a root cause investigation of the failure of the connector were found. Consistent with PG&E’s practice, as supported by the evidence, PG&E did not conduct climbing or aerial inspections on other Caribou-Palermo line towers with similar connectors.

f. Tower Collapse

On December 21, 2012, a catastrophic failure occurred on the Caribou-Palermo line that generated six corrective work forms. Five towers, 22/187 through 23/191, collapsed and a sixth

⁷⁷ PG&E divides electrical transmission work (repair/replace/maintain/improve) into “major work categories” (also referred to by PG&E personnel as budgetary “buckets”). The program manager oversees all projects within a major work category.

⁷⁸ It appears that this is a reference to a Federal Energy Regulatory Commission (FERC) rate case. In support of requests for rate increases PG&E files a rate case with FERC. To justify the proposed rate increase in the rate case PG&E lists planned capital projects with cost projection. Projects are generally forecasted five years in the future.

⁷⁹ A former Maintenance and Construction (M&C) engineer.

⁸⁰ A PG&E form generated by field personnel to document and describe problems, defects, wear or other conditions on transmission assets requiring maintenance/repair/replacement.

tower, 23/192, {[Attachment – Google Earth map of towers](#)} was badly damaged to the extent that it needed to be replaced.

A PG&E Civil Engineer investigated the incident and did not author a report, but did communicate his conclusions in an email. He determined Tower 22/188 initially collapsed causing a domino effect that pulled down towers 22/187, 22/189, 23/190 and 23/191. He concluded the collapse of Tower 22/188 was caused by the failure of the “stub angles”⁸¹ possibly due to strong wind and/or icing wet ground conditions. No formal “Root Cause Analysis” was conducted. Although he concluded his analysis by stating “Due to this failure phenomenon, it would be advisable to inspect towers with similar line angle on this line to ensure no other foundations had experienced similar uplift during same wind storm.” The evidence established none of the other Caribou-Palermo line tower foundations were inspected. Again, this is consistent with PG&E’s practice of not following up on clearly established potential safety and/or maintenance issues.

The six towers were temporarily replaced by a “Shoe Fly,” consisting of fifteen wooden poles, constructed along Camp Creek road. {[Attachment – Google Earth map of Shoe Fly](#)} The Shoe Fly was completed by January 30, 2013. The Shoe Fly remained in service until the six towers were permanently replaced. The six towers were eventually, permanently, replaced by modern H-Frame tubular steel pole structures in 2016.

g. Center Phase Conductor on Tower 24/200

On January 10, 2014, a PG&E employee doing “crew work” documented a problem on the center phase conductor on Tower 24/200. Pictures attached to the Corrective Work Form appear to show a damaged conductor. In addition, the photos appear to show damage to the corona shield⁸² (part of the hot end attachment hardware) and melting on the conductor below the corona shield. Another photograph appeared to show a piece missing from another section of the conductor and blackening on the conductor a few inches from that missing piece. The Corrective Work Form stated the conductor was repaired on 5/1/2014, but did not indicate that either the hot end attachment hardware generally, or the corona shield specifically, were replaced. No records were found indicating a root cause analysis was ever done to determine the cause of the damage to the conductor and corona shield.

h. Broken J Hook

On October 19, 2016, a J hook in Tower 11/99 broke when a member of a PG&E contractor painting crew attempted to use a cross brace attached to the J hook for support. According to the PG&E report on the incident “[I]t appears as though about 20% of the thickness of the bolt had been compromised through corrosion.” Although the incident was reported to and investigated by PG&E, nonetheless true to the company’s practice, the failure of the J hook did not cause inspections of J hooks in other similar towers.

⁸¹ The stub angles connect the foundation to the base of the tower.

⁸² Corona discharge is the leakage of electric current into the air around high voltage conductors. A corona shield is a disc of conductive material designed to absorb the destructive corona discharge and protect the attachment hardware.

IX. INSPECTION AND PATROL OF THE CARIBOU-PALERMO LINE

Based upon PG&E records and flight records obtained from their contracted helicopter company, the evidence established inspections and patrols of the Caribou-Palermo line did not comply with the standards set forth in the ETPM and did not meet the requirements of the law or the regulatory agencies.

Routine inspection and patrol records for the Caribou-Palermo line were obtained back to 2001. According to PG&E, no inspection or patrol records prior to 2001 could be located. Based upon the inspection and patrol records the evidence established that the Caribou-Palermo line was subjected to “Detailed Ground Inspections” in 2001, 2003, 2005, 2009 and 2014. Based upon the inspection and patrol records the evidence established the Caribou-Palermo line was subjected to “Annual Aerial Patrols” in 2001, 2002, 2004, 2006-2008, 2010-2013, 2015-2018. There is no record of any climbing inspections, detailed ground inspections above 10’ or aerial inspections conducted on the Caribou-Big Bend section of the transmission line. All of the inspection and patrol records were reviewed and all of the troublemen/linemen who conducted the inspections and patrols were interviewed.

Because it was the last “Detailed Ground Inspection” of the Caribou-Palermo line prior to the Camp Fire, the 2014 Detailed Ground Inspection became a focus of the investigation. The 2014 Detailed Ground Inspection was memorialized in a 60-page “Report” which included an “Operational Control Ticket,” a “Transmission Line Data Inspection Sheet,” a “Priors” list⁸³ and a “Transmission Object List.”⁸⁴ According to the report, the detailed ground inspection was completed between August 5, 2014 and August 13, 2014 by a troubleman and a lineman. Four issues that necessitated the creation of a Corrective Work Form were documented in the report: flashed insulator bells were found on tower numbers 21/180A, 26/215 and 16/129 and a broken insulator bell was observed on tower number 27/226. The report was signed by both the troubleman and the lineman on August 28, 2014 and the Transmission Line Supervisor on September 3, 2014. The evidence established that the lineman was assigned to “assist” with the inspection because the troubleman, who was nearing retirement, was no longer physically able to hike/climb to many of the towers on the Caribou-Big Bend section of the line. The evidence also established that the troubleman and lineman were also assigned to take line clearance measurements (which included date, time and air temperature) at pre-determined intervals along the transmission line to determine compliance with new NERC clearance guidelines.

The 2014 Detailed Ground Inspection Report was subjected to intense scrutiny. PG&E records, including troubleman and lineman daily timecards, were obtained for comparison against the report. The evidence established the following:

⁸³ A list of previously documented issues pending an open corrective work form.

⁸⁴ The Transmission Object List lists every structure on the transmission line. In 2014 each structure was identified by its tower number, a SAP equipment ID number, a physical description of the structure and the GPS coordinates for the structure. For each structure the list has an Inspection Result section in which the QCR checks the applicable box and a notes section for the QCR to write any notes about the structure or record any problems/issues/defects observed.

- 1) The detailed ground inspection started on July 24, 2014 and ended on August 27, 2014. Although the report states that the physical inspection of the Caribou-Palermo occurred on August 5, 6, 7, 13, and 14; emails, records and interviews established that an unknown, and undocumented number of towers was inspected on August 27.
- 2) In addition to the troubleman and lineman, four linemen whose names do not appear in the report assisted with the inspections on August 27, 2014. According to emails and helicopter records, prior to August 27, 2014, the Transmission Line Supervisor scheduled a helicopter to fly the lineman to difficult to reach towers. Four additional lineman were assigned to assist with inspections on August 27, 2014. No records indicate which towers were inspected on August 27, 2014 and which lineman inspected which tower.
- 3) The allotted time⁸⁵ for the 2014 Caribou-Palermo Detailed Ground Inspection was 89.5 hours. Based upon time cards, 121 hours were initially billed to the Caribou-Palermo Detailed Ground Inspection. After the inspection was complete, a secretary changed billing records to re-assign hours billed to the inspection of the Caribou-Palermo line to lower the total hours billed to the Caribou-Palermo Detailed Ground Inspection to 91 hours.
- 4) The lineman assigned to assist with the 2014 Detailed Ground Inspection of the Caribou-Palermo line had previously completed some troubleman training but focused mainly on “Switching.” The lineman did not recall receiving any training on performing inspections and patrols other than informal training by troublemen. No evidence was found to establish the four other linemen who performed inspections had previously completed any training on inspection and patrol. Additionally, the evidence established the lineman did not complete his inspections under the supervision of the troubleman. The evidence established that the troubleman divided the Caribou-Palermo line between himself and the lineman, and each conducted an independent inspection of the towers in the assigned section. The lineman was assigned to inspect the Caribou-Big Bend section of the line.
- 5) Recall the six steel towers numbered 22/187 through 23/192 ceased to exist in December 2012 due to the catastrophic failure and were replaced by a “Shoe Fly” consisting of 15 wood poles in January 2013 until the towers were permanently replaced in 2016. However, according to this 2014 report, those missing towers were physically inspected in August 2014, including a previously documented issue on tower 22/188. The previously documented issue on Tower 22/188 was the replacement of the parallel groove connectors identified during the 2009 Detailed Ground Inspection.
- 6) The lineman assigned to assist with the 2014 Detailed Ground Inspection of the Caribou-Palermo line was not trained to complete the ground clearance

⁸⁵ The amount of time budgeted for each inspection/patrol. See section VI – “Reduction of Unit Costs for Inspections and Patrols” and subsection A – Expense Budget of section XI – “Budgetary Considerations”

measurements. According to PG&E policy, clearance measurements must include the measurement, and the date, time and air temperature when the measurement was taken. Although the report shows the clearance measurements were done concurrently with the inspection, the evidence established they were not. The lineman said he was not initially instructed to perform the clearance measurements and did not do so during his initial inspection. He went on to say it was not until after he had completed his inspection of the Caribou-Big Bend section of the line and submitted his report that he was told to perform clearance measurements. He stated he was ordered⁸⁶ to return to the field and perform the clearance measurements. He stated he was not initially told he needed to record the time of each measurement. According to the lineman, he returned to the Caribou-Big Bend Section of the line with the "Transmission Object List" and obtained the measurements. He stated he then added the measurements and air temperature to the already completed "Transmission Objects List." He then submitted his report a second time and was informed of the requirement to record the time of each measurement. He said that he then estimated the time he had taken the measurements and added those time estimates to his report. The result was the dates and times of the clearance measurements documented in his reports were not accurate.

Written documents clearly establish the Table Mountain Transmission Line Supervisor knew the dates inspected on the Transmission Object List were wrong. Written documents also clearly established that he knew that for some of the towers the name of the inspector conducting the inspection was wrong. The evidence also establishes he knew the line clearance measurements did not occur on the dates listed on the Transmission Object List. Despite specific knowledge the report was not accurate; the Transmission Line Supervisor approved and signed the report.

Although the investigative team did not scrutinize other patrols and inspections of the Caribou-Palermo line to the extent devoted to the 2014 Detailed Ground Inspection, similar issues were found in other inspection and patrol reports. The 2009 Detailed Ground Inspection of the Caribou-Palermo line was conducted by the same troubleman who conducted the 2014 Detailed Ground Inspection. There is evidence that a lineman, who was not mentioned or listed in the 2009 report, assisted with that inspection also.

The 2012 Annual Air Patrol Report was also found to be inaccurate. In 2012, another troubleman, was assigned to complete the patrol. According to the date-inspected line on the report, this troubleman started his patrol on August 6, 2012. The patrol was interrupted at Tower 16/130 due to "fire." The remainder of the patrol was completed by yet another troubleman. However, the report only lists the assigned troubleman and lists the "Date Inspection Completed" as August 6, 2012. In an email dated August 13, 2012 from the assigned troubleman to the Transmission Line Supervisor, the troubleman stated he would be going out on medical leave and had updated the subsequent troubleman on the "caribou-palermo partially flown on 8-6...not compl't'd do to the fire in the canyon." According to the assigned troubleman, he was

⁸⁶ The lineman was not clear about who ordered him.

unable to complete the patrol prior to going out of medical leave and the another troubleman completed the patrol sometime after August 21, 2012.

One former troubleman admitted he did not like flying the Feather River Canyon transmission lines and, whenever possible, assigned an available lineman to complete the routine air patrols. According to the former troubleman, after the lineman completed the air patrol the troubleman would use the lineman's notes to complete the patrol report and submit the report as if the former troubleman had personally completed the patrol.

The evidence also established during the 2013 and 2015 Annual Aerial Patrols of the Caribou-Palermo line, which were completed by different troublemen, towers 22/187 through 23/192, which ceased to exist in December 2012, were "inspected" and the pre-existing condition (parallel groove connectors) on Tower 22/188 was checked.

The inspection and patrol records clearly established that between 2001 and 2018 aerial patrol by helicopter was the primary method of inspection and patrol for the Caribou-Palermo line. As such, the thoroughness of aerial patrols of the Caribou-Palermo line was examined closely. The evidence established the thoroughness of the aerial patrols declined through the years.

Troublemens assigned to inspect the Caribou-Palermo line from 1987 through 2018 were interviewed regarding the thoroughness of air patrols. A former troubleman who conducted air patrols prior to 2001, described helicopter patrols of the Caribou-Palermo line as taking one to one and half days. One former troubleman explained his protocol for aerial patrols included instructing the pilot to fly low enough and slow enough that the troubleman could step out onto a tower if necessary. On a report of the 2001 Annual Air Patrol was a handwritten note "10 hrs." According to the former troubleman who performed the 2001 air patrol, 10 hours was the approximate flight time for the patrol of the Caribou-Palermo line.

During the investigation, helicopter flight records from 2011 through 2018 for Caribou-Palermo line aerial patrols were obtained from a local helicopter company contracted by PG&E to assist with aerial patrols. According to that company, flight records and billing records prior to 2011 no longer existed.

In 2011, flight records document 3.2 hours for the aerial patrol of the Caribou-Palermo line. In 2012, the aerial patrol of the Caribou-Palermo line was interrupted by fire and complete records for the patrol were not located.⁸⁷ In 2013, a troubleman completed aerial patrols of the Caribou-Palermo line, Caribou-Westwood and Palermo-Pease transmission lines (990 total structures) in 7.6 hours. In 2015, a troubleman completed the aerial patrols of the Caribou-Palermo line, Cresta-Rio Oso, Oroville-Thermalito-Table Mt #1, Oroville-Thermalito-Table Mt #3, Oroville-Table Mt (CDWR), Hamilton Branch-Chester, Collins Pine Tap and Palermo-Pease transmission lines (1,430 total structures) in 6.1 hours. In 2016, a troubleman completed the aerial patrols of the Caribou-Palermo line, Grizzly Tap, Cresta-Rio Oso, Butte Valley-Caribou and Plumas Sierra Tap transmission lines (1050 total structures) in 6.8 hours. In 2017, a troubleman completed the aerial patrols of the Caribou-Palermo line, Butt Valley-Caribou and Hamilton Branch-Chester transmission lines (813 total structures) in 4.9 hours. In 2018, a troubleman completed the aerial

patrols of the Caribou-Palermo line, Grizzly Tap, Grizzly Tap SVP, Plumas-Sierra Tap, Butt Valley-Caribou and Caribou #2 transmission lines (1708 total structures) in 5.7 hours.

A retired PG&E employee, who spent over 30 years in the Electrical Transmission Division reviewed the flight records. This former employee had been involved in the drafting of the 1995 inspection policy memo and the ETPM and the troublemen training program from 1995 to 2005. This former employee stated the flight records reflected the aerial patrols are "fly bys" not patrols or inspections. One recently retired troubleman admitted when doing aerial patrols he was only confirming the structures and components were "standing upright".

All of the troublemen who performed aerial patrols on the Caribou-Palermo line since 2012 and the current Transmission Line Supervisor assigned to Table Mt. Headquarters, were shown photographs, both the January 31, 2019 BCDA photographs and PG&E WSIP⁸⁸ photographs, of worn C hooks and hanger holes. All of the troublemen consistently denied it was possible to see and assess the wear on the C-hooks and hanger holes during aerial patrols.⁸⁹ The Transmission Line Supervisor asserted that, based upon wind and topography, it was not safe for the helicopters to fly low enough and slow enough to enable the troublemen to see and assess the C-hooks and hanger holes. The troublemen also denied it was possible to assess the wear on the C hooks and hanger holes during a detailed ground inspection. The ETPM corroborates the troublemen on both. According to Table 2 in section 1 of the ETPM the best view positions for assessing insulators and hardware do not include ground inspections nor aerial patrols. Only climbing inspections or lifted bucket inspections above 10 feet in the air would give the appropriate best view for assessment of insulators and their connectors.

Since the enactment of the ES Guideline E-TSL-G013 in 1995, **climbing inspections have only occurred "as triggered."** The specific language regarding triggers has changed very little since 1995. Appropriate "triggers" for climbing inspections were covered in section 2.1.3 of the ETPM (emphasis added):

Triggers are specific conditions that require follow-up inspections and/or maintenance scheduled by the supervisor, independent of the routine schedule.

The following triggers can be applied to one unit of inspection or many units, either grouped or spread over a line section/area:

- **Component defects identified by inspection**
- **Component failure (including failure in like components)**
- **Components proven defective by testing**
- **Wire/structure strike**
- **Burned area or high fire hazard**
- **Failures caused by natural disaster or storm**
- Third-party observations and complaints
- Marginal capability components of a re-rated line section

⁸⁸ Wildfire Safety Inspection Program – an "enhanced" post Camp Fire inspection of all PG&E electric transmission structures. See section X – Comparison of Caribou-Palermo With Other Transmission Lines for details on the WSIP and analysis of WSIP results.

⁸⁹ All of the troublemen also denied knowing the sizes of the hanger holes and C hooks. Therefore, even if the troublemen had looked at the C hooks and hanger holes, without knowledge as to their respective sizes, the troublemen would not have been able to assess wear.

- Known, recurring conditions that jeopardize line integrity
- Suspected vegetation clearances less than required or less than legal vegetation clearances, or concerns about fast growth of vegetation

Despite the facially mandatory language, “specific conditions that **require**,” many PG&E employees who were interviewed, including electric transmission troublemen, linemen and support personnel expressed an understanding that an occurrence or discovery of a specific condition did not necessarily trigger climbing inspections. The evidence clearly established that on the Caribou-Palermo line, PG&E interpreted the mandate of “require” as discretionary. The maintenance/repair/replacement records established that since 2007 many of the “required” triggers occurred. Some of the triggers (e.g. failures caused by storm, fires under the transmission line) have occurred multiple times. The evidence established the following triggers documented in PG&E records between 2007 and 2018:

- 2008 Lightning Complex fires (burned under and around transmission line)
- 2008 Rock Fire (started by failure of connector on Caribou-Palermo line Tower 11/87)
- 10/17/08 - failure to underarm jumper
- 2009 identification of parallel groove connectors on 83 towers (defective components)
- 2009 ATS Lab Test Report identifying defects in installation of parallel groove connectors
- 2012 fire which caused delay of 2012 Annual Air Patrol
- 2012 tower collapse (defective component)
- 1/10/14 - Unknown Failure/Locked Out causing interruption, no cause determined
- 2/7/15 – storm damage
- 12/10/15 Sustained outage. Found center phase guy wire tie down broken. North phase top insulator unpinned @ structure 23/194.
- 10/19/16 failure of a J hook in structure 11/99.
- 1/9/17 Storm related emergency due to (6) lockouts on the Caribou Palermo line. Non-routine air due to line locked out, crew found problem of floating center phase conductor at tower 24/200.
- 1/10/17 storm damage, conductor repaired.
- 2/1/17 storm related interruptions. “Non-routine airs due to momentary outages, fault location 10/79, found hold insulator hold down parted at structures 8/67 and 11/89, will create notifications for repairs.”
- 2/21/17 “Non-routine air patrol due to storm related momentarys [sic]. After several relays GCC placed non-test on line and line went to lock-out.” “Per [Troubleman] on 2/21/17 during storm damage: Air patrolled [sic] fault area and found hardware loose on tower 3/28 but not sure if this was part of the problem, re-energized line and held.”
- 3/2/18 “Investigate relay that occurred on 3/1/18 @ 11:43. Found damaged insulator on structure 37/301. Created notification to replace insulators.”

Between January 1, 2017 and February 21, 2017 there were at least nine documented storm related interruptions on the Caribou-Palermo line and at least six equipment failures. Based upon the evidence neither the individual events nor the cumulative events were deemed sufficient to trigger climbing inspections on the Caribou-Palermo line.

Although several PG&E transmission line employees referred to the ETPM as “The Bible” and asserted strict compliance with the standards and policies of the ETPM, the totality of the evidence shows that on the Caribou-Palermo line, the ETPM was not followed. Because PG&E had inexperienced, untrained and uninformed personnel conducting inspections and patrols under unrealistic time constraints, the inspections and patrols did not spot defects and wear.

On June 26, 2018, a PG&E work order requiring climbing inspections of all Caribou-Palermo line structures was issued by a PG&E Tower Department supervisor. The supervisor was interviewed. The supervisor could not provide any reason or rationale for the work order. Specifically, the supervisor stated that the work order was requested by someone else and his job was simply to compile the information into a template report and forward the template report to the appropriate work group.

PG&E was unable to provide any further information. “PG&E’s inspection records do not identify the factors that led to the selection of the Caribou Palermo 115 kV Transmission Line as one of the lines selected for climbing inspections as part of this effort. PG&E understands that the age of lines was a factor that was considered in their selection.”⁹⁰

Beginning in September 2018 climbing crews from the PG&E Tower Department climbed and inspected 80 towers on the Caribou-Palermo line. The vast majority of the towers climbed and inspected were on the Palermo-Big Bend section of the Caribou-Palermo line. “PG&E understands that the reason these approximately 80 towers were selected first and the order in which they were inspected was determined by the Tower Department based on various considerations, including weather conditions and crew availability.”⁹¹

All of the towers climbed in September and October 2018 were subjected to WSIP enhanced inspection starting in December 2018. The WSIP enhanced inspections documented problems and defects on numerous towers that were not discovered/detected/documented during the September 2018 climbing inspections.

The fact that PG&E has no explanation for how or why or by whom the decision to conduct climbing inspections was made is disturbing but not unusual. Numerous decisions and policies were investigated. As to many decisions and policies, PG&E was unable to provide any documentation as to who made the decision, how the decision was made and upon what the decision was based. This inability to determine who made decisions and upon what those decisions were based, frustrated efforts to identify individuals potentially personally liable for policies that lead to the conditions which caused the Camp Fire.

⁹¹ PG&E written response to CPUC Data Request 008, Question 1.

X. COMPARISON OF CARIBOU-PALERMO WITH OTHER TRANSMISSION LINES

Although the undetected problems on the Caribou-Palermo line were bad, the evidence established that the Caribou-Palermo line was only marginally worse than other comparison transmission lines. Records from post-Camp Fire enhanced inspections of other, similar lines clearly established PG&E's problems were systemic as opposed to local.

The evidence established by early afternoon on November 8, 2018, a PG&E troubleman on an emergency air patrol of the Caribou-Palermo line had identified and photographed the equipment failure on Tower 27/222. Within six days PG&E initiated climbing inspections of the Caribou-Palermo line and other similar transmission lines. The initial inspections were named the "Nine Lines Inspections."⁹² PG&E records established that by November 14, 2018 the inspections were underway. The evidence showed the inspectors were specifically focused on C hook and hanger hole wear. By early December the Nine Lines Inspection program was superseded by the Wildfire Safety Inspection Program (WSIP). The WSIP involved enhanced (climbing and drone) inspections of all electrical transmission lines within higher wildfire risk areas. The WSIP inspections "identified thousands of conditions requiring repairs on PG&E's system that had not been previously identified."⁹³

As a result of the WSIP, and at the request of the CPUC, an independent engineering company named Exponent was retained to review the data from the WSIP. According to its website "Exponent is a multi-disciplinary engineering and scientific consulting firm that brings together more than 90 different disciplines to solve engineering, science, regulatory and business issues facing our clients." Based upon historical records, Exponent has a longstanding relationship with the CPUC and has conducted failure analysis investigations of previous PG&E incidents.

According to interviews with Dr. Brad James, PhD in Metallurgical Engineering and Failure Analysis expert at Exponent, Exponent was tasked to confirm whether the Caribou-Palermo line had significantly more repair tags when compared to other lines and to discover the reasons behind the high volume of high priority repair tags.

Exponent published its final report, entitled "PG&E Caribou-Palermo Asset Condition Investigation" to PG&E and the CPUC on November 1, 2019. A copy of the report was obtained via Grand Jury Subpoena.

According to the Exponent report the comparison lines were chosen from a list of transmission lines based on four criteria:

- 115 or 230kV lines only
- Elevations greater than 1,000 feet
- Single circuit steel lattice towers
- Tier 2 or Tier 3 fire zones

⁹² The nine lines were identified as the Caribou-Palermo line, the Drum-Rio Oso #1 line, the Pitt #1-Cottonwood line, the Caribou #2 line, the Caribou-Plumas Jct line, the Colgate-Alleghany line, the Fulton-Hopland line, the Hat Creek #1-Westwood line and the Keswick-Trinity line.

⁹³ CPUC Data Request: SED-007, Response to Question 6.

Other criteria that were also applied included mountainous terrain and wind exposure. Based upon the criteria only transmission lines in running through low population, rural areas were chosen. There were no transmission lines from the Bay Area, Central Valley or central coast chosen for comparison.

Among the conclusions reached by Exponent are the following:

- The Caribou-Palermo line was confirmed to have greater post-Camp Fire high-priority (“A” + “B”) repair tag⁹⁴ counts than all selected comparison lines, as well as an increased per-structure high-priority tag rate when normalized⁹⁵ for the number of steel lattice towers.
- Other lines adjacent to Caribou-Palermo line such as Bucks Creek–Rock Creek–Cresta (BCRC), Cresta–Rio Oso (CRO), and Paradise–Table Mountain (PTM) had the second, fourth, and fifth highest post-Camp Fire high-priority tag counts, respectively, when normalized for steel lattice towers. Pit #4 Tap (P4T) had the third highest normalized high-priority tag count. It is not near Caribou-Palermo line.
- Wear was the most commonly observed post-Camp Fire damage mechanism for Caribou-Palermo line “A” tags and second most commonly observed damage mechanism for “B” tags. Nearly all Caribou-Palermo line wear-related tags were associated with cold-end hardware. Cold-end hardware wear issues were likely caused by repeated conductor and insulator movement over time.
- Caribou-Palermo line, BCRC, and CRO lines, each located within the North Fork Feather River Canyon, exhibited high-priority cold-end hardware wear tag counts more than three times higher than the next highest comparison line when normalized for steel lattice towers.
- Caribou-Palermo North experiences higher annual average wind speeds than non-adjacent comparison lines. Lines analyzed within the North Fork Feather River Canyon may have increased wear tag rates associated with longer-duration high-wind conditions. No apparent correlation between wear tags and temperature, precipitation, or peak wind speed (50-year return) was observed.
- From 2001 to November 2018, the Caribou-Palermo line was subjected to similar ground inspection and patrol frequencies as comparison lines. These inspections and patrols yielded comparable normalized high-priority tag counts between Caribou-Palermo line and comparison lines.

