

THE CAMP FIRE GRAND JURY TRANSCRIPTS

PLEASE BE ADVISED:

THIS IS THE RECORD OF A MASS HOMICIDE CASE. SOME VOLUMES CONTAIN DISTURBING AND GRAPHIC DETAILS.

Dear viewer:

The enclosed document contains the criminal case that led the Pacific Gas and Electric Company to plead guilty to crimes for starting California's deadliest and most destructive wildland fire: the Camp Fire.

On November 8, 2018, the fire destroyed the Butte County communities of Paradise, Concow, and Magalia. 85 people died. The fire destroyed more than 14,000 homes, displacing tens of thousands of people. PG&E was convicted of felony reckless arson and 84 felony counts of involuntary manslaughter. An 85th person died by suicide.

Under California law, these thousands of pages of grand jury transcripts would ordinarily have become public within ten days of PG&E's criminal convictions in June 2020. Instead, PG&E funded a lawsuit seeking to redact the names of all PG&E employees from the records. The lawsuit was eventually defeated,* but it sealed the entire record for two years.

ABC10 argued to the court for the public's right to know. The *Wall Street Journal* joined our legal effort. The release of the documents is the result of a court victory by Butte County District Attorney Mike Ramsey and deputies Marc Noel and Jen Dupre-Tokos.

In ABC10's investigative reporting, many survivors have called for the release of these pages. They want transparency and accountability. Most of all, they want others to be spared their same suffering in the future.

16 million people (one in 20 Americans) live in PG&E's monopoly. For them, this company's behavior is a matter of life and death

It's been said "an apology without changed behavior is just manipulation." To judge whether PG&E's apologies and promises to change are sincere, the details of its past criminal behavior must be available.

Truth is a necessary component of accountability. To that end, ABC10 has chosen to make these records freely available to all.

The documents are attached as received by ABC10. This reading may not be for everybody.** One survivor (who still wants these pages to be published) told me he had to stop reading. The details evoked extraordinary anger in him. To continue would have added to his suffering. Stopping was an act of self-care. So was choosing to share that decision with someone. *If you or someone you know is struggling or in crisis, help is available: Call or text 988 or visit [988lifeline.org](https://www.988lifeline.org).*

As a journalist who went into the Camp Fire, I'll never forget my own escape. I empathize with the trauma experienced by all who were there. I think of the rescuers who faced warlike scenes. I think of the victims and survivors whose trauma is compounded by immense and sudden loss: loved ones, homes, pets, livelihoods, memories, community, and countless other tangible and intangible things.

May all find healing.

Sincerely,

Brandon Rittiman

Special Projects Reporter, ABC10

**Names of local PG&E workers in Butte County have been redacted from these records and replaced with names such as "WITNESS #1," etc., a concession prosecutors made prior to the lawsuit seeking to redact all PG&E employee names.*

***While all of the testimony has been provided, some other proceedings were omitted from the records received by ABC10. Volumes 1, 19, and 39 were excluded. In order, those volumes cover: jury selection and opening statements, a day when one grand juror called out sick, and an "evidence review" day. The volumes that were provided contain further redactions, including some proceedings outside the presence of the grand jurors. For example, a conversation between lawyers and the judge about what to do when a PG&E employee invoked his fifth amendment rights (see Vol 8, p. 24-26) is marked "PROCEEDINGS OMITTED."*

2 AFTERNOON SESSION

3
4 MR. RAMSEY: We will go back on the record.

5 And will the foreperson confirm that all grand jury
6 members that were here at the break for lunch are back now.

7 GRAND JURY FOREPERSON: They all are.

8 MR. RAMSEY: We took lunch until 1:50 in the
9 afternoon.

10 GRAND JURY FOREPERSON: Yes, they are all back.

11 MR. RAMSEY: Okay. And if we could have --

12 You ready for your first witness?

13 MR. NOEL: We're ready for the first witness.

14 MR. RAMSEY: You call your first witness. You call
15 his name.

16 MR. NOEL: Tom Kluge.

17 GRAND JURY FOREPERSON: Okay.

18 MR. RAMSEY: And our Sergeant at Arms will retrieve
19 him.

20 We'd ask that the foreperson please swear in the
21 witness.

22 GRAND JURY FOREPERSON: Do you solemnly swear that
23 the evidence you shall give in this matter pending before
24 the grand jury shall be the truth, the whole truth, and
25 nothing but the truth so help you God?

26 THE WITNESS: I do.

1 GRAND JURY FOREPERSON: You may be seated.

2 THE WITNESS: Thank you.

3 **EXAMINATION**

4 BY MR. NOEL:

5 Q. Could you state your name and spell your last name
6 for the record, please.

7 A. Tom -- Thomas Kluge, K-l-u-g-e.

8 MR. RAMSEY: Just make sure that everyone can hear
9 you.

10 THE WITNESS: Okay.

11 MR. RAMSEY: Testing.

12 BY MR. NOEL:

13 Q. Captain Kluge, by whom are you employed?

14 A. Cal Fire.

15 Q. In what capacity?

16 A. I'm a peace officer fire captain specialist
17 currently assigned to the Fire Prevention Bureau in Butte
18 County. My job is to investigate fires of all types.

19 Q. What training do you have that qualifies you for
20 Cal Fire?

21 A. I'm POST certified. I've also had FI-210 which is
22 the fire investigation curriculum. I've also had advanced
23 fire investigation. I've had --

24 Q. Let me stop you. Let's build up to that.

25 A. Okay.

26 Q. First of, how long have you worked for Cal Fire?

1 A. I've worked for Cal Fire since 2002. So 17 years.

2 Q. How long have you been a -- a fire captain
3 specialist, a peace officer, and fire prevention officer?

4 A. Since June of 2017 a fire captain.

5 Q. So when you started with the fire department with
6 Cal Fire in 2002 and when you were assigned as a fire
7 captain specialist to the Fire Prevention Unit, what did you
8 do?

9 A. I'm sorry. Can you repeat the question one more
10 time.

11 Q. From 2002 until 2017 what was your assignment with
12 Cal Fire?

13 A. I was a firefighter. So I started from -- worked
14 my way up the ranks. I was a firefighter in San Bernadino
15 County, promoted to engineer in Amador, El Dorado County.
16 And I transferred to Butte County in 2012 as an engineer,
17 promoted to fire captain in Humboldt-Del Norte Unit in 2014
18 and eventually made it back here in 2017.

19 Q. What training did you receive that qualified you to
20 start off as a firefighter?

21 A. My training for being a firefighter started when I
22 was 15 years old. I was an Explorer with the Boy Scout
23 Program in the city of Highland. It basically introduced me
24 to the firefighting fire department career through trainings
25 there. And then I eventually was able to obtain a job as a
26 paid Cal Firefighter which is a quasi paid position as a

1 volunteer at the same station. There I learned everything
2 from fire behavior to the effects of fire, how to extinguish
3 it. All the training you can imagine that go -- that
4 coincides with being a firefighter.

5 Q. When you moved up, you said --

6 Well, first of all, let me back up to that. What
7 is the difference between a firefighter and an engineer?

8 A. A firefighter is kind of the entry-level basic
9 position. It's a point where you start to learn your
10 career. It's kind of boots on the ground, the solders. And
11 you're instructed on what to do and given direction by your
12 engineer who is a first-level supervisor. And then from
13 there, if I may continue, engineer would then promote to
14 fire captain who oversees an entire fire station.

15 So consider a firefighter as kind of the real
16 worker bee. The engineer is the first-level supervisor of a
17 fire engine. A fire captain will oversee an entire fire
18 station and sometimes multiple fire stations depending on
19 particular geographic area and the need.

20 Q. So how long were you a firefighter?

21 A. I was a firefighter from 2002 until 2006
22 professionally, not voluntary status.

23 Q. What training or experience qualified you to
24 promote to the engineer?

25 A. I had demonstrated the skills. I had to go through
26 an interview process. I took classes as a fire officer.

1 These are classes that are put on by state and
2 federal level education forums in the fire service. The
3 NWCG, which is National -- National Wildfire Coordination
4 Group, they put on a lot of courses. I took college work in
5 fire technology. All these different curriculum combined
6 gave me the skills and the abilities to compete for the
7 examination. I was tested against my peers and promoted.

8 Q. How long were you an engineer?

9 A. I was an engineer from 2006 until 2014. So
10 roughly, what, six years? Eight years.

11 Q. So what training and experience did you obtain that
12 qualified you for the promotion to fire captain?

13 A. Well, I had to go through what we call the Joint
14 Apprenticeship Committee Program. For other trades it would
15 be a journeymen's program basically or an apprenticeship.
16 And I had to fulfill certain trainings, hours and hours of
17 training. I'd have to refer to my CV for the exact number
18 of hours that were obtained through that program.

19 But also continuing education through course work.
20 I obtained my degree in fire technology during this time as
21 well and continued my course work again with the state and
22 national curriculums that are available to me. And again, I
23 had to prove my worthiness by being tested against my peers.
24 And I was able to promote.

25 Q. At the same time you were going through all this
26 training, you were still fighting fires; is that correct?

1 A. Yes, I was. All along the way. I know I did
2 earlier state that the firefighters were worker bees. And
3 that is true. They -- the firefighters do work up against
4 the fire a lot more than the fire captains and the
5 engineers. However, I was still on the line. I was
6 directing groups of people, working as a division. So
7 overseeing like an entire half of a fire, overseeing entire
8 fires as an incident commander, doing logistical work,
9 providing support to firefighters. So really put myself
10 available to all aspects that are required to fight a fire,
11 not the just, you know, putting water on a fire. There's a
12 lot of support and a lot of coordination, instruction,
13 direction goes into it. And I participated in all of that.
14 So there's quite a bit there.

15 Q. You used a term early that I'd like to have you
16 define for the jurors, and that is fire behavior.

17 A. Yes. Fire behavior is pretty much, well, what we
18 describe as the science behind fires, like what happens to
19 fire as it's growing, as it's going from it's -- basically
20 it's kindling like the first -- let's use a match as an
21 example. You know, you keep on lighting a match, you just
22 think about striking it and you have a fire. But there's a
23 lot of processes that happen from that first contact, the
24 first friction which, you know, starts a chain reaction.
25 This is all part of the fire behavior.

26 And it's influenced by many things. That match is

1 influenced by how much humidity is in the air, how wet those
2 matches are. This is all part of the fire behavior. So the
3 weather is part of fire behavior, the science. You know,
4 what factors are in place, how much oxygen is in the air,
5 how much humidity?

6 I can bore you to death with the science because I
7 love it. But it's -- the fire behavior is really the known
8 standards that we have learned just through the science and
9 scientific process of analyzing fire.

10 Q. As a firefighter why is it important to understand
11 fire behavior?

12 A. To understand fire behavior is multiple-fold.
13 Number one, it's safety being able to recognize conditions
14 that are developing to protect ourselves. That is first and
15 foremost. Secondly, to understand fire --

16 I'd like to correct myself. In order to put out a
17 fire, you need to figure out what the fire is doing and what
18 is it feeding off of. Is this fire -- you need to know if
19 the fire is influenced by the terrain, is it influenced by
20 the wind, is it influenced by the fuels that are available
21 to it, is there an oxygen source, something that's outside
22 of the norm that we've got to take care of, the humidity
23 first, or can we just focus on the basic fire behaviors?

24 So understanding fire behavior is absolutely
25 essential in putting out a fire. Excuse me. But to
26 understand fire behavior also allows us to prevent fires.

1 So if we know what is causing the fires, what is allowing
2 the fire to propagate, we can prevent these fires from
3 happening. And I think that is also incredibly important
4 especially my prevention -- my job in the Prevention Bureau
5 that's what we do. We prevent fires.

6 So fire behavior -- it's one of those fundamental
7 skills they taught me when I was 15 years old. There's a
8 lot of science involved. There's a lot of understanding of
9 technical terms; Boyle's law, Charles' law. All these
10 physic things come into play. Chemistry comes into play.
11 All these different disciplines come into place. You know,
12 meteorology, which is what fire behavior is.

13 And it's so important. And it's one of the very
14 first things they teach us. Before we're even able to get
15 on a fire engine, we have to demonstrate a basic fundamental
16 knowledge of fire behavior.

17 Q. As I understand, if I can summarize it, a big part
18 of that is -- as a firefighter, as being the guy in the
19 front lines, it's safety so that you can put yourself or
20 make sure that you're in a place of safety while you are
21 fighting the fire.

22 A. Yes.

23 Q. And then when you see -- if I can summarize this,
24 as you move up the chain as an engineer, now it becomes
25 important because now you're actually starting to place
26 assets and plan for attack on the fire; correct?

1 A. Yes, and the responsibilities of the other
2 firefighters and fire engineers on the line as well.

3 Q. Right. And always the safety?

4 A. Always.

5 Q. And you're in charge of those other people in
6 making sure that they're then in correct positions?

7 A. Correct.

8 Q. And then as a fire captain now you've got a big
9 overall view of everybody; correct?

10 A. Correct, yes.

11 Q. All right. So you were a fire captain for three
12 years?

13 A. Yeah, from 2014 to early 2017. Two and a half.

14 Q. And then you said you became a fire captain
15 specialist?

16 A. Yes.

17 Q. What is the distinction between a fire captain and
18 a fire captain specialist?

19 A. Instead of me being assigned to a fire station as a
20 captain, I was assigned to a Fire Prevention Bureau which
21 kind of takes me out of the normal rank and file and puts me
22 in a position that identifies me as a specialist amongst
23 experts I guess is probably the best way to put it. So if
24 you consider all firefighters experts in the world of
25 fighting fire, then I would be a specialist amongst them.
26 So it puts me in a position to do certain investigations

1 that they wouldn't be allowed to do which also is a
2 requirement of me having gone to POST to become a
3 standardized police officer.

4 Q. What are the duties and responsibilities of a Fire
5 Prevention Unit?

6 A. Our primary duties, our day-to-day duties start
7 with the prevention of fires just like the bureau says. So
8 our job is to go out there, respond to all fires in Butte
9 County, make determination if this was, number one, an
10 actual fire. A lot of times they turn out to not be fires.
11 Overheating vehicles, things like that. And then more
12 important you find out how the fire started, where the --
13 where the fire started and then how the fire started. So we
14 can collect that information, compile the data, and figure
15 out how to prevent further fires from happening. And then,
16 of course, public education and all the other duties. But
17 primarily, our job is to figure out where and how fire
18 starts, what happened, and what we can do to stop it from
19 happening again.

20 Q. Is there a prevention component to the Fire
21 Prevention Bureau?

22 A. Yes, there is. The prevention component has to do
23 with us going out and performing inspections on houses
24 everything from new construction and how it's being built to
25 old construction and how it's being maintained and
26 everything in between. So the roads, trains, distribution

1 and power lines, any type of utility, any type of potential
2 heat sources out there, we kind of keep -- I want to say
3 keep an eye on it, but we go out and make sure that the
4 public is educated, companies are educated, and they
5 understand, you know, what they can do in cooperation with
6 the fire departments in the communities to prevent fires
7 from happening.

8 Q. What training and experience do you have that
9 qualifies you as a fire prevention specialist?

10 A. So I attended, as I said, hours and hours of
11 training. I've investigated well over 300 different fires,
12 significant fires. I'd say significant. I've written
13 hundreds and hundreds of reports on them. I've compiled all
14 data, entered it into national archiving systems. I've
15 reviewed the information. I have identified potential
16 prevention targets that we can acquire and, you know, make a
17 good -- a good difference.

18 I already mentioned that I've got a POST
19 background; the training. My training -- my curriculum
20 vitae that includes arson investigation courses, fire
21 investigations courses, simple origin, vehicle fire origin
22 and cause specialist. I'd have to refer to my curriculum
23 vitae to state everything.

24 Q. So just to make sure it's clear, you are a
25 firefighter, but you're also a police officer; is that
26 correct?

1 A. Yes, I am.

2 Q. And unlike most firefighters or engineers or fire
3 captains, you actually have specialized training in doing
4 criminal investigations?

5 A. Yes. I have been -- I've attended standardized --
6 California Peace Officers Standardized Training course. And
7 that has given me the tools and the resources to know what
8 needs to be done systematically within an investigation in
9 California and to be able to have a -- if there's any type
10 of indication that there is further investigation needed, I
11 can officially package everything, write the report, and
12 move on with the forward investigation from there.

13 You know, understanding the laws that are required,
14 understanding what is required of me, evidence collection,
15 interview and interrogation techniques called BATI, evidence
16 handling, scene security; everything that is required within
17 the California Peace Officers Standardized Training.

18 Q. Just you answered my next question which is the
19 definition. You have used the term "POST" multiple times.

20 A. Yes.

21 Q. What is Post?

22 A. Thank you for catching that. POST stands for Peace
23 Officers Standardized Training. So . . .

24 Q. And what is POST?

25 A. Post is a curriculum developed by the State of
26 California to make sure that all law enforcement is held to

1 specific standards, that all officers are taught the same
2 essential criteria and are held to the same standard in
3 testing and held to the same standard as required by the
4 people of California.

5 Q. Another term that you have used several times
6 already is origin and cause. Can you explain to us what
7 origin and cause means.

8 A. I can. Origin and cause is one the fundamental
9 skills of my job. It's what I do on my day to day. When we
10 do what's called an origin and cause investigation, it's
11 actually two investigations we're doing. First, we are
12 trying to figure out the origin, where the fire started,
13 where did this giant fire come from. I know I've been asked
14 this many times by many people "How do we figure this out?"

15 Want me to go into that?

16 Q. Sure.

17 A. Okay. So I'm going to bore you with a little bit
18 of science. Please stay with me. If I'm going too fast,
19 slow me down.

20 So when I arrive at a scene -- I'm just going to
21 use a wildland fire. I think it's a good example here.
22 You're talking, you know, 153,000 acres. It's a big fire.
23 Where do we start?

24 Our origin and cause will go through and we'll take
25 all information that we can gather up and put it together
26 and compile it. So from witness statements, firefighter

1 accounts, what they saw when they first got there, what it
2 looked like when they first got there, what are the weather
3 conditions. We put all the stuff together and start just
4 slowing from the outside edge working our way back. We'll
5 look at it from 360 degrees all the way around and keep
6 examining it in a serpentine fashion, kind of just work our
7 way back and forth until we get to an area where it's within
8 a certain -- depending on the size of the fire. You know,
9 it could be five feet, it could be 100 feet diameter but a
10 certain area which we call a general origin area.

11 Once we get back to this general origin area, then
12 we really get into little smaller details. We have what's
13 called the macro and micro indicators.

14 So a macro indicator would be -- if you can imagine
15 a big, giant, you know, Ponderosa Pine standing up healthy
16 and happy and a fire comes through and the wind is blowing.
17 If you can imagine all those limbs are going to kind of be
18 blowing in the wind; right? And as they are blowing in the
19 wind, they are getting kind of heated up by the fire. And
20 it's going to cook the tree like vegetables. I mean, it's
21 going to wilt like cabbage or anything else would on the
22 stove.

23 But it continues to heat it to the point where it
24 dries out. And now you have all those limbs and all those
25 needles standing in time kind of frozen. We call that
26 needle freeze or stem freeze. That's a really big macro

1 indicator.

2 Or you may see the tree just has burning on one
3 side of it as the fire came through and burned off the bark
4 on one side and left the bark on the other side. I'm sure
5 everybody has seen that in Butte County at some point here
6 lately. That is kind of one of our bigger macro indicators.

7 We also have micro indicators. That can be
8 something as small as a single pebble that has soot on one
9 side but not on the other. Or it could be a single blade of
10 grass that -- I have a hard time explaining this one because
11 it's kind of technical. But if you have a standing blade of
12 grass and the fire is walking really slowly, you know,
13 really slow low-intense fire, as it starts to impinge upon
14 the side of the blade of grass, this side of the grass is
15 burning but this side is not. And as this side starts to
16 burn, the cellular wall starts to collapse and the stem will
17 fall and point right towards where the fire started.

18 And you may have an entire crescent shape of these
19 grass stems pointed right towards the origin. And sometimes
20 it's that easy to find. And other times you've got to look
21 for those little pebbles. And so we get down on the ground,
22 and we get dirty. We're digging through dirt just like I
23 did when I was a little kid. It's -- there's so much
24 science there. And we're looking at all these different
25 indicators, all the totality of indicators. We may have 100
26 different indicators in a one-foot square area. And we'll

1 identify that as either being the fire as moving forward in
2 what we call a progressing fire or the lateral --
3 progressive vector. Or it may be backing like real slow
4 kind of as your fire is kind of working it's way back kind
5 of against the winds. We call that a vacuum vector. And
6 there's a lateral which is kind of beside the fire kind of
7 working its way out as your V starts to get bigger.

8 Has everybody -- anybody -- well, let me explain
9 what the V pattern is. So there's a V pattern typically
10 with any type of fire. Whether it's a structure fire, we
11 have a vertical V pattern or you have fire on the ground.
12 Something is going to influence that fire. It may be the
13 terrain, it may be the wind, it may be the fuels, but it's
14 going to travel in a direction.

15 And usually unless it's absolutely still, it's
16 perfectly flat grounded and it's all the same fuel, it's
17 going to want to one run in one direction or the other. And
18 you're going to have a "V." It's going to look like a "V"
19 in the sky or look like a "V" on the wall if it's a
20 structure fire.

21 So we'll take all these things in consideration,
22 and eventually you will bring all this stuff back down and
23 say "Okay. This is where my origin is." Sometimes we can
24 get it down as small as, you know, what I can cover with the
25 tip of my thumb. Other times it's an area that is three
26 feet in diameter. And we'll call that a specific origin

1 area. And you'll hear me talk about specific origin area
2 and a general origin area, which is kind of that bigger
3 circle where we're first getting down on the ground. We
4 call that the general origin area.

5 Once we've identified that "Okay, we have an
6 origin," half of my investigation is kind of done. Then I
7 go to the other part, which is the cause. And now I am
8 trying to identify what caused this fire. Is it the match
9 on the ground? Is it mice with matches? Is it electrical
10 in nature? Is it a camp fire? Is it a barbecue? Is it a
11 car? Is it -- you know, whatever.

12 And that's when we start looking at what's on the
13 ground? What evidence do we have? What indicators do I
14 have? What kind of fire behavior do I have? Were there
15 accelerants involved? Should we test this stuff and get
16 experts in here to tell me something more? We put all this
17 stuff together and then we can have a determination of what
18 the cause was.

19 So my investigation is still not done. Now I have
20 to disprove everything. I have to try and disprove every
21 hypothesis that I have. I have to try and prove myself
22 wrong. Because if I can't prove myself wrong, then I know
23 I'm right. So every time I do an origin and cause
24 investigation, I try to put as many holes in it as possible.
25 I will go find another location, start over from scratch and
26 do it again. And if I come back to the same point, I'm on

1 the right track. But until that point I've got to continue
2 to look for another possibility until I have eliminated
3 everything.

4 Q. It sounds like a very detailed knowledge of fire
5 behavior would be necessary for a competent origin and cause
6 investigation. Is that true?

7 A. Very. Yes, that's true.

8 Q. Do you have any advanced training or certification
9 in origin and cause investigation?

10 A. Yes, I do. I have taken the course called Fire
11 Investigation 210 and Fire Investigation 110. 110 is kind
12 of an introductory understanding of fire origin and cause
13 investigation and then FI-210 is the advanced fire captain
14 specialist level, fire captain level course. And then I
15 have also had in 2017 -- or 2016 I took a course in Advanced
16 Fire Investigation Techniques through the Bureau of Alcohol,
17 Tobacco, and Firearms who does all the federal instruction
18 for all of this kind of stuff.

19 Q. Throughout your career how many origin and cause
20 investigations do you believe you completed?

21 A. Over 300. That is not including the ones that I
22 was participating in as an Explorer and volunteer
23 firefighter. That is just within my professional career.

24 Q. Now, prior to ascending to a fire captain
25 specialist and being assigned to the Fire Prevention Bureau,
26 did you have opportunities to do origin and cause

1 investigations?

2 A. Yes.

3 Q. How so?

4 A. Just in the standard responsive --

5 Let me clarify. Did you say before just being a
6 fire captain specialist?

7 Q. Yes, before.

8 A. Yeah. Just in the course of working with fire
9 engines, we were expected with a little bit of training to
10 be able to identify what a basic origin looks like. Cause
11 wasn't necessary unless we saw something obvious. But as a
12 firefighter, one of our jobs is to also not only extinguish
13 the fire but protect the origin so that the fire
14 investigator that is going to be coming right behind us can
15 come and investigate the fire and figure out why this fire
16 started.

17 Every firefighter is responsible for the fire
18 prevention portion of our job. So part of our prevention
19 job as a firefighter was to protect the origin. So every
20 single -- virtually every single fire that I went to, I did
21 a minimum portion of an origin investigation at least
22 identifying where the origin was.

23 And you talk to most people on a smaller incident
24 where you can see the whole thing standing from one vantage
25 point, every firefighter knows what that origin is because
26 that is -- we're trained to do that. We have learned the

1 fire behavior. We understand what we're looking for.

2 So and then as I progressed through my
3 understanding, my rank, and my career, my responsibilities
4 became greater and greater where I went from just me being
5 the firefighter on the ground to being the engineer
6 responsible for that fire company to make sure I don't park
7 on it as I am driving and that my crews stay away from the
8 origin, teaching the younger, you know, new firefighters
9 what to look for, how to stay out of origin, identifying the
10 origin. So not only was I doing the origins, I was also
11 teaching this to firefighters since 2006.

12 Q. Do you have any specific training or experience
13 investigating electrical caused fires?

14 A. Yes. As part of the standard FI-210 course -- and
15 that is the fire investigation 210 course -- part of that
16 training involves identifying electrically caused fires and
17 what to look for. I have also had one-on-one training with
18 a specialist, and I do come from an electrical background
19 through my family.

20 Q. Prior to November 8th did you ever investigate a
21 potentially electrical utility caused fire?

22 A. Yes, I have.

23 Q. On how many occasions?

24 A. I would have to check it out. I would say at least
25 more than 25, 30.

26 Q. On November 8, 2018, what was your assignment?

1 A. I was assigned to the Fire Prevention Bureau in the
2 Butte Unit. I was the on-duty prevention officer for all of
3 Butte County.

4 Q. Where were you at at approximately 6:30 a.m.?

5 A. I was at home trying to enjoy my morning.

6 Q. Sometime shortly after 6:30 a.m. on November 8,
7 2018, were you dispatched to a fire?

8 A. I was.

9 Q. By whom?

10 A. Oroville Emergency Command Center located here in
11 Oroville. It's our dispatch center run by Cal Fire.

12 Q. And how did they communicate the dispatch to you?

13 A. They broadcasted it over radio tone frequencies
14 which alerted my pager alerting me that there was an
15 incident occurring and gave the vocal dispatch over the
16 radio.

17 Q. Okay.

18 A. And CAD and then text page as well.

19 Q. Were you given instructions as to the location of
20 the fire?

21 A. I was given a general area. I was -- I received
22 the call as being along Highway 70 Camp Creek Road near the
23 transmission lines.

24 Q. Did you start to respond to the area?

25 A. I did.

26 Q. Were you in a state truck?

1 A. I was. I was in a state marked vehicle in my
2 uniform.

3 Q. Were you in a highbred fire/police vehicle?

4 A. Yes. It's mostly built for my position. I do have
5 firefighter equipment on there, but it's also all of my
6 investigation equipment. So, yeah, it's kind of a -- it
7 doesn't have the big pumps on it, but it's a pickup truck
8 with a water can. And the rest of it's just investigation
9 materials and some safety gear.

10 Q. So what was the route that you took responding to
11 the fire?

12 A. Generally speaking, I took Highway 99 to Wick's
13 Corner to Highway 70.

14 Q. When was the first time you got a view of the fire
15 you were responding to?

16 A. The first true clear view that I had was just past
17 Skyway south on Highway 99 when I saw with real clarity the
18 entire column of smoke, the plume of smoke. I was able to
19 see that clearly from just past Skyway and Highway 70.

20 Q. Describe your drive up to the fire location.

21 A. If I may, I'd like correct that. I said
22 Highway 70. I meant Highway 99 and the Skyway.

23 Q. Good. Thank you. I didn't even catch that. I
24 don't think 70 and Skyway intersect.

25 A. Yeah, I don't think so.

26 Q. Describe for us your drive up to the fire location.

1 A. Well, as I was driving, I noticed that the valley
2 floor -- before we even got up into the hills, that the --
3 number one, that the column of smoke was really, what I
4 refer to, as kind of churning and boiling. The smoke is
5 really moving. It was very similar to other major fire
6 smoke columns I'd seen in the past. And I've seen many of
7 them. And the way it was really kind of moving -- we've
8 been taught this in our fire behavior classes. That's kind
9 of an indication of a lot of energy being released in the
10 atmosphere which tells me the fire is burning with a lot of
11 intensity early on.

12 I was able to overcome -- it was early in the
13 morning. I was able to see that, you know, the fire was
14 really being -- rephrase. Not the fire. The smoke was
15 really being pushed down by the wind. It was still able at
16 times to overcome the inversion or what I would call an
17 inversion layer. There wasn't much of an inversion that day
18 because of the -- because of the amount of wind kind of --
19 but with really high winds you have what's called a stable
20 environment even though it seems really windy, but all the
21 air is moving in one direction.

22 There were times where the smoke column was
23 overcoming that wind. That -- that high pressure system was
24 coming in. And the wind -- the smoke was actually able to
25 overcome that high pressure system. So it told me earlier
26 on that this is going to be a significant fire. This is

1 going to turn into a major event.

2 I also identified -- to continue with my
3 observations, I also identified on the valley floor that the
4 tops of trees were moving significantly. It was clear to me
5 that it was a very windy day. I didn't know how windy it
6 was going to get until I drove further up Highway 70 where I
7 was met with the real winds.

8 Q. You mentioned earlier -- and this would be a good
9 time to segue into the meteorology. Why is meteorology
10 important to an origin and cause investigator?

11 A. Meteorology and understanding what weather patterns
12 are doing and are going to do, again safety. Knowing what
13 the fire is going to do is paramount importance. But also
14 it gives us kind of an understanding of what we can expect
15 and prepare for.

16 The morning -- actually, if I can back up the day
17 before. It had been identified that a high pressure system,
18 which has a clockwise rotation -- so if you're looking down
19 on the Earth, you're looking over Oregon, California,
20 Nevada, looking to the Great Basin, you have a high pressure
21 system that is kind of running clockwise and pushing down
22 from Oregon into Nevada and the Great Basin. And as that
23 clockwise rotation is coming down, you can just imagine all
24 those winds that kind of are coming off that spiral effect.
25 It's going to actually have a rotations to push all of that
26 air right down through the Highway 70 corridor.

1 So knowing that ahead of time, having done my
2 homework every day like I do, knowing what the weather
3 patterns were going to be, what to expect for the day, I
4 knew that we were in for a fire fight. But I also knew that
5 at some point as we started to get -- as this weather system
6 continued to move across the earth, the wind was going to
7 change direction on us because now we're getting the other
8 side of that rotation where it's going to blow everything in
9 the opposite direction which is extremely dangerous for
10 firefighters, extremely difficult for the environment, for
11 the destruction aspect of it. And then, you know, for being
12 able to contain this thing in a reasonable amount of time
13 without, you know, too much effort.

14 So knowing that and being prepared for that was
15 great because not only were the individuals firefighters
16 able to make plans and work on that but our emergency
17 dispatch center, the ECC, Emergency Command Center, they
18 were able to order a bunch of equipment heavy early and get
19 them coming to at least effect some better good. This was
20 the kind of fire that took all the resources we had and
21 still was not enough and not fast enough.

22 Q. When you were on your way up to the fire scene,
23 what was the status of the firefighting efforts?

24 A. I heard -- driving up Highway 70 I heard Fire
25 Captain McKinsey give an update on conditions. I heard him
26 put himself at scene. I -- I heard him on the radio put

1 himself at scene and give an update on conditions basically
2 saying where the fire is located, how big it had grown. And
3 he verbalized over the radio that he cannot make access due
4 to Camp Creek Road being blocked by debris and the road
5 being closed due to a washout and rock slides.

6 I later investigated and found that to be
7 absolutely true. The access to the initial origin of the
8 Camp Fire was absolutely blocked from all directions,
9 impassable by really any means.

10 Q. So as you're heading up into the -- up 32, the
11 Feather River Canyon, you're monitoring the fire radio.
12 What is going on up at the -- essentially the initial fire
13 fight?

14 A. So the initial fire fight, I wasn't there for the
15 initial fire fight, but I did locate the incident command
16 post. Excuse me. I did identify where the initial incident
17 command post was, and I spoke to the incident commander
18 whose Division Chief John Messina. I spoke with him and I
19 got some fire history with him. He told me that there
20 were -- they were unable to get crews into where the actual
21 fire started itself and that Pulga was under mandatory
22 evacuation. Concow was under evacuation orders. And
23 everybody was basically spending all their efforts trying to
24 evacuate people.

25 Q. Why as an origin and cause investigator is it
26 important for you to get information from the first-in

1 firefighters and incident commander?

2 A. The first-in firefighters -- that's a two-part
3 question. Those first-in firefighters are important because
4 they were the first official eyes on the fire. We do have
5 witnesses, and we take that information as important as
6 anything else in getting the next report because usually our
7 witnesses usually leave the area. And so knowing how
8 quickly the fire progressed, what actions were taken, who's
9 done what, you know, has anybody come and gone, were any
10 vehicles seen coming and going? All this stuff is super
11 important first eyes to actually see that are first
12 responding firefighters.

13 So we try and grill our first responding
14 firefighters early on while their memories are still fresh.
15 And pieces of paper with that information written down are
16 collected early on.

17 Secondly, it's important -- the second part of the
18 question was to contact me as a commander to find out what
19 has been done so far, what do we know. Because the incident
20 commander is in charge of everything on the ground. Every
21 single person, every fire engine, everything on the ground
22 is under one person's responsibility. Of course, there's a
23 chain of command, but ultimately the incident commander is
24 responsible for it. And so going directly to the commander
25 I could find out how many evacuations are happening, how
26 many folks are out there, what have they done, who are my

1 first responding individuals, and has there been an origin
2 identified by those firefighters where I can -- if I don't
3 go right to it, I can, you know, check it later if I end up
4 in a different position. So it's both of those bits of
5 information are absolutely invaluable.

6 Q. Where did you meet with Chief Messina?

7 A. Chief Messina and the incident command post were
8 located at the Yankee Hill Hardware Store, the Ace Hardware
9 store on Highway 70 just outside the gate there. I met with
10 him there. That's where they set up their temporary ICP.
11 Incident command post. Excuse me.

12 Q. After meeting with Chief Messina, did you proceed
13 further up the canyon?

14 A. Yes. I met with Chief Messina, and he told me who
15 was up canyon. I found out that Captain McKinsey was still
16 up there with his fire crew and one other fire engine.

17 I asked him where specifically it was located? He
18 said "Not sure just right now because it is still very fluid
19 and dynamic." He told me they were north of -- north of the
20 station likely near the town of Pulga or the community of
21 Pulga.

22 So I was able to finally contact Captain McKenzie
23 on his fire engine Engine 2761. Contacted him and he was
24 able to meet me at Highway 70 and Pulga Road.

25 Q. When you met with Captain McKenzie, did you get a
26 briefing on his observations -- initial observations of the

1 fire?

2 A. Yes. I asked him what he saw when he first got
3 there. And he asked me to follow him and he took me to the
4 point where he first saw the fire. And that location was --
5 I have it documented in one of my photographs. It was on
6 Highway 70 directly south of Poe Dam. There's a turnout
7 there. And he showed me what the fire was doing.

8 Q. Did Captain McKenzie indicate to you if he had
9 taken any photographs or video of the fire?

10 A. Yes. He told me that he had taken a photograph and
11 he showed it to me on his Smart Phone. With no service we
12 weren't able to -- I was unable to capture that photograph
13 from him right then and there, but I was able to get that
14 from him at a later date. But he did know me the fire -- or
15 I'm sorry. He showed me a picture of the fire when he first
16 arrived.

17 Q. In front of you you have a stack of photographs
18 that are binder clipped together.

19 A. May I open it?

20 Q. Yes, please.

21 A. Okay.

22 Q. The first photograph in that stack should be what
23 is marked as Exhibit Number 1.

24 A. Yes.

25 Q. Do you see that? Do you see the exhibit tag?

26 A. I do. It's on the back, yes.

1 Q. And that is Exhibit Number 1?

2 Do you recognize that photograph?

3 A. I do.

4 Q. What is that photograph?

5 A. This was the photograph that Captain McKenzie
6 showed me on the morning of November 8th.

7 Q. Is that the photograph that was shot by
8 Captain McKenzie shortly after you arrived on scene of the
9 fire?

10 A. Yes.

11 Q. Can you explain to us or show us what we're seeing
12 in this photograph.

13 A. Yes. The fire is -- right now you have several
14 things happening with the fire actually. You have some
15 backing fire and you have some advancing fire. It's
16 actually working its way in a circular motion kind of off
17 the hillside. So earlier when we talked about fire behavior
18 and how things kind of spread, this backside of this side of
19 the hill that we can see, while the fire tends to be high,
20 it's not as high as you'd expect for the winds that morning.

21 And as I spoke to Captain McKenzie outside of my
22 truck, I found it difficult to walk. The winds here were so
23 much that he was actually having to lean into the wind as I
24 walked to Captain McKenzie's fire engine.

25 I wasn't asking him to get out of his vehicle
26 because he was in a fire response vehicle that had to move

1 if he needed to move in a hurry. So I walked to him. So
2 the winds were really, really laying over. There was a
3 strong northeasterly wind. And right now what you see in
4 this photograph is the intensity. If I --

5 Q. Let me stop you real quick. I skipped a step. We
6 have up on the big screen in front of the jury a photograph.
7 Correct?

8 A. That is the same photograph.

9 Q. Is that the same photograph that you're looking at
10 that is marked as Exhibit Number 1?

11 A. Yes, it is.

12 Q. And if you want to -- if it's okay with madam
13 foreperson and the jury, if you want to get up and point to
14 things on the photograph on the big board, go ahead.

15 GRAND JURY FOREPERSON: Yes, please.

16 THE WITNESS: Thank you. I work better standing
17 up.

18 So like I was trying to say, the fire -- the way
19 the fire was burning through here it has a higher degree of
20 intensity. I wouldn't call this a backing fire. However,
21 in the greater scope of this particular fire and the speed
22 at which this fire grew, this would be kind of relative to a
23 backing fire. The winds were blowing northeasterly. So
24 coming across this way so . . .

25 BY MR. NOEL:

26 Q. Oops. Sorry.

1 A. Did I do that?

2 Q. Nope. I did that.

3 A. So this is being -- kind of being protected by the
4 wind kind of like hiding behind a shelter in a storm. It's
5 a little bit protected so it's not really intense. Out here
6 in the open it is burning much more intense. It's in the
7 face of the wind. So then also there are -- it may be
8 difficult to see from back there, but I count one, two,
9 three transmission towers.

10 Is that visible?

11 Q. Do you want me to pull it up a little bit? Nope.
12 I've got to do it for whatever reason on here.

13 A. So here is the top of one tower. Here is the full
14 tower over hear. And you can see the shadow in here through
15 the smoke.

16 Can I just stand up here while we go through --

17 Q. Sure. Do you want to grab the other exhibits and
18 your list?

19 So after talking with Captain McKenzie, what did
20 you do?

21 A. After I spoke with Captain McKenzie, I took a
22 photograph myself. I wanted to get a photograph of what the
23 fire was doing at the moment that I was there. This is the
24 first documentation. Captain McKenzie told me that the fire
25 had not really backed against the wind.

26 What item is this?

1 Q. It's should be number 5. Six. I'm sorry.

2 A. Number 6, photograph six.

3 Q. And that's the photograph that is displayed on the
4 big board?

5 A. Yes, it is.

6 Captain McKenzie told me the fire had not backed
7 towards the east much more than when he first saw it when he
8 arrived. And that is a reasonable expectation with the
9 winds that were -- the winds that were present that day.
10 The winds were pushing so hard it wasn't really allowing the
11 fire to burn against it.

12 Are we able to come back to this photograph later?

13 Q. Yes. But right now you keep using a term and that
14 is "backed."

15 A. Yes.

16 Q. Define what it means for a fire to be -- to back
17 or . . .

18 A. So to say a fire is backing, in other words, it's
19 burning against the dominating force. So if it's burning
20 against the wind, burning downhill from a slope-driven fire,
21 that is considered a backing fire. It's not -- you know,
22 usually, like I said, you have a "V" pattern. On one side
23 you have a strong forward progress. On the backing vector
24 it's working against the dominating force. That would be
25 the wind, terrain, and fuel.

26 Q. So why was it important to you that Chief

1 McKenzie --

2 A. Captain McKenzie.

3 Q. I'm sorry. Captain McKenzie indicated that he
4 hadn't really observed any backing since he had arrived?

5 A. It gave me one perimeter to start with. Number
6 one, we knew with the scope of my investigation with his
7 witness statement I have one side of the box. Eventually, I
8 had to build four sides of my box of my investigation. So I
9 have one side to start with because I know from what I can
10 see and from what Captain McKenzie told me the fire did not
11 start back here (indicating) because I don't have fire back
12 here. I know that it started somewhere. I don't know at
13 this point. And that is why I wanted to document it.

14 And I also noted the GPS location of where I took
15 the photograph. So if this fire did run out the opposite
16 direction like I expected it to, because of the weather
17 conditions and the meteorology we knew was going to happen,
18 I would at least have a point to reference to go back to.
19 It did eventually push back. And this all ended up burning
20 eventually.

21 Q. So you shot this photograph?

22 A. I took this photograph.

23 Q. And from where did you take this photograph?

24 A. On Highway 70 on the south side -- southwest --
25 southeast side -- southeast side of Highway 70. I'd have to
26 reference the GPS location for the exact spot, but this was

1 northeast of Poe Dam.

2 Q. When you shot this photograph, did the towers have
3 any significance to you?

4 A. At this point, no. I consider them only because
5 they are there and it's part of what I saw. For me
6 initially the most value the transmission towers were a
7 reference point. Again, my first step is to figure out the
8 origin location. So it was something to consider, but it
9 wasn't -- it was noted but not sought after at this point.

10 Q. And you were shooting this photograph from quite a
11 distance away from the towers; correct?

12 A. I was and from a much lower location. Can we --
13 no. Well, it's hard to see here, but we're --

14 Can you see this insulator string right here
15 (indicating)?

16 Q. We'll get to that in a second.

17 A. I'm talking about --

18 Q. Well, once you were -- later did you get a chance
19 to examine this photograph on a computer screen where you
20 could blow it up and focus on certain things?

21 A. I did. Several days later -- I'd have to look at
22 the timestamp. I looked at it. But several days later
23 after I concluded my origin investigation, I was able to go
24 back and look at this on a screen that was bigger than my
25 two-and-a-half inch view finder on my camera.

26 Q. And did you notice anything significant?

1 A. I did. In this photograph when it was blown up and
2 zoomed in, I noticed that one of the insulator strings on
3 the tower was not in its correct position. If you see right
4 here, Ladies and Gentlemen, this is an insulator string.
5 This over here is also an insulator string. And it's really
6 hard to see, but right along here (indicating) --

7 Can I use the --

8 Q. I think so. Is it coming out? There it is.

9 A. I'm going to mess it up.

10 Q. There it is.

11 A. So right here (indicating) is the support for this
12 insulator string. Here (indicating) is the support for this
13 insulator string.

14 Q. And just for the record, you're using the drawing
15 function on the big screen, and you have highlighted the
16 insulator supports in yellow and the downed insulator in
17 red?

18 A. Yes.

19 Q. Okay. Go ahead. Keep going. I will stop to make
20 sure we get all of this on the record.

21 A. And we're well below elevation here. And so this
22 upper support arm is actually closer to us than this
23 (indicating) one. So it gives you an idea of how high in
24 elevation this thing is from my location. So it's a little
25 bit hard to understand the perspective. But we're looking
26 at an almost 45-degree angle uphill. So it's very steep in

1 this country.

2 Q. So where should that insulator string that you have
3 highlighted in red actually be?

4 A. So right now it's inverted upside down. And it
5 should be hanging on the tip of the support arm over here
6 (indicating.)

7 Q. And you are indicating the upper support arm?

8 A. Well, what appears to be the upper support arm,
9 yeah.

10 Q. And actually, they are flat? Those two are
11 absolutely level --

12 A. They are level, yeah.

13 Q. -- to each other?

14 A. Absolutely level.

15 Q. As you were explaining, it's the angle of the
16 picture that makes it look like one is higher than the
17 other?

18 A. Correct.

19 Q. Okay. For the record, erase the highlighting on
20 the picture.

21 So what did you do after you talked to
22 Chief McKenzie?

23 A. After I spoke with Captain McKenzie --

24 Q. Or Captain McKenzie. I'm sorry.

25 A. I tried making access. He pointed out some good
26 information. After having seen his original picture, I

1 identified that potential area. And I'm going to --

2 Can you shrink that down more.

3 I did identify in Exhibit 6, this photograph, that
4 that may be part of the origin of our fire just based on
5 Captain McKenzie's initial photograph that he showed me. So
6 I tried to make access. Unfortunately, the road was blocked
7 by burning debris. There was rock slides. There were giant
8 boulders. There were trees. There were power poles in the
9 road. I mean, it was a mess. It was an absolute mess.

10 Q. All as a result of the fire?

11 A. No. Actually, some result of the fire; the burning
12 debris. Some of the rocks slides, I assume, were from the
13 fire, but there were also rocks slides that had been there
14 for a long time. They were well compacted, had been --
15 basically taking up the entire road and absolutely
16 impassable.

17 I didn't see any evidence of anybody coming or
18 going out of there as I made my way in. But I was only able
19 to -- initially I was only able to get to basically Pulga
20 Road and Highway 70. It wasn't until later I was able to
21 identify all this stuff.

22 Q. So were you able to find a way in?

23 A. Eventually. So initially I was able to flag down a
24 Caltrans pickup truck with the road scraper in front. And
25 they initially cleared at least the community of Pulga. We
26 had a fire engine working down there, and I wanted to at

1 least have egress for them because that had been blocked off
2 by rocks. And the Caltrans operator in the pickup truck
3 didn't feel comfortable going down Camp Creek Road.

4 I told him "Hey, thank you anyway for clearing
5 Pulga and at least our firefighters have a way out." I was
6 later able to identify a private dozer that was actually
7 hired for the fire early on. It was Tom's Earth Dozer was
8 the name of the company, and they were identified as E-22,
9 which stands for equipment number 22. They are the 22nd
10 piece of equipment on the fire.

11 I spoke with Tom Funes, who was the operator. Tom
12 Funes told me he was assigned to the fire. I had asked Tom
13 Funes if he had good radio communication. He said yes, he
14 did. I asked him if he felt comfortable driving his
15 bulldozer down Camp Creek Road and to make sure that his cab
16 was environmentally sealed for fire protection and smoke
17 protection and visibility. And he said yes. So I said
18 "Make a road," and I drove right behind him.

19 I stayed with him as he was clearing rocks,
20 clearing trees. Luckily the power pole we were able to get
21 around it. That power pole was clearly damaged by the fire.
22 There was several washouts that had to be basically rebuilt
23 and portions removed for us to make access. And it took us
24 until about 1:43 p.m. to get into a change of location, I
25 should start with. So as I was driving in --

26 If I may continue.

1 Q. Yep.

2 A. As I was driving in, part of my job and part of my
3 origin investigation I was looking at those macro indicators
4 we talked about, looking at the trees, the way the trees are
5 burned, if there's soot on the rocks, all this stuff as I am
6 driving in. And as I am driving in, I am clearly in the
7 advancing -- what we call the advancing vector of the fire.
8 So I was in the right direction. I knew that.

9 And I'd say about 1:43 I got to -- I noticed kind
10 of a total change in all of the indicators. It was very
11 obvious. It went from being, you know, almost moonscaped to
12 having trees, brush, and power poles, small distribution
13 poles still standing. Trees are still standing even some
14 tress on the roadside.

15 And so I marked the location with a chartreuse or
16 green flagging. I noted the time and the GPS recording of
17 that location. And then I continued because again my job is
18 to disprove my hypothesis. So I hypothesized at this point
19 something changed. And I just kept driving to disprove it.
20 Because if that was just a smaller portion of the bigger
21 fire, I needed to know.

22 So I kept driving. I drove in a quarter mile,
23 drove to the fire's edge and realized that this was as far
24 as the fire goes. And I came back to my original location
25 that I had marked as 1:43 p.m.

26 Q. So before we start getting into that, we talked a

1 little bit earlier about the importance of gathering
2 information from witnesses; for instance, Captain McKenzie
3 as one of the first on scene.

4 Were there other persons who were identified as
5 having been present early on in the infancy of the fire?

6 A. Yes. So as I was responding to the fire, I
7 identified that this was going to be a major incident. I
8 knew that I was the only fire investigator in Butte County
9 who was on duty due to people off duty. One was on
10 vacation. People were unavailable. So I called my regional
11 support staff -- Northern Regional Support Battalion Chief
12 Ryan Finn (phonetic). I spoke with him early in the morning
13 and told him -- I had apprised him of what was happening in
14 Butte County; that we had a major incident. He already knew
15 about it. Dispatchers talk to each other. And I told him
16 that I needed additional staffing. Because a fire this big
17 requires a lot of manpower, a lot of people looking at a lot
18 of indicators and a lot of follow up.

19 And so I also identified -- as with any major fire
20 we treat everything-- we treat every fire as a crime scene
21 until we can prove otherwise. So one thing that I noted is
22 I didn't know if I was even going to be able to get to the
23 origin that same day.

24 So I also ordered security and what we call LiDAR,
25 which is like a surveying and mapping production. It's a
26 team that comes out and just plots everything and maps

1 everything. And I asked them to respond as well along with
2 additional investigators.

3 Q. One thing I just realized we skipped over. Does
4 Cal Fire give names to all these fires?

5 A. Yes, they do.

6 Q. And does Cal Fire have a standard naming convention
7 for fires?

8 A. It's typically geographic. They're not always --

9 Q. And how so?

10 A. Most fires are named either off of a geographic
11 known location either by the name of a town, a community, a
12 road, a monument, or something they can identify and that
13 can be known to responders as maybe a hint to where the fire
14 is at. Not a hint but kind of a local degree of knowledge.

15 Q. The fire to which you were dispatched on
16 November 8, 2018, shortly after 6:30 a.m., was it given a
17 name?

18 A. Yes, it was.

19 Q. And what was the name of the fire that was given?

20 A. The Camp Fire.

21 Q. And why the Camp Fire as opposed to Camp Creek
22 Fire?

23 A. We try to keep the name convention short.

24 Q. All right. Now moving back, we were asking -- I
25 was asking about identifying and interviewing witnesses and
26 obtaining photographs and videos if possible from early

1 witnesses to the fire. Were you able to identify any of
2 those in this case?

3 A. Yes.

4 Q. And who were you able to identify?

5 A. So as part of our regional response the Battalion
6 Chief and Investigator Mike Thompson also responded at
7 approximately -- Mike told me at approximately 11:00 p.m. --
8 a.m. Excuse me. At 11:00 a.m. he had contact with a
9 Caltrans worker at the Caltrans yard that is directly across
10 from what was later identified as Caribou-Palermo 27/222.
11 There is a gravel yard. There are a couple of buildings and
12 some equipment. One of the workers there had taken a
13 photograph and had shared that photograph visually with
14 Mike. I later interviewed this individual. And his name is
15 Colton Taylor. Colton Taylor provided me with the image --
16 his images of the fire at approximately 6:44 a.m.

17 Q. Now, you should have in front of you what has been
18 marked as People's Exhibit Number 5 or Exhibit Number 5 for
19 identification. I'm going to pull it up onto the board
20 here. Now, can you look at the exhibit, look at the board
21 and tell us if what is being shown on the board is the same
22 as the exhibit you're looking at.

23 A. This is the same picture.

24 Q. Okay. This is the photograph that you obtained
25 from the Caltrans employee Colton --

26 A. Taylor.

1 Q. -- Taylor?

2 A. Yes.

3 Q. Okay. Now, what does that photograph show?

4 A. This photograph is a perspective first from the
5 Caltrans yard. Right now the fire is burning up on a hill
6 up on the knob in the photograph. There are three
7 transmission towers in the vicinity of the fire more so
8 around the furthest right tower. Right now the fire
9 behavior is doing exactly what we expected it to do and what
10 our indicators told us.

11 I did not see this photograph until several days
12 after the fire. Mike Thompson told me he saw a photograph
13 that was -- he described this to me, but I did not see this
14 until several days after the fire. This fire is making a
15 small uphill run running laterally along the side here and
16 then backing down the hill. Again, the intensity here is
17 fairly low. Relative speaking on the right side of the
18 photograph, which would be the south side of the hill, the
19 intensity is much higher where it's exposed to the wind
20 again, which is what we'd expect with the conditions we had
21 that morning.

22 MR. NOEL: Madam Foreperson, it's just after
23 3:00 p.m. Would this be an appropriate time for the
24 afternoon break?

25 GRAND JURY FOREPERSON: Yes, please. Everybody
26 ready?

1 MR. RAMSEY: 15 minutes?

2 GRAND JURY FOREPERSON: Yes, please. Sorry.
3 Fifteen minutes.

4 [Recess taken from
5 3:03 until 3:25 p.m.]

6 MR. NOEL: Ready to resume?

7 GRAND JURY FOREPERSON: We are ready to resume.
8 Everybody is back.

9 MR. NOEL: Yep. The record will reflect all 19 are
10 seated in their appropriate locations and awake despite my
11 best efforts.

12 BY MR. NOEL:

13 Q. All right. Captain Kluge, we have talked a lot
14 about the location. What is around this area of Highway 70?

15 A. In reference to?

16 Q. Buildings, businesses, anything like that.

17 A. I guess more specifically like which area of
18 Highway 70? There's kind of --

19 Q. Let's start with this photograph that we have on
20 here People's Exhibit Number 5. There is obviously a
21 building in the foreground of this picture.

22 A. Yes.

23 Q. Do you know what that building is?

24 A. I do.

25 Q. What is that building?

26 A. That is the Caltrans maintenance yard at Pulga.

1 Q. Okay. So describe for us the Caltrans maintenance
2 yard in Pulga.

3 A. The Caltrans maintenance yard consists of several
4 buildings, equipment, gravel yard. It's -- I don't know the
5 exact acreage of the facility, but it's a prominent location
6 just past the Pulga bridge on Highway 70. When I say
7 "past," I mean east of the Pulga bridge.

8 Q. Okay. Earlier one of the landmarks you mentioned
9 was the Poe Dam.

10 A. Yes.

11 Q. What is the Poe Dam?

12 A. Poe Dam is a generation station. I believe it's
13 owned by Pacific Gas & Electric Company, and it generates
14 electricity.

15 Q. To your knowledge, are there people that work at
16 the Poe Dam?

17 A. There are.

18 Q. Are there other PG&E facilities in this area of
19 Highway 70?

20 A. Several, yes.

21 Q. Which ones?

22 A. That I know of, I'm familiar with Rock Creek
23 Powerhouse, Caribou 1 and 2 Powerhouse. There's several
24 others there that I don't know the exact names of them.

25 Q. Crest?

26 A. Crest, yes.

1 Q. Poe Powerhouse?

2 A. Yes.

3 Q. So where we left off was I was asking about if you
4 made efforts as part of your investigation to identify
5 persons who like Colton Taylor would have been present
6 during the infancy of this fire and may have observed the
7 fire and may have photographed the fire?

8 A. Yes. We were able to review the 9-1-1 calls that
9 came in to the Emergency Command Center. One of those phone
10 calls -- one of the first phone calls that came in came from
11 the Rock Creek Powerhouse, and they identified that there
12 was a worker in the area that had reported via their own
13 radio frequency that there was a fire in the area of Poe
14 Dam. And it was related to our ECC by landline. And so we
15 tried to follow up with that individual unsuccessfully.
16 However, we did put a request to Pacific Gas & Electric
17 Corporation for any photographs they may have had of the
18 fire. And we did receive one. Two, I believe. Two
19 photographs as part of a package.

20 Q. Okay. Now, I want to direct your attention to what
21 has been marked as People's Exhibit Number 2 in front of
22 you. Do you have that?

23 A. I do have it.

24 Q. Do you recognize that photograph?

25 A. I do.

26 Q. Do you recognize what is depicted in that

1 photograph?

2 A. I do.

3 Q. You can see up here on the big screen I have a
4 photo displayed. Is that identical -- that photograph
5 identical to what you're looking at People's 2?

6 A. Yes, it is.

7 Q. And explain to us what we're looking at and where
8 it comes from.

9 A. This is the photograph that was provided to us by
10 Pacific Gas & Electric Company as one of their -- one of
11 their data productions we requested from them. This was a
12 photograph, according to PG&E's response, that was taken by
13 an individual by the name of Jerry Parks. And this is a
14 photograph taken from -- what I believe to be from
15 Highway 70 near the Caltrans yard.

16 Q. Now, let's move on to Number 3. Do you recognize
17 the photograph marked as Exhibit Number 3?

18 A. I do.

19 Q. What is depicted in Exhibit Number 3?

20 A. Exhibit Number 3 is a similar photograph to
21 Exhibit 2. This was also presented to us in the Pacific Gas
22 & Electric data production and was presented to us. It was
23 supposed to come from Jerry Parks.

24 Q. Now, the photograph that you have in front of you
25 Exhibit Number 3, is that the same photograph that is
26 displayed on the big board for the jury?

1 A. Yes, it is.

2 Q. Do you have an idea as to the location from where
3 this photograph was taken Exhibit 3?

4 A. Having worked in the area, I do recognize the
5 gravel piles that are on either side of the photograph. I
6 recognize this area. The photograph is likely to have been
7 taken near the Caltrans yard.

8 Q. Where would this be in proximity to where Colton
9 Taylor was taking his photograph?

10 A. This would have been basically right outside -- if
11 Colton's photograph was taken inside the Caltrans yard,
12 which it appears to have been, this photograph was taken
13 just outside the gate or close to the gate of the Caltrans
14 yard.

15 Q. Now, what does this photograph Number 3 tell us
16 about the fire?

17 A. So this photograph shows the fire in a stage of
18 higher burn than we have seen in other photographs. What we
19 see in this photograph and from what we're able to tell on
20 the information provided within what we call the MedData of
21 the photograph, this photograph was taken at approximately
22 6:44 a.m. That was just the information that was imbedded
23 within the photo. So that's as accurate as the equipment it
24 was taken on.

25 Q. Okay. Let me back up on that. What is MedData?

26 A. MedData is the information that is imbedded within

1 a digital photograph. It includes information such as --
2 can include information such as the time the photograph was
3 taken, where the photograph was taken if it's a GPS-enabled
4 device, the raptor speed, the lighting conditions it's taken
5 under, whether a flash was used or not used. Anything that
6 could be -- any feature to a camera may have -- could be
7 imbedded in the MedData including the device it came from.

8 Q. How do you know how to check or obtain MedData from
9 digital photographs?

10 A. MedData is a technique that is taught to us while
11 going through our standardized -- Peace Officers
12 Standardized Training. Part of our evidence collection is
13 to identify that information within a photograph.

14 Q. Is this something you've done before?

15 A. Yes, it is.

16 Q. So you said that Number 3, according to the
17 MedData, was taken at approximately 6:44 a.m.?

18 A. Yes, on November 8th.

19 Q. Now, let's back up to Number 2. Okay. We will
20 start it over from here.

21 Okay. Number 2. Were you able to obtain MedData
22 off of Number 2 also?

23 A. I was.

24 Q. And what time does the MedData from Number 2
25 indicate that that photograph was taken?

26 A. Also at 6:44 and some seconds and some milliseconds

1 later.

2 Q. Does the MedData identify the seconds?

3 A. It does.

4 Q. And Number 2 what is the exact time that that photo
5 was taken according to the MedData?

6 A. Can you ask the question again.

7 Q. For Exhibit Number 2, according to the MedData what
8 was the exact time including the second that it was taken?

9 A. I would have to look at the exact second again. It
10 was also within 6:44 and I believe 21 seconds, but I'd have
11 to look at the MedData to be accurate.

12 Q. And how about going back to Number 3. You said it
13 this was 6:44?

14 A. And 06 seconds. But again, I would have to look at
15 the MedData to be accurate.

16 Q. Okay. We can go back and check that later.

17 All right. So let's move on now. And you have a
18 photograph Number 4 in front of you?

19 A. Yes.

20 Q. Recognize that photograph?

21 A. I do.

22 Q. Do you know what is depicted in that photograph?

23 A. I do.

24 Q. Did you take that photograph?

25 A. I did.

26 Q. Is the photograph marked Number 4 that you have in

1 your hand the same photograph that is displayed on the
2 board?

3 A. Yes, it is.

4 Q. What is this photograph depicting?

5 A. This was a photograph that I took once I was able
6 to identify the general origin area. This was a photograph
7 that I took while trying to document that area and just the
8 surrounding view in the photograph. It captures the
9 Caltrans yard and the gravel piles that I believe are in
10 Exhibit 3.

11 Q. Do you want to step down and use the big board and
12 the drawing tools again --

13 A. I do.

14 Q. -- to point out what it is you're talking about on
15 this?

16 A. So he talked about Exhibit 2, and the gravel piles.
17 I believe there are two gravel piles in Exhibit 2 and I
18 believe this (indicating) is the lighter-colored pile and
19 this (indicating) would be the darker-colored pile.

20 Q. So those are the piles of gravel that are in the
21 foreground of the photograph marked 2?

22 A. Yes.

23 Q. Now, does it this photo show the Caltrans yard?

24 A. Yes, it does.

25 Q. And where is the Caltrans yard in this photograph?

26 A. Highlighted in yellow.

1 Q. So for the record, the two gravel piles alongside
2 Highway 70 in the photograph have been highlighted in blue
3 and the highlighted yellow pen has been used to surround the
4 Caltrans yard; is that correct?

5 A. Yes.

6 Q. And just to give us some idea of location and
7 context here, the road running down there that we can see in
8 the photograph is Highway 70?

9 A. Yes, it is.

10 Q. Where is the Feather River?

11 A. The Feather River is not entirely visible because
12 of the angle of the slope. If we can see through the
13 mountain -- and this is strictly an estimate -- I'd say the
14 Feather River is probably down here (indicating).

15 Q. And you are drawing the florescent green line
16 across the photograph to demonstrate the approximate
17 location of the Feather River?

18 A. Approximately, yes.

19 Q. Okay. So Colton Taylor who was in that box -- in
20 the highlighted yellow box inside the Caltrans yard and
21 Jerry Parks who was somewhere on Highway 70 looking across
22 the two gravel piles highlighted in blue; is that correct?

23 A. I believe so.

24 Q. And they're looking up to where you're taking this
25 picture from; is that --

26 A. That is the best of my understanding, yes.

1 Q. Okay. You're somewhere inside the fire semicircle
2 that you -- that is depicted in the photographs?

3 A. Yes.

4 Q. Okay. Great. All right. So now we can go --
5 well, you can stay up here.

6 Do you have the photographs?

7 A. I do. They are right here.

8 Q. All right. So when we kind of took that little
9 diversion to look at the photographs, you were just starting
10 to identify the general area of origin. You had gone up
11 Camp Creek Road following the bulldozer, identified an edge
12 to the fire. And you said you drove past, checked
13 everything, and then you came back.

14 A. I did.

15 Q. And what did you do at that point?

16 A. At that point, I had met with Battalion Chief
17 Officer Mike Thompson and Assistance Chief Investigator
18 Officer Shawn Zimmermaker. They both came as part of the
19 regional response. The three of us -- I discussed with them
20 my findings. They concurred what they saw coming in that,
21 yes, the road coming into that location was in the advancing
22 vector. So we were on the same page or in agreement. And
23 then all taking a separate path we just started following
24 all the fire flow indicators. And that basically brought us
25 up the hill to the location that I took this photograph
26 from.

1 Once I -- and as we were working our way up the
2 hill, once we started getting into some of those little fine
3 macros -- so smaller macros which are the bigger ones and
4 some of the micro indicators -- we started setting pin
5 flags. So the pin flags that we use are quite simply; a
6 wire pin with a color flag on them usually made of cloth or
7 plastic.

8 Those flags represent the totality of the
9 indicators in the specific area. So if I'm walking up the
10 hill and I see 12 different indicators that tell me I'm in
11 the advancing vector, I will set a red flag down. If I see,
12 you know, another 15 indicators that say that I'm in the
13 backing vector, I will set a blue flag down. And so on and
14 so forth for all of our different vectors we call them. We
15 have advancing, which is always going to be red, backing
16 which is always blue, lateral which is always yellow,
17 anything of interest is green, and evidence or/and origin
18 would be -- a very specific origin would be a white flag.

19 And that's all based off of NWCG; National
20 Firefighter Coordination Group. And it's part of the
21 curriculum, the fire investigative curriculum that teaches
22 how we do our investigations. The standardized training
23 tells us to use those colors in that convention.

24 So I'm placing my flags. Mike is also placing
25 flags. And Zimmermaker didn't have flags with him, but he
26 gave good strong moral support. So as we are setting flags,

1 we are also observing the weather, fire behavior around us,
2 any potential hazards which there were many that day. But
3 we're trying to document as much as we can while we are
4 there.

5 We did identify early on that there is some serious
6 safety concerns. The fire is still burning. The fire is
7 burning within our direct proximity. We have safety gear,
8 but our escape route is very steep, very dangerous, not good
9 footing. If anything were to go sideways, we were kind of
10 in a bad position. Winds were blowing extremely strong.
11 There was a potential for re-burn with fire below us. We
12 were unsure if anything in the area had been de-energized.

13 Okay. See in this photograph, which is still
14 Exhibit -- what is this? Exhibit 4. I'm standing under the
15 transmission lines and we have again winds that are up here
16 on the top of the ridge seriously affecting my ability to
17 stand upright. So if -- with these safety factors in mind,
18 we concluded that we needed to do a very efficient initial
19 origin investigation and get off the hill for safety
20 concerns. But we wanted to document as much as we possibly
21 could because we didn't know when we'd be able to come back
22 in. And so we took as many photographs as we can, put as
23 many flags down as we possibly could, did a confirmation on
24 each other's work to make sure we were seeing the same
25 things and in agreement, and then we got off the hill
26 posthaste.

1 Q. All right. So I'm going to switch back to the
2 photograph marked as Number 6.

3 A. Okay.

4 Q. There we go. You talk about walking up the hill.
5 And I'd like you using this photograph to explain to the
6 jurors what you're talking about.

7 A. Not the best photo to explain the hill, but I will
8 do my best. So as we talked about and just to make sure we
9 are talking about the same language here, I'm looking at
10 Exhibit 6 and the photograph on the screen is Exhibit 6.

11 I kind of testified earlier how steep this hill was
12 and the angle that it was on. The direction that we came in
13 and traveled on we actually traveled through the black areas
14 because in my world that's the safest place to be. We call
15 it black which is the burn area. We try to always walk in
16 the black area. The fire has the least chance of burning us
17 although it does have potential.

18 Coming in from this direction was extremely
19 dangerous. If the fire made a complete reversal on us, we'd
20 be in a very bad position especially with the fire behavior
21 and activity that we had that day. We actually came in
22 through the valley of the bridge or two bridges. That was
23 where we first identified our change in vectors. We went
24 from the advancing vector to lateral and to a backing
25 vector. Again, the backing vector over here is our lateral
26 and over here is our advancing.

1 So we came up -- when I say "came up," we were off
2 scene and behind up the top here. I would say it's
3 somewhere in the neighborhood of about 6 to 700 feet
4 elevation change. But I would have to compare that on a map
5 for accuracy. And that is my best estimation for my
6 experience.

7 Q. At the time when you are hiking up there, are you
8 aware at that point that there is an insulator string
9 hanging upside down on this tower?

10 A. No.

11 Q. Now, I want to move on to the next photograph that
12 is better. And that is Number 7. Okay. And do you have
13 Number 7 with you?

14 A. I do.

15 Q. Do you recognize Number 7?

16 A. I do.

17 Q. Did you take Number 7?

18 A. I did.

19 Q. Do you see the photograph that is being displayed
20 on the big board?

21 A. I do.

22 Q. Is that photograph the same as the photograph
23 marked as Number 7 that you have in your hand?

24 A. It is.

25 Q. So this photograph now is from up above near the
26 base of that tower?

1 A. Yes.

2 Q. Does this show a little bit better the terrain you
3 were -- that you were hiking and what you were dealing with
4 hiking up to this tower?

5 A. Yes, it does much better.

6 Q. Describe for us what we're seeing.

7 A. So speaking of terrain, if you can imagine this
8 piece of metal right here on the tower that I'm pointing to,
9 which is the lower-most horizontal on the east side of the
10 tower, is actually level as I'm looking up at the tower.
11 And this kind of shows the type of slope we're working on.
12 So it's pretty steep. The ground is either extremely rocky
13 or extremely sandy and nothing in between. What's left we
14 have to work with is very difficult to access. It was
15 arduous work to carry out all our gear and investigative
16 equipment with us which consists of a backpack with a bunch
17 of heavy items.

18 So this area is pretty well protected from most
19 foot traffic. I didn't see any recent evidence up there of
20 any foot traffic being up there. So in my mind I'm already
21 starting to develop different hypotheses and I am starting
22 to eliminate things as I find them fit to be eliminated.

23 So one of my initial hypothesis was "Okay. It's
24 November. It's very likely that somebody could be up here
25 shooting, hunting. Anything like that." But I found no
26 evidence up there that told me there was anything like that.

1 So it's a pretty secluded, pretty isolated area.

2 And as the three of us are walking up, we are
3 setting pin flags. We are identifying little things that
4 are unusual. That is what this green flag is here. There
5 is a piece of ceramic material right here (indicating). It
6 might be something. Don't know yet. It's not evidence.
7 It's not marked as a white item yet but definitely an item
8 of interest.

9 But as we are walking up, Officer Mike Thompson
10 Battalion Chief says "That doesn't look right." And so we
11 all looked up because we were looking down at the ground
12 looking at indicators, following indicators for a scientific
13 process and counterclockwise kind of rotation. And I look
14 up and I see this.

15 And if I may draw on the board again.

16 Q. Yes.

17 A. What I initially identified and agreed with
18 Officer Thompson is this item right here that I'm
19 identifying in red is an inverted insulation suspension
20 string. So that item is supposed to be supporting a
21 conductor. Adjacent to it on the same tower on the same
22 side of the tower on the side again in red I'm identifying
23 another insulation string that appears to be in the correct
24 position.

25 I identified this when Officer Thompson pointed it
26 out and determined that is an important picture to take. So

1 I immediately photo documented it. So this is the first
2 up-close photograph that I have showing any type of damage
3 to the tower later identified as the Caribou-Palermo 27/222
4 tower.

5 Q. So this tower that we're looking at in photograph
6 Number 7, that is the same tower that we're were looking at
7 in photograph Number 6 which was the initial photograph that
8 you shot; correct?

9 A. Can I clear this?

10 Q. Yes, clear that.

11 A. Yep.

12 Q. So now we're close up to it. That is the same
13 tower that is depicted here and in Colton Taylor's
14 photograph?

15 A. Yes, it is.

16 Q. And is there anything -- I should go back to it.
17 Is there anything distinctive about this tower as opposed to
18 all the other towers in these lines that helps you to
19 identify that this is the tower in question?

20 A. There are a few things identifying it. Initially,
21 just from a quick glance from the roadside you can identify
22 one of -- this type of tower by a few things. So just an
23 aside from the specific type of tower, there is a
24 superstructure on top of this tower. It forms a "T." The
25 tower next to it had the same "T." That's a superstructure.
26 That makes it what we call a transposition tower. A

1 transposition tower, as I have been told by one of our
2 electrical engineers, is used to kind of balance the
3 electricity.

4 So there's a lot of physics involved with the
5 transmission of electricity. There are forces that are
6 incurred upon the line. So there is induction. And there
7 is somebody who can speak on this who is a scientist
8 specifically within the field. But there are certain things
9 that they rotate these phases, the different phases to
10 basically bounce electricity.

11 So this tower is a little bit different than the
12 towers that are west of it. So it kind of stands out.
13 There is also another one of these arms sticking out. I
14 cleared that one. Anyway, I will redraw it. No. These
15 arms here also are part of the transposition setup. There
16 is only a handful of these throughout -- more than a
17 handful. There is several of them throughout the canyon
18 that look like this, but most of the rest of them are flat
19 across the top and don't have these extra hardware on them.
20 So that was identifiable. And I don't have -- I don't think
21 I provided the -- I don't think the other photographs show
22 the tower number very well.

23 Q. No.

24 A. On the tower there's a number. It says 27/222.
25 It's written -- it's painted directly on the tower. And the
26 tower has a panel on it that says "27/222." We identified

1 that and took the information back. We didn't know what it
2 meant, but we knew it had to be something. So we recorded
3 that as well.

4 Q. So when you refer to the tower as 27/222, that is
5 where the information comes from?

6 A. Yes.

7 Q. That is a number that is actually affixed to the
8 tower itself?

9 A. Yep.

10 Q. And if you look at the other towers --

11 A. Several.

12 Q. -- do they have this same number on them?

13 A. They have a similar type of number convention but
14 not the same number. Every tower has its own number. And
15 it's -- I have learned the convention is the first number --
16 the 27 is the mileage from the power substation or the power
17 station that it came from or the generation station where
18 the power is coming from. And the second number, the 222 in
19 this case, is just the sequence number for the tower in that
20 line. So it's basically two different measurements. How
21 many miles and how many towers away from the power source.

22 Q. So this tower would be 27 miles away from the power
23 source and tower number 222 in the line?

24 A. Yes.

25 Q. And you were able to identify that line as the
26 Caribou-Palermo transmission line?

1 A. Yes, we were able to identify that through
2 confirmation from PG&E.

3 Q. Now, going back to our earlier photographs, we had
4 talked about the distinctive factors in the first
5 photograph -- Colton Taylor's photograph -- is the T-top
6 structure visible on that photograph?

7 A. It's clearly visible to me, yes.

8 Q. And then there is the Jerry Parks photograph going
9 back to People's Number 2.

10 A. And the transposition superstructure is clearly
11 visible to me.

12 Q. And which part of it -- if you can use the drawing
13 map on there again and show us.

14 A. Again, there is the T on tower 27/222 and these are
15 the other superstructures on the towers in the same line.

16 MR. NOEL: For the record, he's highlighted in
17 green the T structure -- capital T structure on top of the
18 tower with the green highlighter pen.

19 BY MR. NOEL:

20 Q. All right. So let's get out of that. So you're
21 wandering around up there, and Chief Thompson says "That
22 doesn't look right." And you turn and you notice something
23 unusual about this tower which you identify as 27/222;
24 correct?

25 A. Correct.

26 Q. And you said you started photographing it to

1 document it immediately?

2 A. Yes.

3 Q. Now, I have in front you a photograph marked
4 Exhibit Number 8 that is -- do you recognize that
5 photograph?

6 A. I do.

7 Q. Did you take that photograph?

8 A. I did.

9 Q. Is the photograph you have in your hand Exhibit
10 Number 8 the same photograph that is being displayed on the
11 big board at this time?

12 A. It is.

13 Q. Describe for us what we're looking at in Exhibit 8.

14 A. So this is a moderately zoomed-in photograph
15 similar to Exhibit 7. It's a little bit different
16 perspective and a little bit further from the east but not
17 much.

18 This photograph's main intent was to capture in
19 this photograph what this tower looked like referring to
20 transition tower 27/222 on the Caribou-Palermo line and the
21 neighboring tower on the same line who had a similar type
22 structure on the east side of that tower. And I would have
23 to verify that specific tower number and line.

24 Q. Again, does this photograph show the insulator
25 string upside down?

26 A. It does.

1 Q. If you can show us use the marking app or the
2 drawing app -- it seems to take longer to start each time.

3 A. Patience. Here is the insulator string that is
4 inverted.

5 Q. Now, you have used a term a few times. And I think
6 this photograph is a good one to illustrate it. The
7 conductor or the jumper conductor. Can you identify for us
8 on this photograph what is the jumper conductor.

9 A. Yes. It's what we have been referring to as the
10 transposition conductor.

11 Q. Okay. Transposition conductor is another word?

12 A. Yep. Again, if I'm being too technical. This
13 transfers the right phase to the left phase. So the right
14 phase coming into this tower gets transpositioned onto the
15 left phase going out of the tower towards Palermo.

16 Q. Okay. Probably at this point it's a good chance to
17 define what you mean by "phase."

18 A. So in blue I have identified where that conductor
19 is; the transposition conductor. So a phase is a term used
20 in electrical sciences to describe the pulse. So there is a
21 different phase you can do with electricity. So typically a
22 house has what we call a single phase. As we know, it's an
23 alternating current. You have an up-and-down arc. We have
24 highs and we have lows across a variable medium. Those
25 highs and those lows are single phase. They just look like
26 a regular wavelength.

1 However, commercial electricity, in order to be
2 more efficient with power, there is actually three separate
3 phases. That means there is three actual wavelengths. And
4 I'm going to draw it up here in blue just to --

5 Q. Go ahead.

6 A. -- make it more visual than I am. So you have -- a
7 single phase has a wavelength just like you see here. Here
8 is your column line and a neutral line. There is no power
9 happening. On these phases you basically have the same
10 line, but it looks -- you actually have different
11 wavelengths working together. And so what that does is it
12 gives you kind of a more opposing piece so they are both
13 high electrical currents on either side. So that is
14 basically three phrase in a nutshell.

15 And what we have here is each one of these lines is
16 basically coming with a pulse at 60 hertz per second. And
17 that is each one of these colors represents these lines. So
18 this would be red. This would be black. This would be
19 green. And so it is rotated to kind of balance out static
20 electricity and all that other stuff that gets kind of
21 induced on the lines.

22 Q. So basically each one of the lines -- the
23 electrical lines that comes into the transposition tower is
24 referred to as a phase?

25 A. Yes, it is.

26 Q. Now, you have also used the term conductor. What

1 is that? What is a conductor, to your knowledge?

2 A. A conductor is a firewall; anything that can move
3 heat or electricity. In electricity world in what I
4 learned. If I may, in electricity a conductor is either
5 steel, aluminum, or copper wire that can transport
6 electricity vision ly.

7 Q. So when you say a -- that the conductor and the
8 transposition conductor or the jumper conductor or the
9 electric conductor itself, we're talking about the wires?

10 A. Yes.

11 Q. What most of us would refer to as the wires?

12 A. Yes.

13 Q. The power lines?

14 A. Yes.

15 Q. Okay. But then technically they are also referred
16 to as phases as they come in and out of the towers?

17 A. Yes.

18 Q. And then on this tower there are three phases, and
19 they go from right to left. And they are called right,
20 center, left; correct?

21 A. Yes. So if I may elaborate on that, I clarified
22 with Pacific Gas & Electric, which I have been referring to
23 as PG&E off and on. The way they identify their phasing is,
24 if I can explain without losing myself in the explanation,
25 with your back phasing the generation source -- in this case
26 Caribou Powerhouse -- and if you're looking at the tower,

1 you have right, center, and left phase.

2 So right now I am looking uphill towards the right.
3 Now I am looking uphill towards the generation station. If
4 I turn my back this way, it would be the right, center, and
5 left.

6 Does it make sense? Okay. I can get highly
7 technical sometimes. And forgive me for that.

8 Q. You said this line -- the Caribou-Palermo line
9 originates at the Caribou Powerhouse?

10 A. Yes, as provided to us by PG&E.

11 Q. Earlier you said that the wire comes out on, you
12 know, the transposition line. It goes from the right phase
13 down under, comes up on the left phase, and then comes out
14 of the transposition tower heading down the line towards
15 Palermo?

16 A. Yes.

17 Q. So do we know why it's call the Caribou-Palermo
18 line?

19 A. Because it starts at Caribou and ends in Palermo.
20 And that is the naming convention that has been used
21 since -- as I understand since this line has been in place.
22 And all the lines in California within the PG&E company, as
23 far as I know, it's always -- as far as I know it's always
24 named for where the electricity starts on that line to where
25 it ends on that line.

26 So it may be a generation station, it may be a

1 substation, it may be a switch station, but basically from
2 control point to control point that is how they name them.

3 Q. All right. So you guys are up here taking
4 pictures. And let's go over that real quick and move along.

5 Next up is a photograph marked as Exhibit Number 9.
6 Do you have Exhibit Number 9?

7 A. I do.

8 Q. Do you recognize what is depicted in Exhibit
9 Number 9?

10 A. I do.

11 Q. Did you take People's Exhibit Number 9?

12 A. Yes, I did.

13 Q. And see the photo that is being displayed on the
14 big board for the jurors?

15 A. I do.

16 Q. That is the same photograph that you have in front
17 of you? Number 9?

18 A. It is.

19 Q. This looks like it's a photograph of somebody's
20 cellphone.

21 A. That is. That is my work-issued cellphone.

22 Q. Why are we looking at a photograph of somebody's
23 cellphone?

24 A. One of my documentation techniques is to bring up
25 my GPS Essentials application on my work-issued Samsung
26 phone and use that as my GPS. It gives me several things.

1 Number one, I've compared it to hand-held versions of GPS by
2 Garmin, et cetera. This has a very similar accuracy from
3 what I can tell. It also gives me the accurate timestamp.
4 So I use this as a documentation tool to show my location
5 with a network-accurate timestamp.

6 Q. So where were you when you took this picture?

7 A. I took this photograph right after I took the two
8 previous photographs documenting the tower. I wanted to
9 identify the time and location I took those photographs.
10 Again, I did not know if I'd be able to return to that
11 location.

12 Q. Or if this location would look the same if you did
13 get back?

14 A. Or if it looked the same when I got back. I
15 believe this photo was taken at 2:12 p.m. Yep, 2:12 p.m.

16 Q. So how much work were you able to get done on the
17 afternoon of November 8th?

18 A. We were able to work on the south side of the
19 tower. We did kind of cross under the power lines a few
20 times but minimally. We were concerned about the stability
21 of the tower, the stability of the conductors, whether or
22 not if it was going to fall, stand. We already had damage.
23 We were unsure of what the outcome is going to be with the
24 winds given. And I'd have to look at my last photograph
25 timestamp, but I believe we were only up here for
26 approximately one hour getting work done. But we got -- I

1 would say we were able to get a 360 view of the tower and we
2 were able to get probably 60 percent of the origin flags
3 placed that first day.

4 Q. So describe the actual work that you accomplished
5 that first day.

6 A. We were able to identify, first off, a GOA. That
7 is -- the first step is to identify a general origin area.
8 Like, that is the -- you know, where is our starting point
9 of our origin. In this case, it was about 100 feet. So
10 about a quarter acre was the size of our GOA.

11 Q. The GOA means?

12 A. General origin area.

13 Q. Okay.

14 A. On this day we were also able to identify three
15 specific origin areas. Those three specific origin areas --
16 one was located directly east of the tower, one was located
17 directly south of the tower, and the other one was kind of
18 southwest of the tower kind of in a line.

19 That day we did identify a couple pieces of
20 aluminum conductor fragments within one of the GOAs, the
21 specific origin area. That first specific origin area had
22 two -- what looked like two fragments of conductor wire.
23 And it appeared -- all our indicators told us that this was
24 an origin area because we had an initial point, we had
25 backing fire in all directions, which tells me super low
26 intensity, really low movement, still protected because it's

1 close to the ground. It hadn't build up any heat. It
2 wasn't influenced yet by the wind, topography, or fuel.

3 Our second SOA was definitely bigger than our first
4 SOA. It was basically a half radius about ten meters in
5 diameter directly to the south of the tower. And our third
6 SOA was about seven feet in diameter. And that was again
7 just southwest of the tower. All three of these had the
8 line.

9 Q. So we talked earlier about in general how you look
10 at -- how you determine general areas of origin and specific
11 areas of origin and ultimately going into cause. Can you
12 explain for the jurors how it was in this specific case --
13 what the indicators were -- the micro indicators, the macro
14 indicators. What was it that brought you into the general
15 area of origin and the general origin area and eventually to
16 the specific origin areas?

17 A. Yes. I kind of talked to you about using the
18 macros and some of the larger micro indicators to get us in
19 the general origin area. And I got into the general origin
20 area and started looking at ways we define details. It was
21 really down on the ground. We are looking at the sides of
22 rock for sooting and staining or basically where the smoke
23 is deposited. We are looking at areas where you have grass
24 that is unburned. It's hiding behind a rock and being
25 protected.

26 We're looking at how you could have fuels in an

1 area that are unburned or you have small fine grasses that
2 are burned, which kind of gives us the intensity. All these
3 factors are kind of taken into consideration.

4 I talked about the stem fall we were looking at.
5 We saw some of that up there. I didn't even know what they
6 were. There was some sort of a seedpod that was up there.
7 Those are great little indicators kind of on the outlying
8 area because those showed really good shifting, bending,
9 twisting, and burning on one side and would be completely
10 whole on the other. I believe we had -- I think we have an
11 exhibit here for that too as well.

12 So all of these indicators we take into
13 consideration, everything in a specific area. And that is
14 where you determine how the flags are going to go. And then
15 once we set all of our flags, it's almost like painting a
16 picture. Every stroke doesn't really show you the whole
17 picture. But once you've done all your paint strokes and
18 all the flags are down, you kind of stand back and take a
19 look. And you can really just kind of see -- once you
20 understand what blue means, what yellow means, what red
21 means, you can just kind of see how the fire moved. And if
22 you know how the fire moved, you can track that back to this
23 specific area. And that specific area is where they
24 identify it as a specific origin area.

25 In this case, we actually had three of those in a
26 very confined -- relative confined space were the size of

1 our GOA.

2 Q. One thing I noticed as I was looking at this
3 photograph marked as Number 9 as well as looking back to 8
4 and 7, we don't see a whole lot of grass or vegetation.

5 A. On this side we do not.

6 I'm sorry. Which one were you talking about?

7 Q. Seven, 8, and 9.

8 A. Seven, 8, and 9.

9 Q. I have all three pictures.

10 A. So, yeah. There is -- well --

11 Can we bring up 8 and 9 into the lower area?

12 Q. Absolutely.

13 A. So actually, there is quite a bit of vegetation
14 here. Initially, from those first photographs if you're not
15 really looking at it, I guess, through origin and cause
16 eyes, it looks pretty barren. But there is actually quite a
17 bit of unburned fuel until here. There's still like a lot
18 of unburned fuel. For the way this fire was burning and the
19 way the fire was kind of running through the rest of Butte
20 County, right here it was really, really low intensity,
21 really low intensity, which tells me that the fire started
22 right in this area. And all my indicators validate that.

23 But when I first see all this unburned fuel and
24 everything around it is moonscaped, that tells me that this
25 is where the fire was its least intense. And typically, in
26 my experience the top of a ridge, the top of a knob usually

1 gets some of the most amount of heat because not only is it
2 going to be influenced by the fuels and the vegetation, it's
3 also being influenced by the slope, running up hill with
4 heat, but it's also influenced by the wind. And so if the
5 fire started anywhere but here, I'd expect this to be
6 completely moonscaped. There is no vegetation anywhere up
7 here save for a few small protected areas hiding behind
8 rocks. But we have some way out in the open and other that
9 should have been completely consumed.

10 So the more I went through this -- and that is just
11 in the first day and the first hour of me being at the
12 GOA -- I could not disprove this. So there was quite a bit
13 of vegetation there.

14 Q. You said you spent about an hour up on this
15 location -- yours, Chief Zimmermaker, and Chief Thompson --
16 on the afternoon of November 8th?

17 A. Yes.

18 Q. And then you had to leave?

19 A. Yes.

20 Q. And how long was it before you could get back to
21 this location?

22 A. Well, we weren't able to return until Saturday; two
23 days later.

24 Q. Is that Saturday, November 10th?

25 A. Yes.

26 Q. Why weren't you able to get back up there?

1 A. When we left the site, the GOA -- after documenting
2 everything as best as we could and as efficiently as we
3 could, we were unable to return because the fire activity
4 had increased so severely that access to this location was
5 impossible.

6 Q. So you couldn't get back?

7 A. No. For safety there was no -- the risk was too
8 great.

9 Q. You had talked earlier about the possibility of a
10 re-burn and a possibility of the wind shifting blowing the
11 fire back. Did either of those occur?

12 A. Yes. Both of those occurred as we expected them to
13 with the weather pattern that was presented.

14 Q. So this whole area burned one more time before you
15 could get back in there to finish up?

16 A. Significantly, yes.

17 MR. NOEL: All right. Madam Foreperson, I believe
18 it's after 4:20. This would be a nice natural breaking
19 point for the day.

20 GRAND JURY FOREPERSON: Okay. Does everybody want
21 to leave or stay?

22 GRAND JUROR NUMBER SEVENTEEN: Another hour,
23 please.

24 MR. NOEL: We get paid until 5:30 you know.

25 GRAND JURY FOREPERSON: Captain Kluge --

26 THE WITNESS: Kluge.

1 GRAND JURY FOREPERSON: Kluge -- I'm sorry -- you
2 are admonished not to discuss or disclose at any time
3 outside of this jury room the questions that have been asked
4 of you or your answers until authorized by this grand jury
5 or the Court. A violation of these instructions on your
6 part may be the basis for a charge against you of contempt
7 of court. This does not preclude you from discussing the
8 legal rights with your own attorney.

9 Captain Kluge, what I have said -- just said is a
10 warning not to discuss the case with anyone except the
11 Court, your lawyer, or the district attorney.

12 THE WITNESS: Okay.

13

3 (Confidential Grand Jury Hearing Proceedings)

4
5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 GRAND JURY FOREPERSON: Okay. Good morning,
10 Captain Kluge. I'd like to remind you that you are still
11 under oath at this time.

12 THE WITNESS: Yes, Ma'am.

13 GRAND JURY FOREPERSON: Thank you. You can have a
14 seat.

15 THE WITNESS: Thank you.

16 **EXAMINATION CONTINUED**

17 BY MR. NOEL:

18 Q. When we left off last week, Captain, we were
19 talking about Exhibit Number 9. It's a photograph of your
20 state phone documenting your GPS location.

21 A. Yes.

22 Q. And you were up near the area of origin in the fire
23 or what you ultimately determined to be the area of origin
24 of the fire; correct?

25 A. Correct.

26 Q. And just to remind us very briefly, can you go over

1 how you reached that area, how you determined that that was
2 an area of interest?

3 A. As I described last week, I was following the
4 evidence left on the ground, how the burn pattern works its
5 way down the hill. And I just followed it backwards back to
6 the site where everything kind of came together and pointed
7 back to a single location.

8 Q. Now, the next series of photographs we're going
9 through are some photographs that, as you termed them last
10 week, are micro and macro indicators that you observed.

11 Do you have the stack of photographs in front of
12 you?

13 A. I do.

14 Q. You should have photograph Exhibit Number 10 right
15 in front of you.

16 A. Yes, I do.

17 Q. Exhibit Number 10 is up on the board.

18 A. Yes, it is.

19 Q. Can you explain to us what we're looking at in
20 Exhibit Number 10 and specifically what these yellow and red
21 pin flags mean.

22 A. Yes. So what we're looking at is a -- I'm standing
23 with my back toward the tower and I'm facing west looking
24 down the hill. If you look in the kind of upper
25 left-corner, you see a little section of road. That is Camp
26 Creek Road just to kind orientate where we're at.

1 And so this photograph I took because this is
2 basically showing the advancing vector. So I'm looking in
3 the direction the fire traveled. So the fire would have
4 been traveling away from my standing position, if that makes
5 sense.

6 And may I approach the --

7 Q. Absolutely, absolutely.

8 A. So there's a lot of actual indicators here. I know
9 it looks very barren and there's a lot of material that had
10 turned away here from what I saw on the next ridge over on
11 the first day. For how much vegetation there should be here
12 there's a lot missing. So that to me is instantly kind of
13 an indicator that, you know, with it being so well burned
14 through here and only sparse little bits of vegetation still
15 left, that tells me that the fire burned with great
16 intensity through this area.

17 These yellow flags here -- as I indicated last
18 week, these yellow flags are indicative of a lateral
19 advancing fire. So I know we kind of talked about them.
20 I'll go over them again real quick.

21 We talked about that "V" pattern. On the bottom of
22 that "V" pattern we're going to have backing where it's
23 super low intensity at the head of the fire which is
24 represented by the red flags. Those are going to be really
25 well-burned indicators that the fire was moving with greater
26 intensity. And the lateral is as the fire kind of burns

1 outward using like radiant heat as its means of transition,
2 a little bit of convection.

3 So as I go through this if I lose anybody, please
4 just stop me a little bit. So what I'm looking at here is
5 in this particular flag here, for example, there is a whole
6 lot of information that I can see. I have a lot of sooting
7 underneath this rock here in this space where I don't have
8 it so much over here.

9 And if you can see the other side of this rock,
10 there is actual protection. So there is actually a little
11 bit of vegetation that didn't burn as cleanly as it did on
12 this side. So that tells us as the fire is going through
13 here, that rock provided protection and prevented some of
14 that vegetation from burning. You know, I know there's a
15 lot of different colored flags here, but the fire did burn
16 with an eddy effect.

17 So we're looking downhill. Over to my left-hand
18 side as I'm facing the screen, that would be the Feather
19 River drainage. And that was the main pathway for all the
20 winds that were blowing that day. So if you can kind of
21 consider the totality of the scene, we're sitting up on a
22 bit of a knoll or on a bridge. And as the winds blow around
23 us, it's creating these eddies into this little kind of spur
24 valley here. And so what that wind was doing was causing
25 fire to kind of burn in all directions. There is a blow to
26 it, an ebb and flow that just kind of would surge and back

1 off and surge and back off and surge and back off.

2 So we're going to have, you know, kind of all these
3 different indicators, but the totality of indicators tells
4 me that at one point we have the fire -- the fire is burning
5 down in this area. It slowed way down when it started to
6 get in this little canyon area where it started to become
7 less influenced by the wind and more influenced by the
8 topography. In other words, it wanted to burn uphill.

9 And so down here at the bottom we have all this
10 vegetation that did not burn even in the gully here where
11 it's actually backed slowly into it and didn't have the
12 intensity where it burned everywhere else. That actually
13 came up later when we were kind of reviewing some other
14 photographs.

15 I think we can -- can we go back to one of the
16 other images?

17 Q. Absolutely.

18 A. I will take these with me so I'm not bouncing back
19 and forth.

20 May I use the corner of your desk?

21 GRAND JURY SECRETARY: Yes.

22 THE WITNESS: So if we can go to Exhibit 5, in
23 Exhibit 5 -- I didn't have the opportunity to see this
24 photograph until several days after the fire. What we're
25 looking at right here in Exhibit 5 are those exact
26 indicators I was looking at. The fire had made a forward

1 run, slowed down, and was backing in this lower area right
2 through here (indicating). So that just validates that my
3 scientific processes are accurate.

4 And we're always looking for that. As a scientist
5 of fire, which I am, I'm always looking for that validation,
6 that check, that control to make sure that we're on the
7 right track. So there is good validation. And then it goes
8 back to --

9 BY MR. NOEL:

10 Q. So real quick before this -- and I'm not sure that
11 we hit on it. You talked a lot last week about "V"
12 patterns.

13 A. Yes.

14 Q. And on this fire -- on this photograph Number 5 we
15 see somewhat of a "V" pattern coming down the hill; correct?

16 A. We see several "V" patterns, yes. So our initial
17 "V" pattern -- and other photographs will also validate
18 this -- we have the fire kind of moving out towards us. If
19 we could put this in three dimensional perspective, this
20 fire is actually moving towards us generally speaking. But
21 there are little "V" patterns here where it started to
22 become terrain influenced and is now burning up here.

23 So we had this "V" pattern and a lateral fire -- a
24 little lateral fire here, here, and a backfire through here
25 and then, of course, the advancing vector over here on the
26 most southern side at the time that the picture was taken.

1 Q. Now, before we go back to Number 10, can you use
2 this photograph Number 5 to show us exactly the location
3 where you were taking the photograph in Number 10?

4 A. Regarding -- yes, I can. I can zoom in.

5 Q. Yeah. I think it's zoomed in as much as it will
6 but just in the general area.

7 A. I was standing -- so if you can see the tower
8 clearly, I would be kind of in this spot here (indicating).
9 I can draw it on with technology --

10 Q. Yep.

11 A. -- with a dot.

12 Q. Yep. There it goes.

13 A. I would have been in that photograph. I was
14 standing approximately right there (indicating).

15 Q. So just downhill from the subject tower 27/222 in
16 the advancing vector of the fire?

17 A. Yes.

18 Q. That would be on the west side. Okay.

19 A. Can I clear the screen?

20 Q. Yep, please.

21 And before we move on, just remind us from last
22 week can you define for us what you mean with the lateral
23 vector and the advancing vector.

24 A. Yes. When I describe using the term vector in
25 regard to the fire progression, vector just means that, you
26 know, we take a totality of all the -- I use that word

1 totality because we don't go by one specific thing. It's
2 the totality of all the indicators. Because a vector -- if
3 we say the exact path of the fire, we don't necessarily know
4 the exact path. We can estimate an approximation based on
5 all the factors. But when we talk about vector, we are
6 talking about, you know, the fire generally moving this
7 (indicating) direction.

8 If I were to say "Specifically the fire is moving
9 in this exact path," it's impossible. So when I talk about
10 the vector, we're talking about the advancing vector, the
11 direction the fire is generally moving in. We call it the
12 head of the fire. And the lateral vector is basically a
13 side-moving vector as it moves laterally. And, of course,
14 the backing, like I talked about, just as it's creeping with
15 low intensity in the opposite direction, typically the
16 opposite direction of the head of the fire.

17 Q. On that topic, you're talking about trying to chart
18 the path of the fire. What role in that determination do
19 photographs such as the one we just looked at People's
20 Number 5 or Exhibit Number 5 play?