⁹⁴ A report that documents a problem found, assigns a priority code to that problem and requests repair/replacement. PG&E Corrective Work Forms (CWF) are commonly referred to as tags. CWFs/tags are also referred to as notifications, especially in Transmission Asset Management.

⁹⁵ Normalization is a statistical analysis used for comparison purposes. Exponent divided the number of tags on a transmission line by the number of towers in the transmission line in order to compare transmission lines with disparate numbers of towers.

- The Caribou-Palermo line had more normalized equipment-based outages between 2007 and 2018 than approximately 80 percent of the other WSIP transmission lines.
- Caribou-Palermo line and other North Fork Feather River Canyon lines appear to have a unique set of factors that contributed to increased rates of high-priority cold-end hardware tags relative to other comparison lines. Factors such as design (link connectors and a relatively large number of non-tensioned insulated conductors), long-duration exposure to higher winds, age, and historical inspection methodologies likely all contributed to these cold-end hardware wear issues.

Although Exponent did not complete a forensic root cause analysis of the C hook that failed on Tower 27/222, when questioned Dr. James stated “That said, things like wear, things like fatigue do have a time component because the more times you rub that metal against each other, the more chance you have to – create wear. The more times you cyclically load the spring in your garage door, the longer you do that, the more chance you are going to initiate a fatigue crack and eventually grow it.”

The Exponent report analyzed historical (2001-2018) high priority tags⁹⁶. Consistent with the statements of the troublemen and linemen who have completed all inspections and patrols on the Caribou-Palermo line, Exponent found no high priority tags for cold end attachment hardware wear. Exponent also examined historical (2001-2018) inspection and patrol records for all of the comparison transmission lines. Exponent did not find any high priority tags for cold end attachment hardware on any of the comparison lines. This evidence established that the local Table Mountain District troublemen and linemen were not doing less than the troublemen and linemen assigned to other districts involved in the study.

Although the primary focus was cold end attachment hardware wear, the Exponent report also analyzed all Priority A and B “tags” generated by the WSIP. Priority A and B tags were “binned”⁹⁷ by component type and damage mode.

Organized by component type, on the Caribou-Palermo line there were actually more tags (all Priority B) generated for “Foundation” issues than “Cold End Hardware.” There were also tags generated for steel frame issues, insulator issues and conductor issues.

Organized by damage mode, there were more tags generated on the Caribou-Palermo line for soil movement (associated with foundation) than wear (exclusively associated with cold end attachment hardware). The other damage mode tags included bent, loose, missing, broken and corrosion.

The fact the troublemen and linemen missed that tower foundations were buried and portions of the steel structures were bent, loose, broken or missing contradicted the assertions of PG&E

⁹⁶ Issues that would be considered A or B priority under the current version of the ETPM

⁹⁷ In layman’s terms the tags were separated, sorted and organized by category.

employees that inspections and patrols were being conducted pursuant to the requirements of the ETPM.

Tower 27/221 best illustrates this lack of attention and thoroughness. On September 11, 2018, during the Annual Air Patrol of the Caribou-Palermo line, the troubleman noticed that a “hold down insulator anchor” on Tower 27/221 had failed. The troubleman noted the problem on his report and created a Corrective Work Form for repair of the hold down insulator anchor. On November 11, 2018, during the Camp Fire origin and cause investigation, the electrical engineer retained by Cal Fire noted and photographed the failed hold down insulator anchor on Tower 27/221. The electrical engineer also noted the arm of the transmission tower to which the hold down insulator anchor should have been attached was bent and two of the steel members of the arm were buckled. No corrective work form for the arm was located. The troubleman **only** created a corrective work form for the hold down insulator anchor. According to PG&E policy, as explained by multiple transmission troublemen, supervisors and specialists, corrective work forms are problem specific and if there are multiple problems in a tower each problem gets a separate corrective work form.

The Exponent report also compared the number of post-Camp Fire A and B tags with the comparison lines. Except for tags related to foundation issues, Exponent did not separate and organize the tags from the comparison lines. According to the Exponent report there were previously undocumented issues on all of the comparison lines. The only reasonable conclusion to be drawn from this data is that inspections and patrols on other lines are only marginally more thorough than those done on the Caribou-Palermo line. This conclusion was corroborated by Exponent’s comparison of A and B tags across maintenance districts. According to the Exponent report the post Camp Fire normalized A and B tags for comparison lines in the Table Mountain maintenance district (referred to as Table Mountain Headquarters by PG&E personnel) were not inconsistent with those of comparison lines in the Sacramento and Lakeville maintenance districts.

Based upon the totality of the evidence regarding the ETPM and inspections and patrols the only reasonable conclusion to be drawn was the Caribou-Palermo line specifically and the Table Mountain District in general are not outliers. The evidence established the lack of thorough inspections and patrols on the Caribou-Palermo line was a systemic problem not a local problem. Based upon the evidence the only reasonable conclusion was that in low population density mountainous areas, the PG&E Electrical Transmission Division was not following the standards and procedures established by the ETPM. As a result in those areas PG&E was not complying with the standards and procedures submitted to the regulatory agencies and required by regulation.

XI. BUDGETARY CONSIDERATIONS

Financial records from 2007 through 2018 obtained from PG&E, the CPUC and FERC clearly established PG&E had consistently increased its budget for maintenance, repair and replacement of transmission assets⁹⁸. The central issue in the FERC litigation over PG&E's 2018 Transmission Owner's Rate Case request was how that money was being spent. In the "Summary of the Prepared Rebuttal Testimony of {Vice President of Electrical Asset Management}"⁹⁹ then PG&E Vice President of Electrical Asset Management states: "PG&E makes these investments to address deteriorating electric system infrastructure and to address equipment that has reached the end of its useful life and system designs that no longer meet operational requirements." The PG&E Senior Director, Transmission Asset Management at the time, also provided testimony in the FERC litigation. In the "Rebuttal Testimony of {Senior Director, Transmission Asset Management}"¹⁰⁰ it was stated:

"PG&E must repair or replace assets that are approaching the end of their service lives, that are deteriorating, or that have failed. Replacement and repair of PG&E's assets are essential to maintaining and improving PG&E's transmission service to its customers. PG&E expects that replacement-related capital work will continue to grow as PG&E's assets continue to age. A significant part of PG&E's transmission infrastructure was constructed in the years following World War II, with some assets being even older. In addition, PG&E has one of the largest investor-owned fleet of hydroelectric facilities in the Country. By and large, these facilities are located remotely from PG&E's load centers. Many of these facilities—and their related transmission assets—were constructed in the early 1900s. Due to an increasingly large number of these assets nearing the end of their useful service lives, capital investment will shift significantly, from capacity increase-related projects, to lifecycle replacement projects."

However, the evidence gathered during the Camp Fire Investigation contradicted the FERC testimony of both Vice President of Electrical Asset Management and Senior Director, Transmission Asset Management. PG&E was **not** using the money to replace the oldest and most deteriorated transmission assets.

Because of limited available resources, the investigation was unable to fully analyze PG&E's financial records and assumed all figures were correct. The investigation instead focused on how, where and why the money was being spent. The evidence established the maintenance/repair/replace budget was primarily based upon "reliability metrics"¹⁰¹.

⁹⁸ During litigation relating to PG&E's 2018 Transmission Owner Tariff (TO18) rate case, PG&E represented that from 2007 (\$405,739,000) through 2016 (\$1,124,457,000) electrical capital expenditures increased every year except 2013 (decreased app. \$20,000,000 from 2012) and 2016 (decreased app. \$7,000,000 from 2015). In total, spending increased \$734,812,000 between 2007 and 2015 (the high spending mark), or an average of \$81,645,777 per year.

⁹⁹ Exhibit PGE-0037, FERC Docket No. ER16-2320-002.

¹⁰⁰ Exhibit PGE-0038

¹⁰¹ Reliability metrics measure how often a power line is out of operation, how long it is out of operation and how many customers are affected by that outage. SAIDI, SAIFI, CAIDI, ACOF and ACOD were the performance metrics used.

The evidence established PG&E electrical transmission expenditures were divided into two budget categories: 1) capital and 2) expense. The capital budget for the electric transmission division of PG&E was funded through customer rates which were determined by FERC “rate cases.”¹⁰² The expense budget was funded by the company. Any money spent on the expense budget potentially reduced the amount of profit of the company. In general, inspection, patrol and maintenance of electrical transmission assets were paid from the expense budget. Replacement of electrical transmission assets was paid from the capital budget. FERC rate cases, and PG&E’s future capital budgets, were based upon PG&E’s projections of capital projects. The evidence established that, for budget purposes, all components of the electrical transmission system were considered “assets.”

A. Expense Budget

Based upon PG&E internal records and interviews of electrical transmission employees, including a former employee of the PG&E Business Finance Department, it was established the budget for inspection and patrol of the transmission lines was controlled by the Business Finance Department. Each year the Business Finance Department set an inspection and patrol budget for each of the PG&E transmission maintenance divisions. That budget was based upon the allotted time for all of the inspections and patrols scheduled for that year. The allotted time for each inspection and patrol was based upon the specific time allotted for a troubleman to spend on a single structure (e.g. tower or pole). To compute the time allotment for a transmission line, the single-structure time-allotment was multiplied by the number of structures in the transmission line.

The time allotted to be spent on a single structure was a system-wide constant and did not take into account the physical location of any specific structure or the amount of time necessary to travel from structure to structure. For example, the time allotment assumed the inspection of a tower on the Caribou-Palermo line, parts of which could be accessed only by hiking a steep trail, would take the same amount of time as inspecting a tower in the Central Valley, located directly adjacent to a public roadway.

When questioned about the time allotments for inspections and patrols, a former employee of the Business Finance Department who was intimately involved in the allotment process, admitted he had no knowledge or experience with inspections and patrols, and based the allotments solely on dividing up the overall electric transmission expense budget. This former employee also asserted the Transmission Line Supervisors and Superintendents were consulted regarding the proposed allotments. The Transmission Line Supervisors and Superintendents interviewed denied having any input or control over the time allotted for inspections and patrols.

Although denied by the involved employees, emails between the Table Mountain Headquarters secretary and several troublemen indicated the troublemen were not able to complete some

¹⁰² A rate case is the utility’s explanation and justification for a rate increase. In layman’s terms, the utility lists all of the capital projects the utility deems necessary and their projected costs. If the total cost of all of the projects is higher than the projected amount to be collected from customers, the utility requests a rate increase and files a rate case. The rate increase is based upon the difference between projected costs and projected collections from customers. The rates which PG&E is allowed to charge customers includes a profit margin defined by FERC.

inspections in the time allotted. For example, the 2014 Detailed Ground Inspection of the Caribou-Palermo line was allotted 89.5 hours. PG&E records showed, before the secretary re-assigned hours billed by the troubleman to other projects, that the troubleman and five linemen actually spent 121 hours completing the inspection. When asked, a former Transmission Line supervisor asserted that because of the artificially constrained budget, his district was constantly under pressure to limit the hours necessary to complete thorough inspections and patrols of transmission lines.

During this same time period internal PG&E emails indicate the expense budget for electrical transmission was being reduced. An October 2015 email noted: “For the overhead tower inspections, I don’t think we would be able to do any repairs and incur land costs shown in item three and four in 2015.” The email includes a chart of projects with the 2015 and proposed 2016 budgets. Item three in the chart is “Severe deterioration repair (tower department).”

In an August 2016 email regarding a transmission expense budget meeting from a manager in Business Finance to a Senior Director of Transmission Lines, it was stated: “The purpose of the meeting is to obtain Leadership guidance on *which* items to pursue and *when*. This input is important given the Expense reduction pressures being pushed down on Transmission Operations for 2017.” One of the people involved invited to this meeting was the former Business Finance employee assigned to track unit costs for the transmission inspection and patrol budgets. When questioned by investigators, the former Business Finance employee conceded one way to reduce budget for inspections and patrols is to reduce the unit cost. According to the employee, the unit cost is reduced by reducing the time allotted for inspection/patrol of each transmission asset.

During this same time period, internal PG&E documents establish the “T Lines Patrols and Inspection Continuous Improvement Charter” was formed. The T Lines Patrols and Inspection Continuous Improvement Charter was a committee made up of PG&E personnel from the transmission line division, asset management, asset strategy and business finance. One of the specific mandates of the committee was evaluation of the feasibility of reducing costs by changing the frequency of inspections and patrols or finding more efficient work practices.

Based upon the totality of the evidence, specifically the reductions in times allotted for patrol and inspection, the internal emails indicating budget reductions and the formation of a committee to investigate reducing patrol and inspection costs, the only reasonable conclusion was that PG&E achieved expense budget cost savings by reducing the thoroughness of inspections and patrols.

PG&E also reduced its expense budget by charging expense projects to the capital budget. Moving projects from the expense budget benefits PG&E in two ways. First, every expense budget dollar saved was an additional dollar of potential profit. Second, the customers (ratepayers) pay over 100% of each dollar spent on capital improvements that brings in additional profit. Based upon internal emails and interviews with engineers involved in the planning and management of transmission projects, it was common for PG&E to look for ways to bootstrap expense budget projects on to capital budgets projects. Hypothetically, for example, instead of paying \$1000 from the expense budget to fix a component, PG&E would pay \$10,000

from the capital budget to replace the component. The \$1,000 saved from the expense budget becomes profit and the company charges the customers \$10,500¹⁰³ for capital improvement of the component.

The evidence established that PG&E personnel were consistently looking for ways charge expense budget projects to the capital budget. In a 2018 email from a PG&E civil engineer to a supervisor in the Transmission Line Asset Strategy Department of Transmission Asset Management, the civil engineer wrote:

“I understand Asset Strategy has been working on a new way to define unit of capital to make it easier to capitalize a partial replacement on tower sections (e.g. footing, crossarm, etc...). We are replacing the top part of a distorted tower under emergency and was wondering if that could be considered a unit of capital and capitalize the project for corporate accounting purposes.”

Based upon interviews with various PG&E personnel it was established that PG&E, as is common with large companies, had developed company accounting rules. Application of these rules determines if a project is charged to the expense budget or the capital budget. In general the rules hold that maintenance and repair are paid from the expense budget and replacement is paid from the capital budget. The above email indicates a move within PG&E to blur the lines between repair and replace to allow some repairs to be charged to the capital budget.

Another example occurred after the cancellation of the 2007 project to relocate ten deteriorating towers on the Caribou-Palermo line. The original Advance Authorization (AA) requested \$800,000. Only \$200,000 was approved. Once the project moved forward, the \$200,000 budget was quickly surpassed. By the time the project was cancelled in 2009 almost \$800,000 had been spent. A portion of that money was spent constructing an access road along the proposed new route of the ten new towers. According to internal emails obtained, the money spent to construct the new access road was charged as a capital improvement on another, adjacent transmission line. According to the former PG&E Director of Electric Asset Strategy who approved the 2007 AA, the rest of the money spent on the canceled project should have been charged to the expense budget. Internal emails establish that PG&E made an effort to find ways to charge the remainder of the money spent on the canceled project to the capital budget. A 2013 email from the former Maintenance and Construction Engineer (M&C) Engineer in charge of the project stated:

“Looks like we will be forced into trying to Capture the \$650K+/- that has been spent on the now canceled project for relocating Towers 6/53 to 7/65 from the non-accessible River side to Hwy side that (Project Manager) was managing.

In order to not have to Expense the dollars spent we will be required to perform the following work.”

¹⁰³ The extra \$500 added to the \$10,000 is the FERC allowed profit margin that PG&E would charge on capital improvements.

The email goes on to list the proposed work which mainly consisted of replacing insulators on the towers that Maintenance and Construction Engineer had previously described in the Advance Authorization as deteriorated. The work did not include replacement of the deteriorated conductor (annealed and parting) or any of the deteriorated hardware.

In a subsequent, 2014 email regarding the canceled project, the former M&C Engineer stated:

“In order to try and capture the \$900K that was spent for nothing, Asset Management decided that we would just replace the Insulators and Hardware on the section of towers that were initially going to be relocated.”

In a 2016 email regarding the canceled project the former M&C Engineer stated:

“This work was deemed by *{the Sr. Director of Transmission Asset Management}* in order not to end up expensing \$800,000 that was spent by *{Project Manager}* on an original job started by *{former Table Mountain TLine Supervisor}* to relocate this section of towers.”

When asked about these emails, the former M&C Engineer denied he was instructed to find ways to capitalize the money already spent and asserted that he was lying in the emails in order to get necessary work done quickly. As to the 2013 and 2014 emails, he stated the recipient of the emails, the Transmission Line Supervisor at Table Mountain Headquarters, distrusted engineers, so he lied and put blame on Asset Management in order to avoid argument. When asked about the 2016 email, which was directed to an engineer in Asset Management, the former M&C Engineer replied that the Sr. Director of Transmission Asset Management was not involved in the project and he invoked the name of the Sr. Director of Transmission Asset Management to speed up the process. This person is the same former M&C Engineer who wrote the original AA and the approved AA and now claims that his description of the condition of the relevant Caribou-Palermo line structures and conductor was unsupported and exaggerated for the purpose of securing funding for the project. In a 2016 email to the Transmission Line Asset Strategist, who canceled the 2007 project, the former M&C Engineer stated:

“The only thing that after reading the below that came to my mind would be to also add life expectancies on some of our older lines that we purchased from other utilities. Caribou-Palermo (old Caribou-Golden Gate) for example...Built roughly in 1907. This line is in a very remote area. Access is extremely limited. Conductor was deemed annealed several years back. Line has tons of splices in it. Some spans have 5 splices within said span. Most of the upper line section is subject to rockslides that have taken this line out in the past. Restoration time is lengthy..

Just one example, but I feel we should identify lines or line sections that meet this type of criteria and add them to our mitigation plan or part of future complete structure replacements...”

B. Capital Budget and Comparative Risk Analysis (RIBA)

For the capital budget, the evidence established PG&E employed “comparative risk analysis” to determine the budgetary priority of potential capital projects. Based upon interviews with several current and former PG&E employees who were involved in risk analysis, it was established PG&E has traditionally used some form of comparative risk analysis. Comparative Risk Analysis balances the probability of risk against the probability of consequence; and depends upon accurate projections and analysis of both. One of the former employees interviewed was the former Senior Vice President of PG&E. According to the former Senior Vice President of PG&E when he arrived at PG&E in 2007 the company was using comparative risk analysis, which he disapproved because of its subjective nature¹⁰⁴. The former Senior Vice President of PG&E tried to install an objective risk model focused solely on the probability of failure. The former Senior Vice President of PG&E left PG&E in 2011.

The evidence established in 2014 PG&E again began using comparative risk analysis for capital funding. Since 2014 PG&E has used the Risk Informed Budget Allocation (RIBA). Based upon internal documents and interviews, the evidence established that under RIBA, capital projects were evaluated for funding based upon safety, environmental and reliability impacts that were scored based upon a complex matrix. According to a Manager in Transmission Asset Management, and one of the persons actively involved in the RIBA scoring process in 2014, reliability is “more about the customer impacts. So number of customers, the duration of outages, large cities, metropolitan areas. It’s what we call critical locations. This can be anywhere from towns to cities.”

For each category (safety, reliability, environment), a project would score between 1 and 10,000. The scores for the three categories were combined with the result being a project score between 3 and 30,000. The final score, according to the Manager in Transmission Asset Management, represents the “consequence if we don’t complete the project.” Once all of the proposed projects are scored the projects are ranked high to low by total score. RIBA scoring determined whether a project that is not mandated by a regulator was funded for the coming year, RIBA scoring and ranking was independent from and occurred after a project had been included in a FERC rate case.

Based upon the evidence, projects were used in FERC rate cases to justify rate increases and then, later, not funded because of a low RIBA score.

As examples, in 2014 three proposed projects on the Caribou-Big Bend section of the Caribou-Palermo line were scored under RIBA; the TL¹⁰⁵ Relocate 10 Towers project, the Replace 5 Damaged Towers project, and the 115kV NERC Alert. Through internal documents and witnesses it was determined that the TL Relocate 10 Towers project was the 2007 project to replace and relocate the ten deteriorating towers that had been canceled in 2009. By 2014 the only portion of the project active was the replacement of insulators so that the money spent on the project prior to cancellation could be charged to the Capital Budget. Based upon internal

¹⁰⁴ Relative risk analysis is a form of comparative risk analysis.

¹⁰⁵ TL is abbreviation for Transmission Line.

documents and witnesses, it was established that the Replace 5 Damaged Towers project referred to the replacement of the five towers that collapsed in December of 2012. Based upon internal documents and witnesses it was established that the 115kV NERC Alert project referred to the 2013 Caribou-Big Bend NERC project.

According to the “Risk scoring for baselined projects” the Replace 5 Damaged Towers total risk score was 180. The total risk score for the Replace 5 Damaged Towers project was explained in a February 2014 email from a RIBA team member¹⁰⁶ to the Senior Director of Transmission Asset Management in 2014. According to the RIBA team member:

“<200 score because there is no likely large environmental event (if structures fail, it will be likely due to heavy rain and no wildfires are possible then). Also no likely public safety issue with live wires down because it is in a remote area. Reliability score is not that high because although the likelihood of failed structures happening is high, the affected customers are likely in the order of >1K.”

According to the RIBA scoring sheet for the Replace 5 Damaged Towers project the person(s) scoring the project felt that the failure of the Shoe Fly “Probably could happen this next season.” On the “Frequency/time-to-impact taxonomy” the project scored 6 out of 7 possible points.

In 2014 the Manager in Transmission Asset Management took part in the RIBA scoring. In addition she was the “Program Manager” for the Replace 5 Damaged Towers project. Based upon the 2014 RIBA scoring records the Manager in Transmission Asset Management stated that the Replace 5 Damaged Towers project scored the lowest possible scores of 1 for safety and environmental and scored 178 for reliability. According to the Manager in Transmission Asset Management the safety score was justified because the “worst reasonable direct impact,” (WRDI) “basically in the particular case, would a structure fall down and hit somebody” was negligible because of the “remote” location of the Shoe Fly poles. According to the Manager in Transmission Asset Management, despite the written statements from 2014 documenting concern for the long term reliability of the Shoe Fly, the Shoe Fly was “temporary permanent” and it was not felt to be a danger to collapse. A former Transmission Specialist for PG&E and the person who was in charge of the construction of the Shoe Fly, was also asked about the Shoe Fly. According to the former Transmission Specialist, the Shoe Fly was only designed to be in place for a few months with the expectation that permanent replacement towers would be erected the following summer of 2013. Notes in the RIBA scoring sheet under the category reliability category of “Frequency¹⁰⁷” corroborate the former Transmission Specialist. The former Transmission Specialist was also corroborated by an October 2013 email from the former M&C Engineer to multiple people. In the email the former M&C Engineer states “I do not believe there was a PO¹⁰⁸ created under MWC 70¹⁰⁹ yet for that replacement project that is now sitting

¹⁰⁶ The position/job title of the RIBA team member was never determined.

¹⁰⁷ The “Frequency” category measures how often a problem is expected to occur.

¹⁰⁸ In layman’s terms, a project proposal.

¹⁰⁹ MWC is an abbreviation of Major Work Category. Each major work category is identified by a number. In this case the proposed project falls with major work category number 70. All PG&E electric transmission work projects are assigned to a major work category for accounting purposes.

on Wood poles and was not intended for long term reliability.” The project was assigned a frequency score of 6 out of 7 possible with the note “Probably could happen this next season.”

No records were ever located to support The RIBA team member’s conclusion that the Shoe Fly poles would most likely fail due to heavy rain. According to the Manager in Transmission Asset Management, The RIBA team member was an expert on the RIBA process who was assigned to assist “the engineer walk through the process.” Based upon the records the Manager in Transmission Asset Management identified the engineer as the engineer most familiar with the overall project and assigned to do the RIBA scoring for the project. According to an undated PG&E Org Chart, the engineer assigned to score the project was a Senior Engineer assigned to Transmission Asset Development and reported directly to the Manager in Transmission Asset Management. According to the notes on the scoring sheet, as interpreted by the Manager of Transmission Asset Development, “the concern here is the note says that the structures would go down during rainy and wet storm. And what’s not shown here is that the wildfire is not likely, because on the wet ground not likely to have wildfire.” No records in support of Senior Engineer’s conclusion were ever located.

On the other hand, the TL Relocate 10 Towers project scored 581. According to the scoring sheet, the Senior Engineer was also the engineer assigned to score this project. Despite the fact that by 2014 the scope of the project was limited to the replacement of insulators so that money spent on the project prior to cancellation could be charged to the Capital Budget, the project scored 18 points out of 10,000 possible points for safety¹¹⁰. Despite the fact that the project involves the same Caribou-Palermo line the Reliability Risk Score is 562. 434 of those points are justified because “WRDI is possible contact with public leading or to other facilities causing potential injuries to few employees” according to the notes on the scoring sheet.

The 2014 RIBA scoring is used to highlight the subjective nature of the comparative risk analysis. Because they are subjective the risk scores are easily manipulated. PG&E was highly motivated to complete the TL Relocate 10 Towers project in order to be able to charge the budget overruns, money already spent, to the capital budget. By 2014 the Replace 5 Damaged Towers project was about future spending. The best example of the manipulation is the WRDI justifications. One of the oft-stated justifications for the TL Relocate 10 Towers Project was the fact that the ten towers were located in a remote, inaccessible location. The towers were so inaccessible that PG&E had to use helicopters to fly personnel to the towers. Also, there was no evidence that any of the ten towers was on the verge of collapse according to the 2009 email from the manager who cancelled the project in 2009. On the other hand, the Shoe Fly was built on Camp Creek Road and any, or all of those poles, could reasonably be expected to fall down within a year.

Another example of manipulation of facts in the 2014 RIBA was the RIBA team member’s conclusion, apparently based upon the Senior Engineer’s scoring note that “structures would go down only if it is rainy and wet”; and restated several times by the Manager in Transmission Asset Management that the wood Shoe Fly poles would probably only collapse during heavy rain

¹¹⁰ 18 times the safety score for the Replace 5 Damaged Towers project

thereby minimizing the chance of a wildfire. This statement was made in 2014, in the middle of a historic drought.

PG&E's own records clearly establish wind has long been classified as one of the top causes of structure failure on both transmission and distribution lines. PG&E's own records also establish the Feather River Canyon is known for high and sometimes extreme winds. Based upon PG&E wind records, the Exponent Report stated "Maximum (or peak) wind speeds in the areas of the chosen lines are generally found to vary between 60 to 100 mph, as measured and reported in "Extreme Wind Speed Estimates Along PG&E Transmission Line Corridors" across one-minute time intervals and at an elevation of 33 feet above ground level, over a 50-year return period." According to data pulled from the Jarbo Gap RAWS¹¹¹ by Meteorologist Kris Kuyper the highest number of high wind events occur in the month of October.

The inherent weakness of comparative risk analysis is its subjective nature. Data can be manipulated to achieve a desired result. Based upon the evidence the 2014 RIBA process exposes the manipulation of comparative risk analysis by PG&E personnel.

C. Transmission Asset Management

The examination of the 2014 RIBA scoring also highlighted the central role of Transmission Asset Management (TAM) in the development and execution of the capital budget. The former Senior Director was replaced as Senior Director of Transmission Asset Management in 2017. The Senior Director of Transmission Asset Management who assumed the position in 2017 explained the role of Transmission Asset Management:

"My team's responsibility for managing those assets would be to track performance of the operation of the assets and ultimately make recommendations for enhanced -- future enhancements for those assets, investments that would occur over the next five to ten years both to replace aging infrastructure, enhance existing infrastructure for greater operational flexibility as well as increased capacity to meet NERC reliability plan and standards."

"My job is to identify future work, future planned capital work. Our process has a bias towards identifying work approximately six years out."

In 2017, shortly after the new Senior Director of Transmission Asset Manager took over, TAM published the Electric Transmission Overhead Steel Structure Strategy Overview (2017 Strategy Overview). The document was written by a Senior Engineer assigned to Transmission Asset Strategy (TAS) within TAM. According to the Senior Engineer, the function of TAS is to review conditions reported from the field, study performance of the assets, apply criteria and develop a strategy for replacement or repair. According to the Senior Engineer the "conditions reported from the field" are the notifications/tags generated by the troublemen, linemen and towermen¹¹². The "criteria" listed by the Senior Engineer include the age of the asset, environmental risk, safety risk, reliability risk.

¹¹¹ Remote Automated Weather Station. See section XVI "Drought and Wind"

¹¹² Towermen work only on the steel structure of the tower.

According to the Senior Engineer, prior to the 2017 Strategy Overview neither a comprehensive plan for tower risk nor a tower risk database existed at PG&E. The Senior Engineer's statement was corroborated by internal emails obtained from PG&E. A June 10, 2016 email from a Manager in Transmission Line and Substation Asset Strategy¹¹³, to a group of PG&E employees including the Senior Engineer, appears to be the genesis of the 2017 Strategy Overview. This email regarded a "Comprehensive Plan for Towers." According to the text the email was follow-up to a meeting held earlier in the day. The stated goal of the meeting was "Develop a Comprehension Plan for Tower Risk with emphasis on steel corrosion risks. Plans should include maintenance plans, detail inspection specifications, repair vs. replace criteria, capital and expense cost estimates, risk database, update Standards." Based upon the evidence, the only reasonable conclusion to be drawn is that, despite the fact that PG&E decisions were allegedly based upon risk analysis, until 2017 PG&E had no consistent and comprehensive risk database or policy for evaluating risk.

According to the 2017 Strategy Overview "The Transmission Line Steel Structure strategy will manage the asset life cycle (e.g. Create, Utilize, Maintain, Renew (replace), and Dispose) based on risk. The renew asset life cycle is based on proactive cost replacements for high-risk assets. For medium risk assets, it is based on reactive replacements following asset failures." The "high risk," "medium risk" theme continues throughout the 2017 Strategy Overview. Although not mentioned in the quoted sentence, there is also a "low risk" category. The appendix to the 2017 Strategy Overview includes an "Asset One Page Summary T-Line Strategy From A PAS 55 Framework." The summary consisted of five different charts. Although she is the author of the 2017 Strategy Overview, the Senior Engineer asserted that she was not familiar with the charts and was unable to explain the charts or their significance. According to the Senior Engineer the One Page Summary was prepared by her supervisor and attached to her work. The final chart, which has no title, appeared to summarize PG&E TAM risk strategy. According to the chart, for low risk assets the strategy was "run to failure" with "minimal patrol to continuously assess risk," "no maintenance," and "only replacement no repairs." For high risk assets the strategy was "condition base and cause evaluation," "extensive patrol with more frequency," "minimum req¹¹⁴ maintenance" and "replace/repair."

During interviews and testimony, TAM personnel stated that the high, medium and low risk categories applied to components of the transmission lines and not the entire lines. Insulators were identified as an example of a low risk component. All current TAM personnel disavowed the term "run to failure" during interviews and testimony.

Shortly after publication of the 2017 Strategy Overview PG&E published the 2018 TD-8101 – Transmission Line Overhead Asset Management Plan (2018 AMP). According to the Senior Engineer the 2018 AMP was written by multiple engineers, including herself. The "Document Owner" listed on the 2018 AMP is the Senior Director of Transmission Asset Management.

¹¹³ At the time The Senior Engineer's direct supervisor

¹¹⁴ abbreviation of required.

The 2018 AMP included a modified version of the TAM Risk Strategy chart found in the Appendix of the 2017 Strategy Overview. According to the preface to the chart:

“The characteristics and condition of each transmission line overhead asset inform the risk and approach to replacement and operation, as well as patrol and maintenance frequency, as shown in” the charts

For low risk assets the strategy is “run to maintenance,” with “low degree of patrol with minimal frequency to continuously assess risk,” and “corrective maintenance.” For high-risk assets, the strategy is “preventative maintenance and cause evaluation,” with “high degree of patrol with more frequency,” and “preventative maintenance.” The 2018 AMP also includes a table entitled “Risk and Replacement Strategy per Asset.” The Risk and Replacement Strategy per Asset table identifies individual components of the, identifies the risk for each component and defines the replacement strategy for each component. Overhead conductor is listed as a “high to medium” risk with the replacement strategy “preventative maintenance for high risk” “run to maintenance for medium risk.” Steel structures are listed as high risk with the replacement strategy “preventative maintenance.”

The most relevant difference between the chart in the 2017 Strategy Overview and the chart in the 2018 AMP is the replacement of “Run to Failure” with “Run to Maintenance.” When asked about “Run to Failure” TAM employees tended to distance themselves from the phrase and criticize the phrase as being undefined although the term “Run to Failure” appears to be an industry standard and was discussed as an appropriate strategy for some components of the electrical transmission system in the 2010 Quanta studies. When asked to define “Run to Maintenance” most TAM employees identified failure as the trigger to maintenance. Based upon the evidence it appears that the change from failure to maintenance was semantical only.

As Senior Director of Transmission Asset Management the witness was responsible for overseeing the organization within PG&E responsible for managing assets of transmission and substation infrastructure and overseeing risk management within electrical transmission. As the manager of transmission assets, he played a sponsor role for new capital projects to replace to replace infrastructure. Transmission infrastructure was defined as transmission structures, conductor, insulators, circuit breakers, substation busses and transformers.

According to the Senior Director of Transmission Asset Management, information from the field, in the form of notifications/tags generated as a result of inspections and patrols, play a role in identifying potential projects to be included in the five year plan. According to the 2018 AMP “Transmission line overhead asset performance is primarily tracked through two factors: historical line outages and maintenance and inspection found notifications.” The Senior Director of Transmission Asset Management conceded the quality of the input received from the field has an impact on the overall asset strategy. The Senior Director of Transmission Asset Management also conceded problems not identified by field representatives would never be brought to the attention of TAM. As a result projects to repair or replace those problems would never be

planned. The Senior Director of Transmission Asset Management also conceded that as of 2018, other than the NERC Project there were no projects planned through 2022 on the Caribou-Big Bend section of the Caribou-Palermo line.

Although PG&E policy, as defined in documents like the 2017 Strategy Overview and the 2018 AMP and explained by TAM personnel, represented that decisions were made based upon a combination of performance information and patrol and inspection findings, the evidence indicated that performance information played an oversized role and patrol and inspection findings were insignificant. As a result of years of reductions of frequency and thoroughness of patrols and inspections, problems were not being identified. Based upon the WSIP and the Exponent report it was clear that on the Caribou-Palermo line and comparable lines, PG&E troublemen were not identifying problems.

The evidence established decisions regarding repair or replacement of transmission assets could not have been based upon non-existent patrol and inspection notifications. As such, then the decisions were being made solely on asset performance information. Performance information consisted of a complex series of reliability metrics (SAIDI, SAIFI, CAIDI, ACOD, ACOF). The evidence established these reliability metrics were a statistical analysis of outage data. This information was required to be tracked and reported yearly to CPUC, CA ISO, WECC, NERC and FERC. In general, all of the reliability metrics measured either the number or the effect, or both, of power outages per year. Effect is measured by either the number of customers who lose power as a result of the outage or the duration of the outage or both. The evidence established that the Caribou-Palermo line had only one dedicated customer (a powerhouse) who could be effected by an outage.

Information regarding transmission asset conditions was based upon information received from the field. This includes notifications/tags generated by troublemen, linemen and towermen during inspections and patrols, both routine and non-routine). According to the Senior Director of Transmission Asset Management, TAM relied upon notifications/tags to identify potential preventative maintenance projects. After substantial discussion the Senior Director of Transmission Asset Management conceded that the fact that if troublemen, linemen and towermen did not inspect specific components of the transmission assets, it would affect the reliability of the information upon which TAM was making decisions. Specifically he conceded that because nobody was looking for wear on cold end attachment hardware and therefor, no notifications/tags were being generated for replacement of cold end attachment hardware there were, as of November 8, 2018, no projects in the foreseeable future for the replacement of cold end attachment hardware.

Although there were no specific plans to replace cold end attachment hardware the Senior Director of Transmission Asset Management asserted that plans were being made to perform preventative maintenance on the Caribou-Palermo line. According to the Senior Director of Transmission Asset Management, the NERC Project included non-NERC required preventative maintenance on the Caribou-Palermo line. When confronted with the Project Scope document for the NERC Project the Senior Director of Transmission Asset Management was unable to identify any non-required work. According to the Senior Director of Transmission Asset

Management the non-required preventative maintenance was not included in the Project Scope document but that plans were being made to perform the preventative maintenance. However, no records or plans for any preventative maintenance projects on the Caribou-Palermo line were located through 2022.

Another concept, which came up repeatedly in interviews and testimony of TAM personnel was “bundling.” Based upon the evidence, for PG&E, bundling meant doing multiple projects on a transmission asset or line at the same time. According to the Senior Director of Transmission Asset Management TAM decisions were, in part, “informed by the most cost-effective approach for our customers.” Having crews do multiple projects at once is much more cost effective than having multiple crews make multiple visits to the asset or line. An example of bundling occurred in 2018 on the Parkway-Moraga 230kV transmission line. The line had been de-energized so that the tower department¹¹⁵ could fix a tower. While the line was de-energized the line department¹¹⁶ performed preventative maintenance by replacing insulators.

Bundling often involved the intertwining of capital budget and expense budget projects. Based upon internal PG&E emails and interviews with PG&E personnel, it appeared PG&E bundled expense budget projects with capital budget projects in order to charge the expense budget costs to the capital budget project.

Despite their preference for bundling projects there is no evidence of any intent to bundle any preventative maintenance projects to the 2013 NERC Alert Project.

The only reasonable conclusion to be drawn from the totality of the evidence is that PG&E was employing a run to failure strategy on the entirety of the Caribou-Big Bend section of the Caribou-Palermo line. Pursuant to the run to failure strategy, PG&E only applied a low degree or patrol with minimal frequency to continuously assess risk, and only performed corrective maintenance.

XII. SAFETY, RELIABILITY AND ENVIROMENT

The phrase “Safety, Reliability, Environment” appears consistently in PG&E documents, regulatory filings and public pronouncements. Members of the Electric Transmission Asset Management interviewed said safety, reliability and environment are the criteria by which all project decisions are judged. The Senior Director of Transmission Asset Management testified:

“In terms of how PG&E quantifies consequences, we usually categorize it in a number of areas focused on safety, impact reliability, impact to the environment are some examples.”

“An analysis starts with defining a risk event, and that's really defining what is that event that we believe could have exposure from a public safety reliability environmental standpoint, and then quantifying the potential drivers for that event, and the associated consequences for that event.”

¹¹⁵ The tower department deals solely with the steel transmission structures. Employees are called Towermen.

¹¹⁶ The line department deals with energized components (conductor, insulators, hot and cold attachment hardware) of the transmission system. Employee are called Linemen.

All members of TAM were asked which of the three criteria was considered the most important. They unanimously replied safety. The evidence, however, contradicted that assertion. The evidence showed disparate treatment of transmission assets based upon the reliability metrics.

The most basic example of disparate treatment based upon reliability metrics was the 500kV transmission lines. According to PG&E personnel the 500kV lines are the backbone of the electrical transmission system and an outage on a 500kV can potentially affect millions of customers. According to the ETPM, all 500kV structures were subjected to detailed ground inspections every three years. “Critical” 500 kV structures were subjected to climbing inspections every three years and as triggered. “Non-Critical” 500 kV structures were subjected to climbing inspections every twelve years and as triggered. All 500 kV structures were also subjected to yearly patrols. In contrast, 115 kV structures were subjected to detailed ground inspections every five years, air patrols in non-detailed ground inspection years and are never subjected to climbing inspections.

Another example of disparate treatment based upon reliability metrics established by evidence developed during this investigation was the Bay Waters power towers. Since 2005, the Bay Waters towers had their own classification in the ETPM. Although the ETPM refers to the Bay Waters Foundation Inspection, numerous PG&E documents and TAM personnel established the special treatment extended to the entire tower. Some documents limited the Bay Waters towers to only towers that were actually in the water but other documents and information from some TAM personnel indicated the Bay Waters towers included all towers in the Bay Area. The justification given by TAM personnel for the special treatment of the Bay Waters towers is the highly corrosive effect of salt on steel structures. When asked why special treatment was afforded to Bay Area steel towers but not steel towers along the Sonoma, Mendocino, Humboldt, Monterrey and San Luis Obispo coasts, TAM personnel were unable to explain the difference.

The final example of disparate treatment based upon reliability metrics established by the evidence arose out of a 2018 PG&E Lab Report on the hanger plates from the Parkway-Moraga 230 kV transmission line. According to the Lab Report, the hanger plates were submitted by the Supervisor, T-Line Construction, T-Line M&C Central-Bay Maintenance. When questioned, the supervisor stated wear was observed on the hanger plates while replacing insulators on the Parkway-Moraga line in the spring of 2018. There was no mention made of the C hooks and none were preserved. According to the supervisor a tower on the Parkway-Moraga was damaged in a mudslide and needed to be repaired. In order to repair the tower the line had to be de-energized. While the line was de-energized, a decision was made to proactively replace all of the “old” insulators and hardware. The Parkway-Moraga line was built after World War II in 1946. The insulators and hardware were assumed, because PG&E has no definitive records, to be 72 years old. In contrast, the Caribou-Palermo line was 91 years old when it was de-energized for over a month in December 2012 and January 2013 as a result of tower collapse. There is no record of PG&E doing any preventative or proactive maintenance on the Caribou-Palermo line while it was de-energized. According to PG&E, the reason no preventative or proactive maintenance was done was that the winter weather was not conducive to working in the Feather River Canyon.

A former PG&E Transmission Line Supervisor who, during his career in transmission lines, worked in almost all of the transmission line maintenance districts was asked if he had noticed a difference in the way transmission lines were inspected and maintained based upon a local population base. The former supervisor responded “We’re kind of out-of-sight, out of mind up there,” “We’re always fighting the political battle,” “But if something flips the screen down there [the Bay Area] they get a lot of attention.”

XIII. RISK MANAGEMENT

Prior to the Camp Fire, risk management for electric transmission was supervised by TAM. During his testimony the Senior Director of Transmission Asset Management at the time of the Camp Fire, stated that the formulation of strategies by TAM relied, in part, on the assessment of risk. He defined “Risk” as “the probability and consequence of an event occurring.” He defined probability as the “likelihood of something happening” and consequence as “the impact of that event occurring.” He defined consequence as the result of an event occurring measured by impact on safety, impact on reliability and impact on the environment.

The Camp Fire investigation focused on two types of risk; risk of equipment failure and risk of fire.

A. Risk of Equipment Failure

The recommendations of the 2010 Quanta reports focused on ways to minimize the risk of equipment failure. In summary, the Quanta reports stated wear is a product of age and failure is a product of wear. All of the complex statistical analysis in the Quanta reports boiled down to the fact a large percentage of PG&E’s transmission assets were very old and needed extra attention. Despite hiring Quanta to assess and analyze its transmission assets and make recommendations, PG&E ignored those recommendations. According to internal PG&E documents, in 2010 a committee was assigned to review and comment on the Quanta reports. Numerous current and former TAM personnel who were part of that committee were interviewed. None of the former committee members could recall who made the decision to disregard the recommendations of Quanta or why. The Senior Director of Transmission Asset Management, who was not on the committee and was not assigned to TAM in 2010 testified regarding the Quanta reports:

“The Quanta study did not look at asset data from those utilities but rather business practices from those utilities. The only age information and corresponding failure data that was used in that study was associated with the subset of assets that failed in a two-year period within PG&E and made some assumptions that made the statistical analysis incorrect. So it wasn't sufficient for us to justify significant amounts of investments in the future, and we needed to do additional analysis in order to build the case for our regulators to be able to justify requesting authorization to be able to make additional investments in the infrastructure based on the results of that bullet point at a later date.”

Although the Senior Director of Transmission Asset Management was dissatisfied with the Quanta reports, information from the Quanta reports was used and cited in numerous subsequent TAM documents, including documents produced by himself.

PG&E internal documents and reports and a report filed with the CPUC clearly established PG&E was aware of the risk of equipment failure. In an undated internal PG&E draft report entitled “Transmission Overhead Conductors¹¹⁷” it was stated, “The major root cause of conductor failures is Equipment Failure (35%).” The report also stated inspections and maintenance performed according to the ETPM “are not preventing equipment failure due to wear, corrosion and other factors on conductors and associated equipment (splices).” The report also addressed the use of infrared inspections on transmission conductor: “In most cases, Infrared Inspections identify faults with components just prior to failure. Ariel (sic) inspections are conducted annually. This proactive approach yields little results.” No final copy of this report was located and it is unknown why this report was drafted and to whom this report was distributed.

In another undated, unattributed internal report entitled “EO¹¹⁸ Transmission OH¹¹⁹ White Paper¹²⁰” the effects of equipment failure was again discussed. Whereas the Transmission Overhead Conductors was focused on conductor failure and how to mitigate/reduce the number of conductor failures, the EO Transmission OH White Paper focused on outages and how to reduce outages to improve reliability metrics. According to the OH White Paper, at the time of writing, conductors 105 years old were still in service. According to the OH White Paper, “The root causes of about 85% of the outages due to conductors from 2007 to 2012 can be attributed to trees, hardware, conductor, wind and snow...” Under the heading “Existing Conductor Strategy” the report reflects the strategy “is primarily Run to Failure (RTF), supplemented by” “periodic condition assessment and maintenance” and “program of targeted reliability improvements focusing on poorly performing lines which contribute the most to SAIFI.”

In November, 2017 PG&E filed the 2017 Risk Assessment and Mitigation Phase Report (RAMP)¹²¹ with CPUC. Chapter 10 of the RAMP was dedicated to, non-wildfire risks of the electric transmission overhead system. The RAMP looked at the known risks (identified as risk drivers) to the electric transmission system and explains how PG&E is mitigating those risks. The RAMP identified “Equipment Failure – Connectors/Hardware” as a significant risk. “Deterioration of connectors, splices or other connecting hardware that results in wire down events. This driver was associated with 28 out of 279 (10.0 percent) wire down events from 2012-2016, or an average of 5.7 events per year.” Efforts to mitigate the risk of Equipment Failure – Connectors/Hardware are divided into past (2016), present (2017-2019) and future

¹¹⁷ The author of the report is not identified and was not identified during the investigation. Based upon content it appears the report was written in 2013

¹¹⁸ EO is the PG&E abbreviation for Electric Operations.

¹¹⁹ OH is the PG&E abbreviation for Overhead.

¹²⁰ The author of the report is not identified and was not identified during the investigation. Based upon content it appears the report was written in 2014

¹²¹ Although not specific to equipment failure, the RAMP stated “Much of PG&E’s transmission infrastructure was constructed in the years following WWII. As such, many assets are nearing “end of useful life”. As these of assets near the end of their expected useful lives, PG&E will need to increase its level of asset replacements to avoid degradation in overall customer reliability and system performance.” Construction of the Caribou-Palermo line began in the months (six months) following WW1.

(2020-2022). The mitigations listed are “Inspection and Maintenance,” “Overhead Conductor Replacement” and “Insulator Replacement.”

The 2018 AMP also addressed equipment failure. The 2018 AMP used and defined the term “Risk Driver.” The definition includes reference to equipment failure:

“A risk driver is defined as an element which alone or in combination with other drivers has the intrinsic potential to give rise to risk (which can be a single risk or multiple risks). There are 83 risk drivers related to transmission overhead line assets. Though there are many risk drivers, common drivers for transmission line overhead assets include equipment failure, vegetation, natural hazards (wind, snow, earthquakes, etc.) and third-party contact. These risk drivers enable PG&E to evaluate the controls that are in place and to strategically allocate resources to programs that strengthen these controls or create new controls to mitigate these risks.”

According to the 2018 AMP “Conductor or connector/hardware failures account for 37% of all wire down events.” The AMP also stated 25% (26 of 103) of wire down events 2013-2017 were caused by failure of “connector/hardware and 42% (44 of 103) of wire down events 2013-2017 were caused by conductor failures.

The documents prove beyond any doubt that PG&E was aware of the risk of equipment failure causing conductor failure or “wire down events.” The undated draft Transmission Overhead Conductors established that at least one person within PG&E TAM was aware that inspections and patrols being done pursuant to the ETPM were doing very little to identify and prevent equipment failures.

B. Risk of Fire

Since, at least 2007, fire has been identified as the number one risk for PG&E. Chapter 11 of the 2017 RAMP stated:

“PG&E defines wildfire risk as: PG&E assets may initiate a wildland fire that endangers: the public, private property, sensitive lands, and/or leads to long-duration service outages.

PG&E has designated wildfire as an enterprise risk (in addition to being a top safety risk) since 2006. This risk is reviewed annually by the Safety, Nuclear and Operations, Committee of PG&E’s Board of Directors. PG&E’s exposure to wildfire risks continues to escalate despite increasing investment in compliance and public safety programs given various environmental and human factors. The most notable investments are the T&D routine VM work and the CEMA VM work related to the drought and the ongoing tree mortality state of emergency.

The CEMA work investment alone amounts to \$190 million in 2016 and \$208 million in 2017.¹⁴ Environmental variations, such as drought conditions or periods of wet weather that drive additional vegetation growth and wildfire fuel increases, can influence both the likelihood and severity of a wildfire event.

Although vegetation management is rightfully a focus of PG&E's fire mitigation efforts, equipment failure was also identified as a significant fire risk. According to PG&E statistics included in the RAMP, 33% of fires initiated by PG&E assets were caused by equipment failure. Vegetation management caused 37% of fires initiated by PG&E assets. The RAMP breaks equipment failure into three categories: 1) conductor; 2) connector/hardware; and, 3) other. Equipment failure – connector/hardware is defined in the RAMP as “Failure of connectors, splices, or other connecting hardware resulting in wire down and fire ignition.” Equipment Failure – Connector/Hardware risk driver accounts for 6 percent of 243 ignitions, or 15.5 per year.

Similar to Chapter 10 discussed above, Chapter 11 of the RAMP identified fire mitigation efforts as past (2016), present (2017-2019) and future (2020-2022). Although the RAMP listed extensive fire mitigation efforts done, being done, or planned to be done, none directly addresses the risk of connecting hardware failure.

The 2017 RAMP was not the first PG&E document that connected equipment failure – connectors/hardware to fire. The draft Transmission Overhead Conductors cited fire risk in a discussion of the “Bolted Connector Program.” The Bolted Connector Program was apparently¹²² a name given to the replacement of bolted, parallel groove connectors, which began prior to 2009. As to the Bolted Connector Program the report sets forth: “M&C¹²³ only replacing bolted connectors during routine or emergency work with to those components identified during infra-red inspection or in areas identified as high fire risk.”

PG&E records also document a previous equipment failure – connector/hardware on the Caribou-Palermo line. The 2007 Rock Fire was caused by the failure of a connector on a Caribou-Palermo line.

The evidence clearly establishes, beyond a doubt, PG&E was aware of the causal relationship between fire and equipment failure on transmission towers. The vast majority of PG&E initiated fires were caused by something (a tree, an animal, a person, the ground, or a steel structure) coming into contact with an energized conductor. The entire purpose of the electric transmission system is to move electricity from point A to point B through the conductor. The entire purpose of all of the components of the overhead transmission system, except the conductor, is to keep the conductor safely hanging in the air. Essential to keeping the conductor hanging in the air is the hardware that connects the conductor to the structure. PG&E knows that if that hardware breaks the result is a wire down event. Despite all of this knowledge PG&E did absolutely nothing to identify and replace the worn hardware essential to keeping the conductor safely in the air.

¹²² This is the only reference to the Bolted Connector Program found in records provided by PG&E. Based upon the description of the program it refers to the replacement of bolted, parallel groove connectors.

¹²³ Maintenance and Construction

XIV. San Bruno

Early in the Camp Fire Investigation, San Mateo County District Attorney Stephen M. Wagstaffe generously and graciously assigned Senior Inspector James Haggarty to assist in this investigation. Senior Inspector Haggarty was the lead investigator on the San Bruno explosion and an expert on investigating PG&E. Senior Inspector Haggarty immediately began seeing parallels between PG&E Gas Transmission operations prior to the San Bruno explosion and PG&E Electric Transmission operations prior to the Camp Fire.

On September 9, 2010, a PG&E gas transmission line buried beneath a residential neighborhood in the City of San Bruno ruptured and exploded. The explosion and ensuing fire killed eight people, destroyed 35 structures and damaged many more. In 2014, after three years of investigation by city, county, state and federal law enforcement PG&E was federally indicted for multiple federal felony counts. PG&E was later found guilty of five felony counts by a federal jury in the Northern District of California. A transcript of the jury trial testimony and copies of all admitted exhibits were obtained from the Federal District Court in San Francisco. During that trial, testimony established two relevant factual issues: 1) PG&E record keeping was flawed; and, 2) PG&E inspection policies for the gas transmission lines were budget dependent.