21 A. Again, it validates our scientific process. If we
22 have it beforehand, before we actually have a chance to go
23 up and do my origin investigation, it gives me a launching
24 point. It's information. It helps me get to where I need
25 to go. That is taking into consideration with all the
26 evidence that I see on the ground, witness reports,

1 photographs, videos, that all plays into how I come to my
2 origin determination.

3 If I get the photographs after, again, it's just
4 validation either that my scientific process is correct, my
5 hypothesis is correct, or my hypothesis is wrong and my
6 process was wrong. And then we can go back and reevaluate
7 and figure out, you know, as more information comes about
8 what we need to do to get on track. It's a living,
9 breathing investigation. We don't set ourselves on a train
10 track and stay the course. We follow the evidence and we
11 adjust as necessary.

12 Q. So, for instance, in this case you saw the
13 photograph that is marked as Exhibit Number 1 from
14 Captain McKenzie before you ever went up the canyon;
15 correct?

16 A. Yes.

17 Q. And that helped you get a starting point?

18 A. It told me that his first view of the fire put it
19 up on the hill. I knew I needed access from the Camp Creek
20 Road. I couldn't see if --

21 May I refer to his photograph?

22 Q. Yes, please.

23 A. And I'm looking at Exhibit 1. This photograph --
24 when you consider seeing it on a five -- I have a
25 five-and-a-half, six-inch smart phone screen. It wasn't
26 great detail. And considering the location and the

1 elevation we were on, we were still looking uphill. As we
2 talked about last week when we were talking -- looking at
3 the angle of the tower, we're still from Highway 70 looking
4 uphill. So, yes, it puts me in a general location. This is
5 more advanced fire progress than our other photographs that
6 we have. But it did tell me that I need to get up Camp
7 Creek Road to start my investigation. That was a starting
8 point. It was a point to launch from.

9 Q. So and then the remainder of what we'll term
10 witness photographs, which are Exhibits 2 through 6 --

11 A. And I have those here.

12 Q. Yep. Six including the first photograph you took.
13 You didn't have access and you didn't see those until much
14 later after you had done your initial investigation up at
15 the tower 27/222; correct?

16 A. Correct.

17 Q. And how did you use those? How did those
18 photographs affect your investigation?

19 A. As I said, all those photographs, as they started
20 coming in to us little by little by little through our
21 investigative process and identifying witnesses, it was able
22 to validate what we had done and what we had seen up on the
23 hill and that the work that we had done, the scientific
24 process we followed was accurate.

25 And, you know, as an investigator, as a scientist,
26 you know, it's always good to see that validation. You

1 know, it's that end result that, you know, you have
2 accomplished the task that was put in front of you. And,
3 you know, it's good validation to see this kind of thing and
4 to know that, you know, it works basically in your control.
5 You know, it proves that your work was accurate.

6 Q. You read the science correctly?

7 A. I read the signs correctly.

8 THE REPORTER: "Science" or "signs"?

9 THE WITNESS: Signs.

10 THE REPORTER: Thank you.

11 THE WITNESS: That's what I heard.

12 MR. NOEL: I said science.

13 THE REPORTER: That's why I asked.

14 BY MR. NOEL:

15 Q. All right. Let's move on. And one thing just
16 foundational, your origin and cause investigation was
17 comprised of two days on the hill; correct?

18 A. Mostly. There was some information that was
19 gathered on our evidence collection day.

20 Q. Okay. So you went up there the first day
21 November 8th and then you testified that you had to leave
22 because of the fire conditions?

23 A. Yes.

24 Q. The danger. And then you came back two days later
25 on the 10th or --

26 A. On Saturday, the 10th.

1 Q. The photographs that were shown, as we are going
2 through them you could identify as best as possible whether
3 this was a day one November 8th or day two November 10th
4 photograph?

5 A. Yes, I should be able to.

6 Q. All right. Number 11. You have that in front of
7 you?

8 A. I do.

9 Q. Tell us what we're looking at in Number 11.

10 A. So on -- and that's the same photograph that's on
11 the screen. The -- I'm standing on kind of a mid slope
12 trail. I don't know if we identified that in the previous
13 photographs. There's a little -- I believe it's a
14 maintenance trail used by either PG&E or it might just be an
15 animal trail. It's kind of a mid slope and it runs right
16 along the under slope there. So I'm standing on the trail,
17 and I'm still kind of -- I'm standing roughly southwest of
18 the tower for orientation, and I'm looking east.

19 And what we're looking at is this was a quick shot
20 that I took on the first day showing not only the vegetation
21 that was around but also there's a bunch of debris on the
22 ground. The debris includes old paint cans, fallen logs,
23 and then also here (indicating) there is a piece of ceramic
24 insulator that is on the ground. That is marked with a
25 green flag. Green was my industry standard for items of
26 interest.

1 In this photograph you can see that obviously
2 there's still a bunch of unburned fuel below us. It's still
3 smokey. That is our concern. This is very close and near
4 to where we were working. If this were to re-ignite and
5 re-burn, it would have been difficult escaping for all of
6 us.

7 You see it did burn partially again in a backing
8 vector super low intensity. You can see underneath all the
9 fuels here in the photograph. This is all ash underneath
10 all of the standing vegetation. So it burned really, really
11 low intensity. It was backing not only against the wind but
12 against a slope. The fuel almost had no influence on the
13 fire behavior here.

14 Q. So this photograph is taken from below and upwind
15 of the area of origin?

16 A. Below and standing downwind. The wind would have
17 been at my face if I'm facing east.

18 Q. Okay. But the area that you're photographing would
19 have been somewhat upwind of the area of origin?

20 A. Upwind wouldn't be a good way to describe it. The
21 way I would describe it is almost directly south and
22 downhill. It would be lateral to the tower.

23 Q. Okay.

24 A. So --

25 Q. How about photograph Number 12? Exhibit Number 12?

26 A. I have it here.

1 Q. Explain to us when this was taken, where this is,
2 and what we're looking at.

3 A. This one was taken on Saturday, the 10th. It was
4 when we returned and placed additional flags. So this photo
5 shows a lot of evidence on the ground. Number one, it shows
6 the tower. And just to be clear, the photo on the screen is
7 the same as the photograph I have in my hand.

8 It shows the tower and it shows a lot of the
9 backing indicators. This vegetative material here, this
10 dead and downed stuff you can see it's all cut at the base.
11 This is as a result of what I would assume would be the
12 PG&E's Vegetation Management Project. But I would again be
13 assuming by saying that.

14 But there's a lot of dead and downed material.
15 This stuff is dry. It had been baking for Lord knows how
16 long. It's bleached in the sun. It's dry. There is no
17 water content in there whatsoever. And yet it survived.
18 That tells me that the fire even though we're uphill from
19 what we determined to be one of our origins, the fire is
20 still just really low intensity, extremely low intensity,
21 and backing in this direction.

22 And there's grass on the ground that's an unscathed
23 route through here and up here (indicating). You see
24 there's still standing grasses up here. There was the fire
25 just really slowly backing here. That tells me the fire did
26 not come from the previous ridge or the previous valley. It

1 was -- the fire started beyond this point.

2 And then if we go back to photograph -- I'm sorry,
3 Exhibit 10, we have the opposite. You know, where it's a --
4 this is just really on the other side of the tower. So a
5 lot of evidence tells me that the fire -- well, go back to
6 12. The fire was started somewhere between these last three
7 photographs. It clearly starts somewhere in that
8 (indicating) area.

9 Again, we have more backing evidence here. We
10 didn't go much further past this because beyond this
11 photograph toward the east it's just the same thing for
12 quite a while. All the way down the hill on the other side
13 it's just more and more backing. We didn't feel the need to
14 just continue putting flags just like we didn't move
15 forward, you know, all the way down with red flags. It was
16 enough. We can see -- the flags are a tool that we use to
17 help us identify and put together an overall view of how the
18 fire progressed.

19 Q. So this photograph is taken from a little bit
20 upslope and a little bit upwind of where you ultimately
21 determined the fire started?

22 A. Yes.

23 Q. Can you kind of clarify for us a little bit more of
24 the role that slope and topography play in the behavior of
25 fire.

26 A. Yes. So there's three major influences on fire

1 behavior. That is the weather, topography, and fuel. Those
2 are the three dominating forces on how a wildland fire is
3 going to move. And they correlate with each other. If you
4 can put all three of them in a triangle, the fire is going
5 to want to waver to whichever is going to be the most
6 dominating influence at the time.

7 Here we have -- and typically on a normally calm
8 day topography will almost always trump any other influence
9 almost always. It -- usually topography issues are usually
10 in line with fuels. And a lot of times topography is in
11 line with the weather as well because we have what is called
12 upslope winds. As valley floors heat up, the wind wants to
13 expand and it pushes wind upslope. So typically they are
14 all in alignment.

15 In this case, however, it was not in alignment.
16 The fuels -- you know, the fuels were there. The fuels were
17 ready to burn. There were well-cured, receptive fuel beds
18 on the side. It would have burned even with the radiant
19 heat there was enough wind that day. The winds were so
20 intense that it was overcoming every other influence which,
21 in my career, this doesn't happen very often. It's -- it's
22 not -- it's not a common occurrence where it's this extreme.

23 And if you look at the overall progression of the
24 fire, which at some point we're going to get to, the fire
25 just -- it stuck with the wind and it went over the hill and
26 down and just went with the wind the whole way eventually

1 running into changes of the weather which allowed it to
2 be -- which allowed it to become -- be influenced by terrain
3 and other factors.

4 Q. You said you testified last week that when you
5 first arrived and got out, I believe, to meet with
6 Captain McKenzie, that the -- the wind was absolutely
7 howling to the point that you were leaning into it; correct?

8 A. Yes.

9 Q. How much time have you spent in the Feather River
10 Canyon?

11 A. I was assigned to Jarbo Gap Station for about a
12 year.

13 Q. Where is Jarbo Gap Station in relation to the area
14 that we're looking at in the area of tower 27/222?

15 A. The fire station is about 20 minutes to the west of
16 this location. It's within the direct vicinity.

17 Q. Have you heard the term "the Jarbo winds"?

18 A. Yes.

19 Q. What is the Jarbo winds in your experience?

20 A. Jarbo winds are a wind influence that occurs
21 usually early morning hours to about early to late
22 afternoon. It's a localized wind. It stems from the Great
23 Basin heating up in the early morning hours. So two hours
24 ahead of our sunrise you will have these expansions of air
25 mass in the Great Basin. As that air expands, it needs to
26 go somewhere. And the lowest point for it to pour over into

1 California is at the Feather River Canyon.

2 And so all those winds as they are expanding --
3 again, as they expand, they are getting hotter and they are
4 getting -- their relative humidity is going down. Because
5 as you expand a space and you only have one gram of water,
6 you have this bigger volume still in one gram of water. So
7 the relative humidity is going to go down based on volume.

8 So as this air is pouring over in the Feather River
9 Canyon, it's funneled and pressurized which is going to
10 cause it to heat up more. As it's pressurized, it dries out
11 more because the temperature is going up and winds increase
12 higher. And that happens almost every single day. As long
13 as the Great Basin has water, we're going to have Jarbo
14 winds.

15 Q. How were the winds on the morning of November 8th
16 when you arrived into that area as compared to previous
17 experience?

18 A. Typically, the winds in the area range anywhere
19 between 15 to 20 miles an hour. That's probably being on
20 the high side, 15 kind of being a normal morning. These
21 winds were -- when I was there, they were -- as I said, they
22 were pushing the tops of the trees over. When I say pushing
23 them over, they weren't toppling the trees, but the tops of
24 the trees were leaning over.

25 In our fire behavior science we understand that
26 means that the winds are above 30 miles an hour. That was

1 my visual reference. I didn't take the time to get any
2 weather statistics. Not many people were -- that day there
3 was a lot going on. Personal safety was the utmost
4 importance. But we do know that that was raw data
5 available. And I'd have to reference that in specifics.
6 But we do know that throughout the day we had winds anywhere
7 between 40 miles an hour to as much as 70 miles an hour in
8 the area.

9 Q. I'm talking just your personal experience having
10 been assigned to the Jarbo station, having been in these
11 winds before and the Jarbo winds before, when you got up
12 there that morning and you said you got out of your truck to
13 make contact with Captain McKenzie and the wind was howling
14 so hard that you were literally leaning against it as you
15 walked up to Captain McKenzie's truck, how was that your own
16 personal experience compared to previous days, your previous
17 time spent in the area?

18 A. Unusual, unusual to be that strong. However,
19 not -- not unusually out of character for the Jarbo Gap
20 area. These winds happen and they happen on a regular
21 basis. It's not every day they happen, but it happens
22 several times a year. It's a known event that happens. So
23 it's not a usual encounter to jump out of your truck and to
24 be toppled over. It's unusual. However, for the Jarbo Gap
25 area in the Feather River Canyon it didn't strike me as
26 terribly odd.

1 Q. You know a lot about meteorology; is that correct?

2 A. I know enough for my job.

3 Q. Well, that's where I'm going to is meteorology
4 important to firefighters in general but even more so to a
5 fire captain specialist and especially a fire prevention
6 officer like yourself?

7 A. Yes. And knowing the weather is one of the
8 fundamental skills of my job. I mean, I need to know what
9 the weather is doing, what it's going to be doing. And we
10 talked about this last week. The meteorology and knowing
11 what the weather has done is going to fall into my origin
12 investigation. Knowing the weather, knowing what the
13 weather is going to do, knowing what the weather has done,
14 and what it typically does with the relative humidity, how
15 much precipitation we've had in the last 30 days, lightening
16 in the last several weeks -- all that comes into play
17 because by knowing all of this stuff, number one, it
18 excludes certain causes like lightening.

19 There was no lightening in this area for several
20 weeks. Actually, for months before. But I looked back as
21 far as two weeks, and there was no lightening. But more so,
22 knowing that -- you know, knowing the relative humidity,
23 what type of weather patterns come through, what is expected
24 humidity-wise kind of helps me determine, you know, should
25 this vegetation burn or not burn, did we get rain, and that
26 stuff. Was it soaking wet and that's why it didn't burn?

1 That was changing my perspective on how these
2 indicators were set. It's part of the totality with the
3 full picture of everything. The meteorology is part of that
4 greater examination of the scene.

5 Q. Are you familiar with the term "red flag day"?

6 A. I am.

7 Q. What does "red flag day" mean to you?

8 A. Red flag means the National Weather Service or
9 another similar type agency has determined that conditions
10 exist that are going to make it very likely that a fire,
11 should it start, will progress into a major incident.

12 Q. So it's a very important thing for you as a fire
13 prevention specialist to monitor things like red flag days?

14 A. I check it several times a day.

15 Q. Was November 8, 2018, a red flag day?

16 A. Yes, it was. And it had been identified for
17 several days.

18 Q. Now, very quickly before we move on, the tower that
19 is in the background of that photograph number 12, which
20 tower is that?

21 A. That is the Caribou-Palermo 27/222 tower.

22 Q. And the blue flags -- remind us again what those
23 mean.

24 A. Backing indications.

25 Q. Okay. Let's move on to Number 13. Tell us what
26 we're looking at when it was taken and where it was taken

1 from.

2 A. Okay. So this is a very similar photograph that we
3 saw in 12. I'm -- roughly without measuring I'd say 15
4 to -- about 15 feet south of my previous location. Again,
5 just showing the vegetation in the area, the backing
6 indicators. I do have a couple of green flags in here. And
7 we will discuss those coming up, I imagine.

8 There are some items of interest in that area. I
9 did identify this as a specific origin area. Again, we are
10 in the general origin area. This whole investigation occurs
11 within, if not the whole, specific origin area. Let me
12 rephrase that. General origin area.

13 Within the specific origin area here there is two
14 flags. If you look at the vegetation around here, there
15 isn't a ton of growth here although that's not unusual under
16 transmission lines.

17 This is -- I would not typically see this much
18 vegetation this close to a specific origin area in the
19 aftermath of a fire. That just tells me this wind was
20 really howling in here and that it was really pushing this
21 down. Not necessarily unusual for this area but this is a
22 specific area with very specific weather conditions that
23 allowed the fire to progress this way.

24 So, you know, we've got all this backing here, you
25 know, very, very slow backing. So high level of confidence
26 that is a specific origin area.

1 Q. And just for the record, the tower structure that
2 is shown here?

3 A. Caribou-Palermo 27/222.

4 Q. Let me make sure we have a complete record. You
5 are talking the specific origin area around these two green
6 flags that are displayed in the photograph?

7 A. Yeah. And that would be, just for reference,
8 directly east of the tower.

9 Q. And we have blue flags down in the lower middle
10 right of the photograph.

11 A. Yes, yeah. And those blue flags -- I mean, if you
12 look -- I'm going to take your position here. We have a lot
13 of flags strewn throughout. And I talked last week about,
14 you know, as the fire is coming towards you and it starts to
15 burn one side of the grass, it makes it collapse and point
16 towards the fire. We have a bunch of that down here. And
17 that only occurs when the fire is at a specific intensity
18 that allows it to happen.

19 And so what we end up with is a perfect crescent
20 shape with all those type indicators right through here
21 (indicating). And they all point right back up to that
22 point which is where we found some items of interest.

23 Q. Photograph marked as Exhibit Number 14.

24 A. I have it.

25 Q. Tell us what we're looking at and where this was
26 taken.

1 A. So this was taken on Saturday. This is what we
2 just spoke of. Within this area we can see not only the
3 stem -- and this is the same picture on the screen. We do
4 see kind of some better examples of stem fall kind of in
5 this area all kind of pointing back in this direction.
6 Granted, they don't all point in the exact same direction,
7 but again we have to take into account the totality of all
8 the indicators. You know, you take them all together and
9 form a conclusion that way.

10 And then also within it are the items I marked.
11 Essentially, items one and two are pieces of metal that
12 appeared to be metal wire. They were located within those
13 SOAs. This particular --

14 Q. And just to define it because I know it's going to
15 come up time and again, SOA is specific origin area?

16 A. Yes, it is.

17 Q. Correct?

18 All right. So we started off in a big general
19 origin area, and now we're narrowing that down to small
20 specific areas?

21 A. Yes. And that is how the whole investigation --
22 origin investigation works. We start big and we just keep
23 working our way smaller and smaller and smaller until we get
24 to a point where we can't get any smaller.

25 Q. And that's how you figure out where the fire
26 started?

1 A. That is how we figure out where the fire started.

2 Q. All right. Let's move on to Number 15. First of
3 all, what is the tower -- there is a tower in the foreground
4 or in the background.

5 A. So the tower in the background -- I would have to
6 look up to see the exact tower number. So I don't remember
7 it offhand. But this tower right here that we see in the
8 left-hand side of the photograph, that is the same one I
9 have in my hand as Caribou-Palermo 27/222.

10 In this photograph this is just above the SOA one,
11 this first specific origin area. This again just shows a
12 couple things from a bunch of vegetation, unburned grasses.
13 It just kind of shows I think -- so I took this photograph
14 because this is probably the best representation of the
15 vegetation in our GOA. It is pretty much unscathed. There
16 is almost no burning indicators around it. There it looks
17 like it hadn't burned at all, which again tells me super low
18 intensity at this point.

19 Q. So this is just a few feet from one of the
20 locations you determined that the Camp Fire started?

21 A. Yes.

22 Q. And it's relatively unburned?

23 A. Yeah.

24 Q. But then a few feet -- as you're looking at this
25 photograph off to the left is where all the red flags start;
26 correct?

1 A. Correct.

2 Q. Let's move on to 16. And what are we looking at
3 here? When was it taken?

4 A. So we're standing on that sloped trail. Excuse me.
5 And what we're looking at is I'm facing -- I took this
6 photograph. We are directory below the Caribou-Palermo
7 27/222 tower, and we are looking west.

8 Within these photographs we can see that it has
9 some blue flags, again showing the fire was backing in this
10 direction. Again, there is still a lot of unburned material
11 in the area. There is a little bit of, you know, downed
12 sticks and everything here using what little burn indicators
13 were left here. Because it didn't burn really very much
14 through them. You've got to remember we're on the side.
15 It's hard to tell, but this is actually really steep right
16 here.

17 So not a lot -- I believe this area here didn't
18 have a lot of growth to it. In fact, if you look there's
19 almost no stubs left in the ground where everyone else is.
20 But what we have here is material blown into the area by a
21 previous wind event. It may a wind event. I don't know.
22 But there's some vegetation here, but it didn't really burn
23 very well through here. We had a few vines where it's
24 backing and kind of came downhill towards us if that makes
25 sense.

26 And then you see there is a whole lot of green

1 flags. All these green flags in here are indicating that
2 there is something interesting here. You know what's
3 interesting and what we found? Almost every one of these
4 green flags except for this one and a couple others, most of
5 these green flags are referencing broken pieces of ceramic
6 insulator.

7 When we arrived at scene the first day, we did
8 notice that this was -- you know, these lighter colored
9 green flags we put on the first day, there was all of this
10 ceramic material. But there was also a lot of garbage. And
11 we couldn't -- initially, we didn't really understand why
12 there was so much garbage. We thought maybe it was just
13 from previous work done.

14 As we progressed in our investigation, we came to
15 realize that all of this insulator material came from the
16 broken insulator string which is pretty incredible because
17 the amount of wind it would take to move that heavy material
18 plus a slope influence brought all of that material way over
19 here when the tower is up here on the hill. Again, just an
20 indication of what those Jarbo winds are like.

21 Q. Now we're on to Exhibit Number 17. And first,
22 let's identify the tower whose legs we see.

23 A. Yep. The tower in the foreground is the
24 Caribou-Palermo 27/222. This photograph was taken nearly in
25 the same position as the previous photograph. I may be a
26 couple steps towards the west looking almost directly north,

1 relatively north at the tower from the walking trail.

2 Q. So you're looking up at the tower?

3 A. I'm looking up at the tower, yeah. And there's
4 just kind of a close-up showing those indicators again and
5 how it really burned low intensity and got really small.
6 There's fine material in here that didn't burn. A couple
7 stubs but not very much, not a lot of vegetation in here.
8 Some really good indicators.

9 Nonetheless, we had some sitting over here that
10 showed the fire was backing over here and a little
11 protection back here. Really good protection right here
12 (indicating). It didn't really -- just the ground, the
13 grass, and litter but really, really low intensity.

14 Q. So over in the background up here in the left-hand
15 corner, is that a red flag?

16 A. Yes, it is.

17 Q. So in this area is the heavy intensity backing
18 fire, but just up the hill right there we have high
19 intensity advancing fire. And there is a reason for that.
20 What is that?

21 A. There is actually another origin right here
22 (indicating). So just to the south of Caribou-Palermo
23 27/222 we identified a second origin. The fire we had seen
24 remember back in here (indicating) and then we had little
25 bits. And we didn't mark it with a flag because there was
26 only maybe one or two indicators. We did have some

1 advancing through here where it burned a little cleaner, but
2 there is almost nothing left where over here we still have
3 little bits here. So we did identify a third origin -- or
4 excuse me, a second origin just to the south of the
5 Caribou-Palermo 27/222 tower.

6 Q. Exhibit Number 18 we have a photograph. Do you
7 have that?

8 A. I do.

9 Q. What is Exhibit Number 18 depicting?

10 A. This is a close-up and is the same on the screen.
11 This is just a close-up examination of the broken ceramic
12 insulator material that we found in the area we refer to as
13 a ceramic debris field or the insulator debris field.

14 Q. What in this photograph is ceramic debris?

15 A. These pieces of material here where the concentric
16 circular rings are part of the insulators. And there's a
17 small piece right there (indicating).

18 Q. Why were these items significant?

19 A. These items show -- well, these items didn't belong
20 there. These items belonged, I believe, to the insulator
21 string that was hanging inverted from the conductor wire
22 that rotated the phases on the transposition tower. Later I
23 know we are going to talk about that specific insulator
24 string. And you can see there's -- several pieces of that
25 are broken off. In fact, I think in one of our first
26 photographs we can actually see it fairly well.

1 Bear with me. Our best photograph so far we've
2 gotten to is Exhibit 8. And can you zoom in on that.

3 You can see the white kind of jagged edges of the
4 insulator string. As it came down, I believe it -- let me
5 rephrase that. As to came down, it came down with force and
6 the weight of gravity behind it. And I believe four -- I'd
7 have to re-examine a closer picture. Four of those
8 insulator bells shattered and the resulting debris field
9 came from that insulator string as the wind pushed it in
10 that direction.

11 There is another significance to that if we can go
12 back to.

13 Q. Eighteen?

14 A. No. I think I'd rather go to 16. I know it's hard
15 to put together a 360-degree view of this, but a minute ago
16 we saw in 18 -- we had a photograph -- not 18. I apologize.
17 It's 17. So 17 and 16 --

18 If you can kind of go back to 16, imagine as I'm
19 sweeping across here and put them together. There's a
20 significant distance where these portions of insulator
21 traveled through the air to land in their final resting
22 place where we found them.

23 The other significant point is they are in
24 alignment. Those pieces of insulator string are in direct
25 alignment with the slope direction to our two GOAs we have
26 identified so far. So that tells me that all the stuff --

1 basically as it came down everything fell in a separate
2 line.

3 As you can imagine, you know, when you have water
4 on your hands and when you sling it down, it's going to go
5 out in a straight line. It's going to follow an arcing
6 path. That's what happened here. As the stuff came down,
7 the influence of wind and its velocity created a straight
8 line that all the stuff came down in.

9 Q. All right. The photograph marked as Number 19,
10 let's start off. Let's identify the tower structures that
11 are in the background to the photograph.

12 A. So this tower structure is closest to us that we
13 can see in the photograph is Caribou-Palermo 27/222. In the
14 foreground photograph we see again a bunch of different
15 indicator flags, vegetation. Again, great indicators.

16 A couple more items of interest here. Those ended
17 up being, we determined, partially buried portions of wire
18 or metal wire. So it may have been there a while. So they
19 ended up being not significant. However, we did document
20 and identify them anyway.

21 But another fascinating portion is over here on
22 the -- closest to the right side of the photograph, you
23 know, we can see where we previously identified the second
24 specific origin area right in this (indicating) area. Here
25 we have a third specific origin area. Again, we have what
26 we anticipate should have been -- you know, this should have

1 all burned clean. But we had a separate origin that had
2 backing and then again moving uphill with the wind, with the
3 topography influenced the fire. We have our advancing
4 vector going up the hill. So one, two, and three separate
5 specific origin areas.

6 Q. So we have talked a lot today about blue flags and
7 we have talked a lot about red flags. Remind us what the
8 yellow flags mean.

9 A. The yellow flags are the natural vector of the
10 fire. So as our fire is burning uphill, the fire is also
11 making an advancement to the east just by following the
12 fuels partially influenced by the wind. But we are
13 protected back here (indicating).

14 It's a fascinating phenomenon. When you're walking
15 around this tower, when you're on the backside of the tower
16 here towards the east, you feel wind, but it's not a
17 significant wind. And as you come around the trail and you
18 hit basically just south of the tower, you get pushed by the
19 wind. And as you come back around over here, there is no
20 wind whatsoever. It's really amazing how this topographic
21 structure of this hill will influence the wind's velocity.

22 So the fire is actually making an uphill
23 advancement following the topography and the fuel and
24 following lateral. And that is what the yellow flags are
25 identifying.

26 And then once it gets up to the top of the hill, it

1 actually starts making another movement to the west and is
2 influenced by the wind again once it gets exposed to that
3 wind. And that has been validated in our photographs that
4 we received from our witnesses in Exhibit 5.

5 Q. Moving on to a photograph marked as Exhibit
6 Number 20.

7 A. So this is just a close-up of that backing
8 indicator. It was in the previous photograph at the bottom
9 left-hand corner.

10 I have Exhibit 20 here, and it's the same
11 photograph that is on the screen.

12 This is just -- again, this is -- all of this
13 material is super dry and it just barely burned, super low
14 intensity. And it's just -- this was a really good
15 indicator that the fire came in here. A little bit of that
16 is kind of a great example because we actually have some
17 conflicting indicators here.

18 So this branch tells me the fire is moving in this
19 direction, but yet you have sooting on this side of the
20 rock. But what I have to consider is this fuel was an
21 influence. Everything is influenced by something else. The
22 rock influences the fire. The material influences the fire,
23 the topography. Everything kind of comes into play.

24 And so we have just conflicting information. This
25 would tell me the fire came from this direction, but that
26 actually is just soot from this piece of tree burning. So

1 there's a lot to consider, but at the end of the day we take
2 a totality. This one indicator is contradictory to
3 everything else in the area.

4 Q. Number 21 starts off by identifying the tower
5 structure there in the background.

6 A. Again, this is Caribou-Palermo 27/222.

7 Q. That is the structure on the right?

8 A. Yes, it is.

9 Q. And the structure on the left is a separate line;
10 correct?

11 A. Yes, it is. So we're kind of uphill from our
12 previous location, and we are rotating our position to the
13 northwest. And this is me just capturing and documenting
14 all the indicator flags.

15 And again, kind of continuing on with our previous
16 photograph here, here is our -- at the southwest corner of
17 the Caribou-Palermo 27/222 would be our third specific
18 origin area right in here. And then as it advances a
19 proceeding advancing vector coming across the top influenced
20 with a lateral vector working its way down the hill. A
21 little greater intensity. That is why it's not a backing
22 vector. It's a lateral vector based on intensity.

23 Q. And the photograph of Exhibit Number 22.

24 A. This is a close-up of some of our previous flags we
25 just saw. Orientation is not great in this photograph.

26 It's actually a little bit skewed, but the terrain is -- you

1 saw the terrain. It's difficult to stand up straight. He
2 was leaning on rocks trying to hold our position from
3 sliding down the hill. This was just, you know, a real
4 intense fire coming through here, really just jet black
5 staining the rocks through here.

6 This side of this stick was burned. The other side
7 was not. More sooting up here. And right over here we have
8 a lateral vector because we can see the fire did not make
9 its way around here. It's actually working its way kind of
10 diagonal of the photograph.

11 Q. A photograph marked as Exhibit Number 23.

12 A. Again, this is from -- on the left-hand side we're
13 looking at the Caribou-Palermo 27/222. This is that
14 advancing vector at the top of the knob as it started to
15 make its way eventually as it was running towards Paradise.

16 Q. All right. Now, a photograph marked as Exhibit
17 Number 24.

18 A. This was taken on the second day we were up there
19 which would be Saturday, the 10th. I was -- I had set
20 spikes in the ground to take --

21 Yes, Sir.

22 GRAND JUROR NUMBER FOUR: We have different exhibit
23 numbers.

24 GRAND JUROR NUMBER FIFTEEN: Ours is 25.

25 GRAND JUROR NUMBER FOUR: We show that as 25.

26 GRAND JUROR NUMBER THREE: I think our page is 23

1 and the exhibit is 24.

2 MR. NOEL: Twenty-four.

3 GRAND JUROR NUMBER ELEVEN: It's the way the
4 PointPower is paginated.

5 MR. NOEL: Oh, you're looking at the page number.
6 For some reason when we were getting ready last week to
7 print these for you, it dropped -- the exhibit markers up on
8 the top right-hand corner disappeared. And so you're
9 looking at the page number. The page number and the exhibit
10 markers disappeared. I have no idea. I had to go back over
11 the weekend and redo it. Thank you for reminding me of
12 that.

13 BY MR. NOEL:

14 Q. So back to Exhibit Number 24.

15 A. Confirm it's 24.

16 Q. Confirm it's 24.

17 A. Okay. So in this photograph we're looking at one
18 of the wire segments we found in SOA one. This is just me
19 documenting as I am measuring out -- one of our ways we
20 measure out as a scientific process is we actually sink
21 steel spikes into the ground below grade that we can find
22 with a metal detector in the future. Basically, it's
23 setting reference points so that if we come back in five
24 years, we can basically recreate a scene if we need to.

25 So what I do is set the spikes in the ground and
26 from those spikes I measure our points of interest with

1 different indicators. This is kind of the old-school way of
2 doing it. There's much higher technology that we use, and
3 we'll get into that as well. But we always follow our same
4 process. And part of that process is setting spikes and
5 measuring everything from those spikes. So if we need to go
6 back and reference it in the future and satellites aren't in
7 the sky, anyway we can still do it.

8 Q. And this is the specific or general area number
9 one?

10 A. Number one, yes.

11 Q. Exhibit Number 25.

12 A. Exhibit 25. This confirms 25 and the photograph is
13 25. Nope. Yeah, we can rotate it. That works. This is a
14 wire fragment that we found using a metal detector within
15 SOA two. Originally, we did not see this. It came up with
16 a metal detector. And that is how we are able to identify
17 it. And this metal fragment was what I determined to be the
18 very center of SOA number two. And SOA number two had some
19 very small indicators within it. We were able to get it
20 done in an area about -- well, about five inches in
21 diameter.

22 This is still very, very small. This piece of
23 metal is about half a centimeter. With all the debris there
24 we didn't initially find it. I wear glasses. I didn't
25 exactly see it the first day. We were able to identify this
26 with a metal detector. And you can see it's a fantastic

1 photograph here of this rock. It doesn't matter what size
2 the rock. It's always a good indicator because physics
3 still affects it the same way.

4 So we still have a little sooting over here. Same
5 thing with over here with sooting over here. Good sooting
6 right here. The fire -- this one is really great. The fire
7 started here or a fire started here and worked its way out.

8 Q. Number 26. You have that photograph?

9 A. Number 26, yep.

10 Q. And let's identify the tower structure in the
11 photograph.

12 A. Again, Caribou-Palermo 27/222.

13 Q. And what are we looking at in this photograph?

14 A. So my back -- I'm facing with my face to the east.
15 I'm looking kind of uphill at the west face of the
16 Caribou-Palermo 27/222 tower. This photograph is -- excuse
17 me. This is SOA three right in this area right here
18 (indicating). I stand correct. Sorry. It's over here
19 (indicating). Right over here. So SOA two is kind of the
20 bottom right-hand corner of the photograph.

21 This wasn't the best SOA we've had; specific origin
22 area. The evidence is there on the outer edges. We did not
23 find anything specific in the area with metal detectors
24 otherwise. However, with our metal detectors there has to
25 be a certain degree of mass to that material in order for it
26 to be picked up. It doesn't mean there wasn't anything

1 there, but we weren't able to find it. I believe the amount
2 of material that would have fallen to the ground potentially
3 may be small enough we wouldn't have been able to find it.

4 Q. So now you have been wandering around investigating
5 behind or under tower 27/222. You have identified three
6 specific origin areas. You have swept this with a metal
7 detector and you found wire. What comes next?

8 A. Well, we had developed a hypothesis. We had
9 developed a plan of action. What is the next steps? We
10 know where the fire started. Now we have to figure out how
11 did the fire start. So now we finish our -- basically our
12 cause. We have some evidence. We have some ideas. We have
13 some hypotheses we are working on. But we need to go
14 through and do a cause investigation now, which is much more
15 detailed. You have to really -- you have to try and
16 disprove yourself. You have your hypothesis and you have to
17 go through and try -- you know, basically poke holes in your
18 hypothesis and try and break what you found to be truly
19 accurate.

20 And that is what we started doing. We identified
21 items we needed to look at more closely. Certain things we
22 knew. You know. In part of our cause determination we had
23 to eliminate things right off the bat. So on Tuesday I
24 spoke about my entry into the G0A, how to get the bulldozer
25 to kind of clear the roads. I was able to identify that
26 first day that there was no evidence of foot traffic, no

1 evidence of vehicle traffic, dirt bikes, anything like that.
2 One of our witnesses that I think we'll be talking to here
3 in the near future told me -- we'll get to that later.

4 There is no evidence that anybody was up there. So
5 it being human caused could be almost completely eliminated.
6 So camping, shooting, debris burning, a barbecue escape; all
7 these things I was able to eliminate.

8 There is a railroad in the area. And we have all
9 heard stories of trains causing fires. However, this
10 train -- the nearest location to the tower is about 1200
11 feet horizontal distance and about 900 feet vertical
12 distance away from the tower.

13 In my experience -- and I worked in Devore in
14 Southern California where there's six train lines, one
15 running through the backyard of the fire station. We dealt
16 with train fires on a regular basis.

17 You know, I work in Butte County. We have lots of
18 trains here, too. In my experience with all the train
19 fires, this is not a location that would be a likely train
20 fire started. The distance is so far away, plus in order
21 for that to happen the winds are out of alignment. Even if
22 in the unlikely event that this was a train-started fire,
23 the winds are going 90 degrees in the wrong direction. If a
24 train did start a fire, it would have been down in the
25 Feather River Canyon close to the waters's edge and not up
26 the hill. So we were able to eliminate trains rights off

1 the bat.

2 Q. So let me just make sure that we're on the right
3 track. When you say 1200 feet horizontal and then you said
4 800 feet vertical or 900 --

5 A. Eight or 900 feet.

6 Q. We're talking about this tower is up on the canyon
7 wall and the train tracks are down at the river.

8 A. At the water's edge, yep.

9 Q. So we're way up above.

10 What about vehicles? Where is the road in
11 reference to this tower and the specific origin area?

12 A. A very steep and sandy climb away from the tower.
13 There is a road. And I told you that is how we were able to
14 get in. But there was trees across the road, a washout in
15 the road. There was debris in the road. Not just debris
16 from the fire but years and years of slides and earth moving
17 from erosion had made that road impassable.

18 Could you walk in? Absolutely. But the amount of
19 time it would take for somebody to run out of there, they
20 probably would have perished at the rate this fire was
21 moving. You're talking -- I think it's about 2.2 miles.
22 I'd have to look, but it's quite a distance from the town of
23 Pulga in a very unfriendly environment with a fire going,
24 earth in the way, unable to drive. Unlikely somebody
25 walking. I think human cause can be eliminated.

26 Q. And what is the distance between the specific

1 origin areas under the tower and Camp Creek Road?

2 A. It varies. In some points it's a horizontal
3 distance. It's only about 120 feet, which isn't very far.
4 But if you take into consideration that that specific point
5 is almost on the cliff and then other points. It's almost a
6 quarter mile depending on how it loops around and the
7 distance to get there.

8 Q. So the tower is up above the roadway?

9 A. Yes. And if you consider, you know, any mountain
10 road is windy. It usually follows the terrain. There's
11 kind of a spur ridge coming off the main Feather River
12 Canyon ridge. Soon the road basically makes this big
13 lapping turn almost like a horseshoe around where this tower
14 is located. So to give a specific -- I mean, it's far
15 enough away from the road that it's not an easy access.

16 Q. So as you're switching from an origin investigation
17 to a cause investigation, did you become aware of
18 information from PG&E?

19 A. Yes, I did. I did. The first day we were up
20 there, obviously we had no cellphone communication, no
21 Internet, anything like that. But I don't remember if
22 specifically that evening -- actually, it wasn't that
23 evening. The following day we couldn't make access so we
24 went back to our office and tried to do as much research as
25 we can. And we became aware that Pacific Gas & Electric had
26 made a filing with the California Public Utilities

1 Commission in the public filing. I assume that's what
2 you're getting at.

3 Q. Yes.

4 A. In a public filing they had notified -- as a
5 requirement of their company under the regulations of the
6 California Public Utility Commission they had made a public
7 filing that they had a loss of service at 6:15 in the
8 morning on the Caribou-Palermo line in the -- directly at
9 the Caribou-Palermo 27/222 which they indicated was near the
10 area of the Camp Fire.

11 Q. So when you get back up there and you start your
12 cause investigation, where is the first place you looked?

13 A. We looked up.

14 Q. Oh.

15 A. We looked up. We looked up at the tower.

16 Q. And now direct your attention to Exhibit Number 27.
17 What does the Exhibit Number 27 show?

18 A. So this is a picture provided to me, Cal Fire, by
19 Pacific Gas & Electric.

20 If I may kind of talk about evidence collection
21 and --

22 Q. Well, let's describe what the photograph is first
23 and then we'll go back to that.

24 A. Okay. So this photograph is our insulator string.
25 At the very bottom of the insulator string -- actually, it
26 should be the top of the insulator string, but it's

1 inverted. So this is the end of the support hook -- what
2 was left of the support hook that held it to the tower.

3 Q. So when was this photograph taken?

4 A. I would have to refer to my MedData, but I believe
5 this was taken on the 14th of November.

6 Q. Did you take this photograph?

7 A. No, I did not.

8 Q. Was the photograph taken under your supervision?

9 A. Yes, it was.

10 Q. And do you know by whom this photograph was taken?

11 A. This was taken by a Pacific Gas & Electric tower --
12 excuse me, electrical line worker.

13 Q. Now, based upon on the orientation of the
14 photograph it appears that this photograph was taken by
15 somebody in tower 27/222.

16 A. Yes, it was.

17 Q. Can you explain to us why on November 14th,
18 approximately six days after the Camp Fire started, while
19 you're doing your cause investigation of the Camp Fire there
20 are PG&E employees in tower 27/222 taking photographs for
21 you?

22 A. Yeah. So I don't mess around with really big
23 electricity, and this is a big electricity. When I say "big
24 electricity," I'm referring to high voltage. If they tell
25 us it was de-energized, we still don't touch their lines.
26 That's not part of my job description. And PG&E Company is

1 a large entity. They're an industry leader in electrical
2 distribution transmission. And we could not find within
3 four states a contractor or any other licensed professional
4 who is willing to remove this equipment for us off of a
5 Pacific Gas & Electric tower.

6 Q. So you had to rely on Pacific Gas & Electric to
7 remove the equipment off the tower?

8 A. Yes, we did.

9 Q. And document the condition of the tower?

10 A. Yes, we did.

11 Q. So you were present?

12 A. I was.

13 Q. Was there other Cal Fire present to watch this?

14 A. Yes, there was.

15 Q. And a supervisor?

16 A. Yes, there was.

17 Q. And take control of the evidence?

18 A. Yes, there was.

19 Q. So photograph number 27 -- is that how that
20 insulator string was found?

21 A. Yes, it is. I watched this photograph being taken.
22 This was one of the first photographs that the line person
23 took. And they were instructed by me not to touch anything
24 until it had been well documented by photographed. Also,
25 there was an agreement -- and the reason why I have this
26 photo is we had an agreement with them that any photo they

1 took that day, because of their value, they would turn them
2 over to us so we would be able to examine them.

3 Q. And by "turn it over," you mean the SD card from
4 the camera?

5 A. The information from the SD card. They provided --
6 at the end of the day after all the evidence was collected,
7 they provided the SD cards to us, "us" being myself and
8 co-worker Mark Hillskotter, who is also in the prevention
9 bureau with me. Basically he's my counterpart. Mark
10 Hillskotter put the SD card into his computer and
11 transferred that information directly on his computer and
12 let me back that up. He copied the information to his
13 computer and returned the SD card, which stands for "secure
14 data," to PG&E employees to make sure they still had
15 their -- all their photographs as taken initially when they
16 confirmed, yes, they were whole in all the pictures.

17 Q. All right. Before we move on -- interesting here.
18 Can you give us a little bit of, I guess, placement as to
19 where this is, where this hook is as compared to the -- the
20 specific origin areas.

21 A. Yes, I can. Can I actually jump to -- hold on a
22 second. Let me take a look at it. Still try and describe
23 this in words. I don't have a really good overshoot of this.

24 When we were up there taking this photograph, there
25 was still firefighter operations going on. And so any
26 aircraft that was in the area was being used for

1 firefighting operations. So we had to get a really good
2 overshoot of everything like we'd normally like to get.

3 So this -- if I can kind of put it in perspective
4 here, this vertical beam right here that we're looking at in
5 this photograph is just a little bit turned from being
6 plumb. This vertical beam right here would be the southeast
7 corner of tower 27/222. This would almost be --

8 So if you're to draw a line between SOA one, two,
9 and three and just establish -- draw a straight line, this
10 would almost be directly above that line. And then our
11 insulator debris that came off of this bell here would also
12 be in line with it had it not tumbled down the hill a little
13 bit. So taking all of those factors into consideration, you
14 know, it's pretty easy to paint a picture of the sequence of
15 events that occurred.

16 Q. That was going to be my next question. You see the
17 white here at the top of the bell shape. That is, you said,
18 a broken insulator?

19 A. It's a broken insulator.

20 Q. And what other thing of interest --

21 Before we move on, what's all the greenery in the
22 background?

23 A. Yes. So to photograph -- excuse me. That was
24 taken several days after. This would have been in the
25 backing vector. We have already had something occur because
26 we are several days after the fire. The pine needles had

1 died and had fallen to the ground. So we see a lot of brown
2 down here and some ash pits down in this lower left-hand
3 corner. The fire backed from this location down that way.
4 So we're looking -- the way we're looking is almost straight
5 downhill towards the Feather River Canyon towards the
6 Feather River.

7 Q. Now, you went up to it the first time on
8 November 8th. You left. You went back on November -- you
9 couldn't get back in until November 10th. You did the
10 origin investigation and then ultimately you came back
11 approximately on November 14th to start the collection of
12 evidence in the cause investigation.

13 A. We never officially left.

14 Q. Right. That is the question I'm getting to. What
15 steps were taken to make sure that the scene was secured --

16 A. Okay.

17 Q. -- when you weren't physically there?

18 A. So early on -- I believe I touched on this last
19 Tuesday. Early on in the fire even as I was responding, I
20 identified that this would be a major incident. One thing
21 that we always do, like any good police officer or
22 investigator, is you always treat every scene as a potential
23 crime scene until you deem it otherwise.

24 So early on, like any other fire I go to, I had
25 identified a need for security. Now, sometimes I can
26 fulfill that need. Other times I cannot by myself. I'm

1 just -- physically I can't stay away for seven days straight
2 and watch a scene. So early on I ordered security as a
3 protective measure of the scene should we decide that there
4 was a potential for a crime scene to exist. So early on we
5 ordered security. We had security there 24 hours a day
6 seven days a week until we were done with our investigation
7 at this site.

8 Additionally, I had mentioned that we had Tom's
9 Earth Dozer, E-22. We had that dozer drive uphill -- not
10 uphill, up Camp Creek Road. He investigated for us. He
11 said there was a rock in the road and nobody has been
12 driving down it.

13 The next major intersection we knew east of there
14 was Dixie Road and Camp Creek Road. That intersection was
15 closed due to fire activity and again washouts, and later on
16 we investigated and determined that road was destroyed.
17 There was nobody going to be driving down that direction.

18 On the Pulga side of our GOA, which would be east
19 of the GOA, we actually had Tom's Earth pull another giant
20 boulder into the road and brought a fallen broken tree into
21 the road as well. So for some reason if somebody should get
22 past security and get past the bulldozer parked in the road
23 and still continue to go through, they're going to run into
24 an oak tree and another giant boulder.

25 So nobody was getting through. We did everything
26 we could to prevent anybody from getting through to our

1 protected scene.

2 We couldn't physically have security at the
3 location because they don't have the fire training and the
4 safety gear. They don't have that ability to be safe out
5 there. So we did everything we could to exclude the area
6 from all directions.

7 Now, could somebody have hiked over the hill, over
8 down through the fire and made their way through there?
9 It's not impossible, but I find it very unlikely.

10 Q. Now, you said that last week when you testified
11 that as you were walking up here and starting to look around
12 in your origin investigation, that -- I believe it was
13 Battalion Chief Thompson said something to the effect of
14 "That doesn't like right" and pointed up to the inverted
15 insulator string.

16 And you documented that in the photographs?

17 A. Yes, I did.

18 Q. When you finally got somebody up into the tower on
19 November 14th, had you noticed any changes to the insulator
20 string?

21 A. Changes in position or --

22 Q. Yeah.

23 A. No, there had been no changes.

24 MR. NOEL: It's two minutes after 10:00.

25 MR. RAMSEY: Go to 10:15.

26 MR. NOEL: You want to go a 10:15?

1 MR. RAMSEY: Correct.

2 MR. NOEL: All right.

3 BY MR. NOEL:

4 Q. All right. Let's go on to the photograph marked
5 People's Number Exhibit 28.

6 A. Yep. I have it here.

7 Q. Explain to us what we're looking at here.

8 A. Again, this is the insulator string with the
9 damaged hook from Caribou-Palermo 27/222. As I know it to
10 be coming from, it should have been the left phase of the
11 transposition line.

12 Q. You described it as "the damaged hook." What makes
13 you think this is damaged?

14 A. It no longer appears to be a hook. There's a -- so
15 I'm not a metallurgist. But from what I can see and my
16 understanding of metal, which is within the scope of -- you
17 know, I've had some training to understand how metal is
18 affected by fire, how it's affected by wear to the limited
19 scope within, you know, my discipline.

20 Some things I noticed in this photograph that I saw
21 is that there's -- and also in Exhibit 27 is there is a flat
22 face that has -- and this would be what I would call the
23 apex of what should be a hook. There's a flat face. It
24 appears to be oxidized. It's not shiny. It's not new
25 metal.

26 Q. Let's get away from there for now.

1 A. Okay.

2 Q. It's just pretty obvious that this is an incomplete
3 hook?

4 A. Yeah. It's not a hook.

5 Q. It doesn't look like it would actually hold up
6 anything?

7 A. No.

8 Q. All right. Now, obviously the hook breaking isn't
9 going to cause a fire?

10 A. No.

11 Q. So was the tower checked for other evidence of what
12 might have been the cause of the fire?

13 A. Unfortunately, I wasn't able to inspect the tower
14 myself, but I was able to examine some photographs that were
15 provided.

16 Q. Right. So we'll move onto Exhibit 29. What is
17 depicted in Exhibit Number 29?

18 A. In this photograph this is the conductor that we
19 spoke of from the transposition line from right to left
20 phase. And this is a point where -- although I can't see
21 it, it looks like this is a point where it made contact with
22 the structure of the Caribou-Palermo 27/222 tower.

23 Q. Why do you believe that this photograph shows that
24 the conductor may have made contact with the structure?

25 A. As part of the FI-210 fire investigation, the 210
26 course, we're taught to identify several things which causes

1 fire. It's a specific chapter within the curriculum.
2 Certain things we look for is scorch marks, a clear
3 demarcation from damage in the material. In other words, it
4 looks like it's been melted from a native position of the
5 metal. So in other words, if you look -- I'm going to use
6 this as a bad example. But here we have, you know, what
7 appears to be downed wire. It's round. I was straight.
8 It's as we expect a wire to look.

9 If you look in here, we have pitting, which there's
10 actual material missing. That is called a clear line
11 demarcation where it goes from very much a piece of drawn
12 wire to almost instantly having material missing. And there
13 is a pit in there. So I have a little bit of experience in
14 electrical --

15 Q. Why don't we take this opportunity to go over what
16 experience you have with electricity and electric wires.

17 A. So my whole family is in the International
18 Brotherhood of Electrical Workers on my mother's side; my
19 uncle, grandfather, my cousins. They all work as
20 electricians to some capacity; wiremen, linemen. I
21 disappointed them by becoming a firefighter instead.

22 But as I was growing up as a young man, I would
23 work with my uncles and my grandfather and my older cousins
24 in the trade, you know, staying out of trouble in the
25 summertime, making a little extra cash. And so I have been
26 pulling wire since I was about 15 years old and, honestly,

1 with my grandfather probably since I was four years old just
2 handing him screwdrivers. You know.

3 So seeing a wire that has arcing, I mean, it's --
4 to me it's pretty clear what it is. You know, having -- and
5 I still enjoy the trade. I still help out, you know, at mom
6 and dad's house and grandma and grandpa's house -- they're
7 still with us -- doing work for them. And so I am still in
8 the field, if not the trade. And so for me to identify, you
9 know, arcing is -- to me it's pretty clear.

10 Q. You used the term "arc" several times. What
11 does that term mean to you?

12 A. So arcing is when you have an electrical discharge
13 that is not turned on. So it's either going to be what we
14 call phase to ground, which this is an example of phase to
15 ground, or even phase to phase. So if you cross two
16 different wires, you energize two 110 wires that weren't
17 supposed to be touching. If they start touching, there is
18 going to be an arc. And that arc is basically electricity
19 jumping from one conductor to the other and burning the
20 atmosphere in between them causing even for just a second a
21 plasma which is basically superheated gases. And so it
22 creates heat in the area. And that is exactly what an arc
23 is.

24 So what ends up happening is you have this
25 discharge, this basic ground discharge where it energized
26 the conductor and made contact with a grounded structure and

1 an arc ensues.

2 So we had discharge from the conductor to the
3 grounded structure creating that plasma that are super hot
4 heated gases that heat the atmosphere which in turn melts
5 the conductor. And as it expands from it's super intense
6 heated, you know, localized area, it actually sends the
7 material out of its original case as it expands out.

8 It 's just a super fast -- I wouldn't call it an
9 explosion but more of a -- you know, maybe a burst where
10 that -- as that is heating up, it has to expand to go
11 somewhere so it goes outward. And so we are left with
12 pitting and melting and burning of material around it. You
13 know, there's lots of evidence of a discharge here.

14 Q. So just to define terms here, what you're referring
15 to as the conductor is what most of us would refer to as the
16 power line or wire; correct?

17 A. Yes. The industry calls them conductors.

18 Q. So what makes you think that this conductor was
19 energized when it fell?

20 A. If it wasn't energized, we would not have any of
21 this marking. What we would have is abrasions where it came
22 into contact -- maybe even a dent as gravity and part of its
23 force on it came into contact with the tower. But these
24 types of markings only happen from a discharge.

25 Q. And where is this in relation to this broken hook
26 and that insulator string that we're looking at?

1 A. So this photograph here is a really close-up
2 photograph. And so this (indicating) is a support arm.
3 They use, it looks like, three-quarter inch conduit or
4 three-quarter inch galvanized pipe of some sort. These are
5 used to support it. There's clamps between them. They keep
6 the conductor attached to the support.

7 In the photograph here in the bottom left-hand
8 corner is where the attachment to the conducting structure
9 string would be. And then this goes up attached to another
10 insulator string and then to the tower which leads to
11 Palermo.

12 Q. So this is above the inverted insulator string and
13 the hook which is dangling at the bottom?

14 A. Yes.

15 Q. Exhibit Number 30. Can you describe what we're
16 looking at here.

17 A. Exhibit 30 again just another view of the
18 conductor. It looks like they moved it a little bit. This
19 particular marking here a metallurgist would have to define
20 what that is exactly. That could be arcing evidence. It
21 can be abrasions from this just leaning against the tower.
22 Regardless though, here we have really good pitting, really
23 good lines of demarcation that comes from being normal drawn
24 conductor to having material damaged.

25 Again, here are the support bars. We have good
26 pitting as well. Now, this is -- I believe this to be

1 steel. I didn't test it with a magnet. But based on its
2 makeup, mass, you know, I believe it to be steel. This
3 appears to have -- and also because it has kind of a
4 different pattern the way it burned. Steel takes much more
5 energy to melt it and for it to become fluid.

6 The aluminum, you know, somewhere between 750 and
7 1200 degrees, depending on the alloyed steel upwards of 2500
8 degrees for it to melt. So there was arcing that occurred
9 here as well although not as defined as the aluminum. There
10 is arcing that occurred on the support arm itself because
11 it's energized in line.

12 Q. All right. Now, we're on to Exhibit 31; the
13 photograph.

14 A. So this is kind of a back-up picture. Can we back
15 up a little bit. This kind of just shows the overall -- for
16 reference, this is Caribou-Palermo 27/222 and this rope here
17 is the lineman's or the line worker's safety line that he's
18 using to protect himself from falling. I watched him attach
19 that. That wasn't already there natively before we arrived.
20 And this is just kind of an overview kind of showing all the
21 damage.

22 Q. Again, right here is the southwest leg of the
23 tower?

24 A. Yes.

25 Q. Or southeast. I'm sorry.

26 A. This would be the southeast corner of the tower,

1 yes.

2 Q. The crossmember that we were talking about earlier?
3 The crossbeam?

4 A. Yes. And this photograph is at the -- actually, it
5 would be at the horizontal level. So we're kind of looking
6 from a lower position looking up at the damage.

7 Q. Now, in the earlier photograph we were looking at
8 the damage on this metal or steel pipe, for lack of a better
9 term. Here we're seeing a little bit better the
10 relationship between it and the conductor.

11 A. Yes.

12 Q. Are you familiar with why that pipe is there or
13 what that pipe is?

14 A. So I asked -- during our evidence collection day, I
15 asked the PG&E representatives who were there "What is the
16 purpose of that bar?" And they said it was just to
17 stabilize that conductor to keep it from slacking and having
18 the ability to sway in the wind.

19 Q. All right. One more photograph; Number 32.

20 A. So this is a different perspective of the same
21 photos we had just been looking at. So this is -- again,
22 this is the member steel right here is the southeast corner
23 of the Caribou-Palermo 27/222 tower. This is that arcing
24 evidence we've been talking about the last two photos.

25 What this photo provides is the contact points on
26 the tower itself. So what I earlier described as that

1 horizontal level member that can -- is what we're looking at
2 across this beam here. And these pitting marks here are
3 what I recognized and what one of our electrical engineers
4 identified as evidence of discharge for a phase ground
5 discharge.

6 Q. So basically the energized conductor made contact
7 with the steel crossbeam right in that location?

8 A. In at least these two locations, yes.

9 Q. Right. And so as a result there's pitting on the
10 conductor itself as well as the pitting on the crossbeam?

11 A. Yes.

12 Q. And then from the electricity arcing between the
13 energized conductor and the steel crossbeam?

14 A. Yes.

15 MR. NOEL: We ready to take a morning recess?

16 GRAND JURY FOREPERSON: I think we are.

17 Everybody agree? Yes.

18 MR. RAMSEY: Madam Foreperson, approximately
19 15 minutes?

20 GRAND JURY FOREPERSON: 15 minutes, yes, please.

21 MR. RAMSEY: Thank you.

22 GRAND JURY FOREPERSON: Back by 10:30ish.

23 [Recess taken from

24 10:18 until 10:33 a.m.]

25 GRAND JURY FOREPERSON: I think every one is back
26 from break. Yes.

1 MR. RAMSEY: It does appear everyone is back.

2 GRAND JURY FOREPERSON: It does appear that
3 everyone is back from break.

4 MR. RAMSEY: Yeah.

5 BY MR. NOEL:

6 Q. All right. Now we're up to Exhibit Number 33, the
7 photograph. Do you have that in front of you?

8 A. I do.

9 Q. Can you please describe what we're looking at in
10 Exhibit Number 33.

11 A. Yes. So this is again looking at the southeast
12 corner of the Caribou-Palermo 27/222 tower. This is part of
13 my instruction that I gave to -- or direction that I gave to
14 the PG&E workers as they were removing evidence was to
15 photograph everything before they touched it and photograph
16 everything after they have touched it.

17 So that is a photograph after they removed the
18 conductor. Before they removed the conductor, I also had
19 them mark the tower using electrical tape below as well as
20 above the contact points so that if we have to go back in
21 the future, we can identify that again as well. But in this
22 photograph that we're looking at is again that horizontal
23 support member of the tower.

24 And to reference the previous photograph
25 Exhibit 33 -- excuse me, Exhibit 32, these are the same two
26 discharge evidence that we saw in the previous photograph.

1 Now, this is just another perspective of the discharge
2 evidence that we saw in the photographs. We have another
3 one here. Although it doesn't have good clarity in this
4 photograph, there is evidence of a discharge in both the
5 sooting and staining of the painted metal. There also you
6 can see there are white marks that, I think, in this
7 photograph would be similar to these as well referring to
8 the discharge evidence.

9 Q. So let's move on to 34. Do you have that
10 photograph?

11 A. I do.

12 Q. And describe for us what the photograph Exhibit
13 Number 34 is showing.

14 A. This is the Caribou-Palermo 27/222 tower. Again,
15 this is a perspective of the southeast corner. And we're
16 basically from the outside looking towards the inside of the
17 tower. So we are basically outside looking in.

18 This line we see up here I believe -- without
19 having been up there just off these photographs, I believe
20 this would be evidence of an abrasion from that conductor
21 making contact after it was de-energized. But this mark
22 right here we can see in the photograph with the black
23 around it, around the corner of the support tower member has
24 evidence of a discharge at that point as well.

25 These different spots here are different. You
26 notice that they don't have the -- if you -- if I may refer

1 back to real quickly a better photograph. To Exhibit 32.
2 Exhibit 32. You see this discharge that is here, it also
3 looks like there's a button in the middle of it where the
4 metal had melted and then cooled. Like it almost looks like
5 there's a coat button in the center of that metal.

6 And if we go back to 34, it's different. That
7 black around the smaller dots is much smaller which means
8 that we didn't -- I don't believe these are points of
9 discharge. I believe these to be actual -- where molten
10 metal from where the conductor had fallen onto the member
11 after it left the conductor and it adhered itself to that
12 metal and only burned the paint around it.

13 Q. We also had spots like that on this other
14 crossmember?

15 A. Yes.

16 Q. Three of them to the left way?

17 A. Yes.

18 Q. All right. So 35. This one, because it's backlit,
19 it's a little hard to see. But if you can explain to us
20 what we're looking at.

21 A. Again, this is the southwest corner of the
22 Caribou-Palermo 27/222. The very bottom of the picture we
23 see that tape mark identifying the lower extent of the
24 contact with the conductor. This is after the conductor had
25 been removed. This is a really terrible picture on the big
26 screen, but it does appear to be the same as the exhibits I

1 have in my hand 35. I can see on your photograph that there
2 is that black mark. It's a close-up. And again, a lot of
3 that small metallic pitting all over as well. Judging by
4 this photography I would say that that is evidence again of
5 metal that had melted, was hot, and made contact with the
6 tower.

7 Q. Now, we have seen photographs of the inverted
8 insulator string and the apparently broken hook. Did you
9 direct the PG&E employees who were in the tower removing
10 this for you to also take photos of other similar insulator
11 strings in position?

12 A. I did.

13 Q. Moving on next to what is marked as Exhibit
14 Number 36 for identification. Do you have that photograph?

15 A. I do.

16 Q. And what is it that you see in Exhibit Number 36?

17 A. I recognize this photograph to be the photograph of
18 the -- what we call the right phase insulator string that
19 supported the transposition line conductor in the
20 Caribou-Palermo 27/222.

21 Q. And what is the significance of this photograph?

22 A. Several things. Number one, it gives us a good
23 example of the position our subject insulator string should
24 have been in. It tells us "I know this is the way it was
25 intended to be set," not the insulator string hanging from
26 the conductor touching the tower. This gives me an idea of

1 what the original hook would have been most likely to look
2 like.

3 But as part of my cause investigation, I didn't
4 settle for just that. I wanted to find out more about this
5 equipment. So I put in a request to PG&E asking them for
6 any information they had on these hooks and any of the tower
7 components. And they were -- they complied with my request.
8 And I actually got specific drawings for this
9 Caribou-Palermo construction line identifying what these
10 hooks originally should have looked like and what these
11 towers originally looked like.

12 Q. Let me stop you right there. When you say
13 drawings, are you talking about like computer drawings or
14 hand drawings?

15 A. No. These were hand drawings like drafted
16 documents from I believe -- I'd have to look at the
17 individual documents but circa 1910 to 1922. So old
18 documents. But these are the documents they provided for
19 the -- as built for the Caribou-Palermo line, which was
20 originally called the Caribou-Goldengate line originally.
21 It was under the Great Western Power Company.

22 That's what I learned from those drafted documents
23 is that the apex of this hook is supposed to be 15/16ths of
24 an inch from top to bottom. It is somewhat oblong. The
25 width should only be 7/8ths of an inch.

26 This hole that you see in the foreground -- there's

1 two. You can see the hole in the foreground on this
2 bracket. That is attached to the end of the support arm of
3 the Caribou-Palermo 27/222 tower. That hole -- by those
4 specific drawings that hole is only supposed to be an inch
5 and one-eighth in diameter drilled with a machine drill.
6 That being said, simple math where they're showing me
7 three-sixteenths of space between the top of the apex of
8 this hook and the top of the apex of that hole. And as you
9 can see, there are a lot more than three-sixteenths of an
10 inch. I was not able to measure it on the tower as it
11 stood. But looking at it I can see that there's more than
12 half a diameter of that hole showing air space between the
13 hook and the hole itself.

14 Q. And what are these brown disk-like things?

15 A. Those are the insulators; the insulator bell.
16 These insulators are actually three parts. You have a cup
17 that is made out of steel. This insulator itself, the
18 concentric circle that is made out of ceramic. It's
19 actually cemented and ground into the cup. And then there's
20 a pin inside. You have a better view down here. These pins
21 are also cemented and grounded inside the ceramic insulator.

22 So there is no metal-to-metal contact. That is how
23 they insulate it. So this is what the insulators are
24 supposed to look like when they're in good repair; the
25 insulator and the hook. This hook is actually showing signs
26 of damage as well.

1 Q. Now, moving on to 37, do you see that photograph?

2 A. I do.

3 Q. And what is depicted in the photograph marked as
4 People's Exhibit 37?

5 A. This is another perspective. This is again the --
6 what I recognize as the right phase insulator of the
7 transposition conductor of the right-to-left phase of the
8 27/222 tower. It's just another perspective looking more
9 easterly. It's a great example because this also shows that
10 there is another hole drilled in the actual support member
11 itself. And if you look closely -- I examined this
12 photograph zoomed in pretty well. There appears to be
13 another wear mark that makes it greater than an inch and
14 one-eighth in diameter. This tells you at some point there
15 was another piece of equipment hanging from that hole and it
16 caused wear on that location.

17 Q. So one of the other things that this photograph
18 gives us is some perspective. This looks like a road
19 running through the photograph there.

20 A. Yes, it is.

21 Q. What road is that?

22 A. That is Camp Creek Road.

23 Q. So earlier when we talked about the proximity of
24 tower 27/222 and specifically the specific origin areas and
25 the general origin area to Camp Creek Road, were you talking
26 about how far up above -- vertically above the road?

1 A. Yes.

2 Q. And this photographs illustrates that?

3 A. Yes, it does. It also shows the terrain very well
4 as well as the background. You can see that at the next
5 spur ridge, for lack of a better term, it shows the terrain
6 and how steep it is. And the hill that the subject tower is
7 on has very similar terrain.

8 Q. All right. Now, you noted in photograph Exhibit
9 Number 37 that there is two holes. Did you direct the
10 photographs be taken to document those holes?

11 A. I did.

12 Q. Directing your attention to photograph Exhibit
13 Number 38, do you have that photograph?

14 A. I do.

15 Q. And what is Exhibit Number 38 showing?

16 A. This is a photograph that was taken by PG&E tower
17 line personnel and this is the left -- we call the left
18 phase of the transposition conductor of Caribou-Palermo
19 27/222.

20 Q. So let's take a second here and define what you
21 mean by "left phase" and "right phase."

22 A. So like we spoke before on Tuesday, with my back
23 towards the Caribou Powerhouse I am facing -- in this case I
24 would have been facing west. We refer to the tower as
25 everything on the ride side is right-hand phase and
26 everything on the left is the left-hand phase and the center

1 is going to be middle phase.

2 Q. So is this the crossarm to which the inverted
3 insulator string with the broken or apparently broken hook
4 should have been attached?

5 A. Yes. As exemplified in photograph 37 all things
6 being the same, yes, this is where it should have been
7 hanging.

8 Q. So that hook, if it had actually been a hook at
9 that point, would have been hanging through either one of
10 these holes that we see here in 38?

11 A. Yes.

12 Q. Now, let's move on to 39.

13 A. Okay. I have that photograph in front of me.

14 Q. You have that photograph?

15 A. Yes.

16 Q. And describe what we're looking at?

17 A. This is the same perspective, but they've began
18 removing equipment. So the crossarm we saw above the prior
19 is now missing. So as I directed them, they photographed
20 everything as they -- before, after, and during the removal.
21 And this better kind of shows a little different
22 perspective. It's a little higher. You can see -- although
23 it's not the best picture, you can see the wear, the pattern
24 a little better in this photo than in the previous photo.

25 Q. So just to quickly summarize the photographs we
26 have been looking at now starting at number 27 and running

1 through this one Number 39, those were photographs that were
2 taken by PG&E personnel in the tower; correct?

3 A. Yes.

4 Q. And those were taken at your direction and
5 under your supervision?

6 A. Yes.

7 Q. And then immediately that day when they came out of
8 the tower the SD cards were handed over to you to download?

9 A. Correct.

10 Q. Or actually to your partner Mark Hillskotter?

11 A. Hillskotter.

12 Q. All right. So you direct PG&E to remove all this
13 stuff from the tower?

14 A. Yes.

15 Q. And what is done with it when it's removed?

16 A. Once it is removed, it's lowered to the ground
17 where a receiving team -- again, because of the location,
18 the receiving team was comprised of Pacific Gas & Electric
19 employees. They received the equipment on the ground. It
20 was placed on a yellow tarp for protection to keep it clean
21 and then it was documented and photoed.

22 Q. So moving on to People's -- or to Exhibit Number 40
23 for identification, do you have that exhibit with you?

24 A. I do.

25 Q. Describe what we're looking at in Number 40.

26 A. So this is the left phase insulator string with the

1 hook still attached. This is when it first came to the
2 ground. And I started photographing, you know, basically
3 its condition. In the photograph what we see is a Pacific
4 Gas & Electric pre-marking each bell just in the order from
5 number one being close to the rack down to ten which is the
6 last insulator on the string. Again, we see the broken
7 insulators and at the end of the insulator bell one you see
8 the damaged hook.

9 Q. So that is immediately after that insulator string
10 was removed from the tower?

11 A. Relatively, yes. There were a series of
12 photographs that were taken, yes.

13 Q. Moving on to Number 41, what is depicted in Exhibit
14 Number 41?

15 A. So this is the hook that is damaged. That is
16 attached to the first insulator string. This is the first
17 insulation bell of the insulator string that you saw
18 inverted from Caribou-Palermo 27/222. In the photograph you
19 can see that there is wear and metal that has been deformed
20 near the edges.

21 One thing that I did note when it came to the
22 ground and I had an opportunity to exam it is that there's a
23 difference in the presentation of this metal and the phase
24 of the damage as opposed to this even -- I know it's not
25 terribly easy to see in the photographs that you have but --

26 Can we zoom into this a little bit.

1 Q. Sure. Is that better to see?

2 A. Earlier when I was kind of speaking of what I think
3 is oxidization, that is more for a metallurgist to
4 determine. But this appearance and presentation is
5 different than that. This appears to be relatively smooth.
6 This appears to be jagged. And you can actually see what
7 was told to me to represent a --

8 Q. Okay. Let's not go with anything that's told to
9 you.

10 A. Yep. So we can see it's a jagged point which
11 appears to be something as simple as a break, yeah.

12 Q. Let's move on to 43.

13 A. You skipped one.

14 Q. Did I skip one? Oh, yeah. I skipped 42.

15 A. I have 42 in front of me.

16 Q. And also in both 41 and 42 there's some kind of a
17 white thing.

18 A. Oh, a glove?

19 Q. A glove.

20 A. Yes.

21 Q. So that is somebody's hand?

22 A. Yes, it is.

23 Q. Somebody is holding it. Maybe we have to make a
24 record of all of this.

25 A. Yes. And I'd also like to note that these pictures
26 that we're looking at right now were not taken by me. These

1 were actually taken by Mark Hillskotter.

2 Q. Spell that last name for us.

3 A. H-i-l-l-s-k-o-t-t-e-r.

4 Q. And who is Mark Hillskotter?

5 A. Mark Hillskotter is my counterpart of the bureau.
6 At the time of the fire he was assigned to Lassen/Modoc Unit
7 as prevention 2224 here in Butte County. He's now 2124.

8 Q. So he's a fire captain just like you?

9 A. Yes, he is.

10 Q. Assigned to the Fire Prevention Bureau?

11 A. Yep. And he attended POST with me.

12 Q. And a fire investigator?

13 A. Yes, Sir.

14 Q. Okay. What are we looking at here in 42?

15 A. It's a similar photo to 41. It's a different
16 perspective. I asked the PG&E employee to rotate the
17 insulator bell and attached the damaged hook to get a better
18 view of the phase of the damaged portion. I know the shadow
19 here -- this is kind of still the rounded portion. So this
20 is kind of turned up just a little bit and this would be
21 what used to be the apex of the hook.

22 Q. Now, you said that you've reviewed documents from
23 PG&E, original schematics on this and that this hook -- the
24 apex from edge to edge, that is supposed to be
25 fifteen-sixteenths of an inch?

26 A. Yes.

1 Q. Now, and the hole that it was going through was
2 supposed to be one and one-eighth of an inch?

3 A. That is correct.

4 Q. Or basically eighteen-sixteenth of an inch?

5 A. Yes.

6 Q. All right. Let's move on to 43. Tell us what
7 we're -- what we see in Exhibit Number 43.

8 A. So this is as they're disassembly portions of the
9 tower you've identified that we wanted to maintain as
10 evidence. This is the left -- wait, a PG&E employee
11 referred to as a runner. We have been referring to it as a
12 support beam. This is a tower portion. This is the --

13 Oh, my goodness. I didn't touch it.

14 Q. The county no longer likes Java so 14 times a day
15 Java sends a message.

16 A. So this is the -- basically the left support
17 structure that's supported the subject insulator that was
18 damaged and made contact with the -- allowed the conductor
19 to make contact with the tower. So this is just kind of an
20 overall view of it coming down to be marked by an PG&E
21 employee.

22 Q. So you said PG&E refers to this as a left runner?

23 A. It's more of a colloquial term. There's jargon
24 within the industry and these being.

25 Q. But that's what's PG&E's writing on the inside;
26 correct?

1 A. Yes.

2 Q. And I just want to have you explain real briefly
3 why it is that when evidence is removed like this, that it's
4 immediately written on and marked.

5 A. In order to keep items identified -- you never know
6 at the end how many pieces of whatever we're going to have
7 so everything gets identified immediately. Documentation is
8 absolutely of the utmost important when collecting evidence.
9 You've got to know who collected it, how it was collected,
10 what item was collected, the time it was collected. A lot
11 of information is actually captured by camera and the
12 MedData that goes with the camera. But everything needs to
13 be identified from the moment we get our hands on it until
14 it's maintained.

15 Q. So let's talk briefly about the process of removing
16 these items from the tower. Just give us a basic overview
17 of how that occurs.

18 A. Specifically towers in general?

19 Q. From these towers just give us a general --

20 A. Well, it's no feat of ease. I will tell you that
21 much. All of that equipment is extremely heavy. You have
22 to basically identify who is going to do it, the individuals
23 identified after briefing and clear direction climb up in
24 the tower using safety harnesses. They have to have minimum
25 one point of contact all the time. When I say "contact," I
26 mean they have to be tied in.

1 So as they are climbing, they are using two hooks
2 to work their way up the tower to get through the members.
3 So they are never disconnected from a safety line.

4 Once they get up there, they have to de-energize
5 the lines. Excuse me. Not de-energize. They have to
6 insure they are grounded so, you know, that the lines -- the
7 line is de-energized by their company. They still have to
8 attach grounding wires. So they connect the wire to the
9 conductor. I don't do it. But if they feel it's safe, they
10 connect a wire to the conductor and then attach that wire to
11 the structure itself because the structure is grounded. So
12 once they know that everything has been grounded and it's
13 safe, then they have to slowly disconnect the parts.

14 They have pulley systems they rig up to load all
15 this heavy equipment and safely lower it to the ground.
16 It's quite a feat to watch. I'm sure it's more of a feat to
17 do, but I will never know that.

18 Q. So one of the things that I want to get is these
19 parts are being disconnected and lowered to the ground one
20 at a time; correct?

21 A. One at a time.

22 Q. So as they're being lowered to the ground by ropes
23 and the pulley system, they are immediately taken -- they
24 are immediately marked up. They are immediately documented?

25 A. Immediately.

26 Q. Okay.

1 A. And they are even photographed as they are coming
2 down. We have --

3 Q. And that was the next point is you're standing
4 there or in this case your partner Captain Hillskotter is
5 standing there photographing everything as it's going on?

6 A. Yes, Sir.

7 Q. All right. So this is what the PG&E person
8 identifies as a left runner; correct?

9 A. Correct.

10 Q. Which we have talked about as a left crossarm, a
11 left crossmember, or a left phase?

12 A. Yes. I know we keep bouncing back and forth in
13 terms, but there's -- a lot of these terms are used
14 unilaterally in the industry.

15 Q. And also a lot of them depend upon what exactly it
16 is that you're talking about the context?

17 A. Correct. Most of these pieces start out as a piece
18 of angle iron.

19 Q. So this is the phase or the crossmember or the
20 runner to which the inverted and broken insulator string
21 should have been attached?

22 A. Yes.

23 Q. And these holes -- one of these holes is where the
24 hook -- what used to be a hook or appears to have been --
25 used to be a hook should have been attached?

26 A. Yes.

1 Q. All right. Let's move on to 44. Describe what we
2 are looking at in Exhibit Number 44.

3 A. Again, this is the item that the PG&E worker
4 identifies as the right runner. Excuse me. Left runner.
5 Left runner. Excuse me.

6 Q. Is that right or left?

7 A. This is the left. Oh, 44. I had 45 here. Sorry.
8 Okay. I got out of sequence here.

9 Q. All right.

10 A. Forty-four. This is 44, and this is the same
11 photograph that is on the screen.

12 Q. Great. So that is the right runner. That is the
13 runner crossmember phase to which the insulator string was
14 still attached?

15 A. Yes, it is.

16 Q. And see the holes that are -- that are in the phase
17 crossmember runner?

18 A. Yes, I do see them.

19 Q. And you've looked at documents provided by PG&E as
20 to designs for these things?

21 A. Yes.

22 Q. Did the holes that we are seeing in these items
23 match what the design specs show?

24 A. No, they don't. If I may elaborate.

25 Q. Yes.

26 A. The design specifications for both of these pieces

1 of equipment, both the pieces of angle iron that is
2 identified as right runner but also the bracket that was
3 identified in their specifications is ST-20. I'm not sure
4 what that means, but that is what the bracket is identified
5 as. They both are identified to have an inch and one-eighth
6 diameter hole drilled with just a machine drill. So this
7 should be as round as a hole could be drilled. And what we
8 see in the photograph is we see this oblong wear mark, this
9 one being shiny and this one is not shiny. I actually used
10 this as comparison to identify which hole was likely being
11 used on the other support arm.

12 Q. Let's get to that real quick because that is the
13 next photograph we have. Number 45.

14 A. Yes. So in 45 when the equipment was down on the
15 ground, I was able to examine it closely. And I could
16 see -- and also evident in this picture -- that on the ST-20
17 bracket, there is a shiny wear mark and on the angle iron
18 portion, what I would consider probably to be the original
19 use hole, there was no shiny wear marks. So using the right
20 support arm as an exemplar I was able to figure that the
21 bracket, the ST-20, is where the damaged hook was hanging
22 from.

23 Q. Now, going back to the original schematics, the
24 blueprints for those towers that you went back to, do those
25 blueprints show this ST-20? This additional bracket?

26 A. No, they don't. That ST-20 was intended to be used

1 on the T superstructure that is above the towers for a
2 transposition tower.

3 Q. Okay.

4 A. That was not identified to be used as a support
5 bracket for this use.

6 Q. So in the original schematics and the blueprints
7 that were provided to you by PG&E for these towers, where
8 were the insulator string, the suspension hooks to connect
9 to the crossarm?

10 A. In the original drawings the hooks that supported
11 the insulator strings were supposed to be in the angle
12 iron -- the hole drilled was in the angle iron itself.

13 Q. Okay. Let's move on to 46.

14 A. I have 46 in front of me.

15 Q. And what does 46 show?

16 A. Exhibit 46 is the right support arm or right runner
17 inverted. This photograph just shows a different
18 perspective; the underside of those brackets. I think it's
19 a better example of the original wear that had occurred in
20 the original hole that was drilled in the angle iron. It
21 also shows the sharp corners where it goes from the original
22 drilled hole to the worn area where the hooks are sitting.

23 Q. So why don't you pull out the drawing tool on
24 there. And just to demonstrate, show us when you said the
25 original hole wear versus the wear. Highlight that.

26 A. I will use red. These corners are here. They are

1 visible. I'm exaggerating here just a little bit for that.
2 These sharp corners are what are referred to as a clear line
3 demarcation where it goes from the original hole that was
4 drilled into transitions in the wear line.

5 Q. Right.

6 A. Does that answer the question?

7 Q. Yep.

8 A. Okay.

9 Q. Let's move on to 47. And what are we looking at in
10 47?

11 A. This is the left runner, and this is probably one
12 of the better pictures that shows the same wear pattern.
13 Again, using the drawing tool in red I will identify those
14 same points of demarcation where the transitions from the
15 original milled steel to the wear pattern.

16 Is that more visible? Does that help?

17 Q. Now, this one also shows again the shiny metal on
18 the base of the hole on the bracket. The ST-20 bracket;
19 correct?

20 A. It does, yes, right here on the bottom edge. I
21 will draw that again.

22 Q. It sure is nice having this big TV.

23 A. So you could see here I'm going to draw in blue --
24 actually, I'm going to circle it because I don't want to
25 draw on top of it. Even though there's a shadow there, I
26 can tell you I did not see anything shiny in that hole. And

1 even in this picture you can see there is nothing shiny or
2 reflective in that area. Right here in blue again on the
3 ST-20 bracket you can see that there's a shiny edge.
4 Actually, I wouldn't call it an edge. It's somewhat rounded
5 where the wear had taken place.

6 Q. And just to specify, I know it's pretty obvious,
7 but can you show us what side is top and which side is
8 bottom. Kind of up and down.

9 A. Yeah. So it's native position that we found it in
10 would have been up.

11 Q. All right. Moving on to number 48. Oops. There
12 we go.

13 A. Can we zoom in on this picture.

14 Q. First, let's set the foundation here. What are we
15 looking at?

16 A. So this is Exhibit 48; the same photograph that I
17 have in my hands. This is the right phase insulation string
18 hook. This is the -- that one was still intact on the tower
19 as we found it. Again, we have a PG&E employee holding it
20 in his hand. And there is other evidence in the background,
21 but specifically what we're looking at here is this specific
22 hook. There is several things to note about the hook.

23 Q. Want me to blow it up?

24 A. Yes, please.

25 Q. There.

26 A. There are several things to note on the hook.

1 First off, it's a complete hook, mostly complete hook.
2 There are marks that we identified. I know you can't see
3 texture here so much, but this is actually a raised "B."
4 It's a casting place. And then you have an "OB" or a circle
5 with a "B." We later learned that "OB" is the signature
6 stamp or raised insignia for the Ohio Brass Company. The
7 raised "B" was an earlier stamping or identification for the
8 Ohio Brass Company. And that particular raised "B" was also
9 identified in the build specifications that we got from PG&E
10 in those hand-drafted documents.

11 So this is what was the intention when they
12 designed the -- this isn't the intended hook that was used.
13 That's the original design specifications. So this raised
14 "B" here you see, that appears in the original design specs
15 for the tower line. And that is the only place we found it.

16 Q. Okay. And those records that were provided by PG&E
17 reference this as the Ohio Brass Company?

18 A. Yes, it is. And there is a category number that
19 goes with it, but I don't have that on me.

20 Q. Okay. And then you said this circle with a "B"
21 inside, that you were also able to identify that that goes
22 to the Ohio Brass Company?

23 A. Yes, it is.

24 Q. How were you able to identify the circle "B" to the
25 Ohio Brass Company?

26 A. I did a great deal of research through the

1 Internet, contacting different companies. Come to find out,
2 the Ohio Brass Company was originally -- was later purchased
3 and owned by Hubble Company who now makes equipment for the
4 transmission line industry. They were able to tell me and
5 confirm what I found on the Internet; that the "OB" was --
6 the circle "B" is the Ohio Brass Company. So not from the
7 original company but the company that bought them told me
8 that that is the emblem for Ohio Brass Company.

9 Q. Have you been able to determine how far back in
10 time the circle "B" goes?

11 A. So we know that our drawings with the raised "B"
12 are from 1911 and the circle "B" is somewhere around 1921.
13 So we're in that area. So roughly a ten-year period was the
14 first -- I think 1921 is the first record of the circle "B"
15 and our first record of the raised "B" is 1911.

16 Q. Now, we didn't put another picture in here, but
17 this is the right phase. This is the insulator string that
18 was still hanging on the right crossarm; correct?

19 A. Yes.

20 Q. And this has the circle "B" which would indicate
21 1921?

22 A. Yes.

23 Q. At least. The left phase, the broken hook --

24 A. Yes.

25 Q. -- were you able to find a marking on it?

26 A. Yes. I think we actually have a photo of it if we

1 go back to Exhibit 28.

2 Q. There it is.

3 A. There's the raised "B."

4 Q. So the hook that failed only had the raised "B"?

5 A. Correct.

6 Q. And you said that was consistent with the hook that
7 was shown in the schematics and diagrams for the building of
8 this tower line and that were provided to you by PG&E?

9 A. Yes. All told it was on the opposite phase. So in
10 this schematics it would have been written on the other side
11 of it.

12 Q. So more or less the same?

13 A. The same "B" design.

14 Q. And there was no circle "B" on this hook?

15 A. No, no. That was the only marking that is still
16 visible.

17 Q. All right. Let's go to 50. Oh, you want to go
18 back?

19 A. Yeah.

20 Q. Okay. Go ahead.

21 A. There's still some -- actually, I don't think we
22 talked about 49 yet. We talked about 48 so we can talk
23 about 49. That works.

24 Q. Okay.

25 A. So I have 49 in my hand. This is the same on the
26 screen. This it's a little bit different angle than 48.

1 I'm going to identify a couple things here that may be
2 difficult to see. So of course we have the white glove in
3 the background. What I can identify here -- it only
4 identifies the glove outlined as I see it in this
5 photograph. So that is where I see gloves. So what this
6 shows is that there's a significant wear pattern in this
7 hook. I know it's difficult to see in the photographs you
8 have in front of you, but there's a significant amount of
9 material missing from this particular support hook or C-hook
10 as they call them.

11 And again, we have the shiny phase that is
12 consistent with the shiny wear marks on the inside of the
13 support arm or the right runner in this case.

14 Q. So is it safe to say that this channel lines up
15 with where this hook would be hanging from the support arm
16 or the phase or --

17 A. Yes. That's -- I saw that hook in the eye of that
18 ST-20 bracket on the right runner.

19 Q. So when you were able to see it up there, that is
20 where the contact is being made between the angle iron of
21 the phase or crossarm or runner and the hook itself?

22 A. Correct.

23 Q. All right. Ready to move on?

24 A. Sure. You skipped one.

25 Q. Double-checking. All right. The next couple of
26 photographs I think are going to have to do with the wires.

1 You know.

2 A. Yes. There's quite a few of them.

3 Q. Yep. 50, 51, 52. We're up to Exhibit Number 50.
4 Do you have that in your hand?

5 A. I do.

6 Q. And describe for us what is depicted in Number 50.

7 A. So this is the conductor -- the transposition
8 conductor with the support bar that was brought down. This
9 is a close-up view of it once it was on the ground. What we
10 can see is we have the conductor with damage to it where it
11 goes from being in tact to being frayed and the material
12 missing.

13 Q. All right. Exhibit 51.

14 A. Exhibit 51 again is more evidence of discharge in
15 the different portion of the conductor. This was the
16 portion that you saw earlier that had the portion actually
17 touching the tower when we arrived. Again, this is on the
18 ground and this is the transposition conductor.

19 Q. All right. From your training and your experience
20 in dealing with electrical fires and electrical wiring, are
21 you familiar with the term "bird-caging"?

22 A. Yes.

23 Q. What does bird-caging mean?

24 A. So bird-caging is when you have a strand set of
25 wires within a C conductor. So that is a sealed conductor.
26 And each one of these individual segments is a wire within

1 the conductor. And what occurs is when we have some sort of
2 discharge or significant overheating, the aluminum conductor
3 expands. I mean, it gets heated up. And like all metal it
4 expands as it gets heated. And if it's not continued -- if
5 it's not allowed to cool slowly and it cools rapidly, it
6 will actually freeze in that expanded position which is what
7 we see here.

8 So we have where this entire conductor should be
9 wound tight like it is right next to the bracket here.
10 Actually, this isn't wound that tight. There's a little bit
11 of evidence of bird-caging here, but it's probably the
12 tightest portion we can see in this whole conductor line.

13 But this (indicating) is the bird-cage. Basically,
14 it opens up and visually it's comparative to a birdcage.
15 And that's why they call it bird-caging. That is a
16 technical term; bird-caging. That is how it occurs just
17 from that rapid heating and rapid cooling.

18 Q. All right. Moving on to Exhibit 52, tell us what
19 we're looking at here.

20 A. So this is another perspective of the conductor at
21 the most significant discharge point. I say it because
22 there is the area that had the most amount of material that
23 is missing and some of our best evidence of a discharge.
24 There is a foot in the background. I believe that is one of
25 the PG&E employees. Yeah.

26 Q. All right. So first up on this one, again is this

1 an example of bird-caging where the wire is?

2 A. Yes, it is. So there's all this open and twisted
3 area. This is bird-caging. I'm not going to exclude the
4 possibility that some of this was opened up from the wind
5 potentially moving this after the fact. But all the way
6 down here this is mostly significantly here. This is all
7 bird-caging here. This within the protected area is
8 absolutely bird-caging. That is absolutely bird-caging.
9 This was definitely portions of bird-caging, but I think it
10 might be some other articulation that occurred within.

11 Q. Now, you said that this also shows that we have
12 wires that are broken. We have strands of this conductor
13 that are broken. But you also said it shows that there's
14 strands of wire missing.

15 A. Yes. In the next photo it has -- actually the next
16 two photos have a better example.

17 Q. All right. Let's go on to 53.

18 A. So 53 is a little bit more closer up. And I do
19 have that photograph in front of me. This is 53. Wrong
20 direction but a closer-up example. But I think 54 is
21 actually going to be the best one to talk about. It shows
22 the most material missing. We can come back to 53.

23 I have 54 in front of me; that very good close-up
24 photo. A lot of great things to look at here. First off,
25 what we have is these marks here and there is wire that has
26 been separated. It goes from being -- again, we talked

1 about a clear line of demarcation.

2 There is some previous abrasive damage that is done
3 here to this bracket that you can see where this conductor
4 has almost been adhered to a flat surface on the top right
5 side over here where it appears to be rounded. But that
6 actually helps in identifying that clear line of demarcation
7 because the flat surface is dropping off instantly. Again,
8 that happens when you have very concentrated heating.

9 So if this had been subjected to a fire, what you
10 would have is all these conductors would be evenly tapered
11 to the point where they started to melt off. They would
12 slowly start -- almost like a pencil tip is what they would
13 look like. When you have a discharge like this, you know,
14 we actually develop a plasma. When you get that heat built
15 up, it very quickly expands the metal and thrusts it
16 outward. And then once the electrical discharge is stopped,
17 there is no more heating. So the time it takes to heat up
18 this entire mass isn't there. So you have a very finite
19 location of damage. And that is exactly what we have here.

20 Now, if we go back to the previous photograph, we
21 can see again now that we're looking at all these
22 conductors. And these conductors -- after we packaged up
23 our evidence, one thing we want to do is protect all of
24 this. And so we wrapped it all up. As we were wrapping
25 this up to bring it together to protect those ends, we
26 noticed there's a gap; that those wires did not touch their

1 counterparts. There is actually a significance amount of
2 material missing.

3 Q. For the record, you are holding up to the jury your
4 thumb and your forefinger approximately half to
5 three-quarters of an inch apart.

6 A. Yeah, that sounds about right.

7 Q. So that approximately a half inch to three-quarters
8 of an inch gone of these strands?

9 A. And there is more material missing then that
10 because we also have portions that are just no longer in
11 existence. You can't see from the backside, but that strand
12 is broken off completely. So that accompanied with the
13 evidence we found on the ground, I think there is a nexus
14 there. I think the point of these two items might have been
15 together at one point.

16 Q. So that is where I want to go. You said "Coupled
17 with the evidence I found on the ground." Now we can go
18 back to the SOA photographs, the specific origin area
19 photographs and specifically origin Number 2 where we saw
20 that little tiny piece of metal.

21 Describe what you're talking about when you say
22 "Coupled with what we found on the ground."

23 A. Can we go back to that photograph. It might
24 actually help.

25 Q. Sure.

26 A. I know it's not 25.

1 So I know it's not really great for size reference,
2 but this piece of material is about a centimeter to half a
3 centimeter in length. It's a very small piece of material.
4 There are certain things that I noticed about this piece of
5 material. And you can't see the other side because I didn't
6 photograph it upside down. I photographed it as the native
7 position as I found it. But we have a very finite point
8 here where it goes from being nice straight steel to a clear
9 line of demarcation again. There was some deformation right
10 at this apex of the turn right there and even more along the
11 approach to the apex which tells me that this whole piece of
12 material at some point in its entirety was influenced by
13 heat. In other words, it had been deformed by heat.

14 There is no process that I'm aware of that causes
15 this expansion in a localized area other than the fire that
16 allowed it to basically as it's melting --

17 You guys heard of surface tension of water. Almost
18 all materials that have liquid have surface tension
19 including molten metal. So if you have a piece of metal
20 that is molten, it wants to form a bead or a ball just like
21 water does in a droplet. That's the process that is
22 happening here. So it's actually widening like trying to
23 form that ball or that bead. And that out of all the
24 evidence that we have collected this is my most competent
25 piece of evidence that it was likely from our transposition
26 conductor.

1 Q. Other than that small piece of wire that is shown
2 in the photograph from 25, did you find any other wiring or
3 what appeared to be wiring on the ground?

4 A. Yes. We found actually quite a bit of it. Some of
5 it was partially buried. Some of it was on top of the
6 surface. We did find two segments of wire within SOA one.
7 Those wires were significantly larger in size. And because
8 of their degree of damage, we're not sure how long they were
9 there anyway because those were in an area that did sustain
10 a little bit more heat and were not as defined as this
11 particular piece.

12 Q. So we have kind of walked through the origin
13 investigation. We have kind of walked through the cause
14 investigation. What was done prior to finishing your
15 investigation up there at origin -- or at tower 27/222 to
16 document where all this evidence was found?

17 A. We do a couple things. Number one, we did have an
18 electrical engineer come up and examine some of the evidence
19 before it was collected so he could see it in its native
20 position and we also had a -- we call it a LiDAR team. It's
21 light and distance ranging is what it's called. It's
22 acronym to LiDAR because what they're doing is this team
23 comes in. It's a Cal Fire survey team. We ordinarily use
24 them for surveys of property and realized that they'd fit
25 very well into our investigations for identifying and
26 mapping items down to half a centimeter. So that's all

1 their measurements. They came and they scanned our sites.

2 And if we can, can we look at --

3 Q. That's where we're going to.

4 A. Fifty-five.

5 Q. Once the LiDAR team comes in and does their scans,
6 are they able to generate those scans into a diagram for
7 you?

8 A. Yes, they can.

9 Q. And as part of that scan that we've talked a lot
10 about today and we'll talk a little bit more in a second
11 about all of your different colored flags, do the LiDAR
12 scans also document the locations of the flags?

13 A. Yes, they do. And they use what is called Trimble
14 GPS Technology which is, I mean, commercial grade GPS. For
15 those of you who aren't familiar with Global Positioning
16 System, it's identifies location.

17 Normally Global Positioning Systems are good for up
18 to six to nine yards, somewhere in there, where a Trimble
19 grade takes it down to half a centimeter which is extremely
20 accurate to both horizontal locations but also vertical
21 distance in relationship to the ground.

22 And so this is --

23 Q. Well, first of all, let's stop right there. You
24 have in front of you in your hands what is marked as Exhibit
25 Number 55.

26 A. Yep.

1 Q. Can you explain to us what is Exhibit Number 55?

2 A. Exhibit 55 is an end product from the LiDAR team.
3 So after they collect all their data, they're able to put it
4 into a computer and generate this, for lack of better term,
5 map.

6 Q. Okay.

7 A. This map is able to identify -- these lower three
8 red lines are the three conductors from the Caribou-Palermo
9 line. In the very center of the map we have a square with
10 triangles on either side. That is the representation of the
11 Caribou-Palermo 27/222 tower.

12 Around it we see all the flags or indicated flags
13 that I put on the ground. And it's -- the resolution isn't
14 great here. But here we had the yellow, which appears to be
15 more orange in this printing. And we have reds and the
16 blues, all my greens, and my -- what we call the debris
17 field. And so these triangles down here at the bottom,
18 these are the reference spikes that I set. Two and three
19 are reference spikes that the LiDAR team set. Here is my
20 evidence. Here is evidence one and evidence two. There is
21 evidence three. GOA number three.

22 Q. SOA. Specific or general?

23 A. I'm sorry. Specific origin. Yeah, number three is
24 over here and here is our debris field. So we have specific
25 origin number one, specific origin number two, specific
26 origin number three, and here is our debris field.

1 Q. Okay. As you're pointing to them, we need to
2 reference those for the record so Madam Court Reporter can
3 get them down exactly where you're pointing to them on the
4 screen. So if we're on the exhibit --

5 A. So on the screen -- my middle screen, this is
6 identified as E-1 and E-2. That would be specific origin
7 area one. On the screen where it says E-3 that is specific
8 origin area two. And directly off what would be the south
9 corner -- southwest corner of the tower is where
10 specifically origin area number three would be.

11 Q. Now, we talked -- and just to make sure we've got
12 all this straight, the various times during the day, we'll
13 go over it one more time. The colors. What does each of
14 the colors mean?

15 A. So that is a great view to talk about it. So since
16 I always start in the advancing vector, I will start over
17 here. As I was driving in -- and it's hard to see here.
18 Actually, it's not even in the screen. But Camp Creek Road
19 kind of runs through here and basically follows the contour
20 line. It's kind of out of shot here, but I came in here.

21 These are all the advancing vectors as I was
22 walking up the hill. And I came up the steepest side
23 because I like to work hard. That is where I started
24 setting all my flags. And I was identifying all these
25 advancing vector indicators. Actually, excuse me. I
26 actually came up over on this side and first came around and

1 realized I was getting the backing vector, came back around.

2 This is the serpentine counter clockwise approach I
3 was making okay. So we're going back and forth working my
4 way up and working my way around here. Here is the
5 advancing vector again. There is some lateral. Got to the
6 point where I got to this roadside. These are the blue
7 backing vectors we saw along that walking trail. All these
8 greens down here next to reference point number 20 on the
9 diagram is where we took a lot of photographs looking up at
10 the tower. And we got back here and we saw the photographs
11 of a lot of vegetation that was still intact looking west
12 past the tower.

13 So once you identify and can understand "Okay.
14 Backing lateral and progressing," you can really -- and that
15 is why these flags are such a great tool for us. It really
16 shows us how the fire started here and progressed out. And
17 the flags kind of give you that visual reference. It kind
18 of puts the story into place. Because I have no way of
19 seeing 360 degrees all at once around an incident. I have
20 to use these flags as a tool to help me identify, you know,
21 the flow.

22 And it's really a matter of me -- I'm looking down
23 at the ground and I'm setting flags. And I'm not even
24 really paying attention to where -- you know, my
25 relationship with the other flags. I'm just setting this
26 flag right now. Once it's set, I move on. And I'm just

1 look for the next place to set a flag. And then when it's
2 all done I stand back and then I look. So with what I see
3 it's pretty clear how the fire progressed.

4 Q. All right. A couple other things just to make a
5 note of this. We see these black lines kind of through
6 here. And some of them have numbers on them, prints on the
7 far left 2075 and then the next one to the right is 2100.

8 Can you explain what those are, what they mean.

9 A. Yes. These are contour lines. In this particular
10 diagram, we have 25-foot interval contour lines. Basically,
11 it's showing the elevation. So if you can imagine each one
12 of these lines is a slice of the topography, the horizontal
13 plane. It kind of gives an example of what the terrain
14 looked like. So these dark lines are separated by 25 feet
15 of distance. And I could see that there's five smaller
16 lines -- sorry, four smaller lines in between for a total of
17 five intervals between 25. So each one of these
18 lighter-shaded lines represents five feet.

19 Q. Okay. So red is the advancing fire; correct?

20 A. Correct.

21 Q. Yellow is the lateral movement of the fire?

22 A. Correct.

23 Q. And blue is the backing fire?

24 A. Correct.

25 Q. Now, can we use the drawing tool over there and can
26 you give me the specific origin area one, specific origin

1 area two, specific origin area three, and the direction of
2 the wind.

3 A. So for the record, I'm identifying specific origin
4 area one in black, two is in blue, and three is in green.
5 The wind --

6 Q. Probably use the highlighter to make the wind.

7 A. So the wind is running this (indicating) direction
8 generally speaking. That was the general direction of the
9 wind contour lines. The topography always had an influence,
10 but it was a hard easterly wind. Hard is not a good
11 descriptive word. It was an easterly wind.

12 Q. Coming out of the east?

13 A. Yes.

14 Q. The insulator pieces that we talked about earlier
15 when we saw several photos and you talked about the
16 insulator being in line with everything, can you identify
17 for us on Exhibit Number 55 where the insulator string or
18 the insulator pieces were.

19 A. Yes. Right here (indicating). So this is
20 generally where the insulator debris field was, which again
21 taking into consideration the debris, the wind, and the
22 topography it always kind of fits in the line there.

23 Q. I -- just to make sure it's absolutely clear, we
24 have talked about the right phase and the left phase. Can
25 we indicate on the tower structure itself the phases.

26 A. So in the electrical engineer field we use the phi

1 symbol for phase and the middle phase.

2 Q. All right. So we have right phase, middle phase,
3 left phase. And it was the left phase where the hook
4 failed; correct?

5 A. Yes, it is.

6 Q. And the left phase that was found with the inverted
7 insulator string and the broken hook?

8 A. Yes, it is.

9 Q. All right. You can return to the witness stand. I
10 don't think we're going to need that any more.

11 All right. A couple things to clean up real quick.
12 You used the term "debris field."

13 A. Yes.

14 Q. What debris was found?

15 A. Ceramic insulation from what I believe to be the
16 concentric circles of the insulator bells.

17 Q. Now, we were talking about the arcing and what
18 happened probably when the energized conductor came into
19 contact with the steel structure. And we looked at the
20 pictures of those contact points and the pitting and the
21 other damage. And you used the term "molten metal."

22 A. Yes.

23 Q. Did you search below in the areas of origin of the
24 fire -- the specific origin areas of the fire for molten
25 metal?

26 A. I looked for metal. I didn't expect there to be

1 still molting.

2 Q. Okay. And what is the different metal and molten?

3 A. Molten metal is high temperature, has viscosity to
4 it whereas regular metal is not. It's in a solid form.

5 Q. Molten would indicate it's liquified?

6 A. Yes.

7 Q. Did you find any other metal in any of the specific
8 origin areas?

9 A. Other than the piece I identified so far, no.

10 Q. The hook off the left phase that looked to have
11 appeared to have failed and was broken we have compared with
12 the hook right next door, the hook from the right phase?

13 A. Yes.

14 Q. Do you know what the apparent missing portions of
15 the hook look like?

16 A. Yes.

17 Q. Did you ever locate the missing portion of the
18 hook?

19 A. Too exhaustion.

20 Q. What do you mean by that?

21 A. We had everybody from our investigation team up
22 there looking for that missing portion of the hook. We
23 both -- I did an examination -- metal detector examination
24 and I observed the PG&E employees also looking for that
25 missing piece of metal during the evidence collection day.

26 Q. So it was never found?

1 A. To my knowledge, no, it's not been found.

2 Q. All right. Now, the final question. Based upon
3 everything you know right now to date, do you have an
4 opinion as to what started the fire underneath 27/222?

5 A. Yes, I do.

6 Q. And what is that opinion?

7 A. In my professor and in my discipline we always look
8 for what' called a -- the most competent ignition source.
9 My original hypothesis included the possibility that the
10 hook failed, came in contact with the transposition tower,
11 an arc occurred and allowed hot metal to fall to the ground.
12 The ensuing metal that was hot came in contact with the
13 receptive fuel bed, which is the material on the ground, and
14 started a fire.

15 I was not able to disprove that hypothesis. And
16 the other hypotheses that I had which included, you know,
17 trains and everything else, they are not competent ignition
18 sources. The only competent ignition source on that hill
19 that day was the energized conductor of the Caribou-Palermo
20 115 KV line.

21 The only way that could have happened was when the
22 insulator hook broke, fell, and came into contact with the
23 tower and allowed hot material to fall in the receptive fuel
24 bed and started the Camp Fire.

25 Q. Do we see evidence of that in the tower struck
26 itself?

1 A. Yes, Sir.

2 Q. Does the fact that PG&E reported a problem on that
3 line also come into play in your opinion?

4 A. Yes, it does.

5 Q. How so?

6 A. The Cal Fire Butte Unit Oroville Emergency Command
7 Center received a first 9-1-1 report at approximately 6:29
8 in the morning. That came directly from a Pacific Gas &
9 Electric facility. It was radioed in from a Pacific Gas &
10 Electric employee who didn't have cell service to call 9-1-1
11 himself. He reported that fire and said it occurred
12 directly -- he reported it as being under a Caribou-Palermo
13 transmission line. That coupled with the evidence that we
14 found coupled with their reports saying they had an event
15 where they lost power and had a discharge at 6:15 again
16 supports my hypothesis. It solidifies it along with the
17 photographs from witnesses including the first responding --
18 excuse me, the first known witness which was the PG&E
19 employee and his photograph.

20 Q. That's the Caltrans employee?

21 A. I'm sorry. Excuse me. Yes, the Caltrans employee
22 was -- excuse me. Yes, the Caltrans employee was the first
23 one. His photograph showed -- the photograph showed the
24 fire directly under the tower. All this stuff put
25 together -- my origin investigation, my cause investigation,
26 and all the support evidence that tells me that my

1 scientific method was sound leaves me no other opinion to
2 have.

3 Q. And that opinion is that this fire was caused by
4 the failure of the hook on 27/222?

5 A. Yes.

6 MR. NOEL: I have nothing further.

7 Do any of the grand jurors have any written
8 questions? If you'd give them to the Sergeant at Arms to
9 give to the foreperson to review with us.

10
11 [DISCUSSION OMITTED.]
12

13 MR. RAMSEY: What we will do right now is just a
14 bit of cleanup. This is Exhibit 55. And Captain Kluge --
15 he had made various markings on this in front of the jury as
16 an explanation. And it should be noted that he put in terms
17 of the debris field in which he put basically red oblong
18 circles around where the green dots are, which were -- the
19 green dots were items of the interest.

20 And he also made note as to where the specific
21 point of origin was. And that was in terms of the number
22 one point of origin would be where we see on this diagram
23 just to the right of the placement of E-2 where I just put a
24 red dot there unfortunately with my hand. But it's to the
25 right of the affected tower in the small circle saying that
26 that would be the specific point of origin on the parts of

1 this surveyor diagram that is noted as E-2. And for a point
2 number three -- or pardon me. Specific point of origin
3 number two it's around a green dot that is on the surveyor's
4 map as E-3. And then for number three, it would be
5 basically a small circle -- number three specific point of
6 origin would be to the right lower corner of the affected
7 tower.

8 The three lines or conductors that come on the
9 diagram Captain Kluge has noted it's the left and then using
10 the word or the symbol for phi. So the left phi is the
11 lower of the lines, the middle line is M-5 is the middle
12 phase, and the right phase would be the upper line on the
13 affected tower. There is a yellow arrow that shows the
14 direction of the wind basically from an easterly to a
15 western direction.

16 MR. NOEL: Can we save that?

17 MR. RAMSEY: We can but, I don't know how.

18 MR. NOEL: Successfully saved. All right. Now,
19 how do we get back to where we were?

20 MR. RAMSEY: You've done it now.

21 MR. NOEL: All right. So we've saved that. And a
22 good point was made with all the drawing on that. We will
23 have that marked later on as 56-A so you can keep it in the
24 record.

25 All right. Now, we are going back to the markings
26 on the "B." We have the broken hook here as it was found

1 hanging in the -- in the tower showing the raised "B." And
2 the question is does the raised "B" without the circle "B"
3 and the broken C-hook indicate that the C-hook in question
4 was made before 1921?

5 THE WITNESS: I wouldn't be able to answer that
6 specifically. I was not working in the foundry to know
7 specifically that that was the absolute time that that
8 happened. The only thing that I was able to reduce from
9 basically doing Internet searches and then the drawings that
10 we had is I know the range that these were identified.
11 Beyond that being able to identify the year in which this
12 was made or specific parameters in which this specific hook
13 was made I wouldn't be able to answer that question.

14 MR. NOEL: And I am handing the question back to
15 madam foreperson to mark it and document it.

16 Who is responsible for maintaining Camp Creek Road
17 where the fire started, if you know?

18 THE WITNESS: It's my understanding that that is a
19 county maintained road. Who has the ultimate financial
20 responsibility I don't know.

21 MR. NOEL: And again, I'm handing this to madam
22 foreperson.

23 Have you ever seen a fire move as fast as you saw
24 the Camp Fire moving?

25 THE WITNESS: That's a tough question to answer. I
26 assume by fast you're talking about the rate at which it

1 spread. After a relatively long career I wouldn't be able
2 to say specifically that I have seen a fire -- I wouldn't be
3 able to answer that question with any type of accuracy
4 unfortunately. I'm sorry.

5 MR. NOEL: I guess see if I can summarize this up.
6 The speed with which this fire moved from its starting
7 location at 27/222 and just a couple hours later hitting the
8 town of Paradise, is that in your experience normal.

9 THE WITNESS: No, that's not a normal phenomenon.
10 We've had many large fires throughout the North State and
11 all of California, and we do have fires that move quickly.
12 We have fires that will take individualized runs that are
13 fast and other runs that are slow.

14 That's the same thing that happened in the Camp
15 Fire. Some runs -- when I say a run, I'm referring to, you
16 know, a specific, you know, timelines for the fire, times
17 where it moves very fast and there's some times where it
18 moves very slowly. It's called ebb and flow. There's give
19 and take on the progression.

20 So I can say that -- and I'd have to confirm this,
21 but I believe this is in terms of acreage in a single
22 burning period, I think this is the -- the top fire for the
23 amount of acres burned in a single burning period. But I'd
24 have to confirm that.

25 MR. NOEL: If you know, what is the distance
26 between the area -- the general area of origin and the

1 general origin area of the Camp Fire under 27/222 and the
2 town of Paradise?

3 THE WITNESS: I would have to refer to a map to get
4 the exact distance. I -- knowing the area -- and this would
5 be a ballpark -- I' say it's about five to six miles from
6 the outer edges of Paradise in that direction.

7 MR. NOEL: What is between the general origin area
8 under tower 27/222 and the town of Paradise?

9 THE WITNESS: Community of Concow.

10 MR. NOEL: Do you know how far the distance between
11 the eastern edge of Concow and Concow Road specifically the
12 intersection of Concow Road and Rim Road and the tower
13 27/222?

14 THE WITNESS: I believe it's just over two miles.

15 MR. NOEL: If you know, could the fire itself have
16 caused the broken insulator string?

17 THE WITNESS: That was a hypothesis that we had.
18 We absolutely examined that possibility. There's no
19 evidence that I could see on the hook itself that lends me
20 to believe that that hook was subjected to any type of heat.

21 MR. NOEL: The next question was in the photos of
22 the ground at the base of the tower in question -- and I
23 pulled up on the board here in front of you the photograph
24 marked as Exhibit 8 -- where is the scorching?

25 THE WITNESS: May I approach?

26 MR. NOEL: Absolutely.

1 THE WITNESS: And just to confirm, we're talking
2 about scorching on the tower?

3 MR. NOEL: Yes.

4 THE WITNESS: Okay. And I -- for specifics we're
5 talking about the scorching that was kind of an "S" pattern?
6 There's several points of scorching.

7 MR. NOEL: All the scorching. Was it all in
8 different areas of the tower or it was all in one?

9 THE WITNESS: And if I'm not on point here, please
10 let me know. The majority of the photos that we had that
11 showed the scorching or the spot burning around it or the
12 "S" pattern that you saw on the one phase, it was all in
13 this (indicating) area right here. So the area I'm pointing
14 to is basically directly south of the hanging -- or I'm
15 sorry. Right here (indicating).

16 Can you zoom in?

17 MR. NOEL: Yes, I can zoom in.

18 THE WITNESS: There we go.

19 MR. NOEL: Nope. Can't zoom in at the same time.

20 THE WITNESS: So all those photographs -- obviously
21 all different perspectives, different points of view -- were
22 all done in this (indicating) area here. And so what I'm
23 pointing to is the one -- basically it's right at the second
24 horizontal crossarm of the Caribou-Palermo 27/222 where it
25 meets with the southeast corner of the tower.

26 Does that make sense? So we're looking at this

1 area here (indicating). Now it works.

2 MR. NOEL: Is it better in this area up here?

3 THE WITNESS: It's this area right here
4 (indicating).

5 MR. NOEL: Right. Okay.

6 THE WITNESS: This is the first on this phase.
7 We've got a crossarm down here, and that is the first
8 crossarm that I see on this phase. Correct. This one here.

9 MR. NOEL: Oh, okay. Now I see.

10 THE WITNESS: It is right within this crossarm
11 here? This is where you saw all of our contact places.

12 MR. NOEL: And that is basically where we can see
13 the conductor -- the jumper conductor in contact with the
14 tower in the photograph?

15 THE WITNESS: In this photograph, yes.

16 Does that answer the question?

17 GRAND JUROR NUMBER FOUR: Can I -- I'm the one that
18 wrote the question. And I'm simply saying --

19 MR. RAMSEY: Write it down.

20 MR. NOEL: Yep.

21 MR. RAMSEY: If you can.

22 GRAND JUROR NUMBER FOUR: I'm sorry?

23 MR. RAMSEY: You've got to write it down, if you
24 can.

25 GRAND JUROR NUMBER FOUR: Oh.

26 MR. RAMSEY: If you need clarifying.

1 GRAND JUROR NUMBER FOUR: No. It's okay. Close
2 enough.

3 MR. NOEL: Sir, do you want your paper with the
4 questions back to write it?

5 GRAND JUROR NUMBER FOUR: No. That's fine.

6 MR. NOEL: The other questions on here is what was
7 the time at which the City of Paradise was ordered
8 evacuated?

9 I'm going to skip that. I think that will be for
10 another witness. I don't think that's within Captain Kluge.

11 And I think this one -- how old are the components
12 that failed? That would be the C-hook. That's good.

13 THE WITNESS: That's a good question. We are still
14 trying to seek out that information. We have not yet
15 confirmation on the exact age or installment date of that
16 specific piece of equipment. So I do not have a record of
17 the installment date of that particular equipment.

18 We have evidence that work has been done on the
19 tower in the past and even evidence that there was work done
20 at that specific point of contact. Because something at
21 some point changed. We know that. But when that happened
22 and whether or not equipment was replaced or reused, we
23 couldn't know. We don't know. We don't even know if this
24 has been sitting in a warehouse for 20 years before they
25 used it or 40 years before they used it. We don't know. We
26 don't have a record of it.

1 MR. NOEL: Now, you brought up a good point as a
2 good final follow-up question on there. There is still
3 stuff that you don't know; correct?

4 THE WITNESS: Yes.

5 MR. NOEL: And there is evidence that's being
6 examined, being analyzed, being tested by experts?

7 THE WITNESS: Correct.

8 MR. NOEL: You mentioned metallurgists?

9 THE WITNESS: Electrical engineer.

10 MR. NOEL: Electrical engineer, other people. And
11 we talked a minute ago about your conclusion, your opinion.
12 But the question was based upon -- at this moment in time
13 based upon everything else.

14 THE WITNESS: And what I know right now based on
15 the facts that I have.

16 MR. NOEL: Could that opinion change in the future?

17 THE WITNESS: Of course. There's always -- I don't
18 know what would do it. But if something was brought to my
19 attention that disproved my hypothesis, then yes, that would
20 change my opinion. And we had reexamined the evidence and
21 we had continued with our scientific process, which is a --
22 honestly scientific process is a living, breathing thing
23 figuratively speaking. It's ongoing. It's going to
24 continue to be ongoing as information comes in. It's going
25 to be, you know, compared and conclusions drawn from all
26 available information.

1 MR. NOEL: I believe that's all that we have unless
2 there's any further questions from the group.

3 Madam Foreperson, I would ask that the remainder of
4 the Exhibits 10 through 55 be entered into evidence and that
5 the questions -- the written questions from the jurors also.

6 A couple of clean-up questions real quick for you.
7 The Exhibits 27 through 39, those were the photographs that
8 you said were taken by the PG&E people?

9 THE WITNESS: I'd like to refer to those
10 photographs.

11 MR. NOEL: Go ahead.

12 THE WITNESS: Can you repeat those numbers for me.

13 MR. NOEL: They are 27 through 39.

14 THE WITNESS: Yes, 27 through 39 were taken by PG&E
15 personnel.

16 MR. NOEL: Right. And just to clean this up, those
17 photographs -- you were present when those photographs were
18 taken?

19 THE WITNESS: Twenty-seven through 29, yes, I was.

20 MR. NOEL: Thirty-nine?

21 THE WITNESS: Twenty-seven through 39, yes, I was.

22 MR. NOEL: And those photos were taken under
23 supervision and at your direction?

24 THE WITNESS: At my direction and under my
25 supervision.

26 MR. NOEL: And from your vantage point -- of

1 course, you couldn't be up there in the tower for reasons
2 that were explained. But those photographs accurately
3 depict the tower as it appeared to you?

4 THE WITNESS: Yes.

5 MR. NOEL: And some of the photographs were taken
6 as things were being taken off. So things were changing in
7 the tower, but it's still accurately depicting the tower?

8 THE WITNESS: Yes, they are.

9 MR. NOEL: And finally, 40 through 54, which is the
10 photographs that were taken by Captain Hillskotter. And
11 again, you were present when those photographs were taken?

12 THE WITNESS: Yes. I was present for all of those.

13 MR. NOEL: And those photographs also accurately
14 depict the items depicted?

15 THE WITNESS: Yes, they did.

16 MR. NOEL: Now I have nothing else. And we will
17 ask that the exhibits be entered into evidence.

18 MR. RAMSEY: Would that be acceptable to the
19 foreperson that they be received into evidence?

20 GRAND JURY FOREPERSON: Yes.

21 MR. RAMSEY: And then we'll ask that the foreperson
22 then sign each of those.

23 MR. RAMSEY: And also the photos.

24 GRAND JURY FOREPERSON: Oh.

25 [Exhibits 10 through 55
26 received into evidence.]

1 MR. RAMSEY: And as the foreperson is doing that,
2 we'd also ask that Captain Kluge be released with this
3 (indicating) admonition.

4 GRAND JURY FOREPERSON: Captain Kluge --
5 Captain?

6 THE WITNESS: Yes, Ma'am.

7 GRAND JURY FOREPERSON: Kluge. Sorry. You are
8 released with -- with -- with an admonition that the grand
9 jury proceedings and investigations are secret. You are
10 therefore admonished on behalf of the Butte County Superior
11 Court and this grand jury not to disclose to any person the
12 following: The fact that you received a grand jury
13 subpoena, the fact that your appearance before the grand
14 jury, any questions asked and any responses given during
15 your testimony before the grand jury, any other information
16 concerning the nature or subject of the grand jury
17 investigation and that you acquired during your grand jury
18 appearance.

19 This admonition does not apply to information that
20 you give your attorney. This admonition continues until the
21 occurrence of the one of the following three events: The
22 transcription of your grand jury appearance is made public,
23 a court authorizes its disclosure or disclosure is otherwise
24 authored by law. Violations of this admonition are
25 punishable as contempt of court.

26 Do you understand this admonition?

1 THE WITNESS: I do.

2 GRAND JURY FOREPERSON: Thank you so much.

3 THE WITNESS: Thank you. Have a good day.

4
5 [DISCUSSION OMITTED.]

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

MR. NOEL: Call Mr. Taylor, Colton Taylor.
Right up there.

(GRAND JURY FOREPERSON swears in witness.)

COLTON TAYLOR

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. You may
have a seat.

EXAMINATION

BY MR. NOEL

Q. Mr. Taylor, by whom are you employed?

A. I work with Cal Trans.

Q. How long have you been working with Cal Trans?

1 A. About eight months now.

2 Q. What do you do for Cal Trans?

3 A. I just mainly flag, and I'll help move
4 equipment and clean up.

5 Q. Are you assigned to a particular area with Cal
6 Trans?

7 A. The Pulga yard.

8 Q. How long have you been assigned to the Pulga
9 yard?

10 A. The whole eight months.

11 Q. November 8th, 2018, were you scheduled to work
12 that day?

13 A. Yes, I was working.

14 Q. Do you recall what time you were supposed to
15 report to work that day?

16 A. I was starting work at 7:00, but I showed up
17 about 30 minutes early.

18 Q. So about 6:30 in the morning?

19 A. Yeah.

20 Q. And just in general, what area of the county do
21 you live in?

22 A. I live in Oroville.

23 Q. So when you're working, you drive from your
24 home up into the canyon?

25 A. Yes.

26 Q. Is there a route that you take normally?

1 A. I just take Ophir Road to the highway and then
2 take it up to Highway 70.

3 Q. Okay. So you take Highway 70 up the canyon to
4 Pulga?

5 A. Yeah.

6 Q. What time do you generally leave, leave home?

7 A. About 5:45.

8 Q. How long does the drive usually take you?

9 A. About 40, 45 minutes.

10 Q. So on November 8th, 2018, you said you arrived
11 at the Pulga Cal Trans station around 6:30 in the
12 morning?

13 A. Yes.

14 Q. As you were driving up the canyon on Highway 70
15 that morning, did you notice anything unusual?

16 A. Yes. As I was passing the Pulga Bridge, I
17 noticed like a glow behind some of the trees. And so
18 when I pulled up into the Pulga yard, I noticed that the
19 -- there's a little fire over there on the hill.

20 Q. Okay. So let's back up. As you're going up
21 Highway 70, as you're getting ready to come across the
22 Pulga Bridge, you said you noticed a glow in the trees?

23 A. Yes.

24 Q. In terms of the direction that you were
25 traveling, that you were driving on Highway 70, where was
26 the glow?

1 A. Well, I was driving east up Highway 70, so the
2 glow was on the left-hand side, on the other side of the
3 river. Is that what you mean?

4 Q. Okay. I'm just trying to get acclimated. So
5 the other side of the river, the side on which the Cal
6 Trans station is located? Or the side, the other side of
7 the river away from the Cal Trans station?

8 A. The opposite side of the Cal Trans.

9 Q. Okay. So are you familiar with the community
10 of Pulga?

11 A. I know it's there, but I've never been up
12 there.

13 Q. Was the glow on the side of the river with the
14 community of Pulga?

15 A. Yes.

16 Q. So as you're driving up and going across the
17 bridge, you see this glow?

18 A. Yeah.

19 Q. You keep going, you get to the Cal Trans
20 station, and then what do you see?

21 A. I just see a small fire around one of the
22 towers and then -- yeah.

23 Q. When you say "one of the towers," what are you
24 talking about?

25 A. It was one of the electric towers. What are
26 they? It was just -- yeah, a small glow around one of

1 the bases of the towers.

2 Q. Okay. Same area that you saw the glow earlier?

3 A. Yeah.

4 Q. Now, this is about 6:30 in the morning?

5 A. Yes, around 6:30.

6

7 (Grand Jury's Exhibit 5 was marked for identification.)

8

9 Q. In front of you, you have a photograph that's
10 marked as People's as Exhibit No. 5 for identification.
11 Can you pick that up? On the back there should be a
12 white evidence tag. Is that Exhibit No. 5?

13 A. Yeah.

14 Q. Do you recognize that photograph?

15 A. Yes. This is the photo I took a couple minutes
16 after I got there.

17 Q. Okay. So you took the photograph Exhibit No.
18 5?

19 A. Yes.

20 Q. And you took that photograph sometime shortly
21 after 6:30 a.m. on November 8th, 2018?

22 A. Yes, I did.

23 Q. And where were you located when you took the
24 photograph?

25 A. Right out front of the Cal Trans office.

26 Q. Now, I've put a copy of that photograph up on

1 the board so the jurors can see what you're looking at.
2 Why don't you describe to us what we're looking at in
3 this photograph.

4 A. Well, you can see that the fire's on the hill
5 above the opposite side of the river. And then when I
6 first, first got there, it was closer to the right tower
7 of the three. So it was like more centered around there.
8 But then I was -- I didn't take the picture until like a
9 couple minutes later, and it grew a little bit.

10 Q. Okay. So when you're talking about the right
11 tower of the three, you're talking about --

12 A. Yes, that one.

13 Q. That one.

14 Let's see if I can make this work. Come on.
15 There it is.

16 So you're talking about that tower down there?

17 A. Yes.

18 Q. And you said when you first arrived at the Cal
19 Trans station the fire as even smaller?

20 A. Yeah, it was smaller and closer to that one,
21 but then I didn't take a, the picture until about up to
22 five minutes later. I'm not completely sure.

23 Q. Okay. Did you continue to watch the fire after
24 taking the photograph?

25 A. Yes.

26 Q. How long did you watch it?

1 A. I watched it until the work started, so about
2 7:00. But then I was also working in the yard all day,
3 so I got to see it grow and -- yeah.

4 Q. Describe for us what you observed over the
5 course of the day.

6 A. Well, the fire just continued to get bigger and
7 bigger. And then there are little spots that like the
8 wind would catch the fire and push it faster, because
9 that was an incredibly windy day like more so than usual.
10 And so the fire just kept growing, and then it covered
11 the whole face of the mountain on the other side of the
12 river and then just started traveling west and then just
13 kept going.

14 Q. How long had you been working up there at the
15 Pulga station on November 8th?

16 A. I've been working since about September 11th.

17 Q. Always at the Pulga station?

18 A. Yeah.

19 Q. You said that that day was incredibly windy.
20 How did, that day, the wind compare to what you normally
21 saw up in the canyon?

22 A. It was more windy than usual. That was one of
23 the windiest days I've experienced there, at least in
24 that yard.

25 Q. Now, as you're watching this and taking this
26 photograph at 6:30 a.m., or around 6:30 a.m., did you

1 call 9-1-1 to report the fire?

2 A. I don't get any phone service anywhere in that
3 yard, so I did not.

4 Q. Okay. Was there any, anybody else in the yard,
5 any --

6 A. At -- when I first showed up, my co-worker was
7 there, but he was sitting in his car not paying attention
8 because he said he didn't notice the fire was there. And
9 I guess he showed up a couple minutes before me. And
10 then, yeah, I took the picture, and I pointed it out to
11 him. But -- yeah, it wasn't until maybe like 15 minutes
12 later or 10 minutes later that other people started
13 showing up. The lead worker was already there, but he
14 had taken off.

15 Q. I understand you didn't have cell phone
16 service. Were there landline phones available?

17 A. They were in the building, but the building was
18 locked at the time.

19 Q. And you didn't have the key?

20 A. No, I did not.

21 Q. So you had to wait for the boss to get there?

22 A. Yeah.

23 Q. All right.

24 MR. FOGG: Marc, I just want to clarify on the
25 record that you marked the right tower?

26 MR. NOEL: Right.

1 Q. (By MR. NOEL) Let's just clarify on the
2 record, the photograph you have in front of you, the
3 photograph being displayed on the board here, in the
4 center of the photograph we see three towers; correct?

5 A. Yes.

6 Q. And it's the tower on the furthest right with
7 the fire just below it, in front of it, and above it,
8 that's the tower that you identified, that I circled,
9 that is where you first saw the fire?

10 A. Yes. It was closer to that.

11 Q. Yep. So as you first saw the, pulled into the
12 station and saw the fire up there, the fire was up tight
13 on the bottom of that tower?

14 A. Yeah.

15 Q. Okay. All right. I don't think I have
16 anything further of this witness.

17 Any of the grand jurors have anything?

18 MR. NOEL: All right. I think you're done.

19 THE WITNESS: All right.

20 MR. NOEL: Madam Foreperson, I would move No. 5
21 into evidence. That's one of the ones reserved from
22 earlier on.

23

24 (Grand Jury's Exhibit 5 was admitted into evidence.)

25

26 MR. NOEL: And I will walk him out and get the

1 next witness in.

2 Take one and pass these around.

3 (Off the record discussion.)

4 (GRAND JURY FOREPERSON swears in witness.)

5

6 STACER HARTSHORN

7 having been called as a witness in

8 the matter now pending, having been first

9 duly sworn, testifies as follows:

10

11 THE WITNESS: I do.

12 GRAND JURY FOREPERSON: Thank you. Have a
13 seat, please.

14

15 EXAMINATION

16

17 BY MR. NOEL

18 Q. Captain, by whom are you employed?

19 A. I'm employed with Cal Fire.

20 Q. In what capacity?

21 A. I am a captain in the Butte County Oroville
22 Emergency Command Center.

23 Q. How long have you been with Cal Fire?

24 A. Almost 22 years.

25 Q. What training do you have that qualifies you
26 for Cal Fire?

1 A. I have hundreds of certificates, stemming from
2 basic EMS to weeks, weeks' long academies.

3 Q. Walk us through your experience in 22 years as
4 Cal Fire; what you've done, the positions you've held.

5 A. I started in southern Butte County as a
6 firefighter in '97.

7 Prior to that, my first six years with Butte
8 County Cal Fire was as a volunteer. So I actually
9 started in '91 through '97, became career in '97 in the
10 Harts Mill Berry Creek station.

11 I promoted to engineer in 2000, and I left
12 Butte County and went to Grass Valley and worked at the
13 Higgins Fire District station in 2000 for a couple of
14 months in the late summer.

15 I came back to Butte County as a limited-term
16 engineer and went to Robinson Mill Station 54 up in
17 Forbestown. I spent the next three years there as an
18 engineer.

19 I then promoted to a Schedule A station in
20 Biggs as a permanent firefighter 2 in 2002. I spent most
21 of 2002 working in the Biggs station.

22 I came back to an engineer, permanent engineer,
23 in 2003, back to Robinson Mill.

24 I then moved over to a Schedule A station in
25 Bangor, and there I stayed almost four years, from 2004,
26 '5, '6, and into the spring of 2007. And then I promoted

1 to fire captain, which I currently hold my rank
2 currently. And when I promoted to captain, I had to
3 leave Butte County.

4 I went over to Tehama County and promoted to
5 the inmate fire crews that you guys have seen in the
6 area. So I stayed at the Valley View Conservation Camp
7 from 2007 to May of 2015, did almost ten years in fire
8 camp as a captain running hand crews on hundreds of
9 wildland fires.

10 And then in May of 2015 I promoted and left
11 camp and went to the command center, the ECC environment
12 that I currently hold now in Oroville. But I left Valley
13 View Conservation Camp to Tehama County ECC.

14 I did two years in Tehama County, then I
15 transferred back as a captain to the Oroville command
16 center in December of 2016. That is where I currently
17 stay.

18 Q. So you've been a captain in the, in the Butte
19 County ECC?

20 A. For two and a half years.

21 Q. Two and a half years. What does ECC stand for?

22 A. ECC stands for -- it's Cal Fire's version of
23 the Emergency Command Center. So command centers are
24 different from dispatch centers in such we have captains
25 that are able to make decisions based on types of phone
26 calls that we get, information that we're told, where

1 dispatch centers just take a call as it comes in. If
2 they get five calls in a row, even though the fourth call
3 is a higher priority, they send them out by call
4 priority, not life-saving priority. Command centers have
5 the ability to alter how those calls come in and which
6 ones go out first based on life, property, and
7 environment.

8 Q. Describe for us the Butte County Emergency
9 Command Center.

10 A. So the Oroville Emergency Command Center on a
11 typical summer day has four people assigned to it on any
12 given day, seven days a week, 24 hours a day.

13 So we have essentially a lead -- or if any of
14 you listen to scanners, the person you hear on the
15 scanner, that voice is the lead or the, what we call the
16 radio person.

17 Their support person is essentially the one
18 that answers the 9-1-1 calls as they come in, and they
19 process those calls by getting the location, getting a
20 name, getting a call back phone number, and why they
21 called 9-1-1, whether it be for EMS, fire, public
22 assistance, to help somebody, et cetera.

23 So as that person enters that call in our CAD,
24 which is the Computer-Aided Dispatch, that's what's CAD
25 stands for, then the radio, or lead, person opens that
26 call, dispatches that call, and the closest appropriate

1 resource and paramedics that go with it.

2 Then there's a position that I currently hold
3 today as the duty captain. So the duty captain
4 essentially is the one that controls the floor for the
5 day. You're the one that's making the decisions based on
6 the type of calls that you get, the type of information
7 that you're provided, and when we have multiple stations
8 that may be empty because they're on a call or on a house
9 fire that, where we need to move resources around to
10 busier stations. So the duty captain is the one that is
11 responsible for making those decisions, moving resources
12 from one area to the next, and backfilling those
13 resources for an emergency that's underway in the county.

14 We also are the ones that are calling the
15 region for resource updates, requesting additional
16 resources, or talking to our local duty chief to see what
17 kind of needs that the unit may need on his behalf.

18 So essentially it's the voice of the duty
19 captain, we speak for the county fire chief. That's how
20 that works.

21 In the last position that's available in the
22 summertime role is the aircraft person. So Cal Fire has
23 aircraft throughout the state. We have helicopters,
24 tankers, air attacks, private-call-when-needed
25 helicopters that we can hire on emergency basis. And in
26 that capacity as the aircraft person, you deal with the

1 region intercom. We are talking to northern region,
2 which is up in Redding. And we facilitate the orders
3 based on the needs of the, of the incident or the
4 incident commander that he's requesting as far as
5 tankers, helicopters, things like that. Then we would
6 process those orders and put them in the system of
7 record, which is our ROSS program that everything is
8 filled in and tracked that way. And we have access to
9 that at any given time.

10 Q. So the first person is the support person, they
11 answer the phones, take the 9-1-1 calls, and enter the
12 information into the CAD?

13 A. In a routine basis, yes. If just one phone
14 call comes in at a time, that support person would just
15 pick up the phone, talk to the caller, get those four
16 things that I described -- location, name, phone number,
17 what's wrong -- and then the call gets entered in CAD,
18 then the radio person would dispatch it.

19 Q. How is -- describe for us how the 9-1-1 system
20 works with relation to Cal Fire ECC?

21 A. So the 9-1-1 system is all tied together in
22 CAD. So the phone system basically looks like a computer
23 screen. So as calls come in, there's certain information
24 that autopopulates. So it's called an ANI/ALI -- auto
25 number of location, auto address location.

26 So if you call 9-1-1 from a house phone, a

1 landline, it prepopulates in CAD the location of that
2 emergency. Then our job as the call taker is to confirm
3 that location with the caller, get them to verbally state
4 it. We don't repeat it to them. They need to physically
5 tell us the address that they're at for the emergency.

6 Then once we confirm that information, there's
7 a process in CAD that pulls the information from the
8 phone system over to CAD into a screen. Then we get the
9 caller's name, we confirm the phone number that
10 autopopulates as well. And then once we okay it, it
11 drops in CAD live at every position in the command
12 center. And then that's when the radio person is able to
13 double click the call, it opens up, we confirm the
14 resources, then we hit the okay button, it dispatches it,
15 then we voice it out, which is what you hear on the
16 scanner.

17 Q. The calls themselves?

18 A. Uh-huh.

19 Q. When someone calls 9-1-1 from a landline phone,
20 how does that get to Cal Fire?

21 A. So Cal Fire is a secondary PSAP. And a PSAP is
22 a Public Service Answering Point. So when you call
23 9-1-1, everything goes to a primary PSAP, which is law
24 enforcement, whether it be Paradise PD, Oroville Police,
25 Butte County S.O., Oroville, Gridley, or sometimes they
26 wind up with Chico Fire, Chico PD as well.

1 So once the caller states, "9-1-1, what's your
2 emergency?"

3 "Well, I need an ambulance. My dad's having
4 troubling breathing."

5 "Okay. Hang on. I'm going to get to you Cal
6 Fire."

7 So then they transfer the call to us, if it's
8 in our jurisdiction. And then that's when our phone
9 rings usually from CHP, or S.O., Paradise, whomever, and
10 then we pick it up and then process that call.

11 Q. How about if somebody's calling from a cell
12 phone?

13 A. So somebody's calling from a cell phone, it's
14 essentially the same thing. It still goes to a primary
15 PSAP, and then once they deem that the caller is
16 requesting medical, or reporting a fire, or just needing
17 assistance by helping somebody up, which we do on a daily
18 basis. Somebody falls down, guy's a little overweight,
19 little lady that's there is elderly, she can't pick him
20 up, we show up, get him to his feet, put him back to his
21 chair, away we go.

22 So the cell phone is essentially the same way,
23 but all a cell phone will give us is a, like a lat-long
24 of the cell phone in the close proximity or the closest
25 ping of the tower. So that's when we really need to get
26 in depth with callers to confirm their location.

1 Q. What do you mean when you say lat-long?

2 A. So a legal description is a, it's degrees,
3 minutes, seconds. So it's a term in the fire service,
4 military. It's a way to get some of somebody's location
5 based off of a legal description. So it could be like 39
6 degrees, 21 minutes point 48 seconds, by negative 121
7 degrees, 48 decimal 56 seconds and so on. So we can put
8 that in CAD, and it will give us kind of a general
9 location based on what tower that that cell phone is
10 hitting off of.

11 Q. So the terms "latitude" and "longitude" are
12 shorthand for -- lat and long are shorthand for --

13 A. For latitude and longitude, yes.

14 Q. Latitude and longitude. And those are location
15 terms?

16 A. Correct.

17 Q. You also used the term "pinging" off of the
18 towers?

19 A. So when we hit the answer button on our phone,
20 we have a map that accompanies CAD. So it's a map of
21 every street, every county. It's maintained almost
22 daily.

23 So there's a little phone icon that pops up on
24 the map where that phone is telling us it's being pinged
25 by a cell tower or a latitude longitude. So it also
26 gives us, as far as the phone system goes, gives us a

1 percentage and a distance to that phone. So a lot of
2 them will say 58 meters at 90 percent. Well 58 meters is
3 a couple hundred feet, that's pretty accurate, which we
4 have used in the past, we can really scroll into our map.
5 And sometimes that little phone icon is in the middle of
6 an address parcel and they don't know where they're at,
7 and we can go, "Do you think it's on 13759 Creston Road?"

8 "I don't know. Yeah, we're on Creston Road."

9 We tell the resources try 13760, whatever, and
10 they actually are able to find people in that manner.

11 MR. NOEL: Madam Foreperson, I'm informed that
12 the other witness is back outside. Take a quick break,
13 we'll send out Captain Hartshorn, bring him in, deal with
14 that.

15 GRAND JURY FOREPERSON: Okay.

16 MR. NOEL: Have you step down. We'll be right
17 back.

18 And did we have a question?
19

20 CONTINUED EXAMINATION
21

22 BY MR. NOEL

23 Q. I'm sorry we had to bring you back, Mr. Taylor.
24 We had forgot a couple of things.

25 A. It's all right.

26 Q. First off, you've been gone now for about 20

1 minutes; is that correct?

2 A. Yeah, I think so.

3 Q. Since you left the courtroom, have you talked
4 to anybody about your testimony?

5 A. No, I have not.

6 Q. Has anyone tried to talk to you about your
7 testimony?

8 A. No.

9 Q. And then after, afterwards, the last thing I
10 did was ask the jurors if they had any questions, and I
11 missed one. So the grand jurors did have two questions
12 for you that they'd ask me to you ask.

13 A. Okay.

14 Q. So on November 8th, 2018, when you noticed the
15 fire near the tower, why did you observe for around 15
16 minutes and not go to a place to report the fire?

17 A. Because I believed that my lead worker had gone
18 to go report the fire. I thought that's why he had left.

19 Q. Okay. And you said that there was another
20 co-worker who was there when you arrived sitting in his
21 car. Why did you not inform that other co-worker that
22 you were going to call in the fire and go call it in?

23 A. Yeah, I could have done that. I was just kind
24 of caught off guard. And then I'd only been working
25 there for a little bit, so I wasn't too comfortable with
26 everything yet. Yeah. It was just a mistake. I should

1 have.

2 MR. NOEL: Any follow-up?

3 Madam Foreperson, if you'd admonish him,
4 please.

5 GRAND JURY FOREPERSON: Mr. Taylor, you are
6 admonished not to discuss or disclose at any time outside
7 of this jury room the questions that have been asked of
8 you or your answers until authorized by this Grand Jury
9 panel or the Court. A violation of these instructions on
10 your part may be the basis for a charge against you of
11 contempt of court. This does not preclude you from
12 discussing your legal rights with your own attorney.

13 What I have said, have just said is a warning
14 not to discuss this case with anyone except the Court,
15 your lawyer, or the district attorney.

16 THE WITNESS: Okay.

17 GRAND JURY FOREPERSON: You understand?

18 THE WITNESS: Yes, I understand.

19 GRAND JURY FOREPERSON: Thank you.

20 MR. NOEL: Now you can leave. We will try not
21 to chase you down this time.

22

23 CONTINUED EXAMINATION

24

25 BY MR. NOEL

26 Q. All right. You're back. You're still under

1 oath. Remember, you got to speak out loud so that the
2 court reporter can take it down. We have a court
3 reporter here to take down every word, and she can only
4 take down things verbalized. Head nods and alike are not
5 -- don't show up well in transcripts.

6 All right. So when we left off we were talking
7 about receiving calls into the ECC?

8 A. Yes.

9 Q. And you just described what happens when
10 someone calls in from a cell phone?

11 A. Correct.

12 Q. So just to summarize that, the ECC phone system
13 will harvest certain location data from the phone call
14 making the -- or the phone making the call, allowing you
15 at least some idea as to where that person is located?

16 A. It does, with one exception. There's still
17 probably a quarter of the callers that know an old
18 seven-digit emergency number that is still in our
19 Emergency Command Center. And that's the only way that
20 it does not go through a primary PSAP to law enforcement.
21 But generally, the folks that still have that number know
22 they need help with a fire or medical or whatever and
23 those calls come directly to us.

24 Q. So there's non 9-1-1 calls?

25 A. They're emergency lines, they're just a
26 seven-digit emergency line that's not 9-1-1.

1 Q. Right. So it's a direct line to you?

2 A. Correct.

3 Q. And with those calls, does the system
4 automatically harvest?

5 A. It does not. We have to verbally get every
6 detail out of that caller based on where they're at,
7 location, their name, and a phone number, because nothing
8 populates on a seven-digit emergency line. And we try
9 and educate people that it's safer, a little easier to
10 just call 9-1-1, because certain things populate for us.
11 It helps us find them if they don't know where they're
12 at.

13 Q. So when the calls come in, the computer system,
14 the Computer-Aided Dispatch system --

15 A. Uh-huh.

16 Q. -- immediately populates a screen for that
17 call?

18 A. It does. It, it gives us what's called an EVA
19 screen. So it's basically, it's an event entry. So it
20 tells us we need to get a location, a name, a phone
21 number, and then the reason that they're calling 9-1-1,
22 whether it's for help up, fire, heart attack, chest pain,
23 whatever. So then once we get that information captured,
24 then the lead or the radio person can dispatch those
25 resources to that location.

26 Q. So that information gets inputted into the

1 system by the support person who is answering the phones?

2 A. Correct.

3 Q. And then that support person pushes a button
4 and what happens?

5 A. So once they have the information captured, we
6 know where they are by an address or intersection,
7 landmark, things like that, we have their name, or at
8 least a name they give us, a phone number, and a reason.
9 Then there's a green "okay" button. Once they push that
10 button, it drops into the system.

11 So we have seven positions, seven CAD positions
12 in our command center. Once that information is dropped
13 in CAD, it can be accessed from any one of those seven
14 positions. So it doesn't matter where you're sitting.
15 Maybe the lead dispatcher was making lunch and they're
16 away from their desk in the kitchen. Then that support
17 person can drop that call, or the duty captain by chance
18 might just open that call by double clicking it in CAD,
19 it gives the same information because CAD's live at every
20 single position in the center.

21 Q. So once that call is dropped into CAD, that
22 information is dropped into CAD and it goes live, the
23 information goes to the radio dispatcher?

24 A. So -- it does. So we, like with any computer
25 program, double click, it opens a program; right? So
26 double clicking the call when it's sitting in "pending"

1 is telling us that that pending call is awaiting
2 dispatch. So we double click it, it opens up. It's just
3 kind of a screen that reiterates the location, the name,
4 the phone number, and the reason that we're going.

5 Then once the lead dispatcher kind of confirms
6 -- it gives us a suggestion based on where all those
7 resources are in the community. So as things move
8 around, we do certain commands in CAD to move, so we have
9 the closest available research -- or engine to send to
10 that emergency.

11 Q. So the system also keeps track of all the
12 assets throughout the county?

13 A. It does. Half of the stuff, the state stuff
14 has AVL, which is Auto Vehicle Locator, which is going
15 statewide. And then the county stuff does not, so we
16 have to physically, manually move those engines in CAD to
17 different facilities. So if an engine goes to the county
18 shop for maintenance, we physically do a command in CAD,
19 move that resource in CAD to the county shop so they can
20 go get their oil changed or whatever the case may be.
21 And then we, when they come available and are returning
22 to their respective station, we would move them back in
23 CAD. That's how it works.

24 Q. So once a location is entered by the support
25 person taking the call, the system automatically finds
26 what the nearest resources would be?

1 A. It does. So how CAD works is it works
2 backwards. So it starts at the emergency. So if the
3 emergency is at 123 Main Street, let's say, it takes the
4 center of the emergency and works back to the closest
5 fixed facility where resource is at. Or, if it's a state
6 resource and one happens to be driving by, that AVL, Auto
7 Vehicle Locator, refreshes every 8 to 15 seconds, so as
8 that state engine drives by, CAD would see that and
9 suggest that engine 2162 is the closest engine to this
10 emergency. If there's no state engines in the general
11 area, it works off the closest fixed fire station to that
12 address. So CAD works backward from the emergency to the
13 closest facility or resource.

14 Q. So how does it work when the phone is not
15 actually in the same location as the emergency?

16 A. We have taken numerous calls -- I took just one
17 the other day, somebody was calling from South Lake
18 Tahoe. So it works off basically an address. They know
19 where the emergency is, which happens on quite a few
20 occasions, more so than I thought would in this county.
21 So there's certain individuals that call relatives to
22 call 9-1-1. So then that relative has to know where that
23 person is at. We try and get the address, we get a phone
24 number for the person at that address, the person's name
25 that's calling or the family member, and a call back
26 number for them as well.

1 Q. And so at that point, the call taker, the
2 support person, would manually enter in the address of
3 the emergency into the CAD?

4 A. Yes. So let's say that person is a family
5 member that lives in Chico, is calling for somebody in
6 Oroville. Well, our phone system and CAD system is going
7 to autopopulate their information in Chico. So then we
8 would have to highlight that information, delete it, and
9 then put in the information based on where they're
10 calling for the emergency. So they're calling for
11 Grandma in Oroville from Chico. That information would
12 be manually, by us, backspaced, deleted, new location
13 entered, phone number for them, phone number for the
14 residence that they want us to go to, and what's going on
15 there.

16 Q. And as soon as the support person clicks upload
17 or end or whatever, the system immediately plots that
18 onto a map, finds where the nearest resources are, and
19 then?

20 A. Then it gives us a suggestion for the closest
21 engine response, yes.

22 Q. And then the radio dispatcher picks up the
23 call, gets on the radio, and starts calling in the
24 resources?

25 A. Yeah.

26 Q. Once the CAD is released by the call taker,

1 does it go out to anyone else besides the people in the
2 ECC?

3 A. The information that we -- basic information
4 that we enter in CAD goes out via a CAD page. So every
5 Cal Fire employee that works in this county, or any
6 county for that matter, there's a form that you can fill
7 out if you wish to receive the CAD information. And in
8 our particular county, it's based on a CAD Inquiry Form
9 or just an e-mail to one of the supervisors like myself,
10 the duty captain that day, for a phone number to be
11 entered into CAD.

12 So every firefighter, every engineer, captain,
13 chief, it doesn't matter, everybody has a record in CAD.
14 We attach those phone numbers' carrier -- yeah, the
15 carrier and the type of messaging, if you just want
16 standard text or MMS, which is the Multi Media Message,
17 to that individual's record in CAD.

18 Now, when that individual rosters themselves on
19 a fire engine via CAD Web, which is another portion of
20 CAD, kind of another program that lives at this fire
21 station's computers -- so for, rostering for us to know
22 that captain so and so and firefighter so and so are on
23 Engine 81 today, they do CAD Web. And when they roster
24 themselves, that information or their phone number, it's
25 attached to that fire engine now.

26 So until somebody else staffs that engine

1 that's a different, two different people or three
2 different people, that information is going to remain on
3 Engine 81 resource in CAD. So the minute we hit the
4 dispatch button, the location, the phone number, and the
5 reason, like we would put in remarks chest pain, that's
6 why they're calling, so for those two individuals on
7 Engine 81 that roster themselves on that fire engine,
8 that information is going to go to their cell phone.
9 Then there's a link attached to that CAD page that routes
10 them to that call.

11 Q. So, for instance, if a, if Jarbo station was
12 the closest station to a call, once the CAD was released
13 by the call taker, a text would automatically go out to
14 any of the personnel at Jarbo station?

15 A. Only the personnel attached to that. If we
16 send -- for instance, one of the engines at Jarbo Gap
17 station is Engine 2176. So if we are sending 2176 to a
18 medical aid for chest pain, down the street at Scooter's
19 Restaurant, let's say, there was a captain and two
20 firefighters on that engine. They rostered themselves on
21 Engine 2176 for that day via CAD Web, which is another
22 program attached to CAD, then just those three
23 individuals get that CAD page.

24 Q. So that would be a little bit extra early
25 warning of a call coming out?

26 A. Well, it's -- they would actually be alerted

1 sooner than the CAD page comes out by the process that we
2 use. So we use a, a three-alert system that you would
3 hear beep, beep, beep over the radio. And then Engine
4 2176, medical, Scooter's Restaurant, blah, blah, blah,
5 Highway 70. So that's their pre-alert or
6 pre-announcement, as you would call it. Then the
7 dispatcher would open that call, hit the dispatch button,
8 then we would set off the tones for Jarbo Gap Fire
9 Station, which is the station quick call, their alerting
10 system, then we would basically read that screen for
11 Engine 2176, medical aid, chest pain, Scooter's, Highway
12 70. And then 10 to 15 seconds generally after that is
13 when that text shows up.

14 Q. Now, let's go to the morning of November 8th,
15 2018.

16 A. Yes.

17 Q. Were you assigned to the ECC at that time?

18 A. I was that morning. And I showed up for work
19 about 6:40 in the morning and there was not much going
20 on. I was quickly filled in that we were running a fire
21 that was previously dispatched prior to my arrival.

22 Q. Okay. Now let's back up at this point. As of
23 November 8th, 2018, how long had you been a captain in
24 the ECC?

25 A. Little over two years.

26 Q. And were you scheduled as the duty captain on

1 November 8th, 2018?

2 A. I was supposed to be the duty captain that day,
3 yes.

4 Q. What time were you scheduled to go on duty?

5 A. 7:00 o'clock.

6 Q. You said you arrived at approximately 6:40?

7 A. Correct.

8 Q. Is that when you physically walked into the
9 ECC?

10 A. I walked in the door at 6:40 that morning.

11 Q. Was there a duty captain on whom you would be
12 relieving?

13 A. Yes.

14 Q. Who was that person?

15 A. Marcus Ekdahl. He's another captain that has
16 been in there probably six or seven years. And each one
17 of us captains rotate duties throughout your shift. And
18 I was supposed to be the duty captain that day.
19 Generally, we try not to change roles if somebody's
20 already underway facilitating one of those roles.

21 So he and I had a brief conversation when they
22 filled me in about the fire. There was, really nothing
23 verbalized at that point that early in the morning
24 that it was going to be something this significant. So
25 we had discussed let's see how this thing pans out,
26 you're already dealing with the role of the supervisor,

1 the duty captain for the day, and we'll -- if things calm
2 down, we'll transition a little later. Well, we never
3 transitioned because we never got the time.

4 Q. Got a little busy there?

5 A. Just a bit. So what we did in the meantime is
6 he and I discussed, as I discussed earlier, that the
7 aircraft role. So I already had a lead dispatcher, I had
8 a support person answering phones, Marcus was
9 facilitating the role of the duty captain already in the
10 morning. So I, he and I decided that I would hold the
11 role of the aircraft dispatcher that particular day.

12 Q. What does it mean to be the aircraft
13 dispatcher?

14 A. So generally our aircraft doesn't come up until
15 10:00 o'clock in the morning. So with -- in summertime,
16 you want them flying later in the day, when fires are
17 more active. So they don't start until later. So
18 generally, as a rule of thumb, you're not a busy person
19 at your work station with aircraft at 7:00 o'clock in the
20 morning. So you have time to allow someone else to make
21 some breakfast, to get a cup of coffee, maybe to do PT,
22 something like that. So you're typically not busy until
23 a little bit later on in the morning into the afternoon.

24 As those times come upon you is when you would
25 be the one listening to the aircraft that's over an
26 incident or the incident commander requesting tankers,

1 helicopters, things like that. That person, myself, as
2 the aircraft dispatcher, would be on the region intercom
3 calling for those resources to come to our fire.

4 Q. So just to define terms, you used the term
5 "PT"?

6 A. Physical training.

7 Q. Exercise?

8 A. Exercise.

9 Q. Important you stay in shape?

10 A. So -- yeah, it is. So we rotate those roles.
11 So at any given time, even the duty captain, like myself
12 today, could be taking phone calls because that
13 individual is in the restroom or they're making their
14 lunch. And then we just rotate through the three or four
15 of us that are in the Emergency Command Center and share
16 those roles. But as everybody's in their work station,
17 then it reverts right back to the lead, the support, duty
18 captain, and aircraft if we have it.

19 Q. So normally on a morning like this, the
20 aircraft would not be going up until after 10:00?

21 A. Yes.

22 Q. You're taking over as the aircraft coordinator
23 before 7:00 in the morning, not a whole lot for you to
24 do?

25 A. There was not much for me to do, so once I had
26 that brief conversation with Marcus that was going to

1 remain the duty captain, they kind of filled me in on a
2 little bit of the dispatch that happened prior for the
3 Camp Fire, and then I went and grabbed a cup of coffee
4 and just started talking to the rest of the folks about,
5 you know, how the call came in. And it was pretty slow
6 at that point. There really wasn't a whole lot going on.
7 The first wave of the fire engines were responding to the
8 Camp Creek area, and there really wasn't a whole lot for
9 anybody to do, myself included.

10 Q. So were you able to access the CAD for the
11 call?

12 A. I did. And I signed into my work station and
13 got all the appropriate monitors up for myself to be able
14 to facilitate CAD and aircraft and all the programs that
15 I needed and was kind of reading through the call and
16 looking at what resources were assigned to it already
17 that morning.

18 Q. According to the CAD system, what time did the
19 initial 9-1-1 come in?

20 A. That call came in at 6:29 in the morning.

21 Q. Do you know where that call came from?

22 A. The Pulga area.

23 Q. Landline or cell phone?

24 A. I believe it was a cell phone, but I'm not a
25 hundred percent sure.

26 Q. Okay. Do you know who the caller was?

1 A. Not right offhand. Like I said, it happened
2 prior to my arrival.

3 Q. Were there additional subsequent calls coming
4 in?

5 A. At that time in the morning, there was not.
6 Not too long after that, yeah, it didn't stop.

7 Q. All right. So you've got yourself up to date
8 with this, with the Camp A fire at that point, the 6:29
9 a.m. 9-1-1 call?

10 A. Yes.

11 Q. You've got your station up and running,
12 everything's doing, there's not a whole lot of aircraft
13 to deal with at that time in the morning, so what are you
14 doing?

15 A. So I decided we have another tool at our
16 disposal called the Fire Watch cameras, so they're
17 cameras that we can manipulate -- zoom, go live -- if we
18 feel the need that we need to look at a particular area.
19 So I grabbed my cup of coffee and went over to the work
20 station that houses these Fire Watch cameras, and I sat
21 down and I started thumbing through different images
22 trying to find the Camp Fire that they dispatched at
23 6:29.

24 MR. NOEL: Madam Foreperson, this would be a
25 good point if we wants to take the morning recess. I
26 know we've been in session for almost an hour, and Madam

1 Court Reporter might need a break.

2 GRAND JURY FOREPERSON: Okay. Let's take a
3 break. Ten minutes?

4 MR. NOEL: Sounds good.

5 GRAND JURY FOREPERSON: Okay.

6 (Break taken.)

7 GRAND JURY FOREPERSON: Are we all back?

8 All members of the Grand Jury are here.

9 Q. (By MR. NOEL) All right. Captain Hartshorn,
10 just as we went to break we were starting to talk about
11 Fire Watch cameras?

12 A. Yes.

13 Q. What are Fire Watch cameras?

14 A. Fire Watch cameras are strategically placed
15 around the county on some of the high mountain peaks
16 around the county -- Bloomer, Bald Mountain, Flea
17 Mountain -- in the Concow Jarbo Gap area, Sawmill Peak,
18 things like that. So they're attached to the top of some
19 of the radio towers that have to be on high mountain tops
20 in order for our radios to be able to work. And they're
21 placed there. And we can access different cameras from
22 the command center to take a, kind of a quick still shot
23 of a certain area that, again, updates every 15, 20, 30
24 seconds. Or we can actually ask the camera to go live
25 and physically look at an area to where we can zoom in
26 and take pretty good looks at images in certain areas.

1 Q. So from the ECC, do you have access to the Fire
2 Cam data?

3 A. We do. Captains do, yes.

4 Q. Describe that for me.

5 A. So alongside everybody's work station, kind of
6 on the side of the building, is six screens. And in
7 those screens is the computer, the PC, the mouse, all the
8 monitors that just kind of rotate through quick images of
9 Flea Mountain, Bald Mountain, Bloomer, Bloomer East,
10 Bloomer West, Sawmill Peak. And just routinely there's
11 just images up there that are dated every 15, 30 seconds.
12 And it just kind of flips like a screen saver through a
13 mode of the different cameras.

14 When you want to access one of those cameras,
15 you basically activate that camera and then you can click
16 on, let's say, like I did Flea Mountain. And it gives
17 you a drop-down list. And, let's say, there's seven or
18 eight views that you can look at. So it just says Flea
19 1, Flea 2, et cetera, all the way down to number 8. When
20 you click on those, the camera changes and it takes -- I
21 said it's slow -- it takes 15 to 20 seconds for it to
22 kind of clean up its view of that image and then auto
23 zoom itself. And now you're looking at a particular
24 camera that you picked from the command center. So I
25 have access to all of those, as I was that morning.

26 Q. So access to the live view or access to past?

1 A. Both. I can access archive views as well and
2 then I can put a camera into live mode and physically
3 look at what I'm looking at in real-time.

4 Q. So on the morning of November 8th, 2018, you
5 said after you logged into your computer you got your cup
6 of coffee, you got all ready to go, you decided to go
7 take a look at the Fire Cams?

8 A. I did.

9 Q. What time do you think you started looking at
10 the Fire Cams?

11 A. I was over there pretty quickly after I had the
12 conversation with Marcus. It was probably close to 6:50.
13 Somewhere right in there. Little before 7:00.

14 Q. So describe the process of looking through the
15 Fire Cam data.

16 A. So when I sat down around that 6:50, I started
17 scrolling through some of the images trying to find the
18 fire that they dispatched prior to me getting to work.
19 So I'm looking through some of the images, and I'm not
20 finding nothing. I'm looking at Bloomer, I'm looking at
21 Sawmill, I'm looking at several different cameras, and I
22 happen to go to the Flea Mountain, which is above Jarbo
23 Gap, and started looking at a couple of images. And in
24 the camera that I was looking at, also in real-time, at
25 6:50 in November it's still right at dawn, it's still
26 kind of dark outside and not fully light out, as it was

1 going to be for the start of November 11th. So in the
2 video of the Fire Watch cameras it's showing me the same
3 thing, right about dawn, just starting to get light
4 outside.

5 So I'm scrolling through some of the Flea
6 Mountain. Knowing the geographical area, because I've
7 worked here for a long time, I assumed that the Flea
8 camera would give me the best view of the Camp Fire.
9 Just kind of picking through cameras to see which
10 direction I was looking at right around 6:53, 4, 5,
11 somewhere right in that range, I saw something that
12 caught my eye, and I started kind of focusing on just
13 that one camera, toggling back and forth between one view
14 and the next. And right about dawn I started to see
15 smoke.

16 Q. What did you see in the photograph that caught
17 your eye?

18 A. What I saw was the development of smoke at the
19 top of the ridge. And then as I watched it in the live
20 mode, I started to see actual flame. And it started to
21 get a little bigger. And I zoomed in. And, again, it
22 took 20, 30 seconds for the image to clean itself up.
23 Once you move a camera, it takes lag time from the camera
24 to the location to filter and auto focus itself back up.
25 Then I'm looking at a pretty good image of flames that
26 are in the brush and the trees, and that's when I voiced

1 out, "Hey, Marcus, I think I found your fire."

2 Q. So does the Fire Watch camera system allow you
3 to save images and video?

4 A. It does.

5
6 (Grand Jury's Exhibit 56 (erroneously marked Exhibit 57)
7 was marked for identification.)

8
9 Q. In front of you, you should have what's marked
10 as People's Exhibit No. 57, a photograph, for
11 identification. You should have a physical.

12 A. Yes, I do.

13 Q. Do you see People's Exhibit 57?

14 A. I do.

15 Q. See the photograph that's being displayed on
16 the big board here for the jurors?

17 A. Yes.

18 Q. Same photograph?

19 A. It is.

20 Q. Describe to us what we're looking at in the
21 photograph marked as People's Exhibit 57.

22 A. So what you're looking at is a picture of the
23 Fire Watch camera monitor that this particular camera
24 was, was centered in. So this is the top smoke that
25 caught my eye when I started watching the cameras. And
26 the top of this ridge is where that smoke started to kind

1 of show itself.

2 Q. Okay. So when we're talking about this smoke,
3 we're talking about just off of center, right, that I
4 just circled in black?

5 A. Correct.

6 Q. So that's the smoke that you saw?

7 A. Yes, that's what I found that morning shortly
8 before 7:00.

9 Q. That's what caught your attention?

10 A. Yes.

11 Q. Now, does the Fire Watch camera system or the
12 computer system that you're watching, does it have time
13 and date stamp?

14 A. It does.

15 Q. And does it -- when you isolate an image, save
16 an image, does the system time and date stamp it to tell
17 you when, what time what camera, the image was taken?

18 A. It does.

19 Q. And where is that information located on the
20 photograph?

21 A. Typically top left-hand corner of your screen.

22 Q. So right up here where I'm highlighting yellow?

23 A. Yes.

24 Q. So can you read for us what this image, what
25 the time and date stamp for this image says?

26 A. This one, November 8th at -- that's small. I

1 can't read this one. I can't quite make it out in the
2 photograph.

3 Q. Do you want to come up here and read it off
4 the --

5 A. Sure.

6 Q. Obviously, the seven-foot version of it is a
7 little bit bigger than the 8-by-10.

8 A. So November 8th, 2018, 06:48 and 46 seconds,
9 from Flea camera 5.

10 Q. Okay. So this image was shot at 6:48 a.m. and
11 46 seconds?

12 A. Yes.

13 Q. And you said from Flea camera 5?

14 A. Yes.

15 Q. How many cameras are there on Flea Mountain?

16 A. I believe there's eight.

17 Q. So when you saw this, when the smoke coming up
18 over the hill attracted your attention, what did you do?

19 A. I brought it to the duty captain, Marcus. He
20 was facilitating that role that morning. He came over,
21 looked, and as did a couple other people, my dispatcher
22 and my support, because they were there that dispatched
23 that fire previously at 6:29. And we had all kind of
24 thought that we had found that fire.

25 Q. So what did you think, what fire did you think
26 you had found?

1 A. I thought I found the Camp Fire, the initial
2 dispatched fire at 6:29.

3 Q. So you showed this, the image, to the others,
4 and then what happened?

5 A. So shortly after that, it started to become a
6 little more light and a little more people were awake in
7 the valley. And by 7:05 or so multiple 9-1-1's started
8 coming in from everywhere. So I had to leave this
9 position and go answer overflow 9-1-1 calls that were
10 coming into the command center.

11 Q. So things started blowing up?

12 A. To say the least. That they did. It was
13 purely nonstop 9-1-1's for hours and hours and hours.

14 Q. Describe for us what it was like in the ECC on
15 the morning of November 8th.

16 A. We like to call it a duck in a pond. So we try
17 and keep a calm demeanor, because we're the voice of the
18 county, but underneath water you're paddling like crazy
19 because it was pure chaos. Everybody was trying to stay
20 calm, everybody was trying to get as much of the
21 information captured from the callers, because they were
22 calling from south Chico, to Gridley, to Berry Creek. If
23 they saw it, they called, because it was starting to
24 develop and really get ahead of steam going, and
25 everybody that saw it called 9-1-1. Almost 1,700
26 callers.

1 Q. And in what period of time?

2 A. Geez, that first probably ten hours. On
3 average, we were each answering about 103 calls an hour.

4 Q. Now, you said normally you have one support
5 person answering the calls, one radio person dispatching
6 out units?

7 A. Uh-huh.

8 Q. Now, you mentioned earlier that you became an
9 overflow support person?

10 A. Correct.

11 Q. How many people did you have working on the
12 floor answering calls?

13 A. Four prior to 8:00 o'clock. We were able to
14 get a hold of one additional by 8:00 that was off duty on
15 vacation that came in to help. And by 8:00, 8:15, we had
16 a fifth. So for that first wave of panic that morning
17 was just four of us.

18 Q. The duty captain, yourself, the radio
19 dispatcher, and the support person?

20 A. Correct. Up until about 8:00 or 8:15 when my
21 other dispatcher arrived.

22 Q. And sometime prior to about 8:30 your little
23 team swelled to six people?

24 A. It did by 8:30, 9:00 o'clock.

25 Q. So the six, six of you were there dealing with
26 all of these calls?

1 A. That's all we did. I mean, literally that's --
2 even the radio person that particular day, he was trying
3 to dispatch and voice out, physically say the engines to
4 respond to the fire. We still had other emergencies in
5 the county, other medical aids and traffic collisions and
6 things like that that we had to try and get assistance
7 and help to. There was times that that radio person was
8 trying to voice out just a medical aid down the street,
9 still on the phone with callers from the Camp Fire. I
10 mean literally for hours all we did is answer phones.

11 Q. You said I believe somewhere around 1,700?

12 A. Just -- yeah, just shy.

13 Q. You said over a hundred calls an hour?

14 A. I mean that's our math, yeah, for the four of
15 us. And then broke it down to a fifth a little later.
16 It was, roughly, about a hundred calls per person per
17 hour. I was there, I can vouch that it was -- every line
18 we had for hours was lit up red. You would hang up with
19 one, answer the next, hang up with one, answer the next,
20 over and over and over.

21 Q. How long were you doing this?

22 A. Thirty-six hours. At least.

23 Q. So, obviously, you stayed in the ECC?

24 A. All of us did.

25 Q. Captain Ekdahl?

26 A. Stayed.

1 Q. The support person, the dispatcher on when you
2 came in at 6:30?

3 A. The support person that was there initially was
4 one of my night shift staff. She held over for a short
5 time, while the overflow was starting to come in, but
6 then when the fire did what it did and crossed into the
7 Paradise area, she was also a Paradise resident that was
8 affected. So we were able to get her into somebody with
9 a vehicle to get her up to try and secure her house. So
10 that's when she left and in a few hours later came back.

11 Q. So you yourself were on in the ECC for 36 hours
12 straight?

13 A. At least.

14 Q. And how about Captain Ekdahl?

15 A. Same. He was there for 30, 36, 40 hours as
16 well.

17 Q. Were you able to get any rest?

18 A. We, we tried in the wee hours of the morning on
19 the 8th going into the 9th, but the amount of workload,
20 it -- just three people couldn't do it. We just, we
21 physically just couldn't leave the building.

22 Q. Now, when that deluge of calls started, you
23 were at the Fire Cams looking at what you thought was a
24 photograph, Exhibit No. 57, of the Camp Fire --

25 A. I was.

26 Q. -- correct?

1 At some point were you able to return to the
2 Fire Cams?

3 A. About 24, 28 hours. Time is crazy that
4 particular day. Twenty-four to 30 hours later I went
5 back to the Fire Watch cameras on that half of the
6 command center and I saw a different image that was just
7 stuck there and froze.

8 Q. What was that image?

9 A. It was an image of a major fire and smoke
10 plume. Just basically -- I wasn't sure where it was
11 left, so I accessed the archive footage and was able to
12 back that video up and pick up where I left off when I
13 got busy with phone calls.

14
15 (Grand Jury's 57 (erroneously marked Exhibit 58)
16 was marked for identification.)

17
18 Q. Okay. So we still have 57 up here.

19 Next up in front of you you have Exhibit 58?

20 A. Yes.

21 Q. Do you see Exhibit 58?

22 A. I do.

23 Q. And do you recognize 58?

24 A. I do.

25 Q. Is the 58 that you are holding in your hand the
26 same as the photograph that's being displayed on the big

1 board?

2 A. It is.

3 Q. Describe for us what we're seeing in 58.

4 A. So in this photograph is basically as the fire

5 slowly intensified, and I just started to see the flames

6 pop to the top of the ridge.

7 Q. Okay. Is the time and date stamp on this one?

8 A. It is.

9 Q. Can you read that?

10 A. November 8, 2018, 06:55 I think.

11 Q. 06:55 and 54 seconds?

12 A. 54 seconds, yes.

13 Q. Again, this is Flea camera number 5?

14 A. Yes, it is.

15 Q. Same camera image we looked at before?

16 A. Yes.

17 Q. So this photograph comes basically about 7 1/2

18 minutes after 57 --

19 A. Yes.

20 Q. -- correct?

21 A. Yes.

22 Q. And you said now in 58 we can see flames

23 starting to crest that little ridge where you saw smoke

24 in 58 -- 57?

25 A. It is.

26 Q. So initially you're thinking that this is the

1 Camp Fire?

2 A. First thought, yes, I had tunnel vision into
3 just that image. And I really didn't take a bigger look
4 until that 20 or 30 hours later when I was going back and
5 re-accessing these images.

6 Q. So when you came back to these images somewhere
7 two to three days after, did you see other parts of the
8 image that made you question your initial reaction?

9 A. I did. And what I noticed the second time, now
10 with the actual Camp Fire raging through Paradise and
11 wherever else, I noticed when I accessed these archive
12 videos, I had a little bit broader perspective to look at
13 this image, and what I realized from this image is that
14 little body of water that's out in front of it is -- I
15 thought was Concow Lake, which made me guess that this
16 was actually the Camp Fire.

17 Q. So when you're talking about this body of
18 water, I've circled in blue over here --

19 A. Yes.

20 Q. -- is that the body of water you're talking
21 about?

22 A. It is.

23 Q. Center of the photograph on the right side,
24 right-hand side of the photo?

25 A. It is.

26 Q. And that's Concow Lake?

1 A. That's what I originally thought my second look
2 at this image, yes.

3 Q. And now that you realized this is from Flea 5
4 and that appears to be Concow Lake, are you able to
5 access the camera locations and determine where that
6 camera is pointed?

7 A. I did. And that's when I started looking at
8 different views, different cameras, accessing that
9 archive footage as well.

10 Q. And you realized that this fire depicted in 57
11 and 58 that you had seen early in the morning on the 8th
12 was not actually the Camp Fire?

13 A. No, it was not, it was actually a second fire.

14 Q. All right. So you have -- in front of you
15 there should be a DVD. You said you were able to view
16 the video from the different cameras?

17 A. Yes. I accessed the archives.

18 Q. And then you were able to capture those videos
19 and save those videos; correct?

20 A. Yes.

21 Q. When you realized that the images you had seen
22 were not of the Camp Fire up in Pulga, that there was
23 something over in Concow, what did you do?

24 A. Well, I immediately went to a different camera,
25 I went to a different view, and tried to confirm my
26 suspicion that I was looking at actually a separate fire.

1 And once I did that, I immediately called our prevention
2 officer that was handling the investigation for this
3 fire. And I said, "I need to speak with you immediately.
4 It's imperative that you get over here and see what I
5 need to show you."

6
7 (Grand Jury's Exhibit 58 (erroneously marked Exhibit 59)
8 was marked for identification.)
9

10 Q. All right. So you have 59 there in front of
11 you. It's a DVD?

12 A. Uh-huh.

13 Q. And I'm going to play that. And you want to
14 step out here where you can, you have a good view and you
15 can see and you can tell me what it is?

16 A. This is an image of the Flea Mountain camera
17 that I was looking at. Here's that ridgetop area from
18 the images of the still.

19 There's the smoke that I saw. And then as it
20 progresses, you saw the flame. And then this is where
21 the other image that comes through that I found a day and
22 a half later when I accessed the archive footage.

23 Q. All right. Let's back up. When we talked
24 about earlier, you said there's multiple ways of viewing
25 the footage from the Fire Cams; correct?

26 A. Yes.

1 Q. You can look at single still images?

2 A. Uh-huh.

3 Q. Or you can look at a, essentially a video made

4 up of single still images?

5 A. Essentially, yes.

6 Q. Kind of a time-lapse?

7 A. That's basically what it is, yes.

8 Q. Or you can actually look at the live feed?

9 A. At a live view.

10 Q. So what are we looking at in this video?

11 A. So essentially the image that was down here,

12 that initial smoke that I was looking at, that's just

13 changed.

14 Q. So this is time-lapsed?

15 A. So this is Bloomer.

16 Q. Hold on. How did we -- okay. Yeah. We forget

17 that that's touch screen.

18 All right. So we're back to the Flea Mountain,

19 No. 59?

20 A. Yes. You'll see the fire pick up here, there.

21 Fire is just cresting the ridge. And then I started to

22 notice, as I'm accessing this archive footage, this big

23 band of smoke off to my left, or the east, that is coming

24 into view of the fire that I initially thought I was

25 looking at, which told me without a doubt at that point

26 that what I was looking at was not the initial Camp Fire.

1 And then, of course, it shows itself and runs right over
2 the top of that smaller fire that we were just looking
3 at.

4
5 (Grand Jury's Exhibit 59 (erroneously marked Exhibit 60)
6 was marked for identification.)
7

8 Q. All right. So then let's move on to No. 60.

9 We've got a numbering problem. The numbers
10 aren't matching up. So we're going to have to deal with
11 that. We will deal with that at the break. These
12 numbers aren't matching up.

13 All right. So, now, you said you went back and
14 you looked at other Fire Cam videos?

15 A. I did.

16 Q. One of those was Bloomer?

17 A. I know the county geographically really well,
18 I've worked here a lot of years, so knowing where Bloomer
19 lives, Bloomer Mountain, where the fire was, I knew kind
20 of basically what couple of camera views that I needed to
21 look at to look back towards that northeast, which is
22 what this is.

23 Q. And which camera is this from?

24 A. Bloomer 9 East Camera.

25 Q. And this is the same type of video, kind of a
26 time-lapse?

1 A. It is. You'll see it starts to show here,
2 there.

3 MR. FOGG: Captain Hartshorn, sorry to
4 interrupt, when you point at the screen, could you please
5 indicate what part of the screen you're pointing to,
6 either the right-hand side or left-hand side?

7 THE WITNESS: Sure.

8 MR. FOGG: Thank you.

9 Q. (By MR. NOEL) Okay. So --

10 A. Right up here, top right --

11 Q. Okay.

12 A. -- you'll start to see a little bit of smoke
13 and what appears to be just a little bit of band of smoke
14 that's coming off the east from the actual Camp.

15 Q. Okay. Just the way things are going today.

16 A. Upper right and then behind. There's the big
17 band as it comes through and runs into Paradise.

18 MR. FOGG: Captain, you're moving from the
19 right-hand side of the screen to the left-hand side
20 screen at the top?

21 THE WITNESS: Right-hand, top right, moving to
22 the left side of the screen you'll see the smoke plume.

23 MR. FOGG: Referring right now to Exhibit 60;
24 correct?

25 THE WITNESS: Correct.

26 MR. FOGG: Thank you. Or what is marked as

1 Exhibit 60.

2 MR. NOEL: All right.

3

4 EXAMINATION

5

6 BY MR. FOGG

7 Q. Captain Hartshorn, I want to direct your
8 attention back to Exhibit 57. If you'll remember, it's
9 one of the Fire Cam pictures we talked about the date
10 stamp in the top. How often do you use the Fire Cam
11 system in the course of your career at Cal Fire?

12 A. Well, it's relatively new as far as the
13 technology coming into command centers.

14 Q. Right.

15 A. I know we've had it in there for several years.
16 And we've been able to access it a handful of times each,
17 as needed for some of the fires that have gone on in the
18 county.

19 Q. When you've previously accessed it, have you
20 seen the date and time stamps on the images?

21 A. Yes.

22 Q. In your experience, is this date and time stamp
23 generally accurate?

24 A. They're not as accurate as real-time. And we
25 can't figure out -- the maintenance company that
26 maintains the cameras cannot figure out why it slowly

1 changes. We have the same problem with security cameras
2 in our center as well.

3 Q. So the date and time, the day and time are off.
4 Are they off by a matter of seconds, a matter of minutes,
5 a matter of hours?

6 A. Generally, couple of minutes.

7 Q. So when you -- when we have Exhibit 57, if
8 you'll recall, the time stamp said November 8th -- the
9 date stamp said November 8th?

10 A. Dates are always correct. Years are always
11 correct.

12 Q. Also said 6:48?

13 A. Correct.

14 Q. Do you remember when you were, when you saw --
15 well, let me take a step back.

16 You saw that image 57 live on the screen;
17 correct?

18 A. Yes.

19 Q. When -- did 6:48 appear to be, roughly,
20 approximately the time you were viewing that image?

21 A. It was.

22 Q. Thank you.

23 I have no further questions.

24 No, I think that's it for us.

25 Madam Foreperson or the jurors, anyone have
26 questions?

1 GRAND JUROR: I do.

2 MR. NOEL: Go ahead, write them up, give them
3 to the Sergeant at Arms.

4

5 EXAMINATION

6

7 BY MR. NOEL

8 Q. All right. Some questions from the Grand
9 Jurors.

10 Does CAD prioritize calls independent of
11 personal answering?

12 A. It does based on call type. So if we dump a
13 medical aid, a structure fire, and a wildland fire, it's
14 going to basically put them in priority of medical aid
15 first, structure fire second, wildland fire third. Based
16 on life, property, environment.

17 Q. So that's after the support person, the call
18 taker, has entered that information into the system?

19 A. Yes.

20 Q. So it doesn't prioritize calls before you
21 answer them?

22 A. No. The captain, or the duty captain that
23 particular day dealing with that call, has the ability in
24 a command center to change the priority of those calls,
25 add resources to a specific call, or take away and
26 reduce. Dispatch centers do not.

1 Q. Are all seven CAD positions in the ECC manned
2 at all times?

3 A. No, they are not. General staffing in the
4 off-peak season or non fire season is three. Whether it
5 be one duty captain and two communications operators or
6 dispatchers; or two captains, one dispatcher. A total of
7 three people in the off-peak season. During fire season,
8 a minimum mandatory four and two 24-hour people wide
9 awake at night.

10 So there's three on the floor 24 hours a day,
11 seven days a week, whether it be a captain that's there
12 for -- when you're the duty captain, it's also your night
13 to stay. So if I have the duty captain role today, it
14 will be my 24-hour day to stay the night as well. And
15 I'll have the duty for tonight for my night shift.

16 Q. When significant events, for instance red flag
17 days occur, do you have additional staffing present in
18 the ECC?

19 A. Potentially, yes, we have the ability to bring
20 in possibly a fifth and sixth if needed, yes.

21 Q. And would that be just for the day or reacting
22 to some type of emergency?

23 A. It varies. Most of the time, Region, which is
24 our -- Region, or what we call OCC, the Operation Center
25 for -- there's two. There's one in the north and one in
26 the south. So in an event they want extra staffing,

1 Region will put out a message and an incident number to
2 tie back to that extra staffing; maybe more engines, more
3 dozers, more ECC help, things like that. That's all
4 mandated by north office in Redding. They want extra
5 people somewhere or extra equipment somewhere, they give
6 us a number to tie into.

7 Q. Does the CAD system auto centralize equipment
8 when particular pieces of equipment are out of service?

9 A. No. We have to physically move engines around
10 to maintain a level of staffing at a particular location
11 that we want.

12 Q. You stated that on a normal day you don't send
13 out air support until around 10:00 a.m?

14 A. Correct.

15 Q. This was not a normal windy day, it was not a
16 normal wind day, so why didn't you have air support
17 available earlier?

18 A. They had bases -- we did. They had certain
19 bases that, again, Region dictates which base will be
20 available for what we call "early up." And basically all
21 that takes is a phone call, which I made. So there was a
22 request from the incident commander to, in his words,
23 "get everything earlied up." I made that phone call to
24 Region and they got -- contacted those pilots and bases,
25 and that stuff showed up and was earlied up. I think we
26 had -- the air attack was over the fire at 8:02.

1 Q. Okay. Do you know what time you called to tell
2 the air attack to saddle up and get ready to move?

3 A. It was about 7:35, 7:40, somewhere right in
4 there.

5 Q. Do you know what time air attacks began air
6 operations that day?

7 A. Like I just stated, I believe he was over the
8 fire at about 8:02. Right at 8:00 o'clock. Just a few
9 minutes after.

10 Q. Now, you've been a professional firefighter for
11 29 years now?

12 A. Yes.

13 Q. Including your volunteer experience?

14 A. Uh-huh.

15 Q. A great deal of that was fighting wildland
16 fires. You said you were at Harts Mill, you were at
17 Bangor. What other stations were you at?

18 A. Robinson Mill.

19 Q. Robinson Mill. I'm sorry.

20 A. Biggs. I mean, I've worked everywhere. I've
21 worked Kelly Ridge, Palermo, Gridley, Schedule A,
22 Schedule B truck. I've done every aspect of our job
23 except prevention basically.

24 Q. In your professional experience, have you ever
25 seen a fire move or expand as fast as this one, the Camp
26 Fire, did on November 8th?

1 A. I've never seen anything like this. I've seen
2 fires move rapidly, consume everything in its path, but
3 I've never seen something as destructive and move as fast
4 as this did that day, no.

5 Q. So following up on that, we've got the Bloomer
6 9 Cam back up on the board. I'm playing it for the jury
7 to see that. You can see the smoke in the background?
8 It goes off. We'll save that for later.

9 All right. Madam Clerk, the questions.

10 Anything else?

11 (Counsel confer.)

12 [DISCUSSION OMITTED.]

13 MR. NOEL: Anything further?

14 We have to give Captain Hartshorn the
15 admonition he will be back again, assuming that there's
16 other areas in the case that we want to move into, other
17 avenues. He would also be testifying if, if the jury
18 should decide that they want to hear the coroner's
19 evidence.

20 GRAND JURY FOREPERSON: Captain Hartshorn, you
21 are admonished not to discuss or disclose at any time
22 outside of this jury room the questions that have been
23 asked of you or your answers until authorized by this
24 Grand Jury or the Court. The violation of these
25 instructions on your part may be the basis for a charge
26 against you of contempt of court. This does not preclude

1 you from discussing your legal rights with your own
2 attorney.

3 Mr. Hartshorn, what I have just said is a
4 warning not to discuss this case with anyone except the
5 Court, your lawyer, or the district attorney. Do you
6 understand?

7 THE WITNESS: I do.

8 GRAND JURY FOREPERSON: Thank you.

9 MR. NOEL: You are excused for now, subject to
10 recall.

11 And the next witness would be Captain McKenzie.
12 Summon him, and I'll get some other stuff.
13 Did we swear the witness?

14 GRAND JURY FOREPERSON: Not yet.

15 (GRAND JURY FOREPERSON swears in witness.)
16

17 CAPTAIN MATT MCKENZIE

18 having been called as a witness in
19 the matter now pending, having been first
20 duly sworn, testifies as follows:

21
22 THE WITNESS: Yes.

23 GRAND JURY FOREPERSON: Thank you.

24 You may have a seat.

25 MR. NOEL: Ready to proceed?

26 GRAND JURY FOREPERSON: Yes.

1
2 EXAMINATION
3

4 BY MR. NOEL

5 Q. Captain McKenzie, by whom are you employed?

6 A. Cal Fire.

7 Q. In what capacity?

8 A. Here in Butte County as a fire captain.

9 Q. How long have you been with Cal Fire?

10 A. About 21 years.

11 Q. What training do you have that qualifies you to
12 work for Cal Fire?

13 A. I went through the Butte Fire Academy for
14 firefighter and got my Cal Fire Firefighter 1, CFR back
15 then. So I went through the Butte Academy. And I've
16 been through Cal Fire's academy in Ione for both engineer
17 and firefighter; several other training courses and
18 classes, hundreds actually throughout my career.

19 Q. Walk us through your training and experience as
20 a Cal Fire employee over the last 21 years.

21 A. Okay. So if you get your Cal Fire Basic
22 Firefighter, you're able to be employed by Cal Fire as a
23 Firefighter 1, the entry level position, which I obtained
24 that cert through Butte Fire Academy independent. That's
25 just something you independently go through Butte
26 College, pay for it yourself, then get hired with Cal

1 Fire. Then once you're hired with Cal Fire, you either
2 -- there's several different mandatory training courses
3 that you have to go through -- EO, defensive driver,
4 and stuff like that.

5 Then to become a Firefighter 2, you have to go
6 to the academy in Ione and get more formal training --
7 ropes, knots, ladders, over the edge rescues, vehicle
8 extrication training -- all the required courses.

9 And then to become an engineer or a
10 driver-operator, what we call a company officer, you have
11 to go back to the academy for another six weeks. First
12 one is six, the second one is six weeks. So the
13 driver-operator, what we call the company officer
14 academy. Pumping; you have to go through driving
15 operation; defensive driver; public operations; what we
16 call WUI -- Wildland, the Urban Interface firefighting
17 that we do. There's actually a whole scenario. You have
18 to go protect a fake village. Training continues with
19 just annual training; EMT, keeping your EMT up. It's not
20 required that you're an EMT, but you get EMT when you
21 come out of Butte Fire Academy. But we have to have -- I
22 can't remember -- it's a module, it's like Basic First
23 Aid that's a minimum requirement.

24 Q. How did you get to be a captain?

25 A. Promoted through the ranks. I started in
26 Oroville here. I'm from Oroville. And I started as a

1 volunteer in 1994 at this station right around the corner
2 in Thermalito. And I just promoted through the ranks,
3 made myself competitive by going and obtaining different
4 training courses, paying for it myself. It took a while.
5 I didn't want to promote because I wanted to be at my
6 hometown station, which served me well for about 15
7 years. And I've been up in the Jarbo Gap Concow station
8 now for five. But I promoted throughout the years.

9 There's something called a temporary
10 appointment, and that's a temporary appointment that you
11 don't have to compete for. You become a captain but you
12 don't have to compete for the position. You don't -- you
13 didn't actually do an interview to get it or a test.
14 It's just you're basically, you've been an operator for
15 three years or more, you're off of what we call JAC,
16 which is the joint apprenticeship program where there's
17 -- while you're an engineer, there's several different --
18 there's a whole book, three years' worth of training that
19 you have to get through. Once you get through that and
20 you've journaled, you're able to be a captain.

21 So I went to the Magalia -- well, it was
22 Stirling City, Magalia, relief position as a captain in
23 2008. And then in 2009 I was in Magalia the whole time.
24 2010, Feather Falls. 2011 Feather Falls. These are all
25 temporary appointments with limited term. Then I got my
26 permanent captain's job, I had to compete for the

1 position, in 2014. And that was the -- getting, you
2 know, permanent employment as a captain. So before, I
3 would be a captain in the summertime and back to my
4 engineer position in the wintertime. As of 2014, I went
5 permanent full-time captain at the Concow Jarbo Gap
6 station.

7 Q. So what is your current assignment?

8 A. Concow Jarbo Gap Fire Captain.

9 Q. What station are you based out of?

10 A. Station 36. That's the Concow Jarbo Gap
11 station.

12 Q. How long have you been at the Concow Jarbo Gap
13 station?

14 A. Five years.

15 Q. Were you on duty on November 8th, 2018?

16 A. I was.

17 Q. How important is weather to a fire captain?

18 A. Very important. It's the -- our morning
19 briefing pretty much at the breakfast table, you know.
20 We watch the news, we watch the weather, but we also get
21 plenty of updates from our department; e-mails, you know,
22 safety notifications that they would like us to go over
23 with our crew, which we do. But it's always, it's always
24 important to us. Weather is pretty much a big driving
25 force in the way fires behave.

26 And in my particular response area, there's

1 always wind, and we know it. They call it the Jarbo
2 zephyrs. And it's taught in our Cal Fire Academy down in
3 Ione. It's just normal down-canyon winds. Everybody
4 gets down-canyon winds. At night it gets cool. You
5 know, the air sinks and starts to go down canyon. Where
6 it's worse at our station is that the river makes a big
7 bend, hence the name Big Bend Road, and if you look at it
8 from a topo map, it makes a -- Big Bend comes back and
9 then goes down to Lake Oroville. Well, all of that
10 down-canyon wind compresses there because it's trying to
11 make that corner, and spills up and over and goes into
12 the community. So it's always strong. And it's always a
13 concern. And we talk about it daily.

14 Q. Describe for us your schedule, your work
15 schedule, as a captain at the Concow Jarbo station.

16 A. Okay. I work three days on, four days off. My
17 counterpart, my partner, is the same. Then we have a
18 relief day. So there's always a station captain there or
19 company officer. But I work three on, four off.

20 Q. So when did you come on prior to November 8th,
21 2018?

22 A. Wednesday morning at 7:15.

23 Q. So that would have been November 7th?

24 A. Correct.

25 Q. At 7:15 a.m.?

26 A. (Nods head.)

1 Q. And while you were on duty, you are living at
2 the station; correct?

3 A. Yes. Yes. It's, it's a 72-hour shift.

4 Q. So you're on for your entire 72-hour shift.
5 When you're not out working, you're in your station?

6 A. Correct.

7 Q. So you were aware that there was weather issues
8 coming up on the 8th?

9 A. Yeah, we, we had an email come out several days
10 prior, said that forecasted strong winds and a front.

11 I also had communications with my old partner
12 that works in Magalia who was on duty for that, for the
13 fire as well, that just sent me a quick text message.
14 And I can't remember the miles per hour. He said,
15 "Strong winds forecasted in Jarbo tomorrow." He just
16 sent that to me.

17 And I sent him one back that said, "Great," or
18 "Yay," I can't remember what I said.

19 But it's not that -- it is a concern because
20 they're already strong, and when people say strong winds,
21 that usually means double, then 20 miles an hour, 25
22 miles an hour, what we normally get at night.

23 Q. At that point, you had been assigned to the
24 Jarbo -- Concow Jarbo Station 36 for almost five years;
25 correct?

26 A. Correct.

1 Q. You were used to the winds?

2 A. Used to the wind. It was also my second due.
3 So when I worked here in Oroville, in Thermalito, that
4 was my second due. So if they got a fire, I was the
5 second -- well, there's two engines that run out of that
6 station. Essentially, I would be the backup coming from
7 the valley for 15 years. And I've been to many, many
8 fires up there, coming in second in or third in.

9 Actually burned over in the Poe fire up there
10 in 2001. We had our engine overran by fire and burned
11 the engine off, the back end of the engine. So I knew --
12 I was very reluctant to even interview for that job, that
13 position, because I knew what was up there. But it's
14 also kind of a -- you want it to be a feather in your
15 cap, too. You want to stop those, you want to be able
16 to stop those fires up there, you know, because they do
17 get bad quick. And we had a lot of success for a lot of
18 years doing that.

19 Q. You want to be the one to be known for taming
20 the Jarbo winds?

21 A. Correct. Yeah. You want to be able to get
22 there, and people, "Wow, that was a good stop. Those
23 were strong winds and steep country, and you guys made a
24 good stop." Several of those have happened. But
25 sometimes the weather dictates what you're going to do,
26 how you're going to do it.

1 Q. So based upon the weather forecast on November
2 7th, did you do anything to prep?

3 A. We, we spoke, we discussed -- we know our
4 target areas and what, what has happened in the past when
5 the strong winds come in and what the fire does. Fire at
6 night goes faster downhill than it did going uphill
7 during the day because it's being pushed by the winds.

8 So we talked about our areas, you know, like
9 all of our escapes, the community's safety zones and
10 such. And, yeah, we definitely discussed, you know, our
11 target is usually the community of Concow itself. If
12 something gets established up there, those winds just
13 push it right down in the community. So we did talk
14 about, you know, where we would go, where would we try to
15 fight it if something happened or how we'd anchor in. We
16 talked about tactics for the next day. Well, the next
17 week, because I think it was scheduled to -- I mean, they
18 were forecasted to blow hard for a few days. So --

19 Q. So when, when we say you live at the station
20 for 72 hours during your shift, do you -- you are
21 literally living at the station; correct?

22 A. Correct. We have a barrack. I have my own.
23 The captain has their own room. It's attached to the
24 kitchen. So it's a small room; a bed, a bathroom,
25 television, toilet, that type of deal. It's attached to
26 the kitchen. And then below the kitchen is actually the

1 TV room, laundry room, and barracks. That's where all
2 the firefighters and engineers sleep is there. We have
3 -- it's your home for three days. Well, in the
4 summertime it's your home for about a month. Sometimes
5 you don't get off for about a month.

6 Q. Why?

7 A. Staffing patterns, fires in other areas,
8 predicted, projected forecasts. Sometimes we do staffing
9 patterns, hold all personnel on duty so that we don't
10 have -- so that we can staff up extra equipment in case
11 of an emergency, something like the Camp Fire or
12 whatever. Or, you get stuck on -- because we sent five
13 engines or ten engines to another unit, another county,
14 to fight a fire, we just don't have the personnel to
15 relieve you.

16 Q. Right. So for a good example from last summer,
17 the Carr Fire.

18 A. Carr Fire, correct. We were all held on duty
19 for quite a while. If we weren't held on duty, we were
20 on the fire line. That soaked up a lot of resources.

21 Q. So firefighters through Butte County, from Cal
22 Fire Butte County Fire, were sent up to Redding to help
23 with the Carr Fire?

24 A. Yes.

25 Q. And then the rest of you that had to stay here
26 had to stay on duty to cover for the guys who were up in

1 Redding?

2 A. Yes. Yep. Sometimes we'll put on a, the state
3 will put on a staffing pattern, and it will hold all
4 personnel on duty the entirety of the state of
5 California. Or it can be a northern region staffing
6 pattern. So everything from, say, Fresno north is held
7 on duty. Or it can be a southern region staffing
8 pattern. Or it can be a local staffing pattern. Our
9 unit chief can decide, hey, we're going to have these
10 local winds, we are going to do our own staffing pattern.
11 And they have to get it approved by region for that to
12 happen.

13 But, yeah, we have what's called an
14 out-of-county bag, and you pack like five different pairs
15 of uniforms and some off duty clothes so that you can be
16 prepared to be on the fire line for days. And the same
17 thing goes for the station. I mean, you have your off
18 duty wear at the station. Like maybe 7:00, 8:00 o'clock
19 you kind of try to relax, but you're, you're on duty. I
20 mean, you're -- we tell the guys come to work and be
21 ready to be on the Mexican border in 12 hours. Because
22 we can be from northern California all the way down to
23 San Diego in no time. So summertime is that way. From
24 the Oregon boarder all the way down to the Mexico border
25 is what we cover from California and some parts into
26 Nevada first due. So it's -- yeah. I mean, you're

1 prepared to stay for a long time.

2 Q. How many times in your career have you been
3 sent out of county?

4 A. Hundreds. I really couldn't, I couldn't count.
5 A lot.

6 Q. It's a common thing; correct?

7 A. Very common, yeah.

8 Q. You've been sent out of state?

9 A. I've been into Nevada once. We went to Montana
10 in 2000, I believe. We sent 10 or 15 engines to Montana.
11 And we were on the rotation, so we sent the engines. The
12 crew went on the engines to fight the fire. They were
13 going to stay for longer than our two-weeks commitment
14 for our duty time. They left engines there, bussed the
15 personnel out, and bussed more personnel in to get, to
16 relieve them.