During the San Bruno investigation and subsequent trial, the flaws in PG&E's historical records were exposed. Evidence established that for many of the older gas transmission lines PG&E had few records. Many of those gas transmission lines had been acquired from other gas companies and PG&E never made an effort to examine, evaluate and catalogue the components of those lines. Instead, PG&E used "assumed values" instead of inspecting the actual line to determine true values.

Similarly, during the Camp Fire investigation the evidence established that the Caribou-Palermo line was purchased from Great Western Power in 1930, and PG&E never made any effort to examine, evaluate and catalogue the line components.¹²⁴

The San Bruno investigation also established that PG&E was making inspection policy decisions based on budget. Testimony and documents presented during the Federal jury trial clearly established in the years prior to the San Bruno explosion, PG&E used the least expensive inspection method to inspect older gas transmission lines, including the San Bruno line that ruptured and exploded. The chosen inspection method was less expensive in two ways: 1) it was less expensive to execute; and, 2) it was not designed to actually detect pipe integrity flaws that would require immediate and costly repair or replacement. Prior to the Camp Fire, for the Caribou-Palermo line PG&E utilized the least expensive inspection method (air patrols) in a

¹²⁴ In a written response to a CPUC data request PG&E states "PG&E has not historically maintained an inventory of suspension hooks or their manufacturers, age or material composition. As a result, PG&E does not have an inventory of all transmission and distribution facilities in the entire PG&E service territory organized by location and the presence of suspension hooks similar to the Incident Location 1 suspension hook. Suspension hooks are common hardware on transmission structures and occasionally are used on distribution structures. In PG&E's service territory, there are in excess of 50,000 steel transmission structures, most of which have multiple suspension hooks of some type supporting insulators and other equipment. There are also suspension hooks on many of the nearly 100,000 non-steel transmission structures in PG&E's service territory. There are more than two million distribution poles in PG&E's service territory."

manner guaranteed not to detect any problems that would require immediate and costly repairs. Because troubleshooters were not finding safety problems requiring repairs, PG&E was able to devote capital budget funds to projects focused on improving reliability metrics.

The evidence uncovered during the investigation and presented during trial clearly established the San Bruno explosion was the direct result of the fact that, because of faulty record keeping, PG&E was unaware of the potential threat/defect in the San Bruno pipe. Because PG&E intentionally used an inspection method that could not detect the potential threat/defect, the threat/defect was not found.

XV. THE BUTTE FIRE

On September 9, 2015, a pine tree fell onto an energized PG&E distribution line in Amador County sparking the Butte Fire. The Butte Fire burned over 70,000 acres in Amador and Calaveras Counties, killed two people and destroyed hundreds of structures. Cal Fire conducted an investigation of the origin and cause of the Butte Fire. PG&E was not criminally prosecuted for the Butte Fire. A civil suit was brought against PG&E by the victims of the Butte Fire in the Sacramento County Superior Court. Early in the Camp Fire Investigation, records from the Butte Fire civil suit, including investigative reports and deposition transcripts, were obtained and reviewed.

The investigation into the Butte Fire focused on the PG&E vegetation management practices in the Stockton Division. Similar to the ETPM in the transmission division, PG&E had written policies for distribution vegetation management. Much like the Camp Fire investigation, the evidence uncovered during the Butte Fire investigation established as a result of reductions of the vegetation management budget, the written vegetation management policies were not being followed; vegetation management inspections and patrols were being conducted by unqualified, untrained, inexperienced personnel;¹²⁵ and PG&E was instructing those tree inspectors to ignore all but the most dangerous conditions. Additionally the evidence established PG&E had no quality assurance programs to monitor and evaluate the vegetation management program. As with the transmission inspection and patrol policies in effect at the time of the Camp Fire, PG&E relied solely on the observations of unqualified, untrained and inexperienced inspectors to identify dangerous conditions.

XVI. DROUGHT AND WIND

Since at least 2013, PG&E was aware of increased risk of catastrophic wildfires. Chapter 11 of the 2017 RAMP begins:

“Extreme weather, extended drought and shifting climate patterns have intensified the challenges associated with wildfire management in California. Environmental extremes, such as drought conditions followed by periods of wet weather, can drive additional

¹²⁵ The vegetation management program was conducted by hired contractors.

vegetation growth (fuel) and influence both the likelihood and severity of extraordinary wildfire events.

Over the past five years, as we have seen across California, inconsistent and extreme precipitation, coupled with more hot summer days, have increased the wildfire risk and made it increasingly more difficult to manage.

The risk posed by wildfires has increased in PG&E's service area as a result of an extended period of drought, bark beetle infestations in the California forest and wildfire fuel increases resulting from record rainfall following the drought, among other environmental factors. Other contributing factors include local land use policies and historical forestry management practices. The combined effects of extreme weather and climate change also impact this risk."

According to the United States Geological Survey¹²⁶ three of the five worst droughts¹²⁷ in California history have occurred since 2001. The three droughts listed are 2001-2002, 2007-2009 and 2012-2016. According to the U.S Drought Monitor¹²⁸ in 2012 the Feather River Canyon was classified as "Abnormally dry." By 2013 the Feather River Canyon was classified as "Severe Drought." By 2014, and through 2015, the Feather River Canyon was given the highest drought classification: "Exceptional Drought"

According to an internal PG&E presentation from late 2013 entitled "Wild Fire –Enterprise Risk", PG&E was already aware of the heightened fire risk. "Wild Fire risk in California is increasing due to weather conditions and resulting record low fuel moisture content. Fire activity has seen a significant increase in 2013 as compared to 2012 with PG&E responding to 36% more fires YTD. Acreage impact as compared to 2012 is almost doubled."

According to the presentation PG&E created "administrative zones for areas at highest risk of a major wildland fire and proactively addresses these areas through operational and asset management standards. Current administrative wildland fire boundaries encompass geographies which exhibit a combination of active fire history, fire prone vegetation, terrain that promotes rapid fire spread, and/or locations specified by existing regulations for special treatment." The presentation includes a map of "Wildfire Administrative Areas at PG&E." The Feather River Canyon, from approximately Beldon to Lake Oroville appears to fall within a Wildfire Administrative Area. Under the title "Lessons Learned: Previously-Approved Mitigation Activities" bolted connector inspection/replacement is listed with the note "Wild Fire zones are now a consideration for program rollout prioritization."

Also in 2013 PG&E published the "Wild Fire Administrative Zones in PG&E's Service Area" map. According to this map the Feather River Canyon is falls within an "Other Wildfire Area." In 2014 PG&E Transmission Asset Strategy compiled a list of all transmission structures located within the boundaries of a designated wild fire area. Approximately 85 towers on the Caribou-Palermo line between the Butte-Plumas County line and the Big Bend Substation were included

¹²⁶ ca.water.usgs.gov

¹²⁷ measured by precipitation and runoff

¹²⁸ <https://droughtmonitor.unl.edu>

on the list. Tower 27/222 for some unknown reason was not on the list, but Towers 22/187 through 23/192 (which did not exist in 2014 because they had collapsed in 2012) were listed.

According to PG&E documents, including publicly available reports, PG&E has its own meteorological department and continuously monitors data from both its own weather stations and government weather stations. The closest weather station to Tower 27/222 is the Jarbo Gap RAWS¹²⁹. Meteorologist Kris Kuyper analyzed data from the Jarbo Gap RAWS, as well as other government sources including the National Oceanic and Atmospheric Administration and the U.S. Drought Monitor and PG&E. According to Kuyper's analysis, although the winter of 2016-17 was very wet and broke the 2012-16 drought, the winter of 2017-18 was dry "abnormally dry." Although the season as a whole was abnormally dry, March and April were wet. As a result of spring rains, native grasses grew in abundance. In May the rain disappeared.¹³⁰ From June 1, 2018 through November 8, 2018, there was no measurable rain in Paradise.¹³¹

Because of the lack of rain, by November 8, 2018 the EDDI¹³² listed the Feather River Canyon in the ED3 or ED2 drought categories¹³³. Based upon the lack of rain and the EDDI statistics, Kuyper opined that the dry air was "taking moisture from the plants, draining the plants of their moisture, making them even drier than they should have been." As a result, on November 8, 2018 the Feather River Canyon was approaching "record dry levels of fuel (trees, shrubs, bushes, grasses)."¹³⁴

According to data from the Jarbo Gap RAWS station from 9:13pm on November 7, 2018 until 5:13am on November 8, sustained winds were between 24 mph and 32 mph with gusts between 41 mph and 52 mph. According to Kuyper this wind pattern was not unusual for Jarbo Gap. Based upon analyzing six years of wind data from the Jarbo Gap RAWS Kuyper determined that Jarbo Gap experiences this wind pattern approximately 20 times per year,¹³⁵ the majority of which occur from October through February.¹³⁶

According to Kuyper, the Jarbo Gap winds occur as the result of a difference in atmospheric pressure between east of the Sierra Nevada and west of the Sierra Nevada. Higher pressure over the Great Basin in Nevada forces air west, towards lower pressure on the west side of the Sierra Nevada. The Sierra Nevada blocks this, except through gaps and passes such as the Feather River Canyon. The air is then channeled through the gaps and passes, which accelerates the flow of air. Cold air flowing downhill also causes acceleration.

¹²⁹ Remote Automated Weather Station

¹³⁰ Average rainfall in Paradise area in May is approximately .5". May, 2018 rainfall for Paradise was .14".

¹³¹ Average rainfall in Paradise area in October is approximately 3".

¹³² Environmental Demand Drought Index, esrl.noaa.gov

¹³³ On a scale of 0 – 4. 0 being normal, ED2 is defined as "Severe Drought." ED3 is defined as "Extreme Drought." 4 being "Exceptional Drought."

¹³⁴ <https://gacc.nifc/once/fuelsFireDanger.php>

¹³⁵ From 2013-2019, 118 individual events with wind gusts over 45mph, 66 individual events with wind gusts over 50 mph.

¹³⁶ October averages more than 5 events per month, November averages under 2.

Internal PG&E records established PG&E has known since the mid-1980s that high winds constitute a serious threat to its electric transmission assets. In 1990, PG&E Research and Development published the “Extreme Wind Speed Estimates Along the PG&E Transmission Line Corridors” report. The report was the result of a five year study, recommended by the CPUC, “to assess the adequacy of PG&E’s power wind loading design criteria” after five separate incidents in which transmission line assets were toppled during wind storms in 1982 and 1983. The report mainly focused on the 500kV transmission line corridors. According to the report “Electric transmission lines in the PG&E service area were originally designed to withstand wind loadings associated with 1-minute average gusts to 57 miles per hour (mph). The report concludes the original PG&E wind loading criteria for transmission lines was inadequate at some locations and needed upgrade. According to the reports, from November 1984 through November 1985 PG&E had wind meters installed at the Cresta Reservoir and the Rock Creek Reservoir in the Feather River Canyon. Both locations recorded gusts in excess of 50 mph hour in November, 1984 (54.6 mph) and February, 1985 (70.9 mph).

In 1999, PG&E Technical and Ecological Services published an updated “Extreme Wind Speed Estimates Along the PG&E Transmission Line Corridors.” The report stated “Electric transmission lines throughout the PG&E service area were originally designed to withstand wind loadings of 70 miles per hour.” No explanation was given as to why the original wind loading design increased from 57 miles per hour (as stated in the 1990 report) to 70 miles per hour between 1990 and 1999. Although not stated as a justification for the update, the report did note that severe storms in January, March and December of 1995 caused approximately \$100 million damage to electrical transmission and distribution systems. The report mainly focused on the 500kV transmission line corridors and Bay Area, while noting a lack of wind data from the Sierra Nevada and northeastern areas. The report did include the 1984-85 wind speed data from the Rock Creek and Cresta reservoirs.

The 1999 report included a section entitled “Santa Ana Type Winds.” According to the report Santa Ana type winds occur because “High pressure frequently forms in the Great Basin area of the Rockies in the vicinity of Utah and Nevada during winter months. When pressure builds beyond a critical point, air spills through the mountain gaps, gaining momentum as it flows to lower elevations.” The report recognized although mainly thought to be a Southern California phenomenon, Santa Ana type winds do occur in Northern California, mainly in the Tehachapi region near Bakersfield.

In 2015, PG&E Applied Technology Services published the “Extreme Wind Speed Estimates Across the PG&E Service Territory” report. This report updated and built upon the previous wind reports. According to the report “major wind storms” occurred in December, 2005, January, 2008, October, 2009 and January 2010. The report did not mention the December, 2012 wind event that toppled five Caribou-Palermo line towers.¹³⁷

The 2015 wind report refers to “Offshore/Northerly Wind Events.” According to the report:

¹³⁷ According to historical wind data for RAWS available at <https://wrcc.dri.edu> the maximum wind gust speed recorded by Jarbo Gap RAWS on December 21, 2012 was 30 miles per hour.

These events occur when surface high pressure develops north or east of the territory, which sometimes occurs as storm systems bypass California to the north and drop southeast of the territory generally east of the Sierra Nevada. This pattern produces a northerly to easterly pressure gradient and offshore winds. When flowing downhill these winds are known as ‘katabatic’ winds and are also named by geographic location in some instances (e.g. Diablo, Mono).

The wind report does not recognize the Feather River Canyon/Jarbo Gap winds. The wind report does conclude:

“The quality and precision of the data is proportional to the density of weather stations in the analysis and is generally higher in the Bay Area and Central Valley where station coverage is robust and lower in the Sierra Nevada and Coastal Ranges. Since wind speeds were produced from the RAWS in the more remote terrain in the Sierra Nevada and north and south Coast Ranges and since RAWS are more often located in more exposed terrain, the isotachs¹³⁸ ... typically represent ridge top winds.”

According to the report the “most notable offshore wind event in recent history occurred on November 30 to December 1, 2011, which produced katabatic winds across the Sierra Nevada and the elevated terrain of the Bay Area and Central Coast. Wind gusts from 40-60 mph were observed across the central and southern Sierra Nevada foothills...” According to historical wind data from the National Oceanic and Atmospheric Administration gusts of 66 mph were recorded at Jarbo Gap on November 30, 2011.

The report also concluded “Offshore or Northerly wind events are typically associated with extreme fire danger and can be strong enough to produce widespread damage to distribution and transmission infrastructure.”

This natural phenomenon has been occurring for many years. Exponent also analyzed the wind in the Feather River Canyon. According to the Exponent Report, the Caribou-Big Bend section of the line experienced the highest average wind speed, the highest average time at high wind conditions and the highest percentage of towers that experience more than 605 hours of high wind conditions per year of the comparison transmission lines.

During its investigation, the CPUC asked PG&E if PG&E had “ever done a wind loading study” on Tower 27/222. In its written response¹³⁹ PG&E stated “A wind loading study was completed as part of the initial installation of the transmission line between 1919 and 1921” and “PG&E’s understanding based on its records is that no additional wind loading studies were performed on the two towers (27/222 and 27/221) since the installation of the transmission line between 1919 and 1921. PG&E’s transmission line design criteria do not require analysis on structures for which no significant work is proposed.” According to the design criteria listed in PG&E’s written response, the towers were designed to withstand winds of approximately 56 miles per hour. During the short period of time that wind meters were installed at the Cresta Reservoir and

¹³⁸ An isotachs is a line on a map connecting points of equal wind speed.

¹³⁹ CPUC Data Request SED-002, Question 27.

the Rock Creek Reservoir in the Feather River Canyon, PG&E recorded wind gusts over 70 miles per hour. From 2013 to 2019 the Jarbo Gap RAWS station recorded wind gusts over 50 miles per hour over 60 times. Despite the fact the towers of the Caribou-Palermo line were routinely subjected to winds at or near their design criteria, PG&E never inspected or tested any of the towers or components for wind damage.

Based upon the meteorological data, PG&E knew that the Feather River Canyon was a drought ravaged tinderbox. Based on their own reports, PG&E also either knew or should have known the Feather River Canyon experiences katabatic winds during the fall when the fire danger is highest. Despite its own meteorological data, PG&E chose not to replace the aged and deteriorating conductor and components on the Caribou-Palermo line.

XVII. PUBLIC SAFETY POWER SHUT-OFF

On November 6, 2018, PG&E issued a Public Safety Power Shut-Off (PSPS) notice to approximately 70,000 PG&E customers in nine California counties, including Butte. The PSPS notified customers of potential de-energization of power lines on November 8, 2018, based upon meteorological forecasts. On November 6 and November 7 PG&E went to great lengths to notify customers in the nine counties of the potential de-energization¹⁴⁰ on November 8, 2018. On November 8, 2018 PG&E decided not to de-energize power lines.

An initial focus of the Camp Fire Investigation was the decision by PG&E not to de-energize power lines in the Feather River Canyon prior to ignition of the Camp Fire on November 8, 2018.

The PG&E PSPS Policy was enacted in September, 2018. A PSPS guide was published on the PG&E website {[Attachment - Public-Safety-Power-Shutoff-Policies-and-Procedures-September-2018](#)} in September 2018. PG&E's PSPS Policy was enacted based upon a CPUC decision in July, 2018¹⁴¹ to allow electrical utilities to pro-actively de-energize¹⁴² at-risk power lines during wind events. The PSPS guide publicly available on the PG&E website broadly described the meteorological conditions necessary for de-energization. The publicly available PSPS guide used the term "power lines" and did not differentiate between distribution and transmission lines or by voltage or area.

Based upon the meteorological data, {[Attachment - Jarbo Gap Weather Station Readings](#)} the conditions in the Feather River Canyon in the hours prior to the failure of the C hook on Tower 27/222 exceeded the wind conditions necessary for de-energization under the publicly posted PSPS guidelines.

However, the Butte County DA obtained copies of the PSPS policy filed by PG&E with the CPUC. The actual PSPS policy was much more detailed and specific than the guide published

¹⁴⁰ In layman's terms shutting off the power.

¹⁴¹ CPUC Resolution ESRB-8.

¹⁴² In layman's terms shutting off the power during high wind events to avoid fires caused by contact between energized power lines and objects such as vegetation.

on PG&E's public website. As opposed to the publicly posted PSPS guide, the official PG&E PSPS policy differentiated between transmission and distribution lines. The actual policy specifically and explicitly exempted all 115kV, 230kV and 500kV transmission lines from the PSPS. After comparing the PSPS guide published on the website with the actual PSPS policy, it appears the authors of the public PSPS guide, in an effort to make the guide understandable to the average PG&E customer, simplified the policy to an extent that became misleading.

Additionally, the transmission and distribution lines in the Feather River Canyon were not within the area of PSPS program. According to internal PG&E documents, inclusion of 115kV transmission lines in the new PSPS program was initially considered. The committee drafting the PSPS policy explored three transmission line options: 1) all 70kV and below; 2) all 115kV and below; 3) all 70kV and below and some 115kV depending upon factors such as location within high fire threat areas. Ultimately the committee settled on all 70kV transmission lines and below and exempted all 115kV transmission lines from the PSPS program. PG&E did not provide any written documents explaining or justifying this decision. However, based upon all the documents provided, there was no evidence the decision to exempt all 115kV transmission lines and above was reckless or criminally negligent. Based upon the 2018 PG&E PSPS policy, the Caribou-Palermo line was not subject to de-energization prior to the ignition of the Camp Fire and was therefore not included in any PSPS. However if PG&E had included 115 kV lines, the Caribou-Palermo line should have been included based on the extreme wind conditions in the Feather River Canyon.

XVIII. KNOWLEDGE OF RISK/CONSEQUENCE

Internal PG&E documents show that by 2006 PG&E was aware that equipment failure (risk) causes fires. According to the October 2006 Risk Analysis of Urban Wild land Fires, written by the PG&E Enterprise Risk Management Committee, in 2005 PG&E electrical equipment failures caused 20 fires. That same document defined the Urban Wild Land Interface area as the "geographical area where structures and other human development meets or intermingles with wild land or vegetative fuels" and lists aging infrastructure as a potential "gap" in PG&E's fire mitigation efforts. Another potential gap identified by PG&E is "our asset strategy to address urban wildland fires is limited." To mitigate this potential gap the report included the following "Proposed Solutions:"

- Identify urban wildfire geographic area
- Identify quick result items such as:
 - Perform patrols/inspections just before fire season
 - Replace parallel groove (PG) connectors
 - Inspect equipment that could be high risk.

The 2009 Enterprise Risk Management Urban Wildland Fire Risk Review report written for the Executive Management Committee specifically listed as fire risk drivers:

- Failure to perform quality inspections or workmanship
- Inadequate procedures relating to fire danger
- Failure to consider local conditions in design standards

Improperly maintained equipment
Failure to replace aging equipment.

Under “Current Mitigation Activities,” the report specifically listed “Equipment maintenance and replacement programs, including patrols and inspections.”

These themes were repeated in Enterprise Risk Management (ERM) reports for several years.

“EMC: Electric T&D Asset Road Map,” an internal PG&E document believed to have been published within the company in 2010, stated:

“For more than twenty years, PG&E’s asset management practices have focused on maximizing the utilization of T&D¹⁴³ assets and reducing capital investments to the greatest extent possible. Only recently has the Company utilized an alternate approach that places a higher value on reliability and operational flexibility of the electric T&D system. It is recommended that PG&E continue this current approach to pursue a combination of measures designed to upgrade and modernize its aging electric T&D assets.”

In the section of the document entitled “Aging Assets” it is stated:

“While much has been done in the last several years to improve the design, maintenance and operations of the system, the Company’s electric T&D assets comprise an aging system that it operated close to its design capacity limits. Many of our electric T&D facilities were installed in the 1950s and planned lifetime design for these facilities is 40 years. Continuing to rely on aging facilities has increased the Utility’s risk of equipment failure and extended service interruptions. Additionally, the repair time and costs for failed equipment is much higher than planned replacement.”

In December 2018, in response to questions from the Honorable William Alsup, Judge of the United States District Court, Northern District of California, PG&E submitted to the Federal District Court a list of all fires caused by PG&E 2014-2017. 2017 { [Attachment – PGE caused fire 2014-17](#) }. According to the list there were eighteen fires caused by equipment failures on transmission lines.

The list submitted to the Federal District Court did not include the 2008 Rock Fire and the 2018 Murphy Fire,¹⁴⁴ both of which occurred in the Feather River Canyon and both of which were caused by equipment failures on transmission lines. The Rock Fire was caused by the failure of a connector on a tower on the Caribou-Palermo line. The Murphy Fire was caused by the failure of a connector on a tower on the Caribou-Table Mountain 230kV transmission line. In both fires the failure of a connector allowed an energized jumper conductor to make contact with the steel tower structure and sent a shower of molten metal onto dry vegetation at the base of the tower.

In the 2017 RAMP, PG&E clearly identified equipment failure as a known cause of fire. According to section C of Chapter 11, Drivers and Associated Frequency, there were an average of 243 fires per year during 2015-16 caused by PG&E. Of those 243, on average 82.5 (33%)

¹⁴³ PG&E abbreviation for Transmission and Distribution

¹⁴⁴ The Murphy Fire occurred on August 6, 2018. The origin of the fire was directly below a PG&E transmission tower – not the Caribou-Palermo line – just west of Belden in the Feather River Canyon. The fire was caused by equipment failure – specifically failure of a connector – which allowed an energized 230kV conductor to come into contact with steel tower structure.

were caused by equipment failure. Equipment failure caused fires are broken down into Conductor (29.5 per year), Connector/Hardware (15.5 per year) and Other (37.5 per year).

The evidence clearly established PG&E has been aware of the risk/consequence connection between equipment failure and fire since at least 2005. Similarly, the evidence also clearly establishes that PG&E was aware of the risk/consequence connection between aging infrastructure and equipment failure.

In 2009 PG&E retained Quanta Technologies to review, assess and critique the electrical transmission system. In 2010 Quanta submitted to PG&E the Transmission Line Component Management Report. The report was divided into a series of individual reports. Each report focused on a component of the electrical transmission system. Not all of the reports were relevant to the risk of equipment failure on transmission towers.

Relevant individual reports and information in those reports was summarized:

Transmission Line Component Management Executive Summary

“As part of a comprehensive effort to manage its infrastructure PG&E Transmission Asset Management has begun study of all components of transmission line infrastructure, both overhead and underground, to develop an understanding of the component behavior over its installed service life. The intent of this effort is to ultimately develop an understanding of what the expected service life of line components should be, given normal operating and maintenance practices of the service life. This understanding also drives decisions of what the “normal” operating and maintenance practices should be to allow a component to survive to an “end of service life” condition, barring external events that cause sudden or catastrophic failure of a component (e.g. severe weather event, vehicular impact).”

“Certain aspects of a utility maintenance program can be characterized as following a “run to failure” philosophy. The practice of allowing equipment to fail often applies to utility equipment that is large in total population but low in overall impact to the system and/or customer reliability.”

“Run to failure as a maintenance philosophy has a place in the overall maintenance program of a utility. The equipment managed under this philosophy, however, is generally high volume, low risk facilities. Operational risk, technical effectiveness, and financial considerations drive the determination.”

Conductor and Fittings

“Based on PG&E conductor inventory data, the average age of 115 kV copper conductor on the PG&E system is 75 years. Conductor other than copper at 115 kV averages 36 years of age.¹⁴⁵”

“The overall age of conductor is a concern to most utility asset managers and the concern is based primarily in lack of knowledge of what is to be expected from aging conductor.”

¹⁴⁵ The conductor on Tower 27/222 was aluminum.

“Greatest risk of failure in transmission conductors is thought to be with the oldest steel reinforced conductors¹⁴⁶.”

Insulators

“...the failure rate of porcelain increases at a faster rate as they age beyond 50 or so years. Nonetheless, even with increasing failure rate, porcelain is only projected to a rate of 0.06 failures per at age 60.”

“Industry has come to expect a service life for porcelain and glass insulators beyond 50 years. The service life is contingent of course on the original quality and proper application of the units.”

“...lack of data consistency and accuracy result in the need for many assumptions to address data voids. Accurate information on insulator type (porcelain, glass, poly), vintage, manufacture, date of installation, and location is critical to building a dataset that will facilitate meaningful statistical analysis over the service life of the material.”

Structures

63% of the 104 electrical utilities surveyed utilized routine climbing inspections as part of inspection policy. The average inspection period for climbing inspections was 4.2 years.

44.4% of PG&E 115kV structures were installed prior to 1931.