17 The Story Fire happened when it was our
18 rotation, so we got stuck on the Story Fire. So I didn't
19 make it to Montana, but yes, I've been out of the state
20 into Oregon and into Nevada.

21 Q. So I'm assuming at some point on November 7th,
22 the evening of November 7th, you went to bed?

23 A. Went to bed, yeah. Can't exactly remember. I
24 go to bed pretty early. It's kind of -- I have that
25 freedom because I have my own room, my own TV, so it's
26 easier to just kind of go in there and relax. But I'm

1 not sure exactly what time I went to bed.

2 Q. Do you recall what time you woke up?

3 A. Yeah, before 5:00, just before 5:00. The wind
4 woke me up.

5 Q. What do you mean the wind woke you up?

6 A. So on -- I sleep very light. I'm used to the
7 wind, but it was -- I kind of woke up kind of a little
8 bit confused because I was just coming out of being
9 asleep, and I thought it was raining. It was pine
10 needles hitting the roof. And the gust was a roar. It
11 was like -- usually it's kind of a gust every now and
12 then you'll hear, but -- no big deal -- but it was like a
13 sustained roar with pine needles hitting the roof. So it
14 kind of took me a minute, I shook it off and figured out
15 it was the wind that woke me up.

16 Q. So when you first woke up it sounded like it
17 was raining outside?

18 A. Yeah.

19 Q. Did you realize, learn at some point that that
20 was pine needles pelting the roof?

21 A. Yeah. We have a metal roof, and it was
22 obviously amplified. But it, it was weird because it
23 sounded sustained. Like, I mean, it was that many pine
24 needles hitting the roof. Of course, that time of year
25 pine needles are falling, but --

26 Q. You've been at Concow Jarbo Station 36 for five

1 years. Did you ever experience that before?

2 A. That's probably the strongest I've ever seen or
3 heard it. We've had big gusts in the wintertime, but in
4 the summertime you're kind of -- you're on edge anyways.
5 You know, just it's dry, it's hot, and the wind's
6 blowing, you're, "Oh, please, nobody do anything stupid."
7 But in the wintertime I've seen those winds, but not
8 sustained. Winter storms come through, and we will get
9 gusts 60, 70 miles an hour up on the ridgetops and stuff.
10 And you feel it there, but never in the summertime. I've
11 never felt that in the summertime or witnessed it or been
12 a part of it.

13 Q. So you said this was a sustained, consistent --

14 A. Roar, yeah. Because there's a bank behind my
15 room. So there's a building, a driveway, and a bank,
16 kind of a steep bank. And it channels the wind through
17 there. So it was just kind of like a sustained roar
18 through that little, that little section.

19 Q. So once you woke up, what did you do?

20 A. Well, before, the night before -- it's not
21 typical for the captains or engineers to cook. The
22 firefighters do it. Their third day on is their cook
23 day. They have to prep all the meals.

24 I like to cook, so the night before I threw a
25 corned beef in the crock pot. I was going to do corned
26 beef hash for the crew. So I woke up, I took a shower --

1 the wind woke me up, I took a shower, I went in there and
2 started cutting potatoes, got coffee going, kind of get
3 breakfast thing going, watching -- turned on the news,
4 drinking coffee, and prepping breakfast.

5 Generally speaking, everybody -- well, not
6 generally speaking, the rules are you're at the breakfast
7 table in uniform at 7:00 o'clock in the morning.

8 Q. So you're in the kitchen starting to get
9 breakfast ready, you got the news on, does something
10 attract your attention?

11 A. My phone lit up. We have, we have what's
12 called "quick call" that goes off when we have a call.
13 So the command center gets a call, they activate your
14 tones for your station. Well, at night we mute the radio
15 so we don't have to listen to everybody else's calls.
16 But even though the radio is muted, as soon as your tones
17 go off, your buzzer goes off, and it unmutes the radio.

18 We also have CAD pages. So the dispatch system
19 sends a page to your phone of the incident information,
20 Google Map link to where it's at, and all the resources
21 that are assigned.

22 My phone was sitting face up, and it
23 illuminated. And I kind of looked over at it and it said
24 -- I have the actual CAD page, but it said, it said
25 "Jarbo Gap vegetation," and it had the incident location.
26 And then seconds after, the buzzer goes off.

1 Sometimes the buzzer goes off before you get
2 your CAD page and sometimes you get your CAD page before
3 the buzzer goes off. It just depends. This one they
4 launched it pretty quick, I think, so everybody probably
5 got the CAD page quickly.

6 Q. On the morning of November 8, 2018, you
7 received a CAD page first?

8 A. I did. I received the CAD page first, followed
9 shortly thereafter by the buzzer going off. And I
10 immediately went to the backdoor of the kitchen and
11 opened the backdoor of the kitchen, and the wind pulled
12 the door out of my hand. It opens outward into the wind,
13 and it pulled it out and hit the rail behind it and
14 stopped it.

15 Every time there's been a fire in the canyon
16 that I've been on duty and the winds are strong, they're
17 always strong, or there's any measurable amount of wind,
18 you smell it at the station before, usually before it's
19 even reported, because there's no cell service in the
20 canyon and, you know, very little time to get to cell --
21 it takes a long time to get to cell service. So usually
22 you smell it before it's reported. If somebody's seen
23 it, they're trying to report it, but if it's not Cal
24 Trans or if it's not PG&E, or not somebody in a big rig
25 with a radio, it's just not reported.

26 But I didn't smell anything, and I didn't see

1 anything. So I was kind of, oh, well, maybe a false
2 alarm. But, you know, every time we hear "vegetation,"
3 we get moving pretty quick.

4 Q. All right. So let's back up a little bit.

5 A. Yes.

6 Q. So you're in the kitchen, you're cooking
7 breakfast, your phone lights up, and you look down and
8 you have your CAD page?

9 A. (Nods head.)

10 Q. Do you recall what time that occurred?

11 A. 6:29 and 55 seconds, approximately.

12 Q. And then when did your phone start going off?

13 A. Maybe 30 seconds, a minute later. I'd say
14 probably closer to 30 seconds.

15 Q. So you said once that you saw that there was a
16 report of fire up the canyon, you went out, you started
17 to go outside to check it out?

18 A. Well, I needed to go -- I was -- didn't have my
19 boots on, so I had like just house shoes on. I needed to
20 go put my boots on, which were in my room. So I was
21 going that direction anyways. But that's usually the
22 first thing I do up there when I hear there's a fire in
23 the canyon, I kind of like poke my head out, okay, I do
24 smell something, smell something up there. But it was on
25 the way to my room, going outside.

26 Q. So you said you opened the exterior door to

1 poke your head out?

2 A. Poke my head out and head to my room. And the
3 wind pulled the door out of my hand. And I kind of took
4 note of that like, okay, yeah.

5 Q. Is that -- the wind pulling that door out of
6 your hand, was that a significant event?

7 A. Yeah. Never has happened before to me up
8 there.

9 Q. How long did it take you and your men to get
10 out of the station at that point?

11 A. Four, maybe four minutes. Three, four minutes
12 reaction time. I think we even had somebody in the
13 shower. So that sucks when that happens. But usually, I
14 mean, we have -- we had guys lacing up their boots in the
15 engine. I'm looking over, they don't even have their
16 boots all the way on yet. So they were moving pretty
17 quick. Some people are half-dressed, I mean, as far as
18 their safety equipment. They might have their Nomex
19 pants on, one arm into their Nomex top, and putting on
20 their boots.

21 Q. What's Nomex?

22 A. Nomex is a protective outerwear that we use
23 while we're fighting fire.

24 Q. So you guys got up and got out very quickly?

25 A. Very quickly.

26 Q. Were on the road by 6:35?

1 A. Yeah. Yeah. And two engines. We run two
2 engines out of Jarbo Gap station, each staffed with three
3 individuals.

4 Q. What were your engine numbers that day?

5 A. 2161 and 2176.

6 MR. NOEL: Madam Foreperson, this is probably a
7 great time to break for lunch.

8 GRAND JURY FOREPERSON: Okay. Do we need to
9 admonish before lunch?

10 MR. NOEL: Sure.

11 GRAND JURY FOREPERSON: Okay. Captain
12 McKenzie, you are admonished not to discuss or disclose
13 at any time outside of this jury room the questions that
14 have been asked of you or your answers until authorized
15 by the Grand Jury or the Court. A violation of this
16 instruction on your part may be the basis for a charge
17 against you for a contempt of Court. This does not
18 preclude you from discussing your legal rights with your
19 own attorney.

20 What I have said, have just said is a warning
21 not to discuss the case with anyone except a Court, your
22 lawyer, or the district attorney.

23 THE WITNESS: Understood.

24 GRAND JURY FOREPERSON: Okay. Thank you.

25 MR. NOEL: All right. Break until 1:30.

26 GRAND JURY FOREPERSON: 1:30, yes, please.

1 (Lunch break.)
2 MR. NOEL: Back on the record.
3 Everyone's present and accounted for.
4 All right. Want to summons Captain McKenzie
5 back?
6 He's already been admonished.
7 Q. (By MR. NOEL) Captain, you're still sworn,
8 you're still under oath. You understand that?
9 A. Yes, sir yep.
10 Q. All right. When we left off at lunch, you had
11 gotten the call and you and your crew were heading out on
12 fire. You said it took you four to five minutes from
13 when you got the initial call until you guys were out the
14 door?
15 A. (Nods head.)
16 Q. Remember, you have to answer verbally.
17 A. Yes.
18 Q. So the court reporter can't take down head nods
19 or anything.
20 You said it was two engines; correct?
21 A. Yes.
22 Q. Which engine were you on?
23 A. 2161.
24 Q. And what was the other engine?
25 A. 2176.
26

1 (Grand Jury's Exhibit 120 was marked for identification.)
2
3 Q. All right. So you have a photo now in front of
4 you that is marked as People's Exhibit No. 120 for
5 identification. Do you see that photograph?
6 A. I have it, yes.
7 Q. Do you see what's depicted in that photograph?
8 A. I do.
9 Q. Is that the same photograph that's shown on the
10 big board?
11 A. It is.
12 Q. Do you recognize what's shown in that
13 photograph?
14 A. I do.
15 Q. What is shown in that photograph?
16 A. My fire station and Scooter's across the
17 street.
18 Q. Okay. Where is your fire station located?
19 A. If you're looking at the picture, it's on the
20 right-hand side, it's that group of three buildings.
21
22 (Grand Jury's Exhibit 121 was marked for identification.)
23
24 Q. So let's move on to 121. You should have that
25 photo in front of you?
26 A. I do.

1 Q. That photo should be identical to 120 with one
2 exception.

3 A. I got a pin Jarbo Gap station.

4 Q. So now we have a pin marking the Jarbo Gap Fire
5 Station?

6 A. Yes.

7 Q. So that's where you and your crew started your
8 day?

9 A. Yes.

10 Q. That's where you were cooking breakfast when
11 the alarm went off?

12 A. Yes. On the far right building would be the
13 kitchen, yeah.

14 Q. You came out of your station and what's the
15 roadway right there in the middle?

16 A. That's Highway 70.

17 Q. All right. So did you get on Highway 70?

18 A. Yeah. We have a, kind of a looping driveway,
19 kind of J-shaped driveway that heads down there. So I,
20 yeah, left the station, drove down the driveway, made a
21 right onto Highway 70.

22 Q. All right. A right takes you upcanyon?

23 A. Yes.

24

25 (Grand Jury's Exhibit 122 was marked for identification.)

26

1 Q. All right. Let's move on to the next Exhibit,
2 122.

3 Do you recognize what's depicted in Exhibit
4 122?

5 A. I do. The pin is the Jarbo Gap Fire Station
6 with Highway 70 route up towards Pulga.

7 Q. Is Pulga marked?

8 A. It is.

9 Q. How is Pulga marked?

10 A. With a red dot and the name Pulga underneath
11 it.

12 Q. So were you told in the dispatch where you were
13 going?

14 A. Camp Creek Road, I believe. And the access to
15 Camp Creek Road is in the community of Pulga.

16 Q. Is that an area you're familiar with?

17 A. Very familiar.

18 Q. How are you familiar with it?

19 A. We go down in there and probably 10, 12 times a
20 year for different things, just to visit her name's Betsy
21 down there, see how they're doing, see if they have any
22 questions for us.

23 Area orientation we go down there quite a bit.

24 We also access that area for river rescues.

25 Sandy Beach is not that far away from Pulga. It's on the
26 opposite side of the river, on the east side. So when

1 people would be injured on that side of the river, we'd
2 have to access through Pulga and then walk the railroad
3 tracks down to Sandy Beach.

4 Q. Now, you mentioned a woman named Betsy?

5 A. BetsyAnn. I forgot her last name, but she's
6 pretty much the owner of Pulga. Pulga is a community,
7 but she's, she owns all the buildings there. I don't
8 know. They sold the town not that long ago and she
9 bought it.

10 Q. She bought the entire town?

11 A. It's an old PG&E, I believe, town.

12 Q. All right. So you leave the station and you're
13 headed up the canyon past Pulga?

14 A. The destination was Pulga in my mind initially,
15 if the fire was off Camp Creek road, yes.

16 Q. Okay. So how long of a drive is that?

17 A. I'd say maybe 15 minutes.

18 Q. And how long -- well, actually I shouldn't
19 assume anything. You're in there in your fire trucks.
20 Are you just driving normally or are you responding --

21 A. Legally. I'm driving normal. The canyon
22 dictates how fast you drive, obviously. So there are
23 some areas of the canyon I can't go 65, or I can only do
24 65 for a very short time. So it's windy. And we're
25 going as fast as we can safely keep the engine on the
26 road.

1 Q. Are you running with your lights and siren on?
2 A. Lights, sirens, yes.
3 Q. Okay. So you've got all your emergency stuff
4 activated?
5 A. Yes.
6 Q. At this point in time is it light or dark?
7 A. It's pretty dark. Yeah.
8 Q. You said that when you first got the call when
9 you were in the kitchen cooking, one of the first things
10 you did was stick your head out the door to see if you
11 could smell smoke?
12 A. Yes.
13 Q. As you're driving up the canyon, do you smell
14 smoke or see any signs of fire?
15 A. No. Not until just short of Pulga.
16 Q. Where?
17 A. There's a bend in the road. It's not really --
18 can't really -- yeah, I guess right before it straightens
19 out, just after the -- well, hard to see without --
20
21 (Grand Jury's Exhibit 123 was marked for identification.)
22
23 Q. Let's move on to 123.
24 A. Okay.
25 Q. That may make it a little easier.
26 A. Well, 123 is showing kind of the Pulga and the

1 access road to Pulga and Camp Creek. It would be -- so
2 at the Y -- you see the white line that depicts Pulga
3 Road and the yellow line that depicts Highway 70. At
4 that Y it would be back towards the station a little
5 ways.

6 On 122, there's a bend in, there's a bend on
7 the mountain and it straightens out and goes into Pulga.
8 Correct.

9 Q. Right here?

10 A. Right around back there. Right around in
11 there. That's kind of where -- my firefighter was in the
12 backseat and he said, "Oh," blank, "I see it." Because
13 we hadn't seen or smelled anything. And I was paying
14 attention to the road. I had to kind of look down and
15 look up and then I saw it.

16 Q. Right as you come around that bend here --

17 A. Yep. Yep.

18 Q. -- coming around the mountain, that's where
19 from Highway 70, the Highway 70 bridge first comes into
20 view?

21 A. The Pulga Bridge, yeah.

22 Q. The Pulga Bridge?

23 A. Uh-huh.

24 Q. Is that about the area?

25 A. That's about right, yeah.

26 Q. You said you're driving?

1 A. I'm driving.

2 Q. The captain; right?

3 A. Yep.

4 Q. So one of the firefighters in the back of the
5 truck spots the fire and points it out?

6 A. Yeah, rear passenger seat. As I was making
7 that turn, he's got a pretty good view looking off to the
8 right, and he saw it. The front seat firefighter's
9 buried in maps, so he's not even looking at the road or
10 anything. He's looking at -- I said get up -- pull up
11 Pulga and get it in front of you. We have route-in maps.
12 And he's looking at maps. So the rear seat firefighter
13 saw it first, before I did.

14 Q. All right. Back to 123. Tell us what we're
15 looking at in this map.

16 A. So it's the access to Pulga Road just before
17 Pulga Bridge. Or I'm -- the access to Pulga, being Pulga
18 Road, just before Pulga Bridge. And just a little
19 further up from that it looks like that's Four Trees Road
20 on the right, that white line that goes off on the right.

21 Q. This one right here?

22 A. Yep. That's Four Trees Road. Just past Four
23 Trees Road would be the Cal Trans yard.

24 Q. Okay. So down here the white line represents
25 Pulga Road?

26 A. Correct.

1 Q. And Pulga Road comes off Highway 70 right
2 before the Pulga Bridge?

3 A. Directly at the bridge, yeah. Right as the
4 bridge railings start, Pulga Road takes off to the left
5 if you're going upcanyon.

6
7 (Grand Jury's Exhibit 124 was marked for identification.)

8
9 Q. So now we have 124 up there. Should be
10 identical to 123.

11 A. Yeah, the only difference being it's showing --
12 I'm not exactly sure -- what does the I-S stand for?

13 Q. Intersection.

14 A. So that shows -- the only thing different is
15 the pin showing the intersection of Pulga Road and
16 Highway 70.

17 Q. All right. So now that intersection is clearly
18 marked.

19
20 (Grand Jury's Exhibit 125 was marked for identification.)

21
22 Q. Let's go on to 125. Do you recognize what's
23 depicted in the photograph 125?

24 A. Yes. That's the access to Pulga, being that is
25 Pulga Road.

26 Q. Okay. So we're seeing something about a split

1 in the road. The road going off and onto the bridge here
2 to the right would be --

3 A. Highway 70.

4 Q. And the road splitting off here on the left of
5 the photograph?

6 A. Pulga Road.

7 Q. Is Pulga Road.

8 Okay. So as you're going around the bend, your
9 firefighter spots the fire and points it out to you?

10 A. (Nods head.)

11 Q. Where do you see fire initially?

12 A. I see a glow, and it's hard to tell exactly
13 where. I actually thought it may be on the east side of
14 the road. And it's kind of difficult up there. Highway
15 -- they'll tell us eastbound Highway 70, because if you
16 do look at Highway 70 when you get up in the mountains,
17 it predominately goes east. But to me, growing up in
18 Oroville, Highway 70 runs north and south to me. But I
19 thought it was on the east side of the road.

20 Q. So the east side, for instance, on this
21 photograph marked 125 would be to the right; correct?

22 A. To the right. Yes, on the right side of the
23 river instead of left side of the river. I thought it
24 was -- just kind of the way it was lining up with the
25 shoulder of the mountain that comes down there, I believe
26 that's the shoulder of Big Bar Mountain, that kind of

1 comes down, and then the mountains off in the back, I
2 couldn't exactly tell which side of the river it was on
3 until I got pretty much onto the bridge.

4 Q. Okay. And that's this bridge right here?

5 A. Yes.

6 Q. That's the Pulga Bridge?

7 A. That's the Pulga Bridge.

8 Q. What's down below the Pulga Bridge?

9 A. The Feather River. And there's, underneath
10 that there's a train bridge. The train runs along
11 Highway 70 as well.

12 Q. So you said you couldn't really tell which side
13 of the river or which side of the road the fire was on
14 until you got onto the bridge?

15 A. Uh-huh.

16 Q. Tell us what you did.

17 A. So I got onto the bridge and slowed down. If
18 it was on Camp Creek Road, I knew I couldn't, I couldn't
19 access it on Camp Creek Road. The only option would be
20 to leave the area, go all the way up top Concow Road, and
21 come in Dixie Mountain from the top. Obviously knowing
22 what we know now, that would have been impossible. There
23 wouldn't have been enough time to do that.

24 Q. So it's -- stop you right there. Why couldn't
25 you access on Camp Creek?

26 A. So Camp Creek Road has been washed out,

1 semi-washed out in many places; lots of rock slides, and
2 it's pretty rough. ATVs, smaller vehicles, Jeeps and
3 such could get up there. Utility vehicles, they could.
4 But with a fire engine, I've been up that road four or
5 five times in a fire engine in the past, and I'd make my
6 crew get out, fold my mirrors in, and prop my door open
7 in case I start to go down by the river, I could bail
8 out. They're out in front of me doing this: "Go, back
9 up, two or three inches on the right side." That's two
10 or three inches you're going to start going, you're going
11 to hit the railroad tracks or go into the river. And
12 you've got to fold the mirrors in because the rock wall
13 comes out in so many places that you can't avoid it or
14 else you'll roll over. So you've got to fold the mirror
15 in and cross your fingers. And there's no place to turn
16 around. So if you do get in a bad spot, you have to back
17 -- what you just went forward, you have to back down
18 that.

19 Q. As a fire captain, what do you consider getting
20 into a bad spot?

21 A. You never should do a frontal assault on a fire
22 unless you have all your ducks in a row. That being you
23 have aerial assets that are, that can save you; have a
24 way out, you have an escape route; or you have a
25 temporary refuge area that you can escape to and survive
26 without using your fire shelter.

1 So that would have been a frontal assault on
2 this fire with no place to turn around and no safety
3 zones, nothing. So we wouldn't have been able to back
4 out fast enough if we were going to get chased by the
5 fire. So we would have been on foot, with our fire
6 shelters, running and abandoning the engine. Then the
7 engine would block up the road for whatever else, smaller
8 vehicles could get up there.

9 So all around it's a -- when I first started up
10 there, I would go, I would take -- I would take the guys
11 up there on area orientation, and we'd take a utility
12 vehicle with us, we'd park the engine in the community of
13 Pulga, all hop in the pickup, and I'd take them up Camp
14 Creek Road to the actual Camp Creek. And it's even
15 sketchy in a truck, small truck. But I want to impress
16 upon them that if you're with another operator, encourage
17 them not to take this road. I want you to see how bad it
18 is so that you don't, so that you can talk somebody out
19 of it. Because you get these gung ho people that are
20 straight out of the academy, "I can make it. I can do
21 it." Well, you can try and then you're going to screw up
22 in a big way and there's no taking it back. So yeah.

23 Q. You might make it in, but you might not be able
24 to get out?

25 A. You might not be able to get out.

26 The last time it took me about an hour to go a

1 mile, then we finally called it quits. There was one
2 wide spot I found, and the chief came and picked me up.
3 It was for a lightning-struck tree, but it was raining.
4 Battalion Chief, actually Chief Joe Tapia picked me up.
5 And another four miles up that road we found the tree and
6 decided to come back. And the volunteers -- it's an
7 F-550 type 6 pickup pumper -- we downstaffed the engine
8 the next morning and took that up there because it could
9 access it at the time. Then the road got worse. That
10 was years ago.

11 Q. Well, isn't the river right there?

12 A. It gets close to the river in some spots, then
13 others it's quite a ways above the river.

14 Q. So it would be quite a bit of a run or a hike
15 if you had to get out quick --

16 A. Yes.

17 Q. -- to the safety of the road?

18 A. Yeah.

19 Q. So when you, when you got out in the middle of
20 the bridge, what did you see?

21 A. I could kind of get a better idea of where it
22 was. Now I'm sure I can't make it, I can't drive to it.
23 So now I need to see exactly what, exactly where it is
24 and exactly what it's doing. So I wanted to get parallel
25 to it. So I drove up Highway 70 to the Poe Dam.

26 Q. Okay. So from the bridge you could tell that

1 the, that the fire was on the Camp Creek side of the
2 river?

3 A. Yes.

4 Q. Okay. So you know at that point you're not
5 going to be able to get to it?

6 A. Yep. So the options going through my head is
7 either do a long hose lay up Camp Creek Road. Once
8 again, we're doing a frontal assault on a fire that has
9 no anchor point. Don't even have enough hose to do it,
10 or water. And I know I can't park across the highway and
11 swim across the river with my hose and start a hose lay.
12 It was just, it was just absolutely in the worst possible
13 spot because there's just no access. And you're looking
14 at it from here to the door, it's, "Oh, I can't get to
15 it." Not from here to the doors, but it's across the
16 river and you're just -- and you can't do anything. If
17 it was a creek you might be able to do something, but
18 it's a river and you can't do a hose lay across a river.

19 Q. Were you able to determine from the bridge
20 where the fire was in relation to the community of Pulga?

21 A. Not really from the bridge. I mean, I had an
22 idea that it was, that was probably going to be the first
23 thing that was impacted by this fire based on the way I
24 could see the wind was blowing. The column was not -- I
25 couldn't see the wind blowing, obviously -- the column,
26 which way the smoke column was laying over or heading.

1 But it was pretty evident when I got to the fire, and I
2 could put myself right where it is and kind of look where
3 it's going. And then I knew it was headed towards Pulga
4 first, then Concow.

5 Q. Okay. So you said you next went to the Cal
6 Trans yard?

7 A. Yeah, we kind of moved up to the Cal Trans
8 yard.

9

10 (Grand Jury's Exhibit 126 was marked for identification.)

11

12 Q. Let me stop you. We've got up in front of us
13 Exhibit 126.

14 A. Okay.

15 Q. Is that the exhibit you have in your hand?

16 A. I do. I have 126. And it shows the Cal Trans
17 yard and Camp Creek Road across the other -- well, Pulga,
18 shown at Pulga Road, but I know it as Camp Creek Road.

19

20 (Grand Jury's Exhibit 127 was marked for identification.)

21

22 Q. Okay. So let's go on to 127. You have 127 in
23 front of you?

24 A. I have it.

25 Q. What's the difference between 126 and 127?

26 A. It's pinned with the name of the Cal Trans

1 Pulga station.

2 Q. All right. So the location of the Cal Trans
3 Pulga station is now marked?

4 A. Yes.

5 Q. All right. So we've got the yellow line here
6 is representing Highway 70?

7 A. Yes.

8 Q. And this white line on the other side -- well,
9 back up. Down here, you really can't see it, running
10 parallel to Highway 70, what is that?

11 A. I'm sorry? Where are you?

12 Q. Right in here.

13 A. Sandy Beach is down there.

14 Q. But in general, this whole area between Highway
15 70 -- well, what are these things?

16 A. Those the railroad tracks.

17 Q. What is this running between Highway 70 and the
18 railroad tracks?

19 A. The river.

20 Q. That's the Feather River. Then on the other
21 side above the railroad tracks there's the white line?

22 A. Yes. That's shown here as Pulga Road.

23 Q. Okay. And what is this area over here in the
24 middle left-hand side?

25 A. That is the actual community of Pulga.

26 Q. Okay. So this little cluttering of buildings

1 is actually what is known as Pulga?

2 A. Yes.

3 Q. All right. So you said that you slowed down on
4 the bridge to take a look at the fire, and then you
5 finished crossing the bridge and you went up past the Cal
6 Trans station?

7 A. Yeah.

8 Q. Tell us why.

9 A. So I slowed down at the Cal Trans station just
10 to kind of -- I didn't know if that was going to be the
11 best vantage point. I slowed down briefly and then I
12 continued up, up to Poe Dam to get a better look at it.

13

14 (Grand Jury's Exhibit 128 was marked for identification.)

15

16 Q. Let's move on to 128.

17 Do you recognize what's depicted in the
18 photograph marked 128?

19 A. I do, yes. Sorry. It's directly in front of
20 the -- this looks like it's taken from Highway 70,
21 standing on Highway 70. And it's of the, in front of the
22 gates of the Pulga Cal Trans yard. This would be the
23 turnout from the west side of the highway.

24 Q. Okay. And is this photograph looking somewhat
25 in the direction of the fire?

26 A. It is, yes.

1 Q. Now, you said you went through, past the Cal
2 Trans station to where?

3 A. Poe Dam.

4 Q. And where is Poe Dam?

5 A. It's just above -- I don't know in miles or
6 feet -- just above the Cal Trans Pulga station.

7 Q. Why did you go to the Poe Dam?

8 A. That's where it looked like it was across from.
9 It looked like the fire was on the other side of the Poe
10 Dam. I wanted to get directly across from it to see
11 it --

12 Q. Okay.

13 A. -- to give a better report.

14 Q. What did you see when you reached the Poe Dam?

15 A. When I reached the Poe Dam, I opened the door
16 and stepped out and kind of looked up, and I saw -- well,
17 I called it ten acres, and I noticed it had the wind that
18 was on -- it was not the wind we had at the station,
19 which probably the reason why I didn't smell it or see it
20 or whatever, smell it, it was more of a kind of a north,
21 north wind, like pushing towards the lake. And at the
22 station it was right in our face.

23 So, yeah, I just, I saw that it was burning in
24 the maintained vegetation underneath the transmission
25 lines. And it hadn't really gone into the timber yet.
26 And it was just starting to get into some brush on the

1 lower side of it. I couldn't see the upper side of the
2 fire. I could see the glow, but it was kind of behind
3 the hill. I could see the flank that was making its way
4 towards me, towards the river. And it was starting to
5 pick up in intensity.

6 Q. So you're on the other side of the river and
7 the other side of the highway at this point. You said
8 you can't fight the fire from where you're at, so what
9 did you do from there?

10 A. Made the decision that the immediate threat
11 would be the community of Pulga. Pulga can have fifty in
12 it and it can have four people in it, or one. And just
13 so happened that morning it was four people in it. Betsy
14 runs -- she has a -- yoga tents, or yoga huts, and a lot
15 of artists go up there to be inspired. It's a little
16 commune you could call it. And sometimes she has a lot
17 of people and other times she doesn't.

18 This time, like I said, there was only four.
19 So, yeah, I told my second engine, Engine 2176, Engineer
20 Lozano, I said, "Get into Pulga and evacuate."

21 He said, "Okay," turned around, and that's
22 where he headed.

23 Q. What did you do while he was going in to
24 evacuate Pulga?

25 A. I ordered resources.

26 Q. All right. Now, did you have a phone with you

1 that morning?

2 A. I did.

3 Q. A Smartphone?

4 A. Uh-huh.

5 Q. Did you have capability of taking pictures?

6 A. Yep. And I did that.

7 Q. Did you snap any pictures of the fire?

8 A. I snapped one through the windshield and then
9 made my report on conditions.

10

11 (Grand Jury's Exhibit 1 was marked for identification.)

12

13 Q. Next you should have in front of you what's
14 been marked as Exhibit No. 1.

15 Do you see Exhibit No. 1?

16 A. I do. I see it.

17 Q. Do you recognize Exhibit No. 1?

18 A. Yes. It's my photograph I took.

19 Q. And that's the same photograph being shown on
20 the big board?

21 A. Yes.

22 Q. And you said this is the photograph that you
23 took?

24 A. This is the photograph I took out of the front
25 windshield of the engine.

26 Q. What does this photo depict?

1 A. This is what I, what I saw when I got to the
2 Poe Dam. This is what I was looking at and what I told
3 ECC I was looking at, our command center. It depicts the
4 fire underneath the transmission tower and the downhill
5 flank, the flank closest to the Feather River, the
6 backing flank.

7 Q. Okay. So is this what you're referring to,
8 this bright yellow --

9 A. Yes.

10 Q. -- semicircular? That, you term that as the
11 flanking fire?

12 A. Yes. That was the one that was backing towards
13 the river. The smoke column -- doesn't really show how
14 windy it was. A couple of the tops of the trees do. But
15 the smoke column itself doesn't really show how strong
16 the wind was.

17 Q. And you said you were shooting this through the
18 windshield of your fire truck?

19 A. Yeah. There's actually a glare down below.
20 Yeah, that's actually off the windshield. A lot of
21 people think that's a spot fire. It's not. It's a glare
22 off the windshield.

23 Q. All right. You said that the next thing you
24 did was after sending the other engine to evacuate Pulga
25 was to order resources?

26 A. Yes.

1 Q. Describe what you mean by that.

2 A. I need more equipment. So the equipment I need
3 is above and beyond the dispatch, what I was given during
4 the dispatch. It's called "augmentation." When you ask
5 for an augmentation of resources, you're trying to paint
6 a picture of how bad you actually think it will be. So I
7 think I requested 15 engines, but my resource request has
8 to be, it has to be obtainable -- attainable. So, I
9 mean, like I'm, obviously I knew it was going to be a big
10 fire. I can't say I need 300 fire engines. That's not
11 realistic. That can send people into a tailspin. But I
12 wanted 15 engines because I wanted to stop this on Concow
13 Road. My resource order was designed to get enough
14 resources to stop it before it hit the community of
15 Concow. I knew we weren't going to stop it before it hit
16 Pulga.

17
18 (Grand Jury's Exhibit 130 was marked for identification.)

19
20 (Grand Jury's Exhibit 131 was marked for identification.)

21
22 Q. So in front of you you have two CDs?

23 A. Okay.

24 Q. 130 and 131?

25 A. Yes.

26 Q. I'll play for you 130, and listen to it, then

1 you can come back and tell us what it is.

2 (CD plays.)

3 Q. (By MR. NOEL) Okay. That was 130. Whose
4 voice are we hearing?

5 A. That's me.

6 Q. And who are you talking to?

7 A. The Oroville Dispatch ECC, Oroville ECC.

8 Q. And what are you doing in this first
9 transmission?

10 A. Trying to paint a picture to them what I'm
11 looking at. A report on conditions is the, just that,
12 it's giving an idea of the responding resources what
13 you're looking at. Kind of just breaking it down for
14 them. That's your initial "here's what I have," and
15 based on my report they should be getting ready for a
16 resource order.

17 Q. So at one point during your transmission you
18 said the wind is approximately 35 miles an hour?

19 A. I would say, yeah, it was a sustained, just a
20 hard -- not a gusty wind like the canyon wind normally
21 is. It was just a hard, sustained push. It was probably
22 more than that, but I didn't want to, I didn't want to
23 overdo it or underdo it. Kind of like acreage. Call it
24 ten acres, then, "Oh, it was contained to 2 acres." Lost
25 your cool. No, but I knew it was a strong wind, I didn't
26 know exactly, I didn't have a wind gauge out.

1 Q. That's the next question, how did you come up
2 with 35 miles an hour?

3 A. Just working in the canyon for years and
4 knowing my fire weather, and pretty -- I have a pretty
5 good idea of what a sustained 35 mile-an-hour wind is,
6 what it felt like to me.

7 Q. Let's listen to 131.

8 (CD plays.)

9 Q. So you said, "This has the potential of a major
10 incident"?

11 A. Yes.

12 Q. Did you have any idea how major that was going
13 to become?

14 A. No. I knew it was going, I knew it was heading
15 for my community that I, that we protect up there. I
16 knew that was a fact. It was going to get at least to
17 there. I didn't really expect it to jump the West
18 Branch.

19 Q. So once you're in there and you're in place,
20 what is your role?

21 A. So initial attack incident commander, my role
22 is to come up with a plan of what resources we need and
23 where we're going to try and stop it, and get that
24 message out. It's also to order evacuations and
25 resources to do evacuations if I felt it's necessary;
26 which I did for the community of Pulga, ordered

1 evaluations for that. Which we evacuated ourselves, so
2 when BCSO officers got there, they immediately went into
3 Concow.

4 Yeah, my role is to brief -- first of all,
5 safety, brief my people on what the overall plan is, what
6 we're going to do, get the resources to do it, come up
7 with the plan on how we're going to get it done, and
8 start installing those resources into those positions
9 that I want.

10 Q. All right. So after -- once you got Pulga
11 evacuated, you placed your resource order, now what are
12 you going, what are you doing?

13 A. The -- I went back, I went down into Pulga. I
14 turned around and followed my other engine down into
15 Pulga and briefed them.

16 I can't -- I really should have, should
17 remember how long it, how long it is between -- what's
18 the distance between the actual origin and Pulga, the
19 community itself. I don't know if you have those
20 figures. But by the time I got down into Pulga, the fire
21 was just above it. It had spotted over, and there was
22 just fire everywhere above Pulga. So I briefed my
23 engineer quickly. I said, "There's a railroad sighting
24 down by the river, it's wide, there's water. If you get
25 in trouble, go there, back everybody up to the river and
26 get in it if you have to, but that's how you're going to

1 stay safe." And I got out of the community of Pulga and
2 got onto the bridge and acted as a lookout for him down
3 in there.

4 They started firing out around the buildings.
5 "Firing out," I mean they're taking their drip torches
6 and they're starting a fire down in Pulga to meet with
7 the fire that's just above Pulga. And it didn't take
8 long.

9 Q. I want to get to that in just a second, but you
10 used a term I want to get defined before we put out. You
11 said that "fire was spotting."

12 A. Correct. So the main fire couldn't -- after
13 about 30 minutes, I couldn't tell what was the main fire
14 and what was spot fire. There was fire everywhere. So a
15 spot fire, yeah, you just -- if you see a fire detached
16 from the rest of the main fire, that's a spot fire. And
17 it was throwing spots out ahead of itself everywhere.
18 There was no real clear direction on where it was
19 throwing spots because there was some way off to the
20 side, not in line. So the wind kind of eddies when it
21 gets around certain parts of the canyon, and it was just
22 throwing spots everywhere.

23 Q. Right here is actually where I think Flea
24 Canyon starts coming into the Feather River Canyon;
25 correct?

26 A. Yes. Yes.

1 Q. Kind of wreaks havoc with the winds?

2 A. It does.

3 Q. And so just for the record, as you were
4 describing the fire throwing out spots in front of it,
5 you were using your hands to throw things off in all
6 directions?

7 A. Yeah. It just seemed like -- normally a
8 wind-driven fire like that, you'll see spots just
9 directly out in front of it, just directly. And these
10 were everywhere. There were a couple here, couple there.
11 And they were picking up in intensity, and they were
12 burning together, and they were throwing spot fires. So
13 it was just --

14 Q. What is it that's actually being thrown causing
15 the spot fires?

16 A. So the brush, the brush, as it's consumed, the
17 trees are, as they're consumed, a lot of -- actually bark
18 will do it, but mostly leaves, leaves off the brush.

19 Q. All right. Now, you were talking about having
20 your firefighters use drip torches to start fires down in
21 Pulga?

22 A. Yeah.

23 Q. Can you explain that to us?

24 A. A small can of fuel, it's a 2 to 1 diesel to
25 gas mix, with a wick. And the wick just burns. And then
26 when you want, when you want to put fire on the ground,

1 fuel comes from the spout, hits the wick, ignites, and
2 goes onto the ground. So it's -- yeah, it's just a small
3 can of fuel; three gallons.

4 Q. So why would you want to light these fires?

5 A. So, to remove the vegetation in our way; we can
6 handle it. It's not Mother Nature coming at us with all
7 the wind and the fire. It's us putting fire on the
8 ground in a favorable sense. So we have a control line
9 right here, being the houses or our tools or our wet
10 line, our hose, and we start a fire, and we let it go
11 towards the main fire. So it's consuming the vegetation
12 before the main fire gets to us, so it doesn't come and
13 hit us with a head of steam. It's coming fast and then
14 it hits burned vegetation, and that's it.

15 Q. It has no fuel?

16 A. No fuel. Try and remove the fuel before the
17 main fire gets there.

18 Q. So, in essence, you're fighting fire with fire?

19 A. Correct.

20 Q. So you had firefighters down in Pulga lighting
21 their own fires to protect the community?

22 A. Yes. Two drip torches that, we carry two drip
23 torches on the engines. So two drip torches, and the
24 rest would be, we call them Fusees, or essentially a road
25 flare. They're longer road flares. They're made for
26 fires. You can actually stick them together, they have

1 little sleeves that you can stick them together so you're
2 not bending over.

3 Q. How long did your people stay in Pulga?

4 A. Time kind of flew out the window. I'm sorry,
5 at a certain point it was just couldn't really have a
6 concept of time. Six hours, seven hours. We got stuck
7 in there.

8 Pulga Road kept -- the fire had burned along
9 the top of Pulga Road, and you could see in some of the
10 other exhibits how steep it was at that road. So when
11 the vegetation burns, there's nothing holding the rocks
12 in place. And the rocks came down.

13 So those guys got trapped in there several
14 different times with rock falls. And I had to drive over
15 to the Cal Trans yard in Pulga across the -- not in
16 Pulga, the Pulga Cal Trans yard off Highway 70. And the
17 supervisor there, Clay Hemstalk, was able to jump in a
18 loader and open that road up for us several times,
19 because it just kept, kept collapsing. And we didn't
20 have any Cal Fire resources as far as dozers that could
21 come up and do anything with that. So it was perfect.
22 They would have been in there all day, all night, the
23 next night if that, we didn't have that resource to open
24 that road.

25 Q. It's not very often that you're able to say
26 thank God for Cal Trans?

1 A. I was pretty happy there.

2 MR. NOEL: All right. Can you think of
3 anything else?

4 I don't believe we have anything further of
5 this witness.

6 If Madam Foreperson or the jurors have any
7 questions?

8 Q. (By MR. NOEL) In your professional experience
9 -- I think you said you've been a full-time paid
10 firefighter for 21 years now?

11 A. Uh-huh. Yes.

12 Q. And before that you were a volunteer?

13 A. Correct.

14 Q. For four years I think you said?

15 A. Uh-huh.

16 Q. I think you said you started, started with fire
17 service in 1994; correct?

18 A. Yeah, 18 years old.

19 Q. And you've been at the Jarbo station now for
20 five years?

21 A. Yes, five years.

22 Q. And even before that, being here in Butte
23 County fighting fires up in the canyon the entire time?

24 A. Yes.

25 Q. In your professional experience, have you ever
26 experienced a fire expanding or moving as fast as the

1 Camp Fire did on November 8th?

2 A. Never.

3 MR. NOEL: Any further questions?

4 MR. FOGG: Marc, one more.

5 MR. NOEL: One more.

6 Q. (By MR. NOEL) Okay. You talked somewhat
7 during your testimony about summer-winter fire season.

8 A. Uh-huh.

9 Q. Especially you were talking about when you were
10 a, working out of class as a captain, you'd be a captain
11 during the summer fire season and an engineer the rest of
12 the year?

13 A. Yeah.

14 Q. Can you specify the dates of, for the fire
15 seasons?

16 A. For what, fire seasons I was a captain?

17 Q. No, just the, I think in general when the fire
18 season starts, when it ends, what would be considered
19 fire season, as opposed to --

20 A. That's a hard one. From when I started, it was
21 pretty much peak would be July, but I mean we'd start
22 having fires in late May, June would be fire season, then
23 late October it would be over. And now it's -- geez,
24 we've been staffing up in April. We just started
25 staffing last week. Hired our first round of
26 firefighters. We've had escape control burns in Feather

1 Falls last week, two of them. So it's started, it's
2 here. So April. Now, I mean. And what was it last,
3 year before last we went until January. So ordinarily
4 June 1st, middle of November, roughly.

5 Q. Would it be safe to say that a lot of it's
6 based upon meteorological factors?

7 A. Yeah, depending upon how much you believe in
8 the drought and global warming, or if you believe we've
9 just been in an abnormal pattern and we're getting back
10 to normal, you know. There's different schools of
11 thought. But definitely the weather, I can certainly
12 tell a difference from when I first started. It is
13 dryer, it is hotter, and it gets that way quicker than it
14 ever has before.

15 MR. NOEL: Anything further?

16 I believe that's it for this witness right now.
17

18 EXAMINATION
19

20 BY MS. RICHARDS

21 Q. Captain McKenzie, you earlier testified about
22 Exhibits 130 and 131, which were recordings. Were the
23 recordings of your voice?

24 A. Yes.

25 Q. Okay. And did you, were those recordings made
26 while you were approaching the fire?

1 A. Yes. Approaching or looking at. There's a
2 combination of the two.

3 Q. Okay. And, and were those recordings an
4 accurate recording of your voice?

5 A. Yes.

6 Q. And did you make those statements as part of
7 your response to the fire?

8 A. Yeah. Yes, it's a standard practice to as soon
9 as you have eyes on it to let them know what you're
10 looking at and make your resource order, if you need to
11 make a resource order. So that's standard.

12 MS. RICHARDS: Okay. Thank you.

13

14 EXAMINATION

15

16 BY MR. NOEL

17 Q. Those recordings, those were off the Cal Fire
18 radio network?

19 A. Our dispatch center, yes.

20 Q. And all radio communications between
21 firefighters in the field and the dispatch center are
22 recorded?

23 A. They are, on local Butte support, I believe.
24 I'm not sure what else they can record, if they can
25 record our TACNETs or not.

26 TACNET would be a line of sight tactical net.

1 So I don't think they would pick up any of our tactical
2 frequencies from our command center being so far down in
3 the valley. Plus the canyon doesn't offer a lot of good
4 communication. We have a hard time hitting our
5 repeaters.

6 So I'm down in a hole, and I have to hit a
7 repeater, which was tone 13, which was on Bloomer
8 Mountain, or tone 11, which is Bald Mountain in Stirling
9 City above Magalia in Paradise. So those are my two tone
10 options to hit a repeater so they can hear me down in the
11 canyon. And it's just, it's hit or miss whether you're
12 going to get either one of them.

13 I was very happy my report was able to get out,
14 because I hit the mic -- and you're listening for a click
15 back. That means the repeater opened up, got your
16 message, then it closed. If you hear a click back, you
17 know you got a repeater.

18 So a lot of times if you hear these recordings,
19 you'll hear somebody key the mic once or twice -- click,
20 click, click, click. They're trying to find out if they
21 have a clear line of communication so they can start
22 talking.

23 To get on there and give a gigantic speech of
24 what you want, then it falls on deaf ears because it
25 never gets out is very frustrating. So you have to make
26 sure you have a communication line open.

1 Tactically, I don't think they can hear any of
2 our tactical frequencies, line of sight. I could be
3 wrong.

4 Q. All right. Thank you.

5 A. No problem.

6 Q. Thank you.

7 Any others?

8 All right. I think we can admonish the
9 captain.

10 GRAND JURY FOREPERSON: We have done that. You
11 want it done again?

12 MR. NOEL: Sure. We can't admonish too many
13 times.

14 GRAND JURY FOREPERSON: Okay.

15 Okay. You are admonished not to discuss or
16 disclose at any time outside of this jury room the
17 questions that have been asked of you or your answers
18 until authorized by this Grand Jury or the Court.

19 A violation of these instructions on your part
20 may be the basis for a charge against you of contempt of
21 Court. This does not preclude you from discussing your
22 legal rights with your own attorney.

23 Captain McKenzie, what I have said, just said
24 is a warning not to discuss the case with anyone except
25 the Court, your lawyer, or the district attorney.

26 THE WITNESS: Yes, ma'am. Understood.

1 GRAND JURY FOREPERSON: Okay. Thank you.
2 THE WITNESS: Thank you.
3 MR. NOEL: All right. You're excused.
4 THE WITNESS: Thank you.
5 [DISCUSSION OMITTED.]
6 GRAND JURY FOREPERSON: Would you stand, raise
7 your right hand, please.
8 CHIEF DAVID HAWKS: Yes.
9 (GRAND JURY FOREPERSON swears in witness.)
10
11 CHIEF DAVID HAWKS
12 having been called as a witness in
13 the matter now pending, having been first
14 duly sworn, testifies as follows:
15
16 THE WITNESS: Yes, Your Honor.
17 GRAND JURY FOREPERSON: Have a seat, please.
18
19 EXAMINATION
20
21 BY MR. NOEL
22 Q. State your full name, please.
23 A. David Hawks.
24 Q. By whom are you employed, Chief?
25 A. With Cal Fire.
26 Q. In what capacity?

1 A. Currently I am the Butte Unit Cal Fire Chief
2 and Butte County Fire Chief.

3 Q. How long have you been with Cal Fire?

4 A. I started right out of high school in 1984.
5 This will be my 36th fire season. I have 30 total years
6 of service with the department.

7 Q. What jobs have you done during your career with
8 Cal Fire?

9 A. I started off as a seasonal firefighter in the
10 Auburn area, in the Nevada-Yuba-Placer Unit.

11 Promoted in 1990 -- no, excuse me, 1988 to
12 engineer, seasonal engineer, with Cal Fire at the
13 Tuolumne Calaveras Unit down there in Sonora. Spent two
14 years in that unit, transferred back to Butte County as a
15 seasonal engineer.

16 Then in 1994 made permanent engineer with Cal
17 Fire back in the Grass Valley area.

18 Promoted to captain back in Butte County back
19 in 1998. And then to battalion chief 2006 here in Butte
20 County in our Emergency Dispatch Center. Transferred to
21 the field operations battalion in 2011. And then
22 promoted to division chief in the north half operations
23 of Butte Unit, including the town of Paradise where I was
24 a fire chief at the time of the Camp Fire. As a contract
25 -- Town of Paradise contracts with Cal Fire for fire
26 protection services. Then in January 7th of this year I

1 promoted to the unit chief.

2 Q. So on November 8th, 2018, you were in charge of
3 the north division of the county, including the, being
4 the fire chief in Paradise?

5 A. Yes.

6 Q. What experience and training do you have as a
7 firefighter in fire behavior?

8 A. Well, I -- early on in my career, one of the
9 required classes is for us to attend Intermediate Fire
10 Behavior, class known as S290. I attended that when I
11 was an engineer in probably 1995. And then took Advanced
12 Fire Behavior, S490, 491, which is -- I'm trying to
13 remember the names of them now, it's been several years.
14 But I've had three classes related to fire behavior and,
15 of course, many, many years on the ground observing fire
16 behavior, and that's where you can put all the pieces
17 together. Fire is a science. Like any other science, it
18 reacts based on factors and conditions. And those
19 conditions vary over time and vary over the course of any
20 given day.

21 Q. In 36 years of fire service do you have any
22 idea or any estimate as to how many wildfires you've
23 fought?

24 A. I don't. I would only estimate maybe a
25 thousand. I really don't know, to be honest with you.
26 In varying sizes, of course. Many of them, most of them

1 small fires, easily and quickly extinguished by
2 firefighter resources. But it would be, that would be
3 ust a guess.

4 Q. So on November 8th you were the fire chief of
5 Paradise?

6 A. Yes. Again, under contract with Cal Fire.

7 Q. Were you scheduled to be on duty on November
8 8th?

9 A. No. I had just completed my duty assignment,
10 was scheduled to be off duty, but told my peers that I
11 would be available, knowing the circumstances we were
12 facing with the wind.

13 Q. What circumstances were those?

14 A. Well, we were late in the fall, you know, at
15 the time when fuels have been drying in the hot summer
16 sun all year. And we had a very strong north wind event,
17 which is common in California, in northern California, of
18 course, in the spring period that we're going into now
19 and also in the fall. I knew that -- we knew that
20 conditions were, were such that we could have a major
21 fire in northern California. And as an agency, we had
22 staffed up to try and prepare and respond to that. So I,
23 knowing all of those factors, had told my peers who were
24 on duty that if something occurred, I would be available
25 to call back.

26 Q. All right. So I want to talk to you a little

1 bit about fire behavior. Can you describe for us briefly
2 what factors affect fire behavior?

3 A. Fire behavior -- like I said before, fire is a
4 science. It's driven by varying factors who have, all
5 who have varying forces on the direction and rate of
6 spread of the fire. The broad categories that we term
7 "fire behavior factors" are topography, weather, and
8 fuels. And you see those on the screen up there. And I
9 might add -- well, he'll talk more about that. But fuels
10 are anything that will burn, frankly, but we typically
11 think of them as forest fuels.

12 Q. Let's start with topography. Talk to us about
13 the topography in Butte County and specifically the
14 Feather River Canyon.

15 A. So Butte County is kind of at the northern
16 extent of the Sierra Nevadas and southern extent of the
17 Cascade Range. Many large and significant drainages,
18 river drainages, of which we're all very familiar that
19 the Feather River is the most extensive drainage in Butte
20 County and culminates in Lake Oroville.

21 This particular drainage is the North Fork of
22 the Feather River drainage. It's a very, very long
23 drainage that starts in northeastern, the desert area of
24 the northeastern California and the Reno, north of Reno,
25 that area. And it culminates in the Sacramento Valley,
26 at Lake Oroville, and the city of Oroville.

1 That drainage, because of its magnitude and
2 size, is very prone to daily, daily wind occurrences that
3 move up and down the drainage. We'll talk more about
4 that I'm sure.

5 Q. So you said earlier that you had told your
6 peers that you'd be available because of the
7 circumstances of that day, but you said also that wind is
8 a daily thing in the Feather River drainage. Why was
9 this day so special?

10 A. So when we get to weather that will probably be
11 covered, too, but I think that the wind on a daily, daily
12 basis, when you have heating in the Sacramento Valley and
13 the foothills, that wind travels up that drainage and out
14 to the desert. As the hot air rises in the desert, it
15 pulls that wind from the Sacramento Valley up that
16 drainage to the desert in eastern California, the Reno
17 area. Then at night, as the desert cools much quickly
18 than the foothills, that cold air rises and flows down
19 the Feather River drainage into the valley, in the
20 Sacramento Valley. That's what we know as diurnal wind
21 pattern, daily wind patterns, under normal daily heating
22 and cooling.

23 This particular wind was what's known as a
24 "gradient" or a "flowing" wind. It's similar to Santa
25 Ana winds in southern California and the north winds in
26 northern California. It is an overriding regional wind

1 that is driven by pressure gradients. Basically high and
2 low pressure gradients. And the tighter those get -- and
3 I'm not a meteorologist, but the tighter those get, the
4 potentially more severe those winds can be.

5 We knew that the north wind event that was
6 forecast by the National Weather Service on November 7th,
7 8th, and 9th was forecast to be a very significant,
8 stronger-than-your-normal north wind event.

9 Q. You're familiar with the term "red flag day"?

10 A. Yes.

11 Q. What is red flag day?

12 A. So we have, in the weather service we have fire
13 weather watch and red flag conditions. A red flag
14 condition is a condition whereby one of potentially
15 several factors is elevated that puts -- one of several
16 factors is elevated such that it puts conditions at a
17 level that are very prone to rapidly developing fire.

18 In this particular case, the wind and the low
19 humidities in combination, but clearly the wind in and of
20 itself is probably enough to enable that to be considered
21 a red flag day. But sometimes it's a combination of wind
22 and humidity, but in this particular case the wind was,
23 by far, the overriding factor.

24 Q. So you also mentioned several times weather is
25 a big factor. We'll go through the weather factors and
26 how that affects fire.

1 A. Sure. Weather has both short- and long-term
2 impacts on fire. Short -- the long-term impacts on fire,
3 we'll start with the drought. You know California
4 experienced a pretty severe drought 2012 through 2016,
5 over a five-year period. That drought has, as we know,
6 led to a greater number of trees dying, tree mortality,
7 especially in the central Sierras, I believe upwards of
8 130 million trees in the central Sierras. Northern
9 California, the effects of that drought in terms of tree
10 mortality was a little less, but we did have some.

11 What we also had was a higher than normal live
12 to dead ratio in our live fuels, such as manzanita. So
13 in a manzanita, you have live plant material that is
14 still pulling water, it's still growing on an annual
15 basis, and you have dead limbs within that manzanita.
16 That drought heightened the amount, increased the amount
17 of dead component to live ratio that we were accustomed
18 to seeing.

19 Also in 2017, '18, last winter, we had about 50
20 percent of normal rainfall. In January the rain kind of
21 terminated for a period of time around mid-January and
22 then was much below normal in February. In fact, I can't
23 recall for sure if we even had any measurable rain in
24 February last year, which is pretty uncharacteristic.
25 Then the rain returned in March and April. And what that
26 added is overall we had less than about 50 percent normal

1 rainfall. But we also had a late rain, which enabled the
2 grass to grow readily. A mix of rain and moisture and
3 sunshine enables the grass to grow. And we had a pretty
4 healthy grass crop last year.

5 After that rain period in roughly May, we had
6 about 200 days where we had very minimal rainfall, a
7 period of about 200 days in northern California with very
8 limited rainfall, less than a quarter of an inch. We did
9 have one rainfall period around the 8th of October, to
10 the best of my recollection, recollection early October,
11 where we had around a quarter to maybe upward a half an
12 inch across the foothills of California, but it was
13 fairly minimal.

14 And that, shortly after that we had fall wind
15 patterns return to northern California. We had periodic
16 north wind events of a day to a few days. Where that
17 north, north wind is a warm wind, and it brings with it
18 much lower than normal humidities. Humidities at night
19 do not come up to the normal extent that they would. And
20 that enables the very fine fuels, the pine needles and
21 the leaves and fine grasses, to remain very dry where
22 they would normally pull humidity over the course of that
23 night if humidity was to come up. And the fall wind
24 patterns, that does not normally happen. And we were
25 experiencing periodic fall wind patterns from about
26 middle of October into, into the November 8th period, of

1 course.

2 The north winds, again, were forecast on
3 November 7th, 8th, and 9th to be very, very strong. The
4 forecast at 25 to 30 miles an hour with gusts of 45 to 50
5 from the -- we refer to them as "northerly winds," "north
6 winds," but they're from a northerly direction. So in
7 this case, they were more northeast than north.

8 Q. How does humidity -- how is humidity
9 significant to fire?

10 A. Humidity is significant to fire in terms of the
11 fine fuels. Again, the grasses, the annual grasses that
12 we see growing now. Pine needles, leaf material, very
13 fine fuels that lie in the forest floor. Those are the
14 fuels that react mostly on a day-to-day basis from
15 humidity. And when the humidity goes up -- and, of
16 course, if we have rainfall, they reach a point of where
17 they will not be ignitable. And so they're more
18 resistive to firebrand. But when the humidity remains
19 low, the potential for them to ignite from embers cast
20 from the main fire is increased dramatically.

21 Q. That's a good segue into fuels. Talk to us
22 about the fuel conditions last November.

23 A. So the fuels in the area of the Camp Fire are
24 comprised, in this particular area has had significant
25 fire history back in 2008 being the most recent large
26 fire. And I point that out because the fuels normally in

1 that area would be mostly timbered, but they had returned
2 to brush. So we have a mix of timber -- in the fire
3 footprint -- timber brush, timber litter, which is
4 ponderosa pine with the leaf -- or needle understory, or
5 litter understory, then urban structures.

6 And in, again, I mentioned earlier, in late
7 2017, '18, we had late spring rains which led to a
8 greater than normal grass crop. The ERC, the Energy
9 Release Component, is a measure of energy that comes off
10 a area of fuel. And the ERC, that's a measuring stick
11 for firefighters to kind of get a barometer for what the
12 conditions are like out there. The Energy Release
13 Component was running well above average for the October
14 period into the fall, of course, and was at record levels
15 on November 8th. And those ERCs were gathered from
16 varying fuel sampling stations. In this particular case,
17 those figures came from the Plumas National Forest, not
18 too far south of where the fire was.

19 Thousand-hour fuels. So we have, we have both
20 live fuels, live fuels rely on soil moisture to pull
21 moisture from the root -- or through the root system up
22 into the plant to allow the plant to grow. We also have
23 dead fuels. And dead fuels are the dry annual grasses.
24 They're the pine needles on the ground, they're the oak
25 leaves, and then they're also small twigs, and then
26 larger branches, then all the way up to big logs. And we

1 classify those in a time lag. One, one-hour, ten-hour,
2 hundred-hour, and thousand-hour.

3 And the significance of this is the
4 thousand-hour fuels are fuels over three inches in
5 diameter. And those fuels were extremely dry. Typically
6 the large forest logs. And the significance of that is
7 that's a pretty good barometer for the amount of
8 resources and commitment it would take to extinguish a
9 fire, the potential volatility of the energy of that fire
10 released.

11 And on November 1st, that thousand-hour fuels
12 were measured at 5 percent. Average for that November
13 1st time period would be around 17 percent. Kiln dry
14 lumber is around 12 percent. So this is half of what you
15 would get from kiln dry lumber from a lumber mill.

16 Q. 5 percent being the moisture content in the
17 thousand-hour fuels?

18 A. Correct.

19 Q. So those logs, those dead logs, dead trees that
20 are over three inches in diameter; is that correct?

21 A. Yes, that is correct.

22 Q. And the moisture content in those things was
23 under -- or at 5 percent?

24 A. Yes, measured by the Plumas National Forest.
25 That's where I believe we got those figures.

26 Q. And, finally, go ahead, talking about the

1 manzanita.

2 A. So manzanita, obviously, is a live fuel
3 moisture, relies on the plant's root system to pull
4 moisture from the soil up into the plant structure.

5 Right about now, in the March period of time,
6 is when live plants start to pull moisture up from the
7 soil. They start their growing cycle, and they will grow
8 for as long as they can sustain moisture content, pulling
9 moisture up. They will continue to grow. This year we
10 probably will see more than normal growth because we've
11 had a good winter. Last year the rainfall again was
12 about 50 percent of normal, so their ability to grow
13 longer into the summer was not as it would be.

14 So what that means is the plant eventually
15 reaches a point where it says, hey, I can't continue to
16 grow, I have to hunker down for the summer because it's
17 going to be hot, and I have to be just kind of -- they go
18 into a state of dormancy. Plant no longer grows, it just
19 basically hunkers down and rides out summer, fall, gets
20 into the winter period where it starts to grow again.

21 So in the manzanita and the live fuel moisture,
22 we consider critical, in a benchmark measuring stick in
23 the fire service, in wildland fires we consider critical
24 to be 80 percent fuel moisture. Normal for that time of
25 year is 93. And, again, that measure was measured around
26 early November. I don't know the exact date, but around

1 early November by, again, the Plumas National Forest, at
2 74 percent. So well below the critical state for the
3 manzanita live fuel moisture.

4 Q. So the manzanita itself, even though alive, was
5 still much dryer than it should have been?

6 A. Correct. And much dryer equates to much more
7 volatile.

8 Q. So you knew all these factors going into
9 November 8th?

10 A. Yes. Every fall, you know, we face -- that's
11 the end of typically, you know, our summer fire season as
12 we commonly refer to it. And we know the conditions are
13 usually at their most extreme in terms of fuel moisture
14 at that particular time of the year. I knew that this
15 particular year we had had little to no rainfall and that
16 they certainly were at their most critical states at that
17 time.

18 Q. Now, we've had this question come up earlier.
19 When does the fire season usually end?

20 A. Mother Nature dictates when fire season starts
21 and when it ends based upon rain predominately. And not,
22 it's not just one rain storm, it's significant wetting
23 rain over a period of time. If we have, you know, one
24 rain storm that rains a half of an inch, then it turns
25 warm and dry, which is what we basically had, potentially
26 had in that October 8th period, upwards a half an inch,

1 it will dry right back out again. It has limited effect.

2 So we're talking fuel responds, fuel again
3 being forest fuels predominantly, responds to the amount
4 and consistency of moisture over a period of time. And,
5 again, getting back to the thousand-hour fuels, those
6 fuels are slow to respond to moisture.

7 So picture a log or tree log two and a half
8 foot in diameter laying on the forest floor. If you put
9 rain on it for, you know, a day or so and you carve into
10 it with a pocket knife, you may only see moisture into
11 the wood a small amount. But if it rains three days
12 later, a week later, and that log sits on the forest
13 floor, it begins to absorb that moisture into the
14 internal core of it, because it's not pulling it up, it's
15 just absorbing it through direct contact with the rain or
16 direct contact with the soil that's damp. And so it
17 takes a long time for that log to, in essence, equalize.
18 It's always working for a state of equalization, but it
19 takes a long time for that log to pull moisture through
20 it and get to a point where it's not in a condition that
21 it won't burn. And every fuel reacts a little bit
22 differently.

23 So I guess my point is the amount and
24 consistency of rainfall over a period of time is when we
25 will typically declare an end to fire season. And that's
26 when we feel that the fire risk has been abated because

1 of Mother Nature's graces.

2 Then, of course, as we move into the springtime
3 of the year, we're dependent upon again Mother Nature.
4 It's -- as long as we have consistent rain, the risk is
5 reduced. As soon as we get into prolonged periods of
6 dry, warm air, things start to dry out. And if you add
7 wind to that, that is just another factor that
8 precipitates fire exponentially.

9 Q. So all of this was known and understood when
10 you got off duty on November 8th?

11 A. Yes.

12 Q. What time did you get off duty November 8th?

13 A. In the evening, actually, on November 7th. I
14 got off duty in the evening, 5:30 or 6:00 probably when I
15 got home.

16 Q. On the morning of November 8th, at
17 approximately -- well, were you scheduled to work on
18 November 8th?

19 A. No, I was not scheduled to work. I, as I said
20 earlier, I did tell my partners that I would be around
21 and available if something developed. I have a bad back,
22 and my back was really bothering me at that particular
23 time, so I got up about 5:30, told my wife I was going to
24 go to the gym and stretch my back out and do a little
25 workout. And that's how I started my morning.

26 Q. When you went to the gym, did you notice

1 anything unusual?

2 A. I didn't want to be there, but other than that,
3 no.

4 Q. What area of the county was your gym?

5 A. South Chico. Not too far from my home.

6 Q. So you weren't going to the gym up in the
7 canyon someplace?

8 A. No.

9 Q. How long did you work out?

10 A. I left when I became aware of the fire and got
11 a call from my partner. I left the gym around 7:20 I
12 would estimate.

13 Q. You said that you got a call from your partner?

14 A. Yes.

15 Q. Who was that?

16 A. Garrett Sjolund.

17 Q. What was his rank?

18 A. Garrett and I were partners. We were both
19 division chiefs. And Garrett was the unit duty chief.
20 When I went off duty, I turned the duty chief role over
21 to Garrett. He was the unit duty chief for Cal Fire
22 beginning actually the morning of the 7th.

23 Q. And what was the topic of the call you received
24 from Garrett during your workout?

25 A. So I became aware of the fire by virtue of a
26 CAD page on my phone probably about 20 minutes into the

1 fire, so I knew that there was a fire. I didn't know how
2 significant it was at the time. He called me and told me
3 that the fire was developing pretty rapidly. Obviously,
4 I didn't have a radio with me. All I had was my phone.
5 The fire was developing pretty rapidly and wanted to know
6 if I could come back to work.

7 I told him yes, that I would be back in, that I
8 was at the gym trying to stretch my back out, and that he
9 should take one of my partners, John Messina, one of our
10 other division chiefs, and assign him to the incident as
11 the incident commander. John was scheduled to be on duty
12 that day, and so I knew John would be preparing for work
13 already and be immediately available to go in. And I
14 told Garrett that I would come in -- would leave the gym,
15 go home, get into my gear, my uniform and gear, and
16 respond to the fire, respond to Paradise.

17 MR. NOEL: Just as an aside, remember when we
18 were talking about statements that are made, those are
19 hearsay statements, you're not to consider them for the
20 truth of the matter, just the fact that he was being
21 alerted to the fire.

22 Q. (By MR. NOEL) So you leave the gym, you go
23 home, you get, get your gear and get changed, then what
24 do you do?

25 A. I left my house around 7:50, headed to
26 Paradise. I, I had heard just around that time frame of

1 the dire situation going on in Concow. At that
2 particular time, I did not know that the fire was into
3 the Concow Lake area, north end of the lake. But I heard
4 -- I was listening to my pager at that point, and I heard
5 one of our captains state that he had some civilians
6 trapped by fire on the north end of Concow Lake. And so
7 I immediately -- actually, what I did next was I texted a
8 group of former fire chiefs that we utilize during major
9 fires to help bridge the communication between the
10 Incident Command Post and the Emergency Operations
11 Centers.

12 And I knew that while the town at that
13 particular time, unbeknownst to me, I did not -- the town
14 was unaffected at that time. The fire was moving towards
15 town, but not in town at that particular time. So I
16 alerted them of the need to staff the EOC and asked one
17 of them to go to the EOC and one of them to go to the
18 command post to provide that information continuity.

19 And I then got in my vehicle and drove to
20 Paradise. As I was headed up Skyway, I met one of our
21 other responders. He was just in front of me. We, in
22 tandem, going Code 3 up the Skyway to Paradise. I got to
23 my office unloaded some stuff from my vehicle.

24 At that particular time, on the way up to
25 Paradise, I heard one of our battalion chiefs come on the
26 radio and state that there was a fire on I believe it was

1 Merrill Road, north end of Paradise off Pentz. And that
2 he, he didn't associate at that particular time that it
3 was a spot fire from the Camp Fire, from the main Camp
4 Fire. He thought this was a separate incident all in of
5 itself. He was requesting an order of resources to
6 respond to that fire.

7 Q. Let me stop you right there. Before we get too
8 far, you used the term -- we always have to go back and
9 define those -- when you talked about that you were
10 driving up the Skyway Code 3. Would you tell us what
11 that means.

12 A. Yeah. Code 3 is lights and siren, as any
13 emergency responder would be responding to an emergency.

14 Q. So you were in a state fire truck?

15 A. Yes. Actually in a Butte County SUV.

16 Q. County?

17 A. Yes, Butte County.

18 Q. And responding with your lights flashing and
19 your siren going to alert other drivers?

20 A. Yes.

21 Q. All right. So you get into your office in
22 Paradise and now you're starting to get updates on where
23 the fire is and everything?

24 A. Yes. I was obviously listening to the radio
25 traffic, and I heard the incident commander state that he
26 had issued some additional. So I had heard prior to that

1 -- back up -- prior to that that they had issued
2 evacuation orders for zones 3, 8, and 14, and the lower
3 Pentz Road area, which is the eastern most zones in the
4 town of Paradise and the county area just south of the
5 town of Paradise. And so he had issued evacuation orders
6 for those zones. As I got into my office, I heard him
7 update that and add some further interior zones. And I
8 don't remember off the top of my head what those were,
9 but I want to say that they might have been 2, 7, 13, and
10 Morgan Ridge, but I can't be a hundred percent sure.

11 At that particular time, I called the
12 individual that I had sent to the EOC to give him an
13 update of what was going on with the fire and the
14 evacuation orders so he would be familiar with those. I
15 unloaded some stuff out of my vehicle. I had a bunch of
16 stuff in the backseat of my vehicle. I unloaded that. I
17 got into my wildland firefighting gear, and I prepared
18 then to respond over to the Pentz Road side. I can tell
19 you about that if you want me to keep going.

20 Q. Well, before we get into that, because I
21 definitely want to get into that in a second, let's talk
22 about command structure during the major incident.
23 You've used terms like "incident commander" and "EOC" and
24 "ICP." Give us an idea of the command structure during a
25 major fire.

26 A. Sure.

1 In California, we use Incident Command System.
2 It came out of fires in the early 1970s in southern
3 California. In the California version, the Incident
4 Command System has been adopted nationally, referred to
5 as NIMS, but essentially the same system.

6 That structure puts an individual in charge of
7 the incident, sort of like a field general, if you will,
8 who is known as the "incident commander." And under the
9 incident commander, you have four broad areas.

10 Operations. And operations job is to oversee
11 all operations of firefighting associated with the
12 incident: Deploying resources, reallocating resources,
13 settings priorities, anything and everything associated
14 with the deployment of resources and fire fighting
15 efforts on the ground.

16 The next section is the Plans section, much
17 like the military. The Plans section, planning function.
18 Puts together the plan. They gather intel, they order
19 resources, they track resources, they allocate resources
20 based upon the Operation section chief's lead.

21 The next function is Logistics function. The
22 Logistics function provides all of the support to keep
23 the firefighting resources moving. Fuel, food, water,
24 firefighting tools, et cetera.

25 The final function is the Finances. Those
26 folks pay the bills.

1 That's the broad structure. And at the top,
2 that's known as the general staff position. The top of
3 the command staff you have public information officer,
4 safety officer, and liaison officer. And they all have
5 specific functions, obviously, providing information to
6 the public media, the liaison officer, which is
7 corresponding other agencies.

8 That's when the system is fully vetted out.
9 When an Incident Command Team is deployed, if the system
10 is fully vetted out, that would be the structure.

11 At this particular time in the fire, you have
12 an incident commander and an Operations section chief.

13 And then down in the field we geographically
14 break the fire up. So if you are looking, for instance,
15 at this picture, we might break the Concow, as we did,
16 into one branch. Concow area of the fire was known as
17 branch 1. The Paradise area of the fire at that
18 particular time was labeled branch 2. And then we
19 identified a branch 4, which was, which was initially I
20 think in the Magalia area, and I believe we moved over to
21 Forest Ranch later, later in the incident. We skipped
22 branch 3. And we do that; fairly common to skip over
23 branch numbering.

24 And then we assign divisions under each those
25 branches. So you have a branch, then you'll have a
26 division. And the division is responsible for a

1 geographical section of the fire, and the next division,
2 next geographic section, so on so forth, around the fire.

3 It's not uncommon for us to, sometimes to skip
4 a branch or division number to allow for expansion,
5 because while the fire may be moving in this direction
6 right now, it could be moving in that direction in two
7 hours, or this direction the next morning, which is not
8 uncommon in this canyon. So we leave room for expansion.

9 Q. For the record, you're using your hands to
10 point in different directions to illustrate your point?

11 A. Yes. So I think that hopefully provides a
12 pretty good overview of how the Incident Command
13 Structure works. The incident commander is ultimately
14 responsible for all things associated with the fire.

15 Q. So who was the incident commander at this
16 point?

17 A. John Messina was the incident commander from
18 roughly maybe an hour into the fire on through most of
19 that night, until Cal Fire team, one of our six -- we
20 have six statewide Cal Fire teams -- we placed an order
21 very early in this fire for one of those Cal fire teams.
22 And they assumed command in the evening hours; I don't
23 know the specific time frame. But John Messina was the
24 incident commander.

25 Q. This is a perfect time and natural break before
26 he starts talking about wandering into the fire itself --

1 GRAND JURY FOREPERSON: Okay.

2 MR. NOEL: -- for our afternoon break.

3 GRAND JURY FOREPERSON: All right. Fifteen
4 minutes.

5 (Break taken.)

6 GRAND JURY FOREPERSON: All members of the
7 Grand Jury have returned.

8 MR. NOEL: All right. All 19 are seated,
9 witness is on the stand, back on the record.

10 Q. (By MR. NOEL) So when we left off at the
11 break, you were just getting ready to go out into the
12 field.

13 A. Yes. I left my office probably around 8:20 and
14 headed north on Almond Street, east on Elliott, and went
15 through the Clark intersection to where Elliott and
16 Sawmill meet. And at that time, I had been hearing on
17 the radio about people trapped on the Pentz Road side of
18 the town along Pentz Road, that there was substantial
19 amount of spot fires along that area, and that people
20 were trapped. As I came up to the intersection of
21 Sawmill and Elliott, kind of off to my side I saw a spot
22 fire burning in a field amongst a bunch of houses.

23 You have to realize at that time there were
24 very little resources in Paradise. And at that
25 particular time, there were many, many people trapped in
26 the Pentz Road side.

1 While my normal instinct would tell me to take
2 action in that fire and order resources, I knew that the
3 priority was life, safety, and getting people out. So I
4 had no choice but to drive past that fire on over to
5 Pentz Road where I was trying to assist citizens along
6 with other firefighters to get out of town.

7 So I drove -- I -- residents were leaving the
8 area in that particular area. I drove north on Sawmill,
9 east on Bille, to Pentz Road where as I got there there
10 were other cars trying to maneuver up and down Pentz Road
11 and out all of the side streets to get out of the way of
12 the fire.

13 I drove south on Pentz, and I encountered one
14 of my counterparts trying to direct traffic probably half
15 a mile south of Bille on Pentz Road, so I told him, I
16 said, "Hey, I'm going to go back towards Bille, about
17 halfway between Bille and you, and I am going to just
18 assist."

19 The goal at that point, we're taught in the
20 fire service life is the absolute number one priority;
21 property is number two, property being residential
22 structures, commercial property; and three is the
23 environment, in terms of protecting the resources.

24 So it was very evident from the very beginning
25 that that life threat was tremendous and that all efforts
26 should focus on life. So I assisted in just trying to

1 help people get out of harm's way by ensuring that
2 traffic was flowing. I ended up on Pentz Road in an area
3 known, little court known as Chloe Court, which is a
4 fairly new subdivision on Pentz Road. And I was there
5 just basically monitoring traffic and making sure people
6 were moving.

7 Q. All right. So let's back up a little bit.

8 When did you become aware that the fire was now
9 on the west side of the West Branch and actually inside
10 the town of Paradise?

11 A. As I was driving into Paradise, probably around
12 8:00 a.m. or 8:05, somewhere in that time frame, one of
13 our battalion chiefs came on the radio and said he was at
14 the scene of a fire. I believe, again, it was off of
15 Merrill. I think he stated it was about five acres in
16 size. And he thought that this was a separate and new
17 fire, not a spot fire from the Camp Fire, so he ordered
18 through our Emergency Dispatch Center, known as the
19 Emergency Command Center in Oroville, he ordered a full
20 alarm of resources. Which, you know, we had far more
21 fire on the -- in the Concow area for sure, and we did
22 not have the ability to send him a full response despite
23 his request. But the EC -- I did hear the ECC ask him,
24 "Hey, could this be a spot fire?" "We believe this is a
25 spot fire," I think was their words, "from the Camp
26 Fire." That's when it registered with me, oh, my God,

1 this fire is not only in Concow, it's now in Paradise.
2 And there was many more spot fires reported soon after
3 that.

4 Q. So, to your knowledge, when, when did the fire
5 first jump the West Branch of land and land within the
6 town of Paradise?

7 A. 8:00 o'clock, my best estimate.

8
9 (Grand Jury's Exhibit 101 was marked for identification.)

10
11 Q. Okay. Now, showing you what's marked as
12 Exhibit 101. It should be a photograph there in front of
13 you. Do you see 101?

14 A. Yes.

15 Q. And you see what's displayed up here on the big
16 board?

17 A. Yes, I do.

18 Q. Same?

19 A. Correct. They're one in the same.

20 Q. Describe for us what this is.

21 A. This is a, a infrared satellite image from
22 what's known as Land Sat 8, which I believe is the name
23 of the satellite. Was captured around 10:45 a.m. by an
24 individual by the name of Zeke Lender, who is a
25 Geographic Information Systems, commonly known as GIS, he
26 owns a company called Deer Creek Resources. Deer Creek

1 GIS. And they do a lot of mapping. And he was assisting
2 our GIS folks with mapping the fire.

3 Of course, at that time it was very early on in
4 the fire. So this was -- and I didn't see this image
5 until days after the fire started. But this is a, paints
6 a picture of where the fire was at 8:40 -- excuse me --
7 10:45 a.m. on November 8th and the significance of the
8 fire and the number of spot fires. And I think that's
9 what's significant here. I counted them up at one point.
10 And these little fires separate of the main body of
11 fire --

12 Q. You can get out and come up here to the board
13 where you can say, demonstrate what you're talking about,
14 point it out. Okay. And we can use the drawing
15 function, and you can draw on the board, as soon as it
16 comes up. What color would you like? Red?

17 A. Maybe try blue, something that's different.

18 Q. There we go. Blue.

19 A. Okay. So this is the main body of fire,
20 obviously, here, this line of demarcation on this side.
21 And so the intensity of the fire, the infrared satellite
22 picks up based upon the intensity of the fire. The more
23 intense the fire, the more the green and more glow that
24 you have. This is an area what's known as the right
25 flank. This is the heel of the fire right here. Right
26 flank of the fire. Left flank of the fire. And out in

1 the head of the fire.

2 This is an area of intensity here. Obviously
3 an area here. This here is the West Branch of the North
4 Fork of the Feather River, this drainage right here, as
5 it goes along with the town of Paradise.

6 This area here is Pentz Road. And these bright
7 dots that you see, for the most part, I believe are
8 structures. For the most part. This area here -- I'm
9 sorry, touched it with my other knuckle. This area here
10 -- this area here is an area along, you know, the fire's
11 left shoulder, if you will, that's burning intensely.
12 Similar to this area up here. But these areas in here
13 are structures.

14 What I really noted when I saw this picture,
15 and I knew it the day of the fire, but what I really
16 noted was the number of spot fires and how far developed
17 they are, meaning how large they are in size. If you
18 look at this particular fire right here, and I'm only
19 guestimating this fire is in couple 2- to 3,000 acres in
20 size, and this is at 10:45 in the morning, slightly over
21 four hours into the start of the fire way over here.

22 The other thing that's important to note about
23 this fire is this is right on the Skyway as you exit
24 town. A lot of the video that you've seen on social
25 media and on TV and what have you is people traveling
26 down Skyway through fire on both sides of the road. And

1 I, while I was not there in that particular area at the
2 time, I fully believe they were driving through this spot
3 fire. And I talked to my father, who was one of the
4 evacuees from Paradise. He told me that from about Town
5 Hall, little below Town Hall, all the way down to going
6 out of Paradise for quite some distance was on fire on
7 both sides of the road.

8 I also counted up -- at one point, I counted up
9 all of these little spots. There was a little teeny spot
10 there, spot there, spot here, et cetera.

11 This is, this is Magalia Dam right here. You
12 go across the Magalia Dam to get into the community of
13 Magalia right here. This spot right here, pretty
14 substantial spot fire below the community of Magalia.

15 I counted all of the spot fires external to the
16 main body of fire, and at one point I believe I came up
17 with 23 spot fires. I think that just speaks to how, how
18 much, how many embers were produced and how receptive
19 that fuel bed was to receive those embers and start new
20 fires.

21 Q. All right. So let's label these, because we
22 can save what you've been drawing on here.

23 So this big spot fire over here, what you said,
24 this is the Skyway?

25 A. I believe that's the Skyway.

26 Q. Skyway or Honeyrun? So let's mark that Skyway.

1 Then we have a little spot fire down here in
2 the far southwest?

3 A. Yeah. And I would have, you know, trouble
4 identifying exactly where that is in terms of road
5 structure. But this one I can tell you is just above
6 Little Butte Creek, because this is Little Butte Creek
7 that comes out of the Magalia Dam. So that spot right
8 there.

9 Q. So let's write on there Little Butte Creek.
10 Little, Little BC. Little Butte Creek. This is not real
11 conducive for a left-hander.

12 Then we have the left shoulder?

13 A. Yeah. I call that the left shoulder of the
14 fire. That's not a spot, but it just draws the intensity
15 that was going on in that drainage.

16 And if you are looking, that is in the West
17 Branch drainage, probably very similar to where we had
18 the Saddle Fire in 2016. We had a Saddle Fire on
19 September 5th thereabouts, 2016, in that same general
20 area.

21 Q. Spot fires?

22 A. Yeah.

23 Q. Right shoulder?

24 A. Yeah. Right flank. And then the shoulder as
25 it turns into the "head" of the fire, if you will.
26 That's the terminology that we use.

1 Q. Flank.

2 You said the heel back here? That's the origin
3 area of the fire?

4 A. Generally speaking. Not specific. The heel is
5 the, is just that, the backside of the fire.

6 This would be the left flank, left shoulder,
7 right shoulder, then the head of the fire, the spot fires
8 out front. And there's obviously a lot of spot fires.

9 This one here, so this -- little bit of
10 orientation -- this is the North Fork of the Feather
11 River. This is Big Bend here. Those of you who are
12 familiar with Big Bend and Lake Oroville, Feather River
13 makes a big bend and goes on down to the lake.

14 Q. So let's switch to blue. You say the North
15 Fork. Are you talking right here?

16 A. Yeah. This drainage here comes around like
17 this, makes a big bend. It's off the map here. Comes
18 back down.

19 Q. Kind of down there like that and then up
20 through here?

21 A. Yeah. Right here.

22 Q. All right. And then, again, this is the West
23 Branch of the North Fork? Oh, yeah, you have it in
24 there.

25 A. And ultimately they come together east of Lime
26 Saddle, probably a good geographical location.

1 Q. Okay. You said up here, this is where Magalia
2 Dam is?

3 A. Yeah, this is Magalia Dam right here, Paradise
4 Lake right there, and satellite imagery. That's --

5 Q. All right. These land -- these satellite
6 infrared imagery, is this something that's normally used
7 in the fire service?

8 A. Yes, but not, not this early into a fire. It
9 -- so, you know, it's like, it's like the military, you
10 know, you just don't know where the battle is going to
11 start in the fire service. The battle started someplace
12 up here in the Feather River Canyon that day. We have
13 to, we have to mobilize the military, get to that, we
14 have to mobilize the resources that do the planning and
15 the mapping and all of those kinds of things. And that
16 takes time.

17 So yes, it is not uncommon for us to use
18 infrared satellite imagery for looking for hot spots,
19 including hot spots along the line well into the fire,
20 but it's pretty uncommon for us to have it -- and I say
21 have it -- pretty uncommon for it to be mapped this early
22 in the fire. We did not have it -- the commanding, the
23 incident commander in the resources field did not have
24 access to this at that particular time of the day. It
25 came -- you know, I think that I saw it several days
26 after the start of the fire.

(Grand Jury's Exhibit 101A was marked for
identification.)

(Grand Jury's Exhibit 102 was marked for identification.)

Q. Save it before we do something with it. We'll
save this and later print this out as 101A. There we go.

All right. So now we're just back to 101.

All right. Let's move on. You have 102 in
front of you?

A. Yes, I do.

Q. And the photograph you're looking at, Exhibit
102, is the same thing that's being shown on the board?

A. Same thing, just the other one was a, 101 was
an overhead perspective looking down. This is looking,
in essence, from east northeast to south southwest. So
north would be this way, indicative by this right there.
But north would be this way, east would be this way. So,
roughly, northeast trajectory.

Q. So basically if the origin area of the fire was
somewhere on a ridgetop right above Poe Dam, we'd
basically be looking at the fire from behind the origin,
toward the direction it's flowing; correct?

A. Correct. Yeah. The fire starting somewhere
down in here, going away into the town of Paradise, as

1 you see the corner of Paradise right here. This is,
2 basically would be Paradise, then Chico on that way.

3 Q. 191 being Clark Road?

4 A. Correct. 191 being Clark Road. Yes. It shows
5 it all the way to where it terminates with Skyway in the
6 north end of Paradise.

7 Q. Then Skyway running off out the top of the
8 picture towards Paradise -- towards Chico?

9 A. Yeah. And, in fact, here's that spot fire I
10 was referring to on the other one. It shows it overlaid
11 right on Skyway.

12 Q. So this is at 10:45, and we've already got the
13 fire clear up past Pentz Road and clearly over on to the
14 other side of the Skyway going down towards Chico;
15 correct?

16 A. Yeah. Chico would be further this way, going
17 around the Skyway and dropping into Honeyrun Road in
18 Butte Creek Canyon, or in the far northern side as it
19 comes into Paradise. So Honeyrun Road would come into
20 Paradise somewhere right here. This is Honeyrun
21 drainage.

22 Q. Then we also have spot fires up here around
23 Magalia to the south and southwest of Magalia?

24 A. It would be east of Magalia. Again, north
25 being oriented this way. So Magalia would be up here.
26 So there's --

1 Q. Here's Magalia right here.

2 A. Yeah. I'm sorry, you're correct. My mistake.
3 South, yes. I think -- to clarify, I think this is Old
4 Magalia.

5 Q. Okay.

6 A. Obviously, new, will be new Magalia. Or
7 Magalia proffers a little bit above it.

8

9 (Grand Jury's Exhibit 103 was marked for identification.)

10

11 Q. All right. Let's move on to 103.

12 What are we looking at on 103?

13 A. So on 103 we're looking pretty much -- this is
14 probably -- so we're basically looking, you know, from a,
15 again, from more of a north, northeast direction, north
16 being over here now. So north is down in this area.
17 We're kind of looking from a north to a south
18 perspective. And the fire is still mostly off to our
19 east, moving to the south and the west, if you will.

20 Here is that large spot fire. You can see that
21 Honeyrun drainage pretty prominently in this particular
22 picture.

23 Here's Magalia, the main -- if you will, the
24 POA, Paradise Pines Property Owners' Association. Fire
25 in Little Butte Creek below it.

26 Fire in Old Magalia. This is Old Magalia here.

1 Fire just on the north end of Skyway between,
2 roughly between the Old Magalia Church and New, what's
3 known as New Skyway. Actually, it would be right here.

4 Q. So we actually -- on 103, we actually have a
5 map of the main streets of Paradise overlaid over the top
6 of the --

7 A. Correct. In fact, here would be the Skyway.
8 It's a little bit -- you know, the lines are a little bit
9 squiggly if you will. But you have Skyway, Wagstaff,
10 West Wagstaff, probably Oliver. You have Clark. In
11 fact, one thing I draw my attention to here is this is
12 the mobile home park, Apple Tree Village, on Clark Road
13 right there where that spot fire is.

14 Pentz Road here.

15 Bille, Elliott, and Pearson.

16 Q. And then this feature right here, this is the
17 West Branch; correct?

18 A. That is correct.

19 Q. And going up to Lime Saddle would be right at
20 the top or above the top of the photograph?

21 A. Yes.

22 Q. So at this point, we've got the fire all, on
23 both sides of the West Branch. And when we go back to
24 the other, we see the line of all these bright yellow, we
25 can now see that those are all along Pentz Road?

26 A. Pentz Road is just interior up to about

1 Sawmill. If this is Sawmill here. Looks like the main
2 body of fire has progressed pretty consistently infield,
3 probably the best word to put it. You have all these
4 spot fires and the main body eventually catching up as
5 those spot fires are developing. Pretty consistent fire
6 edge at that point up to about Sawmill in the town of
7 Paradise approximately, with spot fires west and north of
8 the town a little bit.

9
10 (Grand Jury's Exhibit 104 was marked for identification.)
11

12 Q. All right. Let's move on to 104.

13 (Counsel confer.)

14 Q. (By MR. NOEL) Go ahead, kind of as Mr. Fogg
15 was pointing out, we can all see you pointing out
16 different things, but the court reporter can't get that
17 in the record. So can you describe, give us descriptions
18 of the areas that you're talking about. Or we can go
19 back and use the writing tools if you want.

20 A. Whatever you'd prefer. I don't know if I'm
21 very skilled with it, but I'll try.

22 Q. I've already used them; you can see my level of
23 skill.

24 A. I think it may be best described then.

25 This is the West Branch of the Feather River,
26 West Branch of the North Fork of the Feather River.

1 MR. FOGG: Chief Hawks, I'm sorry to interrupt.
2 When you say, when you point, can you describe it as it
3 appears to be the geographic feature on the left-hand
4 side of the screen, running from the top of the screen to
5 the bottom. Paint the picture of your words so it
6 appears in the transcript.

7 THE WITNESS: Okay.

8 MR. FOGG: Thank you.

9 THE WITNESS: You're welcome.

10 From the top portion of the screen towards the
11 left-hand side, extending down to about the middle of the
12 screen on the bottom is a prominent drainage known as the
13 West Branch of the North Fork of the Feather River.

14 Just to the west of that begins the town of
15 Paradise, with its road structure, as you can see here --

16 MR. FOGG: Chief Hawks, sorry to interrupt.
17 When you say to the west, I'm assuming it would be the
18 right-hand side of the image would be to the west; is
19 that accurate?

20 THE WITNESS: Yes, generally speaking, that
21 would be accurate. To the right-hand side of the image
22 would be to the west. So north here is down over here.
23 So west would actually be out over here. So it would be
24 the upper right.

25 MR. FOGG: And the bottom right would be
26 generally north?

1 THE WITNESS: Correct. Bottom right generally
2 north, upper right generally west.

3 MR. FOGG: And you were describing a spot fire
4 earlier, that would be generally in the top right-hand of
5 that image?

6 THE WITNESS: Correct. The large spot fire
7 that affected the Skyway is in the west upper right-hand
8 side of this image, would be towards the westerly
9 direction.

10 MR. FOGG: And when you were describing Magalia
11 earlier, that's in the bottom right-hand of this image,
12 generally?

13 THE WITNESS: Correct. Bottom right-hand of
14 this image, or more towards the north, northerly
15 direction.

16 MR. FOGG: I understand. Thank you, Chief
17 Hawks.

18 THE WITNESS: You're welcome.

19 Q. (By MR. NOEL) All right. You ready to move on
20 to 104?

21 All right. Now we have the photograph marked
22 104.

23 A. So 104 is, looking in the lower left part of
24 the screen, would be the southerly part of the screen,
25 and the upper right would be the northerly part of the
26 screen looking towards Magalia as referenced by the north

1 arrow on this Google Earth satellite image.

2 So to the lower right, which would be the east
3 side of the screen, we have again running from the upper
4 right down towards kind of the lower right of the screen
5 the very prominent drainage known as the West Branch of
6 the North Fork of the Feather River.

7 As we come out of that slope of that drainage,
8 we come along the fringe of the town of Paradise.

9 As we go interior a little bit, again, running
10 from the upper right to about the center, lower center of
11 the screen, so roughly from a north to a southeast
12 direction, we have Pentz Road.

13 And then the next interior road in a similar
14 orientation is Sawmill.

15 And then we go next to Clark, which is more of
16 a north-south directional road through the, pretty much
17 the core of Paradise.

18 Then finally over to Skyway, which runs from
19 the upper right north side of the image to the mid point
20 on the left side of the image, roughly a
21 north-to-southwest direction.

22 What's important to note here is the fire
23 progression. Again, at 10:45 in the morning it's pretty
24 consistent up into Sawmill Road. I might point that when
25 I was talking earlier, the spot fire that I encountered
26 when I was driving originally over here was roughly right

1 in about that area.

2 Q. Indicating Sawmill and --

3 A. Elliott.

4 Q. -- Elliott?

5 A. Indicating Sawmill and Elliott.

6 The fire pretty much progressed consistently up
7 to that point. And you see many spot fires scattered
8 throughout town, including this one here along Clark Road
9 near the Apple Tree Village. You can see the makeup of
10 that mobile home park there.

11 This is in an area interior of Clark, probably
12 pretty close to where the Safeway would be, just above
13 Elliott, to the north of Elliott, to the south of Bille.

14 You see several spot fires, of course, in this
15 image, including this large one up here under the, in the
16 Little Butte Creek, which would be the upper right side
17 of the map towards north.

18 And then down in the southwest this very large
19 spot fire along, along Skyway in the Honeyrun drainage
20 and down along Skyway as you leave town.

21 Q. All right. I think that's the last of these
22 we're going to go through, so you can resume your seat if
23 you'd like.

24 All right. So you said that you first became
25 aware that the fire had jumped the West Branch and
26 entered into the town of Paradise around 8:00 a.m. --

1 A. Yes.

2 Q. -- correct?

3 And subsequent to that was when you went, left
4 your office, and headed out?

5 A. Yes, headed towards Pentz Road.

6 Q. You started to tell us about that earlier.
7 Tell us what you found when you ventured out into, into
8 Paradise.

9 A. As I got closer to Pentz Road, I saw more and
10 more people very in tune with the rapidly developing
11 conditions of the fire. As I went from Almond Street out
12 Elliott I did not see -- I saw traffic, but nothing in my
13 memory sticks out as, as is really jumping out for, you
14 know, in terms of people fleeing. But as I went towards
15 the intersection of Sawmill and Elliott is when I really
16 first noticed people. That's when I encountered my first
17 spot fire. People packing up, preparing to go, and
18 people actually leaving -- you know -- moving around
19 their homes frantically, preparing. As I went north on
20 Sawmill, east on Bille, and over to the Pentz Road side,
21 it became more and more evident, which would be about the
22 center right of that Exhibit No. 104.

23 Q. Right in here?

24 A. About where you're pointing. That's Bille and
25 Pentz Road. That's pretty close to where I ended up,
26 just a little south of that intersection. Or southeast,

1 if you will. And it was very obvious at that time, a
2 fair amount of fire. Not as much fire as you see in this
3 picture, of course. That was closer to about 8:25, 8:30
4 in the morning when I arrived over there. A lot of
5 people packing up, fleeing on the road, trying to get out
6 of harm's way.

7 I will say that I was amazed at how composed
8 people were despite the chaos around them. They -- I
9 didn't see anybody really -- only one individual that I
10 recall really, I guess for lack of a better term, freak
11 out and go across country. Most people were very
12 concerned. I could see fear in their face, but they
13 stayed in line with the vehicle in front of them, and as
14 the vehicle in front of them moved forward.

15 Now, when I first got there, it wasn't solid
16 traffic. Again, around 8:25, 8:30, when I first arrived
17 there. But shortly thereafter, I would say by a quarter
18 to 9:00 or certainly by 9:00 o'clock it was pretty much
19 bumper-to-bumper traffic over there in one direction,
20 going north on Pentz Road. The southerly lane was, for
21 the most part, open on Pentz Road, which at times people
22 moved around and stuff, but --

23 Q. You mentioned something earlier, you said that
24 when you started coming across fire, you realized that
25 you didn't have the resources to fight it and that you
26 just needed to go in to rescue. That's where you talked

1 about the priorities being life, property, and
2 environment.

3 A. Yes. When I encountered the first spot fire,
4 it was just me in my SUV. And about half or three
5 quarters of an acre of fire. And my ability to put that
6 fire out was basically zero. Knowing that life was
7 threatened on Pentz Road, I proceeded on to Pentz Road to
8 try and assist people getting out of harm's way.

9 Q. So at some point as a unit did Cal Fire make a
10 decision to go from firefighting to simply search and
11 rescues and protection of life?

12 A. Yes. I know -- I don't know the exact time
13 frame, and that would be a question for Chief Messina,
14 who was the incident commander. I do know at one point
15 he made an announcement over the radio that all efforts
16 would be focused on life, safety, rescuing people, moving
17 people out of harm's way in order to get them out of the
18 path of the fire.

19 Q. Tell us about your effort to do rescue.

20 A. So, again, when I got over to Pentz Road,
21 people were, were focused, they were moving out of town
22 on their own. I was watching what was going on. There
23 was fire predominantly -- in fact, if you're looking at
24 that picture, fire to the right side of Pentz Road. Most
25 of the right side of Pentz Road was involved in fire in
26 various areas. There was some spot fires to the east of

1 Pentz Road early on when I first arrived around 8:30-ish.
2 But people were focused and they were doing what they
3 needed to do.

4 So I was simply monitoring what they were
5 doing. I actually had pulled -- frankly, I had pulled
6 off of the roadway a little bit, because when you're
7 there in a vehicle everybody wants to stop and ask you
8 questions. And I didn't need that complicating the
9 evacuation process. So I had pulled slightly off the
10 roadway and was just simply monitoring people as they
11 were moving.

12 I got out several times -- as traffic stopped
13 and I'd get out and check and make sure that traffic that
14 I couldn't see to my right, to my left was okay, there
15 was no issues, they could continue moving slowly. I
16 simply monitored it from that position for probably,
17 probably about a half an hour at that point, around 9:10
18 or 9:15.

19 While I was monitoring it, and it was back on
20 Chloe Court, a little bit off, I heard a siren/, I looked
21 up. I had been receiving text messages and radio traffic
22 and stuff, and I was trying to address those questions.
23 And I looked up, and I saw a couple of ambulances trying
24 to go around in the southbound lane that was mostly open.
25 They were trying to go around the traffic. And
26 unbeknownst to me at the time, they had a couple of --

1 three, I believe -- critical patients on board they were
2 trying to evacuate out of Feather River Hospital.

3 One of the ambulances, again, unbeknownst to
4 me, they were moving around, so I went back to trying to
5 address phone calls and things that were coming into me
6 in my position. And as I looked back up, I saw a
7 paramedic wheeling a gurney down Chloe Court towards me,
8 maybe 25 feet in front me. And I rolled down my window,
9 and I said, "What's going on?"

10 She said, "My ambulance is on fire."

11 And I looked over, I couldn't make it out
12 honestly, but it was on fire. So I told them to shelter
13 over in a driveway behind me, kind of off to my right
14 shoulder, and to move -- the second ambulance parked
15 behind the first ambulance on fire in the road, to pull
16 it into the driveway and bring everybody over here, we
17 would shelter them in that house.

18 So we did do that. Basically told them, "Hey,
19 we're going to shelter here in this home on Chloe Court,
20 and we need to protect and defend this home because this
21 is our save haven, if you will, from the ember ignition."

22 So one of the paramedics laddered the roof.
23 And I told him, "Hey, we need to clean the roof of all
24 the pine needles, and the gutters from all the pine
25 needles." He laddered the roof, crawled up on the roof,
26 and did just exactly that. He cleaned the valleys of the

1 roof that had accumulated. The valleys are kind of the
2 low depressions where pine needles often accumulate. He
3 cleaned all of those out of pine needles. He cleaned the
4 gutter out of pine needles. And one of the other
5 paramedics found some rakes and was raking stuff back
6 from around the house, all of the light flash fuels to
7 keep the house from catching fire from ember ignition.

8 The other paramedics were tending to the
9 patients which we were able to make access to the garage.
10 And we moved the patients to the garage. And they
11 protected those patients and watched them.

12 At the time, unbeknownst to me, there were
13 three nurses, they were also on board with those
14 patients. And they were huddled in the ambulance. Later
15 on they evacuated the ambulance, or exited the ambulance.
16 They came up to me, and I told them, you know, just to
17 assist in patient care.

18 So that went on for probably in earnest about
19 an half an hour trying to get them all situated and
20 secured while I was at times watching and monitoring the
21 traffic that was continuing to flow, albeit very slowly,
22 stop and go, out of northbound on Pentz Road.

23 Q. So were you able to defend that house?

24 A. Yeah. That house stands today because of the
25 work that those paramedics did to protect it, to keep it
26 from catching fire from embers. The home to the back of

1 the house, we -- they had defended for a while and were
2 not able to -- it eventually became overran by fire later
3 in the morning, I would estimate around maybe 10:45 or
4 11:00 a.m. But the home itself that they were, we were
5 seeking shelter in, they defended, and it's still there
6 today, as well as the home across the street, which had
7 fire in the gutter, pine needles in the gutter. It
8 caught fire from embers. And while all this was going
9 on, a couple of Butte County Search and Rescue
10 individuals ended up there with us. And so I told them
11 just to help the paramedics. When I looked across the
12 street, I saw the gutters burning across the street, I
13 told one of the search and rescue guys, "Go across the
14 street with a garden hose and put the gutters out." He
15 did, and that home is still standing today as well.

16 Q. So the patients, the paramedics, the nurses,
17 they all survived?

18 A. Yeah. In fact, one of the patients was a lady
19 who had just undergone a C-section and was paralyzed due
20 to that procedure from I believe the waist down. So she
21 was immobile. She actually had a birthday party about
22 two weeks ago and invited many of us to it.

23 Q. Eventually all those people were evacuated out?

24 A. Yeah.

25 Q. So after you were able to get those people to
26 safety and secure their safety, what did you do?

1 A. I went south on Pentz Road, or south -- south,
2 if you will, southeast on Pentz Road towards Feather
3 River Hospital. I had heard of people stranded on the
4 roads and abandoning cars down there. I know a lot of
5 our firefighters would protect and rescue people. I know
6 we had a dozer pushing vehicles out of the way to open
7 roads up.

8 I went down there to check on what was going on
9 down there. And I was not integrated into the command
10 structure of the operations at that time. I was, was
11 there mainly as a liaison between the, as the fire chief
12 of the town of Paradise, between the incident and what
13 was going on. But I went down there, tied in with the
14 branch director and the division supervisor. And I
15 actually picked up a, one of our board of supervisors who
16 was caught in the fire. And he was riding with the
17 division supervisor. The division, again, is the
18 geographical area of the fire. The division supervisor
19 had picked up a citizen who was a board member and was
20 transporting him to safety. And I took him in my vehicle
21 so that he could go on and continue with his function in
22 the command structure of the fire, since I was more
23 mobile.

24 I took that board member to his house, which
25 was just off Pentz and Pearson. His house was well
26 involved with fire. His pickup truck was parked in the

1 driveway. I told him, "Hey, get in your pickup and pull
2 it into the cul-de-sac, it will probably survive in the
3 cul-de-sac." Then he and I proceeded just off of the map
4 here, proceeded -- it would be westbound on Pearson down
5 through the hilby curve, which is a steep curve in the
6 Dry Creek drainage, and up to the other side. And we
7 eventually got to his vehicle. And I was able to get him
8 back to his vehicle and told him to go to Feather River
9 Hospital, because that was the largest open area where we
10 could shelter people. Roadways were still pretty
11 congested at that time.

12 Q. All right. Now I want to move, change topics,
13 to the aftermath. And as part of the normal protocols
14 and procedures of a fire, does Cal Fire have, does Cal
15 Fire do damage assessments?

16 A. Yes. Very actively in the last -- very
17 actively and very formally structured process. This has
18 really been going on now for probably three years or so.
19 Before it was done in paper format. Now it's done,
20 collected on -- a tablet collects geographical location
21 of the incident, and also records basic information about
22 the structure as to the extent that the assessment teams
23 were able to determine things like single -- was it a
24 single-family residence or multi-family residence? I
25 believe it even includes some of the building
26 construction features, if they're identifiable.

1 Q. Can you describe for us the damage assessment
2 procedures.

3 A. So based upon the magnitude of the fire and the
4 damage, there is a, what's known as damage inspection
5 lead, a DINS lead. And that oversees the operation. And
6 then there are teams, damage inspection -- I'm not sure
7 if there's a title specialist, but damage inspection
8 teams usually work in teams of two. And they will, they
9 will basically break the damaged areas into quadrants or
10 sections, if you will. I'm not sure specifically, but
11 they break them into sections. And then they send those
12 teams out to assess the damage.

13 They're looking at, you know, destroyed -- and
14 I don't remember the exact breakdown. I think it's 0 to
15 9 percent damage, 10 to I'll say 30 percent. There's
16 categories that they break down the level of damage. And
17 then, obviously, fully destroyed. And then undamaged or
18 no damage.

19 And those teams collect that data in a GIS
20 format through tablets. As long as they have cellular
21 connectivity, that information will upload constantly as
22 the course of the day's assessments go on. And that's
23 what was occurring with the Camp Fire damage inspection.
24 If they don't have cellular connectivity, such as some of
25 the remote areas in Concow, when they come back and
26 connect, all that stuff is uploaded. It's kept and

1 maintained in a, our GIS database, geo database.

2 Q. What is a GIS?

3 A. Geographic Information System. Probably the
4 best way to describe it is a, is what's commonly known as
5 a latitude and longitude or a point on earth.

6 Q. So the inspectors are going out with their
7 tablets, they're going out to individual buildings,
8 structures, whatever you want to call them, assessing the
9 damage, putting that information into the tablet, and
10 then it's automatically uploaded to Cal Fire?

11 A. It's uploaded to, yeah, in our GIS database
12 maintained by Cal Fire. Yes.

13 Q. That's a database that's maintained in the
14 normal course of business by Cal Fire?

15 A. To the best of my knowledge, yes.

16 Q. These are records that are made in the normal
17 course Cal Fire?

18 A. Yes.

19 Q. And the records are made at or about the time
20 of the occurrence?

21 A. Yes. It's as rapidly as they can be collected
22 given the magnitude of the fire and the topography.

23 Q. And they're actually making the record
24 simultaneous to when they're assessing the damage;
25 correct?

26 A. Yes, correct. They're taking that information.

1 Q. And then that information is taken and it's
2 basically overlaid onto a assessor's map of the area;
3 correct?

4 A. I don't know if it's truly an assessor's map,
5 but it is a map of the area, a GIS platformed map that
6 has roads, roads and other features in there. It can --
7 it's layers, so it can have a road layer, it can have
8 assessor's parcel data. Yes, you're correct in that. It
9 can have a number of GIS-based layers in that map.

10 Q. And, most importantly, it documents the
11 locations of every structure in the area?

12 A. To the best of the inspector's ability, every
13 structure, yes.

14 Q. And that builds on it what's known as a Damage
15 Inspection Map; correct?

16 A. Yes.

17 Q. So as the Butte County Fire Chief, did you
18 review the Damage Inspection Reports for the Camp Fire?

19 A. The report is, I believe, if I remember
20 correctly, it's been a couple of months since I've looked
21 at it, skimmed through, it's well over -- the detailed
22 report is well over I think 17- or 1,800 pages or
23 something like that. So yes, I have skimmed through and
24 I have certainly looked at the summary reports associated
25 with it, including some of the maps.

26 Q. And we are not going to get into the details of

1 all of that, we want to go to the summary stuff. How
2 many structures were destroyed in the Camp Fire?

3 A. I believe that the figure is 18,804 from
4 memory.

5 Q. Is that figure broken down between residential
6 structures, business structures, and other structures?

7 A. Yes. And I don't have the details in front of
8 me. The -- so 18,804 is the number of structures
9 destroyed. In addition to that, there are structures
10 that are damaged that drive that figure up further into
11 the 19,400 range. I don't recall the exact figure.

12

13 (Grand Jury's Exhibit 105 was marked for identification.)

14

15 Q. Okay. All right. I want to move on to --

16 I have your notes here, but I wanted to move on
17 to 105, Exhibit 105.

18 Do you see Exhibit 105?

19 A. I do.

20 Q. What is Exhibit 105?

21 A. Exhibit 105 is a map showing the perimeter of
22 the Camp Fire, the outer squiggly lines, if you will,
23 with -- and, of course, the details are a little hard to
24 see, but it also shows all of the structures that have
25 been reported during the damage inspection and their
26 state, whether they're destroyed, whether they're no

1 damage, whether they're lightly, moderately, or severely
2 damaged.

3 If we were to zoom in, we would see -- what
4 jumps out is the number of red structures on the map. If
5 we were to zoom in, we would definitely see potentially
6 green and black structures. I think perhaps one of the
7 other maps will show that.

8 Q. We'll get to that in a second.

9 So this squiggly red line that's running all
10 around inside of here, that's the footprint of the Camp
11 Fire?

12 A. Yes. Correct. And right there where you last
13 pointed, you'll see -- right there -- you'll see where
14 the Camp Fire spotted across Lake Oroville on the West
15 Branch and down into the Cherokee community. And then to
16 the right of that a little bit, where you're pointing
17 there, is the Bloomer Hill area above the -- to the, it
18 would be the west side of Berry Creek, to the best of my
19 recollection in terms of degrees. But west side of Berry
20 Creek. So it spotted across Lake Oroville in several
21 locations.

22 Q. And comes back up, jumps the river again, goes
23 up towards the top right-hand corner?

24 A. Yes.

25 Q. So everything that's inside that, the red line,
26 is the footprint, is inside the footprint of the fire?

1 A. Yes. That is correct.

2 Q. And each of the red dots represents a structure
3 that was destroyed?

4 A. Yes.

5
6 (Grand Jury's Exhibit 105A was marked for
7 identification.)

8
9 Q. Now, let's move on to 105A. Do you have that
10 in front of you?

11 A. I do have that in front of me.

12 Q. And what is Exhibit 105A?

13 A. This is a zoomed-in version of the same map
14 that we just looked at, but zoomed in to the Paradise
15 area.

16 You see just to the right, where Concow Lake
17 is, the right-hand side of the map about midpoint, where
18 you're pointing there, is Concow Lake, but the map is
19 designed to be zoomed in to the town of Paradise
20 predominantly to show a little bit better detail. And
21 it's -- this, I just saw this map for the first time a
22 few days ago, so I'm not well oriented with it in its
23 level of detail, but clearly the red dots are the number
24 of structures destroyed. I don't see any orange, yellow,
25 green, or black dots, which would indicate -- the orange,
26 yellow, and green would indicate some level of damage.

1 Not fully destroyed, but some level of damage. And black
2 would indicate no damage to the structure.

3 Q. So there are some yellow and green in here, if
4 you look really closely.

5 A. According to the legend that I'm looking at on
6 this map, which is very hard to see, the answer to that
7 is yes. However, I do not see any of those on the map,
8 but it might just very well be because of the number of
9 fully destroyed structures identified in red outweigh by
10 far the no damage and moderately damaged structures.

11 Q. So let's give some context. On the right-hand
12 side, starting down at the bottom of the map, there's a
13 blue line representing water coming up; correct?

14 A. Yes.

15 Q. And then the water kind of stops, but follows
16 the contour of a geographic feature all the way up
17 through the top of the map; correct?

18 A. That is correct.

19 Q. That would be the West Branch?

20 A. That is correct.

21 Q. So everything to the right of that is Concow;
22 everything to the left of the West Branch would be the
23 town of Paradise?

24 A. Yes, out to the point of where we get into
25 Butte Creek Canyon drainage to your left side -- you're
26 right.

1 Q. And the streets aren't marked, but you can see
2 a street that starts just to the right of "N" in
3 inspection on the bottom and runs clear up all the way to
4 the top. That would be Pentz Road; correct?

5 A. That is correct. And for orientation, that
6 cluster of red dots on the lower end of Pentz Road, my
7 best estimate, that would be the Quail Trails Mobile Home
8 Park, which is right at the border of the town of
9 Paradise and county of Butte, unincorporated area.

10 Q. So each one of these red dots represents a
11 house or a structure that was destroyed?

12 A. Yes.

13 Q. And each one of the green dots that are very
14 hard to see is a structure that survived with minimal
15 damage; correct?

16 A. Yes. I believe, and I can't read it, but I
17 believe the green signifies damage percentage of 0 to 9.
18 I believe yellow signifies 10 to 30. Unfortunately, I
19 can't see this very well. Then I think the next color is
20 orange, and I believe that is either 30 to, to 90 or
21 something of that nature. I really can't see it very
22 well, unfortunately. You might be able to read it.

23 Q. You can come up and read it off the board here
24 if you want.

25 A. I was afraid you were going to say that.

26 Q. Hard to fit all this information on an 8-by-10

1 picture.

2 A. I can't read that. It looks like -- so it
3 appears that the yellow says minor; orange is signified
4 by major; green, I cannot read it at all.

5 Q. Looks like it says affected.

6 A. Okay.

7 Q. Would that be right?

8 A. It's hard to tell, but very likely could. I
9 mean, if I had a better picture of the map.

10 Now that I'm close, I can see green, some green
11 and some yellow in this map. Now that I'm up close.
12 But, obviously, predominately red. Looking for something
13 that's not damaged; black. There's a black dot here,
14 structure that's undamaged.

15 Q. Which is really strange because you're pointing
16 out a structure that's basically in the middle of the
17 picture, all around it is all red, and then there's
18 black, and there's a couple of greens right around it.
19 Is there any explanation for how or why that occurs?

20 A. Well, we'd have to look at each structure to
21 try to get a feel if it might have survived by simply
22 blind luck, or if it might have survived because it has
23 better defensible space than neighboring structures, or
24 if it might have survived because it has better building
25 structure, or something collectively, all three of those.
26 It's hard to tell. It's hard to say. I've driven the

1 area many times, and people will say, "Why is that
2 structure standing?"

3 I will say, "There's no good reason why that
4 structure is still standing, because it's all wood-sided.
5 Surprised it's there. Lucky." And then I'll drive by
6 another structure that I have known, seen and known in
7 the past, and think, man, that structure had pretty
8 decent defensible space, pretty good built construction,
9 it's burned down.

10

11 (Grand Jury's Exhibit 105B was marked for
12 identification.)

13

14 Q. All right. Let's move on to 105B. You can
15 stay up here.

16 Recognize what's marked as 105B?

17 A. 105B is, again, a zoomed-in Damage Inspection
18 Map, focusing on the Magalia community predominantly.

19 You have the north end of Paradise here, that I
20 might point out in this lower center section of the map
21 is where Pentz Road and Skyway meet. This would be the
22 north corner of the town of Paradise. And then we get
23 into what's known as Old Magalia here. And then the
24 Paradise Pines Property Owners' Association area over
25 here. And this is an area of the fire that had a lot of
26 damage.

1 I might point out, too, that in the damage
2 inspection they also look at homes that are just on the
3 fringe of the fire perimeter to see if they suffered any
4 damage; maybe ember ignition or things of that nature.
5 That's what you're seeing right up in here, some homes
6 that are right along the fire's perimeter, outside, and
7 they're assessing them to see if there was any damage as
8 well.

9 Q. All right. And so just for more, we've got the
10 lake up here, Magalia Dam --

11 A. Yes.

12 Q. -- correct?

13 A. Yes. Magalia Dam, Magalia Reservoir.

14 Q. And what you're talking about between Old
15 Magalia, is this between the dam and the intersection of
16 Skyway and Pentz, right at the top of the town of
17 Paradise; correct?

18 A. Yes.

19 Q. And the Paradise Pines Home Owners' Association
20 is all of this residential area over here on the left
21 side of center?

22 A. Correct.

23 Q. So, again, a lot of destruction with red dots?

24 A. Yes.

25 Q. So I want to go back to something here in a
26 second.

1 You can go back and sit down.

2 And it's a question that keeps coming up about
3 the speed at which this fire moved. Does Cal Fire have a
4 system or any way of measuring and estimating the speed
5 of fire?

6 A. In general terms, yes. And I'm trying to
7 remember the exact terminology. But we have four broad
8 categories that we measure fire in. This is a general
9 rule of thumb. When the first-arriving officer with the
10 fire department arrives, they give what's called a report
11 on conditions. And they make an assessment based on how
12 fast the fire is traveling on this rule of thumb, four
13 thing. The most -- the highest level of rate, what we
14 call "rate of spread," is known as "critical," and that's
15 any spread over 3 miles an hour. And this fire far
16 exceeded that.

17 Q. So if a fire is moving faster, spreading faster
18 than 3 miles an hour, that is considered a critical rate
19 of spread?

20 A. Yes.

21
22 (Grand Jury's Exhibit 110 was marked for identification.)

23
24 Q. All right. I want you to go back to an exhibit
25 there in front of you, 110. We kind of skipped over this
26 one earlier. But I want to come back to it and ask you

1 if you recognize Exhibit No. 110.

2 A. I do recognize it. I did not create this, this
3 particular map, one of my peers did. However, I created
4 a similar map than this. But I do recognize this map.

5 Q. You're familiar with what's on this map?

6 A. I am.

7 Q. And this map -- and, again, this is the --
8 let's assume these as hypotheticals: That the fire
9 starts above Pulga at approximately 6:16 a.m., and that
10 at approximately 7:44 a.m. the fire is reported on the
11 west side, the Paradise side, of the West Branch?

12 A. Yes.

13 Q. So that's an hour and a half; correct?

14 A. Yes.

15 Q. And do you know the approximate distance
16 between those two points?

17 A. Using the Google Earth measuring tool as you
18 see on Exhibit 110, it was calculated from the
19 approximate area of origin near the community of Pulga to
20 Concow Lake, which where our first reported spot fire
21 was. From there on to Paradise. It's not an exact
22 linear measurement. As you can see, the angle goes from
23 one point to another and then over. But it is probably 7
24 plus miles, clearly. And arguably upwards of 7.4 miles.

25 Q. So according to the measuring tool, from the
26 approximate area of origin to the Concow Lake area, where

1 fire was reported at 7:33 a.m., is 4.2 miles; correct?

2 A. Yes.

3 Q. So in 1 hour and 17 minutes, that fire went 4.2
4 miles?

5 A. Yes. I'm not familiar with the specific time
6 frame.

7 Q. Right. Assuming that, the times on here.
8 We'll get back to those later on. But for right now,
9 we're just assuming that, those times.

10 A. Yes.

11 Q. And then 11 minutes later, that fire was
12 already on the west side of the West Branch in the town
13 of Paradise, another 3.2 miles away?

14 A. Yes. And when we talk about fire, we are
15 talking about spot fires in advance of the main fire. So
16 the main body of fire was progressing across the
17 landscape as new spot fires were developing out in front
18 of it. But, yes, that main first reported spot fire,
19 roughly, 7.4 miles from the origin, in Paradise reported
20 around 7:44 a.m.

21 Q. So basically in just under an hour and a half,
22 this fire traveled 7 1/2 miles?

23 A. Approximately, yes.

24 Q. You said 3 miles would be considered a critical
25 rate of speed?

26 A. Yes.

1 Q. You've been a firefighter for a long time;
2 right?

3 A. I have.

4 Q. Have you ever seen a fire spread as fast as the
5 Camp Fire did?

6 A. No. The only fire that I was physically
7 assigned to that had a comparable rate of spread was the
8 Cedar Fire in San Diego that traveled 30 miles in 15
9 hours on average. The only reason I know that is because
10 I did the GIS mapping of that fire, parts of the GIS
11 mapping of that fire, calculated the progression. And,
12 again, it moved 30 miles in 15 hours. But I have never
13 seen a fire in northern California move like this fire
14 did. Now, obviously, many of the 2017 fires did develop
15 rapidly. I'm not familiar with the specifics of those
16 fires. But from my experience, this is the, by far, the
17 most rapid fire development of any fire from its
18 inception into the first few hours of the fire in
19 northern California.

20 MR. NOEL: I think that's all I have.

21 Do we have any juror questions?

22 (Counsel confer.)

23 MR. NOEL: All right. These are very good
24 questions. I anticipate that those questions are
25 actually going to be answered by the next witness, which
26 is going to be Assistant Chief Messina, who was the

1 incident commander and was actually the one giving the
2 orders you're asking about.

3 So, like I said, these are very good questions.
4 If you don't mind, we'll save these for Assistant Chief
5 Messina.

6 So were there any other questions?

7 All right. Chief Hawks, I think we're done
8 with you for the day.

9 THE WITNESS: Thank you.

10 MR. NOEL: You're excused.

11 The admonition.

12 GRAND JURY FOREPERSON: We have to do the
13 admonishment?

14 MR. RAMSEY: Yes.

15 GRAND JURY FOREPERSON: You are admonished not
16 to discuss or disclose at any time outside of this jury
17 the questions that have been asked of you or your answers
18 until authorized by the Grand Jury or the Court. A
19 violation of these instructions on your part may be the
20 basis for a charge against you of contempt of Court.
21 This does not preclude you from discussing your legal
22 rights with your own attorney.

23 Chief Hawks -- is it Hawks?

24 THE WITNESS: Yes.

25 GRAND JURY FOREPERSON: What I have just said
26 is a warning not to discuss this case with anyone except

1 the Court, your lawyer, or your -- or the district
2 attorney.

3 THE WITNESS: Yes.

4 GRAND JURY FOREPERSON: Do you understand?

5 THE WITNESS: Yes, I understand.

6 GRAND JURY FOREPERSON: Okay. Thank you.

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 185

are certified to be a complete transcription of said stenographic shorthand notes.

3 (Confidential Grand Jury Hearing Proceedings)

4
5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 MR. NOEL: We have two witnesses this morning. We
10 were able to -- to get Captain Marcus Ekdahl to come in.
11 He's the dispatcher who took the initial 9-1-1 call. He
12 will be relatively brief. We will start off with
13 Captain Messina.

14 MR. RAMSEY: Assistant chief.

15 MR. NOEL: Assistant chief. Assistant Chief
16 Messina.

17 [Assistant Chief Messina enters the courtroom.]

18 MR. NOEL: I'm sorry. So if we're ready.

19 GRAND JURY FOREPERSON: I will go ahead and swear
20 you in. Please raise your right hand.

21 Mr. Messina, do you solemnly swear that the
22 evidence you shall give in this matter pending before the
23 grand jury shall be the truth, the whole truth, and nothing
24 but the truth so help you God?

25 THE WITNESS: I do.

26 GRAND JURY FOREPERSON: Thank you. Have a seat.

Please state your name for the record spelling your last name.

THE WITNESS: John Messina, M-e-s-s-i-n-a.

EXAMINATION

BY MR. NOEL:

Q. By whom are you employed?

A. Cal Fire.

Q. In what capacity?

A. I'm an assistant chief for the North Division of Butte County.

Q. How long have you been with Cal Fire?

A. Twenty years. Prior to that, I spent ten years with the Federal Wildland Firefighting Agency.

Q. Could you walk us through your training and your experience that qualifies you to be an assistant chief at Cal Fire.

A. So like I said, I'm ten years into the fire service. I have done multiple jobs within Cal Fire between air attack officer to administrative chief to field battalion chief and now field division chief. I graduated from Chico State in 1996ish. Kind of forget sometimes as it goes by.

I have a Bachelor's in GIS. I did a lot of planning for the fire department specifically Butte County using those type of skills.

As far as qualifications, I'm an incident

1 commander. I'm one of the six Cal Fire statewide management
2 teams. Some of you may be familiar with it. They're the
3 ones that come in after a major incident in the state of
4 California and they manage the incident similar to the Camp
5 Fire.

6 So who showed up that day was Incident Management
7 Team Four, and it was composed of fire professionals
8 throughout the state in different capacities. I'm assigned
9 to Team Five. That's where I'm at.

10 Q. You said you started off as a federal firefighter?

11 A. I did. I worked for the Bureau of Land Management
12 right out of high school.

13 Q. Where were you a firefighter for BLM?

14 A. At the time it was called Nor Cal District, and I
15 worked in the Alturas and Susanville area. And during that
16 time I just worked seasonal as I was attending San Diego
17 State at the time. It was just a seasonal job. That was
18 kind of what a lot of people did was seasonal work while
19 you're working on your Bachelor's degree.

20 Q. And then you ultimately graduated from Chico State?

21 A. Correct.

22 Q. You said with a degree in GIS?

23 A. Yes.

24 Q. What is GIS?

25 A. Geographical Information System. At the time it
26 was considered geography with an emphasis in topography, but

1 now it's a full Geographical Information System degree which
2 basically uses maps to analyze data.

3 Q. Is that relevant to your fire service?

4 A. Believe it or not, it has been. As we know, there
5 is a lot of analysis that takes place. And that skill set
6 definitely has helped with collecting data, plotting it,
7 assessing it. So believe it or not, it really has. I
8 didn't think it would, but it did.

9 Q. You had mentioned incident management teams. Can
10 you explain to us a little bit more in depth what an
11 incident management team is within Cal Fire.

12 A. Absolutely. Like I said, there's six of them. And
13 they are what is considered the experts in the field of
14 emergency management. Well, it's logistics, planning,
15 operation, incident command. And what they do is they go
16 out and grab these experts and say "Hey, we want to form a
17 team." And they're composed of two members.

18 So when an incident happens whether it's a wildland
19 fire, earthquake, you know, any major catastrophe, flooding,
20 local CSD the state can take those teams to go in and
21 assist. And they will take over the total operation. And
22 basically, you take the workload off the local CSD so they
23 are not overwhelmed.

24 Similar to the dam. I know you're familiar with
25 that; the dam. We had two management teams, one assisting
26 the DWR and then one assisting Butte County in case

1 something happened. They were going to be the technical
2 expertise to support the major emergency. We typically
3 don't come in on small, only major complex incidents.

4 Q. You said two members of each team?

5 A. Yeah. It varies a little bit.

6 Q. And six teams?

7 A. Six teams.

8 Q. Are all of the members of the teams from Cal Fire?

9 A. No, they're not. They're composed of a whole
10 government component and a Cal Fire component. There are
11 some numbers associated with these teams of how many you're
12 supposed to have of local government. That way we have a
13 good representation. When you're traveling the state, you
14 know, you show up to LA City to assist LA City, you're going
15 to have some potentially city and local government
16 firefighters and emergency responders on that so we speak
17 the same language.

18 Q. So as you said, we have become all too familiar
19 with the major disasters around here and the TV coverage,
20 seeing people from various counties throughout the state at
21 daily press briefs.

22 Are those incident management people if they're
23 wearing a red hat? When you guys watch on video, those are
24 the incident management team members?

25 A. Some are from Butte County. Coincidentally, we had
26 some Cal Fire employees, our own team four. But some of

1 those were from out of the area. But what we make sure we
2 do is if we come into -- let's say, for instance, my team
3 goes off to Napa County. We incorporate the local
4 responders so they have complete input in the plan we just
5 implemented for them. We're a forcible multilayer for lack
6 of a better term.

7 Q. How long have you been involved in the incident
8 management team?

9 A. I started in 2008 on the Humboldt Fire incident
10 here in Butte County. I spent the majority of it on the
11 operations side which means I would be the person in charge
12 of all operational aspects of the incident. And two years
13 ago I was voluntarily asked to move up to the incident
14 command position. And that's where I serve now.

15 Q. Describe for us what you mean when you talk about
16 operations.

17 A. So the operations section of an incident is
18 responsible for just that; anything that has to do with
19 mitigating the emergency. Everything that is outside of the
20 support is to have a role, but they are not considered
21 operations. There's a lot of folks with roles and a large
22 role that supports what we're doing operationally whether
23 it's putting out the fire, stopping a flood. Whatever the
24 operation is to mitigate the emergency, that is what that
25 section within the team is responsible for.

26 Q. And how is that different from the incident

1 command?

2 A. So the incident command decides what operations we
3 are going to do and delegates that down to that section, and
4 that section implements it. So the incident command
5 establishes the incident objectives. And those are usually
6 established with --

7 For example, I will use, for example, Butte County.
8 If Butte County had an incident here, not a wildland
9 incident, we'd work with Butte County county administration.
10 They'd give us our objective marching orders. Here's what
11 we want you to do to help us mitigate this emergency. The
12 incident command team portion of it would establish those
13 objectives and then delegate it down to their sections to
14 implement which is the operation section.

15 Does that make sense?

16 Q. To me it makes sense.

17 What was your position with Cal Fire on November 8,
18 2018?

19 A. I was the administrative chief for the unit at the
20 time. The administrative assistant chief.

21 Q. What does it mean to be an administrative assistant
22 chief?

23 A. I was responsible for all administrative functions
24 in the unit from the emergency command center, human
25 resources, budget. The paper-pushing stuff.

26 Q. Were you on duty at approximately 6:30 a.m. on

1 November 8th?

2 A. I was. We -- yes.

3 Q. What was your assignment on that day?

4 A. To report to my office. How we structured the unit
5 is one assistant chief has the duty -- we call it duty
6 coverage. They're responsible for all operations in Butte
7 County and Cal Fire for a seven-day period. And we rotate
8 every four weeks. There's four of us.

9 So that day I did not have the duty. Another
10 division chief did. When you don't have the duty, you just
11 go to your normal job which was administration at that time.

12 Q. Where was your office located at that time?

13 A. 220 Grand Avenue here in Oroville.

14 Q. When did you become aware of the Camp Fire?

15 A. I got a phone call from a battalion chief asking if
16 I was listening to the radio. It was around 6:45. If I was
17 listening to the radio and what was going on in Jarbo Gap.
18 And I hadn't been listening to the radio at that time which
19 is normal if you don't have the duty that early in the
20 morning to be paying attention to the radio.

21 Q. So did you begin monitoring the radio?

22 A. Oh, yeah, instantly. And we have access to some
23 fire watch cameras. And I immediately pulled up the fire
24 watch camera just to see if what was being portrayed on the
25 radio was actually -- you could visualize the camera to see
26 if it actually matched up.

1 Q. Were you able to locate the fire on the fire watch
2 camera?

3 A. One of the fires, yes.

4 Q. Okay. We'll get to that in a minute.

5 What steps did you take once you became aware of
6 the fire?

7 A. So at that point after we discussed it -- and, you
8 know, it was in November and the wind was blowing. And
9 there are sometimes, you know, when the wind is blowing. A
10 lot of times -- not a lot of times. There are times when
11 you think "Oh, man." You kind of maybe overreact. And so
12 we were initially thinking -- to me personally from home
13 thinking "Oh, the wind is blowing, but we'll catch it at 60
14 acres because it's November. It's 42 degrees out. We
15 shouldn't have a problem dispatching that." That was my
16 initial response.

17 The duty chief at the time called me and asked if I
18 was available to respond up. And typically, how we operate
19 is an incident happens in the fire department. Regardless
20 if it's a wildland fire or a structure fire we have
21 battalion chiefs in an initial response to go. The
22 battalion chief does the incident command.

23 As the complexity grows, then an assistant chief
24 will respond to either help or assume command. But we don't
25 usually go on the initial response until -- we don't respond
26 until we know that it's a significant incident and they are

1 going to need some help at the incident command post.

2 Q. So at some point were you requested to respond to
3 the incident?

4 A. I did. He asked if I was available to go up there.
5 And he was the duty chief who -- he was responsible to go to
6 the main command center and coordinate the operations from
7 there. And then we ask another assistant chief who doesn't
8 have the duty to respond up there and help coordinate. And
9 that's what he asked me to do.

10 Q. And I'm sorry. Who was the duty chief at the time?

11 A. Garrett Sjolund was the duty chief.

12 Q. Okay. So Chief Sjolund asked you to respond to the
13 incident command?

14 A. Correct.

15 Q. At some point did you take over as incident
16 commander for the fires?

17 A. Yeah. Like I said, initially usually I go up and
18 assist the battalion chief, mentor him a little bit, let him
19 run the incident. Once it expands beyond, you know, a small
20 little incident, then we will step in and we will assist
21 either assuming command or taking a portion of the operation
22 off of him to help with span and control.

23 When I initially got there, I was helping him
24 coordinate a little bit. And it was obvious just from some
25 of the reports coming back that this was going to be a
26 fairly significant incident. So that's about ten minutes

1 after I showed up at the incident command post that I
2 assumed command.

3 Q. Could you spell Chief Sjolund's name for us.

4 A. The last name is a handful. Let me write it down
5 real quick. S-j-o-l-u-n-d, Sjolund.

6 Q. Common spelling; right?

7 A. Common spelling.

8 Q. All right. So as the incident commander, what were
9 your responsibilities?

10 A. Like I said, the incident commander is responsible
11 for setting the overall objectives of the incident,
12 responsible for the overall operations dictating what
13 happens, who goes where, and obviously the overall
14 responsibility for the overall safety of the civilians and
15 the firefighters that are assigned to it.

16 Q. As the incident commander, did you -- were you
17 responsible for everything that was going on with the Camp
18 Fire?

19 A. Yeah, yes.

20 Q. How long were you the incident commander?

21 A. From about 7:44ish to -- it's disputable when the
22 incident management team took command and when we actually
23 transitioned out. But until about 9 o'clock that night. I
24 stayed actively engaged in the operation through about 4:30
25 the next morning.

26 Q. So as the incident commander is it important for

1 you to be familiar with all of the factors and facts of the
2 incident you're in charge of?

3 A. Absolutely, absolutely.

4 Q. So you became intimately familiar with basically
5 everything about the early hours of the Camp Fire?

6 A. Yes.

7 Q. So I'd like to go through a timeline with you of
8 the Camp Fire. And you put your timeline up here on the
9 board so that it can be seen.

10 When was the initial dispatch to the Camp Fire?

11 A. 6:31.

12 Q. And what did that involve?

13 A. There is a standard response plan in Cal Fire which
14 means on a wildland fire -- I'm looking for the exact term.
15 On what is considered a high-level dispatch depending on the
16 weather, you get what is written down on there; six engines,
17 two crews, two bulldozers, two air tankers, a helicopter,
18 chief officer in prevention. The voluntary staff on the
19 state side is a bonus. And we use the -- Butte County
20 volunteered their water tenders and fire engines. Anything
21 that comes outside of the state is a plus.

22 Q. Okay. So this was a red flag day; correct?

23 A. Correct.

24 Q. A high fire threat day?

25 A. Yes.

26 Q. High winds blowing through the canyon; correct?

1 A. Correct.

2 Q. And low moisture content, no trace. Only trace
3 amounts of rain for up to six -- or over six months. Is
4 that correct?

5 A. Correct.

6 Q. So this initial batch that is displayed up here was
7 more than, say, Cal Fire was expecting to a similar fire in
8 February after 20 inches of rain?

9 A. No. On a formal -- you know, depending on the fire
10 danger rating that we established, there is a low, medium,
11 high. And we'll adjust our dispatch based off of that. So
12 on a high that is a normally high dispatch. A low would be
13 something significantly less so we're not committing a bunch
14 of resources to an incident that doesn't dictate it.

15 Q. And November 8, 2018, was a high day; correct?

16 A. That was a high day.

17 Q. Now, can you walk us through -- we're looking at a
18 bunch of numbers here, letters, and themes. "B2118, initial
19 P2121." Can you explain that to us.

20 A. Sure. So the "B" is the battalion chief 2118. And
21 that is the initial attack incident commander that is always
22 dispatched on a multiengine response. Prevention 2121. The
23 "P" -- he goes there purely to start investigations right
24 off the get-go. And we do that so that the origin doesn't
25 get disturbed by firefighters. Because we get there and the
26 firefighters put the fire out. If we wait too long to get a

1 prevention officer starting the investigation, sometimes the
2 origin can be disrupted and it's a little bit hard to
3 determine where the fire started.

4 The training officer -- that is "Train2107" -- he's
5 in his own pickup or in a department pickup. And he's
6 responding as an effort officer to help coordinate the
7 safety aspect of it. And anything with an "E" is fire
8 engine. Anything with a "TD" is a transport dozer. So
9 those are our bulldozers. And the BFC is Butte fire crews.
10 Those are hand crews. So that day we sent three hand crews.

11 Q. So what's a hand crew and how are they different
12 from a normal fire engine?

13 A. So hand crews show up and they've got -- they come
14 in a bus. You've probably see them in the red buses.
15 Specifically, those crews are 33C members, California
16 Conservation Corps members supervised by Cal Fire captains.

17 They show up from anywhere from 13 to 17 members
18 with hand tools. And that's where the hard work is. They
19 chop hand lines and they put fire out throwing dirt with
20 hand tools. They don't have water.

21 Q. When you talked about cutting a hand line, describe
22 that for us. What is a hand line?

23 A. There are a couple ways to put a wildland fire out
24 and that is to extinguish it with water or to remove the
25 fuels from the flames out front so it will burn into
26 something such as bare dirt and go out. That is their

1 assignment. Their assignment is to get their hand tools,
2 chainsaws and they start removing fuel along the line.

3 You know, they can be right up next to it or maybe
4 parallel to it. They remove the line. And the width of the
5 lines that they create with their shovels and rakes is
6 determined on the fire behavior.

7 So if it's really tall flame, the lengths of the
8 line has got to be big. If it's just a small grass fire two
9 feet and they cut some brush back, fire burns into it and it
10 goes out. And that is the theory behind the hand line.
11 Obviously, it's a little more complex than that, but that's
12 the basis of hand line construction.

13 Q. All right. So you said B2118 is the battalion
14 chief first assigned; correct?

15 A. Correct.

16 Q. So that would be -- B2118 would be
17 Captain McKenzie?

18 A. No. B2118 was Curtis Lowry who lives in the
19 Paradise area, engine 2161. Because of where our stations
20 are spaced, what ends up happening is the fire engine shows
21 up first. And that is what you want. No one wants a white
22 pickup to show up first. Fire engines shows up first. They
23 immediately will assume command. Someone has to be in
24 charge.

25 So at that point, it was Captain McKenzie. Once
26 the battalion chief gets there -- he's got to drive from

1 Paradise. He drives up into the area and gets there and
2 says "Now I'm here. I'm going to take command, and you can
3 get into firefighting."

4 Q. Okay. So Captain McKenzie is one of those first
5 engines 2176, but B2118 is Battalion Chief Lowry?

6 A. Yes, correct.

7 Q. All right. So Captain McKenzie in the engine goes,
8 Battalion Chief Lowry comes and, once Battalion Chief Lowry
9 arrives on scene, he takes over as incident commander?

10 A. Correct.

11 Q. All right. So, oh, and you said P2120 was a
12 prevention officer?

13 A. Yes.

14 Q. Is it someone from the Fire Prevention Bureau?

15 A. Correct.

16 Q. Do you know who 2110 is?

17 A. I think it's Tom Kluge. We've had some moving
18 around in our prevention bureau but --

19 Q. So it's 6:31. All of those resources are
20 dispatched up to the Pulga area; correct?

21 A. Correct.

22 Q. Next up 6:44 we have heard Captain McKenzie's radio
23 transmissions. We get more resources ordered up. What is
24 ordered up at that time?

25 A. So on his report on companies, you know, he gives a
26 clear picture of a fire with a fairly significant sustained

1 wind too. He makes an appropriate augmentation which means
2 we're going to need some help and asks for 15 additional
3 engines, bulldozers, some water tenders, and a few more hand
4 crews.

5 Now, what you see up there when it says "4STG,"
6 that is four strike teams of golf. And we will get into
7 that. But that is -- the strike team is composed of two
8 hand crews. So he asked basically for eight hand crews.
9 And we -- for response of a control issue we will group them
10 together and put one guy in charge of them. And we will
11 call them a strike team of hand crews.

12 Q. And what is the -- it says "They were all set up
13 NOPS."

14 A. Repeat that.

15 Q. N-O-P-S. What does that mean?

16 A. Oh, sorry. North ops. That is our geographical
17 coordination center for filling resources. It's in Redding.

18 Q. So this was a second request or the second dispatch
19 in less than 15 minutes from the initial dispatch. Is that
20 normal?

21 A. Yes and no. Under this situation, yes, it would be
22 normal to order that. On a normal wildland fire, you know,
23 "Oh, hey, that might be a little bit much this early. Let's
24 try to get around this fire before we start moving a bunch
25 of resources." In this case, it was obviously appropriate.

26 Does that kind of answer your question?

1 Q. Yep.

2 All right. So we have talked a little bit and
3 you've got through a little bit already.

4 The weather. As an incident commander, how
5 important is the weather to you?

6 A. Extremely important. Probably the number one
7 factor in wildland firefighting is the weather.

8 Q. As a firefighter do you keep daily tabs of the
9 weather?

10 A. Yeah. Weather briefings go out once a day on the
11 radio so everybody has good situational awareness especially
12 when there's red flag warnings. It's discussed daily,
13 reinforced. It's extremely important in wildland
14 firefighting.

15 Q. So what were the weather conditions at the time of
16 the initial dispatch of the Camp Fire?

17 A. I believe these conditions came off the Jarbo Gap
18 RAWS, which isn't -- it's reflective to the location. It's
19 not specifically the origin of the fire. But 42 degrees out
20 at 20 miles an hour and whipping up to 40 miles an hour
21 northeast gusts at 23 percent humidity.

22 Q. Why is humidity important?

23 A. It's basically the moisture content in the fall at
24 that specific time. So as you guys know, green grass
25 doesn't burn. Dead grass does. Relative humidity affects
26 the grass significantly. If you've got 80 percent,

1 90 percent, 100 percent humidity, that means there's rain
2 falling. When you have something below 20 percent, it's
3 extremely dry. You're putting Chapstick on. What that does
4 is accelerate fire spread and growth.

5 Q. You mentioned the RAWS station and the wind.
6 Briefly explain your understanding of what is the RAWS
7 system.

8 A. RAWS stands for remote automated weather system,
9 and it collects weather data from -- there's probably three
10 or 400 throughout the state of California. And it collects
11 weather data at an hourly, sometimes on a quarter of an hour
12 basis. And you're able to log in and look at these weather
13 factors that are being recorded. And it will record
14 multiple weather factors; temperature, relative humidity,
15 wind direction, wind speed, max speed. All kinds of stuff.

16 Q. Things that are important to you as incident
17 commander on a wildfire?

18 A. Absolutely.

19 Q. And you had access to that information once you
20 took over or even before you took over as incident commander
21 on November 8th?

22 A. Yes.

23 Q. In front of you you have what is marked as Exhibit
24 Number 106. It should be at the top of the stack. Do you
25 see that item?

26 A. I do.

1 Q. And displayed up on the board is Exhibit 106. Is
2 this the same?

3 A. Yes.

4 Q. Describe for us what we're looking at on 106.

5 A. So the top graph just shows the average wind chill
6 speed from November 3rd through November 10th. And it just
7 shows it through the day. So you can see it.

8 If the red line goes up, that's a higher wind
9 speed. If the red line goes down, it's a lower wind speed.
10 But the one below it is the max wind gusts.

11 So as a red line goes up, you have a higher gust,
12 recorded gust, peak gust. So it will take the highest gust
13 and plot it on that chart. And that is November 3rd through
14 the 10th.

15 Q. All right. Let's back up a little bit. We were
16 talking about the RAWS station and Jarbo Gap RAWS.
17 Exhibit 106 shows two graphs of information from the Jarbo
18 Gap RAWS station; correct?

19 A. Correct.

20 Q. And in this case the graphs are wind speed graphs?

21 A. Correct.

22 Q. The top graph deals with average wind speed per
23 hour?

24 A. Correct.

25 Q. And the bottom graph by maximum gusts per day?

26 A. Correct.

1 Q. And if I said per hour earlier on the topography,
2 it's actually per day; correct?

3 A. Correct.

4 Q. So is November 8th in here?

5 A. Repeat your question.

6 Q. Is November 8th displayed on the graphs?

7 A. November 8 is displayed on there.

8 Q. What was the top wind speed meaning wind chill --
9 the average wind speed on November 8th?

10 A. So if you look on the graph, it looks like 32 miles
11 per hour was the average wind speed at some point during
12 November 8th or the morning of November 8th because it's
13 collected on an hourly basis which just gives you a -- the
14 graph just gives you a rough idea of where the wind was.
15 There are daily charts that will show you by hour, and this
16 isn't one of them. This is by day.

17 Q. Okay. So we already went through the initial
18 resources that were dispatched.

19 This was a high-level wildland dispatch; correct?

20 A. Correct.

21 Q. And just briefly again, what were the resources?

22 A. You see a Cal Fire battalion chief prevention
23 officer, six Cal Fire engines, two volunteer engines which
24 we consider a bonus, a safety officer, two water tenders,
25 two Cal Fire dozers. And at the time because of the type of
26 fire this was no aircraft was dispatched.

1 Q. Now, I want to back up. When we're talking about
2 your experience with Cal Fire, you said at one time you were
3 an air ops commander?

4 A. Yeah. Air tech officer at Grass Valley and the
5 Chico air attack base.

6 Q. So you have a great deal of experience with air
7 attacks?

8 A. Correct.

9 Q. Why wasn't an air attack dispatched at 6:30 in the
10 morning?

11 A. Specifically at Chico we have to balance our
12 pilots' availability to fly. There's requirements. We
13 can't fly them for 12 hours. It's a safety issue. So our
14 pilots only fly seven hours a day. And the State of
15 California has determined the best time for those pilots to
16 be available is from about 10:00 until sundown in the summer
17 which typically the majority of the fires in California
18 start later in the day. It's hotter and dryer than in the
19 morning. Typically, not always.

20 So that's why we balance our pilot flight time to
21 start at 10:00. It will carry you all the way through the
22 6, 7, and 8 o'clock hour in the evening during the summer.
23 They have to have -- by our policy -- 14 hours of rest time.
24 So our start-up times are a little later in the day.

25 Specifically that day -- though when we do have red
26 flag conditions, the region will implement a staffing

1 pattern which allows us to staff aircraft earlier. Three of
2 our attack bases --out of six of our air attack bases in
3 Northern California, three of them were considered earlied
4 up which means they were at base at 08:00 ready to fly.

5 Q. So 08:00, which is 8:00 a.m., was considered early
6 for flying?

7 A. Yes, correct.

8 Q. At 6:30 they weren't even awake yet?

9 A. Weren't even awake. It has to do with pilot time.

10 Now, we did get -- incidents in the evening or at
11 night or early in the morning, we can call pilots back. And
12 that's what we do if we need the aircraft. It just takes a
13 while for them to come from home and stuff. We always have
14 that option to do that. And in this case that happened
15 initially.

16 Q. Does air attack operate at night?

17 A. No. We have no aircraft currently right now that
18 can do any type of night operations.

19 Q. So this incident begins at 6:30 in the morning.
20 The sun is just coming up; correct?

21 A. It's twilight. It would be -- it would be unsafe
22 to fly regardless if they are available due to light
23 conditions.

24 Q. Right. That would be about the time that the light
25 conditions would be fine to get up and fly anyway?

26 A. Correct.

1 Q. All right. Let's walk through some more of the
2 timeline here and the timeline of the fire as incident
3 command. So go ahead. You put together the timeline for
4 us.

5 A. I wasn't there at the incident yet, but at 6:45
6 orders were given to evacuate Pulga. And if you're not
7 familiar with Pulga, it's a small community of about 30
8 structures that sits in the Flea Valley drainage near the
9 incident. At 6:55 there was evaluation warnings that went
10 out first. And then quickly after they figured out what the
11 weather was doing it went straight to evacuation orders.
12 There was a report of a second fire off of Rim Road, and the
13 ECC relays this to the incident commander. And the incident
14 commander says "Hey, send two engines down Rim Road and
15 we'll see if there's another fire."

16 So two of the initial six fire engines get diverted
17 to Rim Road to assess whether or not there's a second fire.
18 At 7:20 that's when I leave my house and respond. I live in
19 Durham. So that gives me about 20 minutes to get to the
20 Concow area. And at 7:42 I show up at the incident command
21 post and at 7:46 I assumed command.

22 Q. So from 7:46 until the incident management team
23 arrived you were the man in charge?

24 A. Correct.

25 Q. You mentioned the fire cams earlier. And that is
26 one of the first things that you did when you heard about

1 the incident was start checking the fire cams.

2 A. Exactly. And that is the camera I pulled up on
3 Flea Mountain. And this is the image that I saw initially.
4 I didn't look at any of the other cameras because I just
5 assumed this was the fire that we were talking about not
6 understanding that there was two fires. And the fire that
7 started in Pulga would be to your left on a different
8 camera. You couldn't see it that early in the morning
9 anyway.

10 Q. All right. So what you're talking about is the
11 photograph that is in front of you that is displayed on the
12 board. That is Exhibit Number 58; correct?

13 A. Is that in here?

14 Q. Yeah, it's in there.

15 A. Sure, yes.

16 Q. It's Exhibit Number 58.

17 A. I don't have a 58.

18 Q. Somebody took it out.

19 A. Correct. Exhibit 58. I have it here.

20 Q. All right. Exhibit 58 we have displayed up here on
21 the board.

22 Now, you said a few minutes ago that you responded
23 from home?

24 A. Correct.

25 MR. NOEL: Oh, that's the ones where we had the
26 problem with numbering.

1 GRAND JURY SECRETARY: Yes.

2 MR. NOEL: Okay. That's why. It should be 57.

3 THE WITNESS: That's the photograph I saw earlier
4 in the morning.

5 BY MR. NOEL:

6 Q. And that is the same photograph that is displayed
7 on the board. It says number 58 on the PowerPoint.

8 Okay. How was it that you were able to access and
9 look at this photograph from home?

10 A. We have a fire watch system that the chief officers
11 have access to with a pass number and log in.

12 Q. So from a computer?

13 A. Yeah, from a computer. From my work computer I was
14 able to pull it up.

15 Q. Do they have a laptop or PC?

16 A. The laptop.

17 Q. Okay. So you have a state laptop that you can take
18 home with you?

19 A. Yes.

20 Q. So that when you get a call like this in the
21 morning, you can pull it up and check it?

22 A. Yep.

23 Q. So you were able to check the cameras before you
24 even headed out to the incident command?

25 A. Absolutely. And I was able to check the weather.
26 You know, it just creates a "favorite" and you're able to

1 pull up the Jarbo RAWs. And say the wind is really blowing.
2 Maybe this isn't -- maybe that is something significant.
3 And that is pretty standard protocol throughout any incident
4 in Butte County is we'll use those items and gather them to
5 try to assess the potential.

6 Q. Okay. Going back to what we talked about earlier,
7 the weather is very important as a firefighter or as an
8 incident commander?

9 A. Absolutely.

10 Q. So before you even went up there that morning, you
11 were able to check the fire cams, you were able to check the
12 Jarbo Gap RAWs and get the weather reports; is that correct?

13 A. Yes, correct.

14 Q. Anything else that you were checking on?

15 A. No. Just listening to the radio traffic also gives
16 you a clear idea of what is happening. Captain McKinzie is
17 a very experienced fire captain. He's been around a long
18 time. And we all -- all the chief officers have said if he
19 says it's got significant potential, it's got significant
20 potential and especially coming from him. He's worked in
21 that area a long time.

22 Q. Right. He's been in charge of Jarbo for quite a
23 while?

24 A. Yes.

25 Q. And when he gets to a fire and says "We've got a
26 problem," that is something that is taken seriously?

1 A. Yes.

2 Q. So that is why within 13 minutes of initial
3 dispatch they were already scrambling up -- what was
4 it? -- fifteen more engines and multiple dozers and hand
5 crews?

6 A. Yes, correct.

7 Q. All right. So you see this image Exhibit
8 Number 57. And do you know what you're looking at at this
9 point?

10 A. Yeah. I just assume it's the fire we're responding
11 to.

12 Q. Did you realize where this fire that's shown again
13 was?

14 A. Yeah. You could see -- I could tell it was in the
15 Flea Mountain area. And I can see Concow Lake in the
16 background. So it made sense where he was. Because I was
17 just told there was a fire in Concow and I wasn't
18 specifically told initially where it started at. And I'm
19 assuming that's it.

20 Q. Where was the incident command initially?

21 A. The initially established ICP was at the hardware
22 store in Concow.

23 Q. So when you responded from your home, that is where
24 you responded?

25 A. Correct.

26 Q. So let's get back to our timeline. And walk us

1 through the timeline.

2 A. At 7:31 we hear radio traffic that is the first
3 reports of fire on Meadow Springs Road. And until you're
4 able to pull a map out and reference where that is, other
5 than the fact that there's fire in somebody's backyard, it
6 doesn't really mean a lot until you're able to reference
7 where the fire started and where the fire is currently, if
8 that makes sense. And at the time I'm still driving to the
9 ICP and Curtis Lowry at the time is taking in this
10 information.

11 Q. So we're looking at the slide that is marked as
12 Exhibit Number 107. And you should have the original in
13 front of you?

14 A. Yep, correct.

15 Q. And that's a slide that you put together?

16 A. Yep.

17 Q. Describe for us what we're looking at.

18 A. It just showed a general location over by Pulga
19 where the fire started in that general location. And the
20 intent of this slide and the presentation we're doing is to
21 show how fast the fire was moving and impacting communities.

22 And we had drove spikes in. On Goggle Earth you
23 type in the address where the metal spikes are that are
24 recorded and that's where the location came up. And we just
25 drew a snap line to it.

26 Q. All right. And there's one kind of contradiction

1 in here. In the white box on the top left it says "Fire
2 spread 4.3 miles." But on the legend to the right it says
3 "Fire spread 4.2 miles."

4 A. It may have been just a staging area. I think the
5 legend on the left of 4.2 is actually what Goggle Earth will
6 pop out. I think I had the fire spread 4.3. That was a
7 good catch. I didn't even notice that. But I would have to
8 say 4.2 is probably the correct line distance right there.

9 Q. So this Meadow Spring Road point, that was the
10 first report that you got of fire in the Concow residential
11 area?

12 A. Correct.

13 Q. Let's talk a little bit about rate of spread of the
14 fire. What does it mean rate of spread to you as incident
15 commander?

16 A. Rate of spread is how fast the fire is moving at
17 the head of the fire, the front of the fire. We don't take
18 into consideration the flames. And we gage it feet per
19 minute. Even during the day we'll announce the typical
20 weather or fire behavior factors over the radio. That will
21 give you an idea of if a fire starts, how fast a fire
22 travels.

23 Obviously, we hadn't done that yet. But prior to
24 that, we'll do a spread component. So we'll say a spread
25 component to 156 which means the fire potentially is going
26 to spread 156 feet per minute which is fairly rapid. In

1 general terms speaking a low, medium, and rapid or dangerous
2 to critical rate of spread, those are the four
3 characteristics that we use to describe them. And anything
4 more than three miles an hour is considered a dangerous or
5 critical rate of spread specifically on this incident.

6 So if we said the fire started at 6:31 and at 7:31
7 we already are 4.2 miles ahead of it, we know that three
8 miles an hour is considered critical. You can say it's
9 spread 4.2 miles an hour which is well above critical rate
10 of spread.

11 Q. Now, we know 6:31 was the initial dispatch time.
12 So let's assume that the fire probably started sometime
13 before the initial dispatch. So it wouldn't quite be
14 4.2 miles per one hour. But does that mean it's any less
15 critical?

16 A. No. And I will briefly talk on rate of spread
17 specifically on this one. This fire wouldn't have initially
18 started. It took a little bit of time to align with that.
19 See on the map up there where it says "Pulga," that sits in
20 the Flea Valley drainage. Once the fire gets in the mouth
21 of that drainage, that's when you start to see extreme and
22 rapid fire growth. It gets in the mouth of that drainage.

23 And that is just my interpretation of what I've
24 done. There is no specific data that says "At this time."
25 But 7:02 is when we feel it actually gets into the mouth of
26 that drainage. That is when the rapid growth starts at

1 7:02.

2 Q. And you said that this reached a critical rate of
3 spread?

4 A. Correct, critical. It goes from dangerous to
5 critical.

6 Q. All right. Next up you have Exhibit Number 108.
7 It's another map satellite photograph that you prepared for
8 us. Do you have that 108 in front of you?

9 A. Yes.

10 Q. And you are familiar with 108?

11 A. I am.

12 Q. And it's the same as what is displayed on the big
13 board up here?

14 A. It is.

15 Q. Explain to us what we're looking at on 108.

16 A. So the intent of this slide was the first reports
17 of fire on the west side of the -- or the west side of the
18 west branch in the town of Paradise was at the end of Drayer
19 Lane and shortly after that Merrill, Shay Lane, which you
20 can't really see on this. But those are roads right there
21 (indicating). And the intent on this was to show you the
22 drainage area. Just left to the red arrow that is called
23 Griffith Gulch.

24 This day the wind was channeled through that
25 drainage causing -- it was grabbing every hot ember you
26 could imagine that was airborne and channeling it through

1 that drainage. So that's what has been referred to ground
2 zero for the Town of Paradise as far as when the fire enters
3 the town of Paradise.

4 Q. So this right here (indicating), this is Griffith
5 Gulch?

6 A. That is Griffith Gulch.

7 Q. And you said that acted as a drainage for the
8 winds?

9 A. Yes. Similar to how the Feather River Canyon does
10 it. It takes the wind out of the Feather River Canyon and
11 it chokes it down and speeds through that little gulch right
12 there.

13 Q. And back here in the background we have Concow and
14 Concow Lake?

15 A. Correct.

16 Q. So the fire is coming from this (indicating)
17 direction coming from up above?

18 A. Yes.

19 Q. And basically is riding these winds into the --
20 through the gulch which opens up and takes it across into
21 the town of Paradise?

22 A. Yes.

23 Q. All right. You said that the first reportings of
24 the fire were on Drayer Drive?

25 A. Correct.

26 Q. We have Exhibit Number 109, another Google Earth

1 map. You see 109?

2 A. Yes.

3 Q. Do you recognize 109?

4 A. Pardon me?

5 Q. Do you recognize 109?

6 A. I do.

7 Q. And what does 109 indicate?

8 A. It shows Drayer Lane. And that was our first
9 report through ECC that there was fire on the Paradise side
10 of the west branch.

11 Q. And what time is that?

12 A. 7:44.

13 Q. That is right before you took command; correct?

14 A. That is what triggered me to take command.

15 Q. Right. You arrived at 7:42 and you took command at
16 7:46?

17 A. When we got reports of that, we knew we had
18 something that we had been planning for years and expecting.
19 It was obvious that that report right there took the
20 incident to a new level of complexity.

21 Q. Next we have a map marked as 110. Do you have 110
22 in front of you?

23 A. I don't, but I am very familiar with it.

24 Q. Okay. Yeah, I know. There's 110. You're familiar
25 with 110?

26 A. Yes.

1 Q. This is another slide you prepared?

2 A. Yes.

3 Q. And 110 is the same photograph that we're looking
4 at on the big board?

5 A. Correct.

6 Q. Describe to us what we're looking at here.

7 A. This here shows that the distance of 4.2 miles from
8 an estimated origin to the first reports of fire in Concow
9 and then from that to the first reports off of Drayer Lane
10 just gives us an estimated distance of travel of the fire.

11 Q. So the distance from Meadow Springs to Drayer Drive
12 is 3.2 miles?

13 A. 3.2 miles.

14 Q. And so that's at 7:44?

15 A. Correct.

16 Q. Thirteen minutes after the first reports of fire in
17 the community of Concow?

18 A. Correct.

19 Q. So now we have this fire has moved around seven
20 miles in an hour and 13 minutes; correct?

21 A. Correct.

22 Q. We talked about three miles an hour being a
23 critical rate of speed?

24 A. Yes, correct.

25 Q. I'm not a mathematician but seven miles in an hour
26 and 14 minutes or 13 minutes would be pretty close to six

1 miles an hour?

2 A. Yeah. It was unprecedented. That was the issue.
3 When we started getting reports, it was hard to comprehend
4 at the ICP exactly how fast it was spreading. And remember
5 too 9-1-1 phone calls are coming in by the hundreds. And
6 that's normal for a wildland fire anywhere in California.
7 We will get calls from Vina saying that the fire is in their
8 backyard, and we have to verify that.

9 So we will get false information. But people don't
10 understand. Yes, obviously a lot of people were calling
11 from Paradise saying "There's fire in the backyard," but we
12 were also getting calls from outside the area saying they're
13 seeing ash dropping in the Chico area and fire is in my
14 backyard in Chico. So it's really important that we verify
15 exactly where that fire is.

16 So at the ICP initially there we're thinking maybe.
17 Is it true? Is it not true? That is what's going through
18 your mind. We treat it as true. We have to but still
19 comprehend that the rapid rate of spread you're still kind
20 of thinking "We're going to send a fire engine, but there's
21 just no way it's there."

22 Q. And that's the next question I was going to ask is
23 a lot of this now you're seeing, you know, in hindsight;
24 correct?

25 A. Correct.

26 Q. And that's a lot different than what you knew and

1 what you were seeing on the morning of the 8th; correct?

2 A. Yes, correct.

3 Q. So you're in the command post. You're not thinking
4 "But that fire just traveled seven miles." What are you
5 thinking?

6 A. I'm trying to grasp the magnitude because it's
7 7:44. At 8 o'clock we were already getting reports of
8 fatalities and burn-offs in Concow. And when we start to
9 have that stuff happen on an incident, obviously the
10 complexity goes way up because now our number one priority
11 is life safety. And now we are converging on Concow. Heads
12 are down. Our employees on the 8 o'clock hour are not only
13 taking care of their own safety but they're rescuing
14 hundreds of civilians in Concow. So we're focused on the
15 civilian rescue portion of it.

16 And when these reports of rapid spread, of "Hey,
17 we've got fire in our backyard," you have to stop and think
18 "Holy cow, now we have a major issue seven miles away from
19 where we're at right now." And it makes things extremely
20 complex. There is only so many resources to go around. So
21 many firefighters and first responders and law enforcement
22 are sent to specific locations.

23 I don't know the population of Concow, but I think
24 it's 5 to 6 to 700. That takes a lot of resources to assess
25 all of those. Our initial response went into Concow.

26 It's typical for fire to travel eight miles an

1 hours. So the assumption is we're going to put all
2 resources in Concow. Maybe we'll pick the fire up and
3 rescue everybody and we'll start planning for Paradise. It
4 was outpacing any thoughts that we had, plans that we had
5 determined that we were implementing at the ICP.

6 Q. I want to talk a little bit about rate of spread.
7 Because for most of us when you talk about fire spreading,
8 you see the typical disaster movie. You know, this huge
9 wall of flames, you know, 50 feet high and a mile wide and
10 is sweeping down and taking out everything.

11 What is it like in reality?

12 A. Other than a grass fire, which what you see on TV
13 is you have solid flames in the front. And a grass fire
14 burns fast in conditions like that. The rate of spread is
15 dictated by spot fires. You won't have necessarily a
16 massive wall of fire. You do, but out in front of it you
17 have multiple spot fires. And those turn into major fires,
18 and they push together. And they keep doing that.

19 I always described it as the main fire eats the
20 spot fire up and it feeds itself. It throws a spot fire
21 out. That fire becomes a major incident. It catches up.
22 That spot fire throws another spot fire or ember that
23 creates a spot fire. And that is how the rapid rate of
24 spread is determined.

25 You will have large green pockets in between major
26 fires. So theoretically this day it would be similar to

1 having six, eight, ten major incidents. It's major fires at
2 any one time burning together if that makes sense.

3 Q. Define for us what is a spot fire.

4 A. So spot fires are created by the main fire.
5 Generally, it's enough heat where it takes material, puts up
6 a smoke column. And if the wind is blowing hard enough, it
7 will grab that smoke column and blow it a certain direction
8 depending on relative humidity, temperature, how hot the
9 fire is, how high it can get up into the air, and how long
10 that ember burns, and when it lands on the ground, whether
11 or not it starts another fire, if that makes sense. And
12 that is what happened that day. Because of the weather and
13 the wind it was able to make it a lot further than what
14 would be normal conditions.

15 Q. So when we're talking about this fire, the rate of
16 spread, we're talking about not just some fire front that is
17 coming out of Pulga, we're talking about all of the embers
18 that are being thrown out in front of the fire, the main
19 fire and igniting more and more fires?

20 A. Correct.

21 Q. And so we're starting to see that the fire is now
22 getting over into Paradise?

23 A. Yes.

24 Q. So by 7:44 we've got embers that are now being
25 thrown several miles from -- or now are starting additional
26 fires several miles from where this fire started in Pulga?

1 A. Correct. And I'll tell you in all of history of
2 Butte County no fire has ever crossed the west branch.
3 There has been a lot of fires take a shot at it, but because
4 of the geographical features it hasn't allowed it.

5 Even when -- if you're familiar with the 2008 Butte
6 Lighting Complex Fire, the fire ran down really hard through
7 Concow and it stopped at the west branch. And because of
8 past history we have to -- we use that as a planning
9 mechanism. And some comments we made is "The west branch is
10 going to help us."

11 So when we first initially got a spot fire across
12 the west branch, no big deal. We're going to send a fire
13 engine there. We get spot fires all the time. Put it out.
14 The main fire, we're assuming, is going to stay on the west
15 side -- or the east side of the west branch.

16 Q. You talked earlier about hand crews and cutting
17 fire lines and dozers cutting fire lines. Technically, the
18 west branch is basically considered a huge fire line;
19 correct?

20 A. And a fire break, correct. It's got water in the
21 bottom of it. We use geography for fire control line;
22 roads, rivers, and ridges. That's your basic fire tactics
23 class right there. We use ridges because they're easy to
24 hold fire and we use roads and we use rivers; the three
25 "R"s. So that would be considered a control line on any day
26 that we're fighting fire in that area.

1 Q. Right. In general, fire doesn't like to go
2 downhill; correct?

3 A. Correct.

4 Q. And it goes downhill much slower than it goes
5 uphill?

6 A. Yes.

7 Q. So the west branch was considered part of your fire
8 defense?

9 A. Absolutely. And a lot of times with north wind
10 conditions the wind changes from northeasterly to -- it gets
11 in that canyon because the canyon runs north and south and
12 the wind starts blowing through Paradise. And it kind of
13 catches and heads to the south a little bit which kind of
14 skirts the fire. And that's how come it -- not only is
15 there water in the bottom of it and it slows down when it
16 gets there, the wind changes a little bit and directs it
17 down canyon.

18 Q. We can actually see that on this map here. We've
19 got a series of canyons running from the northeast to the
20 southwest out of the Flea Mountain area into Paradise;
21 correct?

22 A. Correct.

23 Q. And those canyons tend to funnel the wind. And
24 much like we've already talked about on multiple occasions,
25 the Feather River drainage winds, the Flea Mountain drainage
26 winds, those are funneling the wind right into Paradise?

1 A. Correct. I think something that is important too
2 is there is no way really to gauge it unless you have a
3 weather balloon up.

4 What was phenomenal about that day was that the
5 winds at higher elevations were significantly more than
6 what we were registering on the ground or at Jarbo Gap. And
7 how we know that is how the smoke column sheared off. It
8 never had vertical growth to it. And it should have because
9 of the heat it was generating which means one thing. The
10 winds are blowing really hard at the higher elevation. It
11 was backed up by our first air tanker that showed up. And I
12 think this is important. That's why we had rapid growths
13 and such is spot fires.

14 I don't know if any of you are pilots. But when
15 they come in for a drop, they put their flaps down and
16 they're pulling back on the accelerator. It's almost like
17 they want to land. It brings them slow and low. They drop
18 and then they put the metal to the pedal and they take off.
19 So when he puts his flaps down and throttles back to idle,
20 he should be falling like a rock to get down to the road.
21 In this case, he was falling a thousand feet per minute
22 elevation because of the amount of wind coming over the
23 wings. So he was -- he said, "No, I can't. I've never seen
24 anything like this." He abandons and goes back to Chico.

25 And there's two types of air speed and ground
26 speed. Air speed is how fast the air is going over your

1 wings. The ground speed is how fast you're actually
2 traveling across the ground. He was going 150 miles an hour
3 back to the base and he was indicating 280 miles across the
4 wing. So that's a 130 mile-an-hour headwind at 3,500 feet
5 above the ground, which is not unheard of but for that day
6 that definitely didn't help us.

7 Q. So when you're going back and defining terms when
8 you're talking about air tankers, you're talking about the
9 planes that are equipped to drop fire retardant?

10 A. Correct.

11 Q. And these are big planes?

12 A. Very experienced pilots. They're turboprop-driven,
13 lots of power made to fly in rough terrain, weather
14 conditions, yes.

15 Q. So you said that the air attack was sped up because
16 of the conditions at about 8:00 a.m.?

17 A. So the air tanker was -- the air attack wouldn't
18 come on until normal because we had three other attack --
19 air attacks staffed at Grass Valley, Sonoma, and Redding
20 that day.

21 Q. Okay. So what time did the first tanker get up to
22 fly and engage the fight in the Camp Fire?

23 A. It's going to be real close. I think he launched
24 from Chico at 7:45.

25 Q. And you said that that tanker got up there and
26 radioed that it just was not safe to fly in?

1 A. Not safe. And shortly after that the air attack --
2 because we called him back and took off after him. The
3 attack -- because he can fly at a higher-up altitude, it's
4 safer to be in rougher conditions. Because if something
5 happens, you have thousand of feet to correct and right
6 yourself.

7 When you're down low level and you're in those
8 rough conditions, it's just dangerous not to mention that
9 the retardant is extremely ineffective. As soon as it comes
10 out the bottom of the aircraft, it blows six miles to the
11 left because of the wind and it's just useless. So it's not
12 worth the risk to utilize them at that point.

13 Q. What is the difference between air attack and a
14 tanker?

15 A. An air attack flies above everyone and he
16 coordinates the air operation making sure that no one flies
17 into each other between the helicopters and the air tankers.
18 He's their aircraft traffic controller. And he also gives
19 operational intelligence to the incident commander on where
20 the fire is, how things are progressing.

21 Q. So the air attack -- that is the little tanker
22 plane that we see circling up above everything else?

23 A. Correct.

24 Q. I want to go back to one other thing. You talked
25 about the plume or actually the lack of a fire, a smoke
26 plume in this case and the significance.

1 A. I know we have all seen it in Butte County. We've
2 had some fires over the Plumas National Forest to the east
3 or even to the west and you see a big column goes up and it
4 looks like thunder; right? I think everybody has seen that.
5 We have a really active fire but probably very little wind.

6 In this case, when you have a fire like this and
7 that column can't get any vertical growth, it's -- there's
8 two reasons why that happens. It's not generating enough
9 heat which means it's non-burning fire or it's ripping and
10 the wind is pushing the column over and driving the fire
11 into a direction. So the fact that there was no smoke
12 column or smoke plume in this case indicates high winds.

13 Q. Okay. All right. You said at 7:44 when you
14 started getting reports of fire in Paradise, you took over
15 as incident commander at 7:46. And I think your exact term
16 for us was that took this to a whole other level. So
17 explain that to us.

18 A. Correct. Evacuation is number one priority. I say
19 in any emergency progress is life safety. So I think just
20 prior to this we had put the Pentz Road corridor into
21 evacuations five minutes before this. Once we had fire on
22 the Paradise side, we had to implement evacuations. And
23 there's something about evacuations. We don't take them
24 lightly.

25 How it works is in a wildland fire, the fire
26 department will recommend areas to evacuate. We base that

1 on fire behavior and potential. We give that to the law
2 enforcement having jurisdiction whether it's the Town of
3 Paradise or Butte County Sheriff's Department. They
4 implement the evacuations. They send out the warnings.

5 What we'd discussed at the ICP base once we had
6 fire in the town of Paradise is we are still going to try to
7 put it out. But if we have no choice to evacuate -- and we
8 don't take evacuations lightly. It can be pretty difficult.
9 And I know we're getting good in Butte County of
10 evacuations.

11 What you don't want to do is cry wolf. We can't
12 evacuate large masses just because it's a huge economic
13 issue with, you know, businesses evacuating for days and
14 days. When a fire doesn't threaten a community, it only
15 happens a few times before the communities are upset that
16 they keep getting evacuated. Nothing really ever happens.
17 And what it does is it desensitizes the community on when it
18 really needs to happen and to get them going. We take it
19 very seriously on evacuations and make sure it's appropriate
20 and that we're not crying wolf. In this case, we weren't.
21 We weren't crying wolf.

22 Q. All right. So you said a few times before that
23 plans were already made; that it was an expectation that at
24 some point a fire like this was going to happen in Paradise;
25 correct?

26 A. Correct.

1 Q. And we talked about using the west branch as a fire
2 line. Do those plans include evacuation plans for the town
3 of Paradise.

4 A. Yes, correct.

5 Q. And we have on the big board -- and you should have
6 it in front of you -- Exhibit Number 111. Do you see
7 Exhibit 111?

8 A. Yes.

9 Q. And is that Exhibit 111 that you're looking at, is
10 that the same that is up on the board?

11 A. Yes.

12 Q. This is the Paradise evacuation plan; correct?

13 A. Correct.

14 Q. Can you explain that to us briefly before we move
15 on.

16 A. So the plan is based off the zones. And every
17 resident that's living in that zone gets mailed out a flyer.
18 "You're in this zone," and some directions if you're to
19 evacuate, what you should do.

20 The zones are -- the zone theory allows fire
21 commanders and law enforcement to practically pick areas so
22 we don't have to evacuate the entire town in certain
23 instances.

24 So, for example, look at zone three. Maybe we have
25 a fire in Magalia and we only want to evacuate a little
26 portion of Paradise precautionary. Prior to zones, we would

1 say -- well, you try to get some roads and you try to draw
2 it on a map. This right here makes things easy, quick.
3 Evacuate zones 12 and 3. Law enforcement has the plan.
4 They've got their mechanism to message that out. It's a
5 very efficient and appropriate way to establish areas you
6 want to evacuate.

7 Q. So at this point can you explain to us a little bit
8 about the personnel that are involved in the incident
9 command.

10 A. So at that time the incident command post -- ICP
11 for short -- is the location where the incident commander
12 and anybody who's -- any stakeholder having participation in
13 the incident is. It's a known practice where we rally
14 around the incident command post.

15 So law enforcement will show up whether it's Butte
16 County Sheriffs, Paradise PD, Chico PD, depending on where
17 the incident is Public Works, PG&E. Anybody that has input
18 into the operation that day attempts to rally around the
19 command post which allows face-to-face communication. It
20 eliminates phone calls, radio traffic.

21 "Please call Public Works." So someone has to call
22 Public Works to tell them to put up road block signs here.
23 I can talk to the Public Works guy or law enforcement
24 directly and say "We need to shut this down. We need to
25 evacuate this" so we don't have information fall off the
26 plate.

1 Q. So prior to 7:44 when we got the first report of
2 the fire on the west side of the west branch at that Drayer
3 Drive address, you said that an evacuation warning had gone
4 out for the Pentz Road area of Paradise?

5 A. Correct.

6 Q. So that would be evacuation zones 3, 8, 14, and the
7 lower Pentz zone; correct?

8 A. I think the initial incident commander Curtis
9 Lowry -- I think what he voiced out on the radio just put
10 the Pentz Road corridor in evacuation warning which would be
11 3, 8, 14, and the lower Pentz.

12 Q. So at 7:46 you assumed command?

13 A. Correct.

14 Q. And what is the first thing you do?

15 A. Evaluate 2, 8, 14, and lower Pentz based off of the
16 fact that we had fire at 7:44 on Drayer Lane.

17 Q. Okay. So you put out the evacuation order. You
18 said two. Should that have been three?

19 A. Oh, I'm sorry. Yes. It was 3, 8, 14, and lower
20 Pentz.

21 Q. So basically the entire Pentz Road corridor?

22 A. Correct.

23 Q. You immediately at 7:46 ordered the evacuation of
24 all of eastern Paradise?

25 A. Correct.

26 Q. What happened next?

1 A. So the evacuation plan was based off of phasing it
2 in and not having the town all at once to allow roads to
3 clear up so we don't have a backlog. And that was the
4 theory.

5 And I talked to my law enforcement partner at ICP
6 and said "Don't let me forget we'll evacuate in about
7 45 minutes. We'll take some more zones to get them out and
8 we'll let the system flush out."

9 At 8 o'clock our air attack finally gets overhead
10 and makes a call and says "Hey, there's fire all over in
11 Paradise." After that report we basically evacuated
12 multiple zones in another round of evacuations 15 minutes
13 later which includes 2, 7, 13, and Morgan Ridge. And you
14 see we're only evacuating portions closest to the fire
15 trying to give time for the system to flush out.

16 Q. And at 8:02 mandatory evacuations for all of
17 Paradise?

18 A. So typically how it works is evacuation orders come
19 from the first commander down to law enforcement. Because
20 at this point things are starting to become fairly chaotic
21 in the command center with the amount of 9-1-1 calls. We
22 have a law enforcement partner. And I turned to him
23 verbally and said "Evacuate these zones." I also do it over
24 the radio because it gives situational awareness to
25 everybody that's on our frequency. A lot of people scan
26 that we're evacuating portions of Paradise.

1 When I radioed in, I tell them "Make sure you call
2 the Town of Paradise and tell them we are evacuating these
3 zones." The dispatcher gets off the radio and picks up the
4 phone to the PD, gets a little confused, and says "Evacuate
5 the entire town."

6 That is not standard, but on that day that
7 nonstandard direction she gave the Paradise PD helped us
8 because we weren't getting the intelligence of where the
9 fire was. The ECC was -- they were getting 9-1-1 calls and
10 people were saying "There's fire in my backyard." They were
11 so overwhelmed they were not able to relay that to the
12 incident command post. So there may have been a fire on
13 Billi Road and we wouldn't have known until someone told us.
14 We just -- we don't know.

15 They were getting overwhelmed. They were having a
16 difficult time getting some of that information back out to
17 us. They couldn't get off the phones. The phones kept
18 ringing. You have to answer the phones because there's
19 still emergencies going on in Oroville, Gridley, Chico.
20 Mom's sick, heart attacks that are outside of that incident.
21 They have to pick up the phone. They can't not answer it
22 because there could be a heart attack going on in Berry
23 Creek and we need to send a response to it.

24 So she gets confused and says "Evacuate the entire
25 town." So at 8:02 the entire town of Paradise was asked to
26 evacuate.

1 MR. NOEL: Madam Foreperson, is this a good time to
2 take a break?

3 GRAND JURY FOREPERSON: Okay. Fifteen minutes?

4 MR. NOEL: Yes, Ma'am.

5 GRAND JURY FOREPERSON: Do you want him admonished
6 before?

7 MR. NOEL: Pardon?

8 GRAND JURY FOREPERSON: Do you want the
9 admonishment before?

10 MR. NOEL: Sure. It's always better to be safe
11 than sorry.

12 GRAND JURY FOREPERSON: Okay. Mr. Messina, you are
13 admonished not to discuss or disclose at any time outside of
14 this jury room the questions that have been asked of you or
15 your answers until authorized by the grand jury or the
16 court. A violation of these instructions on your part may
17 be the basis for a charge against you of contempt of court.

18 This does not preclude you from discussing your
19 legal rights with your own attorney.

20 Mr. Messina, what I have just said is a warning not
21 to discuss this case with anyone except the court, your
22 lawyer, or the district attorney.

23 Do you understand?

24 THE WITNESS: I do.

25 GRAND JURY FOREPERSON: Thank you. All right.

26 [Recess taken from

1 10:06 until 10:24 a.m.]

2
3 [DISCUSSION OMITTED.]

4
5 BY MR. NOEL:

6 Q. All right. So we left off with the evacuation of
7 Paradise. You have gotten one call that we've got fire on
8 Drayer Drive in Paradise.

9 Now, we are looking at Exhibit Number 112. You
10 should have Exhibit 112 in front of you.

11 A. Yep, I do.

12 Q. What is Exhibit 112?

13 A. That is Merrill Lane and Drayer Drive.

14 Q. What is the significance of Merrill Lane?

15 A. That was probably our first confirmed
16 we-know-by-our-employees of fire being in the town of
17 Paradise off of Merrill Lane.

18 Q. What time did that occur?

19 A. Right around 8:15, 8:16ish. One of our battalion
20 chiefs who we were going to assign to the incident command
21 was driving from Oroville up Pentz Road. He comes up to
22 Merrill Lane and Pentz and sees a fairly significant spot
23 fire already burning homes down. He thinks it's an entirely
24 different fire because --

25 And this gentleman -- he's also a 30-year veteran
26 with lots of experience, been around the state fighting

1 fires. He's still thinking there is no way this is from the
2 fire in Pulga. It's got to be a whole new fire. So he
3 calls the command center on a different frequency and says
4 "I'll take my own wildland response," which is six engines,
5 two dozers, "and augment with another team because there's a
6 fire in Paradise." He doesn't quite understand what's going
7 on on the other side of the west branch on the east side.

8 Q. Do you recall which battalion chief that was?

9 A. Battalion Chief Bill Lopez.

10 Q. Lopez?

11 A. L-o-p-e-z.

12 Q. And so Battalion Chief Lopez calls in and reports
13 to your command center that he's actually viewing a fire on
14 Merrill?

15 A. Correct.

16 Q. So at 8:16 now we have fire in another location in
17 Paradise?

18 A. That's correct.

19 Q. On the eastern side of Pentz on the western side of
20 the west branch?

21 A. Yes.

22 Q. I will move on to 113. Do you have Exhibit 113 in
23 front of you?

24 A. Yes.

25 Q. And you're familiar with that exhibit?

26 A. I am.

1 Q. And we have that exhibit displayed on the big board
2 in the PowerPoint presentation?

3 A. Yes.

4 Q. All right. And describe Exhibit 113 for us.

5 A. This one just shows the locations where fire first
6 got onto the west side and the time that it started to
7 impact the Feather River Hospital. And I think what is
8 important here is you can see Griffith Gulch and you can see
9 how it kind of lines up where if you look at it as the water
10 flows, why we had fire specifically right there. Because of
11 that gulch.

12 Q. So we're talking about this (indicating) right
13 here?

14 A. Correct.

15 Q. And I'm indicating basically the valley or gulch
16 that is running from the top right of the picture down
17 through the -- to the left down to the central?

18 A. That's correct.

19 Q. So what time do we initially have fire at Feather
20 River Hospital?

21 A. 8:25 is the reports of fire at least behind it or
22 just below in the canyon.

23 Q. And Feather River Hospital now is denoted by a
24 yellow pin?

25 A. Yes.

26 Q. So now we know you have fire reported at Drayer

1 Drive, which is the yellow pin at the top, Merrill Road,
2 which is the yellow pin in the middle, and Feather River
3 Hospital which is the yellow pin at the bottom by 8:25?

4 A. Correct.

5 Q. So three distinct and separate locations on the
6 east side of Pentz Road in Paradise?

7 A. At some point during this timeframe -- Shay Lane --
8 we also get reports of fire off of Shay Lane, which probably
9 is right in the middle of your two pin drops of Merrill and
10 Feather River Hospital is Shay Lane.

11 Q. So what actions did you take once you have fire
12 reported in the area of Feather River Hospital?

13 A. So evacuations start to be prioritized on who gets
14 help. And we focus on at-risk civilians, which are the
15 elderly, care homes, hospitals, schools. And in this case,
16 just so you know, when you go to evaluate a hospital, it's a
17 second event where -- when you talk about complexity, this
18 adds significant complexity of evaluating a hospital. And
19 I'm sure you guys can understand why.

20 Luckily, Feather River Hospital does not have a
21 large amount of beds and still doesn't. It doesn't make it
22 any easier on you when you're trying to evacuate a hospital.
23 At that point though the fire has surrounded the hospital,
24 and we're trying to complete evacuations while the area
25 around it is burning. It makes it a little bit difficult.

26 Q. So what time was Feather River -- the fire at

1 Feather River Hospital initially reported?

2 A. Right at 8:25. At 8:31 we decided they needed help
3 evacuating -- expediting evacuations, and we were going to
4 allow whatever helicopter could land on the helipad to pick
5 up the critical patients and transport them by air to
6 expedite the evacuations.

7 We knew that the roads at that point on Pentz Road
8 were starting to become congested and anything by ground was
9 going to take a long time to get them out of Paradise. So
10 the critical patients we were using helicopters to transport
11 them.

12 Q. And what time did you get confirmation of fire at
13 Feather River Hospital?

14 A. Right at 8:40. One of their outbuildings -- I'm
15 not sure exactly what it was -- had caught on fire.

16 Q. And how do you respond once you actually had
17 confirmation of fire at Feather River Hospital?

18 A. Two events happened. At that point there was a few
19 fire engines assisting with evacuations. They were able to
20 suppress that. Later in the day additional buildings in the
21 complex caught on fire.

22 And when we're determining -- there's a lot of
23 priority when you're prioritizing structural defense. When
24 we're going to protect an individual's home or a critical
25 infrastructure, the infrastructure comes first. And the
26 hospital is considered a critical infrastructure. So later

1 that day when other buildings and the complexes became
2 involved with fire, we sent what we had available into that
3 area to suppress that.

4 Q. All right. Let's talk more about evacuations and
5 the timeline of evacuations. And what was the next
6 evacuation order?

7 A. So at 8:49 not knowing that the emergency command
8 center had already told the town of Paradise to evacuate the
9 whole town, the air attack around 8:45 called and said the
10 fire is halfway through Paradise. Halfway. Basically the
11 fire has destroyed half of Paradise already.

12 Smoke was laying over so he didn't really have real
13 accurate information on how far the fire had progressed into
14 the town of Paradise. But from his vantage point he felt
15 half the town of Paradise had already been destroyed which
16 was not really good news because that was the first time we
17 had heard how far the fire had advanced through the town.
18 And that's what triggered the rest of the evacuations.
19 Those zones capture pretty much the entire town. At 8:49
20 that was given to the law enforcement through our emergency
21 command center to make those notifications. Luckily, our
22 command center had already passed on that at 8:02. So that
23 was basically a mute point.

24 Q. But that is when you had made the decision that
25 those areas needed to be evacuated too?

26 A. Correct.

1 Q. All right. Moving on to Exhibit 114, are you
2 familiar with this exhibit?

3 A. Yes.

4 Q. It's the same exhibit that we have up here on the
5 board?

6 A. Correct.

7 Q. And we have seen it previous and we're going to see
8 it here in a minute. What does this exhibit show?

9 A. So I had acquired a photo from an ex-employee who
10 is standing at Lookout Point. And if you guys look on that
11 map right there, down at the very bottom along the whole
12 area, that is Skyway, Tomin Road. The real sharp turn down
13 at the bottom is Lookout Point.

14 He's standing at Lookout Point back up towards
15 Paradise. And at 8:15 he snaps a photo of a fire in the
16 Honey Run Canyon area. He just snaps a photograph of it. I
17 mean, he happens to give it to me.

18 At 9:14 an engine from Chico city is responding to
19 assist us. And they report a well established spot fire in
20 the Butte Creek Canyon/Honey Run area which, if you see the
21 little red line, the yellow line -- if you see the little
22 red icon, if you just go off of that point about right there
23 (indicating) and go up in the canyon a little bit and come
24 down a little bit, right in there, there was a spot fire
25 right in there (indicating). About 8:15 is when it starts,
26 but we don't know about it until 9:15. And it's already

1 pretty well established.

2 Q. So at 9:15 we now have a real established fire
3 reported by Chico fire engines in the Honey Run Canyon right
4 below Skyway?

5 A. Correct. And that becomes a significant issue. At
6 the time what ended up happening is that impacts the
7 evacuation route along Skyway extremely early in the day
8 which compounds the problem we have with congestion.

9 Q. We talked earlier about the evacuation plans. What
10 were the evacuation routes available to the persons in the
11 town of Paradise?

12 A. If you're not familiar with Paradise, there's only
13 really four ways to the south; Skyway, Pentz, Clark Road,
14 and Neil Road. Those are the main exits out of the town of
15 Paradise. Obviously, they can go north through Magalia, but
16 that goes down to one lane.

17 The problem on this day with evacuations were every
18 route was overran with fire during the evacuation. And it
19 was overrun early. And I know you've probably seen a lot of
20 videos through the media. Trying to get civilians to drive
21 through a flaming front isn't real easy. They don't like to
22 do it let alone untrained and not knowing where they're
23 going. So that compounds the evacuation. Flames are
24 leaning over a road so somebody stops. Well, that stops
25 traffic all the way back up. They're like "I'm not driving
26 through that." If there is nobody there to encourage it,

1 traffic just sits.

2 Q. So let's move on to Exhibit 115 that you have in
3 front of you. Do you recognize that?

4 A. Yes. I have 115.

5 Q. Do you recognize 115?

6 A. Yes.

7 Q. And that's the same exhibit that is going to show
8 up here on the big board?

9 A. Correct.

10 Q. This is another slide that you prepared?

11 A. Yes.

12 Q. What does Exhibit 115 show?

13 A. This was supposed to show from an estimated point
14 of origin to where the spot fire was located. This is the
15 distance the fire had traveled by 8:15.

16 Q. So this is 8:15 when the first person you said
17 reported to you fire in the Honey Run Canyon area?

18 A. The pictures were taken at 8:15. We didn't get the
19 reports until 9:14. So at 9:14 we knew this fire was in
20 Honey Run.

21 Q. But subsequently, you received information -- you
22 know that this fire was burning at 8:15?

23 A. Correct.

24 Q. So less than two hours from the initial report of
25 this fire, the fire is now burning on the west side of
26 Paradise in the Honey Run Canyon below the Skyway?

1 A. Yes.

2 Q. And were you able to approximate that distance?

3 A. Twelve and a half miles.

4 Q. So in less than two hours the fire had traveled
5 over 12 and a half miles?

6 A. And the issue now is the geographical distance is
7 so vast to reposition any resources from Pulga or Concow to
8 Butte Creek Canyon. And I don't know if you're familiar
9 with the area. It's an hour and a half drive. So if we
10 want to move a fire engine over there, it would take an hour
11 and a half to get there.

12 Q. And that was going to be my next question. Talk to
13 us about the initial approach. How this incredible rate of
14 spread affected or was effected by -- by your ability to
15 station resources?

16 A. So right around the 9:30 hour we conceded that this
17 was no longer a wildland fire and it was a mass casualty
18 incident at that point. And the fire is just part of the
19 emergency. We were no longer suppressing the fire. We
20 weren't squirting water. We weren't using bulldozers to
21 suppress it. We were purely in evacuation rescue mode.

22 That is when that spot fire got relayed to me.
23 There was nobody to send to it. And we knew it would free
24 burn. We knew it was going to burn a whole bunch of homes
25 at Valley View. But at this point we started basing our
26 actions off of where the evacuations were in the process,

1 who has been notified to evacuate, and how much time did
2 they have to exit the area.

3 Those that had little time got the most resources.
4 Areas that had hours the assumption is you will follow the
5 warnings and you will evacuate. Those areas were last to
6 get resources to assist because they were theoretically the
7 last to get impacted.

8 Butte Creek Canyon -- we did not put resources into
9 that until 4 o'clock. Those people were asked to evacuate
10 well before that. If they heeded the warnings, worse case
11 scenario their property was destroyed. We focused
12 everything on the town of Paradise and Concow because they
13 had very little warning and they were the ones needing
14 assistance. So that is how we allocated throughout the day
15 of who got what for evacuations.

16 And I think you guys have probably all heard it.
17 There just wasn't enough to go around. We had to pick and
18 choose who got what to assist.

19 Q. Let's talk a little about the deployment of
20 resources. Now, initially, the original call goes out and
21 the initial dispatch time is around 6:30 in the morning from
22 the Jarbo station, Battalion Chief Lowry, and
23 Captain McKenzie to Pulga; correct?

24 A. Correct.

25 Q. So we've got a wildland forest fire coming up to --
26 the original reports said the fire. You said that sometime

1 around 7:40 a.m. was when you got the report of the
2 potential or the determination of a potential second fire in
3 the Concow -- the eastern Concow area around Rim Road;
4 correct?

5 A. Correct.

6 Q. And assets from that were being sent to -- from
7 Pulga were pulled off and sent to Rim Road; correct?

8 A. Correct.

9 Q. And then when you know that -- first, we've got all
10 the assets that are scrambling up there. How did the speed
11 of fire affect your ability to deploy assets and get assets
12 out in front of the fire?

13 A. It's a terrible analogy. But as we were driving to
14 where we thought we needed to go, the fire was running past
15 us. So Captain McKenzie's augmentation of 15 additional
16 fire engines, initially we assign them to Concow because
17 that is where we were. When they got into Concow, they were
18 there. There was no redeploying them. The majority of them
19 went into Concow because we had major issues in Concow with
20 civilian fatalities, rescues.

21 In Butte County there's only 28 fire engines total,
22 and that's with operators. Thirty-two depending on the day.
23 We dispatched six, asked for 15. We're at 21 fire engines.
24 So there's only ten left for the entire county. And that's
25 the City of Chico, Oroville.

26 Q. Gridley?

1 A. Gridley. Ten for the entire county. They all got
2 dispatched. So now we have ten engines for a community of
3 30,000 just hit with evacuations.

4 Obviously, law enforcement -- you know, a lot of
5 people were helping. But to actually go up there and defend
6 evacuation routes, there were ten engines left because the
7 fire just progressed so fast where we had issues that that
8 is where we deployed them. By the time they got there, the
9 fire was well past it. We were still having issues in
10 Concow though with civilian rescues. There just wasn't
11 enough to go around.

12 Q. This would be a good time to ask. In your career
13 was this fire unprecedented in terms of the speed with which
14 it was spreading?

15 A. It's funny. You know, we've been asked that
16 multiple times. I have been on a few fires with similar
17 rates of speed. When you get into Southern California and
18 Santa Anna, they blow. I'm sure you've seen them on TV.

19 The difference on that day was -- and you're going
20 to see it. Some of you are looking at it now. It was a
21 direct bullseye. If you look at what we call banks, the
22 right side of the fire and the left side of the fire, it's
23 where the fire stops and the green starts.

24 At one point the flames literally lined up with the
25 town limit boundaries and it smacked Paradise right square
26 in the nose. I have never seen anything like that.

1 Usually, when you got fire in an urban area -- because you
2 start to have pavement, homes, parking lots -- the rate of
3 spread stops and it only penetrates -- you saw it in Sonoma.
4 It goes a little ways and the firefighters are able to pick
5 it up. You don't devastate an entire community.

6 And at one point around noon we needed to have some
7 structure statements for the State Operations Center to make
8 some judgments on what is happening. And when we were asked
9 "How many houses do you think have burned down," we do give
10 a swag. At that point we felt 10,000 homes had burned down
11 which is very unprecedented, the destruction and how fast it
12 moved.

13 And I'll be honest with you. Those conditions we
14 had met the criteria for red flag warning and bad fire
15 weather, but they were at the low end. There was times we
16 were way above that. And for the fire to move and do what
17 it did that day under the low-end threshold of this as bad
18 weather, it's absolutely amazing.

19 Q. You used the term "swag."

20 A. Swag. An estimate, a wind shield assessment of how
21 many homes you think that have been destroyed. It's not an
22 accurate assessment. It has to do with information down at
23 the State Operations Center. Oh, and they need some
24 intelligence on a trigger. It's something that goes on at
25 the state level on the amount of homes destroyed.

26 Q. All right. Next up we have Exhibit 101. Do you

1 recognize Exhibit 101?

2 A. I do.

3 Q. And the 101 that you're looking at is the same as
4 is being displayed here on the big board?

5 A. Yes.

6 Q. What is 101?

7 A. So that was data acquired by a satellite that was
8 passing by. And when the incident management team showed up
9 the following day, our Geographical Information System
10 component of the team, the mapmakers were able to get this
11 data and actually plot it on Google Earth. This photograph
12 was snapped -- if you want to call it a photograph. This
13 aerial imagery was snapped at 10:45 that morning.

14 Q. On the morning of the 8th?

15 A. On the morning of the 8th.

16 Q. And again, this is the GIS that is your degree in
17 college?

18 A. Yes, correct.

19 Q. And you have a background with Cal Fire and GIS?

20 A. Correct.

21 Q. Kind of give us a little explanation of what GIS
22 is.

23 A. I'm going to make it really rudimentary. It's
24 mapping. It's taking digital information and putting it on
25 a map. That is basically what it is.