Component service life was calculated based upon condition and environment. Environment was further divided by “Mild,” “Avg.” and “Severe.” For “Twr attachments : Susp/Jumper.” for the condition “Wear” and environment “Wind run” the component life in years is Mild – 80 years, Avg – 57 years, and Severe – 35 years.

“With recognition of the issues associated with aging infrastructure, more attention is expected to be given to steel tower condition throughout the industry.”

“Inspection, repair, and refurbishment of steel structures and associated components (guys, anchors, foundations, etc.) are a critical part of the ongoing maintenance and management of the transmission infrastructure. Normal aging and deterioration, coupled with years of inadequate inspection and maintenance, put many structure at a point of less than desired structural integrity.”

“A comprehensive maintenance and inspection program for an aging structure population should include a diagnostic testing component, particularly when structures reach and age threshold that is appropriate. That threshold varies by many factors: geographic location and associated environmental conditions, age of infrastructure, proximity to other infrastructure, historical performance of similar vintage structures in the company, etc.”

¹⁴⁶ Steel reinforced conductor has a solid steel core to increase the strength of the conductor. The conductor on Tower 27/222 was steel reinforced.

“An effective strategy for structure and foundation management would include elements such as:

Routine visual inspections by ground patrol and aerial patrol as part of general line inspection process,

Comprehensive climbing inspection at 3-5 year intervals,

....

Laboratory testing of components removed from service as part of repair or replacement work to determine overall condition and remaining strength of material.”

“For a population of structures and foundations such as exists at PG&E, the leading criterion for determining inspection and testing targets, would initially be age. With a structure population age span of over 100 years (according to inventory records), a programmed sampling of the population over 80 years of age to test structure and foundation integrity would be an appropriate beginning.”

According to Figure 9.1¹⁴⁷ the only structures still in use at the time of the report that were built prior to 1923 (87 years of age at time of report) were 115kV structures. According to a footnote to Figure 9.1 and subsequent figures in section 9, there are 6908 115kV structures for which PG&E has no age data. According to other PG&E reports there are 18,800 115kV structures in the PG&E inventory.

The evidence developed during this investigation clearly establishes that PG&E essentially ignored the recommendations of the Quanta Reports. PG&E did not adopt any new policies or procedures for inspection of the oldest transmission assets. There is no evidence of a programmed sampling of the oldest structures and foundations. Even the collapse of five Caribou-Palermo line structures in 2012 did not cause PG&E to take a closer look at one of their oldest transmission assets. In 2010 the TLine Structures Committee met to review the Quanta Reports. Neither The Senior Engineer nor the former Transmission Specialist, members of the TLine Structures Committee and “Required Attendees” of the 2010 meeting, had any recollection of the alleged meeting or any recommendations regarding the Quanta Reports made by the committee. Neither was able to shed any light on the question as to why the recommendations of the Quanta Reports were not adopted. According to the Senior Director of Transmission Asset Management, who was not involved in the TLine Structure Committee at the time of Quanta Reports, the recommendations of the Quanta Reports were ignored because “we could not rely on the information in the Quanta study.” The Senior Director explained:

“The Quanta study did not look at asset data from those utilities but rather business practices from those utilities. The only age information and corresponding failure data that was used in that study was associated with the subset of assets that failed in a two-year period within PG&E and made some assumptions that made the statistical analysis incorrect. So it wasn't sufficient for us to justify significant amounts of investments in the

¹⁴⁷ A line graph displaying the age distribution of PG&E transmission structures.

future, and we needed to do additional analysis in order to build the case for our regulators to be able to justify requesting authorization to be able to make additional investments in the infrastructure based on the results of that bullet point at a later date.”

The Senior Director of Transmission Asset Management also stated “I didn't have high confidence in the Quanta study so we intended to do additional benchmarking and collaboration in the industry in order to come up with more robust information.”

In addition to general knowledge of the problems of wear and failure in aging infrastructure, PG&E had specific knowledge that C hooks and hanger holes suffer rotational body on body wear as far back as 1987.

According to internal PG&E documents, in 1987 a transmission line crew noticed concerning wear patterns on both the C hooks and the hanger holes on the Oleum-G transmission line¹⁴⁸. The transmission line supervisor removed the C hooks and hanger holes from the tower structure and sent them to the PG&E Lab for analysis. The PG&E lab evaluated the C hooks (referred to as J hooks in the report) and hanger holes (referred to as attaching plates) and issued a Laboratory Test Report on February 9, 1987. According to the report “Both of the J-Hooks and their attaching plates had grooves worn in them and there was concern that they may not be able to hold the weight of insulator strings that are suspended from them.” The lab report included photographs of the C hooks and the hanger holes. Figure 1 of the report is a picture of one of the C hooks. According to the caption to Figure 1 “As shown in the Figure above a wear pattern was formed in the bowl-saddle of the J-hook. This was possibly caused by the insulator string swinging in the wind over a period of time.” Figure 2 of the report is a photograph of one of the hanger holes. According to the caption to Figure 2 “This figure shows the key-hole wear in the plate eye caused by the J-hook while in service.”

In 2011, PG&E transmission line crews working in the South Bay, observed similar wear on hanger holes on the Jefferson-Hillsdale transmission line. Photographs were taken of the wear and sent to PG&E engineers. After reviewing the photographs a Supervising Engineer responded via email “Looking at the photo of the hanger plate. I would recommend changing it to a new plate. It appears that there is a groove cutting into the plate probably caused by years of rubbing between the c-hook and the plate.”

In March of 2018, PG&E transmission line crews working on a transmission line in the East Bay observed similar wear on hanger holes. The transmission line supervisor, removed the hanger plates from service and sent them to the PG&E Lab for review and analysis. On June 20, 2018, the PG&E Lab issued a report entitled “Metallurgical Evaluation of Insulator Suspension Plates from the Parkway-Moraga 230 kV line at structure 020/115. The report found that “the wear was attributed to wind-driven swinging of the insulators (wind-sway).” The report opined a wear rate of .007” per year and a useful life of the hanger plates of 97-100 years based upon the wear rate and the expected strength of the remaining metal.

The evidence establishes that PG&E is aware that wear increases with age, the possibility of equipment failure increases relative to the amount of wear, and, ignition of a fire is a definite

¹⁴⁸ The Oleum-G transmission line is located in Contra Costa County, just south of the Carquinez Bridge and near the community of Valona. The Oleum-G line is one of the segments of the original Caribou-Valona line still in service. It is believed, but not confirmed that the tower from which the C hooks and hanger holes were removed was an original, 1921 Caribou-Valona tower and the worn C hooks were vintage 1921.

possible consequence of equipment failure. It is clear, based upon the internal PG&E documents that PG&E has clearly understood, at least since 2006, the correlation between aging infrastructure and fire.

The Quanta Reports and internal PG&E reports clearly established a connection between wear and inspection/patrol. From the October 2006 Risk Analysis of Urban Wild land Fires through the 2017 RAMP inspection and patrol are specifically listed mitigation to fire threat. Since 2005 PG&E electric transmission inspection, patrol and maintenance policies are set out in the Electric Transmission Preventative Maintenance Manual (ETPM). According to section 1.2 of the ETPM “Inspection and patrol procedures are a key element of the preventive maintenance program. The actions recommended in this manual reduce the potential for component failure and facility damage and facilitate a proactive approach to repairing or replacing identified, abnormal components.”

XIX. PERSONAL LIABILITY FOR PG&E EXECUTIVES

During the course of the Camp Fire investigation, many witnesses from PG&E were interviewed and examined under oath by the Grand Jury. Many, many internal discussions were had as to whether there was sufficient evidence to indict any individual PG&E personnel or executives. It was finally determined based on the current state of the law in California and the facts discovered during the investigation that there was insufficient evidence to proceed against individuals.

A. The Law:

Many people have heard of or understand the concept of “Respondeat superior” (Latin for “Let the Master answer”) in which an organization’s top executives are held **vicariously liable** for the actions/omissions of their subordinates regardless of the executive’s personal participation or knowledge. However this is a **civil concept** that does not apply in **criminal** cases. The leading California case in the area of **corporate officer criminal liability** is *Sea Horse Ranch, Inc. v. Superior Court* (1994) 24 Cal. App. 4th 446, which states: “[A]n officer of a corporation is not criminally answerable for any act of a corporation in which he [or she] is not personally a participant. In the context of negligent homicide such an officer would be said not to be liable unless he or she was personally aware of the omissions or other behavior that gives rise to the criminal negligence. The decisions involving criminal liability of corporate officers, either expressly or impliedly, focus either on the officer’s direct participation in illegal conduct, or his or her knowledge and control of the illegal behavior. **The mere fact of the officer’s position at the apex of the corporate hierarchy does not automatically bestow [criminal] liability.**”

B. The Facts:

Based upon the forensic analysis of the failed “C” hook from the suspect tower, it was the opinion of the experts consulted that the wear which caused the hook to break occurred gradually over almost 100 years. It is our belief the wear had been visible for at least 50 years. Over the past 50 years scores of PG&E employees should have been in a position to observe the wear. However, none of the employees documented the wear. Since nobody apparently noticed the wear, it would be impossible to prove any single person was negligent. Additionally PG&E

culture made decision-making “by committee” a standard, virtually eliminating individual responsibility. A “silo mentality” also pervaded the company in which departments and management groups did not share information, goals, tools, priorities and processes with each other. (E.g. The PG&E Tower Division took responsibility for maintenance of the steel tower structures. The PG&E Line Division took responsibility for the maintenance of the power lines. The “C” hooks seemed to fall between their two responsibilities – i.e. neither took responsibility for the hooks, assuming the other division was responsible, which left the hooks as orphan equipment.)

C. Conclusion:

Many of the decisions that ultimately lead to the Camp Fire were made in the 1980s, 1990s and 2000s. It would be almost impossible to prove a person making decisions in 1995 knew the decision was creating the risk of a catastrophic fire over 20 years later and either disregarded or ignored that risk. **But the corporation as an entity is tasked with that knowledge and reckless behavior and was so indicted.**

XX. ELEMENTS OF THE OFFENSES

Unlawfully Causing a Fire to a Structure/Forest land (Pen Code § 452(c))

- a. PG&E set fire to, or burned, or caused the burning of a structure or forest land or property;
- b. PG&E did so **recklessly**;
- c. The fire burned an inhabited structure or the fire caused great bodily injury to another person.

Definition of Recklessly

A corporation acts recklessly when:

- a. It is aware that its actions present a substantial and unjustifiable risk of causing a fire.
- b. It ignores that risk
- c. Ignoring the risk is a gross deviation from what a reasonable person would have done in the same situation.

Involuntary Manslaughter (Pen. Code §192(b))

- a. PG&E had a legal duty to the decedents
- b. PG&E failed to perform that legal duty;
- c. PG&E’s failure was **criminally negligent**;
- d. PG&E’s failure caused the death of decedents

Definition of Criminal Negligence

- a. Criminal negligence involves more than ordinary carelessness, inattention, or mistake in judgment. A corporation acts with criminal negligence when:

- i. It acts in a reckless way that creates a high risk of death or great bodily injury;
- ii. A reasonable person would have known that acting in that way would create such a risk.
- b. In other words, a corporation acts with criminal negligence when the way it acts is so different from how an ordinarily careful person would act in the same situation that its act amounts to disregard for human life or indifference to the consequences of that act.

XXI. DUTY

On September 24, 2016, the Governor signed 2016 Cal SB 1028. SB 1028 added Chapter 6 to division 4.1 of the California Public Utilities Code. One of the newly created sections was 8386, which took effect on January 1, 2017. Section 8386 created a statutory duty on electrical utility companies. Section 8386(a) states “Each electrical corporation shall construct, maintain, and operate its electrical lines and equipment in a manner that will minimize the risk of catastrophic wildfire posed by those electrical lines and equipment.”

California Public Utilities Code section 451, enacted in 1951 and amended in 1977, states “Every public utility shall furnish and maintain such adequate, efficient, just, and reasonable service, instrumentalities, equipment, and facilities, including telephone facilities, as defined in Section 54.1 of the Civil Code, as are necessary to promote the safety, health, comfort, and convenience of its patrons, employees, and the public.”

The California Public Utilities Commission promulgates regulations known as General Orders (GO). GO 165 section IV states “Each utility shall prepare and follow procedures for conducting inspections and maintenance activities for transmission lines.”

GO 95 includes multiple rules that apply to electrical transmission line safety, including:

- 1) Rule 31.1
Electrical supply and communication systems shall be designed, constructed, and maintained for their intended use, regard being given to the conditions under which they are to be operated, to enable the furnishing of safe, proper, and adequate service. For all particulars not specified in these rules, design, construction, and maintenance should be done in accordance with accepted good practice for the given local conditions known at the time by those responsible for the design, construction, or maintenance of communication or supply lines and equipment.
- 2) Rule 31.2
Lines shall be inspected frequently and thoroughly for the purpose of ensuring that they are in good condition so as to conform with these rules. Lines temporarily out of service shall be inspected and maintained in such condition as not to create a hazard.
- 3) Rule 18
Each company (including electric utilities and communications companies) is responsible for taking appropriate corrective action to remedy potential violations of GO 95 and Safety Hazards posed by its facilities.

4) Rule 44.3

Lines or parts thereof shall be replaced or reinforced before safety factors have been reduced (due to factors such as deterioration and/or installation of additional facilities) in Grades “A” and “B” construction to less than two-thirds of the safety factors specified in Rule 44.1 and in Grade “C” construction to less than one-half of the safety factors specified in Rule 44.1. Poles in Grade “C” construction that only support communication lines shall also conform to the requirements of Rule 81.3A. In no case shall the application of this rule be held to permit the use of structures or any member of any structure with a safety factor less than one.

XXII. CONCLUSION

The evidence developed during this investigation clearly established that the reckless actions of PG&E created the risk of a catastrophic fire in the Feather River Canyon, that PG&E knew of that risk and PG&E ignored the risk by not taking any action to mitigate the risk.

The C hook that broke was at least 97 years old. The exact age of the C hook is unknown because PG&E has no record of the hook. Ninety-seven (97) years is assumed because the Caribou-Valona transmission line, of which the Caribou-Palermo line is a segment, went into service in 1921. The records from the Great Western Power Company establish the entire line was built between 1918 and 1921. There are no records of when each tower was built. It is possible Tower 27/222 was built in 1918 and the C hook had been hanging for 100 years as of November 8, 2018. The same is true of the insulator string and the jumper conductor hanging from the C hook.

PG&E also has no records, and no idea, by whom the C hook was made, and more importantly, of what type of metal and how the C hook was made. The type of metal and the process of manufacture are what determines the hardness of metal. The transposition towers were designed to allow for movement of the conductor and insulator. The fact the C hook was constantly rubbing back forth against the hanger hole was known. The concept of body-on-body wear from constant rubbing together of two metals is a long established and well known phenomenon. Also long established and well known is the fact the various hardness of the metals rubbing together plays a key role in the body-on-body wear. The fact that PG&E relied on a 97-100 year old C hook it knew nothing about to hold an energized 115kV conductor is, by itself, negligent and reckless.

It is also disturbing that PG&E’s only information of the composition of the conductor running through Tower 27/222 comes from a 1922 article in an engineering journal. A conductor is the wire that carries electricity from Point A to Point B. A conductor is the most important component of the transmission system. Everything else in the transmission system is designed around the conductor. PG&E has owned the Caribou-Palermo line since 1930. Based upon the lack of records PG&E has never made any attempt to inventory and catalogue the conductor. The fact that PG&E was using a 97-100 year old conductor for which they knew almost nothing is evidence of absolute indifference on the part of PG&E.

Perhaps even more disturbing is the fact the conductor was aluminum reinforced with a steel core. 452.3 kcmil Aluminum Conductor Steel Reinforced to be exact. According to the Quanta report the average age of non-copper conductor was 36 years and the “greatest risk of failure in transmission conductors is thought to be with the oldest steel reinforced conductors” Although PG&E knew almost nothing about the conductor they did know it was at least 97 years old and made of steel reinforced aluminum. Despite this knowledge, PG&E did nothing and made no plans to replace that conductor. Even though because of updated NERC guidelines, PG&E was forced to replace conductor on some segments of the Caribou-Big Bend section, they elected to leave in place the 97-year-old aluminum steel reinforced conductor in other areas. The fact that the Senior Director of Transmission Asset Management preached the cost effective value of bundling projects but had no plans through 2022 to replace the 97-year-old aluminum, steel-reinforced conductor speaks volumes. What it says is that PG&E fully intended to run that conductor to failure. A reasonable person doesn’t need an electrical engineer or Quanta Technologies to tell him that failure of an energized 115kV is extremely dangerous. PG&E’s decision to leave the 97-year-old aluminum, steel-reinforced conductor in service was extraordinarily reckless.

In addition to basic engineering principles and common sense, PG&E had actual knowledge that both the C hooks and the hanger holes suffer wear and would eventually break if not replaced. At some unknown point between 1921 and 2018 somebody added the hanger plate brackets to Tower 27/222. Although there are no records of when or why the hanger plate brackets were added the only reasonable conclusion, based upon the wear observed on the original hanger holes, is somebody noticed the wear and was concerned enough to take action.

In 1987 PG&E had absolute knowledge of the wear to both the C hooks and hanger holes. The photographs in the 1987 Laboratory Report document channeling on the C hooks and key holing on the hanger holes similar to what was found on the Caribou-Palermo line. The similarities are not surprising because the transmission line on which the C hooks and hanger holes were found, the Oleum G line, was also part of the original Caribou-Valona line. The fact PG&E chose to only perform tensile strength testing in 1987 and did not subject the hooks and hanger plates to metallurgical analysis tends to show PG&E was not concerned with the wear or the expected useful life of the hooks and holes. Although in 1987 the evidence indicated at least some action was taken based upon the observed wear on the C hooks and hanger holes, when similar wear was found on hanger holes on the Jefferson-Hillsdale transmission line in 2011 the only action taken was the replacement of the hanger plates. According to the email string a PG&E Engineer correctly surmised that this wear was “probably caused by years of rubbing between the c-hook and the plate.” Based upon the reaction, or lack thereof, to the photographs of the wear it appears that the wear was neither a surprise nor was it considered a major issue by PG&E engineers.

In 2018 the discovery of keyhole wear on hanger plates on the par transmission line caused enough concern that the Transmission Line Supervisor sent the plates to the PG&E lab for analysis and evaluation. Unlike in 1987, in 2018 the lab actually did a metallurgical evaluation. A PG&E lab scientist, with a PhD in Material Science and Engineering, used the available data

to opine the keyhole wear was occurring at a rate of .007 inches per year. Based upon the average wear rate, the PG&E lab scientist determined the useful life of those hanger plates to be between 97 and 100 years. PG&E now had scientific confirmation of the body-on-body wear caused by the constant movement of the C hooks within the hanger holes and had an estimate of average wear per year. Nothing was done. The report was not distributed through the company and no targeted inspections of older C hooks and hanger holes were ordered. Based upon this report, a reasonable person, knowing they had C hooks which were 90+ years old hanging in hanger holes that were 90+ years old would have taken immediate action to determine the condition of those hooks and holes. The fact PG&E did nothing is evidence of complete and absolute indifference to the inherent danger of a C hook or hanger hole breaking.

Knowledge of the danger inherent in a C hook or hanger hole breaking is firmly established in PG&E documents. Since at least 2006, PG&E has recognized bad things, especially fire, happen when equipment failures occur on transmission lines. Everything in the overhead electric transmission system is designed to keep the conductor hanging in the air and away from persons or objects it could harm. Despite this knowledge PG&E put almost no effort into ensuring the components that keep the extremely dangerous overhead transmission lines hanging safely in the air were safe. Based upon the assertions of the PG&E personnel assigned to inspect and patrol the Caribou-Palermo line, it was not possible to assess the condition of the C hooks and hanger holes from either the ground or a helicopter flying 30 to 40 miles per hour a couple hundred feet above the line. Although claims it was impossible to assess the condition of the C hooks and hanger holes from a helicopter were completely discredited by BCDA investigators, the results of the post Camp Fire “enhanced” inspections and the Exponent Report clearly establish this was not solely a Caribou-Palermo line or Table Mountain Headquarters problem. This was a systemic PG&E problem.

During the post Camp Fire inspections, worn C hooks and worn hanger holes were found throughout the PG&E Overhead Transmission System. Despite the knowledge C hooks and hanger holes wear over time and despite the knowledge of the danger inherent in the failure of a C hook or hanger hole, the evidence clearly established nobody in PG&E was inspecting C hooks and hanger holes.

Despite the efforts of PG&E personnel to distance the company from the “Run to Failure” model, the evidence clearly establishes quite the opposite. PG&E had knowledge of the potential consequences of failure of the nearly 100-year-old C hooks, yet PG&E continued its policy of “Run to Failure.”

Because nobody was looking at and assessing the C hooks and hanger holes, there were very few, if any, notifications/tags generated for worn C hooks or hanger holes. As a result, the need for replacement of C hooks and hanger holes never came to the attention of Transmission Asset Management. The lack of verified records for many of the older, acquired transmission lines made the problem worse. In large population areas PG&E was staffed by experts, trained and qualified engineers and specialists having decades of experience. In less populated areas, Transmission Line Management was almost completely dependent upon less qualified Troublemakers, Linemen and Towermen and other personnel. For approximately ten years the

M&C engineer assigned to the rural northern area was not an actual engineer and had no engineering education, training or background.

Very little effort was made to audit the lack of findings of line personnel. Equipment failure related outages were repaired as they occurred and no effort was made to investigate the root cause of the failure. Transmission Asset Management essentially employed a strategy of either intentional or incompetent ignorance.

In essence, in 1930 PG&E blindly bought a used car. PG&E drove that car until it fell apart. The average reasonable person understands the basic proposition that older equipment needs more attention. A reasonable person doesn't buy a used car blindly and without at least a test drive. A reasonable person doesn't drive that used car for 200,000 miles without, at the very least, changing the oil and rotating the tires. A reasonable person has the common sense to know that service and maintenance become more important as the car ages and the miles accumulate.

This is, in essence what PG&E did. PG&E bought a used transmission line in 1930. PG&E knew next to nothing about the transmission line and made no attempt to learn about the line. PG&E ran the line for 88 years with minimal maintenance and repair. But for the Camp Fire, PG&E would have continued using the line with minimal maintenance and repair. Catastrophic failure of the Caribou-Palermo line was not an "if" question; it was a "when" question.

Although Quanta Technologies is well known and well respected in electrical utilities circles, the conclusions and recommendations of the 2010 Quanta Reports were essentially common sense findings. The basic findings of Quanta were that PG&E's infrastructure was aging and continued use required increased inspections and maintenance. According to the Senior Director of Transmission Asset Management, the Quanta Reports were discredited because of issues with tower failure data. The PG&E criticisms of the Quanta Reports may have been well founded, but the areas criticized have very little relevance to the ultimate conclusion that the transmission assets were old and needed more attention and care. PG&E obviously didn't take issue with the Quanta conclusions about the age of the transmission infrastructure. Transmission Asset Management continued to cite the Quanta age data and conclusions in subsequent internal and regulatory documents for the next seven years.

The evidence established that despite common sense and the Quanta Report, PG&E went the opposite direction. PG&E internal emails and documents established that by 2007 PG&E was aware of the aging electric transmission infrastructure problem. Former employees of the predecessor departments to the current Transmission Asset Management established PG&E was aware of its aging electric transmission infrastructure problem by the early 1990s.

Despite its knowledge that many of its assets were built prior to World War 2 and despite its lack of knowledge of the components of acquired electric transmission lines, PG&E had consistently reduced the frequency and thoroughness of inspections and patrols on those lines. In other, more populated areas, PG&E routinely used the fact that transmission lines were built after World War 2 to justify repair and replacement.

The 2014 RIBA process demonstrated how PG&E manipulated data to achieve desired results. It is beyond reasonable comprehension that a project to replace temporary poles not expected to stand through the winter scored lower for safety than an unnecessary project proposed solely to allow PG&E to transfer money spent from the expense budget to the capital budget. The fact that PG&E minimized and, ultimately, ignored a serious safety issue is reckless and negligent. The fact that they did so in the middle of a historic drought in an area known for consistent, extreme winds, is criminally negligent.

Despite its knowledge that its transmission assets were nearing the end of useful life and deteriorating PG&E decreased the expertise of the persons doing the inspections. This pattern continued after and in spite of the Quanta Reports. This is the exact opposite of how a reasonable person would have been expected to respond. The evidence clearly demonstrated PG&E understood the relationships between age of components and wear, wear and equipment failure and equipment failure and fire, but unlike a reasonable person, devoted less time and qualified personnel to inspecting the oldest assets.

This trend continued even in the face of the devastating effects of climate change. According to data from the US Geological Survey three of the four worst droughts in the recorded history of California have occurred since 2001. PG&E risk analysis reports, both internal and regulatory have consistently identified wildfire as the number one enterprise risk since 2006. The evidence clearly established PG&E was aware of the drought and the danger of catastrophic fire by 2013. Internal PG&E documents established that in 2013 PG&E identified the Feather River Canyon as a high fire danger area. Despite its knowledge of the increasing risk, the evidence established PG&E not only did nothing to mitigate the fire risk in the Feather River Canyon, it ignored known fire dangers for years.

Prior to 2006 PG&E had identified parallel groove connectors as a fire danger. In PG&E's 2006 "Risk Analysis of Urban Wild land Fires", the replacement of the parallel groove connectors is listed as a proposed mitigation. Unfortunately the proposal was only applied to Urban-Wildland Interface areas, which PG&E limited to the Bay Area. In the Feather River Canyon hundreds of known fire threats were left in transmission towers until 2016. Although the parallel groove connectors were ultimately replaced before causing a known fire, the fact those connectors remained in use for ten years, through two historic droughts, shows the complete disregard and indifference to the potential consequences by PG&E.

PG&E electrical transmission policies and records prior to the Camp Fire mirrored PG&E gas transmission policies prior to the San Bruno catastrophe. The investigation of the San Bruno catastrophe established that prior to the explosion, PG&E gas transmission had made very little effort to investigate and catalogue the components of the acquired gas transmission assets. Instead PG&E relied on assumed values. The San Bruno investigation also established PG&E intentionally was using the least expensive method of inspection in the least expensive manner. The chosen inspection method also saved money because problems that are not found do not need to be repaired. The investigation also established records relating to inspections, both justifying methods of inspection and the inspection reports, were fraudulent.

Somehow, the lessons of San Bruno were not learned on the electric transmission side. The evidence established that despite the lessons of San Bruno on the electrical transmission side, since 2010 PG&E has continued to rely on assumed values, the least expensive method of inspection and done nothing to ensure the veracity of inspection reports. The tragedy of San Bruno somehow had no effect on the electric transmission division. The five felonies for which PG&E was convicted changed nothing on the electric transmission side.

The philosopher George Santayana is credited with saying “Those who cannot remember the past are condemned to repeat it.” By ignoring the lessons of San Bruno PG&E condemned itself to another catastrophe. Based upon its own history PG&E knew it was creating a high risk of causing a catastrophic fire but, unlike a reasonable person, chose to ignore that risk.

Because of PG&E’s reckless and negligent decisions to unreasonably ignore risk, 18,804 structures, including almost 14,000 residential structures were destroyed – and 84 Butte County citizens needlessly lost their lives.

XXIII. SENTENCING

The court’s sentencing options are limited. As a corporation PG&E cannot be incarcerated and PG&E has indicated that it will decline probation. The only punishment available to the court is to fine PG&E. The maximum fine for a violation of Penal Code section 192(b) is \$10,000. The maximum fine for a violation of Penal Code section 452 is \$50,000. Based upon the foregoing the People urge the court to impose the maximum possible fines.

A. RESTITUTION

The People request that the court reserve jurisdiction over restitution and set a hearing in six months to review restitution in light of PG&E’s bankruptcy proceedings. In the wake of the Camp Fire many civil suits were filed against PG&E by the victims of the Camp Fire. Subsequently PG&E filed for bankruptcy in the Federal Bankruptcy Court in San Francisco. All Camp Fire civil suits and claims have been transferred to the Federal Bankruptcy Court. As of December 31, 2019, it is estimated that over 90% of the eligible Camp Fire victims have filed claims in the Federal Bankruptcy Court. PG&E has entered into a settlement agreement with all claimants in the Federal Bankruptcy Court.

Based upon consultation with bankruptcy experts in the California Attorney General’s Office, the People believe any restitution order issued by this court would be discharged in the bankruptcy proceedings. PG&E filed for bankruptcy under Chapter 11. A Chapter 11 reorganization produces a plan detailing how much various debts will be reduced. (11 U.S.C. § 1123(a)(3).) The plan applies to all debts that “arose before the date” of the confirmation of the plan by the bankruptcy court. (11 U.S.C. § 1141(d)(1)(A).) A debt arises at the time of the “conduct giving rise to the debt.” (4 Collier Bankruptcy Practice Guide (2018) § 76.03A.)

The Supreme Court has ruled that criminal restitution qualifies as a debt for bankruptcy purposes. (See *Pennsylvania Dept. of Public Welfare v. Davenport* (1990) 495 U.S. 552, 564.) Thus, restitution may be reduced or discharged in a Chapter 11 plan unless an exception applies. An exception exists for criminal fines and restitution. (11 U.S.C. § 523(a)(7); *Kelly v. Robinson* (1986) 479 U.S. 36, 53.) But the exception applies only to “individual” debtors. (11

U.S.C. § 1141(d)(2).) And exceptions for individual debtors do not apply to corporate debtors. (See *Garrie v. James L. Gray, Inc.* (5th Cir. 1990) 912 F.2d 808; *In re Spring Valley Farms* (11th Cir. 1989) 863 F.2d 832, 834; *Yamaha Motor Corp. v. Shadco* (8th Cir. 1975) 762 F.2d 668, 670.) As one bankruptcy court put it, “It is almost undebateable and universally held that a corporate Chapter 11 debtor is not subject to the” exceptions that apply to individual Chapter 11 debtors. (*In re Push & Pull Enterprises, Inc.* (N.D.Ind. 1988) 84 B.R. 546, 548 (N.D.Ind. 1988).)

Of the exceptions that apply to corporations, none includes criminal restitution. The closest exception deals with debts owed on money or property obtained by fraud. (11 U.S.C. § 1141(d)(6).) In short, criminal restitution owed by a corporation for a crime committed before the bankruptcy petition is filed is a debt that may be reduced or discharged as part of a Chapter 11 reorganization. The one court to have considered this issue reached the same conclusion. (See *In re Wisconsin Barge Lines, Inc.* (E.D. Mo. 1988) 91 B.R. 65, 67-68.)

Thus, any restitution owed by PG&E to persons harmed by the Camp Fire will be subject to reduction or discharge in a Chapter 11 reorganization. Any restitution order by this court is limited in fact, if not in law, to the final order of the Federal Bankruptcy Court and this court should await the outcome of the pending Bankruptcy proceedings.

B. Factors In Aggravation

California Rule of Court 4.421 defines factors the court may consider in making a sentencing determination. Under Rule 4.421 the court may consider the following relevant factors:

(a) Factors relating to the crime

- (1)** The crime involved great violence, great bodily harm, threat of great bodily harm, or other acts disclosing a high degree of cruelty, viciousness, or callousness;

PG&E is pleading to 84 felony counts of Involuntary Manslaughter in violation of Penal Code section 192(b) and one count of Unlawfully Causing a Fire in violation of Penal Code section 452. PG&E is also admitting Special Allegations involving Great Bodily Injury to a firefighter and two civilian victims.

The facts establish a callous disregard for the safety and property of the citizens of Butte County.

- (3)** The victim was particularly vulnerable;

There are almost 50,000 victims of the Camp Fire. All of those people relied upon PG&E to provide safe electric power. Despite years of extreme drought, consistently high down canyon winds and the knowledge equipment failure on high voltage transmission lines can

cause fires, PG&E ignored warning signs and did the absolute minimum to mitigate the fire danger.

The most vulnerable population were the mobility challenged and the elderly. People like Rafaela Andrade, Andrew Downer, Rose Farrell, Helen Pace, Ethel Riggs and Kimber Wehr had no ability to escape the fire. Those and other lives depended upon PG&E doing its statutory and moral duty.

(4) The defendant induced others to participate in the commission of the crime or occupied a position of leadership or dominance of other participants in its commission;

PG&E, although an inchoate entity, nonetheless operates only through the actions of its employees. Through a corporate culture of elevating profits over safety by taking shortcuts in the safe delivery of an extremely dangerous product – high-voltage electricity – PG&E certainly lead otherwise good people down an ultimately destructive path.

(9) The crime involved an attempted or actual taking or damage of great monetary value;

By saving money on needed maintenance, repairs, replacements was able to generate profits in the billions of dollars.

(11) The defendant took advantage of a position of trust or confidence to commit the offense.

PG&E was entrusted by the People of the State of California to provide safe and reliable electricity. PG&E took advantage of that position of trust and was able to generate billions of dollars in profit.

(b) Factors relating to the defendant

(2) The defendant's prior convictions as an adult or sustained petitions in juvenile delinquency proceedings are numerous or of increasing seriousness;

In 2016 PG&E was convicted of multiple federal felonies as a result of the 2010 explosion of a PG&E gas transmission pipe in the City of San Bruno. The San Bruno explosion killed eight people, destroyed 35 residential structures and damaged many additional residential and commercial structures. The felonies for which PG&E was convicted related to inspection policies, procedures and record keeping. Eight years later, as a result of similar reckless and criminal inspection policies, procedures and record keeping PG&E stands convicted of 84 counts of manslaughter.

(4) The defendant was on probation, mandatory supervision, post release community supervision, or parole when the crime was committed;

PG&E was on federal probation on November 8, 2018. On January 26, 2017, PG&E was granted five years' probation in United States District Court, Northern District of California case number 0971 3:14CR00175-001 TEH.

(5) The defendant's prior performance on probation, mandatory supervision, post release community supervision, or parole was unsatisfactory.

Special condition of probation number 1 states “While on probation, PG&E shall not commit another Federal, State, or local crime.” While on probation, as a result of policies similar to those for which PG&E was convicted, PG&E has continued to cause disasters, including the 2015 Butte Fire, the 2017 Wine Counties Fire, the 2017 Honey Fire, the Camp Fire and, most recently, the Kincaide Fire in 2019.

C. Factors in Mitigation

a) Factors relating to the crime Factors relating to the crime include that:

(1) The defendant was a passive participant or played a minor role in the crime;

Not applicable

(2) The victim was an initiator of, willing participant in, or aggressor or provoker of the incident;

Not applicable

(3) The crime was committed because of an unusual circumstance, such as great provocation, that is unlikely to recur;

Not applicable

(4) The defendant participated in the crime under circumstances of coercion or duress, or the criminal conduct was partially excusable for some other reason not amounting to a defense;

Not applicable

(5) The defendant, with no apparent predisposition to do so, was induced by others to participate in the crime;

Not applicable

(6) The defendant exercised caution to avoid harm to persons or damage to property, or the amounts of money or property taken were deliberately small, or no harm was done or threatened against the victim;

Not applicable

(7) The defendant believed that he or she had a claim or right to the property taken, or for other reasons mistakenly believed that the conduct was legal;

Not applicable

(8) The defendant was motivated by a desire to provide necessities for his or her family or self; and

Not applicable

(9) The defendant suffered from repeated or continuous physical, sexual, or psychological abuse inflicted by the victim of the crime, and the victim of the crime, who inflicted the abuse, was the defendant's spouse, intimate cohabitant, or parent of the defendant's child; and the abuse does not amount to a defense.

Not applicable

(b) Factors relating to the defendant Factors relating to the defendant include that:

(1) The defendant has no prior record, or has an insignificant record of criminal conduct, considering the recency and frequency of prior crimes;

Not applicable

(2) The defendant was suffering from a mental or physical condition that significantly reduced culpability for the crime;

Not applicable

(3) The defendant voluntarily acknowledged wrongdoing before arrest or at an early stage of the criminal process;

PG&E plead guilty as charged to the Indictment at arraignment.

(4) The defendant is ineligible for probation and but for that ineligibility would have been granted probation;

Not applicable

(5) The defendant made restitution to the victim; and

PG&E has agreed to restitution to victims of the Camp Fire as part of a civil settlement in the Federal Bankruptcy Court.

(6) The defendant's prior performance on probation, mandatory supervision, postrelease community supervision, or parole was satisfactory.

Not applicable

(c) Any other factors statutorily declared to be circumstances in mitigation or which reasonably relate to the defendant or the circumstances under which the crime was committed.

Not Applicable

D. Conclusion

The factors in aggravation greatly outweigh the factors in mitigation. For this reason the court should impose the greatest sentence allowed under the law – the maximum fines of \$10,000 for each of the 84 counts of manslaughter and the maximum fine of \$50,000 for the count of Unlawfully Causing a fire.

INTRODUCTION

PG&E accepts responsibility for the 2018 Camp Fire that killed 85 people and destroyed homes, communities and wildlife. PG&E pleaded guilty to the charges brought by the Butte County District Attorney and agreed that the grand jury investigation established a factual basis for those charges. PG&E should have found and replaced the worn C-hook that broke and caused the catastrophic fire.

Following the Camp Fire, PG&E began accelerated and enhanced safety inspections in high fire-threat areas. As PG&E acknowledged a year ago, the number of safety issues found as a result of those inspections was unacceptable. In addition to overhauling its inspection process, the Company is hardening its energy system to make it more resilient and is incorporating advanced technology to predict and detect extreme weather conditions. The increased wildfire risk in California demands, and PG&E is working to deliver, industry-leading wildfire prevention programs.

The Court has instructed PG&E to respond to the Butte County District Attorney's detailed Statement of Factual Basis ("SOFB"), accepting what is true, and indicating disagreement with those statements it believes to be contrary to the evidence. None of the assertions below is in any way intended to diminish PG&E's acceptance of, and accountability for, the Camp Fire and the devastation it caused.

I. INITIAL TIMELINE

PG&E admits all of the statements in this Section of the Statement of Factual Basis, except lacks sufficient information to admit or deny that a second fire (the "Camp B Fire") ignited as a result of vegetation contact with PG&E's facilities.¹ PG&E lacks access to the relevant physical evidence, as well as the relevant reports from the California Department of Forestry and Fire Protection ("CAL FIRE") and its experts.

¹ Where PG&E states that it does not have sufficient information to admit or deny an allegation, it should have the effect of a denial of the allegation. *See* Fed. R. Civ. P. 8(b)(5) ("A party that lacks knowledge or information sufficient to form a belief about the truth of an allegation must so state, and the statement has the effect of a denial.").

II. ORIGIN AND CAUSE INVESTIGATIONS

PG&E admits all of the statements in this Section, except lacks sufficient information to admit or deny statements regarding the Camp B Fire other than to admit that PG&E's Big Bend 1101 12 kV Distribution Circuit experienced an outage at 6:45 a.m. on November 8, 2018. PG&E does not have access to the analyses, reports, data and physical evidence on which these conclusions regarding the Camp B Fire are based, including relevant reports from CAL FIRE and its experts and the Ponderosa pine tree examined by CAL FIRE's retained arborist.

III. INJURIES AND LOST LIVES

PG&E admits all of the statements in this Section.

IV. BACKGROUND OF THE FAILED COMPONENT

A. History of the Caribou-Palermo 115 kV Transmission Line

PG&E admits that, at the time of the Camp Fire, structures on the section of the Caribou-Palermo Line from the Caribou Powerhouse to the Big Bend Switching Station (the "Caribou-Big Bend section") had components of original vintage. PG&E records indicate that insulators were replaced on transmission towers on the Caribou-Palermo Line in the decade preceding the Camp Fire, including on the Caribou-Big Bend section. As to statements to the effect that PG&E did not "catalogue" components before the Camp Fire, PG&E clarifies that it identified splices on the Caribou-Palermo Line conductor and recorded changes in conductor size and type in various locations.

PG&E does not have sufficient information to admit or deny that "the transposition components on Tower [:]27/222, including the transposition arms, C hooks, insulator strings and jumper conductor, were original components in service since 1921", or that the "insulator string hanging from the C hook that broke on November 8, 2018 was an original 1921 insulator", as the available records and evidence are not conclusive as to their date of installation. (SOFB at 17.)

PG&E denies that it “had little or no information” regarding the “conductor and the hooks, original hanger holes and bolted-on hanger hole plates supporting that conductor”. (*Id.*) PG&E produced engineering drawings and manufacturer catalogs that include information on the characteristics of these components.

B. C Hook and Hanger Hole Wear

PG&E admits that transposition runner arms, hanger plates, insulators and C-hooks were removed from Towers :27/222, :20/160, :24/199, :32/260 and :35/281 on the Caribou-Palermo Line and collected as evidence by investigators with CAL FIRE and the Butte County District Attorney’s Office. PG&E admits that C-hooks and hanger plates removed from Towers :27/222, :20/160, :24/199 and :35/281 were worn. PG&E admits that it does not have records of work done on the jumper conductor on Tower :24/199 to “shorten[it] and splice[it] together using a parallel groove connector”, (SOFB at 19), and PG&E therefore lacks sufficient information to admit or deny that any such work was done.

PG&E cannot admit or deny the remainder of this Section of the Statement of Factual Basis. It consists of observations, conclusions, analyses, inferences, testing results and opinions attributed to an FBI metallurgist, investigators with CAL FIRE and the Butte County District Attorney’s Office, and a meteorologist and engineer retained by the Butte County District Attorney, none of which are matters within PG&E’s knowledge. PG&E does not have access to the physical evidence or the analyses, tests, models and data on which the conclusions in this Section are based, including the FBI’s metallurgical tests on components removed from Towers :27/222 and :24/199, Light Detection and Ranging scans of Towers :27/222 and :24/199 taken by CAL FIRE, the referenced “computer model of Tower [:]27/222” and “wind load model of the Feather River canyon”, (*id.* at 20), and components from Towers :27/222, :20/160, :24/199, :32/260 and :35/281 that were seized by CAL FIRE and the Butte County District Attorney’s Office.

PG&E denies that “[t]he hooks were intended to fit snugly into the holes”. (*Id.* at 18 n.25.) As the Statement of Factual Basis notes, there was “space between [t]he top of the C hook and the top of the hole”. (*Id.* at 18.)

V. INSPECTION AND PATROL POLICIES

PG&E unreservedly accepts responsibility for the Camp Fire, but denies certain allegations in the Statement of Factual Basis concerning its past inspection and patrol policies. As to certain other allegations, PG&E does not have sufficient information to admit or deny them. Those statements are identified and addressed below.

PG&E denies that it “did not, in fact, follow the procedures and requirements established in the [Electric Transmission Preventive Maintenance (‘ETPM’) Manual]” and that “sections of the ETPM relating to inspections and patrols of overhead electric transmission lines were simply a façade created to meet the requirements of the regulators and the CAISO”. (SOFB at 25.) PG&E personnel formulated the procedures and requirements in the ETPM Manual in good faith to maintain PG&E’s transmission system. PG&E instructed its employees to follow the ETPM Manual.

PG&E does not have sufficient information to admit or deny that a PG&E troubleman who worked in the Feather River Canyon between 1987 and 1995 “established the Caribou-Palermo line was considered a ‘Class B Circuit’” and, as a result, was “required to be patrolled three times each year”. (*Id.*) PG&E has not identified any documents from that period that support the troubleman’s assessment of the Caribou-Palermo Line as a Class B Circuit or otherwise permit a determination that the line was so classified.

Similarly, PG&E does not have sufficient information to admit or deny the accuracy of the following statement:

“Former PG&E Transmission Line Supervisors from 1987 noted the checklist inclusion of ‘worn hardware’ was a result of a 1987 PG&E Laboratory Test Report documenting a worn C hook and hanger hole from a Bay Area transmission tower. Photos of the worn C hooks and holes were distributed to troublemen in all of the PG&E regions for training purposes, and inspection of C hooks and hanger holes was made a specific priority during inspections/patrol.”

(*Id.* (footnotes omitted).) The referenced testimony cites events that occurred more than 30 years ago, including photographs that may have been distributed to troublemen and specific priorities during inspections and patrols. It does not appear that any documents corroborating this testimony were presented to the grand jury, and PG&E cannot independently verify the accuracy of the statement given the passage of time.

VI. REDUCTION OF UNIT COSTS FOR INSPECTIONS AND PATROLS

PG&E acknowledges that it established a committee in 2013 to explore opportunities to make transmission inspections more cost-efficient. As the Statement of Factual Basis itself makes clear, PG&E ultimately did not reduce the frequency of its transmission inspections and patrols as a result of that evaluation. (SOFB at 26.)

PG&E admits that it used “unit cost measurement” to calculate the costs of inspections and patrols. Unit cost measurement is a tool commonly used in many industries to measure production costs. PG&E determined unit costs for inspections and patrols based on the time spent by troublemen inspecting or patrolling each structure. Unit costs were determined for each maintenance headquarters based on the hours typically charged by that headquarters for inspections and patrols in past cycles, without regard to factors specific to each transmission line. PG&E denies that a reduction of unit costs for inspections and patrols was intended to be “accomplished by reducing the thoroughness of the inspections and patrols” or that the reduction of unit cost targets resulted in “less thorough and less complete inspections and patrols” of the Caribou-Palermo Line. (*Id.* at 27.)

Before the Camp Fire, PG&E’s Business Finance Department sent transmission line maintenance supervisors and superintendents color-coded monthly budget reports that tracked unit costs for inspections and patrols in their regions. The Business Finance Department did not, however, send such reports to the troublemen who conducted inspections. Unit costs were one of many factors that influenced incentive compensation for transmission line

supervisors and superintendents, together with achievement of the Company's safety, reliability, affordability and customer satisfaction goals.²

VII. TROUBLEMEN AND TRAINING

Before the Camp Fire, C-hook wear was not a commonly reported failure mode and failures of C-hooks in the field were relatively rare. Since the Camp Fire, PG&E has conducted a risk-based analysis of component types and introduced, along with drone technology and digital inspection forms, new training programs that guide inspectors and post-inspection review teams on how to identify and assess wear, including on C-hooks and hanger plates.

For certain findings in this Section of the Statement of Factual Basis, PG&E either denies the findings, states that it has insufficient information to admit or deny the findings, or offers additional context. These findings are identified and addressed below.

PG&E denies that it "eliminat[ed]" or "dropped" training requirements for troublemen. (SOFB at 28-29.) The Statement of Factual Basis notes that "the evidence does show that PG&E had created a Troubleman training program." (*Id.* at 28.) The Statement of Factual Basis cites the paraphrased testimony of a former employee in support of the statements that "a decision was made in 2005 to eliminate direct training of Troublemen" and that "Transmission Line Supervisors were provided training and expected to train the Troublemen under their supervision". (*Id.* at 29.) PG&E is not aware of any such decision to eliminate direct training. As noted below, troublemen have continued to receive formal training on how to conduct inspections and patrols.

PG&E denies statements to the effect that troublemen did not "receiv[e] any formal training", that there was a "lack of specific training and records", and that training concerning inspections was "limited to filling out reporting forms and notifications" and "informal mentoring". (*Id.* at 29-30.) Before the Camp Fire, PG&E administered training to troublemen through a combination of on-the-job learning and formal educational modules that

² PG&E no longer sends these color-coded monthly budget reports to supervisors and superintendents and no longer considers adherence to unit cost targets in determining incentive compensation for these personnel.

1 included exemplar photographs of conditions to be identified and reported. The notion that
2 troublemen in general, and the troublemen who inspected the Caribou-Palermo Line in
3 particular, received no “formal training on how to perform an inspection or patrol” is
4 contradicted by PG&E training records and testimony elicited during the grand jury proceedings.
5 For example, one troubleman testified that he received additional training on how to inspect
6 transmission lines when he was promoted to the position of transmission troubleman and that
7 ongoing training was regularly provided. Another troubleman who patrolled the
8 Caribou-Palermo Line testified that he had received training in the ETPM Manual, including
9 guidance on conditions to be identified and their prioritization. That same troubleman testified
10 that the training materials included photographs of specific conditions to look for during
11 transmission inspections and patrols. Moreover, PG&E records indicate that troublemen who
12 inspected or patrolled the Caribou-Palermo Line completed formal training on inspections.

13 PG&E disagrees with the unsupported statement that troublemen’s lack of
14 knowledge of size differences in working eyes “contributed greatly” to the failure to identify and
15 replace the C-hook on Tower :27/222. (*Id.* at 30.)

16 PG&E also denies the following statements:

17 “The evidence established that, despite the lofty goals of the
18 originators of the troubleman position, and the designation of QCR
19 by PG&E, by 2007 the inspections and patrols of the
20 Caribou-Palermo line were being conducted by inexperienced,
21 untrained and unqualified troublemen. Both of the Detailed
22 Ground Inspections (2009 and 2014) and seven of the ten Annual
23 Air Patrols on the Caribou Palermo were completed by
24 troubleman [sic] who had little or no prior transmission experience,
25 and no formal training on performing inspections and patrols. This
26 is contrary to the third Revision of the ETPM which requires that
27 the ‘QCRs must be thoroughly familiar with all of the facilities,
28 equipment, safety rules and procedures associated with the
facilities and equipment.’ The majority of the
troubleman [sic] sent to inspect and patrol the Caribou-Palermo
line had no idea what the C hooks and hanger holes were supposed
to look like. Because of their lack of knowledge, experience, and
training, the troubleman [sic] could not have been expected to
identify the wear. The overwhelming evidence clearly established
that troublemen and linemen inspecting and patrolling the

Caribou-Palermo line did not meet the standards established in the ETPM.”

(*Id.* at 30-31.) As noted above, PG&E records confirm that the troublemen who patrolled and inspected the Caribou-Palermo Line had received formal training in inspections. Further, the troublemen with experience working on distribution lines had skills and knowledge that were transferable to their work on transmission lines. A number of other troublemen who inspected and patrolled the Caribou-Palermo Line had relevant experience working on transmission lines. Several previously served on linemen crews that performed routine maintenance on transmission lines, including replacements of insulators and C-hooks.

VIII. FAILURES IN MAINTENANCE, REPAIR AND REPLACEMENT RECORD KEEPING ON THE CARIBOU-PALERMO LINE

A. Hanger Brackets

PG&E admits that hanger brackets were added to the transposition runner arms of Towers :27/222 and :24/199 and that it is reasonable to infer they were added to address wear observed on the original hanger plates. PG&E acknowledges that whoever did this work likely would have been aware of material loss on the original hanger plates. PG&E admits that it was unable to locate any records of when, why and by whom the hanger brackets were installed.

B. Parallel Groove Connectors

PG&E does not have sufficient information to admit or deny the following statements concerning parallel groove connectors and other equipment removed from Tower :24/199, a tower miles away from the Camp Fire ignition point:

“As previously mentioned, during the inspection of Tower [:]24/199 investigators noticed a parallel groove connector on the jumper conductor. It appeared to investigators that, at some previous time the jumper conductor had been shortened and spliced together using the parallel groove connector. Investigators also observed that the right phase insulator string appeared to be less aged than the left phase insulator and, as a result of the shorter jumper conductor, was not hanging plumb. From the ground, investigators also observed black marks on the tower leg nearest the right phase insulator string. On the ground below Tower [:]24/199, investigators found an old insulator string. The old insulator string was complete except for the C hook.

1 “Based upon the observations of investigators, the only reasonable
2 conclusion that could be drawn is that at some time in the past the
3 jumper conductor made contact with the tower leg, causing the
4 blackening observed on the tower leg. This damaged the jumper
5 conductor, necessitating the removal of a portion and replacement
6 of the insulator. It was also clear, based upon the change in the
7 wear pattern on the C hook observed by the FBI metallurgist, the
8 C hook was not replaced when the jumper conductor was
9 shortened and the insulator changed.”

10 (SOFB at 32.) These are opinions that a series of events occurred at Tower :24/199 “at some
11 time in the past”, as well as an FBI metallurgist’s observations of a “change in the wear pattern”
12 on a C-hook on that tower. Investigators for the Butte County District Attorney took custody of
13 the equipment on Tower :24/199 described above. PG&E does not have access to the equipment
14 or the analyses on which the investigators based their conclusions. Moreover, the observations
15 and inferences of the District Attorney’s investigators are not matters within PG&E’s knowledge
16 and cannot be admitted or denied.

17 The Statement of Factual Basis recounts that “as part of a scheduled Detailed
18 Ground Inspection in 2009, the troubleman assigned to complete the inspection of the
19 Caribou-Palermo line was instructed to document all towers with parallel groove connectors and
20 create work orders for replacement of the parallel groove connectors.” (*Id.*) PG&E clarifies that
21 the troubleman was tasked with documenting the existing three-bolt connectors on the
22 Caribou-Palermo Line in advance of their replacement with a different type of connector.
23 Three-bolt connectors and parallel groove connectors are different types of connectors. Neither
24 type of connector is the same type of hardware that failed and caused the Camp Fire.