26 In this case Deer Creek GIS are contractors that we

1 will ask to come help us. We have the expertise. They will
2 show up at the incident base, and they produce whatever maps
3 that we ask them to do.

4 Q. What does this map show?

5 A. So you can see if you guys look at your actual
6 handout -- I hope you can see it. If you want to look at
7 it, if you take the upper portion of it, you can see the
8 little lake. And that is Magalia Reservoir. I think it's
9 clear enough for you to see it to give you an idea.

10 Q. You can come up here to the board and point things
11 out. I'm sorry. And if you'd like to draw on it, we can
12 activate the drawing tools.

13 A. The fire starts somewhere in here (indicating).
14 The Magalia Reservoir is right here (indicating). So Upper
15 Skyway where it gets real narrow before it goes into Magalia
16 is right in this (indicating) area. Town limits. That is
17 Clark and/or Pentz and Skyway. Down here where this
18 really -- that is a heat signature. That means it's really,
19 really burning hot.

20 You can see all the little squares. Those are
21 homes that are on fire. This is the Feather River Canyon
22 right here and Pentz Road goes up there. Matter of fact,
23 you can kind of see the outline of Pentz Road. The town
24 limit sits about right there (indicating). You couldn't
25 have asked for more of a bullseye. This fire could have
26 gone this (indicating) way. This fire could have gone this

1 (indicating) way. If it started down here, it would have
2 been a glancing blow. The conditions were perfect.

3 Would you like me to go over --

4 Q. Sure, yep.

5 A. -- spot fires.

6 When we were talking, that is what those are
7 throughout the town. As the evacuation happened, that is
8 that 8:15 picture. I showed you a picture at 8:15. And at
9 9:14 we reported a fire in Butte Creek Canyon. That's it.
10 It is well-established in Butte Creek Canyon. It's 2,000
11 acres and is already crossing Skyway which impacts the
12 evacuations.

13 These spot fires were burning. If we're trying to
14 go down Skyway and one of these has impacted Skyway, we
15 can't drive through it. We had to reroute traffic. We
16 would reroute it. And I'm just throwing it out no
17 specifics. Because that day we were rerouting it all over.
18 We'd say "All right. Everybody now goes to Wagstaff to
19 Clark Road." And we're going down Clark Road -- so Clark
20 Road sits about right here (indicating). You get over to
21 here and there's fire here that has impacted it. And at one
22 point we just have to say "You got to go through."

23 That is really easy to say. But when you don't
24 have somebody down there actually saying "You have to go
25 through" -- and there wasn't -- that's when people were just
26 stopped and the gridlock started. And that's when we were

1 hearing reports of people saying "I'm getting out of my
2 vehicle and running." And that is when we started using the
3 temporary refuge areas. Like once people exit their
4 vehicles, it's really hard to get them back in their
5 vehicles. And it became very complex to manage that
6 evacuation at this point.

7 Q. Now, we talked earlier about, you know, kind of the
8 chaos. You're getting reports of fire here and there and
9 fire everywhere and, you know, a lot of it as we're looking
10 at it now in hindsight. This is part of the hindsight;
11 correct?

12 A. Correct.

13 Q. You're not seeing this on the morning of
14 November 8th. Now we're going back and seeing these
15 satellite images. And they help you make sense of the
16 information that you were getting at the time that seemed to
17 make absolutely no sense; correct?

18 A. Correct. This would have been instrumental in the
19 response that day. This type of data would have validated
20 or we would have understood the fire was throughout the
21 town. But that would have helped with the evacuations
22 because we just didn't know. All we had was verbal reports
23 of small spots here, spots there.

24 Our emergency personnel and law enforcement -- they
25 were stuck in the traffic also. I mean, they were taking
26 measures to get around it, but you didn't traverse through

1 the turn to go validate whether or not the road was open.
2 We just would assume that you're going to go through the
3 road.

4 Q. On that personal note, your initial incident
5 command post was at the parking lot of the hardware store in
6 Yankee Hill on Highway 70?

7 A. Correct.

8 Q. At one point didn't you have to abandon your post
9 there and evacuate the command post and move it?

10 A. Yeah, we did. Once the fire entered Paradise, we
11 understood what was about to happen. And we were in a poor
12 location with communications, cellphone coverage. This
13 would be a fairly significant event as you guys see now.
14 And we needed that to be more accessible to everybody
15 understanding that this was going to be a pretty major
16 event. So we repositioned it to Butte College around the
17 10 o'clock hour.

18 Q. But you got stuck in the traffic also at that
19 command center?

20 A. Yeah. Through your entire training once you set up
21 an incident command post where everybody rallies up, you
22 only move it if you absolutely have to because you have to
23 tell everybody "We're over here now," and they can't find
24 you. You need to have accessible room to expand.

25 But we had one bar, you know, on our cellphones.
26 And you guys know that type of communication is becoming

1 very critical. For radio traffic we weren't in a great spot
2 to receive radio terrific. It was fine for the initial fire
3 in Pulga and Concow. But when it got into Paradise, it
4 wasn't. So we moved.

5 Half the problem was with the 20 vehicles assigned
6 to that incident command post, only half had lights and
7 sirens. They were law enforcement. Fire -- we still have a
8 lot of non-emergency responders assigned to the command post
9 helping us. So we went in a caravan. And when we came down
10 Highway 70, we turned right onto Pentz and we took a left
11 onto Durham Pentz to head towards Four Corners. And at that
12 point now we're in the opposite lane. You know, the roads
13 are significantly impacted.

14 We broke over into the Butte College area where
15 Four Corners is and where the convenience store and gas
16 station is. And there was probably 2,000 people in that
17 intersection. And that is where we wanted to set our
18 incident command post center up. I thought "Oh, we're in
19 trouble" because we're stuck in traffic now and we're trying
20 to manage the most significant wildland fire in the United
21 States' modern history time and we're going to do it
22 separated from each other. And that is bad news, like bad
23 news. That was -- my first initial impression was "This
24 couldn't get any worse today."

25 The reports we were getting -- we were getting
26 multiple reports of people trapped. You know, burn victims.

1 And I'm trying to drive and write that stuff down, but that
2 is the ICP's responsibility to take that stuff down and get
3 it out to the right resources for assistance.

4 And so I'm stuck in traffic. We were able to take
5 some evasive maneuvers with traffic and didn't know where we
6 were going to go. And we were able to turn into the
7 entrance off of Clark Road into Butte College. And low and
8 behold there wasn't a single soul in there. And I don't
9 know why because there was at least 2,000 people in that
10 intersection right around the corner.

11 There was three events that day that put a pin in
12 my stomach. One was the air attack. One was the fire half
13 through town. The other one was being stuck in traffic at
14 10 o'clock. I really thought that that is where we would
15 spend the next five hours in traffic. That would have been
16 really bad.

17 Q. Now, one of the things we haven't talked about is
18 communication networks. Communications are essential in an
19 incident like this; correct?

20 A. Correct.

21 Q. What did the fire do to the communication networks?

22 A. Early on -- so a lot of main commune -- the fiber
23 optics, the phone lines that run along Pentz, early on those
24 were destroyed or damaged which crippled the landline
25 capability. And they did -- obviously, throughout the day I
26 had heard 60 cellphone towers burned down -- I don't know if

1 that's true or not -- which obviously crippled any
2 communications up on the fire line. We were still good at
3 Butte College to go anywhere else. But to call up into the
4 impacted area it was very difficult.

5 The problem is -- the reason why we use that -- we
6 don't like to use cellphones. We like to use radio traffic
7 because everybody can hear it and it creates situational
8 awareness on what is going on. You can imagine the radio
9 frequencies were pretty overwhelmed with radio traffic,
10 important radio traffic.

11 Q. So the fire took out a lot of the infrastructure of
12 the communications?

13 A. Early.

14 Q. Pretty early on?

15 A. Correct.

16 Q. And crippled communications?

17 A. Correct.

18 Q. All right. Let's move back to our timeline. We
19 are on 116 now. And do you have 116 in front of you?

20 A. I do.

21 Q. Do you recognize 116?

22 A. I do.

23 Q. And you see the same 116 up there on the big board?

24 A. Yes.

25 Q. And we are back to our timeline. Now what are we
26 looking at?

1 A. So about 14:00 -- or excuse me -- 2:00 p.m. traffic
2 starts to alleviate a little bit in the town of Paradise and
3 traffic is flowing. Evacuations are starting to move a
4 little bit better. We still are having problems because
5 there was a lot of people that were either trapped who saw
6 those spot fires. So they decided "I'm okay. I'm in the
7 green area. I'm not going to leave." Well, sooner or later
8 those areas burned. So there was a smaller population that
9 was still in the town of Paradise that we were driving
10 around helping to evacuate.

11 When we utilized those temporary refuge areas, we
12 had to have ways to get those civilians out. They still
13 were in jeopardy because those temporary refuge areas are
14 just that: Temporary. They're in an area that is safe for
15 the time being but most likely isn't going to be safe.

16 Some things that we did that day that has never
17 happened in the United States is we commandeered some
18 busses, the B-Line busses, we brought in Public Works
19 front-end loaders and we assigned fire department personnel
20 with them. And we drove them up the road and had them start
21 evacuating anybody that was walking down the road in these
22 temporary refuge areas.

23 The front-end loaders were pushing cars off the
24 road. And they were actually using their clamshell buckets
25 to cut power lines. Those power lines become a significant
26 issue. I have never seen anything like this. They came

1 down so soon. And they were major power lines, not just
2 little ones you can drive over. You know, the 12-inch cable
3 tower or power lines that were impeding the flow of traffic
4 out of town. And that became very successful that day of
5 getting more people out of the impacted area.

6 As the fire progressed out of the town of Paradise,
7 you guys know very well it gets into a grass-fueled type and
8 becomes easier to manage suppressing from a fire
9 perspective. Just grass is easy to fight fire in. The
10 problem is there was nobody to go fight it. We were still
11 all up in Paradise. We had very few fire engines.

12 At this point, the sun is about to go down. And if
13 we went back to that, you know, you don't need to. The wind
14 charts that you saw, if you went back and took a look at
15 them, on that night we had gusts of 70 miles an hour. The
16 wind blew harder that night than it did on the 8th.

17 The sun went down. So those conditions started
18 again. And we had fire running south, east, west in the
19 grass. It was pretty remarkable. We were back into the
20 "Where is this thing going?" And that is when we started
21 evacuating Oroville, Chico. Some portions of Chico were
22 evacuated. We were getting ready to evacuate the evacuation
23 Center, the jail. Again, there just wasn't enough
24 suppression resources to engage it as it came out of the
25 town of Paradise.

26 Q. So by 18:50 hours or 6:50 p.m., just 12 and a half

1 hours after it started, the next reports of the fire -- a
2 little less than 12 and a half hours where has the fire
3 spread to?

4 A. It's all the way down to Highway 99. A piece of it
5 had run to Highway 149 at Opensaw Road. It had crossed
6 Highway 99, and it was now coming down into the town, the
7 city limits around Skyway, Honey Run, and Stilson Canyon,
8 into the city of Chico.

9 Q. Back to our timeline, the fire continued to spread.
10 You just said the fire is threatening Stilson Canyon by
11 19:43 or 7:43.

12 A. Correct.

13 Q. And then 20:27 or 8:27 p.m. the fire is at Opensaw
14 Road on Highway 149?

15 A. Correct. At this point the incident -- let's back
16 up a little bit.

17 At 8:00 in the morning we asked for 250 fire
18 engines over the radio. Through a phone call we asked for
19 another 250, which is 500 fire engines at 8:00 in the
20 morning. That is the largest request for assistance in
21 California's history on initial attack fire. The problem is
22 there's obviously in California not 500 fire engines. So we
23 have to go as far as Southern California for them to drive
24 up to assist us. Long Beach City takes a long time to get
25 here.

26 About 19:43 and 20:27 Southern California fire

1 resources were just arriving into the county. Luckily, they
2 were driving through those areas as the fire was hitting
3 those roads, and they were able to engage with no direction,
4 no briefing, no frequency which violates pretty much any
5 protocol we have on wildland fire because it's a safety
6 issue. They were able to engage that portion of the fire
7 and make some really good efforts on controlling that spread
8 especially around the community of Chico.

9 Q. You said that -- or I'm sorry. Who is B2112 and
10 P2127? Do you know?

11 A. So the battalion 2112 is Battalion Chief Garrett
12 Sjolund and the prevention 2127 is John Gaddie, G-a-d-d-i-e.
13 Those two run into a little bit of trouble given they
14 weren't assigned to the incident. And they were giving us
15 an idea of where the fire spread was.

16 There's something else to consider on that. We
17 typically get our intelligence from our own personnel. "The
18 fire is at this point. The fire is at that point." In this
19 case on that day that couldn't happen due to the magnitude
20 of the situation and how many rescues were going on. We had
21 very little intelligence on the fire spread. Our aircraft
22 couldn't see through the smoke column because -- you've seen
23 pictures how it lays over. They couldn't tell where the
24 fire was. This was probably the first time that we actually
25 had one of our own employees tell us "Here is where the fire
26 is at" and validate it. It wasn't good news, but at least

1 it was some news.

2 Q. Now, I want to go back to something real quick.
3 You said earlier in Butte County there are 28 fire engines?

4 A. Correct.

5 Q. Correct? So on any given day there are 28 fire
6 engines available to fight whatever is going on? Fires and
7 everything else?

8 A. Correct.

9 Q. Your initial request to the state was for an
10 additional 250?

11 A. Correct.

12 Q. And your second request was for an additional 250
13 on top of that?

14 A. Correct. And this is for the -- what we consider
15 the initial attack, the early stages of a fire. We knew we
16 wouldn't get them all right then and there but that would at
17 least start the ball rolling. And at the time when we
18 placed the orders, we still felt that we were going to
19 defend portions of the town. And we didn't release that
20 thought until about 10 o'clock when we knew that it wasn't
21 going to happen.

22 Q. All right. So you said by 8:27 or by 20:27 the
23 fire had reached Opensaw Road and Highway 149?

24 A. Correct.

25 Q. Right. You have in front you 117, Exhibit 117.
26 See that?

1 A. Yes.

2 Q. Familiar with 117?

3 A. Yes.

4 Q. 117 in front of you is the same photograph that we
5 have up here on the board?

6 A. Yes.

7 Q. This is another map of Butte County; correct?

8 A. Yes.

9 Q. There is some yellow pins all over the place.

10 A. Yes.

11 Q. Describe for us what we're looking at here.

12 A. So I would have to say that is probably the -- as
13 the sun went down and the incident management team like took
14 every, you're looking at basically where the fire's
15 perimeter was on Opensaw to Neil Road up towards Chico. And
16 then, you know, where the pin drops are -- those are some of
17 the significant locations of fire spread throughout the day.
18 The piece down in Opensaw, that is the piece that we were
19 concerned about because of the threat that it had to
20 Thermalito. And if you zoom out a little bit wider, it does
21 have a large swath of grass going right into Thermalito.
22 And I think at this point we declared evacuation warnings
23 for at least the western portion of Oroville and Thermalito.

24 At this point we are starting to get some
25 suppression taking place. Bulldozers are engaging. The
26 Southern California resources are showing up, and we're able

1 to attack and make some really good ground along that
2 Opensaw Road back up towards Clark and then towards Lake
3 Oroville.

4 Q. So at sometime before 6:30 in the morning the fire
5 started clear up here?

6 A. Correct.

7 Q. And by 8:30 that night the fire has come all the
8 way down here through Paradise and is now attacking Chico
9 and potentially Oroville on Highway 149?

10 A. Correct.

11 Q. All right. On to 118. What is Exhibit 118?

12 A. This is the fire progression map throughout the
13 entire incident of the fire, but I'm going to step down if
14 that's all right.

15 Q. Absolutely.

16 A. This is the final perimeter of the incident when we
17 declared it contained November 24th or 23rd. As the sun
18 went down, I want to say, at 9 o'clock our perimeter was
19 basically this piece right to here (indicating). The fire
20 progression map is off on a couple of the colors. It's
21 showing this on the next day. That was done by 9 o'clock
22 that night. So if you want to go just on the outside of the
23 purple all the way around, that was our final -- that was
24 our perimeter at about 9 o'clock at night.

25 Q. Let's have you draw that. Hang on and I will get
26 it. Okay. Draw it with red. If you can draw the perimeter

1 of the fire by 9 o'clock on the evening of the 8th.

2 A. So everything inside the red was the 9 o'clock fire
3 perimeter estimated at 83,000 acres.

4 Q. And let's push "save" so it saves it. And by
5 9 o'clock that night -- oops. I've got to go back.

6 By 9 o'clock that night on November 8th what were
7 the resources that you had at your disposal?

8 A. We had 268 fire engines, 19 water tenders, 17
9 bulldozers, 35 hand crews were actively engaged in either
10 rescues or firefighting. Essentially to approximately 1450
11 personnel give or take some.

12 Q. All right. And then the next slide that you have
13 up there. It's in the PowerPoint entitled "Request for
14 help." I will let you explain this for us, please.

15 A. Yes. That was our request for resources within the
16 first 12 hours for assistance. And as you can tell, we had
17 50 aircraft requests, 585 engines, 87 hand crews, 106
18 bulldozers, and 247 overhead.

19 Q. So when you say 50 requests for aircraft, that's a
20 request for 50 aircraft; correct?

21 A. Correct. That is for a helicopter and a
22 fixed-wing. And we had asked for 50; a combination of 25
23 helicopters and, you know, 25 air tankers.

24 Q. You said that there are three air attack bases in
25 Northern California.

26 A. At the time six. Three had started early that day.

1 Q. Oh, okay. I misunderstood that. So six. How many
2 air attack bases is there total in California?

3 A. There's 11.

4 Q. And how many aircraft?

5 A. We have 23 -- we have 22 air tankers, fixed-wing
6 air tankers that drop retardant, and nine helicopters.
7 Nationwide there's only -- during that time there was only,
8 oh, about depending on what the federal agencies have on
9 contract, another ten. So we had about 33 air tankers
10 available nationwide. And we had asked for every single one
11 of them.

12 Q. So when you're asking for 50 aircraft, whether they
13 be fixed-wing or helicopter, you're asking for resources
14 outside the state of California already in the first
15 12 hours?

16 A. Correct. If they're sitting in Utah at 8:00 in the
17 morning, we asked for them to come out all the way from
18 Albuquerque. Depending on where they're sitting but, yes.

19 To give you an example of that 518 engine request,
20 through the California Mutual Aid System there's only 650
21 available fire engines. So we took 78 percent -- asked for
22 78 percent of the State of California's entire Mutual Aid
23 resources inventory at 8:00 in the morning.

24 Q. What is mutual aid?

25 A. It's where other departments will assist other
26 departments for lack of a better term or Cal Fire. And they

1 actually allow -- the departments will allow so many engines
2 to leave their jurisdiction to go help somebody out but
3 maintain coverage in their own. And it's about 650 state
4 wide.

5 Q. So by 8:00 a.m. you were already requesting
6 assistance from all over the state?

7 A. Correct.

8 Q. And at the bottom it says "overhead 247."

9 A. Yeah. That is line supervision, support personnel
10 specific -- specific individual requests who can help you
11 out with just the suppression. Somebody that helps with
12 logistics, planning. That type of request.

13 Q. All right. Next up we have a chart showing the
14 resources that were assigned to the fire on November 9th.

15 A. Correct.

16 Q. Can you explain this.

17 A. So of those 518 engines 440 of them showed up by
18 night. They may not -- you saw the sun went down. At
19 9 o'clock we had 268 fire engines. A few more went to the
20 line. These showed up the next morning for Friday morning's
21 operational shift. All those resources right there for a
22 total of 3,132 firefighters.

23 Q. So within 24 hours now we've got 440 engines, 67
24 fire crews, 16 dozers, 18 water tenders, and 278 logistics
25 or otherwise overhead personnel here to fight the fire?

26 A. Correct. And the only reason why we didn't get

1 more is if you guys remember around noon on the 8th in the
2 hills the Woolsey Fire started in Southern California which
3 ended up being the fourth most destructive wildfire in
4 California history. A lot of those engines that were coming
5 north turned around to go back to Malibu. So that was a
6 little bit of competition of resources through the day.

7 Q. So basically it was split between the north and
8 south?

9 A. Correct. If the fire would have started after
10 theirs, we would have seen around a fourth of those
11 resources show up.

12 Q. So this fire not only had a huge impact on the
13 North State and, of course, Paradise, the tragic impact in
14 the area, but this fire also especially affected Southern
15 California?

16 A. Drastically. The Cal Fire fleet engines of about
17 360 -- don't quote me on the exact number. The fire engines
18 they had on the Woolsey and the Hill Fires, which were state
19 response fires, they had no Cal Fire resources because they
20 all came to our fire.

21 Later in the year units felt like they could give
22 more than what they normally do. And we took probably
23 90 percent of all Cal Fire resources to this incident which
24 hampered the response in the Woolsey and Hill Fires.

25 Q. All right. Now on to Exhibit 119. And what is
26 119?

1 A. That's the final fire progression map. It's
2 similar to the first one, and it just shows by day how the
3 fire spread with a color associated to each day.

4 Q. Okay. And over near the bottom left corner we have
5 a chart. Can you explain how to read this.

6 A. I have to go take a look at it. So if you look at
7 the blue line and it gets a little bit more of the green,
8 that is -- those first three colors are the fire spread of
9 the first day. And then because there was so much fire
10 spread, they just didn't use one color. They kind of phased
11 it in over three.

12 So you're looking at about this color; right? This
13 line right here (indicating). So the fire spread on the
14 first day and then subsequent days after that shows the fire
15 spread. And we normally do this on every engine department
16 to show when the growth was.

17 As you can see, 90 percent of the fire growth
18 happened in that first 12 hours and after that throughout
19 the night of the 8th. And I note how that wind chart
20 spread. Those wind gusts came back up on the 8th, the night
21 of the 8th. Almost 3,000 homes burned in Magalia, just shy
22 of 3,000 homes that night because of those winds. And we
23 were still strapped for resources.

24 That would have been the third largest loss of
25 structures in any wildland fire just on the 9th. And that
26 didn't even register because of what happened on the 8th if

1 that makes sense. Those 3,000 homes that were burned in
2 Magalia on the 9th would have been the third largest
3 destruction of structures in California's history.

4 Q. You're talking about the destruction as part of the
5 fire -- as part of the mop-up of the fire when Cal Fire did
6 damage estimates and inspections?

7 A. Correct.

8 Q. And what does this slide represent?

9 A. So once it's safe to, we have a damage assessment
10 team that will go out and they will assess every structure
11 within the impacted area of the fire, and they categorize
12 major, minor, or just affected. And those are the numbers
13 that they came up with. And state wide was 19,548. That is
14 including the incorporated areas of Butte County. The one
15 below it is specifically for within the town limits of
16 Paradise.

17 MR. NOEL: All right. I have nothing further for
18 the assistant chief. If there are any questions from the
19 jurors, it will take a second. And give them to the
20 Sergeant at Arms.

21 [Attorneys conferring off the record.]

22 MR. NOEL: Is this the only ones? Nope. Okay.

23 [Pause in proceedings.]

24 BY MR. NOEL:

25 Q. All right. Assistant Chief, we have some of the
26 questions from the jurors.

1 Were you ever able to catch up to the fire in
2 comprehension on November 8, 2018?

3 A. That's a good question. 9:30, 9:38 is when we
4 fully comprehended what we had. And at that point the
5 incident objectives were relayed over the radio of "You will
6 only concentrate on maintaining evacuation routes and
7 rescuing civilians." And at that point is when we realized
8 that it was no longer a normal wildland fire fight, but that
9 it was a rescue, slash, mass casualty incident. But if you
10 want a timeframe on it when we finally said "Holy cow," it
11 was 9:38, I believe, in the morning when we finally . . .

12 Q. At any point were you made aware that evacuation
13 orders were not getting through to significant populations?

14 A. Formally, no. And we wouldn't normally. I do
15 remember a few reports on the radio of people -- you know,
16 people going door to door -- or firefighters going door to
17 door and, you know, radio traffic saying "They weren't aware
18 they were supposed to evacuate."

19 So it was just in passing of radio traffic, no
20 formal notification that evacuation notices weren't reaching
21 the general population.

22 Q. Do you think the conditions of fuel, terrain, and
23 weather were adequate to explain the rate of speed of this
24 fire? If not, what do you think would explain it?

25 A. I think I understand that question. It was a
26 combination of all three of those and the location that the

1 fire started was perfect for the weather to effect it. The
2 type of fuels that it was burning and the terrain that it
3 was going to line up with, you couldn't have asked for -- I
4 don't say this in a positive effect. You couldn't ask for a
5 more perfect alignment for the fire to do what it did.

6 Q. Would it be fair to say that a major fire was
7 anticipated in Paradise the question being a matter of when?

8 A. Yes. I will tell you -- to elaborate a little bit
9 on that. When we went back and I was describing operations
10 to the guys in charge of operations --

11 You have to go to a week-long class. All it does
12 is expose you to the position. In that week-long quantum
13 class you do multiple scenarios. And this is -- every
14 person in every fire department in California that wants to
15 be an operations chief or fire chief has to go through that
16 class to get qualified. In that class for 20 straight years
17 this was -- the Paradise fire was one of the scenarios
18 statewide that we exercised.

19 So I would have to say yes, we fully expected that
20 at some point sometime a fire would start and would impact
21 Paradise. But I'll tell you this: Nobody ever expected it
22 to happen the way it did and how fast it happened.

23 Q. You counted on the west branch being a firebreak;
24 correct?

25 A. Correct. We always thought it would come from
26 maybe Butte Creek Canyon under a north wind or from the

1 south up one of the drainages. And that would be a glancing
2 blow. We'd hold it in some of the communities. Never did
3 we expect it to come directly out of the east.

4 By noon -- essentially the town was destroyed by
5 noon. That never hit anybody's radar. We knew there was a
6 potential, but it never hit anybody's radar of that quick
7 and that large a scope.

8 MR. NOEL: Any further questions?

9 [Attorneys conferring off the record.]

10 **EXAMINATION**

11 BY MR. FOGG:

12 Q. Assistant Chief Messina, are you aware of the fires
13 that affected Sonoma and Napa Counties in 2017?

14 A. Yes.

15 Q. How did those fires affect your understanding of
16 whether fires could possibly impact Paradise and how fast
17 this fire spread?

18 A. Obviously, those were extremely significant fires
19 under the same conditions we had November 8th. They were
20 experiencing high winds also. What that fire did in Sonoma
21 and specifically the Tubbs Fire, like I was saying, when we
22 have wildland fires that encroach on an urban area,
23 typically they go one, two, three streets in and they go
24 out. Because believe it or not towns and cities make great
25 firebreaks. And I don't say that in a positive way. The
26 fire typically doesn't carry all the way through a town.

1 As you saw in Sonoma, it went through like an arrow
2 and hit the City of Santa Rosa and penetrated it and then
3 went out. It ran out of fuel to go house to house anymore.
4 That was the first time a fire has gone so far into a
5 downtown urban area that we've seen ever.

6 So everybody knew "Hey, Man, the fires are starting
7 to push further into town." For whatever reason the
8 conditions that were creating them is becoming a little bit
9 more normal. What it did do on this one is -- yes, we were
10 very -- like, I really expected at any point during the day
11 we'd get radio traffic saying "We've held the fire at
12 Skyway. We've held the fire at Billi. It's not advancing
13 any farther. We're making some success."

14 That never came at all. There wasn't one piece of
15 radio traffic that was positive that day through the entire
16 day. So while it was surprising, it wasn't. And I know
17 that kind of sounds odd but --

18 MR. FOGG: Thank you. I have no further questions.
19 Marc?

20 MR. NOEL: Nope. I think I'm good for right now.

21 GRAND JURY FOREPERSON: Okay.

22 MR. NOEL: Anybody else?

23 Madam Foreperson, would you admonish him and excuse
24 him.

25 GRAND JURY FOREPERSON: Okay. The admonishment
26 that I read to you earlier is still in effect.

Is that good enough?

THE WITNESS: I understand.

GRAND JURY FOREPERSON: Okay.

MR. NOEL: Yes, Ma'am. Thank you.

GRAND JURY FOREPERSON: Thank you.

MR. NOEL: And my next witness would be Captain Marcus Ekdahl. We have two handouts for this one, and they are hole-punched. Oh, I've got another one for you.

GRAND JURY SECRETARY: Okay.

MR. NOEL: Sorry.

GRAND JURY FOREPERSON: Raise your right hand,
please, while I swear you in.

Captain Ekdahl, do you solemnly swear that the evidence you shall give in this matter pending before the grand jury shall be the truth, the whole truth, and nothing but the truth so help you God?

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a seat.

MR. NOEL: Please state your name and spell your last name for the court reporter, please.

THE WITNESS: Marcus Ekdahl. It's E-k-d-a-h-l.

EXAMINATION

BY MR. NOEL:

Q. Captain, by whom are you employed?

A. Say it again.

Q. By whom are you employed?

1 A. Cal Fire.

2 Q. In what capacity?

3 A. Fire captain.

4 Q. How long have you been employed by Cal Fire?

5 A. This is my 17th year.

6 Q. I'm sorry. I was distracted by a typo.

7 A. This is my 17th year.

8 Q. Seventeen years. What training and experience do
9 you have that qualifies you as a fire captain for Cal Fire?

10 A. There's -- you have to be a company officer first,
11 attend six weeks of company officer training. And I had
12 that engine experience, that firefighter experience. So I
13 took several years of company officer, state marshal
14 training. It started as voluntary. And you need all that
15 training to get to the minimum prerequisite to be a captain
16 and then be promoted and such.

17 Q. What was your assignment on November 8, 2018?

18 A. I was duty captain in the Oroville Emergency
19 Command Center.

20 Q. And what shift were you working?

21 A. That was completing my third day shift. So that
22 morning I was to go off duty on November 8th. But that did
23 not happen.

24 Q. What time were you supposed to go off?

25 A. 7:00 a.m.

26 Q. So you were in charge of the dispatch center at

1 approximately 6:25 a.m.?

2 A. Correct.

3 Q. At 6:25 a.m. and 13 seconds did you receive a 9-1-1
4 call?

5 A. Yes.

6 Q. Did you answer the call?

7 A. Yes.

8 Q. You personally?

9 A. Yes.

10 Q. You took the call?

11 A. Yes.

12 Q. And you have in front of you -- or I will hand to
13 you --

14 MR. NOEL: Let's mark this Exhibit Number 132 for
15 identification.

16 [Exhibit 132 marked
17 for identification.]

18 BY MR. NOEL:

19 Q. Are you familiar with the phone call on 132?

20 A. Yes.

21 Q. And what is that phone call?

22 A. The report of the fire from PG&E to us across from
23 the Poe Dam on the north side of the Feather River.

24 Q. So you spoke to the caller?

25 A. Yes.

26 Q. You identified the caller?

1 A. Yes.

2 Q. You inputted information into the computer?

3 A. The CAD, yes.

4 Q. The CAD. So the call was received at 6:25 and
5 13 seconds?

6 A. Yes.

7 Q. And what time was the call dispatched?

8 A. It was 6:31. It was pre-announced and dispatched
9 at that time.

10 Q. At what time did you release the CAD so that it
11 could go out via text message?

12 A. Right after that at 6:31. That is when the
13 incident is pre-announced, pre-alerted to our -- everyone on
14 the radio. And then right following that second call the
15 station alert goes out and dispatch is read.

16 Q. Now, I have also a document that has been marked as
17 Exhibit 132-A. Do you recognize 132-A?

18 A. I do.

19 Q. And 132-A is a transcript; correct?

20 A. Correct.

21 Q. Have you reviewed 132-A, the transcript, against
22 the recording on 132?

23 A. Correct.

24 Q. And does 132-A fairly and accurately represent the
25 conversation recorded on 132?

26 A. It does.

1 Q. If I can get 132 back. I want you -- I want to
2 play this. And we'll listen to it and then we'll come back
3 and ask you some questions about it and have you narrate
4 some things.

5 [Exhibit 132 played in open court.]

6 MR. NOEL: All right. One thing -- I'm sorry,
7 Madam Foreperson. I neglected to deal with this. Standard
8 operating procedure is -- and we should have asked your
9 permission -- is that the court reporter does not take down
10 recordings that are played in evidence. We have the
11 transcript and we have the recording itself. Madam court
12 reporter knows that. I apologize that we didn't alert you
13 to that before that happened.

14 GRAND JURY FOREPERSON: Okay.

15 MR. NOEL: Everybody notice that she was very
16 relaxed and her fingers weren't moving while we played the
17 recording.

18 BY MR. NOEL:

19 Q. All right. You have heard that recording; correct?

20 A. Correct.

21 Q. And that is you talking to the original RP who
22 identifies him as (WITNESS #7)?

23 A. Correct.

24 MR. NOEL: And for the record, just to remind you
25 again, Ladies and Gentlemen, the contents of the recording
26 at this point in time are not being offered for the truth of

1 the matter thereof. That includes the hearsay, for
2 instance, of the identity of the person being Dave Clark.
3 They are simply being offered to explain and lay the
4 foundation for what is going to come later.

5 So any of the statements in there aren't for the
6 truth of the matter at this time until such time as we have
7 proved them up with the people who made those statements.

8 You can hear in the background that the caller, who
9 identifies him as (WITNESS #7), is talking to somebody else
10 and is getting information from that person. And until we
11 get that person to come in and testify, those are hearsay
12 statements and can't be considered as evidence.

13 Thank you.

14 BY MR. NOEL:

15 Q. All right. Give us an explanation of that. As
16 you're in the ECC and you're dispatching or taking calls,
17 what does your workstation look like?

18 A. It's a pod. It consists of four CAD computers,
19 common fire equipment, a desk, a monitor. I have a phone
20 monitor, an emergency com, which is our radio, and a regular
21 9-1-1 phone monitor. So several monitors and one chair.
22 And I've got a console that raises up and goes down so I can
23 stand up and sit down. And there's a plastic partition
24 around there. And there's basically six pods in our work
25 center. And we're -- basically there's four in the center,
26 five over there, and six in the corner.

1 Q. It's fairly obvious in listening to the content of
2 the conversation that you have a map in front of you?

3 A. Correct.

4 Q. Correct?

5 A. Correct.

6 Q. Explain to us how you get a map.

7 A. So when (WITNESS #7) told me where the fire was
8 north of the Poe Power Plant, I put -- I type in Poe, and I
9 get the Poe Power Plant immediately and it plots it on the
10 map. And he said it's on the north side of the river which
11 puts it where he's referring to the railroad tracks. So I
12 could reference where the railroad tracks are. The CAD
13 mapped it, and I could see the transmission lines.

14 And he says "It's near those transmission lines or
15 underneath them." So that's why I was verifying with him
16 "So it's underneath those transmission lines on the north
17 side of the Feather River." Because I want to send help to
18 the right location. And it's really, really important if
19 you're going to send a big response like this that you get
20 it right from the start. So don't sent them to Rock Creek
21 Powerhouse when it's really down by Poe. So take the extra
22 few moments verifying the information and send it to the
23 right location first.

24 Q. So I'm showing you what has been marked as
25 Exhibit 133. 133 is a map depicting the locations that are
26 described in the phone call; correct?

1 A. Correct.

2 Q. Now, that is not the map that you were looking at
3 on your screen?

4 A. No.

5 Q. But something similar to that?

6 A. Yes.

7 Q. And you're able to tag a location and --

8 A. Yeah. Well, what we did was -- so we got the Poe
9 Power Dam plugged into the CAD, but we don't want to send
10 help to the Poe Power Dam. We want to send it across the
11 river. So we select a point on the map and drop the point
12 exactly where he's telling us where the fire is. When it
13 come in as lat/long, we send help exactly where he reported
14 it to us across the river underneath the high tension power
15 lines.

16 Q. So when you're plotting this out, you're getting
17 the information off the map that you're putting into your --
18 you know, basically dropping a pin where he's describing
19 what is going to be the latitude and longitude and that
20 basically turns into what is marked there as the 27/222 Camp
21 Fire origin; correct?

22 A. Correct.

23 Q. That was just above Poe Dam under the power lines?
24 Under the transmission lines?

25 A. Yes.

26 Q. All right. And then also on this map the caller

1 identified that they were calling from the Rock Creek
2 Powerhouse?

3 A. Yes. (WITNESS #7) was and his employees were
4 looking across from the Poe Dam area.

5 Q. Okay. And Mr. (WITNESS #7) indicated that he was
6 getting this information from other PG&E employees?

7 A. Correct.

8 Q. Now, first off at the very start, we hear a female
9 voice -- we start off and we hear a computer voice and then
10 we hear a female voice that is telling you that they're
11 transferring a call to you?

12 A. Correct.

13 Q. Explain to us how that happens.

14 A. So this is the command center. We're a secondary
15 piece. And so public safety is answering at this point. So
16 law enforcement most times gets the call first, and they
17 determine whether it's law enforcement, a fire need, or a
18 combination of both.

19 So in this case listening to the recording it seems
20 to me it was a Chico Fire with a transfer or Chico with
21 transfer. So from what my experience is is Chico PD
22 received the 9-1-1 call from PG&E and then they realize
23 where it's at in the geography and it's in the county and
24 then they transfer the call -- since it's a fire and not law
25 enforcement, they transfer it to us which is the correct
26 thing to do.

1 MR. NOEL: Anything more you guys can think of? I
2 think that's all I have of this witness at this point.

3 Do the jurors have any questions? I don't see
4 anyone volunteering any questions.

5 GRAND JURY FOREPERSON: Okay.

6 MR. NOEL: The witness admonition.

7 GRAND JURY FOREPERSON: Okay. Mr. Ekdahl, you are
8 admonished not to discuss or disclose at anytime outside of
9 this jury room the questions that have been asked of you or
10 your answers until authorized by this grand jury or the
11 court. A violation of these instructions on your part may
12 be the basis for a charge against you of contempt of court.
13 This does not preclude you from discussing your legal rights
14 with your own attorney.

15 Mr. Ekdahl, what I have just said is a warning not
16 to discuss this case with anyone except the court, your
17 lawyer, or the district attorney.

18 Do you understand?

19 THE WITNESS: I understand.

20 GRAND JURY FOREPERSON: Okay. Thank you.

21
22 [DISCUSSION OMITTED.]

23
24 MR. NOEL: As he's doing that, I would ask Madam
25 Foreperson to move all of the exhibits that have been
26 offered today that haven't already been accepted into

1 evidence into evidence.

2 GRAND JURY FOREPERSON: Yes.

3 [Exhibit 101, 106 through 119, 132,
4 132-A and 133 received into evidence.]

[DISCUSSION OMITTED.]

(Grand Jury's Exhibits 118, 118A admitted into evidence.)

[DISCUSSION OMITTED.]

[ROLL CALL OMITTED.]

(GRAND JURY FOREPERSON swears in witness.)

CHIEF STEVEN HAWKS

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. Deputy Chief, can you please state your full
name, spell your last name for the record.

1 A. Steven Renee Hawks, H-A-W-K-S.

2 Q. Now, we had briefly heard from the David Hawks.
3 Is there any relation?

4 A. Yes. He's my brother.

5 Q. By whom are you employed?

6 A. With the California Department of Forestry and
7 Fire Protection.

8 Q. How long have you been with Cal Fire?

9 A. This will be my 31st fire season; since 1989.

10 Q. What is your current rank?

11 A. Deputy chief.

12 Q. What does that mean?

13 A. It's -- I'm the deputy chief of our
14 department's Wildland Fire Prevention Engineering Program
15 out of our state fire marshal's office in Sacramento. So
16 I oversee defensible space, damage inspection, and
17 utilities.

18 Q. Walk us through your career with Cal Fire last
19 31 years.

20 A. I started out in 1989 as a seasonal firefighter
21 with Nevada-Yuba-Placer Unit at Columbia Hill Fire
22 Station. First fire years were just seasonal, because
23 that's our firefighter 1 classification's seasonal
24 classification. So during the non-firefighting months, I
25 would -- went to college and received a bachelor's degree
26 in forestry.

1 So I worked in Nevada-Yuba-Placer Unit as a
2 seasonal firefighter for six years -- six years? Yeah,
3 six years. Then I received a seasonal promotion to
4 engineer, limited term, in Nevada-Yuba-Placer Unit
5 working in Lincoln. And then I promoted to permanent
6 engineer in Sonoma-Lake-Napa Unit over in Napa as a
7 permanent engineer. And then three and a half years
8 later promoted to fire captain at Napa. And then 2013 to
9 battalion chief in Yountville, just north of Napa. And
10 then in 2016 my current classification as Deputy Chief in
11 Sacramento.

12 Q. Couple of terms you have used; if you can
13 explain them for the jurors. You talked about
14 Nevada-Yuba-Placer?

15 A. Yep.

16 Q. And Sonoma-Lake-Napa?

17 A. So we break -- our department is a statewide
18 agency. We break it down into what we call units. And
19 units are based on county boundaries. So
20 Nevada-Yuba-Placer is, those counties comprise that one
21 unit. And then Sonoma-Lake-Napa is a second of our 21
22 units. There's three additional -- we call it
23 Sonoma-Lake-Napa, but there's three additional counties,
24 Colusa, Yolo, and Solano that comprise the
25 Sonoma-Lake-Napa unit.

26 Q. So what unit is Butte in?

1 A. Butte Unit is one singular county comprising
2 that unit.

3 Q. So unlike, unlike them, we're important enough
4 that we have our own unit; correct?

5 A. I believe so.

6 Q. We don't have to share it with Tehama or Lassen
7 or any of those people.

8 What are your duties as the, as the Deputy
9 Chief in the fire prevention?

10 A. So, the Public Resources Code mandates that our
11 department enforce the forest and fire laws. So Public
12 Resources Code 4119 says Cal Fire shall enforce the
13 forest and fire laws. And so there's a number of them
14 that pertain to my job duties. Public Resources Code
15 4290 is fire safe development. Public Resources Code
16 4291 is defensible space around homes. And then Public
17 Resource Codes 4292 through 4296 deal with electrical
18 utilities. And so I oversee the programs that manage,
19 within our department that manage inspections or dealing
20 with those areas.

21 Q. How do you prevent fires?

22 A. Well, the first thing is to try and prevent
23 them from starting. So eliminating or reducing the
24 number of ignition sources. And then, secondly, we
25 understand that, you know, California has an environment
26 that is just conducive to wildland fires, and we're never

1 going to prevent every one of them, is how do we make
2 them less catastrophic, I guess, less damaging to the
3 environment as well as the built environment -- homes and
4 infrastructure, structures in general. So reducing the
5 number of ignitions would be educating the public,
6 because 95 percent of all fires that start are human
7 caused. And so trying to educate the public on ways to
8 reduce those ignitions.

9 Q. Would human-caused include machinery or
10 equipment created by humans?

11 A. Correct. Could be engines or trains, could be
12 electrical infrastructure, it could be someone trying to
13 do defensible space by weeding or weed-whacking down
14 their weeds and inadvertently causing a fire. Could come
15 from a vehicle itself, dragging a chain or catalytic
16 converter that hasn't been properly maintained. There's
17 a number of human-caused categories.

18 Q. Right. So human-caused includes other things
19 than the stereotypical guy throwing the cigarette out the
20 window and starting a fire or actually taking a match and
21 putting it to fuel and starting a fire intentionally?

22 A. Correct.

23 Q. You've used the term "defensible space." Can
24 you define for us what that means?

25 A. So defensible space is reducing the amount of
26 flammable vegetation around the structure.

1 And I referred to Public Resources Code 4291,
2 which is the statute that requires defensible space. It
3 requires up to a hundred feet or to the property line,
4 whichever is closer. So if the property from the outer
5 edge of a house to the property line is 30 feet, then we
6 can only enforce that 30 feet. We cannot enforce the
7 remaining 70 feet on the other side of the property line.
8 And it's broke down currently into two zones. Zero to 30
9 feet out from the structure is the most critical area,
10 the area that requires the most amount of fuel reduction
11 of keeping like weeds mowed down to ground level, trim
12 trees off the ground. We're trying to prevent fire from
13 getting from the ground up into the tree canopy where it
14 becomes more destructive at that point.

15 Spacing of trees and vegetation both
16 horizontally, provide enough spacing to them so that if
17 one bush or tree catches fire it won't spread to the next
18 one or have a reduced chance of spreading to the next
19 one. And also vertically. So not having, you know,
20 grass and then a brush and then a tree so that fire can
21 go from the grass to the brush to the tree, what we kind
22 of commonly refer to as "fuel ladder." The ladder, then
23 that would allow the ground fire to go from the ground up
24 into the tree canopy.

25 It requires eliminating debris that accumulates
26 on a house, on a roof line of a house, or in gutters. So

1 pine needles and leaves and dead branches that may fall
2 off the tree and/or on a house.

3 Having a chimney that has a screen around it,
4 because the law originally was put into place to provide,
5 try and prevent a home from being on fire and spreading
6 to the wildland. Now it's evolved over the years to try
7 and prevent a wildland fire from spreading to a home as
8 well.

9 So that was the original intent of the law.

10 Q. In addition to the 4291, the defensible space,
11 does your division do other things to mitigate the
12 chances of structures burning down?

13 A. I do work with our code development division in
14 our fire marshal's office that is responsible for
15 developing the California Building Code Chapter 7A,
16 Building Standards.

17 So building standards for buildings that are
18 being built out in our Wildland Urban Interface, where
19 the fuel and the structures kind of intermix or meet each
20 other. And that became, or came into effect in 2008. So
21 all of the new construction after that, that's out in our
22 Wildland Urban Interface is supposed to be built to a
23 certain standard that helps reduce the chances of them
24 catching fire or make them more fire resistant.

25 So I sit on that committee that meets regularly
26 to look at that, those codes, and see if there's any

1 changes that we can make to them that would help reduce
2 the number of structures that are catching fire.

3 Q. What is the state fire marshal's office to
4 which you've referred?

5 A. The state fire marshal's office is a, it was
6 originally its own state agency. And I can't remember, I
7 think it was maybe 1993 or somewhere in there, roughly,
8 the state merged Cal Fire -- or the Department of
9 Forestry and Fire Protection then with the Office of the
10 State Fire Marshal. So now the state fire marshal's
11 office resides within California Department of Forestry.
12 And in Sacramento it's its own building. And it deals
13 with a number of things.

14 We have state fire training, we have fire and
15 life safety which do building inspections on new
16 construction as it's going, as it's being constructed to
17 make sure that all life safety components, sprinklers,
18 exits, extinguishers and so forth are in place.

19 We have a fire engineering division that deals
20 with fireworks, extinguishers, sprinklers, and basically
21 certifies them.

22 We have the division that I work in, which is
23 planning and risk analysis, that deals with wildland
24 components.

25 So there's my program, then we have a fire plan
26 program, we have a land use planning program, and, and a

1 fire, fire prevention grants program where we issue out
2 grants to nonprofit agencies and government agencies to
3 reduce fuels in communities.

4 Q. You should have in front of you what's been
5 marked as Exhibit No. 105.

6 A. Yes.

7 Q. Do you see that --

8 A. I do.

9 Q. -- displayed here on the big board, published
10 for the jurors? Do you recognize Exhibit No. 105?

11 A. I do.

12 Q. What is Exhibit No. 105?

13 A. Exhibit No. 105 is a Damage Inspection Map of
14 the Camp incident that my program is responsible for
15 producing.

16 Q. That's the next question. How is it that your
17 program is responsible for doing this?

18 A. So Cal Fire has been doing damage inspection on
19 wildland fires for a number of years, for several
20 decades. And originally the intent was to look at
21 defensible space laws, analyze the data and see if our
22 defensible space laws, 0 to 100 feet of fuel reduction
23 around homes, was adequate enough to reduce the risk for
24 homes in a wildland fire, or should we make additional
25 recommendations to increase the amount of fuel reduction.

26 Originally, it was all hand paper, go out,

1 write all the information that we wanted to document on
2 paper forms. There was no consistency as to what we
3 documented, what final report we produced and so forth.

4 And in 2014, the Boles Fire in Siskiyou County,
5 the town of Weed, burned through the town, and for the
6 first time we used a mobile data collection app. There's
7 a company called ESRI, E-S-R-I, and they produce several
8 different mobile apps. that can be used on any smart
9 device -- tablet or phone -- or any operating system,
10 Android or IOS.

11 And so now we're able to, from that fire going
12 forward, have one centralized electronic database where
13 we standardize the information that we gather during the
14 damage inspection process. And it is at times real-time.
15 It can be used when there's connective environment out in
16 the field.

17 So when inspectors are in the field and they do
18 the documentation, they press save on the record, if
19 they're in a connected environment, it immediately goes
20 into the database and can be viewed from any location if
21 they have access to it.

22 Other times, it can be used what we call
23 "offline," where there's no connectivity, in which case
24 the record is stored on the device until the inspector
25 gets back to a connected environment, then all the
26 records are at that point synced to our database.

1 So it's real-time to near real-time data
2 collection. And it puts the point on the map of the
3 exact location, it geolocates the point on the map of the
4 location of the incident or the structure that was
5 damaged or destroyed. And it ties all the data that we
6 document on each of those structures to that point.

7 And then we also take a picture of the
8 structure. And it's also tied to that location.

9 Q. You said originally the damage inspection
10 program was used to evaluate defensible space. I'm
11 guessing that that's changed or expanded over the last 11
12 years?

13 A. That's correct. So the original intent was to
14 evaluate our defensible space. Now we've added in
15 evaluating public resources. Public Resources Code 4290,
16 the Fire Safe Development Standards, which is clearance
17 around roadways, water source at a house, greenbelts, and
18 so forth.

19 And we've also added in analyzing that the
20 California Building Code Chapter 7A, the WUI Building
21 Standards, to look at the data to see if there's, you
22 know, meaningful recommendations we can make to those
23 codes to improve them, ultimately to make homes more fire
24 safe. And we also report this data at the time of the
25 incident to, through our public information officers, to
26 the media and to the public. So that data goes out to --

1 because what most people want to know about the incident,
2 how is it impacting the communities, how many structures
3 are damaged and destroyed, and so forth. So that's the
4 information that my program has available that, that we
5 make available through our public information officers to
6 the public media, our elected executive officers within
7 our department, and other elected officials.

8 Q. So Exhibit 105 is the Damage Inspection Map.
9 And all of these little red points, all of those little
10 red dots is a structure that was destroyed; correct?

11 A. Correct.

12 Q. But it sounds like these Damage Inspection Maps
13 that get all the publicity and show up, knowing the press
14 and everything else, and that we're using here are
15 actually just a by-product of something else that you're
16 doing?

17 A. Correct. Yeah, it -- again, the main goal is
18 to evaluate our laws and regulations to see if we can
19 make meaningful changes. But the by-product is that we
20 have that information available. And we're one of the
21 only agencies and -- that has that information that can
22 be made available in near real-time to real-time to the
23 public to inform them and the press about the impacts of
24 the incident.

25 Q. And you're required by Cal Fire to collect this
26 information from every fire incident, or wildfire

1 incident?

2 A. We are. Our director of our agency signed a
3 memorandum to direct our agency to conduct damage
4 inspection on every wildland fire in our state
5 responsibility area, the area that we're responsible for
6 wildland fire protection, if one or more structures is
7 damaged or destroyed.

8 Q. I'd like for you to walk through the mechanics
9 of how the information is obtained for us. Start off
10 with, as you said, each one of those little red dots
11 represents a destroyed structure. Who and how goes out
12 and finds those structures and makes the determination
13 whether they're damaged, destroyed, or fine?

14 A. So, I'll go back a little bit to kind of
15 explain the process. There is a two-day training course
16 that we put our inspectors through to train them how to
17 use the ESRI collector app. That's the app. that --
18 ESRI, again, is the company that produces this mobile
19 app. And they produce a generic app. that anybody can
20 purchase a license to utilize. So we have a number of
21 licenses to utilize their products. And then we program
22 into the app. the information that we want to collect.
23 And so that's another slide coming up.

24 Q. We'll get to that in a second. Let's talk just
25 about the people.

26 A. They go through a two-day training course.

1 When they successfully complete the course, they're
2 entered into our ROSS. We call it ROSS, it's an acronym
3 R-O-S-S, stands for Resource Ordering and Status System.

4 So when a fire happens like the Camp Fire and
5 they determine that they need damage inspection
6 personnel, they say, "Okay, we need ten personnel to
7 just," as an example, "to conduct damage inspection on
8 this incident." Those ten requests go into this ROSS
9 system, then it pulls up who is qualified to work as a
10 damage inspection specialist. And then those personnel
11 are contacted and sent to the incident. So that's that
12 component of it.

13 Then there's three different job
14 classifications on an incident that work in damage
15 inspection. There's a damage inspection manager. And
16 they're overall responsible for the whole damage
17 inspection process on the incident. And there's
18 typically going to be two of those. Due to the
19 complexity of incidents that we've been having recently
20 as well as the political aspect of these incidents, we
21 typically assign two of them to the incident.

22 Then we have a GIS, Geographic Information
23 Systems, specialist that do all of the behind-the-scenes
24 -- working with the collector app., programing it to be
25 able to collect the data that we want to collect, make
26 the map products and the final reports.

1 And then there's the damage inspection
2 specialists. And those are the actual field inspectors.
3 And we team them up into pairs primarily for safety when
4 they're out there in the incident. Because of the
5 dynamics of the incident and multiple hazards that are
6 out there, we team them up in pairs of two. And they
7 each have a smart device with them that has the collector
8 app. on it. Then we send them out to the field. And we
9 direct them into -- we break the incident up into zones
10 to methodically search the incident for all the
11 structures that are out there so that we don't miss
12 anything. And then we have them run a track log, which
13 is --

14 Q. Let's stop right there. We'll get to that in
15 just a second. I want to focus right now on who these
16 people are that are actually doing the inspections.

17 So these people have to go through a
18 training --

19 A. Correct.

20 Q. -- that's put on by Cal Fire, by your unit --

21 A. Correct.

22 Q. -- to qualify to do this. But what qualifies
23 them to go to the training in the first place?

24 A. There's minimum qualifications, prerequisites,
25 to get into the class. And so those are some ICS,
26 Incident Command System, courses. So having some general

1 knowledge about the Incident Command System that we
2 utilize on our fires.

3 There's a training handbook that the National
4 Interagency Fire Center, NFC, has created on land
5 navigation so that they know how to navigate using GPS
6 while they're out there on the incident and the smart
7 device as the collector app.

8 Then there's a firefighting course that they
9 have to take through our department, our basic wildland
10 firefighting course so that they understand basic
11 wildland firefighting terminology and hazards so that
12 while they're out there on the incident they can operate
13 safely and not become injured.

14 So they have to do those courses as
15 prerequisites in order to get into the damage inspection
16 course. And then once they complete that, then they are
17 in the ROSS ordering system and they can be ordered for
18 an incident.

19 Q. Is it a prerequisite to getting into this
20 training and ultimately into the damage inspection unit
21 that the person be a firefighter?

22 A. No.

23 Q. Is it a prerequisite that they work for Cal
24 Fire?

25 A. No.

26 Q. Is it a prerequisite that they work for some

1 state agency?

2 A. No.

3 Q. Is it a prerequisite they work for some public
4 agency, including city, county?

5 A. Yes.

6 Q. Okay. So they have to be a public employee?

7 A. Correct.

8 Q. And any particular type of departments within
9 counties?

10 A. It's usually within the fire departments, but
11 it can involve building official.

12 Q. But everybody who is, who is part of this
13 program, everyone who is in your team of damage
14 inspectors that can be called up through the ROSS system
15 testimony are all public employees?

16 A. Correct.

17 Q. Now let's move on to the information that
18 they're actually collecting and how they're collecting
19 that.

20 A. Okay.

21 Q. Who determines -- or is there predetermined
22 information that the damage inspectors, once they've been
23 called up, now they're deployed on an incident, say the
24 Camp Fire, information that, that they're getting?

25 A. Yes. We have a standardized, we call it,
26 technical term is a schema, which is a data set

1 basically. So we have a standardized data set for
2 wildland fire that we collect the same information
3 statewide on any wildland fire that we go to. And that's
4 determined by the program that I manage.

5
6 (Grand Jury's Exhibit 135 was marked for identification.)
7

8 Q. Okay. Directing your attention next to
9 Exhibit 135 in front of you displayed on the big board
10 and published to the jurors. Do you recognize 135?

11 A. I do.

12 Q. What is 135?

13 A. It's the Damage Inspection Worksheet that I
14 created.

15 Q. Is this essentially the information that the
16 damage inspectors are expected to obtain in the field?

17 A. Correct. So just like any electronic device,
18 they cannot function correctly at times. Either the
19 mobile device can stop working or the app. can stop
20 working. So we have a hard copy form to use in those
21 instances so we can continue with our job. In which
22 case, we document -- everything that we would normally
23 enter in through the mobile app. we document on this
24 form. And at some point in the near future we will take
25 that information and enter it into the database
26 electronically. So this, the best that I could make this

1 mirror the information that we collect through the
2 collector app., that's what this form represents.

3 Q. So let's walk through the form and the
4 information that the individual inspectors are to provide
5 and to obtain.

6 So, of course, it starts off with their names,
7 the date the inspection's done; correct?

8 A. Correct.

9 Q. Goes through the incident date, incident
10 number, and incident start date. Can you explain to us
11 what those are?

12 A. So every incident that we respond to gets an
13 incident number based on the Cal Fire unit - based on the
14 state, the Cal Fire unit, and then sequentially based on
15 the calendar year. So for the Camp Fire, the incident
16 number is 12 digits long. And it's standard throughout
17 our department. Or actually throughout California fire
18 service. So starts off with CA for California, then the
19 next three letters are B-T-U for the Butte unit, then
20 there's a space in there. And it's actually standardized
21 throughout the country; some other states have four
22 letter identifiers for their agencies. In California we
23 only have three. Then there's a six digit number that's
24 sequentially starting from January 1 at midnight
25 throughout the year that numbers the incidents. That's
26 how we determine the incident number.

1 Each incident is also given a name. Typically
2 it's based off of a road or landmark in the area where
3 the incident starts. Then the start date is the date the
4 fire starts.

5 Q. So that's all information that Cal Fire
6 provides to the inspector?

7 A. Correct.

8 Q. Now, we move down to the section entitled
9 "Physical Address."

10 A. Yes.

11 Q. Describe for us what that means.

12 A. So we have the lat and long, latitude and
13 longitude, that the inspector can utilize a handheld GPS
14 to obtain the latitude and longitude to the structure
15 that's been damaged or destroyed. They'll document those
16 on there so we can geolocate that point on a map when we
17 enter this information into the database at a future
18 date.

19 There's also the street name, street number,
20 city, state, and zip code. And that's the best that our
21 inspectors can determine in the field.

22 Oftentimes, the homes are completely destroyed.
23 And so if the street, the number of the house is put on
24 the side of the house and the house has been destroyed,
25 then it may be difficult for us to determine the street
26 number, for example. Or if the street name has been

1 destroyed in the incident, then could be difficult for us
2 to determine that. But we try the best we can to
3 identify the site address of the property of that
4 structure on this form.

5 Q. Okay. Like you said, this is, this is a hard
6 copy backup form that was created that goes along with
7 the app.?

8 A. That's correct.

9 Q. For the most part, you, your guys in the field
10 are going to be actually using a smart device, either a
11 phone or a tablet, to enter all this information?

12 A. Correct.

13 Q. Does the app. itself work with say GPS
14 technology?

15 A. Yes, it does. It has.

16 Q. So when they're out in the field with their
17 smart app., with their smart phone or tablets, whatever,
18 using this, does the app. work together with the GPS
19 technology to automatically fill in these latitude and
20 longitude blanks?

21 A. Yes.

22 Q. Correct?

23 A. Correct. Yes.

24 Q. Okay. So the person in the field, the
25 inspector in the field, doesn't actually need to write
26 down those long numbers?

1 A. Right. Yes. If the collector app. is working,
2 they don't fill out this form. They enter all the
3 information into the app., but the geolocated location of
4 the lat and long is automatically determined by the
5 device.

6 Q. Let's move down to the next one, "Structure
7 Status."

8 A. Yes.

9 Q. What is this for?

10 A. So it determines the damage level of the
11 structure. So superficial, or what we call affected,
12 affected minor, major, and destroyed. And we use the
13 FEMA Damage Level Classification or damage categories.
14 So we're mirroring what FEMA does. So they have affected
15 minor, major, and destroyed. So we determine the level
16 of damage and -- based on their definition, FEMA's
17 definition, and some examples that they provide in a
18 manual they produce called the Damage Assessment
19 Operations Manual.

20 Q. So are the inspectors, is part of their
21 training to qualify them to be inspectors, are they
22 trained in using these terms in how to determine the
23 level of damage?

24 A. Yes, they are.

25 Q. And that's from the FEMA manual?

26 A. Yes.

1 Q. Why is it important for you as fire prevention
2 to document the status information as regards to the
3 level of damage?

4 A. Well, it ties back to us trying to look at the
5 Public Resources Codes and whether we can recommend
6 meaningful changes to reduce the number of structures
7 that are being impacted by these fires.

8 So, for example, just analyzing some of the
9 data, 93 percent of all structures that catch fire are
10 going to be completely destroyed.

11 The next biggest category is the affected
12 category, and that's roughly 4 percent of structures are
13 in that category. And that's superficial minor damage --
14 or superficial damage that is mostly cosmetic: Scorched
15 paint, maybe a burn mark in a deck. Or some windows --
16 most of the dual pane windows now are vinyl and they'll
17 melt. The outer aesthetic pieces that help hide the
18 internal framing will melt relatively easily. That's
19 mostly cosmetic damage. And that's either put out in the
20 structure protected by the property owner, typically, or
21 the fire department.

22 Once it gets beyond the affected category and
23 the structure is heading into the minor or major
24 categories of damage, there is typically less that the
25 fire department or property owner can do to protect or
26 defend the house at that point. That's why everything

1 jumps up to 93 percent of the homes are destroyed in a
2 fire once they catch fire.

3 Q. Next we have, "Where did the fire start on the
4 structure?"

5 A. That's if in the affected category, because
6 when the damage level gets into the minor, major,
7 destroyed, it's almost impossible for us to determine
8 where the fire started on the structure. But when it's
9 in the affected category, then we have a better chance of
10 determining that. And that could help us pinpoint some
11 areas that we may need to work on with the code of, okay,
12 if we're having continual problems with decks catching
13 fire, then okay, we need to look at decks, why are they
14 catching fire, as an example.

15 Q. So that provides information that you can use
16 for future fire prevention?

17 A. Correct.

18 Q. And mitigation efforts?

19 A. Correct.

20 Q. "What started the fire, if affected 1 to 9
21 percent," why is that important?

22 A. There's three ways that fires typically start
23 on a house. Either for -- there's continuous fuel right
24 up to the structure. So the fire just burns right up to
25 it and then there's something flammable on that side of
26 the house, then it will catch fire.

1 And then the second way is a radiant heat. So
2 if there's enough fuel close enough to the house and that
3 fuel is burning and that heat's given off, radiant heat's
4 given off, can heat the house or a flammable component to
5 its ignition temperature, then it will start the house on
6 fire.

7 And the third and most prevalent way that
8 structures catch fire are from embers. Fire brands are
9 embers, interchangeable term. It's fuel that's caught
10 fire a distance away. And typically with wildland fires
11 there's a wind component to them, so the wind picks up
12 these embers and sends them downwind. And whatever is in
13 its path, these embers can catch.

14 Just if you look at a house like where leaves
15 and pine needles and stuff accumulate on a house, that's
16 typically where embers will also accumulate. So, you
17 know, they typically, if the homeowner isn't diligent
18 about taking care of those areas where leaves and needles
19 and stuff will accumulate, then the embers will hit those
20 areas, and that's fine fuel enough for an ember to catch
21 those fuels on fire, and then catch the home on fire. Or
22 the embers will typically go through a vent in the house.
23 If there's enough of a gap in the mesh screen for embers
24 to enter, they'll enter into the vents, find something
25 flammable on the inside and burn from the inside out.

26 Q. So with regard to this category, when we're

1 talking about what started the fire, we're simply talking
2 about that one structure; correct?

3 A. Correct.

4 Q. Not the overall --

5 A. Not the cause of the incident, what caused the
6 fire on that particular structure.

7 Q. Right.

8 A. Was it the fire burning up to it, was it
9 radiant heat, or was it embers.

10 Q. So, for instance, with the Camp Fire we've got
11 over 13,000 structures. It all started from one --

12 A. One.

13 Q. -- one place up above Pulga and then burned
14 down. That caused all of these fires. But when you're
15 saying what started the fire for this particular house
16 that the inspector is looking at, you're talking about
17 how the Camp Fire itself hit the house or affected the
18 house?

19 A. That's correct.

20 Q. All right. Next, "Structure Defense Actions
21 Taken by."

22 A. So we have a number of things that we're
23 looking at there. Was anyone there to defend the house?
24 Was the property owner there, and did they try to attempt
25 to defend their house? Or was the fire department there;
26 fire engine or a bulldozer maybe came there and put a

1 line around the house and defended it? Or maybe an air
2 tanker dropped retardant on the house to try and defend
3 it? We're just trying to look at, you know, how many
4 homes are defended against the fire and which ways were
5 they defended and try and build some statistics.

6 Q. Next up, I'm assuming this is going to be an
7 important one, the "Estimated Vegetation Clearance"?

8 A. Yeah. And it is difficult after a fire's
9 burned through to kind of reconstruct what the vegetation
10 was like prior to the fire starting and burning through
11 the area. So this ties back to looking at our defensible
12 space law, 4291, and the hundred feet of defensible
13 space. So we're looking to try and identify the best we
14 can. And we train our inspectors during our damage
15 inspection class as to what indicators to look for as to
16 how much defensible space they had or clearance they had
17 around, around the structure.

18 Q. Next, "Distance of Propane Tank to the
19 Structure." Why is that important?

20 A. That is in our Building Code Chapter 7A about
21 clearance -- or distance from the propane tank to a
22 structure. So this would tie into more of the radiant
23 heat aspect of propane tank ignites because of the main
24 fire, is venting, it gets heated up, so the relief valve
25 releases, vents the propane out of the tank, the fire
26 catches the propane on fire, now you have a propane tank

1 that's near a house that's has a lot of fire coming out
2 of it. And if it's close to the house and the wind's
3 blowing that fire, leaning it over, it can heat the house
4 up and catch fire. So we're trying to determine if
5 there's certain minimum distances we should recommend or
6 require that propane tanks be away from a house.

7 Q. Now, the next two let's deal with together.
8 "Topography" and "Aspect of the Land to the Structure."
9 Explain to us what those mean and why those are
10 important.

11 A. So topography is the lay of the land. And
12 there's certain areas of topography, like chutes or
13 chimneys, saddles, ridges, flat land that, that are more
14 prone for fire to burn hotter in them.

15 So, for example, if a house is in a -- have two
16 peaks, then there's a little valley between the two peaks
17 that's called a saddle. And if a house or structure is
18 in that saddle, the fire is going to funnel right to that
19 location. So we're trying to determine if, the location
20 of these homes, if we should make a recommendation as to,
21 you know, you shouldn't build a home in saddle or at the
22 top of a chimney where a fire is going to race up that
23 what we call a "chimney." It's two ridge lines, and then
24 like a low point between the two ridge lines where water
25 would typically run down through. That's what we call a
26 chimney. So fire is going to race, burn hotter in that

1 area than it would on a ridge line.

2 So that's what we're looking at. I can't
3 remember exactly -- we have I think ridge, saddle, I
4 can't remember the other.

5 Q. Slope?

6 A. Slope, yeah.

7 Q. All right. Then aspect?

8 A. Then aspect is cardinal direction; north,
9 south, east, west.

10 So southwest aspects typically have dryer
11 locations. They get more direct sunlight during the
12 summer months. So their soil is usually not as deep.
13 The vegetation that grows in those locations is more
14 brush and less trees. Trees usually grow better in, on
15 north aspects where there's deeper soil, more moisture,
16 and so forth.

17 So, again, we're just trying to look at is
18 there certain aspects that homes shouldn't be built on or
19 if they're built in those locations should they have a
20 greater level of defensible space around them than other
21 aspects.

22 Q. All right. The next section is called
23 "Structure Type." Go ahead.

24 A. This is related solely to our California
25 Building Code Chapter 7A, the Wildland Building
26 Standards. And so it looks at roof components: What is

1 the roof constructed out of? Is it fire-resistant
2 material or not fire-resistant, like the older sometime
3 wood shake roofs?

4 Siding. What type of siding did the structure
5 have? Is it fire-resistant or not?

6 What type of windows did it have? Are they
7 single pane or dual pane?

8 What type of -- did it have a deck on, attached
9 to the structure? And if so, what type of deck? Was it
10 a wood deck? Was it concrete? Was it synthetic
11 material?

12 Eaves. Were there eaves or no eaves present on
13 the house?

14 Vents. What type of vents did it have? Were
15 they -- or let me back up to the eaves.

16 Did it have eaves and were they open eaves or
17 were they enclosed eaves? So that -- the open eaves are
18 on, typical on your older-style homes that have a vent in
19 the fire blocking between the two rafter -- rafters that
20 come out of the roof. And then enclosed eaves would
21 typically be flat or horizontal to the ground, leading
22 directly over to the structure. And they're enclosed, so
23 they're a little more fire-resistant than open eaves are.

24 Q. Okay. Let me interrupt you before we go on to
25 that because I think you're getting into the next page.
26 We'll put that up in just a second.

1 A. Okay.

2 Q. One of the things I wanted to ask you about is
3 there's a term in here we talked about, "habitable" or
4 "nonhabitable" structures; correct?

5 A. Yes.

6 Q. Can you explain the difference?

7 A. So a habitable structure is meant for human
8 occupancy. So it has typical features like a bedroom,
9 bathroom, kitchen, heating, water supply to it. And
10 nonhabitable structures are those that don't have those
11 features, that aren't meant for continuous human
12 occupancy, like a garage or barn, other types of
13 structures that a property may have.

14 Q. Now, you have this structure type, we have
15 single-family residences -- or single residences;
16 correct?

17 A. Yes.

18 Q. The single-family home?

19 A. Correct.

20 Q. All the way up to mobile homes, potentially?

21 A. Correct.

22 Q. That would be included in that. Multiple
23 residences? Multi-family dwellings?

24 A. Multi-family dwellings; apartment buildings,
25 like that.

26 Q. Then we have mixed commercial residential,

1 nonresidential commercial. Do you have examples?

2 Church, hospital, school?

3 A. Yes.

4 Q. What is an other minor structure?

5 A. So other minor structures are structures that
6 are -- it's in our California Building Code. Structures
7 are identified by occupancy classifications. So these
8 other minor structures are called group U, or utility
9 miscellaneous structures. So they're like detached
10 garages, detached sheds or barns. Structures of that
11 nature.

12 Q. Now, your inspectors that are being sent out to
13 gather this data, they're given training in how to
14 determine the structure type?

15 A. Correct.

16 Q. One other point I wanted to make is when you're
17 talking about habitable or nonhabitable, you're simply
18 talking in a vacuum. Is this a structure that was
19 designed to be lived in as opposed to where we talk about
20 in the legal instructions, for instance, for 452, causing
21 a fire, unlawfully causing a fire, where it talks about
22 inhabited structures? It's a different thing; correct?

23 A. Correct. Yes. We only determine whether it's
24 meant for human occupancy. Doesn't matter to us if
25 somebody's actually living there at the time or not.

26 Q. Your people aren't going out and trying to make

1 a determination whether somebody was actually living in a
2 structure at the time of the fire; correct?

3 A. Correct. And, for the most part, when we're
4 out doing our damage inspection, the area has been
5 evacuated, so there's typically not a property owner
6 there, somebody we can even talk to.

7 Q. Now let's move on to page 2 of that document,
8 which is where you were starting to get to a minute ago
9 when I interrupted you.

10 A. Yes. Sorry about that.

11 Q. Which is "Construction Type"?

12 A. Yes. So we talked about roof construction
13 already, siding, eaves, windows, decks. And decks, we
14 look at on grade, which is basically -- this would be
15 elevated, a little platform right here would be
16 considered a deck on grade, if we were looking at a
17 structure. Elevated decks would be a deck that is built
18 on a second or subsequent higher floors, extending out
19 from the house. Or if the house is built on a hillside,
20 it could be on a lower floor, but just overhangs the
21 hillside, so it's not on the ground level.

22 We also look at attached -- I can't remember
23 the terminology now. Like carports. It's not like an
24 attached garage that's built as part of a home, this is
25 an attached carport that may or may not have sides to it.
26 So we're looking at the construction features to see if

1 that's becoming a habitual problem as to why maybe homes
2 are catching fire and burning down.

3 What else? "Fences" we have on there. We know
4 fences are an issue. Most fences are wood and they're
5 attached directly to homes. And in an incident wildland
6 fire, fence will catch fire and act kind of like a wick,
7 drawing the fire directly to a home. Then once it
8 reaches the house, if it catches -- if there's something
9 flammable right there where that fence is attached, and
10 that is a potential ignition for the home to catch fire.

11 So there's been studies and stuff done about
12 pretty much everything we're looking at to try and
13 determine if there's changes we can make to our Chapter
14 7A for the WUI Building Standards.

15 Q. How and why are these factors important to your
16 policy in statutory requirements to fire prevention?

17 A. So our fire marshal's office, our Code
18 Development Division within our fire marshal's office is
19 required to create and maintain this Chapter 7A. So this
20 is data that we gathered to help analyze that code and
21 see if there's changes we can make to increase a home's
22 chance of surviving a wildland fire.

23 Q. Would it be fair to say that the information
24 that was gathered by your inspectors in the Camp Fire
25 will be used to help make sure that when Paradise is
26 rebuilt, when Concow is rebuilt, that those houses will

1 be in a much better position to survive --

2 A. Correct.

3 Q. -- a future fire?

4 A. Correct.

5 Q. Next section, "Structures with no Damage"?

6 A. So that is something that we had wrestled with
7 internally. The fires that we're having today are so
8 large and damaging that documenting structures with no
9 damage is kind of a capacity issue. We always knew that
10 we should document the structures that didn't have any
11 damage within the fire perimeter, but how do we
12 logistically do that within a 150,000 acre fire with
13 thousands and thousands of structures? The Camp Fire
14 just so happened to be the first fire where we
15 implemented that. And we did document every structure
16 within the perimeter whether it had damage or not.

17 Q. Why is it important to document structures
18 without damage?

19 A. For the same reasons as it is to document those
20 with damage, to learn from them as to why they didn't
21 catch fire. What was so special about these structures
22 that prevented them from burning down? It may have been
23 that they were defended by the fire department or the
24 property owner. It may have been that they had certain,
25 they were built to our Chapter 7A, and even though they
26 took a hit from the fire, just like a lot of the

1 structures that were damaged, that are destroyed, the
2 home itself was able to survive because of how it was
3 constructed.

4 Q. So like recently I know one of the things we've
5 been seeing in the local media is discussion of pre- and
6 post-2008 houses and their survivability --

7 A. Yep.

8 Q. -- during the Camp Fire.

9 A. Yes. All the reports that have been coming out
10 on the news, that's data that we gathered. They're
11 getting that from our data. We've been -- our department
12 is subject to the Public Records Act Request. And so if
13 -- the *San Francisco Chronicle*, who just ran an article
14 on Sunday or Monday, they took our damage inspection data
15 from the Camp Fire and produced that report. *Sacramento*
16 *Bee* recently did one as well, looking at our data and
17 tying it back to 2008 when our building code standard
18 went into effect.

19 Q. Finally, down here on the bottom, "Photo Name
20 ID from the Mobile Device Metadata"?

21 A. So we take at least one picture of every
22 structure that's damaged or destroyed. We did not go to
23 the extent on the Camp Fire taking pictures of the
24 no-damaged structures. We do take a picture of every
25 damaged or destroyed structure. Sometimes on the non --
26 or the affected minor and major structures, if the

1 damage, if you look at the -- we tell our, and teach them
2 in the class, our inspectors, to take the photograph from
3 the road, looking at the structure. So the front of the
4 structure. But if they take the photograph of the front
5 of the structure and the damage happens to be on the
6 backside and you can't see the damage from the front,
7 we'll have them take a picture of the front of the
8 structure, then walk around to the backside and take a
9 picture of the damage that occurred at that location.
10 There may be more than one photograph attached.

11 Q. So every time we have a wildfire that damages
12 structures, you're dispatching a team of inspectors to go
13 out and obtain all of this information; correct?

14 A. Correct.

15 Q. And those, they're all issued smart devices,
16 whether it's tablets or phones, and they collect all this
17 data?

18 A. That's correct.

19 Q. And all those people are public employees?

20 A. That's correct.

21 Q. And they're all -- this is a program that is
22 mandated both by statute and by policy of Cal Fire?

23 A. Correct.

24 Q. Sounds like it's a massive undertaking in a
25 fire such as the Camp Fire?

26 A. Yes, it is.

1 Q. Can you go through a little bit of logistics as
2 to how it is that, that you go out and you search almost
3 19,000 structures?

4 A. So I mentioned earlier there's, it's a
5 three-position job classifications that comprise our
6 damage inspection process on any incident.

7 So there's a, the damage inspection manager,
8 and typically we'll have at least two on any incident to
9 manage the whole process. When you get a fire that we've
10 been having lately, like the Camp Fire, we assign one of
11 our Incident Management Teams to manage the overall
12 incident. And this damage inspection process resides
13 within that Incident Management Team in the Plans
14 Section, and then we utilize the Incident Command System.

15 So the Plan Section, within it is a Situation
16 Unit, and within the Situation Unit is the damage
17 inspection process. So we have two managers. Typically
18 one manages organizing the Damage Inspection Teams,
19 making them up into teams of two, telling them where
20 they're going to go out and inspect and work for the day,
21 making sure that the ESRI collector app. is functioning,
22 that their device is set up and properly working, that
23 they have all the information, things that they need to
24 go out and into the field and do their job successfully.

25 Typically, the other manager will work with the
26 Incident Management Team to ensure that we have the

1 information that we're collecting that they can
2 disseminate through the public information officers.
3 They work with cooperating agencies. So in the Camp Fire
4 we worked with Butte County and the Town of Paradise to
5 ensure that they had access to our damage inspection data
6 for their use and needs.

7 And we also may have trainees. In the case of
8 the Camp Fire, we had one trainee that was as a qualified
9 inspector that's working to become a damage inspection
10 manager. So he performed as a trainee. And he works
11 under a person that -- or -- and he works under a
12 qualified manager. And there's a task book that they
13 sign off to become qualified.

14 Then the damage inspection specialists are
15 formed up into teams of two. And we typically will take
16 -- if we have someone that's relatively new, maybe just
17 recently took the class and this might be their first
18 assignment so they don't have generally any field
19 experience or limited field experience, we will team them
20 up with a more experienced person that's been there on
21 several incidents and performed the duties so that that
22 person can also work with the lesser-trained individual
23 and bring them up to speed.

24 We may assign additional personnel to our
25 teams. Sometimes building officials. The local county
26 will ask if their building officials can go out with our

1 teams and assess the status of the structure, whether
2 it's safe to reoccupy or not. We could have hazardous
3 material specialists that are part of the teams. Just
4 depends. Typically, it's just our team of two, but there
5 could be additional experts in there.

6 And we break the incident into what we call
7 zones. When you're looking at a 150,000 plus acre
8 incident, how do you logistically search that and not
9 miss anything that's out there? So we look at the
10 overall incident perimeter and then we look at the
11 concentration of damage. And we also look at the road
12 infrastructure and, you know, natural breaks in
13 topography, and we try and create zones that are
14 manageable, that we can put one or two teams into to
15 search a zone. And then once we confirm that that zone
16 has been entirely searched, then we will move them into a
17 different zone that doesn't have anyone in it. And we
18 just continue that process until the entire perimeter has
19 been searched.

20
21 (Grand Jury's Exhibit 134 was marked for identification.)
22

23 Q. Okay. Let's, let me move you right there to
24 Exhibit 134. Do you have that in front of you?

25 A. One second. Yes, I do.

26 Q. All right. I have that displayed up on the big

1 board published for the jurors.

2 A. Yes.

3 Q. What is 134?

4 A. 134, the red line is the fire perimeter of the
5 Camp Fire. And then the blue lines within it are our
6 zones. And we identify -- we'll name each zone.
7 Typically, it depends on the damage inspection manager as
8 to how they determine the naming convention for the
9 zones. And so in this case we have, we used M and then a
10 number after it for Magalia. We use C for Concow area.
11 We use P for Paradise. Except for Paradise was, with the
12 amount of structure damage that we had to look at, it may
13 be difficult to see on that map, but we broke it into a
14 lot of smaller areas just because of the amount of damage
15 that we had to go through. So the inspector, the
16 manager, decided to instead of calling Paradise all just
17 P like 1, 2, 3, he used a couple letters between M and P,
18 so N and O to break Paradise up into smaller groups. Or
19 zones. Excuse me, zones.

20 Q. So one of the things I have to ask is the red
21 is the footprint of the fire itself, we're all very
22 familiar that?

23 A. Right.

24 Q. The blue is defining your zones?

25 A. That's correct.

26 Q. But in some places we have blue outside of the

1 red?

2 A. Correct.

3 Q. Why is that?

4 A. So we will typically search a hundred meters
5 outside of the fire perimeter for damaged and destroyed
6 structures, because of embers. Embers will blow. We may
7 stop, physically stop the fire at one location, but an
8 ember might blow outside of that perimeter and could
9 catch a single structure on fire. So we will search a
10 hundred meters outside of the perimeter looking for
11 structures that were impacted.

12 And on this incident, I'm not aware of any
13 structures we found outside of the perimeter. On the
14 Tubbs Fire in Santa Rosa 2017, we did find a couple
15 structures impacted outside of the fire perimeter.

16 Q. So teams of two were sent out to each one of
17 these zones?

18 A. Correct. And there may be more than one team
19 put into a zone at a time. So we typically use what we
20 call right- or left-handed search. And we base that on
21 how we search a house in a structure fire for potentially
22 trapped victims.

23 So what that means is we'll tell them, "Okay,
24 your starting point is, is this location, and you will do
25 a right-handed search. So on that street that you drive
26 down or walk down, search everything on the right-hand

1 side. When you come to another street, make a right-hand
2 turn and search everything on the right-hand side of that
3 street."

4 So typically what that means is eventually
5 you'll keep, when you keep right-handed, you'll make your
6 way back around to the starting point. And the whole
7 goal is to try to not miss anything. I think I may have
8 mentioned earlier that we also have our inspectors carry
9 handheld GPS units and run a track log. So it's dropping
10 or drawing a line, geospatially drawing a line of
11 everywhere they went within the incident perimeter for
12 that day. Then we overlay that on a map and we can see
13 if there's areas or gaps we missed.

14 Q. So essentially the inspectors are doing a grid
15 search?

16 A. Correct.

17 Q. So we've got inspectors with smart devices with
18 the app. on them that are collecting all the information
19 that's in 135 from every structure within the blue
20 footprint of the fire, or blue footprint. What's done
21 with all that information?

22 A. So it's stored in one central database, and
23 which is the ESRI cloud. And anyone who has access to
24 that, that we've granted access to, can access that data.
25 So that's a limited number of people within our
26 department. And some -- we do share that data. Like we

1 gave the data to Butte County as well as the Town of
2 Paradise in this instance. So we will share the data
3 with any local jurisdiction that has authority in the
4 incident for their general record keeping. And they can
5 use it for other purposes. And we store that data
6 long-term as historical records of the incident
7 electronically.

8 Q. Do you do any kind of reports --

9 A. We do.

10 Q. -- after the incident?

11 A. Yes, we do, electronic report.

12 Q. Why is that?

13 A. It's to report on the information that we
14 gathered about the incident as far as damage inspection.

15
16 (Grand Jury's Exhibit 136 was marked for identification.)
17

18 Q. You have in front of you there Exhibit No. 136?
19 That should be the thumb drive.

20 A. Thumb drive. Okay.

21 Q. Do you recognize 136?

22 A. I do.

23 Q. What is 136?

24 A. So 136 is a thumb drive that contains our
25 Damage Inspection Report. And this instance the report
26 is so large that if we printed it it would be over four

1 case of paper. So it's an electronic copy at this point.
2 And it contains our report along with three exhibits that
3 are part of the report.

4 So the report has some general information
5 about our process that I've kind of explained to you.
6 And then it breaks down the structures that were damaged
7 and destroyed by the different damage categories as well
8 as structure type. And we did it on this instance by the
9 town of Paradise, those that are in Butte County, and
10 then for the overall instant -- incident. And then we
11 also have a chart that breaks down the construction
12 features of the structures that we gathered those
13 features on. And then we start to get into our exhibits.

14 So Exhibit A is a list of, it's like an Excel
15 spreadsheet that lists the site address of the structure,
16 the structure type. So was it a single-family dwelling?
17 Was it a commercial building? The percent of damage.
18 And the APN, the Assessor's Parcel Number. So that's
19 Exhibit A.

20 Then Exhibit B is maps of the incident. So
21 there's the fire perimeter map; there's fire history map
22 of the area; there's fire progression, how the fire
23 burned from day to day throughout the life of the
24 incident.

25 And then we get down into fire perimeter with
26 our damage located within that. So an overall map of the

1 incident with the damage. In this report we did not put
2 the damaged structures in there. We usually do. And
3 it's just because on an 8 1/2 by 11 piece of paper it
4 would just be a sea of red within the incident perimeter.

5 Q. Kind of like that?

6 A. Kind of like that, only it would have been
7 probably worse. So it's hard to differentiate, you know,
8 structures from each other.

9 Then we'll take the overall area and break it
10 down into very small parts to where we can actually see
11 the parcels and the structures located within the
12 parcels. So in this incident we had a number of other
13 maps within our appendix, Appendix B, that outlined the,
14 down to the parcel level of damage.

15 MR. NOEL: Madam Reporter, the "that" to which
16 we were referring to was Exhibit 105.

17 THE WITNESS: Then there's Appendix C, which is
18 the last component of the report, which is a single page
19 of each structure that we documented that had damage or
20 was destroyed. And it has all the features, the
21 attributes, the data that we physically input, as well as
22 the picture that we took, as well as a map of the overall
23 incident and location of that structure within the
24 overall incident. And then there's a second map that is
25 kind of a zoomed-in area that gets down to the parcel
26 level and shows that particular structure within that

1 general location.

2 Q. You brought that report with you today pursuant
3 to a subpoena issued --

4 A. I did.

5 Q. -- in the name of this Grand Jury?

6 A. I did.

7 Q. Produced it this morning?

8 A. Yes.

9 Q. Now, the report therein was authored by whom?

10 A. It was authored by the damage inspection
11 managers that were on the incident. So that was -- do
12 you want me to name their names?

13 Q. No. Just all Cal Fire personnel?

14 A. Cal Fire personnel, their damage inspection
15 managers, as well as the GIS specialist.

16 Q. That was based upon the information that was
17 obtained by the damage inspectors themselves?

18 A. That's correct.

19 Q. The information from the smart devices that
20 they were carrying with them, reporting the information
21 on 135?

22 A. That's correct.

23 Q. And all of that information was compiled, made
24 at the time that it was occurring; correct?

25 A. That's correct.

26 Q. The inspectors are out there inputting that

1 information, filling out that form in the field as
2 they're looking at each individual structure?

3 A. That's correct. Then at the end, when all the
4 structures have been documented, then that's when we
5 switch over and start working on the final report.

6 Q. And ultimately the final report is put together
7 by the, by the managers and then it goes where?

8 A. So it is left with, the electronic copy is left
9 with the local Cal Fire unit as part of their records
10 with the Incident Management Team that's assigned to the
11 incident. We also give a copy to the local jurisdictions
12 that had authority. So Butte County, Town of Paradise in
13 this case. And then we keep a copy in our -- I keep a
14 copy for historical records. And we're also often asked
15 through the Public Records Act Request, too, for copies
16 of that report. So we hand them over as we get those
17 requests.

18 Q. So as the, as the Deputy Chief in charge of
19 that unit, you're essentially in charge of keeping
20 historical record of the reports?

21 A. That's correct.

22 Q. So you have reports for all of the fires?

23 A. Yes.

24 Q. So Camp Fire from last year, every other fire
25 in which there was a structures -- wildfire which there
26 were structures damaged, which would include, like you

1 said, the Carr Fire, the Boles Fire, the Tubbs Fire,
2 Atlas Fire, the Delta Fire?

3 A. All of those, all of them that we have
4 jurisdiction on. So if it's a US Forest Service incident
5 that we don't have jurisdiction and it happens to burn
6 structures, then, then more than likely there won't be
7 any damage inspection done. They have a different
8 process.

9 Q. So, for instance, the Delta Fire which started
10 on federal lands last August up on Interstate 5, even
11 though it burned in the state responsibility areas and
12 burned structures, you wouldn't have a report on that
13 fire?

14 A. We do have a report on that fire. If it
15 impacts our responsibility area, we will have a report.

16 Q. So you're the repository of all these reports?

17 A. I am.

18 Q. And you keep those reports, basically legally
19 required to, but also in the regular course of your
20 business?

21 A. Yes.

22 Q. All right. Now I want to go back real quickly,
23 then we'll get ready to take our break. We talked about
24 105. You have 105B in front of you. I mislabeled. You
25 have 105A and B?

26 A. I do.

1 Q. And do you recognize 105A and B?

2 A. I do.

3 Q. What are they?

4 A. So 105A is of the town of Paradise, the damage
5 inspection that we produced for the town of Paradise.
6 And then 105B is the same damage inspection data that we
7 produced for the Magalia area.

8 Q. On 105A and 105B, which are a little closer up
9 than 105, which essentially shows a red blob in the
10 middle of the -- 105A and B actually show individual
11 dots?

12 A. Correct.

13 Q. What do those individual dots represent?

14 A. So the individual dots are an individual
15 structure that is 120 square feet or greater. That's,
16 according to the Building Code, that's at the time that a
17 permit is required to build the building. And so those
18 are the ones that we concentrate on. Anything less than
19 120 square feet we do not document. So those are your,
20 typically your, less than 120 square feet would be your
21 Home Depot style sheds and stuff like that.

22 So the red is, it may be hard to see, but
23 they're down in the lower left corner next to the logos.
24 There's a legend down there. And so that's correct, the
25 red is destroyed structures; orange are major, structures
26 with major damage; yellow is structures with minor

1 damage; and green are structures that were in the
2 affected categories of cosmetic damage. And, again, this
3 is FEMA's, we adopted FEMA's damaged categories and
4 symbology. So that's their color scheme that they
5 developed.

6 Q. That tracks right along with the damage
7 inspection that's being done as part of 135, the
8 information from the app. that the inspectors are
9 gathering?

10 A. That's correct.

11 Q. So as you look through these, the red dots,
12 damaged or destroyed, all the way down to the black being
13 no --

14 A. Black is no damage, correct.

15 Q. And each one of these is an individual
16 structure?

17 A. Correct.

18 Q. Not necessarily habitable. It's not breaking
19 these down by inhabited residences versus commercial
20 structures, these are each just a structure?

21 A. Correct. A structure that's greater than 120
22 square feet.

23 Q. Okay.

24 That is all I have for this witness.

25 Madam Foreperson, if the jurors have any
26 questions?

1 Yes. Hold on. We've got to go through this,
2 remember? You collect them, then we have to go through
3 them and determine if they can be asked.

4 (Counsel and Grand Jury Foreperson confer.)

5 Q. (By MR. NOEL) Deputy Chief, we have a few
6 questions from the jurors.

7 A. Okay.

8 Q. First off, in your experience, have any damage
9 inspectors ever made up, lied about, or provided
10 fraudulent data on the fire damage app. or the worksheet?

11 A. Not that I'm aware of. We do have a process to
12 discipline people if we're made aware of instances like
13 that. But not that I'm aware of.

14 Q. Did you receive any Damage, Damage Inspection
15 Reports that indicated that any structures within the
16 Camp Fire area were caught on fire due to the failure of
17 electrical equipment attached to the structure?

18 A. Not that I'm aware of. Not that I'm aware of,
19 no.

20 Q. Did you receive any data that might indicate a
21 structure may have caught fire due to failure of electric
22 meters in the Camp Fire area?

23 A. No.

24 Q. Are there any standards or policies that would
25 determine which structures fire departments would defend
26 vis-a-vis any other structures in the area?

1 A. It's a lot up to the company officer of the
2 engine company as to what they feel they can defend or
3 not defend, and has to do a lot with a fire intensity at
4 the time and where the location of the structure is at.
5 If it's -- like I mentioned earlier, fire burns more
6 intensely in chutes and chimneys and through saddles and
7 stuff. So if the home is in a bad location, the company
8 officer may choose to not defend that structure as
9 putting the firefighters in too much of harm's way.

10 So there are some methodology that the company
11 officers would use to determine which structures to
12 defend and what not to defend. I know on the Camp Fire
13 the priority was life safety. So evacuations. So the
14 majority of the effort was put into evacuating personnel,
15 then defending structures.

16 Q. Now, following up on that question, isn't one
17 of the big considerations to the company officers the
18 defensible space?

19 A. Correct.

20 Q. So somebody who has maintained defensible
21 space, kept their area clean, their roof clean, like you
22 said, that doesn't create a hazard for the firefighters
23 and gives them a chance to defend, as opposed to you
24 haven't done anything, you've got weeds growing right up
25 against, you got trees all over, your roof's covered with
26 pine needles and leaves?

1 A. They have to make some tough decisions as to
2 what they feel that they can defend; and also, more
3 importantly, being safe for themselves while they're in
4 there at the structure trying to defend it. So
5 defensible space is one of those components that they
6 look at. If a home has defensible space, then it's a
7 higher chance that the home would survive with some
8 intervention by the fire department. So that is one,
9 definitely a thing that they consider whether to defend
10 or not.

11 Q. What is the average length of time for an
12 inspector to complete an inspection report in the field?

13 A. So they have to locate the house, and it
14 depends if they're, homes are tightly packed together or
15 if they're really spread out and they have to drive, you
16 know, or walk to the homes potentially. While they're at
17 the site, they do a 360 around the house just to
18 determine the extent of damage, the construction
19 features, and so forth. Then they will stand at one
20 location and enter the information in the app. and mark
21 the location on the map. So the average length of time
22 is about 15 minutes.

23 Q. How long does it take generally from when a
24 fire such as the Camp Fire starts and when you initiate
25 the damage inspection?

26 A. So when we -- I try to, being the program

1 manager, listen to when and where fires are starting
2 throughout the summer. And if I get a report, our
3 department internally produces some, we call them ROCs,
4 Reports on Conditions, and they come out through the
5 department, "Okay, we have a fire at this location." And
6 if it looks like there's structures, if they put a bullet
7 point in there, there's structures threatened or
8 structures that have burned, then I'll make contact with
9 the local Cal Fire unit or, or the Incident Management
10 Team, if one has been assigned, and start working on
11 assigning damage inspection personnel to that incident.
12 So I like to get the personnel assigned as quickly as
13 possible so that they can get to the incident and start
14 their data collection.

15 Q. So during the Camp Fire you actually had Damage
16 Inspection Teams out inspecting burned parts while the
17 fire was still burning in other locations?

18 A. Correct. We don't have any teams in active
19 fire areas, because a lot of them aren't experienced
20 firefighters. They're trained as firefighters, but they
21 may not have a lot of experience. So there's no
22 expectation that we're there -- see a house catch fire
23 and we're there documenting immediately. We put them in
24 locations where the fire has already burned through, then
25 they go property to property inspecting.

26 Q. Final question: How many Damage Inspection

1 Teams were used in the Camp Fire?

2 A. Twenty.

3 Q. Thank you.

4 Anything further?

5 Seeing none, Madam Foreperson, the
6 admonishment.

7 GRAND JURY FOREPERSON: Okay. Deputy Chief
8 Hawks, you are admonished not to discuss or disclose at
9 any time outside of the jury room the questions that have
10 been asked of you or your, or your answers until
11 authorized by the Grand Jury or the Court. A violation
12 of these instructions on your part may be the basis for a
13 charge against you for contempt of court. This does not
14 preclude you from discussing your legal rights with your
15 own attorney.

16 Deputy Chief Hawks, what I have just said is a
17 warning not a discuss this case with anyone except the
18 Court, your lawyer, or the district attorney.

19 THE WITNESS: I understand.

20 GRAND JURY FOREPERSON: Thank you.

21 MR. NOEL: And the important admonishment,
22 leave all the exhibits.

23 GRAND JURY FOREPERSON: Yes.

24 MR. NOEL: And you're done.

25 This is a good time to take a recess.

26 (Break taken.)

1 MS. RICHARDS: Ready to go on the record?
2 We're back on the record after our morning
3 break. We're going to be calling the next witness,
4 (WITNESS #20).
5 (GRAND JURY FOREPERSON swears in the witness.)
6
7 (WITNESS #20)
8 having been called as a witness in
9 the matter now pending, having been first
10 duly sworn, testifies as follows:
11
12 THE WITNESS: I do.
13 GRAND JURY FOREPERSON: Have a seat.
14 THE WITNESS: Thank you.
15
16 EXAMINATION
17
18 BY MS. RICHARDS
19 Q. Good morning, (WITNESS #20).
20 A. Good morning.
21 Q. Can you please state your full name for the
22 record.
23 A. (WITNESS #20).
24 Q. And are you currently employed?
25 A. No.
26 Q. Are you retired?

1 A. Yes.

2 Q. And who was your last employer?

3 A. PG&E.

4 Q. How long did you work for PG&E?

5 A. Right around 34 years.

6 Q. All right. I'm going to have you go back to

7 the beginning of your employment with PG&E. What was

8 your initial position at PG&E 34 years ago?

9 A. I got hired in as a laborer helper

10 classification, beginning level.

11 Q. And what were your duties as a helper?

12 A. Basically installing underground utilities.

13 Q. What kind of utilities did you install?

14 A. Gas -- gas line, PVC pipe, anything related to

15 what we were putting in for a customer, future service.

16 Q. And over the 34 years that you worked for PG&E,

17 did you work in various different positions?