25 According to the Statement of Factual Basis, “[t]he question of how a troubleman
26 flying in a helicopter could assess the wear inside the bolted connectors was never answered.”
27 (*Id.* at 33.) PG&E denies the implication that the purpose of the 2011 Annual Air Patrol was to
28 identify “wear inside the bolted connectors” as opposed to the conditions of the connectors and
other equipment more generally, including any outward signs of degradation. PG&E performed
five separate infrared inspections of the Caribou-Palermo Line after the connectors were

1 identified for replacement in 2009. As the Statement of Factual Basis notes, such inspections
2 can identify “excessive heat” caused by “[i]nterior wear” in a connector. (*Id.* at 33 n.69.)

3 PG&E denies statements to the effect that Priority Code F “did not come into
4 existence until January 2011”. (*Id.* at 34.) Although Priority Code F did not appear in the
5 ETPM Manual until the January 2011 revision of that document, the priority code itself was
6 active in PG&E’s systems prior to that time and available for use as of October 2009. PG&E
7 further denies the conclusion that “[t]his raised serious questions as to the accuracy of the few
8 maintenance/repair/replace records PG&E was able to locate.” (*Id.*) There is no identified
9 inaccuracy in the records cited.

10 As to the time taken to replace the connectors, PG&E denies the inference that
11 any “explanation for the extended amount of time” was required by the ETPM Manual. (*Id.*
12 at 34.) As stated in the “Reassessments” section of the 2011 ETPM Manual, certain types of
13 Priority Code F “conditions do not require reassessment in the field because they do not change
14 over time, do not pose an immediate impact to circuit reliability, or are used primarily to
15 document field conditions for programmatic use by the asset strategy group.”

16 PG&E admits that one of the connectors on Tower :24/199 “was not replaced
17 when all of the other parallel groove connectors in the tower were replaced in 2016”. (*Id.* at 32.)
18 Photographs of Tower :24/199 taken after the Camp Fire show that other three-bolt connectors
19 on the tower were replaced with parallel groove connectors, consistent with a June 18, 2016
20 Corrective Work Form documenting the replacement.

21 PG&E does not have sufficient information to admit or deny the accuracy of the
22 following observations made by the Butte County District Attorney’s investigators:

23 “While inspecting the Caribou-Palermo line in February and
24 March 2019 investigators noted another tower in which the
25 insulator strings had recently (post Camp Fire) been changed but
26 the C hooks were re-used.”
27
28

(*Id.* at 32 n.65.) Absent further investigation, and without additional information such as the tower number, PG&E cannot determine when the insulator string on this unspecified tower was replaced or whether the C-hook was reused as alleged.

C. The “Deteriorated Transmission Equipment Replacement Program”

PG&E denies that it misrepresented the purpose of any programs for transmission lines. Based on the cited testimony of one of the employees familiar with the program, there were unclaimed funds in the Deteriorated Transmission Equipment Replacement Program that were available for use to replace capital assets more generally. The employee further testified that it was not unusual for PG&E to make unused funds available for other capital projects within the Company’s five-year plan for transmission assets.

D. The Caribou-Palermo 7/55-8/64 Replacement Towers Project

Caribou-Palermo Towers :7/55 to :8/64 were at one time slated for relocation due to access issues. PG&E ultimately determined that relocation of these specific structures was unnecessary because they could be made accessible through roadwork. The towers within the scope of this project were miles away from the tower at which the Camp Fire originated.

PG&E denies any implication that the structures slated for relocation were at imminent risk of failure. As the Statement of Factual Basis notes, the authors of the quoted emails disavowed that interpretation of their communications. (SOFB at 36.) PG&E further denies the implication that it failed to address the condition of the towers that remained in place. After the decision was made not to relocate the towers, PG&E replaced insulators and conductor hardware on the tower spans.

PG&E denies that the Maintenance and Construction Engineer who worked on the relocation project had “no engineering . . . experience”. (*Id.* at 35 n.71.) While he did not have formal engineering qualifications, he had years of experience working on a variety of electric transmission projects.

1 **E. The Rock Fire**

2 PG&E denies that it had a “practice” of “not conduct[ing] climbing or aerial
3 inspections on other Caribou-Palermo line towers with similar connectors”. (SOFB at 37.) The
4 Caribou-Palermo Line was subject to yearly aerial patrols and regular infrared patrols by air that
5 are capable of detecting connector abnormalities. At least five infrared patrols were conducted
6 after the Rock Fire in September 2008, including one that occurred less than three weeks after
7 the Rock Fire. PG&E disagrees with the statement that no records of a root cause investigation
8 were found. PG&E produced to the grand jury an October 6, 2008 Electric Event Report
9 concerning the Rock Fire.

10 **F. Tower Collapse**

11 PG&E admits that five towers on the Caribou-Palermo Line collapsed during a
12 storm in December 2012, and that a sixth tower sustained damage that necessitated its
13 replacement. PG&E denies that “[t]he evidence established none of the other Caribou-Palermo
14 line tower foundations were inspected”. (SOFB at 37.) In the time between the collapse of the
15 towers in December 2012 and their permanent replacement in 2016, structures on the
16 Caribou-Palermo Line were subject to a detailed inspection, three routine aerial patrols, five
17 non-routine ground patrols, eight non-routine aerial patrols, and two emergency ground patrols.
18 The ETPM Manual instructs personnel performing such inspections and patrols to inspect tower
19 foundations for abnormalities, and notifications were generated after the 2012 tower collapse for
20 foundation conditions on the Caribou-Palermo Line. Based on this evidence, PG&E denies the
21 allegation that PG&E had a “practice of not following up on clearly established potential safety
22 and/or maintenance issues”. (*Id.* at 38.)

23 **G. Center Phase Conductor on Tower :24/200**

24 PG&E denies the statements in this Section concerning Tower :24/200, a tower
25 miles away from the Camp Fire origin point. As indicated on the work order produced to the
26 Butte County District Attorney, the damaged conductor on Tower :24/200 was identified on
27 January 10, 2017 and repaired on May 1, 2017, not in 2014, as stated in the Statement of Factual
28

1 Basis. (SOFB at 38.) Based on the referenced photograph, which shows pitting damage to the
 2 conductor, PG&E denies the implication that the “corona shield specifically” and “hot end
 3 attachment hardware generally” also warranted replacement. (*Id.*) PG&E further denies the
 4 implication in the Statement of Factual Basis that it should have conducted “a root cause analysis
 5 . . . to determine the cause of the damage to the conductor and corona shield”. (*Id.*) As indicated
 6 on the face of the records, the conductor was damaged during a storm.

7 **H. Broken J Hook**

8 PG&E admits that, in October 2016, a contractor aloft Tower 11/99 nearly lost his
 9 footing when a corroded J-hook broke. The J-hook that failed did not support an insulator or any
 10 energized equipment. Rather, it was used to connect flat bracing to the tower leg. PG&E denies
 11 that it had a “practice” of not inspecting equipment on similar towers after an equipment failure.
 12 (SOFB at 38.) PG&E records show that PG&E investigated the incident and sent an alert to
 13 employees advising them to exercise caution when working on or near towers fitted with J-hook
 14 hardware and to take “[s]pecial care to inspect the condition of the hardware prior to applying
 15 force”.

16 **IX. INSPECTION AND PATROL OF THE CARIBOU-PALERMO LINE**

17 PG&E denies that “[t]here is no record of any climbing inspections . . . conducted
 18 on the Caribou-Big Bend section of the [Caribou-Palermo 115 kV] transmission line.” (SOFB
 19 at 39.) PG&E records produced to the grand jury indicate that more than 30 of the 80
 20 Caribou-Palermo towers subject to climbing inspections before the Camp Fire were on the
 21 Caribou-Big Bend section of the line. Moreover, in March 2010, PG&E personnel conducted
 22 climbing inspections of the 10 towers identified for relocation, all of which are on the
 23 Caribou-Big Bend section.

24 The Statement of Factual Basis states that the 2014 detailed ground inspection
 25 was completed by “a troubleman and a lineman”. (*Id.*) PG&E clarifies that the inspection was
 26 performed by a transmission troubleman with years of experience and a temporary troubleman
 27 who qualified for the position by virtue of his experience as a journeyman transmission lineman.
 28

PG&E denies the following statement:

“The lineman assigned to assist with the 2014 Detailed Ground Inspection of the Caribou-Palermo line had previously completed some troubleman training but focused mainly on ‘Switching.’ The lineman did not recall receiving any training on performing inspections and patrols other than informal training by troublemen. No evidence was found to establish the four other linemen who performed inspections had previously completed any training on inspection and patrol.”

(*Id.* at 40.) As stated above, PG&E had programs in place for the formal training of transmission troublemen. PG&E training attendance records indicate that the temporary troubleman in question completed formal training on overhead transmission patrols and inspections in December 2013 (before the detailed ground inspection of the Caribou-Palermo Line in August 2014). The four linemen who assisted with the 2014 detailed inspection completed that same training between 2013 and 2016. PG&E understands that the participation of three of these four linemen in the 2014 ground inspection was limited to providing transportation and support at a helicopter landing zone.

PG&E denies the accuracy of the following statements:

“Written documents clearly establish the Table Mountain Transmission Line Supervisor knew the dates inspected on the Transmission [Line] Object List were wrong. Written documents also clearly established that he knew that for some of the towers the name of the inspector conducting the inspection was wrong. The evidence also establishes he knew the line clearance measurements did not occur on the dates listed on the Transmission [Line] Object List. Despite specific knowledge the report was not accurate; the transmission line supervisor approved and signed the report.”

(*Id.* at 41.) PG&E is not aware of any “written documents” that “clearly establish” the Transmission Line Supervisor had “specific knowledge” of inaccuracies in the Transmission Line Object List for the 2014 detailed inspection when he “approved and signed the report”. No such documents are cited, and the District Attorney did not elicit any testimony from the Transmission Line Supervisor in question that supports this statement.

1 PG&E admits that records for the 2012 annual aerial patrol did not identify a
2 second troubleman who assisted with that patrol when the originally assigned troubleman went
3 out on leave, but denies the suggestion that the records were “inaccurate” in other respects or had
4 other unspecified “issues”. (*Id.* at 41-42.)

5 PG&E does not have sufficient information to admit or deny that “[t]he evidence
6 established the thoroughness of the aerial patrols declined through the years”. (*Id.* at 42.) This
7 statement is based in part on “helicopter flight records for 2011 through 2018 for
8 Caribou-Palermo line aerial patrols [that] were obtained from a local helicopter company
9 contracted by PG&E to assist with aerial patrols.” (*Id.*) Those records have not been provided to
10 PG&E. This statement is also based in part on the memories of two former troublemen who
11 conducted aerial patrols 19 or more years ago. (*Id.*)

12 PG&E does not have sufficient information to admit or deny the following
13 statements:

14 “One former troubleman admitted he did not like flying the Feather
15 River Canyon transmission lines and, whenever possible, assigned
16 an available lineman to complete the routine air patrols.
17 According to the former troubleman, after the lineman completed
18 the air patrol the troubleman would use the lineman’s notes to
19 complete the patrol report and submit the report as if the former
20 troubleman had personally completed the patrol.”

21 (*Id.*) Based on review of the grand jury transcripts, PG&E cannot identify the paraphrased
22 testimony of the former troubleman in question. Absent further investigation and without details
23 sufficient to identify the records at issue, PG&E cannot admit or deny the accuracy of the former
24 troubleman’s account.

25 PG&E does not have sufficient information to admit or deny that a “recently
26 retired troubleman” who conducted aerial patrols “was only confirming the structures and
27 components were ‘standing upright’”. (*Id.* at 43.) Based on review of the grand jury transcripts,
28 PG&E cannot identify the paraphrased testimony.

1 PG&E denies that “even if the troublemen had looked at the C hooks and hanger
2 holes, without knowledge as to their respective sizes, the troublemen would not have been able
3 to assess wear”. (*Id.* at 44 n.89.) That statement lacks a basis in the evidence.

4 Contrary to the Statement of Factual Basis, the occurrence of a “trigger” as
5 defined in the ETPM Manual does not “require” a climbing inspection. Rather, “triggers are
6 specific conditions that require *follow-up inspections and/or maintenance* scheduled by the
7 supervisor, independent of the routine schedule”. (*Id.* at 44 (emphasis added).) Such “follow-up
8 inspections and/or maintenance” may include, but are not limited to, climbing inspections. Other
9 forms of “follow-up inspections and/or maintenance” include non-routine ground and aerial
10 patrols, infrared patrols, and repairs.

11 PG&E further denies that “storm related interruptions”, “equipment failures” and
12 other events on the Caribou-Palermo Line from 2008 to March 2018 were “sufficient to trigger
13 climbing inspections”. (*Id.* at 45.) As noted above, the occurrence of a “trigger” did not require
14 climbing inspections where other forms of “follow-up inspections and/or maintenance . . .
15 independent of the routine schedule” were sufficient to address the triggering event. Events
16 identified as triggers in the Statement of Factual Basis did prompt follow-up inspections or
17 maintenance outside the routine schedule, consistent with the ETPM Manual. After the collapse
18 of five towers on the Caribou-Palermo Line in December 2012, PG&E performed a non-routine
19 ground patrol of the affected area. Concerns relating to connector types led PG&E to replace
20 three-bolt connectors on the Caribou-Palermo Line with parallel groove connectors. PG&E
21 replaced the conductor on Tower :24/200 that was damaged during a storm in January 2017. In
22 response to the failure of a connector that was identified as a potential cause of the
23 September 2008 Rock Fire, PG&E investigated the cause of the failure and conducted an
24 infrared patrol of the Caribou-Palermo Line three weeks later.

25 PG&E denies the following statements:

26 “Although several PG&E transmission line employees referred to
27 the ETPM as ‘The Bible’ and asserted strict compliance with the
28 standards and policies of the ETPM, the totality of the evidence
shows that on the Caribou-Palermo line, the ETPM was not

1 followed. Because PG&E had inexperienced, untrained and
2 uninformed personnel conducting inspections and patrols under
3 unrealistic time constraints, the inspections and patrols did not spot
defects and wear.”

4 (*Id.* at 45-46.) PG&E agrees that past inspections failed to identify defects that were found in
5 enhanced inspections in 2019. However, the cited evidence does not show that failure resulted
6 from personnel not following the ETPM Manual. As noted above, the troublemen who inspected
7 and patrolled the Caribou-Palermo Line were not “inexperienced, untrained and uninformed”.

8 PG&E does not have sufficient information to admit or deny that “a PG&E Tower
9 Department supervisor” who was interviewed by the District Attorney “could not provide any
10 reason or rationale for the work order” calling for non-routine climbing inspections of the
11 Caribou-Palermo Line. (*Id.* at 46.) PG&E has not been provided with a transcript or record of
12 the interview and thus cannot admit or deny the reported account of the interview. PG&E denies
13 that “PG&E was unable to provide any further information” regarding the non-routine climbing
14 inspections and that it “has no explanation for how or why or by whom the decision to conduct
15 climbing inspections was made”. (*Id.*) As PG&E explained in a written response to the CPUC
16 that was produced to the District Attorney, the non-routine climbing inspections were “part of an
17 effort to assess the condition of its transmission lines and help inform its broader asset
18 management strategy”. In addition, PG&E produced emails identifying the individuals who
19 selected lines for climbing inspections as part of this effort.

20 PG&E denies the following statements:

21 “As to many decisions and policies, PG&E was unable to provide
22 any documentation as to who made the decision, how the decision
23 was made and upon what the decision was based. This inability to
24 determine who made decisions and upon what those decisions
25 were based, frustrated efforts to identify individuals potentially
personally liable for policies that lead [sic] to the conditions which
caused the Camp Fire.”

26 (*Id.* at 46-47.) PG&E cooperated fully with the grand jury investigation, including by making
27 witnesses available for voluntary interviews and providing extensive document discovery in
28

1 response to informal requests and grand jury subpoenas. Many of the produced emails and other
 2 documents described capital projects and maintenance work on the Caribou-Palermo Line,
 3 memorialized decisions regarding that work, and identified the relevant decision makers.

4 **X. COMPARISON OF CARIBOU-PALERMO WITH OTHER TRANSMISSION**
 5 **LINES**

6 The Exponent Report does not support the conclusion that “the Caribou-Palermo
 7 line was only marginally worse than other comparison transmission lines”. (SOFB at 47.) That
 8 conclusion does not appear in the Exponent Report. Exponent concluded that the
 9 “Caribou-Palermo line and other North Fork Feather River Canyon lines appear to have a unique
 10 set of factors that contributed to increased rates of high-priority cold-end hardware tags relative
 11 to other comparison lines”. (CPUC Incident Investigation Report, Nov. 8, 2019, Attachment N,
 12 Exponent Report on PG&E Caribou-Palermo Asset Condition Investigation, Nov. 1, 2019,
 13 at 76.) As enumerated in the report, that unique set of factors included “design (link connectors
 14 and a relatively large number of non-tensioned insulated conductors), long-duration exposure to
 15 higher winds, age, and historical inspection methodologies”. (*Id.*)

16 PG&E admits that its 2019 Wildfire Safety Inspection Program (“WSIP”)
 17 identified thousands of conditions in need of repair on PG&E’s system that had not been
 18 previously identified. (SOFB at 47.) As PG&E has acknowledged, the number of safety issues
 19 identified was unacceptable. However, PG&E denies as vague, overbroad and unsupported the
 20 statements that “PG&E’s problems were systemic as opposed to local”, (*id.*); that “the
 21 Caribou-Palermo line specifically and the Table Mountain District in general are not outliers”,
 22 (*id.* at 51); that “the lack of thorough inspections and patrols on the Caribou-Palermo line was a
 23 systemic problem not a local problem”, (*id.*); that “the local Table Mountain District troublemen
 24 and linemen were not doing less than the troublemen and linemen assigned to other districts
 25 involved in the study”, (*id.* at 49); and that “inspections and patrols on other lines are only
 26 marginally more thorough than those done on the Caribou-Palermo line”, (*id.* at 51).

PG&E further denies that past inspections were not conducted in accordance with the ETPM Manual. There are reasons other than past non-adherence to the ETPM Manual why conditions would be identified for the first time during the enhanced WSIP inspections. For example, the enhanced inspection methods may have provided a better vantage point for detecting the condition; the risk-based assessment of components and new inspection forms may have helped focus the inspectors' attention on the condition; or post-inspection review teams may have found conditions not identified in the field.

XI. BUDGETARY CONSIDERATIONS

A. Expense Budget

PG&E agrees that it "consistently increased its budget for maintenance, repair and replacement of transmission assets" from 2007 through 2018. (SOFB at 51.) PG&E disagrees with the generalized assertion in the Statement of Factual Basis that "PG&E was **not** using the money to replace the oldest and most deteriorated transmission assets". (*Id.* at 52 (emphasis in original).) PG&E denies the related suggestion in the Statement of Factual Basis that senior leaders in Transmission Asset Management gave incorrect testimony before the Federal Energy Regulatory Commission ("FERC") regarding PG&E's use of funds to replace aging and deteriorating assets. (*Id.*) PG&E's filings with FERC corroborate the quoted testimony and show that PG&E spent significant sums to replace aging and deteriorated transmission equipment. The Statement of Factual Basis alleges that PG&E did not fund replacement of the "most deteriorated" assets, but does not define what is meant by "most deteriorated" in this context. Moreover, the quoted testimony did not address the issue of prioritization among various types of deteriorated or aging assets.

PG&E notes that many of the allegations in this Section of the Statement of Factual Basis are based upon the misconception that while "the capital budget for the electric transmission division of PG&E was funded through customer rates which were determined by FERC 'rate cases'", "[t]he expense budget was funded by the company". (*Id.*) In fact, utility rates are set to permit recovery of both capital investments and expenses. PG&E is permitted to

1 seek, and has sought, rate recovery not only for its capital projects, but also for the costs of
 2 expense work on its transmission assets, including routine repairs and maintenance. PG&E
 3 typically seeks recovery of such costs under the broad FERC category of Operations &
 4 Maintenance (“O&M”).

5 For example, in its last three rate cases filed before the Camp Fire, Transmission
 6 Owner (“TO”) Tariff rate cases TO 18, TO 19 and TO 20, PG&E sought FERC authorization to
 7 recover the costs of routine transmission repairs and maintenance, as documented in written
 8 testimony submitted with each filing. (*See, e.g.*, TO 18, Ex. PGE-0006 (July 29, 2016) at 1
 9 (testimony “to demonstrate that PG&E’s expense forecasts for ET Operations and Maintenance
 10 (O&M) expense are reasonable and should be approved by the Federal Energy Regulatory
 11 Commission”); TO 19, Ex. PGE-0008 (July 26, 2017) at 2 (“testimony . . . to support PG&E’s
 12 Period II (2018) expense forecasts for Transmission Operations and Maintenance (O&M)
 13 expense”); TO 20, Ex. PGE-0006 (Oct. 1, 2018) at 2 (“testimony explain[ing] how PG&E’s
 14 proposed formula rate determines the transmission O&M expense component of the Prior Year
 15 Transmission Revenue Requirement (TRR) in this twentieth Transmission Owner (TO20) Tariff
 16 Application”).) PG&E has sought authorization to recover O&M expenses in FERC rate cases
 17 dating back to 1998.

18 Accordingly, PG&E denies any allegations in the Statement of Factual Basis that
 19 proceed from the mistaken premise that PG&E cannot seek or has not sought FERC
 20 authorization to recover costs incurred for routine transmission repairs or other work charged to
 21 expense accounts, including any allegation that PG&E improperly or inappropriately
 22 “bootstrapp[ed] expense budget projects on to capital budget projects”, (SOFB at 55); “achieved
 23 expense budget cost savings by reducing the thoroughness of inspections and patrols”, (*id.*);
 24 “look[ed] for ways [to] charge expense budget projects to the capital budget”, (*id.*); or “blur[red]
 25 the lines between repair and replace to allow some repairs to be charged to the capital budget”,
 26 (*id.*).

1 Based on a review of his grand jury transcript, PG&E denies the accuracy of the
 2 paraphrase of testimony by a former Transmission Line Supervisor that his district was
 3 “constantly under pressure to limit the hours necessary to complete thorough inspections and
 4 patrols”. (*Id.* at 53.)

5 Based on review of the grand jury transcript, PG&E denies the accuracy of the
 6 following paraphrase of the testimony of a former Maintenance & Construction engineer:

7 “When asked about these emails, the former M&C Engineer
 8 denied he was instructed to find ways to capitalize the money
 9 already spent and asserted that he was lying in the emails in order
 10 to get necessary work done quickly. As to the 2013 and 2014
 11 emails, he stated the recipient of the emails, the Transmission Line
 12 Supervisor at Table Mountain Headquarters, distrusted engineers,
 13 so he lied and put blame on Asset Management in order to avoid
 14 argument. When asked about the 2016 email, which was directed
 15 to an engineer in Asset Management, the former M&C Engineer
 16 replied that the Sr. Director of Transmission Asset Management
 17 was not involved in the project and he invoked the name of the
 18 Sr. Director of Transmission Asset Management to speed up the
 19 process. This person is the same former M&C Engineer who
 20 wrote the original AA and the approved AA and now claims that
 21 his description of the condition of the relevant Caribou-Palermo
 22 line structures and conductor was unsupported and exaggerated for
 23 the purpose of securing funding for the project.”

24 (*Id.* at 57.)

25 PG&E denies that “[t]he evidence established the maintenance/repair/replace
 26 budget was primarily based upon ‘reliability metrics’”. (*Id.* at 52.) While reliability was an
 27 important and appropriate factor in PG&E’s decision making, no evidence is cited in support of
 28 this statement. PG&E weighed a variety of factors in its decision-making process, including
 asset condition, public safety, inspection and maintenance history, operating environment and
 reliability impacts.

This Section of the Statement of Factual Basis quotes from emails sent by a
 Maintenance & Construction engineer between 2013 and 2016, an email sent by a civil engineer
 in 2018, and an email sent by “a manager in Business Finance” in August 2016, all relating to a
 project to relocate 10 towers on the Caribou-Palermo Line. (*Id.* at 53-55.) These towers were

not involved in the Camp Fire. Without additional investigation, PG&E does not have a sufficient basis to admit or deny the accuracy of the interpretations of, or inferences drawn from, those emails. In addition, this Section of the Statement of Factual Basis paraphrases and draws inferences from the Butte County District Attorney's interviews of "a former employee of the PG&E Business Finance Department" and "Transmission Line Supervisors and Superintendents". (*Id.* at 53.) Without additional investigation or records of the interviews, PG&E does not have sufficient information to admit or deny the accuracy of the paraphrased statements or the inferences drawn from the interviews.

B. Capital Budget and Comparative Risk Analysis (RIBA)

PG&E admits that in 2014 it began using Risk-Informed Budget Allocation ("RIBA") to prioritize funding for capital projects based on risk. Subject-matter experts worked with the RIBA team to assign projects RIBA scores based on the safety, reliability and environmental risks associated with continued operation of the relevant assets in their current state. These risk scores accounted for the likelihood and impact of the worst probable event that may occur if the project was not completed as proposed. As part of a standard calibration process, RIBA scorers presented their methodology and findings to the broader RIBA team to ensure standard application of the scoring matrix and consistent scoring across the distribution and transmission portfolios and within each of the project categories.

PG&E admits that RIBA scores depended, in part, on judgments as to the safety, reliability and environmental risks associated with the projects under consideration. PG&E denies the generalized allegations in the Statement of Factual Basis that it abused, "manipulated" or knowingly tolerated manipulation of the RIBA scoring process. PG&E also denies that RIBA scorers engaged in a "manipulation of facts" to justify RIBA scores, (SOFB at 61); that risk scores "are easily manipulated", (*id.*); that the "2014 RIBA process exposes the manipulation of comparative risk analysis by PG&E personnel", (*id.* at 62); that "[t]he inherent weakness of comparative risk analysis is its subjective nature", (*id.*); and that "[d]ata can be manipulated to achieve a desired result", (*id.*). Contrary to these allegations, PG&E conducted multiple

1 calibration sessions to minimize individual variations in the RIBA scoring process and drive
2 more consistent RIBA scores.

3 PG&E denies the following statement:

4 “RIBA scoring determined whether a project that is not mandated
5 by a regulator was funded for the coming year, RIBA scoring and
6 ranking was independent from and occurred after a project had
7 been included in a FERC rate case. Based upon the evidence,
8 projects were used in FERC rate cases to justify rate increases and
9 then, later, not funded because of a low RIBA score.”