18 A. Yes.

19 Q. Did you work for positions within the gas

20 industry?

21 A. That's where I started in, gas, yes.

22 Q. And then did you later go on to work in

23 positions in other areas of PG&E?

24 A. Correct.

25 Q. What other areas did you work in?

26 A. I got a position as an apprentice lineman, so

1 it's line of progression.

2 Q. And was that within gas or another division?

3 A. That's from gas to electric, same company.

4 Q. Okay. And was it -- within electric, was it on
5 the transmission or distribution side or some other side?

6 A. You start out where I started out, was in the
7 distribution side.

8 Q. How, approximately how many years did you work
9 in the distribution side?

10 A. Well, let's see, ended my career in the
11 transmission department, so -- after 34, so I was over
12 there 28 to 29 years total in distribution.

13 Q. And did there come a time where you started to
14 work on the transmission side of electrical operation?

15 A. Correct.

16 Q. Okay. And approximately when did you start
17 working on the transmission side?

18 A. And that was, again, a bid job. It's a line of
19 progression within my progression. And I got that bid,
20 transferred in 2010.

21 Q. And so when you say "a bid job," can you
22 explain what you mean by that?

23 A. Yeah. It's just like you asked me how I
24 started. So what it is with PG&E, like many companies,
25 but especially with a utility, there's lot of different
26 what they call "lines of progression." So you're not --

1 they encourage that you don't stay. It's like somebody
2 on a minimum wage job; you're not going to stay at that
3 job hopefully for too many years. So within the company
4 you're allowed to submit the bid. It generally goes by
5 seniority and what you're applying for.

6 Q. Okay. And so you, you submitted a bid and you
7 got a new position in transmissions?

8 A. Correct.

9 Q. Okay. And do -- when approximately did you
10 start working in transmissions?

11 A. In 2010, but it was, it was I think around
12 September. The way it works is they wait for an opening.
13 You can get an award, but they wait for a body to move
14 out before you can move in type scenario. So I actually
15 got awarded the job I think around July and then I was
16 over, sent over there in September.

17 Q. Okay. So you started in September 2010. What
18 was your position, what was that new position within
19 transmission?

20 A. At that time, it was called a transmission
21 troubleman.

22 Q. And how long did you serve in the position as
23 transmission troubleman?

24 A. Around 33, 33 months. So not quite three
25 years.

26 Q. So that took you, took you until approximately

1 the middle of 2013?

2 A. I had put in my retirement papers, so basically
3 I was done with what I was supposed to be doing in my
4 position probably around February of 2013.

5 Q. Okay. So I'm going to ask you a little bit
6 about your duties as a transmission troubleman. What was
7 your main duties as a transmission troubleman?

8 A. Well, as you can tell by the title, trouble,
9 right? So what happens is in that department it's very
10 critical because that's the backbone of the company, you
11 don't have the distribution without the transmission.

12 So basically a troubleman has a truck, and you
13 can have -- in this country you can have a quad so you
14 can offload and go, further patrol the lines. And you do
15 air patrols and foot patrols. So basically that's what
16 you're doing, you're looking for any potential --
17 there's always something out there, you know, in
18 environment, and that's what we're looking for. And many
19 times you find nothing, but you're looking for those
20 things. Could be a rock slide, trees, birds, nests. So
21 basically that's what you're doing, you're looking for
22 trouble.

23 Q. Okay. Were you, in your position, were you
24 always looking for trouble or did you, or would somebody
25 indicate, indicate to you that there might be a problem
26 and then you need to go --

1 A. That's correct.

2 Q. -- find it?

3 A. In other words, you have your basic work. And
4 then the way the system is, there's a lot of sensors that
5 are built into that. And if there's a hit on that line
6 -- when I say a "hit," in the department that they're
7 controlling the operation, it's a big board panel, and
8 you have lights and alarms -- they can send you in a
9 specific direction that you need to go. So you don't
10 have to go out and drive 30 miles of a 40 mile line.
11 They can pretty much pinpoint it. And so that's where
12 that group helps with the support. So it isn't just
13 going and looking for trouble, it is when there is
14 something that actually happens and they sense it, then
15 you go out and you look and you try to find that.

16 Q. Okay. So when you would hear that there was a
17 hit on the line, what would you do?

18 A. What I just explained, you go ahead and
19 basically you're getting a call, either the supervisor
20 would call you -- many times those happened after hours
21 -- and then you go in and you'd either talk to GCC,
22 somebody -- you always have communication with somebody.

23 Q. Let me stop you there. What's GCC?

24 A. They're the control center. Just like in a
25 refinery, you have your board and everything, and you
26 have valves, buttons, alarms. That's what that does.

1 They're sitting in there and they see this. It's like a
2 map. And the lines, based on voltage, have different
3 colors. But they get these alarms, and then they have to
4 do that so they can send you in the right direction.

5 Q. Okay. Let me ask you -- I should have asked
6 you this earlier, but when you were a troubleman from
7 September 2010 through beginning of 2013, what location
8 of PG&E did you work out of?

9 A. Right here in the Cottonwood substation was my
10 base.

11 Q. Okay.

12 A. That's off Table Mountain. So people familiar
13 with Table Mountain? It's just down the road.

14 Q. Did you work on the Caribou-Palermo 115 kV
15 line?

16 A. That was part of my job duties, yes.

17 Q. Did you also work on other lines as well?

18 A. Yes.

19 Q. I'm going to ask you about a specific incident
20 where there was trouble on the line. Did you ever have
21 an occasion to investigate a tower collapse on the
22 Caribou-Palermo line?

23 A. Yes.

24 Q. And when did that occur?

25 A. You know, I can't really be sure because I've
26 been out of there for -- but it was around 2011 or 2012.

1 I do know that we had more snow in 2012 than we did in
2 2011. So I believe -- I just, I feel bad that I can't
3 give you the exactual year. But I think it was probably
4 2012. We had unusual snow that came in.

5 Q. And how did you first learn that there was a
6 problem on the line that day?

7 A. I believe as you're out running around, and the
8 way the weather was, I believe I got a call from my
9 supervisor. Well, there's a couple different
10 supervisors, but he was kind of like the director now, so
11 I actually got a call from him.

12 Q. And after you received that call, what did you
13 do next?

14 A. Well, then you start looking.

15 Q. Okay. And where did you look?

16 A. Well, this was -- the line that you're
17 referring to, which was the Caribou-Palermo, and I'm on
18 the east side of Feather River, so everything was on the
19 west side. So there was a lot of back and forth. So
20 that's where -- I was actually on Highway 70 at the time,
21 one of the few areas where you could actually get cell
22 reception. So then I had to turn around and go back.
23 And then you go and you get up into the area on the
24 right-of-way. And then sometimes you have to offload.
25 And in that particular day, I was able to offload my quad
26 and go and patrol the line.

1 Q. Okay. When you say "offload," you mean you're
2 taking your quad off your truck and you're --

3 A. Yes.

4 Q. -- driving the quad?

5 A. Right.

6 Q. Why would you do that?

7 A. Well, because the truck I have, four-wheel,
8 it's not going to get you where you need to go.

9 Q. Okay.

10 A. Because the conditions were pretty bad that
11 day.

12 Q. What were the conditions like that day?

13 A. It was really, you know, cold. And it was
14 intermittent rain. And there was some icy spots. And
15 you could actually look up there onto the foothills and
16 you could actually see a little bit of snow.

17 Q. When you went out looking for the problem on
18 the line, did you eventually find it?

19 A. Oh, you bet.

20 Q. Okay. What did you see?

21 A. Well, the wires were down. And at that time,
22 though, you can't access all the way, you would have had
23 to have gone on foot. So once I saw the wire down, which
24 is a big conductor, transmission is big stuff, so right
25 away I just know I got to start mobilizing. You know,
26 you call the supervisors, let them know what you've got,

1 then say, "Hey, you got to start mobilizing crews, we
2 have got to get this stuff fixed." Everything, it was a
3 mess.

4 Q. Who was your supervisor at that time?

5 A. Well, like I say, I believe (EMPLOYEE #3) was
6 my supervisor when I started over there. And then he was
7 gone quite a bit, which is not abnormal. And I think he
8 moved into the director or assisting the director. So
9 probably (WITNESS #12) was the actual supervisor at that
10 time.

11 Q. And you said that the, there was a wire down.
12 Could you see why the wire was down when you --

13 A. You know, I really -- like I had mentioned, we
14 got a lot of trees, a lot of tree conditions in there,
15 and I do know that as I was offloading and heading in, I
16 heard chain saws and stuff going, which we didn't have
17 anything to do with it. PG&E didn't have them out there.
18 I think there's some people up in there that they might
19 have been hunting or four-wheeling. So they had actually
20 cut some trees. There were some trees down. But -- I
21 don't remember, I had to go beyond that point.

22 But once I saw what I saw, as a -- you don't
23 just stay there unless you make it safe. But I didn't
24 need to stay there, so my thing was to just make the call
25 and get everybody rolling, get everybody organized as
26 quick as you can, because you got to get that system back

1 up and running.

2 So I don't -- to answer your question, I don't
3 remember specifically. There were trees that were down,
4 but in conjunction with the snow, I never laid my eyes on
5 that because once I see what I got tower-wise, then it's
6 up to the guys to go in there and do what they got to do.

7 Q. Did you see any issues with any of the towers
8 themselves on the lines that day?

9 A. When you say -- be more specific, could you
10 please?

11 Q. Did you look at the trans, any of the
12 transmission towers on the line that day?

13 A. There was really no -- in other words, as
14 you're going in and they pinpoint, you know, the
15 structure, you're looking at the, there's numbers on
16 those towers, so there's no reason -- I mean, it's not
17 like I'm going to do my routine work. I'm getting in
18 there to where I find the problem. So I wasn't looking
19 at any specific towers except for the ones that were in
20 trouble.

21 Q. Okay. And when you say you saw some of the
22 towers that were in trouble, why do you say they were in
23 trouble?

24 A. Well, because they're downed. They're broken.

25 Q. Was the actual tower itself down or just the
26 line?

1 A. There were towers that were bent and broke.
2 But, like I said, I did not go -- there was no reason for
3 me to go all the way in there. Once you get the
4 coordinates and they get the plan and then they can see
5 what you're looking at, and they go ahead right there and
6 they can see, they can see everything.

7 In other words, if I -- if it wasn't such a
8 massive, catastrophic event that happened, then I would
9 have been more into a more detailed type of situation.
10 But once I saw that stuff, my job is to report it and
11 say, "Hey, get them mobilized and let's go."

12 Q. And how many towers did you see down that day?

13 A. You know, I didn't lay my eyes on all of them,
14 but I believe there was a total of four towers. I think
15 two that actually had buckled and broken and two that
16 were bent. The conductors, the wires, are very, very
17 heavy. So it's like a domino effect; if something
18 happens, it can affect the other one.

19 Q. Did you, were you able to come to any
20 conclusions that day about what had caused those towers
21 to fall?

22 A. You know, I don't really -- I know I had to do
23 my reporting or whatever, but it was basically, I believe
24 it was, it was the weather and the conditions and --
25 because there were trees that were down in there. But to
26 go all the way in there, it's not safe either even though

1 the line is de-energized. It's not safe for even a
2 qualified employee to be around there until you really
3 know that it's de-energized and grounded.

4 So I didn't actually lay my eyes, I didn't, I
5 didn't go any farther in there because it was just a
6 mess, and I couldn't go any farther in there until it was
7 safe to do so.

8 Q. Is it fair to say that on this particular
9 occasion your role was to find the problem and report it
10 but not to conduct the investigation into what had caused
11 the problem?

12 A. Right.

13 Q. Is that fair to say?

14 A. Yes. Because it was catastrophic. So we knew
15 that it wasn't a lightning strike, we knew that it wasn't
16 a bird. And birds do cause a lot of problems. But
17 there's a lot -- so it -- to me it was the weather
18 conditions, but I don't know what the final report, what
19 the final finding actually was. The crew, if there's
20 anything out of the ordinary, they're supposed to say
21 things like that for corporate security as well, to make
22 sure what are we dealing with here.

23 Q. And did you observe any of the repairs that
24 were done to the line after that happened?

25 A. No. I'm sorry. No, I got involved in the
26 switching. Which after they make repairs, and we have to

1 put temporary wood poles in many locations because it
2 takes too long to redo a tower. So I was involved in
3 switching with that.

4 Q. Okay. Let me ask you about the temporary
5 wooden poles. Did you put those temporary wooden poles
6 up?

7 A. No, that's not my function.

8 Q. Did you observe the poles that went up?

9 A. No. No.

10 Q. When you were involved in switching, did -- can
11 you explain what that entails?

12 A. Yeah. When the line's de-energized, just like
13 say for example that row of lights up there, you could
14 have a switch over here by the screen and that one switch
15 could shut off one side, one north or south or whatever.
16 So switching involves clearing a line so that you can do
17 your work or switching so you offload. Not the Razor,
18 but offload the load that's up there on the line. And
19 you shift it over to another circuit. So the switching
20 is the integral part of it because it has to be done in
21 coordination with everything. You can't go out there
22 like a light switch and dump it. Everything has to be
23 set up.

24 Q. Did you see the line when you were helping with
25 doing the switching?

26 A. Well, the parts that I see are right where I'm

1 working. Sometimes you have an apparatus piece of
2 equipment that you're asking if it's necessary to go
3 drive that out again. No, because they're already saying
4 that the work has been completed. So I didn't go back in
5 during the time I was there. I had to go into the areas
6 where I had to do the switching, but I did not go beyond
7 that.

8 Q. Okay.

9 A. I didn't have to.

10 Q. Did you ever see the large wood towers in
11 place?

12 A. Not, not wood towers. Wood pole.

13 Q. Sorry.

14 A. That's okay.

15 Q. Did you ever see the wooden poles in place?

16 A. Like I said, I believe there was five total,
17 going off of memory. Could be wrong. But I saw at least
18 three of those.

19 Q. Okay. And can you describe for the Grand Jury
20 what those look like? How tall they are, how wide they
21 are, to the best of your memory?

22 A. Well, my -- most folks here are probably
23 familiar with poles out in the distribution when you're
24 driving down the street, but these things -- just imagine
25 a really nice healthy redwood tree that's -- you can't
26 even put your arms around it. Because these things have

1 to support a tremendous amount of weight with the wire
2 and the conductor. The wood is supposed to be stronger,
3 I guess, per inch than steel. And they're massive. They
4 can anywhere -- we use poles anywhere from 80 to 110
5 feet tall. Because those towers up in that area were not
6 real tall towers, but what they do is they try to just
7 get it aligned, because everything is out of line. So
8 they try to get it as close as what it was. And it's
9 just a lot quicker to expedite, to get the facilities up
10 and running again. But they're massive wood poles, bare
11 of course, until you frame it and build it.

12 Q. And were those -- you said you, you retired
13 around February 2013. Were those poles still up on the
14 line?

15 A. Oh, yeah.

16 Q. At the time you retired?

17 A. Now, like it's been seven years I think in July
18 that I've actually seen that line, okay? So a lot of
19 things have happened. And we used to do what they call
20 -- there was a term "temporary-permanent," which isn't
21 out of the ordinary. In other words, as long as it's
22 working, functioning, doing what it needs to do, we're
23 not going to replace it until they either get the monies
24 or whatever.

25 So I have no idea whether those poles are still
26 there or if, in fact -- but that department was top of

1 the line. I mean, they didn't mess around. So -- and I
2 don't like to assume, but I would be thinking at this
3 time after six years that those towers are back in place.

4 Q. Okay. But as you sit here today, you don't
5 have any personal knowledge about whether those towers
6 were replaced?

7 A. No. When I left, I was done. I'm just that
8 kind of guy. I wanted to concentrate on other things. I
9 have five granddaughters that keep me pretty busy.

10 Q. I'm going to ask you now some more about some
11 of your other duties as a transmission troubleman.

12 When you weren't out in the field looking for
13 what had caused a hit, did you also perform inspections?

14 A. That's part of the job. Right. Inspections
15 refer to you're actually looking on the specific line.
16 You have documents, a folder. You just don't go out and
17 say tomorrow I'm going to go over here because I want to
18 have lunch over there. You have to follow the way the
19 procedures are outlined.

20 Q. All right. I am going to show you, in a
21 minute, one of the -- a packet that I believe you're
22 talking about. But before we get to that, I'm going to
23 have you -- actually, strike that.

24 I have a few questions for you, and then I'm
25 going to have you identify some parts on a picture, and
26 then we're going to talk a little bit more about an

1 inspection in detail.

2 So my first question is did you perform annual
3 overhead inspections for PG&E?

4 A. Yes.

5 Q. Yes. And can you describe what an overhead
6 inspection is, just generally.

7 A. Well, to do the overhead inspection, obviously
8 you're going to have to do it from above. So those are
9 generally air patrols.

10 Q. And at the time you were employed for PG&E,
11 were overhead inspections performed annually?

12 A. Yes. It's required.

13 Q. And when you say that's required, where do you
14 understand that to be -- where did you understand that to
15 be?

16 A. To be required?

17 Q. Yeah.

18 A. Well, I mean, the guidelines have been set
19 forth. And when I hired in in '79, there wasn't a lot of
20 helicopter patrols back then, but a lot of this comes
21 through because of the PUC.

22 Q. Did you have a manual that you used --

23 A. Yes.

24 Q. -- during your employment?

25 A. Yes.

26 Q. What was the name of that manual?

1 A. There was so many manuals. Basically it's like
2 -- we used to call it a Bible, but it's just, all it is
3 -- it's a thick manual, but it gives you references of
4 how you need to write something up if you don't know how
5 to write something up, if it's a particular -- it's
6 basically it's like a troubleshooting manual.

7 Q. Okay.

8 A. But I can't exactly remember the name of it. I
9 just can't.

10 Q. So you testified earlier you spent over 30
11 years working in distribution and then you -- basically,
12 it sounds like it was kind of like a promotion, you
13 promoted over to transmission?

14 A. It was a step up, yes.

15 Q. Did you have, did you get any additional
16 training on how to inspect transmission lines --

17 A. Absolutely.

18 Q. -- when you promoted?

19 A. Absolutely. You get -- just because you get
20 awarded a job -- I mean, you have to be able to prove, no
21 matter how old you are when you get it, but normally
22 you're not 70, we do have a few, you have to climb wood
23 and steel, you have to show that you're proficient, that
24 you can still do that. You have to do what they call
25 pull top tower rescues. You have to pass that. You have
26 to go to further schools, rigging schools, rigging which

1 I never was involved in in my earlier career.

2 Q. What is rigging?

3 A. That's when you're doing replacements of like
4 these pictures with bells or -- so rigging specifies the
5 equipment tools you need to do. And it was basically --
6 it's basic. Because I'm a troubleman, I could be
7 assigned to the crew as needed. And that's why you have
8 to pass those. And then you also have to qualify for
9 being able to fly in a helicopter. Not fly the
10 helicopter, but be able to not get air sick in the
11 helicopter.

12 Q. Okay. Is there any specific training for
13 spotting issues during an inspection that you received?

14 A. Yes, but because I actually had a troubleman
15 job in the division, you have that basic knowledge. And,
16 I mean, the bigger the stuff is the easier it is. The
17 smaller stuff is more like a bird's nest or say -- it
18 takes more time -- but the bigger the stuff is.

19 So you have that basic knowledge, because what
20 you did -- in other words, if you would have came from
21 say, an apprentice, they're not going to let an
22 apprentice go over there and take a transmission trouble
23 job. You got to meet prerequisites before you can even
24 think about it. But there is further training
25 constantly.

26

1 (Grand Jury's Exhibit 37A was marked for identification.)

2

3 Q. Okay. Let's see. I am going to show you --
4 it's actually in front of you, Grand Jury Exhibit 37A,
5 which is also on this overhead projector screen for the
6 Grand Jury. And you'll see that on this picture I have
7 numbered four different items -- A, B, C, and D. Do you
8 recognize the hardware in this picture as something that
9 you would have worked on or would have inspected when you
10 worked in transmissions for PG&E?

11 A. Now, because of the specific title, didn't work
12 on it.

13 Q. Okay.

14 A. I could be assigned to assist the crew. And I
15 was several times. But most of the time what I was doing
16 was the work on the ground. So they had the transmission
17 linemen up on those structures. But yes, I, I had to
18 assist. But as far as some of those parts, I was never
19 involved. And, I mean, normally if there's a problem, a
20 bulletin could be issued. And if they say, "Hey, we've
21 got to clear this, we've got to replace a thousand of
22 these things," nothing like that ever came through.

23 Q. Okay. Let me, so let me have you look at this
24 picture. Does this look like equipment that was on a lot
25 of transmission lines?

26 A. Correct.

1 Q. That you worked with or?

2 A. I've dealt with, but --

3 Q. That you dealt with?

4 A. I understand what you're saying, but, yeah --
5 yes, that's, that's basically what we have in the
6 transmission department to work with.

7 Q. Okay. So I'm going to ask you questions,
8 because I want to make sure that we're using the right
9 terminology here.

10 A. Sure.

11 Q. And you're our expert.

12 For the Grand Jury, he's not designated as an
13 expert today in the legal sense, but he knows more about
14 these transmission lines than anybody in this room.

15 So if you could look at A, I have it next to
16 this curved piece of hardware on Grand Jury Exhibit 37A,
17 what would you call that curved piece of hardware if you
18 were doing an inspection and you wanted to note something
19 about that?

20 A. That's just a bell hook. It's a dead end bell.
21 And it has to be dead ended somehow. So that is just a
22 part of that component. And it is separate from that
23 insulator. There's a pin in there. If you see just
24 below the tip of that hook, there's a little indentation
25 there, looks like a little spot or a shadow. There's
26 actually, in that area there's a pin. And you can pull

1 that. You could actually put another bell in front of
2 that. But the way this is, it's suspended, so that is
3 just a suspension bell hook.

4 Q. And you mentioned a suspension bell hook. Is
5 that what is next to where I wrote letter C?

6 A. Yes, that is the insulator, which I said it was
7 a bell. There's a lot of different terminology, but --
8 if you need me to be more specific, but that is basically
9 an insulated bell, insulator.

10 Q. Would you call this whole, this whole grouping
11 of different insulators an insulator string?

12 A. Yes. String, bell string. And depending on
13 the voltage of the line determines how many insulators
14 you need to have in there. The engineers, they figure
15 that out.

16 Q. On the, on a transmission line like the
17 Caribou-Palermo and 15K line, how many insulators would
18 you typically see in an insulator string?

19 A. You know, I can't, I can't give you that number
20 offhand because the higher the voltage, of course, you
21 need more insulation.

22 Q. Would you see more than five --

23 A. Oh, yeah.

24 Q. -- in a string?

25 A. You can see in the picture right there you've
26 got with the one almost cut off, I would say that's at

1 least I'd say ten in there.

2 Q. Okay.

3 A. At least.

4 Q. And are you familiar with how much weight that
5 would be?

6 A. They're heavy. Everything is designed, you
7 know, and engineered. But yeah, I mean, to take those
8 apart, there's not a whole lot of weight, but there's
9 some that are bigger based on, again, the higher the
10 voltage the more you need. So I would say that if you've
11 got ten of those in there, you're looking at probably 80
12 pounds' worth, 80 to a hundred pounds. Because there is
13 steel involved in there as well that adds to the weight.

14 Q. Okay. I'll have you look at the picture again.
15 That insulator string is attached to the hook that you
16 identified, and it's sitting in another piece of
17 hardware. Do you know -- what would you call that piece
18 of hardware with the hole that the hook is hanging in?

19 A. And, you know, I didn't get involved in that.
20 I mean, it's just what -- we dead end on that, how that
21 is done. So to me it's just a, I would just say it's
22 like a clevis. It's not really, but it's the way that
23 thing is designed. It's heavy, heavy steel. It's just a
24 dead end termination point on the arm of that tower. But
25 I don't know the correct, the correct name. There is a
26 name for it.

1 Q. Okay. Do you recall being trained on a name on
2 it during your training?

3 A. No, because like I said, if I was part of the
4 crew and then you go in and say, you talk to the clerk
5 and say, "I need 500 of these." But you have a book
6 also, because it's like everything else, so many
7 different things, you have to go in and be specific and
8 have different sizes. So you want to make sure you're
9 ordering it. I just didn't get involved in the parts
10 like that. Now I could say, "Hey, we've got 15
11 insulators that are broke on the voltage." Know what
12 that is. But as far as how they built -- they build
13 things differently, too. That changes quite a bit.

14 Q. Is it safe to say you didn't deal very much in
15 your inspections or in your job as troubleman with this
16 hardware that we're talking about?

17 A. Well, we are required to -- any attachment.
18 That's an attachment. So when -- if you can't get right
19 to it and you're using binoculars or you're flying it or,
20 you know, you've got to hike up to it, you've got to look
21 at it. You're supposed to look at every attachment that
22 has to do with the reliability and the continuity of the
23 service.

24 Q. Okay. One more question about -- actually, two
25 more questions about this picture.

26 Do you see D on this picture?

1 A. Yes.

2 Q. Okay. It's, it's right above this sort of arm
3 going out. What would you call that?

4 A. Are you -- you've got that pretty close to the
5 arm. So you weren't referring to the arm?

6 Q. I am referring to the arm. Is that what you
7 would also call it, an arm?

8 A. Yeah. It's a steel arm. Brace. A brace arm.
9 Those are like -- I don't know how many people are
10 familiar, but when we were kids -- I'm going way back,
11 dating myself -- but they used to have those little
12 ERECTOR sets, and everything was like lights, it was
13 metal, and you could use little nuts and bolts and
14 screws. That's kind of what they do out there, and the
15 stuff is tremendously strong.

16 Q. Okay. And one more question about this
17 picture. It might be hard to tell from this picture in
18 37A, but do the insulator strings usually hang straight
19 down plumb with the ground or are they curved?

20 A. No, it depends on the engineering of the job.
21 You could also have -- this is what I refer to as a
22 "suspension," because it's going down, so it's suspended
23 and holding. But we also have dead ends that are, you
24 know, they're parallel with the conductors. But you can
25 have this -- on the same line, you can have suspension
26 and parallel dead end. So it's not always the same. It

1 depends on the terrain and the configuration and how it's
2 designed.

3 Q. If you were doing an inspection, would you be,
4 would you note if you saw a hanging insulator string that
5 was not going straight down?

6 A. Absolutely. But if that was the case, as I
7 said earlier, the sensors that we have now in place that
8 have gotten better every year, they would almost be able
9 to pinpoint exactly where you would need to go with that.
10 That would definitely cause something. It could be an
11 outage, it could be a momentary. And a lot of times what
12 happened is the jumpers, that's the connectors, that are
13 involved in this, they would actually be holding that up.
14 And that's, that's not good.

15 Q. Okay.

16 A. So, yes, I'm sure they would know about that
17 with the sensitivity of the equipment.

18

19 (Grand Jury's Exhibit 137 was marked for identification.)

20

21 Q. Okay. I'm going to ask you a few questions now
22 about overhead inspections, which you've already talked a
23 little bit about. And I have in front of you another
24 exhibit, Exhibit 137, which we will refer to a little bit
25 while we talk about overhead inspections.

26 GRAND JUROR: We don't have those exhibits.

1 Should we? We don't have any of the exhibits.

2 MS. RICHARDS: For the Grand Jury, there's only
3 two exhibits -- three exhibits today we're going to go
4 through with this witness. And one of them is a bunch of
5 pages. Going to put the pages that we're talking about
6 on the overhead projector.

7 So before we get to Exhibit 137, let me ask you
8 some questions.

9 When you were doing your annual, an annual
10 overhead inspection, was this performed by a helicopter?

11 A. All of the work that is scheduled. In other
12 words, you don't do flying in certain times of the year
13 because of the weather, but there is times it needs to be
14 done, there's a deadline to get it done. But generally
15 we start out patrol using my truck or vehicle. You are
16 doing that without flying it. When it requires more
17 detail, then you get involved with the flying.

18 Q. Okay. So when you had an occasion to do an
19 overhead inspection, who would schedule that?

20 A. Our wonderful clerk.

21 Q. Okay. Who is the clerk while you were
22 employed?

23 A. That was (EMPLOYEE #17).

24 Q. Okay. And when you'd perform an overhead
25 inspection, what, what tools did you take with you in the
26 helicopter?

1 A. Basically you could take your laptop computer,
2 because you could actually -- nobody else can do that,
3 but you access it through the PG&E website, and it's like
4 flying a map, which is a good tool. Some pretty good
5 sites, powerful binoculars, and food.

6 Q. So during an overhead inspection, there would
7 be you and then a person flying the helicopter. Would
8 that be a PG&E employee?

9 A. I believe PG&E did have in the early, when they
10 first started, we had pilot, but everybody that I flew
11 with was not a PG&E employee. They were contracted out.

12 Q. Okay.

13 A. And you were not always by yourself, sometimes
14 you'd be somebody in back. But generally, I'd say 90, 90
15 percent of the time you flew by yourself.

16 Q. Okay. All right. So I am going -- I'm showing
17 you Grand Jury Exhibit 137. I'm going to zoom. You
18 should have a copy in front of you. It's that packet. I
19 think you have it in your hand right now.

20 A. Yes.

21 Q. Do you recognize the first page of this
22 exhibit? It says "Operation Control Ticket."

23 A. Yes, I do.

24 Q. Okay. And what document is this?

25 A. You want me to read what document it is? Well,
26 basically this is just a cover sheet.

1 Q. Okay.

2 A. Okay. And what (EMPLOYEE #17) did, very
3 efficient, very knowledgeable individual, this is
4 basically telling you the circuit, and it's -- with the
5 packet, and it's basically telling you the department,
6 and it tells you that it is an air patrol. So it's kind
7 of a more detailed specific cover sheet versus if you
8 open a binder just on a routine patrol. This is very
9 detailed.

10 Q. Okay. And did you have any part in creating
11 this first page?

12 A. No, I did not.

13 Q. Okay. I'm going to skip ahead to the next
14 page. I'm going to zoom out a little bit. Okay. We're
15 just going to move it around a little bit so the Grand
16 Jury can see.

17 We're looking now at the "Transmission Line
18 Inspection Data Sheet." Is this your name up here at the
19 top where it says "inspector name (WITNESS #20)"?

20 A. Yes, it is, but the handwriting is fairly neat,
21 so I do believe I had a good day that day when I wrote
22 that.

23 Q. Is this your handwriting?

24 A. It is.

25 Q. It is your --

26 A. That one is.

1 Q. Okay. It says "date inspection completed
2 8/6/12." Is that your handwriting, also?

3 A. You know, it's very neat, but that's definitely
4 my name there and then the date. But it's just -- with
5 (WITNESS #12), the supervisor, you asked me about
6 (WITNESS #12), "no problems found," this here, 8/6/12, I
7 may not have been actually there. There's different
8 times that I was off. But, in other words, this cannot
9 have a signature on it unless it's all verified and
10 completed.

11 Q. Okay. And where it says "no problems found,"
12 is that your handwriting in the middle of the page?

13 A. No, that is not. That is not.

14 Q. Then I'm going to go back up to the top. It
15 says, "miles inspected, 62. Number of structures
16 inspected, 445." Is that -- does that refer to the
17 entire Caribou-Palermo 115kV line?

18 A. That is correct.

19 Q. So there were 445 structures on that line that
20 you can remember?

21 A. That's correct.

22 Q. Okay. I'm going to move to the next page.

23 A. May I interject something here? Looking
24 through this far, I know -- if I'm going too far, then
25 stop me, but there is, my partner there, his name is also
26 on it. Because when you're not there, these have to be

1 done, they have to be completed whether it's me or the
2 next person. So it's not unusual the supervisor's going
3 off this information. So if you're, if you're concerned
4 because that is not my handwriting whether he has full,
5 he's within his rights to do that, he's not falsifying
6 anything here. This work is completed before he would
7 ever put his name on it.

8 Q. I'm going to ask you some more about the other
9 pages in the report.

10 A. I jumped a little bit ahead. I apologize.

11 Q. It's okay. I'll try to stop you if you --

12 A. Definitely.

13 Q. -- if you go sort of outside of the scope of
14 the questions.

15 Okay. So we are on the, it's the third page of
16 this exhibit, and it's -- has Bates number on it, PG&E
17 Camp Grand Jury 351. Do you recognize this document?
18 Looks like we have tables for "object codes," "damage
19 codes," and "cause of problem"?

20 A. Absolutely.

21 Q. Okay. And would you use this document during
22 your work?

23 A. That's what it's there for. Like you were
24 talking about a manual earlier, this is a quick-reference
25 sheet. And it has codes, so, so you can be specific.
26 Generally, this is, this is what's going to help you

1 right here, you know.

2 Q. So let's look at object codes. What do these
3 refer to?

4 A. Like I said, any of the detail, point of
5 attachments, anything on that line, they're pretty much
6 -- it's like it goes into detail. If you go down a
7 little farther, it says jumper, it says tree. So, in
8 other words, you're not scrambling around going through
9 some manual trying to find it. You have a
10 quick-reference sheet right here to, you can refer to
11 that, then input that information into your report.

12 Q. Okay. So when you're up in the air, do you
13 have this sheet with you?

14 A. Not always, because you're limited really with
15 what -- some of those helicopters are pretty small. And
16 normally I would leave -- me personally, I would leave my
17 booklet, because when you're following it on the computer
18 and then normally you have a note pad in front of you.

19 Q. Okay.

20 A. Then you also -- one thing I forgot. We had a
21 very good digital camera. I alluded to that. And we
22 also had a camera.

23 Q. Okay. So when you're up -- so imagine you're
24 up in the air and you are looking, you're completing your
25 inspection. What kinds of problems are you looking for
26 during an annual routine overhead inspection?

1 A. Pretty much everything that's listed there.

2 Q. Okay.

3 A. If that helps. You're not up there just to
4 look at the sites and scenery, you know. It's a great
5 job. You're not going as slow -- I want people to know
6 you're not flying at a tremendous speed, you're hovering,
7 but there is room for an error. In other words, I might
8 not see something and tomorrow the next person could be
9 up there and say, "Hey, (WITNESS #20), did you happen to
10 see this?" But it's very rare. That's why you can tell
11 him, "Hey, I saw something, then go back." And plus,
12 these have been looked at for years prior to anybody new
13 who has come over.

14 So you have a format. You have something to
15 look at. Has it been -- is that still there, the splice,
16 or has it been removed? So that's what you're doing,
17 you're trying to update, but find anything. Like that
18 tree. "Hey, there's a tree over there that wasn't like
19 that six months ago."

20 Q. Okay. So is it fair to say that you were
21 looking, you're looking at the towers and then you're
22 also updating the log with any problems that you found?

23 A. Absolutely. That's the whole deal.

24 Q. Okay. I'm going to move on.

25 A. But I'm glad you mentioned that, though. You
26 said "look at the tower," which is good, because when

1 you're also in the air flying, you're looking at those
2 four legs down there on that tower, on that structure,
3 you know, making sure there's no giant boulder up against
4 the leg or whatever. You're supposed to look at
5 everything that you could possibly see that could be a
6 problem.

7 Q. Let me have you look at page PG&E Camp Grand
8 Jury 356 in front of you. It says, "Transmission Line
9 Object List." Or do you see the document?

10 A. Yes.

11 Q. Is this the document that you would use during
12 your inspection?

13 A. Right. And you asked me, it's not necessary
14 that you actually have to take this up in the air with
15 you. As long as you're taking pictures of anything that
16 corresponds, then you go down with any of your notes and
17 you refer to this.

18 Q. Is this your name up in the top right corner?

19 A. It is.

20 Q. Is this your handwriting?

21 A. Yeah. Looks like I've signed my name three
22 different ways, but it is mine. I do do that. That is
23 mine.

24 Q. Do you recall whether you took this document up
25 in the, in the helicopter with you when you did this
26 August 2012 inspection?

1 A. I'm pretty sure I didn't. There's no reason to
2 take that up.

3 Q. Was it your usual practice not to take it?

4 A. Mine. You know, you develop -- like I said,
5 there's nowhere for your paperwork. I don't want to get
6 this damaged up in the air either. And I've actually had
7 papers fly out the window, get sucked out.

8 Q. Was your usual practice to make notes and
9 then --

10 A. Absolutely.

11 Q. Okay.

12 A. You have to -- if you go up there and you're
13 trying to do everything from your memory, you're going --
14 my boss and the co-worker, anybody that you're trying to
15 -- they're going to know that you did not do what you
16 were supposed to do. It has to be very detailed and
17 thorough.

18 Q. Did you have any kind of checklist for each
19 tower as you were flying over them?

20 A. That's what this is. So preflight you'd go in
21 here, if there was anything in here that said it's still
22 pending, there's dates on there, then you would write
23 that down, then you'd get over that specific structure.
24 And generally on that line it was all steel. So yes, you
25 would have advanced, you're supposed to have advance
26 knowledge of that.

1 Q. Okay. And I'm going to have you look at page
2 352. I'm also showing it to the Grand Jury. It looks
3 like --

4 A. I'm sorry, you said 352?

5 Q. Yes.

6 A. Okay. So we're backing up.

7 Q. We're backing up. Sorry. Going a little out
8 of order.

9 This appears to be an Excel spreadsheet. In
10 the first column says "Notification," then we have
11 "Order," "Required," and "Notification Date." And looks
12 like another column that says maybe "Notice," but it's
13 cut off, then "Planned," and then "Description," and then
14 "Functional Location," and then "Notes."

15 A. Correct.

16 Q. Do you recognize this document?

17 A. Yes, I do.

18 Q. Okay. What is this document?

19 A. Well, these are, these are things, these are
20 what we call "priors." There's -- everything that's
21 listed on there. If you go back and look at some of
22 those beginning dates, they predate me, they're back at
23 2009, 2005.

24 Q. And you called them "priors." What is a prior?

25 A. Like I said, when you have a creation of a tag,
26 if you're creating a tag. So somebody's already had a

1 prior creation of a tag of work that either needs to be
2 done or can be done, put out into the future.

3 Q. Do you know who created this document?

4 A. I don't know who designed it. I don't think
5 you're asking it, but this would, again, come from our
6 clerk.

7 Q. Okay.

8 A. (EMPLOYEE #17). (EMPLOYEE #17) puts the
9 packets together.

10 Q. Is this something that you would take up with
11 you in the helicopter?

12 A. These you generally should because -- you make
13 copies. You don't want to take any of the originals up.
14 Like I said, if they get damaged or destroyed. This --
15 what I used to do, and there's quite a few on this, I
16 used to just write it on my note pad. But that takes
17 extra time. So when you got this many, yes, you would
18 have that. You would need to have this with you.

19 Q. Is this your handwriting on the document where
20 it says, "Okay, NVE, 92913, and AP completed 215"?

21 A. That is correct. That looks like my
22 handwriting.

23 Q. What did you mean by writing that?

24 A. Abbreviation there, starts out with "Okay,"
25 okay to move. In other words, the job entails, a lot of
26 it, it's like anything -- I mean, you're saying that,

1 hey, this looks good enough to where we can -- work can't
2 all be done at once. There's just too much of it. It
3 has to be coordinated, again, like I said, with GCC. You
4 just can't go and turn the switch off. Then, when you
5 have an area like this, if you can go in and do 15, 20
6 structures, it makes sense to get as much done.

7 So that was -- the line going down, that's
8 saying that all those it looks like -- well, there's the
9 number. So that includes everything in this box right
10 here with the line going down is okay to move. And that
11 is all right based on the guidelines that, the parameters
12 set forth. But, like I said, if it's something that
13 looks like it could cause a potential problem, it's
14 gotten worse, it needs to be corrected.

15 Q. Let me ask you some clarifying questions so I
16 can make sure everybody understands what you're saying.

17 So when you say -- okay, let's move back.

18 So I'm looking at looks like one, two, three,
19 four, the fifth entry here, "notification 104897639."
20 And there's "required" and "9/29/2012." "Notification
21 date, 9/29/2010." And then it says "description,
22 Caribou-Palermo, 225A, replace brace."

23 What, what would "Caribou-Palermo 225A replace
24 brace" refer to?

25 A. Well, see, and then you go a little farther and
26 that's a wood pole.

1 Q. Okay.

2 A. So that's not steel. And, like I say, normally
3 you will have some wood involved in those. Most of it.
4 What that is, an arm doesn't just sit up there with a
5 bolt through it. It's got braces. And we used to call
6 them what they called "wish bone." It's a heavy brace.
7 But if you think of a wish bone, I mean.

8 Q. Does, does each entry on this form refer to
9 some problem that somebody has seen somewhere on the
10 line --

11 A. That's correct.

12 Q. -- that you are watching?

13 A. That's correct. That's an existing. In other
14 words, these sleeves, they've been working, but what it
15 is, per engineering, things change. So there's a lot of
16 sleeves in there. You can see that. So that's what it
17 is. They want to get those out of there.

18 Q. And, and how did you use this list during your
19 inspection? Why did you need this list while you were
20 doing an overhead inspection? What was your job as far
21 as like how did this list help you do your inspection?

22 A. Because already a known existing problem or
23 potential problem.

24 Q. Okay. Then during your inspections did you
25 look for each of these things on the towers as you were
26 inspecting them?

1 A. You have to. See where I've noted. If I don't
2 and I go in and there's no, there's nothing on here, the
3 boss is going to look at it and say, "What did you do
4 here?"

5 Q. Okay. Okay. So during an inspection you
6 looked, you -- is it fair to say you monitored
7 preexisting conditions on the towers?

8 A. That's exactly correct.

9 Q. Okay. And then did you also look for any new
10 problems?

11 A. Remember that -- yes. Yes. Remember that
12 first sheet? Gives you the objects?

13 Q. Are you talking about the, the codes?

14 A. Just getting them tied in. Yes. Not only am I
15 looking -- you don't go up there just to look for the
16 existing stuff. Like I said, you're going up there,
17 "Hey, that wasn't there when I flew that last year. That
18 looks pretty weird. Let's go back and take some
19 pictures."

20 Q. And if you saw something, would you take a
21 picture?

22 A. Yes. Lots of pictures.

23 Q. And then would you also note the problem
24 somewhere in a document? Where would you note that?

25 A. That would be -- there's another -- I don't see
26 it, but there's another sheet that has what needs to be

1 put on there, a structure number. It's got boxes, check
2 boxes, what it is, what you found. And then you, as a
3 troubleman, based on prior knowledge, past experiences,
4 you can say, "Hey, this needs to go in the first
5 quarter," which three months. Or you have the ability to
6 say, "Hey, that's going to be okay." But, fortunately, I
7 didn't make any calls where somebody had to go out and
8 say, "Hey, what you looked at last week fell down." But
9 the reality, it has happened. It does happen.

10 Q. Okay. But did that ever happen in your
11 experience?

12 A. Not with me.

13 Q. Okay. So we, we saw earlier on the form that
14 there are 445 --

15 (Counsel confer.)

16 Q. (By MS. RICHARDS) Let me ask you one or two
17 questions, then we're going to break for lunch and we'll
18 come back. And testimony should be fairly quick when we
19 get back. But let me ask you just a couple of questions.

20 Earlier you said there were 445 towers on the,
21 like that you're inspecting in an overhead inspection?

22 A. That's what is documented on there. I couldn't
23 -- there could be less now --

24 Q. Okay.

25 A. -- because of the poles. If the poles are, are
26 still there.

1 Q. Is it your recollection that there were several
2 hundred towers on the Caribou-Palermo line?

3 A. Absolutely. That number is not something --
4 it's dialed in. So when it says there's 445 structures,
5 you might not be able to look at all those structures,
6 depending on what's going on. But if that's what that
7 says, then it jives with what, everything that's on here.

8 Q. Okay. Approximately how long were you able to
9 spend on each structure during your annual overhead
10 inspection?

11 A. Well, when you're flying, you're not spending a
12 lot of -- you already have your priors; okay? So that
13 saves you, and all you're doing is you're reverifying.
14 You're -- you know, if something has been fixed, when was
15 it fixed, why isn't it not noted? So it's updated. But
16 yes, you're hovering, you're moving. So that's not a
17 detailed -- what you're asking, when you're flying, it's
18 not a detailed inspection.

19 Q. Okay.

20 A. You're looking for something that's going to
21 jump right out at you.

22 Q. About how many minutes do you think you could
23 spend, on average, looking at each tower during an annual
24 over inspection?

25 A. Oh, gosh, I mean it's -- realistically, it's
26 seconds.

1 Q. Seconds, okay.

2 A. Because you're moving and you're looking, and
3 that's what your eye is trained for. And I'll tell you,
4 those pilots, they are help as well, because I've had --
5 they have flown it, okay? And just because I'm a
6 troubleman doesn't mean I'm going to see everything. And
7 I've had a few pilots say, "Hey, (WITNESS #20), we need
8 to go -- let's circle back and take a look at that." It
9 could be a lightning strike. Like I said, they're kind
10 of tough to identify sometimes because of the birds in
11 the area. So they got, they're not just -- I want them
12 to fly. You're up there, let me do the looking, but they
13 can see when they're hovering. And if they see
14 something, "Hey, did you see that?"

15 "What?"

16 And that's happened. So they are an asset as
17 well.

18 Q. Okay. And two more questions.

19 During your overhead inspection -- did you have
20 any training for overhead inspections that taught you to
21 look at connection points like that, that hook that we
22 saw in Exhibit 37A earlier?

23 A. And that is correct. I -- we were supposed to
24 look at every connection point. That doesn't just mean
25 where equipment is dead ended, that means connection plan
26 is also a jumper that has either a press connection or a

1 mechanical, which is bolts. So, yeah, you're supposed to
2 look at everything.

3 Q. Okay. And would you be able to see everything
4 when you're doing an overhead inspection of the sort that
5 you just described where you --

6 A. Yes, but not in detail. I mean, if there's
7 something that's wearing because of strain and the wind
8 -- you know, wind caused a lot of problems, and there's
9 vibration. We have what we call vibration dampeners.
10 They could be six feet long to go out on the wire, the
11 conductor. This is all figured out by the estimators.
12 Just like anybody who builds a plane, a bridge, whatever.
13 When it says you go out and you do that or it needs to be
14 replaced, that's what you do.

15 Q. Okay.

16 A. But the detail -- I know, I mean, I cannot get
17 in there even when I'm in a helicopter. You have to see
18 something. And with electricity, normally it's a flash
19 or a burnt mark; okay? If you see physical damage,
20 something's bent, twisted, that's going to jump right out
21 at you. But electricity, it doesn't always expose
22 itself.

23 Q. Okay. Is it fair to say during an overhead
24 inspection that while you're looking for all the problems
25 you're likely to only see ones that are sort of more,
26 more visible from a helicopter?

1 A. Well, like on those bells, for example, you
2 were saying earlier, you mentioned that if it was like
3 hanging, well, you, you could not miss that. I mean,
4 you'd see that.

5 Q. I know I said only a couple more questions
6 because it's almost lunch, but since you brought up that,
7 I'm going to show you Grand Jury Exhibit 139, just for
8 identification.

9

10 (Grand Jury's Exhibit 139 was marked for identification.)

11

12 A. Do I have that photo?

13 Q. I'm going to bring a copy up to you, also.

14 A. Thank you.

15 Q. Since we're on the topic, let's just talk about
16 it right now.

17 If you'll look in the middle of that picture,
18 it looks -- do you see in the middle of the picture
19 there's a hanging insulator string?

20 A. Yes.

21 Q. Is that something that you would look at during
22 one of your inspections?

23 A. Yeah, I think I had previously mentioned,
24 normally with the weight and how the things hang.
25 Basically what that is, that is like it's laying into the
26 jumper, the wire. It goes to the bottom of that

1 insulator. It's tied into a shoe. But that's definitely
2 something that when you're flying, even from the ground,
3 you'd want to take a look at say, "Hey, that's something
4 kind of bent, something break." Those strings are very
5 strong, but I mean they could still fail.

6 Q. If you saw this during an inspection, would you
7 note it on one of your inspection forms?

8 A. Based on this picture, I don't think so.

9 Q. Why is that?

10 A. Because there's nothing really abnormal with
11 that. I mean, that's not -- and what did I tell you how
12 many is in there? I said around ten. So there's one,
13 two, three, four, five, six seven, eight, nine, ten I
14 think. That doesn't, that's not really -- I would take a
15 look at it and you would know if there's a problem. I
16 mean, right now I can see where it's suspended from, the
17 suspension point. I can see the conductor. But the way
18 this is, you've got wires jumping around all over, and
19 that's not that unusual. As long as that circuit is
20 still running normal, it's going well.

21 MS. RICHARDS: I think we can break for lunch
22 now.

23 And can we, Madam Foreperson, can we give the
24 witness secrecy admonition before, before lunch?

25 GRAND JURY FOREPERSON: Yes.

26 (WITNESS #20).

1 THE WITNESS: Yes.

2 GRAND JURY FOREPERSON: You are admonished not

3 to discuss or disclose at any time outside of this jury

4 room any questions that have been asked of you or your

5 answers until authorized by the Grand Jury or the Court.

6 A violation of these instructions on your part may be the

7 basis for a charge against you of contempt of court.

8 This does not preclude you from discussing the legal

9 rights with your own attorney.

10 (WITNESS #20), what I have just said is a

11 warning not to discuss the case with anyone except the

12 Court, your lawyer, or the district attorney. Do you

13 understand?

14 THE WITNESS: Yes, ma'am.

15 GRAND JURY FOREPERSON: Thank you.

16 MS. RICHARDS: Thank you.

17 So we will take an hour-and-15-minute lunch?

18 Does that sound right for the Grand Jury?

19 GRAND JURY FOREPERSON: Everybody okay with

20 that?

21 Yes.

22 MS. RICHARDS: Okay. So then we will come back

23 at 1:20 and resume.

24

25 (Lunch Break taken.)

(Grand Jury present.)

GRAND JURY FOREPERSON: All the Grand Jurors are back in place.

MS. RICHARDS: The witness is back on the stand. (WITNESS #20) is back.

And you're still under oath, (WITNESS #20).

THE WITNESS: Thank you.

Q. (By MS. RICHARDS) Okay. So let's go back to the "Transmission Line Object List." We are looking at PG&E Camp Grand Jury 356. And I'm going to ask you a few questions, (WITNESS #20), about some of the things on this form.

A. 356 you said?

Q. 356. Let me know when you have it in front of you. I know you have a big pile of papers in front of you there.

A. We got it.

Q. All right. So we're looking at the "Transmission Line Object List." If you look in the first column, it says "Description of tech ID." Do you know what that refers to?

A. Yes.

Q. What does that refer to?

A. It gives you all the breakdown. The tech ID, I think that would be like technical location. They're

1 giving you -- below that -- see, it lists kind of
2 everything there. Then if you go below, it's giving you
3 000, slash, 001 lattice steel tower, another
4 corresponding number, double digit. So I couldn't tell
5 you, though, why it doesn't actually have a number
6 corresponding next to it. I'm sure it has something to
7 do with the way that it's tracked.

8 Q. Let's go, let's go to the next page. And look
9 at a similar entry on the next page. It says, 001009
10 lattice steel tower. What does the 001, slash, 009 refer
11 to?

12 A. That is the structure.

13 Q. Okay. Can you explain or are you familiar with
14 PG&E's naming conventions for the towers on the
15 Caribou-Palermo line?

16 A. Naming?

17 Q. Yeah. Do you, are you familiar with how the
18 towers were named by this number?

19 A. No. If I -- you know, if I would have started
20 in that department sooner in my career, then I would have
21 had much more -- I mean, just because you go through
22 training and you're qualified doesn't mean that you are
23 familiar with how everything was. Like you asked me the
24 coordinate. So much of the engineering and different
25 departments, so many hands involved in it, so I really
26 can't tell you how.

1 Q. Okay. Do you -- that number right there, the
2 001, slash, 009 lattice steel tower, do you understand
3 that to refer to one particular tower?

4 A. Correct.

5 Q. On the Caribou-Palermo line?

6 A. That's correct.

7 Q. Okay. And if you go down to the next box,
8 there's 001, slash, 010 lattice steel tower. Is that
9 another tower on the line?

10 A. That's correct. Of the four hundred, what was
11 it, forty-four, forty-two structures, that box indicates
12 each individual.

13 Q. Okay. And so would there be, would there be a
14 box for each tower on the line?

15 A. That's exactly what those are, yeah.

16 Q. Okay.

17 A. Yes.

18 Q. Let's see, I'm going to -- let's see, we're
19 going to jump over to -- excuse me just a minute.

20 I'm going to have you flip forward all the way
21 back to -- sorry, bear with me. I had this marked on
22 another copy of the document, which I seem to have
23 misplaced.

24 Okay. We're going to go to page 372. Let me
25 know when you're at that page.

26 A. And I'm there.

1 Q. Okay. So you'll see in the middle of the page
2 there's some handwriting. Do you recognize that
3 handwriting?

4 A. Yeah. I mean, I'm not joking with you when I
5 say that my handwriting -- I can sign my name, my
6 (WITNESS #20s), and five minutes I could -- it looks too
7 neat to be mine, but that is my name at the heading.
8 That's definitely my writing. And down there. And, you
9 know, after so many years went by, I usually -- it says
10 AP, which stands for air patrol, by (WITNESS #20).
11 Normally I would include my initial, but like I said, as
12 long as it's been done. But in all honesty, I can't
13 really say if that's my handwriting there or not.
14 Because, see, at the top I got (WITNESS #20). And then
15 you go down and I say (WITNESS #20). But it sure, it
16 could be.

17 Q. Okay.

18 A. Close. It's sloppy enough.

19 Q. I'm going to read it to you. It says, "AP by
20 (WITNESS #20) to this point only." And you just, you
21 just testified AP you understand to mean air patrol?

22 A. That's what it is, yeah.

23 Q. Okay. And then it says, "Incomplete due to
24 fire 7, dash, 12." What does that mean?

25 A. Well, that's when the other troubleman took
26 over. But there was a fire up there. But, again, I, I

1 don't know -- I remember running material up there for
2 the crew, but I don't remember the actual cause of the
3 fire.

4 Q. I don't need you to testify about the cause of
5 the fire. Let me just ask you a few more questions about
6 this air patrol.

7 Did you, did you have to stop this air patrol
8 midway through because of something that happened during
9 the aire patrol?

10 A. I can't answer that correctly. I don't
11 remember that far back.

12 Q. Okay. Do you recall having to stop the air
13 patrol because there was a fire in the area?

14 A. That is the possibility, because if it's smoke
15 up in that area and you have lack of visibility, you
16 can't fly.

17 Q. Okay.

18 A. Wind, also. If it's above usually 35 knots, 40
19 knots, it's not recommended to do a patrol.

20 Q. Okay. Then let's go on to the next page. In
21 the top right-hand corner it says "Inspector name," then
22 it says, "(WITNESS #1)"?

23 A. Correct.

24 Q. Do you know anybody named (WITNESS #1)?

25 A. That was my partner in crime.

26 Q. Okay. When you say "partner in crime," what do

1 you mean?

2 A. That's, you know, slang stuff. He was my -- we
3 have pole partners, but in transmission you don't -- we
4 work, (WITNESS #1) and I had the same area. About areas,
5 we have four troublemen there. Two of the other guys
6 worked certain areas than me and (WITNESS #1). So we
7 were a team, you're a team.

8 Q. Did he -- was he also a troubleman, the same?

9 A. Yes.

10 Q. He had the same position as you?

11 A. Yeah. He has to be a troubleman to do that.

12 Q. Okay. All right. I'm going to put up the
13 picture that you've seen already, Grand Jury Exhibit 37A,
14 and just ask you a few more questions.

15 In relation to this hardware, when you're
16 performing inspections -- do you have the picture?

17 A. Yes, I do.

18 Q. Okay. Were you trained to specifically look at
19 the connection point between the hook marked as A and the
20 B, and the plate marked as B when you were performing
21 inspections?

22 A. As stated earlier, we were to looking at every
23 connection point.

24 Q. Did you have specific training on what to look
25 for in regard to this type of connection?

26 A. When you say "training," there's really nothing

1 to be trained on. You're looking for something. Like if
2 that hook would be bent abnormal; in other words, not in
3 its normal shape. The eye could have, where it's hanging
4 from, the I-bolt, it could have a rip or a tear or a burn
5 mark. Usually what you're going to see, if nothing came
6 down heavy and hit the stuff, you're going to see burn
7 marks or tracking which indicates leakage. But there's
8 no real specific training. That's what you're looking
9 for, broken stuff.

10 Q. So looking for broken hardware or hardware that
11 has burn marks. Were you trained to look for anything
12 else, any other problems in regard to this type of
13 connection point that's in 37A?

14 A. Well, there's really, I would say there's less
15 than three or four things that can actually be a problem
16 with that, so they would stand out pretty good. But when
17 you asked me earlier before the break, when you're
18 flying, you can miss some things.

19 Q. Okay.

20 A. I mean, like you mentioned, these bells in this
21 other photo. There's no strain, there's no heavy
22 connector on there making it like that. That's just,
23 that's just -- it's pushing back on itself. That's not a
24 heavy conductor, that's a jumper. So that's why it has
25 that.

26 Q. And, for the record, the witness is referring

1 to Grand Jury Exhibit 139.

2 A. Right. Thank you.

3 Q. All right. So I was just asking you questions
4 about the overhead inspection that you performed in 2012
5 that you were not able to complete due to a fire. Did
6 you let anybody know that you weren't able to complete
7 the inspection?

8 A. Well, that's written down on that log sheet.

9 Q. Okay.

10 A. And then when you're done, you know, the
11 supervisor knows. I mean, when you're done with a flight
12 and you have to cancel a flight, you have to go to the
13 proper command and let them know. And I may have been
14 told to cancel, too. I just cannot remember.

15 Q. And did you tell your supervisor that you
16 weren't able to complete the --

17 A. Well, it's documented.

18 Q. -- the inspection?

19 A. So, yeah, there had to be verbal communication
20 as well.

21 Q. Okay. And did you, did you give anybody
22 written -- did you, did you -- well, who was your
23 supervisor at the time?

24 A. That would have been -- since (WITNESS #12) on,
25 that would have been (WITNESS #12).

26 Q. Okay. And did you give him any, did you tell

1 him in writing that you were not able to perform the rest
2 of the inspection?

3 A. It's on that -- in the notes there that we saw
4 earlier. Remember the spec. sheet where it says, "Okay
5 to move," and then complete and drop down and then have
6 to stop, if you go down, it's written there. Then
7 there's a sheet when you fly in a helicopter to keep
8 track of the hours. Because there's a lot of money
9 involved there. That sheet gets turned in with usually
10 my time card with my hours on it. So the clerk,
11 (EMPLOYEE #17), nothing gets by her. It's all there. So
12 there is documentation.

13 Q. So there's multiple places where you would have
14 documented that you were not able to complete the
15 inspection?

16 A. Right. And they might not have seen this right
17 away, when -- until I turn it in. But with all the
18 follow-up, there's at least two or three other types of
19 documentation that are going to be seen.

20
21 (Grand Jury's Exhibit 138 was marked for identification.)
22

23 Q. Okay. Great. I have just a few more things.
24 I'm going to show you Grand Jury Exhibit 138.
25 Now, this is -- the Grand Jury is not going to see this,
26 I am just going to ask you a few questions just to

1 authenticate the document. Is that an email that you
2 wrote?

3 A. Well, it's got my name at the bottom of it. I
4 mean, it's not a signature when you have to sign
5 something, but I communicated with what I needed to do.
6 And I had to take time off. So yeah, that. And it's got
7 my heading at the top.

8 Q. And then who did you write it to?

9 A. That's to my supervisor, (WITNESS #12).

10 Q. Okay. And you mentioned a (WITNESS #1) in
11 there. What (WITNESS #1) does that refer to?

12 A. The (WITNESS #1) on this here.

13 Q. Okay.

14 A. So when you're working with a group of people,
15 you wouldn't really say Megan Johnson or Megan Smith,
16 they know who you're talking about.

17 Q. You probably didn't have a lot of different
18 (WITNESS #1s) on your --

19 A. That's kind of a nickname as well. And I had
20 them as well. His real name is (WITNESS #1). He's
21 (WITNESS #1).

22 Q. Thank you.

23 One moment, please.

24 All right. (WITNESS #20), I have just a few
25 follow-up questions about a topic we've already covered
26 but not in very much detail.

1 So I have right here the "Object Code," "Damage
2 Code," and "Cause of Problems" tables from Exhibit 137.
3 And I'm on page PG&E Camp Grand Jury 351.

4 So if you look at "Damage Code," do you see "MC
5 18 out of plumb"?

6 A. Yes.

7 Q. What does that refer to?

8 A. I have explained that, but not today. When,
9 when you're setting a pole, for example, we take a
10 weighted object with a string. It could be fishing line.
11 Anyway, plumbing means you want to set something as true
12 straight as possible. And if you have an angle, and
13 conductor is going to be pulling into it, what we do is,
14 the terminology is you would set it, say, "a half a pull
15 out of plumb." It's just that's the lingo that was used.
16 It could be even different now.

17 But that's what -- plumbing even a tower,
18 that's what I say if the tower is leaning and one of the
19 legs is damaged, it's dropped maybe two feet, legs
20 buckled, it's not plumb. So when they build those towers
21 and set a pole line, they try to get them as true to
22 being -- how can I -- you know, straight in line, so to
23 speak. But, you know, you can have something straight at
24 an angle in this way. But plumb means when you set that,
25 you build it, it's, it's in line. It's just true,
26 correct.

1 Q. So if you saw a metal transmission tower that
2 was leaning, would you mark "MC 18 out of plumb" on your
3 inspection report?

4 A. No, I don't think I'd use that terminology,
5 because to me that deals more with our wood pole. I
6 never saw that on reference to a tower out of plumb.

7 Q. Would you use that in reference to an insulator
8 that was out of plumb?

9 A. Well, if you're describing it like that picture
10 that you showed me -- go back to that one you gave me.
11 The -- on 139, Exhibit 139. Do you see how the others --
12 there's three strands of bells in there, three sets?

13 Q. Yes.

14 A. You see how they're pretty much -- you can use
15 the word "plumb." See how two of the three are pretty
16 much straight down?

17 Q. Yeah.

18 A. And the other one, though, is resting on that
19 jumper, okay? That's why. And those things are made --
20 it's like an accordion. They're made to swivel, pivot.
21 And it looks -- that's something, though, you asked,
22 yeah, I want to look at that. Why is that like that when
23 the other two aren't? If it's just on a jumper like
24 that, it could be put in a little bit more of a strain,
25 but it's still being held in on the hook.

26 Q. So would you use that out of plumb code to

1 refer to this in Grand Jury Exhibit 139?

2 A. No, not when, not if I'm having to describe
3 like if there is an issue there.

4 Q. Okay. Would it be a close call whether to use
5 the code or is it clear to you sitting here right now
6 that you would not use the code?

7 A. No, I would not use -- I never did. I mean, I
8 had, I never wrote anything up like that as a problem,
9 because you look at it, it looks like you can see that
10 pretty good from below as well, so you'd only want to
11 know why is it doing that? Did something break? Did a
12 pin pop out? Why is it putting extra pressure? But a
13 lot of times it just has to do with things sag, the other
14 wire. And believe it or not, wires, when they're under
15 load, when it's hot and cold, they expand and contract.

16 Q. If you saw, if you saw an insulator out of
17 plumb like that, would it, would it cause you to inspect
18 it more closely?

19 A. Yeah. I said I would. I would want to make
20 sure that I'm not just flying past it, driving by it.
21 But it's very easy to see that scenario right there.
22 Because it's -- the bells are pushing down on that jumper
23 wire, as you can see that wire in the picture in the
24 bottom. That's what that is, it's a jumper.

25 It looks worse than it is. But if you drive up
26 the canyon, Highway 70, and you go there's a bell and

1 substation, a lot of it is just, it's just droopy stuff.
2 Doesn't mean that there's actually a problem. If that
3 thing was this way and laying off this side and the
4 wire's holding it, then you know it's not hanging
5 anymore, so you've got a problem.

6 Is that -- like I say, there's different things
7 in that object list. And you wouldn't -- I didn't, and I
8 don't know anybody else that did, I'm not saying they
9 didn't, just say something's out of plumb. You might use
10 that terminology if you are on the radio and you say,
11 "I'm going to go get a closer look at the tower" if
12 you're driving by, "it looks out of plumb." Whoever
13 you're talking to knows what you're talking about. That
14 thing could be leaning. Why is it leaning? It's just
15 some terminology that's used generically.

16 Q. Okay. Just a moment.

17 MR. NOEL: I'm going to ask you a few
18 questions.

19

20 EXAMINATION

21

22 BY MR. NOEL

23 Q. Going back to your job as troubleman and the
24 basis of your job as a troubleman, make sure I'm
25 understanding this right, it sounds like you're both --
26 your job is both reactive and preventive; is that

1 correct?

2 A. Yes, sir.

3 Q. If something happens to one of those lines, an
4 alarm goes off in the grid control center, you're the
5 ones that they call to go out and find what's wrong?

6 A. That's correct.

7 Q. Not to fix it, but to find it?

8 A. That's correct.

9 Q. On the other hand, you're also doing preventive
10 because you're going out and looking at the lines and
11 trying to identify not just problems but what's going to
12 be a problem?

13 A. Correct.

14 Q. And so that they can be fixed before they
15 happen; correct?

16 A. Yes. That would be our preventive maintenance.

17 Q. So in terms of your training as a transmission
18 troubleman, you spent a lot of time talking about the,
19 not necessarily about the training, but the physical
20 demands of making sure that you're physically able to do
21 the job, which you can climb the tower, climb the pole,
22 that you can ride in the helicopters. Was there any
23 actual training as to how to do the inspections
24 themselves? And what was that?

25 A. Yeah, there was. There was classroom --

26 Q. What was that?

1 A. -- you're in. Constantly doing your online
2 courses as well, which most of us guys don't like because
3 we want to be out in the field. I don't want to be on a
4 computer. But yes.

5 Q. Okay.

6 A. We also would go to school. Some of those
7 schools would involve two weeks', two weeks' worth of
8 training. And you'd get tested on things. But most of
9 it was on, that aspect of it was the rigging, spend more
10 time learning how to do rigging because you had to go out
11 and assist a crew --

12 Q. Right.

13 A. -- at times.

14 Q. But that's, again, that's kind of the physical
15 part of the job?

16 A. Right.

17 Q. Not what to look for on a transmission line or
18 transmission tower to see if there's a problem; right?

19 A. Yes. But there was --

20 Q. I kind of -- to put it in a common sense, what
21 we all do, if I'm going to take my car to a mechanic, I
22 want to take my car for an inspection and an oil change
23 and stuff, I want to take my car to a mechanic who knows
24 what my car is supposed to look like when it's at its
25 optimal performance; right?

26 A. Sure. Correct.

1 Q. So somebody who has never looked at a tire
2 before, has no idea what a brand new tire looks like,
3 can't tell you if your tire is not right. They may be
4 able to tell you that it's flat when there's no air left
5 in it, but they're not going to be able to look at it and
6 tell you if you're about to have a problem; correct?

7 A. Understood. Understand. Yeah.

8 Q. That's what I'm asking is from what did they do
9 to teach you what this stuff is supposed to look like so
10 that when you're seeing things in the field you can
11 anticipate problems?

12 A. Well, again, there's all that on-the-job
13 training that I went to prior to the -- in the other
14 department. But when you look at these fixtures here,
15 there -- you know, you can take somebody that's never
16 seen anything like this, if there's a split, a rip, a
17 tear, a bend, a problem, you would be able to point that
18 out and hopefully they would get that within five
19 minutes. I mean, if I can't see something like that
20 being a troubleman and distribution for X number of
21 years, then -- like you said, nobody's going to miss
22 something like that. But where that hook sits in that
23 eye, there's no way -- and I think that's what you guys
24 are trying to get to -- there's no way you can tell how
25 much wear is under there. You can't.

26 Q. So I'm -- well, let's back up on that. I've

1 got it up on the big board, a copy of that picture. This
2 is the same picture; correct?

3 A. I was looking at Exhibit 3, 37A.

4 Q. You have 37A? Let's give you 37. I'm sorry, I
5 should have done that before I got in there.

6 MS. RICHARDS: 139. Is that 139?

7 THE WITNESS: I have Exhibit 37A, and I think
8 it's --

9 MR. NOEL: 37.

10 THE WITNESS: What's the picture behind the
11 book?

12 Q. (By MR. NOEL) Actually, the one I've got is
13 139 up there. So this is 139.

14 A. Okay. I got it.

15 Q. So in order to inspect this, you need to know
16 what this actually looks like when it's optimal; right?

17 A. But you, you have a general idea because
18 basically the way it comes in on a structure, you're
19 looking at it. And it's, it's -- basically you got to go
20 out in the field and you got to look at the stuff. So
21 that's where a lot of your training comes in. You've got
22 to go out there. And hopefully you're not looking at
23 something that is damaged, you're looking at something
24 that is working, in good order. So then, like you say,
25 if you do have a problem, you can recognize the problem.

26 Q. Right. Well, this, this picture, we have a

1 problem. This bell string, that's not the way that's
2 supposed to look, is it?

3 A. No, they're -- I've seen them in the field like
4 that.

5 Q. That's not the way it's supposed to look. They
6 may look like that, but the wire is supposed to -- the
7 jumper cable, the jumper conductor here is supposed to
8 hang off the bottom of this?

9 A. It should be, it should be, it should look more
10 like the other two.

11 Q. In this one you see the jumper cable hanging
12 off the bottom. In this one the jumper cable isn't
13 hanging off the bottom, is it? It's actually holding the
14 bell string up?

15 A. There should be a shoe. This picture, it's a
16 good picture, but it's not as detailed as it looks. But
17 there's definitely strain on that jumper. I'm calling it
18 a jumper.

19 Q. Do you know what this is right here?

20 A. That looks like that would be part of the shoe
21 that comes out of that bell. In other words, where it
22 lands, the wire. Some of them are flat like a cup and it
23 would lay, and other times it would go in and dead end
24 that way.

25 Q. Would it surprise you if I told you that that's
26 a splice?

1 A. I can't -- you know, I don't have my glasses
2 with me, but looking at this picture, I can't really --
3 if I'm taking the picture, I'm out there looking at it, I
4 would be able to identify it. I cannot identify that as
5 a splice or not.

6 Q. You generally flew the line in the helicopter;
7 correct?

8 A. Excuse me?

9 Q. You flew the line in the helicopter for
10 inspection?

11 A. Flew the line, yes.

12 Q. This photo would appear to have been taken by a
13 helicopter?

14 A. Yes.

15 Q. Now, are there supposed to be splices in jumper
16 lines?

17 A. That's not necessarily a splice. What it is --

18 Q. Well, let's just assume. Let's assume. I can
19 tell you, assume that is a splice.

20 A. No, we don't want to assume. My job, you're
21 not supposed to.

22 Q. No, no. I know. But I'm going to tell you
23 that is a splice. That is a splice in a jumper cable.

24 A. Who told you that was a splice? May I ask you
25 that?

26 Q. Nope. That evidence will come later. But just

1 assume this is a splice, that someone has cut this jumper
2 cable, shortened it, and spliced it together right here
3 next to the, to the shoe that you're talking about.

4 A. That doesn't make any sense, because that
5 conductor, it -- I think that's probably only about 15 or
6 20 feet. And to do that, that would just be -- that
7 wouldn't be repaired properly. You'd just replace that.
8 Because in order to do that, that's going to be
9 de-energized anyway. You cannot do that on a hot
10 circuit.

11 Q. And this is, this is usually -- this should be
12 hanging like this; right? So that's not correct. So
13 somebody's shortened this to the point where now your
14 bell string is actually being held up by your jumper
15 because it's too short?

16 A. No. It's still connected at the hook up at the
17 top.

18 Q. Right.

19 A. But there's strain on there, that's for sure.
20 There's definitely strain on there.

21 Q. So let's go back to talking about the hook.
22 What training have you been given in what to look for in
23 the connection point?

24 A. I never -- you're looking at it visually. I
25 don't know what to say other than you're looking at the
26 components. Nothing's bent or tweaked. So it's hanging

1 there. It's doing its function. Nothing is bent on the
2 end. Doesn't look like anything, if you're looking at
3 them, if you can tell if they've been shot at. So
4 basically, training, there is no training. You're going
5 by what you see. If something doesn't look kosher, you
6 write it up.

7 Q. Going back to our car example, you have to know
8 what this actually looks like when it's, when it's
9 correct; right?

10 A. But that's very easy to see.

11 Q. Do you have any idea -- do you know the size
12 and shape of the hole that the hook is mounted to?

13 A. No, sir. I would not know that.

14 Q. That's not in anything that you're taught?

15 A. No.

16 Q. So let's assume that that hole is a circle and
17 it's 1 1/8 of an inch; okay? You got it?

18 A. Yes.

19 Q. That's a circle 1 1/8 of an inch. In your
20 training, are you told how big these hooks are?

21 A. No, because --

22 Q. Now let's assume the apex of that hook, where
23 the hook connects to the hole --

24 A. Correct.

25 Q. -- is 7/16 of an inch. Not 7/16 of an inch,
26 15/16 of an inch. Right? So 15th of a 16th -- 15/16 of

1 an inch. That hole is 1 1/8 inch. How much daylight
2 should you be able to see through the top of that hole,
3 if this is optimal?

4 A. There's no parameters set forth for that.
5 There's nothing I've ever seen how much. In other words,
6 if you put something in there --

7 Q. Let's do simple math. If the hole is 1 1/8
8 inch and the hook is 7/16 of an inch -- or 15/16 of an
9 inch, that should leave 3/16 of an inch between the top
10 of the hole and the top of the hook. So, in other words,
11 this area right here should be 3/16 of an inch. That's
12 what it should look like brand new, when it's optimal;
13 right?

14 A. Again, I don't know what those parameters are.
15 It's got to be able to swing and move and pivot.

16 Q. Right.

17 A. So if somebody's trying to force something in
18 there on a new build, that's not right. I'm going to
19 tell you, that's not right.

20 Q. I'm telling you if PG&E engineers, the people
21 who designed this, said that this hook, the eye's apex is
22 to be 15/16 of an inch at that place right here where
23 it's going to be in contact. And that hole is going to
24 be 1 1/8 inch around. That's the PG&E specs. You don't
25 know that; right?

26 A. I've never seen, never heard that there needs

1 to be any specs.

2 Q. That was not part of your training?

3 A. No.

4 Q. PG&E, they have engineers and all of that stuff
5 is designed and over designed and everything else; right?

6 A. Yes.

7 Q. If the PG&E engineers determined that that hook
8 is supposed to be 15/16 of an inch, and that hole is
9 supposed to be 1 1/8, that would leave 3/8 -- or 3/16 of
10 an inch of daylight in the top; right?

11 A. Okay.

12 Q. So the fact that there's more than that
13 daylight would be an indication of wear; correct?

14 A. But you're not going to -- that's -- we're not
15 going out there -- when I was in the different
16 department, if I may allude to, there were times you had
17 to go up and measure with a ruler. That never happened
18 when I was, when I was in the transmission department.
19 You can't go over there and say, "Oh, that doesn't look
20 right." You'd never get beyond that structure. I mean,
21 and then the only way, if that thing was built -- the
22 engineer might have designed it right, there's always a
23 possibility the crew didn't install it properly. They
24 maybe went with a smaller bracket. I don't know. I
25 don't know that.

26 Q. Don't know. But you just made the point.

1 Nobody's going up and inspecting this; right?

2 A. You know, it would have to be something that
3 they're having a generic problem with. See how much
4 different that photo looks versus Exhibit -- go back to
5 37A, where you have a much bigger, because it's a
6 different bell strand. So that's a much tighter fit
7 there.

8 Q. So hold on. Let's go back. This is 139A;
9 right?

10 A. Yes.

11 Q. 139, we just looked at this, is a closeup of
12 that hook. And you're saying this is a tight fit?

13 A. It looks like a tight fit, but there's --

14 Q. This space right here is supposed to be 3/16 of
15 an inch; correct?

16 A. Per your figures you were using, yes.

17 Q. That's significantly more than 3/16 of an inch;
18 correct?

19 A. I can't say.

20 Q. Okay. Can you also tell -- and you can come up
21 here and look at it, or you can look at the one in front
22 of you.

23 A. This is a good photo here.

24 Q. This mounting hole is no longer round; it's now
25 oblong.

26 A. Yeah. I mean, I can agree with that, but --

1 Q. Okay.

2 A. -- that's not like you -- as far as specific
3 training, I mean, I never, I never spotted anything like
4 that.

5 Q. Right. And I'm not saying that -- what I'm
6 pointing out is that when you became a transmission line
7 troubleman, your job is preventive as much as it is
8 identifying when problems happen? Your job is supposed
9 to be part of that preventing problems?

10 A. That's correct.

11 Q. Going out and identifying components that not
12 necessarily are failing right now, but are going to fail
13 tomorrow or are going to fail next month or next year or
14 three years from now; right? Because when you're a
15 trouble --

16 MR. FOGG: Marc, can the witness, please,
17 answer the question verbally?

18 THE WITNESS: Yes, that's correct.

19 Q. (By MR. NOEL) One of the things when you're
20 doing your inspections and you do identify problems, and
21 in this 2019 inspection -- you've got the exhibit -- in
22 this 2019 -- 2019 --

23 A. 2012.

24 Q. 2012 inspection. You know, you were talking
25 about page 352 earlier, which is the preexisting
26 conditions list; right?

1 A. Correct.

2 Q. And there's stuff in there, "Okay, it's okay to
3 move this out two years," and whatever. PG&E actually
4 had priority categories for everything; right?

5 A. Yes.

6 Q. "A" priority would be this is an emergency, it
7 has to be done absolutely positively today --

8 A. (Nods head.)

9 Q. -- to "E" priority, it needs to be done
10 sometime in the next 18 months I think it was or
11 something; right?

12 A. Some of those are judgment calls. Like you
13 said --

14 Q. Right.

15 A. -- it might not last. This is within the
16 parameters of what you -- that's why you have a book --
17 but it could fail tomorrow.

18 Q. Exactly. So what you're looking at, the vast
19 majority of that list that's in there, that preexisting
20 conditions list, are conditions that were identified
21 during the 2009 inspection; correct?

22 A. Yes.

23 Q. And somebody doing a 2009 inspection said this
24 is going to be a problem and noted a whole bunch of
25 potential problems basically for the -- you know, but
26 they aren't a problem today, but these are things that I

1 see are going to be a problem down the line. And then
2 you guys as the follow-up inspectors are looking at those
3 things and saying, "Okay. It's still okay. It's still
4 okay"; right?

5 A. (Nods head.)

6 Q. You have to answer verbally.

7 A. Yes. If it is okay, then you would say it's
8 okay, yes.

9 Q. Right. So the whole point I'm trying to make
10 is nobody ever told you to look at this, these connection
11 points, nobody ever told you what those connection points
12 were supposed to look like and said you need to be
13 checking on those connection points for wear and tear?

14 A. Well, I don't need to be told to look at those.
15 I said I look at every connection point. But for me to
16 determine that there's something wrong there, if it's 3/8
17 of an inch and you're in the air, I can't, I can't make
18 that determination.

19 Now, with the picture that we show where
20 there's a little bit more pressure down on that
21 conductor, yeah, there might be something there that you
22 want to go and take a closer look at. And then you might
23 be able to say, "Yeah, that looks like that's wearing."

24 Q. Well, even going back to 139, you can still see
25 a whole lot of daylight. As a matter of fact, you can
26 see the branch in the background through the space

1 between the top of the hook in the top of the hole. The
2 whole point I'm trying to make is nobody ever taught you
3 what it was supposed to look like; right?

4 A. But there was -- I don't believe there's any
5 parameters that were set there, but I may -- as long as
6 it's there and it's hanging. But you can tell if
7 something's bent, pulled, distorted. But because it's
8 gapped or it's tighter or looser, no, huh-uh, I wasn't --

9 Q. So as long as this thing is still connected it
10 wasn't a problem?

11 A. Right. In other words, I would have to see a
12 little bit more than what I see there. There's -- how
13 old is this system? May I ask you that? And, see, I
14 should know that; right?

15 Q. Okay. I don't know if that's relevant to your
16 job or not, but I don't have any further questions.

17 A. But age has something to do with it.

18 MR. NOEL: I don't have any further questions.

19 Madam Foreperson --

20 I'm sorry, Nick, did you have anything further?

21 MR. FOGG: Just if the Grand Jurors have
22 questions, please write them down. We'll look at them
23 with Madam Foreperson. If they're legally competent,
24 we'll ask them to the witness.

25 (Counsel and Madam Foreperson confer.)
26

1 EXAMINATION

2
3 BY MS. RICHARDS

4 Q. All right. (WITNESS #20), we have three
5 questions from the Grand Jury. And one of the questions
6 has two parts.

7 First question, have you or are you aware of
8 anyone who may have provided fraudulent reports of
9 inspections?

10 A. I have never, I have never been privy, if I may
11 use that term, to anything like that. If you, if you --
12 my experience at PG&E, we did establish a hotline, I
13 think it was back in the mid 90's. Even if, as me as a
14 subordinate, if I thought my supervisor or a supervisor
15 was doing something that they shouldn't be doing, there
16 was a number that you could call. You didn't have to
17 identify yourself. But if that's a fact -- I don't have
18 a problem with that. But I've never heard of that. The
19 only thing I've ever heard in my career -- Megan, the
20 only thing I've heard in my career is they have signed an
21 employee's time sheet. And nobody does that. That's,
22 that was in a different department. That supervisor got
23 reprimanded for -- you don't do that.

24 Q. Okay. Next question, does the age of the parts
25 have any bearing on the inspection of those parts and
26 their acceptability of that part?

1 A. Yes, definitely. In other words, I was posed
2 the question for that last photo, and age. And if we
3 write things up and we're allowed, we meaning the
4 employee, to keep saying it's okay to push it out, push
5 it out, push it out, I think that if you keep continually
6 doing that, you're going to have an eventual problem. It
7 needs to be taken care of, whether or not it's that A
8 classification, all the way to E. But being they're
9 being pushed out, it's within the parameters of whatever
10 our engineering department or whatever. We're following
11 guidelines.

12 Q. Okay.

13 A. In other words, I can't just say, "I want to
14 push that out -- why do I got to do papers and say I want
15 to put it out two years? I'm going to push it out ten
16 years." That's a hypothetical, but do you see my point?
17 But some of those, 2009 to '12, that's three years, I
18 imagine some of those got pushed out still while after I
19 retired.

20 Q. Okay. So this question had two parts, so I
21 asked you the first part which was does the age of the
22 parts have any bearing on the inspection of those parts.
23 It sounds like your answer to that was yes, age does have
24 a bearing; is that correct?

25 A. I would love to have more stuff done when I was
26 out there, you know, but it has to all go through the

1 supervisor. But yes, that would be correct.

2 Q. Okay. Then next part of this question is do
3 inspection reports provide information on the age of
4 specific parts?

5 A. You would have a record of when -- in other
6 words, if you went in here and de-energized that circuit,
7 you wouldn't just change out that center string of bells,
8 you would change out all three. That's -- in other
9 words, you try to do it efficiently. You wouldn't work
10 just one side, not do the other and have to come back
11 four years later. You do everything you can do that
12 needs to be done. And that could be including what Marc
13 said about the hook and the gap and the wear, and that's
14 not acceptable. You know, hopefully somebody's going to
15 catch that. When you have your hands on it, you have the
16 ability to see more things, to catch more problems.

17 Q. I'm going to ask you the question again because
18 I'm not sure that you answered it fully. But do
19 inspection reports provide information on the age of the
20 specific parts?

21 A. Only if you've had to do work. I mean, it
22 would document that that's a new component, new part;
23 right? But I don't know the actual age of that
24 structure.

25 Q. Okay.

26 A. If that answers your question. But the new

1 stuff, anything new would be logged in and you'd know,
2 "Hey, that was done just like in 2010."

3 Q. Okay. Let me ask you the final of the Grand
4 Jury's questions.

5 When flying above the lines for annual overhead
6 inspections, how far above the towers are you flying in
7 the helicopter?

8 A. Well, you have a safety factor in there.
9 You're not supposed to get within 20 feet of that
10 structure. That thing loses power, you can't get out of
11 the way, you're going to drop down in there and you're
12 going to have a disaster. Not only getting killed,
13 you're going to take the circuit out. So, yeah. And a
14 lot of these pilots, you got to tell them, too, "I didn't
15 feel real good about what you just did back there." But
16 I didn't have too many problems like that. They're pros.
17 They've flown it. Everybody's different. You know,
18 pilots flying with a new guy; is this new guy going to be
19 this way? And how am I going to be with that pilot? So
20 you've got to work it out. You've got to work it out
21 real quick.

22 MS. RICHARDS: All right. Thank you.

23 Are there any follow-up questions from the
24 Grand Jurors?

25 Looks like we have no more questions.

26 MR. NOEL: Nope.

1
2 EXAMINATION
3

4 BY MR. NOEL

5 Q. I have a follow-up to something you just said
6 that, in response to one of those questions.

7 You said that if you were to get up, if you
8 were to -- it would make sense if you were to climb up in
9 the tower to fix one thing, that you'd fix everything;
10 correct?

11 A. When you have to clear that, that's bucks.

12 Q. Right.

13 A. So you want to do all the work that you can
14 possibly do there at the time so you don't have to take
15 it down again.

16 Q. Exactly. So if you're going to do work in,
17 along that line, you're going to do everything at once
18 when it's taken out of commission?

19 A. Should.

20 Q. Right.

21 A. Yes.

22 Q. Going back to your, to the exhibit here that we
23 had in front, and -- let's see, where was the, where is
24 the list of the --

25 A. The components?

26 Q. No, the preexisting conditions list.

1 A. Right there.

2 Q. No, that's my copy.

3 So this was a 2012 inspection; right?

4 A. The inspection that my name's on?

5 Q. Yes.

6 A. Yes, that's correct.

7 Q. So these were all preexisting conditions that

8 were documented going into your inspection --

9 A. And priors on there.

10 Q. -- and you look at. And you said was it PG&E's

11 policy that if you went up to do work in a tower that

12 you'd do everything that needs to be done?

13 A. But, see, that's a supervisor's call.

14 Q. Okay. But, I mean, was that the general

15 policy, if you have to shut down a tower to do work on it

16 that you do --

17 A. What I was involved in, yes. Yes, they did.

18 They --

19 Q. Okay.

20 A. Yes.

21 Q. But I want to ask you, the top line, this is on

22 page, PG&E Camp Grand Jury page 355, this is part of the

23 preexisting conditions list. Can you read us the top

24 line?

25 A. You want -- the date, 11/30/2015.

26 Q. Yep. And then from there?

1 A. 8/25/2009. It says Caribou-Palermo, looks like
2 27 over 222. And looks like it would be -- part of that
3 is missing, but I'm sure it would be RPO, which means
4 replace connectors.

5 Q. So 27 over 222, that would be tower number
6 27/222 of the Caribou-Palermo; correct?

7 A. That's the structure, correct.

8 Q. Okay. And that's how you read that, the
9 numbers; correct?

10 A. Yes, sir.

11 Q. And I think tried to go into it a little bit
12 earlier with Ms. Richards about naming conventions. All
13 of the, all of the numbers on every transmission line --
14 or every tower on every transmission line is numbered;
15 correct?

16 A. Yes. And if that number is not there upon
17 inspection, you got to get that number back on there.

18 Q. Right. You have to know. Because when you are
19 doing inspections, when you look at the transmission
20 object list, those are listed by the, by the tower
21 number; correct?

22 A. Correct. That coincides. Better coincide.

23 Q. Exactly. So you have to know the tower
24 numbers. Do you understand or know how it was that they
25 numbered the tower lines?

26 A. No, I really don't. I mean, that stuff, it's

1 like highways maybe and byways. You can have the same
2 number, but a different, like a highway is different
3 than --

4 Q. Right.

5 A. So I really don't. I don't know how they did
6 that.

7 Q. Yeah. Well, for instance, do you know where
8 the Palermo, the Caribou-Palermo line starts?

9 A. Yes.

10 Q. Where?

11 A. Comes out of the Palermo substation down and
12 goes up to Caribou.

13 Q. It goes up to Caribou. So Caribou to Palermo.

14 A. However they come up with those names, though,
15 I cannot tell you.

16 Q. No, and I'm just asking do you understand what
17 it means --

18 A. Sure. Yes.

19 Q. -- and the numbers?

20 So as of your inspection, there was preexisting
21 conditions noted on 27/222 to be fixed?

22 A. (Nods head.)

23 Q. And what we were talking about is if somebody
24 went up to fix those things, and it hadn't been done as
25 of the time you left, it would have made sense for them
26 to fix all of the issues in the tower, in this specific

1 tower?

2 A. Again, I don't know how they come up with being
3 able to push things out. As long as you're not getting
4 any momentaries, any alarms on that line. But yeah,
5 anytime you got a connector, there's a potential there
6 for failure.

7 Q. Right. But that was something that you were
8 looking at in the inspections?

9 A. Oh, yeah, I had to. Like sometimes they're
10 done. Sometimes the work is done.

11 Q. And actually in this inspection you didn't make
12 it to 27/222; correct? You stopped short of 27/222?

13 A. Whatever that's logged in there.

14 Q. Right. Okay.

15 A. And then it was taken over by (WITNESS #1).

16 Q. Okay. Thank you. That cleared up what, the
17 issue that was raised.

18 MR. FOGG: Madam Foreperson, are there any
19 other questions from the Grand Jurors for this witness?

20 Madam Foreperson, it appears there are no
21 further questions for (WITNESS #20).

22 GRAND JURY FOREPERSON: Okay. (WITNESS #20),
23 I'd just like to remind you of the admonition that was
24 given to you earlier today and the outcome of it --

25 THE WITNESS: Correct.

26 GRAND JURY FOREPERSON: -- if necessary.

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 143

are certified to be a complete transcription of said stenographic shorthand notes.

DATED: THIS 6TH day of JUNE 2022

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: Raise your right hand.

ZEKE LUNDER

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. Please state your full name, spelling your last
name.

A. My name's Zeke Lunder, L-U-N-D-E-R.

Q. Mr. Lunder, what do you do for a living?

1 A. I'm a geographer. So I study wildfire. And
2 for the last 20 years, I've been working as a contractor
3 on forest fires, making maps for the agencies as part of
4 Incident Management teams.

5 Q. Do you work for yourself or are you with a
6 company?

7 A. I work for company called Deer Creek Resources,
8 which is owned by Fire Storm in Chico.

9 Q. What is Fire Storm?

10 A. Fire Storm is a wildland fire contractor. So
11 we have contract firefighters, fire engines, and then the
12 mapping division, which also does planning. And we also
13 do prescribed burning.

14 Q. And what is your position within Deer Creek
15 Resources?

16 A. Well, I was the founder. I started the company
17 in 2011, and I sold it. And now I'm a consultant to the
18 new owner.

19 Q. You said you do mapping. Can you explain what
20 you mean by that?

21 A. Yeah, I got a degree in map making from Chico
22 State in the mid '90s. And that was right about the time
23 that digital mapping started being used during fires. So
24 in the late '90s they kind of realized -- they were just
25 taking topographic maps before then and drawing colored
26 lines on them and someone would come out to the fire

1 camp, copy the colored lines from the main map on to 20,
2 30 different maps for the people the next day. And they
3 realized that you can use computers and do the same
4 thing.

5 So since then we've kind of helped build this
6 model of how fires get mapped. It's kind of got pushed
7 out to the whole country, but that technology kind of
8 started in California. And we kind of, as private
9 contractors, we took that out from California to places
10 like Oregon, Washington, Idaho, and we trained other
11 people. And so now there's kind of a national standard
12 for how fires get mapped.

13 So we go to the fires, we have trailers that
14 have offices in them, we set up in fire camp, we help
15 manage all the intelligence for the fire teams, make
16 their maps every night.

17 Q. What does the G-I-S stand for?

18 A. Geographic Information Systems.

19 Q. What is Geographic Information Systems?

20 A. Well, if you're familiar with CAD, computer
21 drafting, it's kind of like -- CAD is what engineers use
22 to draw blueprints. So GIS is kind of like the same
23 tools for a landscape scale. So we build -- we create
24 layers of information and we put them on to maps. So
25 it's basically a big spreadsheet that's tied to a map.

26 Q. In front of you you have what's been marked as

1 People's Exhibit 101. Do you see that?

2 A. Yeah.

3 Q. Are you familiar with People's Exhibit No. 101?

4 A. Yes.

5 Q. I'm displaying 101 on the big board. That's
6 the same thing you're looking at?

7 A. Yep.

8 Q. Did you make this image?

9 A. I did.

10 Q. Explain this image to us, what it shows.

11 A. All right. So this is a false color Land Sat
12 image. False color means that the colors aren't
13 necessarily what it looked like from a, if you were up in
14 space and our eyeballs were looking at the same scene.
15 You might see smoke and a few flames around the edge.
16 False color means that I use the heat signal from the
17 satellite to create colors that show the fire intensity.

18 So this is basically really similar to an image
19 you'd see, say, in Google Maps or any other aerial photo,
20 but instead of using the visible bands of light, we use
21 infrared bands.

22 So the satellites -- this is called Land Sat.
23 They've been around since the mid '70s. And they orbit
24 the earth on a near polar orbit, so that means they're
25 going north to south. And every 16 days this satellite
26 goes over a given spot on the ground. So it's really

1 commonly used for things like mapping vegetation, looking
2 at land change, mapping crops. And we don't usually use
3 this on fires because we don't usually get it. It's not
4 like something you'd see on a spy movie where you drive
5 the satellite over and look for the bad guy. This is
6 just routinely capturing imagery of the whole planet.
7 And it happened to pass over the Camp Fire on the first
8 morning. So we created this image from that.

9 This wasn't really an official part of the fire
10 mapping, this is something I made on my own time to put
11 out on our Facebook page to share information just on the
12 mechanics of how the fire is spreading, kind of a public
13 information service.

14 Q. First let's talk about the satellite. You said
15 the satellite is Land Sat 8?

16 A. Uh-huh.

17 Q. Does Deer Creek have their own satellite?

18 A. No.

19 Q. Does Fire Storm have their own satellite?

20 A. No.

21 Q. Whose satellite -- or to whom does Land Sat 8
22 belong?

23 A. It belongs to the tax payers. It's a NASA
24 asset.

25 Q. All right. How do you access information from
26 Land Sat 8?

1 A. It's available to the public through NASA
2 website, which is run by the United States Geologic
3 Survey. So there's a free log-in, and then you can get
4 in there and there's a map that shows the planet. And
5 you can zoom in and say I want to look for imagery that's
6 captured in the last five days of this particular area.

7 So I get on there, and then you download all
8 the raw data basically from the satellite.

9 Q. So it just happened that this satellite was
10 passing over Butte County on November 8th, 2018?

11 A. Right.

12 Q. And that was approximately 10:45 a.m.?

13 A. Yes.

14 Q. So you were able to access the data from the
15 satellite for November 8th, 10:45 a.m., and capture
16 imagery from the satellite of the Camp Fire?

17 A. Yeah.

18 Q. And then you put that imagery together into
19 this photograph?

20 A. Right.

21 Q. And can you explain again for us how it was
22 that you built the different imagery from the satellite
23 to make this photograph?

24 A. Yeah. Well, kind of mechanically, if you take
25 a picture on your cell phone or any digital camera,
26 there's three different sensors in your camera that

1 capture red, green, and blue light. And then those
2 values for every pixel, if you zoom in and you see an
3 individual pixel, there's three different bands there
4 that it's portraying, the red, green, and blue visible
5 light, which is kind of what our eyes perceive. If you
6 adjust the contrast on the photo in Instagram or anything
7 else, you're just basically changing the values in the
8 red, green, and blue bands.

9 So the only difference between a digital photo
10 and Land Sat is that instead of capturing three visible
11 bands, Land Sat captures eight. And they range from kind
12 of the infrared, which is like heat that we can't see, to
13 ultraviolet, which is the wave lengths are too, too short
14 for us to see. Bees see in ultraviolet. Pit vipers see
15 infrared. And we see in red, green, and blue.

16 So by mixing those bands, the infrared bands or
17 the heat bands, as if they're pixels, you know, every --
18 if you zoom in on this and you see individual pixels, on
19 Land Sat, you've got eight different options there, say
20 instead of just displaying red, green, and blue, I'm
21 going to display infrared, near infrared, and red. So by
22 -- the way, the field of creating satellite imagery is
23 called "remote sensing." And it's all kind of based
24 around this challenge we had, say, in the 1960s of
25 finding, say, missile silos in Siberia. Maybe then we
26 had black and white imagery. We'd just say show me

1 everywhere in this forest that we've got bare ground. So
2 it's a way that -- the math around this was all invented
3 around finding nukes in a forest; right? And so the math
4 really hasn't changed. And over time we've come up with
5 different recipes. So, say, like if I'm interested in
6 water temperature of the ocean, I can use thermoinfrared
7 bands, and I can stretch them out, and I can assign
8 colors to them. So it's similar to like the Hubble Space
9 Telescope; right? It's a radio telescope. It -- you see
10 these beautiful pictures of this galaxy that's forming
11 pink clouds. It doesn't really look like that. It's
12 kind of a scientist's interpretation of the data to
13 create this, these colors.

14 So what we're doing here is we're using those
15 infrared bands. What I did to create this image, I have
16 a friend who works for the Bureau of Land Management, and
17 we were looking at another fire, and he came up with this
18 -- he said, "Hey, I did some research, and these are the
19 bands that you use that can see through the smoke and
20 show the heat of the fire." So I used his recipe
21 basically.

22 If you look at the same image in full color,
23 it's a really popular image that you may have seen, it's
24 really similar to this, but you can't really see the heat
25 as much. You see smoke and flames around the edges.
26 What this image was aiming to do was to see through that

1 smoke.

2

3 (Grand Jury Exhibit 101B was marked for identification.)

4

5 Q. Quickly, I want to move on to 101B.

6

7 A. Right. So this is the, kind of the scientist
8 explanation of what I just told you. Those bands 2, 3,
9 and 4, are the red, green, and blue that we see with our
10 eyeballs. So if you look at like a Google Maps image,
11 satellite image, they're just using those three bands, 4,
12 3, and 2. So we used bands 7, 6, and 5. So that's
13 infrared, different intensities of heat basically.