10 (*Id.* at 58.) Projects generally received initial or calibrated RIBA scores prior to the TO rate
11 cases in which they were included. Projects originally included in a rate case may be
12 reprioritized or remain open in the year recovery is sought for a variety of reasons unrelated to
13 their RIBA scores, including permitting, engineering and environmental issues.

14 PG&E does not have sufficient information to admit or deny the allegation that it
15 was “highly motivated to complete the TL Relocate 10 Towers project in order to be able to
16 charge the budget overruns, money already spent, to the capital budget”. (*Id.* at 61.) The towers
17 considered for relocation were situated many miles away from the tower at which the Camp Fire
18 ignited. Accordingly, this project was not a focus of PG&E’s investigation. As explained in
19 prior filings, PG&E ultimately determined that the project was unnecessary because the towers
20 could reasonably be accessed through additional roadwork, and the condition of the towers could
21 be addressed through maintenance. (Dkt. 1078 at 28.)

22 This Section of the Statement of Factual Basis also includes the opinions that
23 “any[] or all of those poles” comprising the shoo-fly on the Caribou-Palermo Line “could
24 reasonably be expected to fall down within a year”, (SOFB at 61), and that the Butte County
25 District Attorney was unable to locate records to “support” the testimony of certain PG&E
26 personnel, (*id.* at 60). PG&E disagrees with these non-factual statements of opinion, which are
27 not supported by the record.
28

1 **C. Transmission Asset Management**

2 PG&E denies that “until 2017 PG&E had no consistent and comprehensive risk
3 database or policy for evaluating risk”. (SOFB at 63.) In fact, PG&E had systems, policies and
4 procedures in place before 2017 for evaluating risks associated with transmission assets. As
5 noted, in 2014, PG&E began using the RIBA scoring process to prioritize capital projects on
6 transmission lines based on evaluation of the safety, reliability and environmental risks. PG&E’s
7 policies for evaluating risk in its transmission system prior to 2017 are described in its asset
8 management plans and asset strategies for specific component types, which were updated
9 periodically. For example, PG&E’s September 2015 Transmission Line Conductor Asset
10 Strategy adopted a risk-informed strategy for conductor replacement based on factors such as
11 age, conductor size, splice count, and location in a coastal area or region prone to snow, ice or
12 high winds. Similarly, PG&E’s February 2015 Transmission Line Insulator Asset Lifecycle
13 Strategy adopted a risk-informed strategy for insulator replacement based on factors such as age,
14 line voltage, and location in a coastal region.

15 PG&E denies the inference, based on isolated uses of the phrases “run to failure”
16 and “run to maintenance”, that “PG&E was employing a run to failure strategy on the entirety of
17 the Caribou-Big Bend section of the Caribou-Palermo line”. (*Id.* at 67.) None of the cited
18 documents references or recommends application of a run-to-failure strategy to the
19 Caribou-Palermo Line. PG&E denies any implication in the Statement of Factual Basis that it
20 intentionally allowed C-hooks or hanger plates to remain in place on transmission towers until
21 those components broke or otherwise failed.

22 PG&E denies that “performance information played an oversized role and patrol
23 and inspection findings were insignificant”. (*Id.* at 65.) PG&E further denies that “decisions
24 were being made solely on asset performance information”. (*Id.*) Asset management personnel
25 weighed a variety of factors in their decision-making process, including asset condition, public
26 safety, inspection and maintenance history, operating environment and reliability impacts.

PG&E further denies the broad assertion that there were “years of reductions of frequency and thoroughness of patrols and inspections”. (*Id.*) Program changes from decades prior reduced the frequency of inspections, as noted above. More recently, however, “there were no changes to the frequency of inspections and patrols between . . . 2005 and 2018”, as the Statement of Factual Basis notes. (*Id.* at 25). Nor is there any evidence that PG&E sought to reduce the thoroughness of inspections that did occur. Statements to the effect that “problems were not being identified” are overbroad. (*Id.* at 65.) Problems were being identified before the Camp Fire, although inspections conducted after the Camp Fire showed that an unacceptable number had not been discovered in past inspections.

Based on review of the grand jury transcript, PG&E disagrees with the following paraphrase of the testimony of the Senior Director of Transmission Asset Management:

“Specifically he conceded that because nobody was looking for wear on cold end attachment hardware and therefor, no notifications/tags were being generated for replacement of cold end attachment hardware there were, as of November 8, 2018, no projects in the foreseeable future for the replacement of cold end attachment hardware.

(*Id.* at 66.)

“Although there were no specific plans to replace cold end attachment hardware the Senior Director of Transmission Asset Management asserted that plans were being made to perform preventative maintenance on the Caribou-Palermo line. According to the Senior Director of Transmission Asset Management, the NERC Project included non-NERC required preventative maintenance on the Caribou-Palermo line. When confronted with the Project Scope document for the NERC Project the Senior Director of Transmission Asset Management was unable to identify any non-required work. According to the Senior Director of Transmission Asset Management the non-required preventative maintenance was not included in the Project Scope document but that plans were being made to perform the preventative maintenance.”

(*Id.*)

For the reasons explained above under “Expense Budgets”, PG&E denies the allegation that PG&E inappropriately “bundled expense budget projects with capital budget projects in order to charge the expense budget costs to the capital budget project”. (*Id.* at 67.) Bundling projects for efficiency and to avoid repeated service disruptions is appropriate, and it is reasonable to structure capital projects in ways that avoid or reduce expenses.

PG&E cannot assess the various non-factual expressions of opinion and assessments of witness credibility in this Section of the Statement of Factual Basis, including the characterization of a chart as “appear[ing] to summarize PG&E TAM risk strategy”, (*id.* at 63); the characterization of something as “[t]he most relevant difference between” a 2017 chart and a 2018 chart, (*id.* at 64); the suggestion that Transmission Asset Management employees who “tended to distance themselves from the phrase [run to failure] and criticize the phrase as being undefined” were not credible, (*id.*); and the opinion that “it appears that the change from failure to maintenance was semantical only”, (*id.*). To the extent such statements include factual content, PG&E denies them as without sufficient support in the record.

XII. SAFETY, RELIABILITY AND ENVIRONMENT

PG&E denies that “[t]he evidence . . . contradicted [the] assertion[s]” of PG&E employees that safety was the most important consideration to PG&E employees. (SOFB at 67-68.) The evidence cited does not support that conclusion.

PG&E denies that 115 kV structures “are never subjected to climbing inspections”. (*Id.* at 68.) The Statement of Factual Basis acknowledges that 115 kV structures are subject to climbing inspections as triggered by specific events and that “climbing crews from the PG&E Tower Department climbed and inspected 80 towers on the Caribou-Palermo line” in the three months preceding the Camp Fire. (*Id.* at 46.)

PG&E further denies the statement that “[w]hen asked why special treatment was afforded to Bay Area steel towers but not steel towers along the Sonoma, Mendocino, Humboldt, Monterrey and San Luis Obispo coasts, TAM personnel were unable to explain the difference.” (*Id.* at 68.) A former transmission executive and the Senior Director of Transmission Asset

1 Management gave evidence that Bay Waters towers experienced levels of corrosion not seen in
2 other areas.

3 PG&E denies that the events described in “a 2018 PG&E Lab Report on the
4 hanger plates from the Parkway-Moraga 230 kV transmission line” exemplified “disparate
5 treatment based upon reliability metrics”. (*Id.*) There is no evidence that PG&E’s proactive
6 replacement of worn hanger plates on the Parkway-Moraga 230 kV Transmission Line was
7 “based upon reliability metrics”. The Transmission Line Maintenance and Construction
8 Supervisor who oversaw the work testified that the hanger plates were identified for replacement
9 during routine maintenance.

10 **XIII. RISK MANAGEMENT**

11 **A. Risk of Equipment Failure**

12 PG&E denies the following summary of the Quanta Report in this Section of the
13 Statement of Factual Basis:

14 “In summary, the Quanta reports stated wear is a product of age
15 and failure is a product of wear. All of the complex statistical
16 analysis in the Quanta reports boiled down to the fact a large
17 percentage of PG&E’s transmission assets were very old and
18 needed extra attention. Despite hiring Quanta to assess and
19 analyze its transmission assets and make recommendations, PG&E
20 ignored those recommendations. . . . None of the former
21 committee members could recall who made the decision to
22 disregard the recommendations of Quanta or why.”

23 (SOFB at 70.) PG&E denies this characterization of the Quanta Report as overly simplified and
24 refers to the Quanta Report itself for Quanta’s findings. PG&E did not make a “decision to
25 disregard the recommendations of Quanta” or “ignore[] those recommendations”. (*Id.*) The
26 Statement of Factual Basis acknowledges that “in 2010 a committee was assigned to review and
27 comment on the Quanta reports”, and that the Senior Director of Transmission Asset
28 Management at the time used and cited “information from the Quanta reports . . . in numerous
subsequent TAM documents”. (*Id.*) As recounted by the Senior Director of Transmission Asset
Management, PG&E ultimately determined that incorrect statistical analysis in the Quanta

1 Report diminished its usefulness, that further industry benchmarking should be done, and that
 2 more robust analysis was needed to build the case to PG&E’s regulators for replacement of aging
 3 infrastructure. (*See id.*)

4 PG&E admits that it “was aware of the risk of equipment failure causing
 5 conductor failure or ‘wire down events’” and “the causal relationship between fire and
 6 equipment failure on transmission towers”, but denies that “[t]he undated draft Transmission
 7 Overhead Conductors [report] established that at least one person within PG&E TAM was aware
 8 that inspections and patrols being done pursuant to the ETPM were doing very little to identify
 9 and prevent equipment failures”. (*Id.* at 72-73.) The Statement of Factual Basis quotes a
 10 passage in the referenced document that reads: “Inspections are not preventing equipment
 11 failure due to wear, corrosion and other factors on conductors and associated equipment
 12 (splices).” (*See id.* at 70.) However, the next sentence in the document clarified that
 13 “[i]nspections are identifying vegetation issues and equipment needing repair or vandalized”.

14 **B. Risk of Fire**

15 PG&E denies the assertion that “[d]espite all of this knowledge PG&E did
 16 absolutely nothing to identify and replace the worn hardware essential to keeping the conductor
 17 safely in the air”. (SOFB at 74.) As explained in PG&E’s prior filings, (*see* Dkt. 1128 at 7-8),
 18 reports of wear on C-hooks and hanger plates were infrequent before the Camp Fire, and PG&E
 19 followed up on instances of wear that were reported.

20 PG&E denies that the “extensive fire mitigation efforts” listed in the 2017 Risk
 21 Assessment and Mitigation Phase (“RAMP”) Report did not “directly address[] the risk of
 22 connecting hardware failure.” (*Id.* at 73.) As noted in the referenced RAMP Report, the
 23 “Overhead Conductor Replacement” mitigation identified in the RAMP as a fire mitigation
 24 measure for 2016 “reduces exposure primarily to the Equipment Failure – Conductor and
 25 Equipment Failure – Connector/Hardware risk drivers”.

1 **XIV. SAN BRUNO FIRE**

2 PG&E acknowledges that the method it frequently used to inspect gas
3 transmission lines at the time of the San Bruno explosion—External Corrosion Direct
4 Assessment, or ECDA—was the least expensive of the available inspection methods. PG&E
5 also recognizes that ECDA is not designed to detect manufacturing defects. However, PG&E
6 believes that the characterization of ECDA as “not designed to actually detect pipe integrity
7 flaws that would require immediate and costly repair or replacement” is not accurate. (SOFB
8 at 75.) ECDA is used to detect external corrosion, which is one component of pipe integrity, and
9 operators must take specific actions based on the results of ECDA assessments, ranging from
10 immediate excavation to monitoring.

11 PG&E denies that “the evidence established” that “PG&E never made any effort
12 to examine, evaluate and catalogue the line components” on the Caribou-Palermo Line. (*Id.*)
13 Prior to the Camp Fire, the Caribou-Palermo Line was subject to multiple inspections and patrols
14 during which components were examined and evaluated. In addition, PG&E cataloged splices
15 on the Caribou-Palermo Line conductor and recorded changes in conductor size and type in
16 various locations.

17 PG&E denies the following statements:

18 “Prior to the Camp Fire, for the Caribou-Palermo line PG&E
19 utilized the least expensive inspection method (air patrols) in a
20 manner guaranteed not to detect any problems that would require
21 immediate and costly repairs. Because troublemen were not
22 finding safety problems requiring repairs, PG&E was able to
devote capital budget funds to projects focused on improving
reliability metrics.”

23 (*Id.*) There is no evidence that PG&E selected an inspection method “guaranteed not to detect
24 any problems that would require immediate and costly repairs”. PG&E’s aerial patrols did detect
25 problems and lead to repairs, and PG&E did not rely exclusively on such patrols. PG&E also
26 performed detailed ground inspections at regular intervals and infrared patrols to identify
27 conditions not visible during ground or aerial inspections. PG&E disagrees with the statement
28

that “troublemen were not finding safety problems requiring repairs”. Although enhanced inspections after the Camp Fire identified problems that past inspections did not, it is not the case that inspections before the Camp Fire identified no problems.

XV. BUTTE FIRE

PG&E denies the following statements in this Section:

“Much like the Camp Fire investigation, the evidence uncovered during the Butte Fire investigation established as a result of reductions of the vegetation management budget, the written vegetation management policies were not being followed; vegetation management inspections and patrols were being conducted by unqualified, untrained, inexperienced personnel; and PG&E was instructing those tree inspectors to ignore all but the most dangerous conditions. Additionally the evidence established PG&E had no quality assurance programs to monitor and evaluate the vegetation management program. As with the transmission inspection and patrol policies in effect at the time of the Camp Fire, PG&E relied solely on the observations of unqualified, untrained and inexperienced inspectors to identify dangerous conditions.”

(SOFB at 76.) In the year preceding the Butte Fire, the area of origin was inspected five times, including as recently as two months before the fire. On each of those occasions, well-trained and experienced inspectors determined that the subject tree—located many feet away from power lines—was green and not a hazard. PG&E also disagrees that it “had no quality assurance programs to monitor and evaluate the vegetation management program”. (*Id.*) PG&E did have a Quality Assurance program for vegetation management at the time of the Butte Fire.

XVI. DROUGHT AND WIND

PG&E became aware before the Camp Fire that Northern California faced a heightened risk of catastrophic wildfires driven, in substantial part, by extreme weather, extended drought and climate change. PG&E also was generally aware before the Camp Fire of higher-than-average winds in the Feather River Canyon and the potential for high winds to damage electric assets, but disagrees with the characterization that it “knew that the Feather River Canyon was a drought ravaged tinderbox”. (SOFB at 81.)

1 This Section of the Statement of Factual Basis includes various weather-related
 2 opinions of Kris Kuyper, a meteorologist retained by the Butte County District Attorney.
 3 Without further investigation, PG&E is not in a position to agree or disagree with Mr. Kuyper's
 4 opinions.

5 The Statement of Factual Basis states that "in 2013 PG&E published the 'Wild
 6 Fire Administrative Zones in PG&E's Service Area' map" and that "[a]pproximately 85 towers
 7 on the Caribou-Palermo line between the Butte-Plumas County line and the Big Bend Substation
 8 were included on the list". (*Id.* at 77.) PG&E drew up the Wild Fire Administrative Zones to
 9 identify lines its service territory at higher risk of wildfire. The Wild Fire Administrative Zones
 10 predated the CPUC and CAL FIRE's joint development of the High Fire-Threat District
 11 ("HFTD") area map that today guides PG&E's wildfire mitigations. The Wild Fire
 12 Administrative Zones consisted of Urban Wild Fire ("UWF"), Other Wild Fire ("OWF") and
 13 "Santa Barbara Wild Fire" ("SBWF") Areas. The Statement of Factual Basis states that
 14 "Tower [:]27/222 for some unknown reason was not on the list". (*Id.* at 77-78.) PG&E clarifies
 15 that Tower :27/222 did not appear on the list of Wild Fire Administrative Zones because it was
 16 not within the UWF, OWF or SBWF Areas. By contrast, the Caribou-Palermo towers included
 17 on the list were situated in the OWF Area, as determined by a multi-factor relative risk score.

18 PG&E denies the statement that "the towers of the Caribou-Palermo line were
 19 routinely subjected to winds at or near their design criteria". (*Id.* at 81.) The Statement of
 20 Factual Basis states that the Caribou-Palermo "towers were designed to withstand winds of
 21 approximately 56 miles per hour" and that "[f]rom 2013 to 2019 the Jarbo Gap RAWS station
 22 recorded wind gusts over 50 miles per hour over 60 times". (*Id.*) But there is no basis to
 23 conclude that, for example, Tower :27/222 on the Caribou-Palermo Line experienced the same
 24 wind speeds, which vary based on topography, as those recorded at the Jarbo Gap weather
 25 station miles away.

26 PG&E denies that it "never inspected or tested any of the towers or components
 27 for wind damage" or "chose not to replace the aged and deteriorating conductor and components
 28

on the Caribou-Palermo line”. (*Id.* at 81-82.) PG&E’s numerous inspections and patrols of the Caribou-Palermo Line were intended to identify damage to towers and components, including damage caused by wind. Any suggestion that PG&E knew of and refrained from replacing equipment that needed to be replaced is not accurate.

XVII. PUBLIC SAFETY POWER SHUTOFF

PG&E admits that, at the time of the Camp Fire, transmission lines operating at 115 kV and above were not within the scope of PG&E’s Public Safety Power Shutoff (“PSPS”) program. Following the Camp Fire, PG&E has expanded its PSPS program so that overhead power lines at all voltage levels, including 115 kV lines, are now considered for proactive de-energization.

PG&E disagrees with the following non-factual statement of opinion in this Section of the Statement of Factual Basis: “After comparing the PSPS guide published on the website with the actual PSPS policy, it appears the authors of the public PSPS guide, in an effort to make the guide understandable to the average PG&E customer, simplified the policy to an extent that became misleading.” (SOFB at 82-83.) The referenced PSPS guide conveyed accurate, basic and non-technical information of relevance to PG&E customers. PG&E does not believe it was misleading.

PG&E denies the hypothetical and non-factual statements of opinion concerning what would or should have happened on November 8, 2018 if the Caribou-Palermo Line were within the scope of the PSPS program, including the statement that “conditions in the Feather River Canyon in the hours prior to the failure of the C hook on Tower [:]27/222 exceeded the wind conditions necessary for de-energization under the publicly posted PSPS guidelines”. (*Id.* at 82.) The Caribou-Palermo Line was not within the scope of PG&E’s PSPS program in 2018.

PG&E denies that “PG&E did not provide any written documents explaining or justifying [its] decision” to exclude 115 kV transmission lines from the PSPS program. (*Id.* at 83.) PG&E produced contemporaneous presentations, emails and other documents to the Butte

County District Attorney that explained PG&E's rationale at the time for excluding 115 kV transmission lines from the scope of its PSPS program.

XVIII. KNOWLEDGE OF RISK/CONSEQUENCE

PG&E admits being aware before the Camp Fire "that equipment failure (risk) causes fires". (SOFB at 83.) PG&E also was aware of "the connection between aging infrastructure and equipment failure", and for that reason sought authorization from its regulators to set rates at levels adequate to support replacement of aging infrastructure over time. (*Id.* at 85.) PG&E admits that, beginning in at least 2006, its Enterprise Risk Management Committee explored a number of initiatives to reduce the fire risk presented by aging assets, including replacement and inspection of high-risk equipment in high-risk areas. PG&E further admits that it identified the Urban Wildland Interface Area—where structures and human development meet with wildland and vegetative fuels—as a particular geographic area in which to concentrate its efforts.

PG&E has insufficient information to admit or deny the following statements concerning the Murphy Fire:

"The Murphy Fire was caused by the failure of a connector on a tower on the Caribou-Table Mountain 230kV transmission line. In both fires the failure of a connector allowed an energized jumper conductor to make contact with the steel tower structure and sent a shower of molten metal onto dry vegetation at the base of the tower.

"The Murphy Fire occurred on August 6, 2018. The origin of the fire was directly below a PG&E transmission tower – not the Caribou-Palermo line – just west of Belden in the Feather River Canyon. The fire was caused by equipment failure – specifically failure of a connector – which allowed an energized 230kV conductor to come into contact with steel tower structure."

(SOFB at 85 & n.144.) The cause of the Murphy Fire is listed as "Unknown" on CAL FIRE's website. Equipment collected from the tower of interest remains in the possession of the United

1 States Forest Service and PG&E is not in a position to admit or deny the conclusions in this
 2 Section regarding the alleged cause of the fire.³

3 PG&E denies the following statements:

4 “The evidence developed during this investigation clearly
 5 establishes that PG&E essentially ignored the recommendations of
 6 the Quanta Reports. PG&E did not adopt any new policies or
 7 procedures for inspection of the oldest transmission assets. There
 8 is no evidence of a programmed sampling of the oldest structures
 and foundations. Even the collapse of five Caribou-Palermo line
 structures in 2012 did not cause PG&E to take a closer look at one
 of their oldest transmission assets.”

9 (*Id.* at 87.) PG&E did not “ignore the recommendations of the Quanta Reports”. As noted in the
 10 Statement of Factual Basis, it convened an internal committee to consider the recommendations
 11 and ultimately determined that further and better analysis was necessary for effective asset
 12 management decisions, as explained above.

13 PG&E admits that it was “aware that wear increases with age, the possibility of
 14 equipment failure increases relative to the amount of wear, and ignition of a fire is a definite
 15 possible consequence of equipment failure.” (*Id.* at 89.) As stated in prior filings, PG&E was
 16 aware before the Camp Fire that cold-end hardware, like many transmission line components,
 17 wears at least to some degree with age. (Dkt. 1146 at 17.) PG&E was also aware that age is but
 18 one of a number of factors that influence wear and the overall condition of cold-end hardware
 19 and other tower components. (*Id.*) The occasions on which PG&E records noted wear on
 20 C-hooks or working eyes were limited in the context of the overall number of such components
 21 in PG&E’s system, and PG&E followed up on identified issues. (Dkt. 1128 at 10-11.)

22 **XIX. ELEMENTS OF THE OFFENSES**

23 PG&E does not dispute the recitation of elements of offenses in this Section.
 24
 25

26
 27 ³ PG&E clarifies that it did not include the Murphy Fire in its December 2018 filing with the
 28 Court because then, as now, the cause of the Murphy Fire and the role of PG&E’s equipment in
 that ignition had not been determined.

XX. DUTY

PG&E does not dispute the recitation of legal duty in this Section.

XXI. CONCLUSION

The Conclusion sets forth the District Attorney's arguments, opinions, inferences and legal conclusions based on various factual assertions that PG&E has either admitted or denied in the preceding Sections. PG&E has acknowledged that it should have identified and replaced the worn C-hook that failed and started the Camp Fire, and PG&E has pleaded guilty to felony charges and accepted criminal responsibility for the Camp Fire. But PG&E disagrees with the arguments, opinions, inferences and legal conclusions set forth in the Conclusion, which PG&E respectfully believes are not supported by the evidentiary record.

With respect to factual assertions in the Conclusion that are the same as or substantially the same as factual assertions in the preceding Sections, PG&E denies those factual assertions to the same extent they are denied in those preceding Sections.

PG&E admits the following new factual assertions in the Conclusion:

- "The exact age of the C hook is unknown because PG&E has no record of the hook", (SOFB at 92);
- "The records from the Great Western Power Company establish the entire line was built between 1918 and 1921", (*id.*);
- "There are no records of when each tower was built", (*id.*);
- "A conductor is the wire that carries electricity from Point A to Point B", (*id.* at 93);
- "PG&E has owned the Caribou-Palermo line since 1930", (*id.*);
- "According to the Quanta report the average age of non-copper conductor was 36 years and the 'greatest risk of failure in transmission conductors is thought to be with the oldest steel reinforced conductors'", (*id.*);
- "[F]ailure of an energized 115kV [line] is extremely dangerous", (*id.* at 94);
- "According to the email string a PG&E Engineer correctly surmised that this wear was 'probably caused by years of rubbing between the c-hook and the plate'", (*id.*);

- 1 • “In 2018 the discovery of keyhole wear on hanger plates on the par [sic]
2 transmission line caused enough concern that the Transmission Line Supervisor
3 sent the plates to the PG&E lab for analysis and evaluation”, (*id.*);
- 4 • “A PG&E lab scientist, with a PhD in Material Science and Engineering, used the
5 available data to opine the keyhole wear was occurring at a rate of .007 inches per
6 year”, (*id.*);
- 7 • “Knowledge of the danger inherent in a C hook or hanger hole breaking is firmly
8 established in PG&E documents. Since at least 2006, PG&E has recognized bad
9 things, especially fire, happen when equipment failures occur on transmission
10 lines. Everything in the overhead electric transmission system is designed to keep
11 the conductor hanging in the air and away from persons or objects it could harm”,
12 (*id.* at 95);
- 13 • “During the post Camp Fire inspections, worn C hooks and worn hanger holes
14 were found throughout the PG&E Overhead Transmission System”, (*id.*);
- 15 • “Transmission Asset Management continued to cite the Quanta age data and
16 conclusions in subsequent internal and regulatory documents for the next seven
17 years”, (*id.* at 97);
- 18 • “According to data from the US Geological Survey three of the four worst
19 droughts in the recorded history of California have occurred since 2001”, (*id.* at
20 98);
- 21 • “The evidence clearly established PG&E was aware of the drought and the danger
22 of catastrophic fire by 2013. Internal PG&E documents established that in 2013
23 PG&E identified the Feather River Canyon as a high fire danger area”, (*id.*); and
- 24 • “Prior to 2006 PG&E had identified parallel groove connectors as a fire danger. In
25 PG&E’s 2006 ‘Risk Analysis of Urban Wild land Fires’, the replacement of the
26 parallel groove connectors is listed as a proposed mitigation”, (*id.*).

27 PG&E denies all other statements in the Conclusion because, as written, they are
28 not supported by the developed record.

29 **XXII. SENTENCING**

30 PG&E admits that facts presented to the grand jury provide a sufficient factual
31 basis for PG&E’s guilty plea. For reasons already stated in this submission, PG&E denies the
32 allegations that it had a callous disregard for safety, ignored warning signs, elevated profits over
33 safety, did the absolute minimum to mitigate fire danger, and took advantage of a position of
34 trust. (SOFB at 101-102.) PG&E further denies the allegation that it caused the 2019 Kincadee
35

1 Fire. (*Id.* at 103.) The Kincade Fire remains under investigation and, to PG&E's knowledge,
2 causation has not been determined by the grand jury or any other agency.

1 Dated: July 1, 2020