14 The deal with the heat is that, you know,
15 there's heat that you can see, you know, like when you
16 are driving along, you see radiant heat kind of simmering
17 off the highway or something. Then there's heat you can
18 feel, like the sun. There's different ways that heat
19 moves through the atmosphere, different wave lengths. So
20 these three different bands are picking up different
21 kinds of heat.

22 Q. So 101B shows the 11 bands, basically the 11
23 filters that the Land Sat 8 uses?

24 A. Yeah.

25 Q. And which ones did you use to create 101?

26 A. Seven, 6, and 5.

Q. Okay. So that would be short-wave infrared

1 S-W-I-R-T?

2 A. Uh-huh.

3 Q. You have to answer out loud.

4 A. Yes, sir.

5 Q. Bands 6, the short-wave infrared S-W-I-R-1?

6 A. Yes.

7 Q. And band 5, the near infrared, or N-I-R?

8 A. Yes.

9 Q. And so you took those layers and overlaid them,

10 you said, onto a map of the area?

11 A. Yes.

12 Q. Explain to us how you do that.

13 A. The imagery from Land Sat, when you get it, it

14 has coordinates assigned to it, so it's easy just to --

15 you can pick these three layers, computer colors them for

16 you, and drops in on a map where it would be on the

17 earth.

18 To create the oblique one, so oblique -- we'll

19 get to that, right? We're going to go to the next

20 exhibit.

21 Q. Yeah, we'll do that. And let me just back up

22 on this one more time. This is information that, the

23 bands and everything, came from the

24 usgeologicalsurvey.gov website on the Land Sat?

25 A. Yes.

26

1 (Grand Jury Exhibit 101C was marked for identification.)

2

3 Q. Okay. So 101C.

4 Mr. Ramsey's pointing out, this far column
5 resolution --

6 A. Right.

7 Q. -- can you explain to us what that means?

8 A. Yeah. Resolution is, it's kind of the same as
9 a digital photo. If you -- you know, a low resolution
10 photo might be like a little profile picture on someone's
11 Facebook page that's a hundred pixels by a hundred
12 pixels. High resolution would be full color like screen
13 saver.

14 The resolution in this case is 30 meters, which
15 means that every pixel in this image is about a hundred
16 feet by a hundred feet, or quarter acre. So almost all
17 the data is captured at 30 meters. There's what's called
18 a panchromatic band, captured at 15 meters, which is
19 black and white. And the other ones that we didn't use
20 are a hundred meters. Basically what that means is it
21 averages the light values within that hundred foot square
22 area to figure out what it, what's going on there. And
23 it tells of kind of the accuracy. We might have a spot
24 fire out here that's four pixels across, and we say,
25 well, that's probably within 100, 200 feet of where that
26 actually happened on the earth.

1 Q. Thank you.

2 Now moving on to 101C. Explain to us what 101C
3 is.

4 A. Okay. So these images are the ingredients,
5 basically, that I used to cook this image pie. This is
6 the near infrared. So -- well, you can see on here a
7 bunch of smoke and see a couple little light spots where
8 there's some heat not sheltered by smoke. So basically
9 this wave length of infrared, it can't really see through
10 the clouds. The clouds kind of absorb the amount of heat
11 that was coming out on this band. This isn't like the
12 most sensitive band that we've got.

13 Q. All right.

14 A. This is what the imagery looks like when I get
15 it before I stack it up.

16

17 (Grand Jury Exhibit 101D was marked for identification.)

18

19 Q. And 101D?

20 A. Okay. This is the, this level of infrared sees
21 better through the smoke, shows the most intense fire.
22 And in the center of that image are all the burning homes
23 of Paradise, every little dot.

24 Q. You're talking about in here?

25 A. All that. Every one of those hot spots is
26 basically an intense piece of fire. Most of them are

1 burning houses or commercial businesses.

2 Q. So -- and you said this is the 30 meter
3 resolution?

4 A. Yeah.

5 Q. Or approximately 100 by 100?

6 A. Right.

7 Q. So not much bigger than each house --

8 A. Right.

9 Q. -- would be?

10 So a house would pretty much be most of a
11 pixel?

12 A. Right.

13

14 (Grand Jury Exhibit 101E was marked for identification.)

15

16 Q. All right. And 101E?

17 A. So that's the most sensitive infrared band. So
18 it's just showing intense heat over most of what has
19 already burned. That's the composite. So if you can go
20 back to the last one real quick.

21 Q. Okay.

22 A. One of the questions that -- so we use this
23 imagery with, with the Incident Command Team, once we had
24 it, to talk about -- we often map the fire progression
25 with the teams. And it's of great interest to us because
26 if we're trying to create fire behavior models later for

1 predictive, for planning, we want to know -- we use
2 imagery and information like this to calibrate a model.
3 So we'd say like, "Okay, well, given that we know we had
4 50-mile-an-hour winds at Jarbo Gap and the fire spread
5 this far in four hours" -- our spread model for
6 predicting future fires, we try to run those models to
7 calibrate them against things that have actually happened
8 in the past.

9 So one question was, that big spot fire on the
10 left, if that was really a spot fire or if that was just
11 an area of the most intense smoke, because that was the
12 area of the most intense smoke. So one question we tried
13 to look at with this imagery was whether or not there was
14 fire across that entire area between the big spot fire on
15 the left and the main fire. But using this most
16 sensitive band, we feel like we couldn't see any heat in
17 there.

18 Q. Let's talk about the image itself. All of
19 these images, 101, 101C, D, and now E, this is all the
20 same image; correct?

21 A. Yes.

22 Q. Just looked at basically through a different
23 filter in each one?

24 A. Yeah.

25 Q. And give us an idea of what we're looking at
26 geographically right here.

1 A. Okay. On the upper right, kind of a nose
2 there, that's around Pulga.

3 Q. This right here?

4 A. Yeah. Coming left of that is Flea Valley
5 Creek. Along the top of the image is mainly Sierra
6 Pacific Industries plantation and land that burned in
7 2008 then was salvage logged. So baby trees.

8 Kind of in the center of the image, there's
9 kind of like a curl or like an ear hole.

10 Q. Right here?

11 A. Yeah, right at the bottom there where it kind
12 of mixes up. That's Lake Concow. So the black area is
13 Lake Concow.

14 What the image shows is that the fire -- the
15 most intense part of the fire is kind of directly through
16 the middle. And, really, things are already cooling off
17 in this image. They're already cooling off on the
18 right-hand side of the fire.

19 Q. All right. I'm sorry. We just had the
20 PowerPoint copies for the jurors delivered that we
21 couldn't do this morning because of the power outage.
22 Take a quick break.

23 (Pause in proceeding.)

24 Q. (By MR. NOEL) Do you want to come down? It's
25 much easier. I can have you draw on this and explain it.
26 You know this stuff better than I do. You can just use

1 your finger to draw on it, mark what's there.

2 A. Okay. That's Lake Concow; Honeyrun Road, some
3 of Honeyrun Road. Lake Concow down here.

4 The main spread of the fire is, this is kind of
5 the most intense. This is the movement of the head of
6 the fire. So as the fire is spreading out, it's less
7 intense, because this isn't really the head, the wind is
8 still blowing this way. Lake Concow, it didn't burn;
9 there's still living trees here, but through here not
10 many because the fire really was hauling directly through
11 there. This is already starting to cool down at this
12 point.

13 Q. Okay. So we have to describe it for the court
14 reporter.

15 A. Okay.

16 Q. So you've marked on the map a circle up here to
17 Pulga?

18 A. Uh-huh.

19 Q. You've marked the outline basically of Lake
20 Concow?

21 A. Uh-huh.

22 Q. And then you've put a circle around the
23 Honeyrun, the spot fire off on the left side, marked that
24 as Honeyrun.

25 Now, you have an arrow going from right to
26 left, kind of a downward angle, from Pulga towards the

1 bottom left corner?

2 A. Right.

3 Q. And one thing, which way, which way is north in
4 this map?

5 A. North is up.

6 Q. Okay. So north is straight up. So we're
7 looking north-south. So you're talking about from Pulga
8 your arrow going southwest?

9 A. Generally, yes. West Branch of the Feather
10 River comes down through here. Can't really see it
11 within the fire, but it goes down through the center,
12 from north to south.

13 Q. And you've drawn a --

14 A. Red line.

15 Q. A red line through the, basically right down
16 the middle of the page, kind of wandering through the
17 page, marked as the West Branch, "FR" for Feather River?

18 A. Yes. Spot fires out here are kind of as far
19 out as -- they're across the Skyway at this point. So
20 Skyway -- can't quite -- Skyway is generally through
21 there.

22 Q. So you've drawn another red line which you've
23 marked as "Skyway"?

24 A. Yeah. This is another drawing of Magalia
25 Reservoir.

26 Q. And you're drawing the outline of the reservoir

1 with "Mag Res"?

2 A. Yes.

3 Q. Up above it?

4 A. Yep.

5 Q. All right. Let's make sure we save this before
6 we move on.

7 All right. Successfully saved. We'll get that
8 printed out later, as that will be 101E1.

9

10 (Grand Jury Exhibit 101E1 was marked for identification.)

11

12 A. All right.

13 Q. All right. Going back to 101. There we go.
14 Now we're back to 101, the original image that we started
15 off with.

16 A. Okay.

17 Q. So the images we just looked at, 101C, D, and
18 E, you said you stacked those on top of a, of a,
19 basically a map of the area?

20 A. The map is -- this is actually the composite of
21 those three bands. The map is kind of embedded in those
22 other three layers. This is a map created from those
23 three layers.

24 Q. Where does the color come from?

25 A. The color comes from assigning each layer to a
26 red, green, and blue layer. So if you want to take a

1 picture on your camera, your camera scans red, green, and
2 blue and sends those pixels to your screen. And the red
3 layer, if it's black on the imagery, it comes back as, as
4 there's no red there. If the red layer is the highest
5 value, then it comes back as bright red. And your screen
6 on your device uses those three different colors to
7 create a color on your screen that matches reality as
8 close as we can do it.

9 So I assigned the band 7 to the red layer. So
10 now I'm just treating this like a photograph; right? So
11 I'm just putting in those three layers into the red,
12 green, and blue layers in Photoshop basically and
13 creating a color composite. So it's just a way of
14 colorizing those three ingredient layers I had to create
15 this portrayal.

16 So, like I said, if you flew over this and
17 looked with your naked eye, it probably wouldn't look
18 like this except that you'd see the -- outside of the
19 smoke you'd see some flames and, you know, looked like.

20 What false color composites are, are using the
21 satellite imagery to create. This could have been purple
22 and yellow and green if I wanted to make it look that way
23 if I thought that told the story better. But basically
24 I'm just taking those different bands and using them to
25 create a visual. In this case, I'm using the hottest
26 colors I can to show the most intense fire, and I'm using

1 less intense collars for lower intensity. And then
2 trying to get colors that match the vegetation basically.

3 So I'm not actually painting with pixels or
4 anything, I'm just colorizing the satellite imagery in a
5 way that portrays it graphically to show best the
6 contrast between the heat and the vegetation.

7 Q. Great. Let's move on to 102.

8 You have in front of you Exhibit No. 102.

9 A. Okay.

10 Q. Another similar image. Can you explain to us
11 what this is and how you built this?

12 A. Yeah, so once I had that image of the overhead
13 view looking down on it that we, the image we just talked
14 about, I used Google Earth. And Google Earth you can
15 create map overlays. Basically you can bring a map into
16 Google Earth and you can kind of stretch it to match the
17 landscape, then you can look at it in 3D.

18 So I brought it into Google Earth because it's
19 the easiest way to make this kind of oblique view where
20 you're looking across the landscape at an angle. And
21 once it's in there, I can take different angles.

22 So I picked this angle just to kind of show
23 basically the effect of the topography. And, you know, a
24 lot of what we do on our Facebook page, Deer Creek
25 Resources Facebook page, is kind of intended as a public
26 information resource, and also because it brings traffic

1 to our Facebook page, and we're in the business of
2 teaching people about fire and doing fuel breaks, and
3 doing labor of ground fire. So I have support from my
4 boss to do stuff like this during fires because, one, it
5 helps people understand what's going on in our community,
6 and also because it creates traffic to our Facebook page.

7 So these I created as part of a story that I
8 did on our Facebook page. Actually, this was on my
9 personal Facebook page. Right after the fire, "Hey, this
10 is what happened. Here's, here's a story of how the fire
11 started, why it spread like it did."

12 So I picked this angle just because it shows
13 really well the story of the fire starting down around
14 Pulga and being funneled by the topography and the wind
15 up this Flea Valley Creek and spreading. This is
16 Paradise on the top of the image, Concow in the middle,
17 and Highway 70 running down in the foreground.

18 Q. So this is, basically this is the same image
19 that we're looking at in 101, it's now just been overlaid
20 on top of a Google Earth map --

21 A. Yes.

22 Q. -- correct? And changing angles?

23 A. Right.

24 Q. How about 103?

25 A. Same story. And the reason that I did this was
26 to be able to show the roads and the landmarks. Also, I

1 did this particular perspective because I wanted to show
2 that by 10:45 in the morning that all the major routes
3 out of town are being impinged upon by fire. So as part
4 of this post, you know, it was interesting, all these
5 comments, people saying like, "Oh, my God, I was right at
6 Pearson and Clark."

7 But basically I picked that perspective
8 because, yeah, it shows the West Branch of the Feather
9 running right through here; shows how wide the fire was
10 when it crossed into town; shows how Pentz Road is
11 completely within the fire; how spots fires are impinging
12 on Clark, on the Skyway, cutting off Skyway at Clark, and
13 cutting off the Skyway above Pentz Road. I thought this
14 really told the story of why the evacuation was so
15 difficult, so that's why I picked this particular
16 perspective.

17 Q. 104. Can you explain this one for us?

18 A. On this one, the West Branch of the Feather
19 River is running right down through here, on the
20 right-hand side of the image. This one I think just
21 shows -- it's a snapshot of all those houses burning. So
22 that's, to me, when we picked this perspective is --
23 also, this shows just how far the spot fires progressed,
24 all the way into Meadowview Creek at this point. You can
25 see things like this mobile home park beginning to burn.
26 So I think it's just, there's a lot going on in this

1 image and wanted to have one that was a little closer in
2 right on the action of the fire burning in Paradise.

3 Q. And, again, you created this by putting 101
4 into Google Earth, overlaying it over the map, and then
5 changing angles?

6 A. Yeah. Yeah, just to give people a variety of
7 perspectives. Everyone reads maps differently. And by
8 creating different angles and different ways of looking
9 at the same information, it increases the number of
10 people that can understand what you're trying to say.

11 Q. All right.

12 I have no further questions. If the jurors
13 have any questions for you. You can sit back down --

14 A. Thank you.

15 Q. -- or we can pull it up. Wait real quick while
16 they're writing their questions down, then they'll hand
17 them off, then Sergeant at Arms collects them and gives
18 them to us.

19 (Counsel and Grand Jury Foreperson confer).

20 Q. (By MR. NOEL) We have a question about 101C.
21 It says Exhibit 101C shows two distinct columns of smoke,
22 one originates at about 9:00 o'clock and extends
23 southwest and a second originates at about 12:00 o'clock
24 and extends southwest as well. None of the other
25 exhibits portray this. Can you explain what is seen in
26 101C and why it does not show up in the other photos?

1 And you can come up, you can approach the board
2 again if it's better for you.

3 A. Okay. Talking about this and this?

4 GRAND JUROR #4: Rotate the picture 90 degrees
5 to the left. That's the perspective we have in the book.

6 MR. NOEL: Can I see your packets real quick?
7 It's the same.

8 THE WITNESS: Well, so you guys can -- what
9 we're seeing there with the smoke or why you don't see
10 those in the infrared? Basically the other images, we're
11 using those to create the heat. The orange and yellow in
12 the composite image is based on the heat. And so it's,
13 this image is intended to filter out the smoke. So the
14 reason you don't see any smoke on the other two images is
15 because, because we're kind of using x-ray vision with
16 the other bands to see through the smoke.

17 GRAND JUROR #4: But do you see two distinct
18 columns of smoke?

19 THE WITNESS: Yes, I do. You're asking me why
20 I think they're there?

21 GRAND JUROR #4: Yeah.

22 THE WITNESS: I think it's got to do with the
23 fuel. The fire burned right through an area that burned
24 really hot. The head of the fire moved through an area
25 that burned really hot in 2008, so it was mainly
26 plantation of trees that are left 10, 15 feet tall, and

1 brush. And that stuff is kind of -- it went up like
2 kindling. And as the fire moved farther up into here, it
3 got into areas that hadn't burned as intensely in 2008,
4 hadn't been logged. So the smoke that you're seeing here
5 that's intense is the fire burning into heavier fuels,
6 like bigger, greener trees, not plantations and brush.
7 And I don't really -- I'm not as familiar with this area
8 down here, but the fire moved through a variety of fuel
9 types in that initial push ranging from brush, grass, and
10 ferns to, you know, mature trees.

11 Q. (By MR. NOEL) So Land Sat, the band 5, Land
12 Sat, band 5 we're talking about, this is the near
13 infrared radar; correct?

14 A. Right.

15 Q. You said this is the one that doesn't really
16 have the X-ray vision looking through the smoke?

17 A. Right.

18 Q. The others are able to filter out the smoke and
19 concentrate on the heat; right?

20 A. Heat, yes.

21 Q. But so when you get to the next, which is 101
22 -- whoops, wrong way -- 101D, now we're looking down
23 through the smoke, but you can still see on the, on the
24 periphery those smoke plumes extending out to the
25 southwest; correct?

26 A. Right.

1 Q. It's just not as prominent on this one because
2 it's looking at a whole different type of picture?

3 A. This is looking at most intense.

4 Q. And the same thing on 101D. Now we're looking
5 at the most intense, or the --

6 A. This is the most intensive one.

7 Q. But we can still see the smoke plumes coming
8 out, extending off the periphery.

9 And when you get back to 101, same thing?

10 A. Yeah. You can see a little bit of smoke here.
11 But, yeah, this is -- you know, I really worked on this
12 to get the smoke out of it. That's the reason that you
13 don't see much smoke in there.

14 Q. The difference with 101C is that it doesn't
15 have the X-ray vision, and it just looks at the smoke?

16 A. Right.

17 Q. And then one other question real quick. The
18 caption down here on the bottom, can you explain, can you
19 explain the caption? It's the same caption on every --

20 A. "This composite image shows infrared heat.
21 Some areas are obstructed by smoke." And I said that
22 because when we created this image we didn't know yet
23 whether or not there was heat in here that we couldn't
24 see because of the smoke. So that's kind of our
25 disclaimer. Because we didn't want to put this out and
26 say like authoritatively there was no fire in here. We

1 didn't know at that point.

2 And I still can't tell you that I know for sure
3 whether or not there was heat in here that we just
4 couldn't see because of the smoke. But based on talking
5 to people who were out there, the general feeling I got
6 in talking to people is that this is what it looked like,
7 and the smoke there wasn't -- you know -- we kind of
8 tried on the creating these images to pull as much
9 contrast as we could to see whether there was any heat
10 out there. And I couldn't see any heat out there. Given
11 these three bands, that's our best approximation.

12 MR. NOEL: Anything else? Anybody have any
13 further questions?

14 I have nothing further of this witness.

15 So you are excused.

16 THE WITNESS: Thank you.

17 GRAND JURY FOREPERSON: Do the admonition?

18 MR. NOEL: You have to do the admonition, I'm
19 sorry.

20 GRAND JURY FOREPERSON: Mr. Lunder, you are
21 admonished not to discuss or disclose at any time outside
22 of this jury room the questions that have been asked of
23 you or your answers until authorized by the Grand Jury or
24 the Court. A violation of these instructions on your
25 part may be the basis for a charge against you of a
26 contempt of Court. This does not precludes you from

1 discussing your legal rights with your own attorney.

2 Mr. Lunder, what I have just said is a warning
3 not to discuss the case with anyone except the Court,
4 your lawyer, or the district attorney. You understand?

5 THE WITNESS: Yes.

6 GRAND JURY FOREPERSON: Thank you. Now you're
7 dismissed.

8 [DISCUSSION OMITTED.]

9 (Lunch break taken.)

10 [DISCUSSION OMITTED.]

11 GRAND JURY FOREPERSON: Stand, raise your right
12 hand.

13

14 STACIE DOYLE

15 having been called as a witness in
16 the matter now pending, having been first
17 duly sworn, testifies as follows:

18

19 THE WITNESS: I do.

20 GRAND JURY FOREPERSON: Thank you.

21

22 EXAMINATION

23

24 BY MS. RICHARDS

25 Q. Good morning, Ms. Doyle. Can you tell the
26 Grand Jury your current employment.

1 A. I work with Pacific Gas & Electric.
2 Q. What is your position?
3 A. I'm a supervisor for Compliance and
4 Maintenance.
5 Q. And how long have you worked for Pacific Gas &
6 Electric?
7 A. I've been with the company since 1992, but I
8 became official PG&E in 1994.
9 Q. What was your first position where you worked
10 with PG&E in 1992?
11 A. I was a, at that time they called us "Kelly
12 girls." I was a temporary utility clerk for the company.
13 Q. And was that a position that dealt mostly in
14 customer service issues?
15 A. I was in customer service department, yes.
16 Q. What was your next position within PG&E?
17 A. I was hired in 1994 as a service representative
18 in customer service.
19 Q. Okay. And how long did you have that position?
20 A. Just about ten years.
21 Q. Okay. And then what was your next position
22 within PG&E?
23 A. I went to the local office as a customer
24 service representative.
25 Q. And approximately when did you have that
26 position until?

1 A. I worked in the local office in Stockton for
2 two years. And then I transferred up to Eureka,
3 California. And I worked in their local office for two
4 years. So I was in customer -- the local office for a
5 total of four years.

6 Q. Okay. And what position did you have after
7 that?

8 A. I was an operating clerk for the Transmission
9 Line Department in Eureka.

10 Q. When did you begin in that position?

11 A. 2008, possibly the latter of 2007.

12 Q. And how long did you have that position?

13 A. Until 2011.

14 Q. Okay. What did you do as an operating clerk
15 for Transmission Lines in Eureka?

16 A. As an operating clerk, the basic data entry.
17 So we enter records into the program that's called SAP,
18 which is the program that PG&E uses, and also filing.

19 Q. Okay. Is SAP an acronym?

20 A. Yes, it is.

21 Q. Do you know what it, do you know what it stands
22 for? That's okay.

23 A. I'm sorry. My apologies.

24 Q. And so, so you -- what sorts of documents did
25 you enter into the PG&E sort of record keeping systems as
26 an operating clerk for Transmission Lines?

1 A. As an operating clerk, we entered time,
2 payroll, for the crew. We would print out patrols and
3 inspections that were scheduled for the troublemen. We
4 would enter notifications or -- which is a work order.
5 And if there was something identified in the field, they
6 used to hand write it on paper and then the clerk would
7 enter it into electronic version of SAP.

8 Q. Okay. And I'll ask you some more questions
9 about some of the details about those records later in
10 testifying.

11 A. Okay.

12 Q. So after, after you were an operating clerk in
13 Eureka until about 2011, what did you do next?

14 A. I took a promotion and I became, at that time
15 what was called an "asset strategist."

16 Q. Okay. How long were you an asset strategist?

17 A. For the better part of five years.

18 Q. And what were your main roles as an asset
19 strategist?

20 A. As an asset strategist, what we do is we, we
21 handle the electronic side in SAP of the assets in the
22 field. So we --

23 Q. Let me ask you a question, too, just to
24 clarify. When you say "assets," what do you mean?

25 A. Assets for me are structures in the field,
26 meaning towers, poles, affiliated with line in the field.

1 Q. Okay. And I cut you off. You were explaining
2 what you do as asset strategy. I'm sorry.

3 A. So we also, as asset strategists, what we do is
4 we work with IT in the fall of -- so, for instance, for
5 2019, like in the fall of 2018 we do an SAP query as to
6 what patrols and inspections are upcoming, then we build
7 a calendar, a manual calendar, for each of the
8 headquarters throughout Transmission so they know what's
9 scheduled for the year to come.

10 Q. What was your coverage area as an asset
11 strategist? Did you have a geographical coverage area
12 that you, that you worked for?

13 A. Yes and no. So the regions were split north,
14 central, south; however, there were three of us and so we
15 shared responsibilities.

16 Q. Can you explain a little bit about the north,
17 central, south division at PG&E?

18 A. Yes. So the north has three headquarters.
19 It's Eureka, Table Mountain, and Sacramento. Central has
20 Victor, Concord, Lakeville, Underground, and Metcalf.
21 And then the south has Pismo, Moss Landing, Bakersfield,
22 Fresno.

23 Q. Okay. And so when you refer to a headquarters,
24 you're not talking about, you're not talking about the
25 corporate offices for PG&E, you're using it in a
26 different sense than sometimes people use headquarters.

1 Can you explain what a headquarters is? Like if you're
2 talking about Table Mountain Headquarters, what is,
3 what's there at Table Mountain?

4 A. So for Transmission, the headquarters are
5 basically the location where everybody shows up to work.
6 Table Mountain, as you asked, is -- it's a location
7 within a facility. And there's trailers, mobile wide
8 trailers, double-wides that are there. And that's where
9 the crew reports, the clerk reports, the troublemen
10 report, and the first line supervisors.

11 Q. Okay. And I sort of derailed you from
12 explaining your background, but I think that's helpful
13 for understanding how PG&E, PG&E operates.

14 After you were an asset strategist, what was
15 your next position in PG&E?

16 A. I was supervisor for the clerical for
17 Transmission Line.

18 Q. Okay. And when were you supervisor of clerical
19 for Transmission Lines?

20 A. I started on a rotation in 2016, thereabouts.

21 Q. Okay.

22 A. And then I became permanent, and I held that
23 position until January of last year.

24 Q. Okay. And when you were supervisor of
25 clerical, who, who were you supervising?

26 A. All transmission clerical.

1 Q. Okay. And what do people in transmission
2 clerical positions do?

3 A. They support the field and the crews of the
4 field. So --

5 Q. Is that, is that similar to what you were doing
6 in 2008 to 2011 in Eureka?

7 A. Yes.

8 Q. Okay. So you were, you were supervising people
9 who had a similar position to what you used to have?

10 A. Correct.

11 Q. Okay. And then as supervisor of clerical, who
12 did you report to?

13 A. Jennifer Brough (phonetic).

14 Q. What's her title?

15 A. It's changed.

16 Q. Okay. What was that back around 2016 to 2018?

17 A. Manager -- I'm not sure if it was work plan
18 strategy. I'm not sure. I apologize.

19 Q. What is her title currently?

20 A. She's still my manager, but I think it's just
21 operation. I'm not, I'm not sure of her exact title. I
22 apologize.

23 Q. No, that's fine.

24 A. She's my boss. That's her title.

25 Q. And is she currently still your boss?

26 A. Yes, she is.

1 Q. Okay. And what is your current position?

2 A. I am supervisor for Maintenance and Compliance
3 for Transmission Line.

4 Q. Okay. Have you had that position since January
5 2018?

6 A. Yes. Possibly the latter part of 2017.

7 Q. Okay.

8 A. Somewhere in there.

9 Q. What are your main duties as supervisor for
10 Compliance and Maintenance for Transmissions?

11 A. We -- my -- I have a team of three, they're
12 asset maintenance planners, but we used to be called
13 strategists. I have three of them that report to me. I
14 also have three program managers. So I have a team of
15 six. And my asset strategists, they are responsible for
16 maintaining the patrols and inspections to all of the
17 headquarters. We are responsible for my data requests
18 that come in. And we handle all of the audits through
19 the regulatory commission, the CPUC, and Cal ISO and WEK.

20 Q. Can you explain what those three regulatory
21 bodies are, just kind of basic picture for the Grand
22 Jury.

23 A. So the California Public Utilities Commission,
24 they audit us every year. The Cal ISO is the California
25 Independent System Operator. And there are several
26 utilities within the state of California. And WEK is

1 Western, Western Enterprise -- I forgot the acronym
2 meaning behind them, I apologize.

3 Q. That's okay. And are these the bodies that
4 send you data requests?

5 A. They do.

6 Q. Okay. And in your position have you gotten
7 pretty familiar with the types of records that PG&E keeps
8 for its transmission lines?

9 A. Yes.

10 Q. Okay. And are those the sorts of records that
11 you deal with daily in your work for PG&E?

12 A. Yes. If I don't deal with them daily, I have
13 at one time or another.

14

15 (Grand Jury Exhibit 140 was marked for identification.)

16

17 Q. Okay. All right. Let's see, so I am going to
18 show you a few different documents, and I'm going to ask
19 you some questions about them. I'm going to go to Grand
20 Jury Exhibit 140. And you've seen -- we met earlier
21 today, so you've seen this document before.

22 A. Okay.

23 Q. But I'll give you a copy so you have it in
24 front of you.

25 A. Thank you. That's a little blurry.

26 Q. You can read it a little bit better then,

1 because I'm going to ask you to actually read off the
2 document.

3 A. Okay.

4 Q. Do you recognize this document?

5 A. I do.

6 Q. Okay. What is it?

7 A. This is a Control Ticket for a patrol or
8 inspection.

9 Q. Okay. What kind of patrol or inspection?

10 A. This particular one is for a detailed
11 inspection.

12 Q. Okay. How can you tell that?

13 A. So if you look on your document, on the
14 left-hand side in the third paragraph down, "operation"
15 is highlighted. You'll see "operation 4," and then next
16 to it in bold black print, it says "transmission overhead
17 detailed inspection."

18 Q. Okay. And, let's see, on the very top --
19 actually, I'm going to go to the second line that says
20 "order 41980167."

21 A. Yes.

22 Q. What does that pertain to?

23 A. That's the order number that the crew utilizes
24 to charge their time to, and that we -- that my team, the
25 strategists, are able to track an SAP. Because that does
26 not get completed in SAP until the inspection is done.

1 So my team can run a query, again, open orders and it
2 would show that this is still open. So once this
3 inspection is done, the troublemen would hand it to the
4 supervisor. Once they sign it off, then they're giving
5 it to the clerk and the clerk would close it in SAP.

6 Q. Okay. I'm going to ask you sort of about the
7 whole kind of life span of this document.

8 A. Okay.

9 Q. Okay. You have in your hand the full Grand
10 Jury exhibit. It's, it's multiple pages --

11 A. Yes.

12 Q. -- separate? This is just the first page of
13 it; is that right?

14 A. That's correct.

15 Q. Okay. Who creates this Operation Control
16 Ticket?

17 A. SAP.

18 Q. Okay. And when you say SAP, you're, you're
19 talking about the database?

20 A. The program.

21 Q. Okay. What user -- I assume like a user is
22 also involved in telling SAP to create this document?

23 A. It's an option to print when, when the clerk
24 goes into SAP to print this, yes. So when you put -- in
25 SAP, the way the program works, you get the, you put in
26 the order number and then the program pops up and you get

1 a little pop-up box, and then you just highlight that you
2 want to print the object list, and then you hit print and
3 then these forms print out.

4 Q. Okay. When would a clerk have occasion to
5 print this?

6 A. Anytime prior to the patrol or inspection being
7 done.

8 Q. Okay. And then if you look at, it's a few
9 lines down, it says "Start date, August 30th, 2014," and
10 then "End date, August 31st, 2014"?

11 A. Uh-huh.

12 Q. What do those dates correspond to?

13 A. End date is the date that the patrol is
14 scheduled, so August 2014. The start date is just a
15 default of SAP. That is not a manual entry or any time.

16 Q. Okay. Are these, are these deadlines for when
17 this detailed inspection would occur?

18 A. So the August 31st, 2014, that's our, our own
19 internal deadline, PG&E.

20 Q. Okay.

21 A. According to the standard, we, as long as the
22 patrol or inspection is completed before the end of the
23 calendar year. But this is our internal guideline that
24 we set on here.

25 Q. Okay. And, and you said this is a detailed
26 inspection. Are there multiple types of inspections that

1 you would --

2 A. Yes.

3 Q. -- that you knew, you know about --

4 A. Yes.

5 Q. -- for transmission lines?

6 A. Yes.

7 Q. What are the types of inspections that you
8 would see?

9 A. There's a detailed inspection, there's an air
10 patrol, and there's a ground patrol, and there are
11 climbing inspections.

12 Q. Okay. I'm going to have you just briefly
13 explain the difference between these different types of
14 inspections.

15 Okay. Here we have "detailed inspection."
16 What is a detailed inspection and how frequently does
17 PG&E perform detailed inspections on 115 kV transmission
18 lines?

19 A. Okay. A detailed inspection is not based on
20 the voltage.

21 Q. Okay.

22 A. It's based on the cycle time of the asset.
23 Asset meaning wood pole, steel pole, or tower. So for a
24 wood pole, the cycle time is two years. For a steel
25 tower, the cycle time is five years for the troublemen.
26 And a climbing inspection from the tower department is

1 every 12 years. And they only climb the 500 kV.

2 Q. Okay. So this is a detailed inspection. So
3 for a tower, how frequently would the detailed inspection
4 occur?

5 A. Five years. Every five years.

6 Q. Okay. Is this a climbing inspection?

7 A. No.

8 Q. Okay. What does this kind of inspection
9 entail?

10 A. So a detailed inspection is done by a
11 troubleman. And the detailed inspection is where the
12 troubleman man goes asset to asset to do the inspection.
13 So it's boots on the ground, walking -- or arriving at
14 the asset, getting out, walking around, and doing a
15 visual onsite inspection, boots on the ground.

16 Q. Okay. And would a detailed inspection like you
17 see here on this Grand Jury Exhibit 140, would that
18 entail walking up to every tower that's on a particular
19 line?

20 A. It would be accessing every tower, yes.

21 Q. Okay. And, let's see, were there, would there
22 ever be times when a detailed inspection occurred when a
23 person might not be able to get to every tower in the
24 line?

25 A. Yes.

26 Q. Okay. And let me -- actually, I'm going to go

1 on to the next page of here. Actually, we'll go to --
2 actually, I'm going to go in order of the exhibit, and
3 I'm going to come back to that question, so don't answer
4 it yet. Okay. So we're going to go to page 2 of Exhibit
5 140.

6 So that is a "Transmission Line Inspection Data
7 Sheet." Are you familiar with this document?

8 A. Yes, I am.

9 Q. Okay. What is this document?

10 A. This is used by the troubleman to record any
11 findings or irregularities that they might have in the
12 field when they're doing a patrol or inspection.

13 Q. Okay. On this document then the inspector name
14 is (WITNESS #23); is that right?

15 A. Yes.

16 Q. Okay. Is it common for inspectors to split up
17 one inspection, or is it more common for one inspector to
18 do a whole line in a detailed inspection?

19 A. Both. And the reason, and the reason is, for
20 both is there are headquarters that are very small where
21 they only have one troubleman, and then some of the
22 larger headquarters have multiple troublemen. So I've
23 seen it on both occasions to where sometimes it's one or
24 sometimes it's multiple.

25 Q. Okay. I'm going to have you look down -- let's
26 see.

1 So we have here on the top line there's an
2 order number and then we have "Patrol inspect 10391
3 Caribou-Palermo Plus."
4 A. Uh-huh.
5 Q. What does that mean?
6 A. So patrol inspection is the description.
7 That's the description line in SAP. So that's a default
8 print. The 10391 is the line indicator for the
9 Caribou-Palermo. And then, of course, the line name.
10 Q. Okay. And you see down here it says "last line
11 last inspected," then it has a number "41815952"?
12 A. Uh-huh.
13 Q. What does that refer to?
14 A. That references the P-M from the previous year,
15 or the order number. I'm sorry, we call them different
16 things. The order number.
17 Q. And then we've got "Inspection Findings Data."
18 And there's some handwritten information in here. I'm
19 going to just go to the first handwritten line.
20 A. Okay.
21 Q. There's -- "date found" is "8/7/14" and then
22 "structure number 26215." What -- when it says
23 "structure number," what is that referring to?
24 A. That's the field indicator as to what asset
25 they're at.
26 Q. Okay. And do you know how PG&E comes up with

1 those numbers for how it names towers?

2 A. So the first set of numbers is the mile marker
3 to where, which mile the circuit -- the asset is located;
4 and the second, or the bottom number, the 215, is the
5 asset number itself, the structure number.

6 Q. Okay. And this Inspection Findings Data Sheet,
7 is this something that is put in a packet by the clerk
8 and then given to the person inspecting, so in this case
9 (WITNESS #23), before he goes out to inspect a line?

10 A. So a blank one of these is put in the packet.

11 Q. Okay.

12 A. Then once the clerk prints it out, they give it
13 to the supervisor. The supervisor hands out all of the
14 paperwork.

15 Q. Okay.

16 A. Yeah. The clerk is just the printer.

17 Q. Okay. And in those Grand Jury Exhibit 140 that
18 you have in front of you, are all of these papers
19 compiled together by the clerk and given to the
20 supervisor?

21 A. Yes.

22 Q. Okay. And then the supervisor gives that to an
23 inspector?

24 A. Uh-huh.

25 Q. And then what's the inspector do with it?

26 A. Goes out and performs the patrol or inspection

1 I hope.

2 Q. Does the clerk see this paperwork again after
3 the inspection?

4 A. When it's completed, yes. So once the
5 inspector completes everything, then they bring it in,
6 they turn it into the supervisor, supervisor reviews it,
7 looks at everything, then it goes to the clerk.

8 Q. Okay. And what does the clerk do with it?

9 A. So if there's findings, which is here, as you
10 see there --

11 Q. Yes.

12 A. -- the clerk will enter the tag information
13 that was written up and assign it an identification
14 number once it's in SAP. Then she'll record the
15 notification number on the data sheet. And then once the
16 data is entered, they put it in the line file.

17 Q. And what is a line file?

18 A. The line file is where the records are housed
19 at each of the headquarters for Transmission.

20 Q. And so where would the line file for the
21 Caribou-Palermo line be housed?

22 A. Table Mountain.

23 Q. Okay. All right. Then I'm looking now at the
24 next page, it's, which is Bates number 1207. And we have
25 tables with some object codes. Is this something that's
26 put in the packet for the inspectors to use?

1 A. I don't know if they're all in there. This is
2 just an SAP print. This is what we call FDA codes,
3 Facility Damage Action.

4 Q. Do you use these codes at all in -- have you
5 used these codes at all in any of the positions you've
6 had at PG&E?

7 A. Yes, but they're incorporated in SAP. So this
8 is, it's actually incorporated into the creation of the
9 notification as well.

10 Q. Okay. If you had a, if you had a broken piece
11 of hardware -- or actually -- okay. If you had a broken
12 piece of hardware on a transmission tower, do you know
13 which damage code that you would use for it?

14 A. Depends on the type of tower.

15 Q. Okay. Like a 115 kV line?

16 A. I apologize, not the voltage, but we have dead
17 end towers, we have suspension towers. There are
18 facility codes for each of them. But yes, you could
19 choose which tower according to where you were at and
20 check the box and check "broken" or "other" and put in
21 the long text of your findings indicating what you found.

22 Q. Did you, did you ever have issues of people
23 referring to certain things by different names? Like one
24 person would see a piece of equipment and refer to it by
25 one name, but another person might refer to it by
26 different name? Was that ever anything you recall

1 having?

2 A. Only between -- not between crews, but between
3 people that didn't understand transmission and the
4 transmission lingo. If -- so between two different
5 departments.

6 Q. Okay. In your experience, is it -- and
7 obviously you have -- you're not a lineman --

8 A. I'm not a lineman.

9 Q. -- isn't that correct? Okay. And -- but
10 you've been working in a lot of different positions
11 within PG&E?

12 A. True.

13 Q. So, in your experience, are there a lot of
14 differences between working on a transmission line and
15 working on like an electric distribution line?

16 A. Yes.

17 Q. Okay. Are there a lot -- and why do you say
18 yes?

19 A. So transmission is higher voltage.

20 Q. Okay.

21 A. Transmission circuits affect a lot of -- so if
22 we lose a transmission circuit or if there's work being
23 done on a transmission circuit, it's not necessarily
24 going to make me lose power at home. But if distribution
25 loses power like during a rain storm, I'm going to lose
26 power at home. So the customer level is different.

1 There are quite a few variances between transmission and
2 distribution.

3 Q. Okay. Are there other differences in how parts
4 are referred to and what kind of parts are on the
5 equipment in a transmission line versus -- or
6 distribution?

7 A. That I can't answer, I'm sorry, because I have
8 never worked for Distribution.

9 Q. That's fine. If I ask you a question that you
10 don't know about --

11 A. I'm doing my best --

12 Q. -- say, "I don't know about this."

13 A. Okay.

14 Q. I'm going to move on to Bates 1208. Do you
15 recognize this page?

16 A. I don't recognize this page, but I can tell you
17 what it looks like.

18 Q. Okay. What does it look like?

19 A. This is an Excel export print of SAP, and I
20 would assume that this looks like a report of the open
21 notifications against the circuit.

22 Q. Okay. When you say "open notifications," what
23 are you referring to?

24 A. So when the troubleman is going to go out and
25 do a patrol or inspection, a lot of times he'll ask the
26 clerk or the clerk had will print out existing tags that

1 are in the system against that circuit so that the
2 troubleman has visibility as to what's already been
3 identified. And if you -- well, you'll see later in the
4 document -- but there's the boxes that he can check where
5 that he checked the preexisting condition or found
6 something that wasn't written up already. So a lot of
7 times this document would be provided to give him
8 visibility as to what's already existing.

9 Q. Okay. So just to look at the first row,
10 there's a long number starting with "103." What does
11 that number refer to?

12 A. That's the notification number.

13 Q. Okay. And then there's some dates. Do you
14 know what those dates refer to?

15 A. You know, the head is cut off.

16 Q. Okay. Yes, it is.

17 Okay. So -- and then this line later on --
18 getting used to it -- later on we see "Caribou-Palermo
19 15120," and it looks like -- it's a little cut off, but
20 it looks like "replace connectors"?

21 A. Replace connectors.

22 Q. So is it true that that is, that is, that's an
23 issue that somebody saw on the line at some point, it was
24 put in SAP, and now it's been populated in this spread
25 sheet so that somebody can go look at it when they
26 perform the inspection?

1 A. Yes.

2 Q. Does that fairly summarize?

3 A. That fairly summarizes it, yes.

4 Q. So is this document something that the
5 inspector would have with him while he's, you know, in a
6 detailed inspection, while he's going asset to asset
7 where you have this document?

8 A. He could. It's not a required document for his
9 inspection, but yes, he very well could have this.
10 Because I know a lot of the headquarters, a lot of
11 troublemen ask for it.

12 Q. Is he required, in an inspection, to check out
13 these, to look at these conditions during the inspection?

14 A. He's required to look at the asset during the
15 inspection.

16 Q. Okay.

17 A. And there is a place, there's boxes on the form
18 that says "preexisting condition checked, no new
19 problems." So there is, there are positions that he can
20 indicate.

21 Q. Okay. Is he -- I'll ask the question a
22 different way, but is he, is he -- would a lineman or an
23 inspector be required to check on each of the preexisting
24 conditions when he's actually looking at the assets? Or
25 is that just a -- I guess my question, because you said
26 he doesn't have to take this form, so I --

1 A. Right.

2 Q. The --

3 A. This isn't a required document. When you look
4 in the manual, it's not required, but a lot of them did
5 take it out because it's, it's itemization. I mean, it
6 helps you to see what you have out there --

7 Q. Right.

8 A. -- so that we don't write up duplicates.

9 Q. Okay. I see. Okay. So this is, this is -- is
10 your understanding that this document is to -- it's not
11 to tell a lineman, "Hey, check on this condition," it's
12 to make sure the lineman doesn't just keep reporting the
13 same condition that we already know about?

14 A. It's for both.

15 Q. It's for both.

16 A. But being not required, they could utilize it
17 to say, "Oh, I looked at these existing conditions." And
18 they could also state, "Okay, well, don't write it up,
19 there's already a tag for it."

20 Q. Okay. So if a lineman didn't take this, is
21 there -- if a lineman didn't take this during his
22 inspection, is there any way he would know about any of
23 the preexisting conditions during the inspection other
24 than if he just remembered them?

25 A. Not to my knowledge, huh-uh.

26 Q. Okay. Let me go forward. Now we're at

1 Transmission Line Object List. And this is Bates number
2 1209.

3 A. Okay.

4 Q. And I think you mentioned this earlier. What
5 is this document for?

6 A. So this is an object list. And what this does
7 is this gives the troublemen the ability to indicate
8 whether, as he inspects -- there you go -- as he inspects
9 each of the assets whether it was completed, meaning he,
10 he inspected it with no problem in the first box; the
11 second box is he completed it and had a new finding; or
12 the third box was that he validated the preexisting
13 condition checked or that he was not able to inspect on
14 this patrol or inspection.

15 Q. Okay. When would a person check the "not
16 inspected this patrol" box?

17 A. If he was not able to inspect the asset to
18 which was due.

19 Q. Okay. When -- and what circumstances would
20 cause that to happen?

21 A. Many. But I can give you examples, if that's
22 what you want.

23 Q. The most common ones you see.

24 A. Right now, snow.

25 Q. Okay.

26 A. There are some assets that are eight feet under

1 snow, and we can't see the bottom five feet of the
2 structure.

3 Q. What are some other reasons?

4 A. Flooding. Customer; customer won't allow us on
5 the property.

6 Q. Okay.

7 A. I'm trying think what else. Those are some of
8 the common ones.

9 Q. Okay.

10 A. Environmental.

11 Q. What does that mean?

12 A. It's a certain type of the year where there's
13 rare beetle or something harvesting, and we're not
14 allowed access per State of California.

15 Q. Okay. And if any of those cases, if any of
16 these circumstances you described were an issue, the
17 inspector checks the "not inspected this patrol" box, and
18 then what happens after that?

19 A. Then they should follow-up with a nonroutine
20 patrol to complete that asset.

21 Q. Okay. I've got it. Two more pages of that
22 document up here. Bates 1252 and 1253. We skipped ahead
23 a little bit.

24 A. Say that one more time.

25 Q. Oh, we're -- so we are on -- this might be
26 easier -- page 45 of the Transmission Line Object List.

1 A. Got it.

2 Q. All right. Okay. So I'm just going to go
3 down, I'm going to look at bottom of the page, "Tower,
4 27/222 lattice steel tower."

5 A. Yep.

6 Q. What box is checked there?

7 A. "Preexisting condition" checked.

8 Q. Okay. Then in the notes what does it say?

9 A. 02 survey C, as in Charlie, 039720.

10 Q. Okay. What does that refer to?

11 A. I don't know.

12 Q. Okay.

13 A. I'm sorry, that was prior to me.

14 Q. Okay. That's fine.

15 A. They did some sort of survey I'm thinking.

16 Q. Okay. From this, from looking at this
17 document, can you tell whether the inspector during this
18 inspection found any other, any other problems with the
19 tower?

20 A. From this specific document, no, I cannot tell
21 you that.

22 Q. Okay. He didn't report any? Did he report
23 any --

24 A. Not on this particular page.

25 Q. -- problems?

26 A. Can I go back to the data sheet? Is that okay?

1 Q. Yes.

2 A. Not on the finding sheet, so I will say no.

3 Q. Okay. All right. Let's see, I just have a few
4 more questions about --

5 A. That's okay.

6 Q. -- about the, about the detailed inspection we
7 were just looking at.

8 So you said it's -- a detailed inspection is on
9 the ground, it's asset to asset?

10 A. Correct.

11 Q. So, and you said sometimes, sometimes a lineman
12 can't get to every asset for various different reasons;
13 okay? Are there situations -- have you seen situations
14 where a lineman can't get within a few feet of the asset
15 but he's able to try to inspect it from equipment from
16 far away, maybe with binoculars, or a telescope, or
17 high-powered camera, would that count in your experience
18 as a detailed inspection?

19 A. Okay. So not to be rude, but it's not a
20 lineman. A troubleman does these.

21 Q. Yes.

22 A. Because I don't want you to confuse them. So
23 linemen do the repairs; troublemen usually find. There
24 have been instances where a lineman will go out with a
25 troubleman, and that's if they've got pulled off due to
26 emergency or storm, but usually it's a troubleman here;

1 okay?

2 Q. Thank you for correcting me.

3 A. No worries. And then have I seen an instance
4 where they're within a few feet of the structure? Yes.
5 And that's common, because they're not climbing the
6 structure. So usually they'll do the base test -- and
7 the troubleman would be more experienced to tell you
8 this, this is just what I hear, but they do scope.

9 Q. I'll stop you here. If you're just testifying
10 off of what you hear, you can just tell me.

11 A. I've never actually done an inspection, so you
12 know --

13 Q. That's fair.

14 Are you aware if there are any requirements for
15 how close a troubleman has to get for it to actually be
16 considered a detailed inspection?

17 A. I am not. I'm sorry. I don't know if that's
18 in the manual or not.

19 Q. Okay. And when you refer to the "manual," what
20 are you referring to?

21 A. My Bible. It's -- we have an *ETPM Manual*, and
22 -- it's the *Electric Transmission Preventative*
23 *Maintenance* -- and it's basically our standard. It's how
24 we answer to the regulatory commissions on the
25 guidelines.

26 Q. You refer to that frequently?

1 A. It's my Bible. I use it every day. If I don't
2 know the answer, that's where I go to look.

3 Q. Okay. Great.

4

5 (Grand Jury Exhibit 141 was marked for identification.)

6

7 Q. I'm going to show you now Grand Jury Exhibit
8 141. Do you recognize this document?

9 A. Is that the one I have in front of me?

10 Q. Yes. Oh, no, it's not actually. I have a
11 paper copy of it.

12 A. Thank you.

13 Q. I've also got it up on the board.

14 A. I've seen this. Not this particular one, but
15 I'm familiar with the document.

16 Q. Okay.

17 GRAND JUROR #15: When you're referring to
18 something on the chart, could you zoom into it? Because
19 it's not readable on here. And so if you zoomed into
20 that, we could see it better --

21 MS. RICHARDS: I'll try to do a better job.

22 GRAND JUROR #15: -- when you're speaking to
23 the witness about a particular thing.

24 MS. RICHARDS: Let's zoom in. Is that better?

25 GRAND JUROR #4: Helps all of us.

26 MS. RICHARDS: I'm sorry, what?

1 GRAND JUROR #4: Helps all of us.

2 MS. RICHARDS: Don't hesitate to raise your
3 hand and tell me if I -- if you can't see. I apologize
4 for that. And let me know if you need me to go back and
5 show you anything. And we'll have copies, too, of some
6 of the exhibits.

7 Q. (By MS. RICHARDS) So we're at the top of
8 Exhibit 14 -- 140, I believe.

9 A. 141.

10 Q. 141, okay. And what, what document is this?

11 A. This is a Transmission Air Patrol.

12 Q. Okay. And how -- so we've talked about
13 detailed inspections are every five years?

14 A. Uh-huh.

15 Q. How frequent are air patrols?

16 A. Every year, off cycle.

17 Q. Okay. What do you mean by "off cycle"?

18 A. So, as I stated earlier, so a wood pole or wood
19 circuit is every two years, meaning we detail it every
20 two years; therefore, every other we're going to patrol
21 it. And the same thing for steel. Meaning that we
22 detail inspect that every five years; so every off year,
23 we'll patrol it. So there's four years of patrols, then
24 they detail.

25 Q. Okay. And are, are these done, are these air
26 patrols done by a helicopter?

1 A. Yes.

2 Q. Okay. And, let's see, we went in some detail
3 over the ground inspection, or the detailed inspection
4 document. Is this Operation Control Ticket for an
5 overhead inspection or overhead patrol different in any,
6 in any major way? Well, that's not very clean. Let me
7 rephrase that.

8 Let's just, we'll get into details.

9 Okay. So this Operation Control Ticket is for
10 a overhead patrol. And here we have a start date,
11 8/30/2018, and end date, 9/30/2018. Are these internal
12 deadlines from PG&E --

13 A. Yes.

14 Q. -- again?

15 And are there ever times when PG&E is unable to
16 make its internal deadlines?

17 A. Yes.

18 Q. Okay. And then what happens?

19 A. So if for some reason we sent out a schedule,
20 and January is a good month because there might be a
21 patrol or inspection that's due January, but the crews
22 were called off and they took the troubleman due to storm
23 response or something, they would ask for an extension.
24 So at that case, there would be a request to the
25 supervisor, the supervisor would then get the approval
26 from the superintendent, and then once the superintendent

1 approves, my group would go in and change the date based
2 on the approval.

3 Q. Okay. And are there, are there ever any times
4 when, ever any times when the troubleman can't get to
5 the, can't get to the inspection by PG&E's deadline and
6 then they also can't get to it by the regular -- any
7 regulatory deadline that may exist?

8 A. I have not seen that happen yet. Not since
9 I've been in Transmission.

10 Q. Okay. And if that happened, if you saw that
11 happen, do you know what sort of repercussions there
12 would be or what kind of, what the result would be?

13 A. I don't know the repercussions, but I do know
14 that we have a self-reporting system in place to where if
15 we were going to miss a requirement as regulated to us,
16 we have a self-reporting system that would take place.

17 Q. Okay. Do you know who is in charge of that
18 self-reporting system?

19 A. I can find out for you. But it would be -- so
20 if I were to be aware of it, so if my team were running
21 reports and, say, we saw something that was not going to
22 make the calendar year to which it was due, they would
23 bring it to my attention, I would take it to my manager,
24 who would then take it to senior leadership, then it
25 would go from there. I have never had it happen yet.

26 Q. Okay. Let's see. I'm going to -- here we have

1 Transmission Line Inspection Data Sheet.

2 A. Okay.

3 Q. And let me get the number here. It's PG&E Camp
4 Grand Jury 185. Is this part of the Overhead Patrol
5 Inspection packet?

6 A. Yes, it is.

7 Q. Okay. And there's an inspection findings data
8 here, and there's two entries.

9 A. Correct.

10 Q. You have -- looking at the packet you have in
11 front of you, the Exhibit 141, can you tell if there are
12 any additional, can you tell if these are the only two
13 findings of issues on this line that was inspected?

14 A. Are these the only two findings that were
15 reported from this patrol?

16 Q. Yes.

17 A. Yes, I would say yes, because there's only two
18 listed. But there were preexisting conditions noted.

19 Q. Okay. And I'll go back to those. And are
20 those what you see in the chart on Bates 184?

21 A. Uh-huh.

22 Q. Okay. So we've got three preexisting
23 conditions, and then we've got two new conditions?

24 A. Correct.

25 Q. Okay. All right. I'm going to go forward.
26 And then I'm going to just go through these a little

1 quickly.

2 We have, we have Bates 186. This is the same
3 object code charts that we saw before?

4 A. Yeah. Uh-huh.

5 Q. What did you refer to this as?

6 A. It's the FDA codes, Facility Damage Action.
7 It's an export from SAP.

8 Q. Okay. All right. So I'm going to go past
9 that. Then we have this next document, which is Bates
10 187. I'll zoom in to the top.

11 A. Uh-huh.

12 Q. All right. What document is this?

13 A. This is not an official document. As you can
14 see, there's no document number on it. It's just a print
15 that can be printed by the clerk. And what it is is the
16 troublemen can record -- so if you're looking at the
17 document, he obviously was -- went from aught over 1 to
18 8067 on 9-11. Then the following eight days he went from
19 8066 back to aught over 1. It was a break of the
20 segment. He just reported that he was there on separate
21 days.

22 Q. All right. And that's the end of the document.

23 So this, this document didn't have the same
24 Transmission Line Object List that we saw --

25 A. No.

26 Q. -- in Exhibit 140? And I'm showing that right

1 now from Bates 1252. Why isn't there a Transmission Line
2 Object List as part of the overhead patrol in Exhibit
3 141?

4 A. So the object list is required on a detailed
5 inspection because the inspector is on the ground and he
6 is inspecting it with -- at this time -- paper in hand.
7 When an air patrol is being done, he's in a helicopter,
8 and the helicopter only hovers over the assets for a
9 little bit of time. So they do not take all of this
10 paperwork. This is not a required document on an air
11 patrol.

12 Q. Okay. Can you tell me -- I'm going to ask you
13 about both types of inspection. Going back to the
14 detailed inspection, is there any other checklists that
15 the inspector would take with them in order to make sure
16 that they're being thorough in what to expect or -- I
17 mean, what to inspect, or just to tell them what to focus
18 on during the inspection?

19 A. This doesn't really tell them what to focus on.
20 This just gives them the assets that are on the circuit.
21 So even this is not instructional as to look at this.
22 This just tells them what they're looking at, if it's a
23 tower, what location, things like that.

24 Q. When you say "this," are you talking about --

25 A. The object list.

26 Q. -- the Transmission Line Object List?

1 A. Yes, I apologize.

2 So -- but this is the required document they
3 take out with them. So to answer your question, no. Is
4 there another required document? Not to my knowledge.

5 Q. Okay. So there's no required document with a
6 checklist. Are you aware of any, are you aware of any
7 checklist that's not a required document but that's
8 frequently used during inspections? Have you ever seen a
9 checklist like that?

10 A. Like the object list? No.

11 Q. A checklist that tells the inspector what to
12 look at on each tower, like inspect these bolts?

13 A. In the climbing inspections.

14 Q. Okay. Okay. And so what kind of checklists
15 have you seen with a climbing inspection?

16 A. It's been a minute. I've seen one. They're
17 very detailed. It's multiple pages --

18 Q. Okay.

19 A. -- for the climbing inspections.

20 Q. Okay. What sorts of assets would that type of
21 checklist apply to?

22 A. The towers on the 500 kV circuits.

23 Q. And you have never -- have you ever seen a
24 checklist like that, that would apply to 115 kV lines?

25 A. No.

26 Q. No. Okay.

1 A. I apologize. Yes, I did.

2 Q. Okay.

3 A. They were used in November of last year.

4 Q. Okay. And why were they used?

5 A. They climbed the towers.

6 Q. Of November of 2018?

7 A. Correct.

8 Q. Was that after the fire?

9 A. It was during.

10 Q. It was during the fire.

11 A. Correct.

12 Q. Let's see, are you aware if there were ever any

13 timing requirements -- well, that's a confusing question.

14 You've talked about the frequency of

15 inspections. Are you aware if there were any guidelines

16 that would tell an inspector how long he should spend

17 performing an inspection?

18 A. Wasn't a guideline written in the standard, but

19 yes, there were, there used to be a variance that on a

20 detailed inspection they would get 15 minutes per asset,

21 and then on an air patrol I believe it was -- I think I

22 told you this earlier, I apologize -- I think it was 4

23 minutes per structure.

24 Q. Okay. And was that, was that a minimum amount

25 of time that they wanted the inspectors to spend?

26 A. Maximum.

1 Q. Maximum?

2 A. Fifteen minutes on a detailed.

3 Q. Okay. Did that include the time to get to

4 each, to get to each asset or did that just include the

5 time that they were at the asset?

6 A. I think it was the inspection time.

7 Q. Okay.

8 A. But that was just on the detailed inspection.

9 Q. Okay. Is there -- do you recall where that,

10 where that would have been written down, those time

11 requirements?

12 A. It might have been something that came out from

13 Business Finance.

14 Q. Okay.

15 A. Because they would calculate the hours on the

16 patrols and inspections, I think.

17 Q. Okay. And that was the Business Finance?

18 A. Business Finance.

19 Q. Okay. Is that a department?

20 A. I'm not sure, I'm not sure specifically who set

21 the 15 minutes or the 4 minutes. That I'm not sure. But

22 I think it was a breakdown of number of structures in an

23 hour, and that's how they did the calculations.

24 Q. Okay. Is there a person that either works or

25 did work for PG&E within Business Finance that you think

26 would be a person that's knowledgeable about this?

1 A. No, but first line supervisor would know.

2 Q. Okay.

3 A. A first line supervisor from Transmission would
4 be able to help us answer that question. My apologies.
5 I'm trying.

6 Q. You're doing fine.

7 Okay. All right. Can you give me -- well,
8 first, can you explain what a first line supervisor does?

9 A. They're, they supervise the crew for each of
10 the headquarters throughout Transmission.

11 Q. Do you, do you know, do you know the names of
12 the first line supervisors that worked out of Table
13 Mountain?

14 A. Yes.

15 Q. Okay. What are some of their names?

16 A. Currently, (WITNESS #22).

17 Q. Okay.

18 A. (WITNESS #12) was a supervisor in Table
19 Mountain.

20 Q. Okay.

21 A. (EMPLOYEE #3) was a supervisors in Table
22 Mountain. I think (WITNESS #18) filled in for a while as
23 supervisor at Table Mountain.

24 Q. Okay. And did --

25 A. That's to the best of my ability.

26 Q. Okay.

1 A. Sorry.

2 Q. All right. Okay. So we looked at several
3 different types of inspection records. How far do PG&E's
4 inspection records go back?

5 A. I don't know that there's a date. I know we --
6 when I started in Transmission, we had SAP. I don't
7 remember exactly when SAP started. I know it was prior
8 to me starting in Transmission. But SAP is the legal
9 record of holding. So it holds everything that's there.

10 Q. You don't know -- do you know what system
11 existed before SAP?

12 A. It was SAP when I got here.

13 Q. Okay.

14

15 (Grand Jury Exhibit 143 was marked for identification.)

16

17 Q. Okay, let's see. All right. I'm going to go
18 to the next exhibit, Grand Jury Exhibit 143. I'm going
19 to zoom in. This is really small, two pages on one
20 sheet.

21 Okay. All right. I'm zooming in to the first
22 page, top half. Do you recognize this document? And
23 I'll --

24 A. I can tell you that's an SAP print for an LC
25 notification, yes.

26 Q. Okay.

1 A. Corrective work.

2 Q. Okay. And who would create one of those
3 documents?

4 A. This would have been -- so back in 2009, the
5 troublemen had paper tags, and they would hand write,
6 then they would bring it in, and after the supervisor
7 reviewed it, he would give to the clerk, and she would do
8 data entry into SAP. And this is a print from SAP.

9 Q. Okay. When you say "hand tags," what does that
10 refer to?

11 A. Handwriting. They would hand write on
12 something that looked like this format. So he would
13 write what the problem was, what line he was on, and he
14 would enter data, then the clerk would enter it.

15 Q. Okay. Does PG&E keep the handwritten papers?

16 A. Yes.

17 Q. Okay. Where would those be kept?

18 A. In the line file at the headquarters.

19 Q. Okay. So looking at this document, it says "LC
20 number," then there's a number there. What does LC
21 number refer to?

22 A. LC number is line corrective. And it's just
23 the type of notification from SAP.

24 Q. Okay. And you see "line name, 10391,
25 Caribou-Palermo." What does 109 -- 10391 refer to?

26 A. That represents the line segment in ETGIS, the

1 line number. So each of our circuits holds five-digit
2 categorized numbers. And that's the number specific to
3 the Caribou-Palermo.

4 Q. And if you look down, I'm going to jump one
5 line, to "equipment"?

6 A. Yep.

7 Q. And there's a number there, "40634311." What
8 does that refer to?

9 A. So that is the asset ID in SAP.

10 Q. Does that asset -- when you say "asset ID,"
11 what asset is it referring to?

12 A. 7 over 60, the ceramic insulator.

13 Q. Does that number refer to the whole -- the
14 tower that's also referred to as 7 over 60?

15 A. No.

16 Q. Okay. Does it refer to just the ceramic
17 insulator?

18 A. Yes, ma'am.

19 Q. All right. And then I'm going to go down to
20 the bottom, there's a box and there's a label of "long
21 text"?

22 A. Uh-huh.

23 Q. What goes in that box?

24 A. Any comments.

25 Q. Okay.

26 A. Or instructions.

1 Q. Okay. And so the first, the first comment
2 there is from (EMPLOYEE #17). Who is (EMPLOYEE #17)?

3 A. (EMPLOYEE #17).

4 Q. (EMPLOYEE #17)?

5 A. (EMPLOYEE #17). She was the clerk at Table
6 Mountain.

7 Q. Okay. And did -- was she in your chain of
8 command at some point?

9 A. She was one of my employees, yes.

10 Q. And what are some other names of people who
11 worked in the same position as clerk at Table Mountain?

12 A. (WITNESS #21) is there now.

13 Q. Okay.

14 A. I don't know if there's been other clerks
15 besides (EMPLOYEE #17) and (WITNESS #21) now that I think
16 back. I'm not sure.

17 Q. Okay. I think we've talked a little bit about
18 this, but I'm going to ask you a few more questions.

19 A. Okay.

20 Q. Can you tell me what a past due tag is?

21 A. A past due tag?

22 Q. Yes.

23 A. Is a tag that has been worked beyond its
24 required end date.

25 Q. Okay. What does that mean?

26 A. When corrective work is identified, it's given

1 a priority. And our priorities are categorized by the
2 nature of the repair. And so if it's an E-tag, for
3 instance, you have two years, so if you find it in May of
4 this year, it's going to be due by May of 2021.

5 Q. Okay.

6 A. So if it goes past that, then it's going to be
7 past due.

8 Q. Okay. When a tag goes past due, what, what
9 does, what happens when a tag goes past due?

10 A. In my role?

11 Q. Yes. Yeah.

12 A. So right now it -- we report, we do a
13 self-report to the CPUC every month, and we report to the
14 ISO on tags when they go late.

15 Q. Okay.

16 A. That's the way we go.

17 Q. Do you ever seek past due exemption?

18 A. Yes. That is the new process that was
19 implemented in 2017.

20 Q. Can you explain that process?

21 A. To the best of my ability.

22 Q. Is that something you, is that something you
23 work with --

24 A. Yes.

25 Q. -- in your position?

26 A. Yes.

1 Q. Just explain it as -- we don't, we don't --
2 just explain it with as much detail as you deal with in
3 your position.

4 A. So an exemption, it's allowing extra time on
5 corrective work for a reason that's met within the
6 guidelines of our standard, meaning within our *ETPM*
7 *Manual*. There are only a few cases that can meet an
8 exemption. And one of them is clearance cancellation,
9 access issues. I know this. I'm sorry. So the first
10 line supervisor has to take pictures of the location,
11 fill out a form, propose the new date that they're going
12 to have the work done. They submit it in an electronic
13 document routing system. And it goes to the
14 superintendent for approval, my strategist for approval
15 so that they are assured that it meets criteria of the
16 ETPM. Then it goes to the senior director for approval
17 as well.

18
19 (Grand Jury Exhibit 146 was marked for identification.)
20

21 Q. Okay. Let's go forward to Grand Jury Exhibit
22 146. I should have brought this up before you started
23 talking about it.

24 A. That's okay.

25 Q. Let's see. I'll bring you a copy. It's
26 entitled Transmission LC Past Due Exemption Process.

1 A. Yes.

2 Q. Do you recognize that document?

3 A. I do.

4 Q. Okay. What is it?

5 A. This is the jobbing for the exemption process.

6 Q. Okay. Is that what you use when you, when you

7 follow the procedure that you just testified about?

8 A. That is correct.

9 Q. Okay.

10 A. Not this one specific. There is a revision

11 newer than this.

12 Q. Okay. So that's an older version?

13 A. This is an older version, correct. But yes.

14 Q. Is that, is that a attachment to the *Electronic*

15 *Transmission Preventative Maintenance Manual*.

16 A. Ask me that again. I'm sorry.

17 Q. Is that an -- well, I called it -- I asked it,

18 is that an attachment to the *Electronic Transmission*

19 *Preventive Maintenance Manual*.

20 A. You can access this through the electronic

21 version of the ETPM, yes.

22 Q. Okay. Is there a hyperlink to that document?

23 A. Uh-huh.

24 (Court reporter interrupts proceeding.)

25 A. Yes. I'm sorry

26 Q. And I'm just going to skip to the last page of

1 this, zoom in. It says on the last page, "Document
2 contact Stacie Doyle, Transmission Line Work Management."
3 That's you?

4 A. That is me.

5 Q. Okay. Why are you listed as a document contact
6 for this document?

7 A. Because my team is one of the approvers for the
8 exemption process based on the standard for compliance.
9 So Robert Cupp is the superintendent of the south, so it
10 was he -- it was like his approval from superintendent
11 and my approval from compliance.

12

13 (Grand Jury Exhibit 145 was marked for identification.)

14

15 Q. And to go forward, another, to the next
16 exhibit, Grand jury Exhibit 145.

17 Do you recognize that document?

18 A. You know, only because you showed me this
19 earlier today.

20 Q. Okay.

21 A. But no.

22 Q. Before today had you ever seen this?

23 A. No. And I have heard of it, but as it a new
24 document.

25 Q. Okay.

26 A. Says October of last year. And this is not my

1 role anymore. But I did hear about this.

2 Q. Okay. And is -- can you tell from the top of
3 the document whether this is something that would be part
4 of the *Electronic Transmission Preventive Maintenance*
5 *Manual*?

6 A. Yes. This is a job aid in our manual. You can
7 tell because in the top right corner its given a form
8 number. So the TD -- if you can make that bigger, I'll
9 show you. Up at the top right corner -- there you go.
10 So the TD is the Transmission Department. The 1001M is a
11 -- our utility manual, the *ETPM Manual* that I referenced
12 earlier. And the JA01 is the actual document number,
13 meaning job A01.

14 Q. Okay. All right. I'm going to have you look
15 at Grand Jury Exhibit 146. I'm just going to zoom in.
16 I'm not going to ask you for --

17 A. That's my Five Minute Meeting."

18 Q. Cool. Let me bring you a copy.

19 A. I'm familiar with it. It's okay.

20 Q. Have you seen this document?

21 A. I created it.

22 Q. Why did you create this document?

23 A. I, I created a new process for our damage
24 claims so that we would be able to track the work to
25 completion better. So it was a process improvement. So
26 the Five Minute Meeting allows us to give visibility to

1 the target audience so that they understand the new
2 process.

3 Q. Who is the target audience for this document?

4 A. This would be in the clerks, the troublemen,
5 and the supervisors.

6 Q. Okay. And so -- okay. So you created this
7 Five Minute Meeting document --

8 A. I did.

9 Q. -- because you wanted to tell people about an
10 issue that --

11 A. A process change.

12 Q. A process change.

13 A. Yes.

14 Q. Are there -- is this something that you came up
15 with, Five Minute Meeting, or is this a type of document
16 that other people create within PG&E?

17 A. Other people create it. I can't take credit
18 for that.

19 Q. Are there any other ways that, that employees,
20 supervisors like you, or anybody else in PG&E that needs
21 to share information, are there any other ways that they
22 would disseminate information other than a Five Minute
23 Meeting?

24 A. Yes.

25 Q. Okay. What are some other ways?

26 A. Tailboards, training.

1 Q. What is a tailboard?

2 A. A tailboard is if we're all in a room together,
3 I have a sign-in sheet, and I can have everybody sign to
4 acknowledge that once -- I would present the new
5 information, and then I would have everybody sign to
6 validate that they received the information on the date
7 that was stipulated on the document.

8 Q. Okay. So Five Minute Meetings, tailboards,
9 what other types of ways would PG&E disseminate
10 information?

11 A. Conference call.

12 Q. Did you ever see any safety bulletins?

13 A. Do I see safety bulletins?

14 Q. Yes.

15 A. Yes. Those are usually tailboarded at the
16 local headquarter or instructor-led base training.

17 Q. Okay.

18 A. And those are kept in the files at the local
19 headquarters for each of the Transmission locations.

20 Q. Does PG&E have any kind of internal message
21 board or sort of a place where any kind of like chat
22 system where people in similar positions can converse
23 about issues that they're seeing?

24 A. Not to my knowledge.

25 Q. Let's see, and this is a slightly different
26 topic, but has to do with training. Have you ever seen,

1 have you ever become aware of any resources specifically
2 training inspectors on how to assess wear on PG&E assets?

3

4 (Court reporter interrupts proceeding.)

5

6 A. No, I never have. I said it's out of my
7 wheelhouse.

8 (Counsel confer.)

9

10 EXAMINATION

11

12 BY MR. NOEL

13 Q. Ms. Doyle, I'm going to ask you a few
14 questions.

15 A. Okay.

16 Q. You've mentioned climbing inspections.

17 A. Yes.

18 Q. You said that the *Electronic Preventive*
19 *Transmission* --

20 A. *ETPM*.

21 Q. Yeah. I remember -- I can't get that. That
22 that designates that climbing inspections must happen
23 every 12 years?

24 A. Yes.

25 Q. And does it also state that climbing
26 inspections must occur "as triggered"?

1 A. As triggered, which is a 12-year cycle. But,
2 yes, it does state as triggered.

3 Q. But it also has a definition of what
4 constitutes as triggered; correct?

5 A. I need my book. I'm going to say yes.

6 Q. I think that's --

7 A. But it also --

8 Q. -- Section 2.3, sub A or sub B, I think?

9 A. Okay. I don't know.

10 Q. But "as triggered" basically says anything that
11 reasonably should cause people to come back and look at
12 this tower, take a close look, especially significant
13 things; correct?

14 A. Correct.

15 Q. So, for instance, if a hundred-year-old tower
16 down in the Bay Area was having problems in early 2018
17 with hardware and C hooks and mounting brackets and wear,
18 that would be something that would trigger other parts of
19 the area that, hey, maybe you ought to go take a look at
20 those things; right?

21 A. Out of my wheelhouse.

22 Q. Okay.

23 A. And I apologize. I handle the electronic side
24 of it. But for that --

25 Q. You handle the records?

26 A. Yes. For that part of it --

1 Q. That's --
2 A. -- that would be more towards the field.
3 Q. You're the person who is in charge, you keep,
4 you process all of the records that go through the Table
5 Mountain Substation; correct?
6 A. Ask me that again.
7 Q. You're in charge of all the records, you're
8 essentially the record keeper --
9 A. No.
10 Q. -- correct?
11 A. No.
12 Q. Who is?
13 A. SAP.
14 Q. Okay. SAP is a computer system; correct?
15 A. Correct.
16 Q. You're in charge of the SAP for the Table
17 Mountain sub; right?
18 A. No, I'm not.
19 Q. Who is?
20 A. Table Mountain headquarters is responsible for
21 the records.
22 Q. Okay.
23 A. We maintain the data requests. We maintain the
24 records for the auditors.
25 Q. Right.
26 A. And that could be multiple headquarters. But

1 they're not located or housed with me or my, my
2 department or my group. We're all in various locations
3 throughout the system because we work through the
4 computer. So as for the records -- or if even if you
5 were to call me and said, "Hey, Stacie, can you get me a
6 copy of this?" it would have to be retrieved from that
7 local headquarter.

8 Q. Okay. But my understanding of why you were
9 sent here today by PG&E is that you are considered the
10 custodian of records for the Table Mountain Center;
11 correct? Especially the inspection records?

12 A. I'm -- to be honest with you, I'm not sure why
13 I'm here, but I'm doing my best.

14 Q. Okay. All right. Let's get to the big
15 question.

16 A. Okay.

17 Q. Are you aware of any records of any climbing
18 inspections in the Caribou-Palermo 115 kV line in the
19 last 12 years?

20 A. Yes. November of last year they started --

21 Q. After the fire; correct?

22 A. During the fire.

23 Q. Well, after November 8th, after the fire
24 started?

25 A. That's correct.

26 Q. So after, as we've already heard --

1 A. That's correct.

2 Q. -- PG&E employees went to a tower, taking down
3 the parts, they knew all about the broken C hook?

4 A. That I don't know.

5 Q. Afterwards, they went out and did substantial
6 inspections; correct?

7 A. They started climbing the towers in November of
8 2018.

9 Q. Right. First it was the Nine Lines Tower
10 Inspection Program from November 14th to December 3rd, I
11 believe, and then it became the Wildfire Safety
12 Inspection Program that started in December. As I
13 understand, is still running; correct?

14 A. Yes, sir, it is.

15 Q. And do you know how many safety issues were
16 found on the Caribou-Palermo line?

17 A. I do not.

18 Q. Substantial; correct?

19 A. I do not have a number. I have no indication
20 on that. That's more field than it is mine.

21 Q. But you have the records; right?

22 A. The safety records?

23 Q. Yeah, the notification records of all the
24 problems that were found on the Caribou-Palermo.

25 A. Yeah. I can -- I have access to them, yes.

26 Q. Okay. All right. So you may have to come

1 back. But prior to November 14th, I believe it is,
2 2018 --

3 A. Uh-huh.

4 Q. -- when was the last climbing inspection that
5 we have a report of on the Caribou-Palermo?

6 A. That I do not know.

7 Q. And none have been provided; correct?

8 A. Not to me.

9 Q. And in some of these reports, on the Operation
10 Control Ticket --

11 A. Yes.

12 Q. Can you flip back to 140?

13 There we go.

14 On this Operation Control Ticket here you
15 talked about someplace, but down here there's a section
16 called "partner"; correct?

17 A. Yes.

18 Q. And that lists?

19 A. Me.

20 Q. Stacie Doyle.

21 A. It doesn't say Stacie Doyle. It says SRF5
22 Doyle.

23 Q. SRF5 JO?

24 A. No. No, no, no. That is not a JO. So, as I
25 was indicating earlier, that's an SAP print. And what
26 you don't see is that's job owner.

1 Q. Okay.

2 A. JO is not a person.

3 Q. Okay. Because they all say JO, right, there?

4 A. Yes, job owner.

5 Q. SRF5 is you?

6 A. That's correct.

7 Q. And that's what's called your LAN ID?

8 A. That's correct.

9 Q. Why is your LAN ID SRF5?

10 A. Because that, that's my, that's the LAN ID I

11 was given when I was hired by PG&E.

12 Q. Do you know what the PG&E naming convention is

13 for coming up with those LAN IDs?

14 A. That's my initials. I don't know what the

15 number 5 is, because there's no other one.

16 Q. And then Doyle, Stacie. Is this your phone

17 number, (REDACTED)?

18 A. Yes, sir, it is.

19 Q. What does it mean that you're a partner of this

20 person?

21 A. So that's an SAP default. And you'll see many

22 names on those. We, as the asset strategists, we

23 schedule the patrols and inspections, and our name ended

24 up there. We didn't put it there. We don't know if it

25 has something to do with when we set the call for the

26 next calendar year from IT, but the strategists' names

1 appear on those.

2 Q. One more thing, just going back to the object
3 list that came up. This is the Transmission Line Object
4 List; correct?

5 A. Yes, sir.

6 Q. This printed, typed information, that's all
7 provided in your SAP system; correct?

8 A. Yes.

9 Q. So your SAP system has a list of all of the
10 towers, all of the structures on the lines?

11 A. Yes, sir.

12 Q. And that's up to date; correct?

13 A. That document is no longer provided now. Now
14 it's all on an iPad.

15 Q. But the iPad has the same information; right?

16 A. Yes, sir.

17 Q. When did you switch from the, from these
18 handwritten documents to the iPads?

19 A. I was asked that earlier today. And I'm not
20 positive. It might have been the latter part of 2017, or
21 that might have been when we piloted it to some and some
22 took over in 2018, but it was recent.

23 Q. Okay. Now, prior to 2016, these data --
24 Transmission Line Object Lists were used in every
25 inspection, not just detailed inspections; correct?

26 A. No.

1 Q. Well, in -- the detailed inspections are every
2 five years; right?

3 A. Yes, sir.

4 Q. There's a detail inspection in 2009 by (WITNESS
5 #1)?

6 A. Okay.

7 Q. A detail inspection from 2014 that was split
8 between (WITNESS #1) and (WITNESS #23) --

9 A. Okay.

10 Q. -- correct? There were also aerial inspections
11 in 2010, '11, '12?

12 A. Correct.

13 Q. '13?

14 A. Uh-huh.

15 Q. '15?

16 A. Uh-huh.

17 Q. All of those, even though they're air
18 inspections, already have transmission line objects.

19 A. Then that's, that's because they chose to use
20 them. That is not a required document on an air patrol.

21 Q. Okay. I mean, going back even further, I think
22 all the way through 2001, every single year has a
23 Transmission Line Object List until 2016.

24 A. Yeah.

25 Q. So were all those different inspectors just
26 doing, voluntarily doing it their way, or was that

1 something that was done and then was subsequently --

2 A. It was not a required document on an air
3 patrol.

4 Q. But with the Transmission Line Object List, it
5 lists out every single tower; correct?

6 A. Yes, sir.

7 Q. And when it's filled out, they're supposed --
8 the troubleman is supposed to fill it out for every
9 single tower as they inspect it; correct?

10 A. On a detailed inspection, yes, sir.

11 Q. I just want to make sure I got this straight.
12 You were talking that at one point there were time
13 parameters for inspections; correct?

14 A. Yes.

15 Q. And you said that the inspectors, the
16 troublemen, were told for a detailed inspection a maximum
17 of 15 minutes per asset?

18 A. Yes. I believe it was 15.

19 Q. All right. And for an air patrol, 4 minutes
20 per asset?

21 A. Yes, sir.

22 Q. Now, what I want to make sure is you said that
23 that was something that was set by Business and Finance?

24 A. I am not positive it was Business Finance that
25 -- Business Finance is not Business and Finance, it's
26 Business Finance.

1 Q. Right.

2 A. So I don't know who set those trigger times.
3 I'm not specific as to that. I said they could have
4 knowledge. But the first line supervisor would know
5 where that came from.

6 Q. And when was that in effect?

7 A. When I was a clerk; 2006, '7, '8. No, wait.
8 I'm sorry, '7, '8, '9, '10.

9 MR. NOEL: Anything else?

10 MS. RICHARDS: No.

11 MR. NOEL: Thank you, ma'am.

12 GRAND JURY FOREPERSON: Thank you.

13 MR. NOEL: Do we have any questions?

14 (Counsel and Grand Jury Foreperson confer.)

15 MR. NOEL: Ma'am, there are some questions from
16 the jurors.

17 THE WITNESS: Okay.

18 Q. (By MR. NOEL) Are you aware of any instances
19 where a required inspection was missed even though the
20 inspection was channeled through your self-reporting
21 system?

22 A. No. No, I'm not.

23 Q. Was it common, uncommon, rare for a past due
24 repair to be pushed off to a future date, in your
25 experience?

26 A. Can you read that again? I apologize.

1 Q. Was it common, uncommon, rare for a past due
2 repair to be pushed off to a future date, in your
3 experience?

4 A. When I was a clerk, they used to reassess
5 notification. So they would go out -- it wouldn't, it
6 wouldn't go past due, but they would go out to reassess
7 the condition to see if it warranted more work or if it
8 was safe at that time. I'm not sure, really sure how
9 else to answer that. That I was a part of that I can
10 speak to.

11 MR. NOEL: That answer the questions? Anything
12 further?

13 I think we're done with this witness. If you
14 could give her the admonition.

15 GRAND JURY FOREPERSON: Ms. Doyle, you are
16 admonished not to discuss or disclose at any time outside
17 of this jury room the questions that have been asked of
18 you or your answers until authorized by this Grand Jury
19 or the Court. A violation of these instructions on your
20 part may be the basis for a charge against you of
21 contempt of court. This does not preclude you from
22 discussing your legal rights with your own attorney.

23 Ms. Doyle, what I have just said is a warning
24 not to discuss the case with anyone except the Court,
25 your lawyer, or the district attorney. Do you
26 understand?

1 THE WITNESS: Yes, ma'am.
2 GRAND JURY FOREPERSON: Thank you.
3 MR. NOEL: Remember, that's your lawyer, not
4 PG&E's lawyers.
5 THE WITNESS: Yes, sir.
6 MR. NOEL: So you can't speak to anybody else
7 about this except if you have an individual lawyer.
8 THE WITNESS: Yes. Which I do not.
9 MR. NOEL: The attorneys outside are not your
10 lawyers.
11 THE WITNESS: No, they're not.
12 MR. NOEL: They're PG&E's lawyers.
13 THE WITNESS: That's Correct.
14 MR. NOEL: That's what I'm talking about. Just
15 wanted to make sure that was absolutely clear.
16 THE WITNESS: Understood.
17 MR. NOEL: Yep.
18 THE WITNESS: Thank you. Am I free to go?
19 GRAND JURY FOREPERSON: You are free to go.
20 THE WITNESS: Thank you so much.
21 [DISCUSSION OMITTED.]

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 91

are certified to be a complete transcription of said stenographic shorthand notes.

3 (Confidential Grand Jury Hearing Proceedings)

4
5 GRAND JURY FOREPERSON: We are on the record.

6
7 (ROLLCALL OMITTED.)

8
9 MR. NOEL: Before we call the first witness, I
10 just want to put one thing on the record. It's 1 o'clock
11 or a little after 1:00. We weren't in session this
12 morning.

13 About 8:30 this morning I received a phone call
14 through our reception through the public number that a
15 person whose name I did not know was calling and
16 wanted -- asking to speak with me. I answered the phone.

17 We don't have the grand jurors' names. We only
18 know the grand jurors by number. I believe it was grand
19 juror number 12. And I simply -- we had a very short
20 conversation where he asked me what time we were starting
21 today. And I told him 1 o'clock and reminded him that
22 one of the grand jurors had an appointment this morning
23 so we had pushed it back.

24 And I think that was the extent of our
25 conversation. It was probably no more than thirty
26 seconds. But I want to make sure that is on the record.

1 Is that correct, Juror Number 12?

2 GRAND JUROR NUMBER TWELVE: Yep.

3 MR. NOEL: So that takes care of that.

4 GRAND JURY FOREPERSON: Do we need to give you
5 our names?

6 MR. NOEL: Nope. We don't want to know the
7 names. Once we -- my understanding is once the jury
8 selection was completed, that everyone's names are sealed
9 and that's why we take roll by juror number and everyone
10 is identified by their number.

11 GRAND JURY FOREPERSON: Okay.

12 MR. NOEL: That's all I want to know.

13 GRAND JURY FOREPERSON: Okay.

14 MR. NOEL: Are we prepared? Anything else we
15 need to deal with before we start?

16 GRAND JURY FOREPERSON: Anything else?

17 MR. FOGG: Appearances for the record.

18 MR. NOEL: Oh, that's a good idea. I'm sorry.
19 I'm Marc Noel from the Butte County D.A.'s office.

20 MS. RICHARDS: Megan Richards for the Attorney
21 General's office.

22 MR. FOGG: Nicholas Fogg from the Attorney
23 General's office.

24 MR. NOEL: We'll call our first witness (WITNESS
25 #1).

26 [Witness enters the courtroom.]

1 GRAND JURY FOREPERSON: Thank you. Put your
2 stuff down, raise your right hand, please.

3 (WITNESS #1), do you solemnly swear that the
4 evidence that you shall give in the matter pending before
5 the grand jury shall be the truth, the whole truth, and
6 nothing but the truth so help you God?

7 THE WITNESS: Yes, Ma'am.

8 GRAND JURY FOREPERSON: Thank you. Have a seat,
9 please.

10 **EXAMINATION**

11 BY MR. NOEL:

12 Q. You ready?

13 A. Yes, Sir.

14 Q. Can you please recite your full name spelling
15 your last name for the court reporter.

16 A. Yes. (WITNESS #1).

17 Q. Let's see if we can pull that microphone up a
18 little bit closer to you.

19 A. (WITNESS #1).

20 Q. Spell your last.

21 A. Pardon?

22 Q. Spell your last name, please.

23 A. (WITNESS #1).

24 Q. (WITNESS #1), do you have a nickname that you go
25 by?

26 A. Yes. (WITNESS #1).

1 Q. Thank you. Can you spell that for us, please.

2 A. (WITNESS #1).

3 Q. Thank you, Sir.

4 What is your profession at this time, (WITNESS
5 #1)?

6 A. I'm retired.

7 Q. From what are you retired?

8 A. PG&E.

9 Q. How long did you work for PG&E?

10 A. Forty years.

11 Q. When did you start working for PG&E?

12 A. 1977.

13 Q. And when did you retire?

14 A. About four years ago.

15 Q. So about 2015?

16 A. Yes, Sir.

17 Q. I'd like to walk through just briefly your
18 career at PG&E, where you started, what jobs you held.
19 Can you do that for us.

20 A. Sure. Started in 1977 for GC Line Concord
21 Walnut Creek. From there I, of course, went all over the
22 state working for them. And then from there I went into
23 the Marysville Division. And from there I went back out
24 to GC Line and became a subforeman A. And from there I
25 went down to the Livermore school and become one of their
26 instructors for five or six years. And then I left there

1 again and just continued to be a foreman, a lineman.

2 That's it.

3 Q. In your 40 years were there a lot of changes
4 within the company?

5 A. Yeah.

6 Q. And the company structure?

7 A. Always.

8 Q. Yeah. So when you started off -- I think you
9 said in GC Line, what did that job entail?

10 A. I was hired on as an apprentice lineman. And I
11 assisted the linemen in doing all sorts of hot work in
12 4 kV and 21, 12 and 2400 kV with rubber gloves and stuff
13 like that.

14 Q. Now, were you working on distribution lines or
15 transmission lines?

16 A. Both.

17 Q. Both?

18 A. Yes.

19 Q. Now, when you started with the company, there
20 was just an electrical side. There was no distinction
21 between distribution and transmission lines?

22 A. Again, Sir.

23 Q. Was there a distinction back then between --

24 A. No. We worked both.

25 Q. Okay.

26 A. Yeah.

1 Q. Let me approach if it's okay with you real
2 quick. I don't want you leaning forward.

3 A. Whatever you need me to do, Sir.

4 Q. There you go.

5 A. Okay. Thank you.

6 Q. Is that good enough?

7 A. Yes, Sir. It's fine if you can hear me, I
8 guess.

9 Q. You just don't look comfortable leaning forward
10 into that microphone. I know I wouldn't be.

11 A. That's the way my body ended up.

12 Q. So as a lineman what were your duties?

13 A. Basically working on poles, wood poles,
14 transformers, all sorts of distribution equipment. And
15 then on the transmission side polar conductors, doing big
16 jobs, the big conductors located down in the Bay Area.
17 That's what we did.

18 Q. And you said you started off in Walnut Creek?

19 A. Yes, Sir. Concord. Walnut Creek, Concord.

20 Q. How long were you in that job?

21 A. Oh, I was probably in that job about four years
22 and then I got laid off.

23 Q. Okay. So you got laid off from the company?

24 A. Yes.

25 Q. Somewhere around 1981?

26 A. No. I -- right around '73 or '4 and then I went

1 back with them about '77, '78. I had broken time in
2 there.

3 Q. Okay. So you actually started with the company
4 in around '73?

5 A. Yeah.

6 Q. You got laid off and came back with the company
7 in '77 and started again?

8 A. Yeah. I just got out of the army in '69.

9 Q. All right. So when you started up again in '77,
10 what was your job?

11 A. Apprentice lineman.

12 Q. Okay. And how long did you -- were you an
13 apprentice lineman?

14 A. I was an apprentice lineman for about two years
15 and then I made journeyman status.

16 Q. Okay. And what were your duties and
17 responsibilities as an apprentice lineman?

18 A. The same; to assist the linemen in all the hot
19 stick work and the hot work and the, you know, general
20 working on the poles and the towers, bells, conductors.
21 Everything.

22 Q. And you said you promoted to journeyman?

23 A. Yes.

24 Q. And what is the responsibility and duties of a
25 journeyman?

26 A. A little higher responsibility because then you

1 have an apprentice with you and you have to watch out not
2 only for him but for you, too.

3 Q. And how long were you a journeyman lineman?

4 A. Since '77. Probably about '79 to this day.

5 Q. Okay. You said then you went to a school in
6 Livermore and became an instructor?

7 A. Yes, yeah. I was an instructor in Livermore for
8 five years at lineman school.

9 Q. Okay. And what were you teaching?

10 A. Everything that -- rubber gloving, hot sticks,
11 rigging, math, equations for hooking the transformers up,
12 and all that stuff.

13 Q. Distribution or transmission?

14 A. Distribution.

15 Q. And what did you do after you stopped teaching?

16 A. Went back to GC Line as a subforeman.

17 Q. And what other duties and responsibilities did
18 the subforeman have?

19 A. Running the crew, doing the jobs, setting poles,
20 stringing conductors, doing hot work, doing stick work.
21 All the above.

22 Q. And do you recall approximately when PG&E split
23 electrical into distributions and transmission?

24 A. No, Sir, I don't.

25 Q. When that split occurred -- assuming that split
26 occurred -- where did you go?

1 A. I stayed in GC Line.

2 Q. Okay. But working on transmission or
3 distribution?

4 A. Distribution.

5 Q. Okay. At some appoint did you move over to
6 transmission?

7 A. No, Sir.

8 Q. You said at one point that you transferred up to
9 Marysville?

10 A. Yeah. That's -- they had the two different
11 setups. Marysville was a division or local people. They
12 did all the distributions and then GC line did all the
13 transmission.

14 Q. Okay. When you were in Marysville, you were
15 GC line?

16 A. No, Sir.

17 Q. Okay. What were you in Marysville?

18 A. I was in the Marysville division as a lineman.

19 Q. Okay. At some point did you end up at Table
20 Mountain Center?

21 A. Pardon?

22 Q. At some point did you end up working the Table
23 Mountain Center?

24 A. At the end of my career.

25 Q. Okay. Do you recall what years?

26 A. No, Sir. Old guy. You know, I'm losing it.

1 Q. That's okay. When you worked at the Table
2 Mountain Center, what was your assignment?

3 A. I was a transmission troubleman.

4 Q. Okay. What were the duties and responsibilities
5 of a troubleman?

6 A. Just patrol the lines and do all the switching.
7 When they had to clear a line for a crew, we cleared it.
8 We opened the switching up and stuff for them and cleared
9 the line.

10 Q. How about inspections and patrol?

11 A. Yeah. As a troubleman you did the inspections
12 and patrols.

13 MR. NOEL: Okay. If I may approach. If you
14 don't mind, Madam Foreperson.

15 BY MR. NOEL:

16 Q. I put -- there's a box of stuff behind you. And
17 we'll get to the rest of it in a second, but I'll hand
18 you what is marked as Exhibit Number 148. Do you see
19 that in front of you?

20 A. Yes, Sir.

21 Q. Do you recognize what that document is?

22 A. That is all the schooling I had.

23 Q. Okay. How long is that document?

24 A. It goes all the way to -- I'm looking at it --
25 2007 on the front page here.

26 Q. I mean, how many pages is that?

1 A. Quite a few.

2 Q. Yeah.

3 A. Quite a few, yeah.

4 Q. I'm not going to walk you through all your
5 training.

6 A. Yeah. I did a lot, quite a bit of it.

7 Q. Exactly. You have an extensive training history
8 there.

9 A. Yes, Sir.

10 Q. And they're all outlined in there. I believe
11 they start in, what, 1987 on the top of that page?

12 A. Yes, Sir.

13 Q. So you actually started with the company long
14 before they started keeping records of your training;
15 right?

16 A. Yes, Sir.

17 Q. So you have a lot more training probably than
18 what's in there?

19 A. A bunch.

20 Q. All right. All right. In the box behind you
21 there's a big binder that is marked as 2005. Well, let
22 me back up. Let me set the tone for this.

23 As a transmission troubleman did you have -- did
24 PG&E have rules or policies on how to do controls and
25 inspections?

26 A. Yes.

1 Q. And were you familiar with those?

2 A. As far as patrols and inspections?

3 Q. Yes.

4 A. Yes, yes. Well, when I did the job, yes.

5 Q. Right. And is there a name for the document?

6 A. Not that I -- I don't know, Sir.

7 Q. Okay. Are you familiar with the Electric

8 Transmission Preventative Maintenance Manual?

9 A. Yeah. I remember the book. I remember that
10 book, yeah.

11 Q. Okay. And was that something that you used as a
12 troubleman?

13 A. All the time.

14 Q. Okay. If you can go back, there should be a
15 binder -- a white binder in there that's marked 2005 on
16 the spine. Can you find it?

17 A. Yeah, I see it.

18 Q. You can grab that out. One of the really bad
19 things about this courtroom is that there is no shelf to
20 keep evidence on like that.

21 All right. Flip over the cover of that binder
22 and there on the first page --

23 Go back to the front page, Sir. You see the
24 evidence -- the exhibit tag on there 149?

25 A. Yes.

26 Q. Do you recognize Exhibit 149?

1 A. Yeah. It's the handbook, yeah.

2 Q. Okay. Now, this manual that -- the
3 Electronic -- the Electric Transmission Preventative
4 Maintenance Manual, this one on the bottom of page 1 on
5 the cover page says December of 2005. And we're talking
6 about a page number that is BAIT stamped
7 PGE-Camp-BC-000030014.

8 Now, were these manuals published yearly or did
9 they --

10 A. Yeah. Every time they needed to be upgraded
11 they were.

12 Q. Okay. So the one that we're looking at here
13 that is Exhibit 149 is the December of 2005 edition?

14 A. Okay.

15 Q. Is that correct? Is that your --

16 A. Yeah. That's what it says. 2005, yeah.

17 Q. Okay. So this would have been one of the
18 manuals that you would have used while you were a
19 troubleman?

20 A. Yes, Sir.

21 Q. So now I want you to reach back into that box
22 and there should be another binder marked 2006.

23 MR. NOEL: And thank you, Juror Number Eight.

24 THE WITNESS: Thank you.

25 BY MR. NOEL:

26 Q. And again, if you can flip open the cover page

1 and look at the cover page. And that document is marked
2 as Exhibit Number 150; is that correct?

3 A. Yeah.

4 Q. And do you recognize the document marked as
5 Exhibit Number 150?

6 A. Yeah, October 2006.

7 Q. Okay. What from October 2006?

8 A. Pardon?

9 Q. What is it from October 2006?

10 A. It says Electric Transmission Preventative
11 Maintenance Manual. Is that what you want?

12 Q. Yep. Again, that's a new copy published in 2006
13 of the manual that you used as a troubleman?

14 A. Sure.

15 Q. Is that correct?

16 A. Yeah. They change all the time. As we get new
17 information, they update the books.

18 Q. Okay. But you said they don't necessarily
19 change every year; correct?

20 A. That I don't know. They would issue it to us
21 and then we'd turn the old ones in and then we just keep
22 on going.

23 Q. Okay. So let's move on to the next binder in
24 there which is 2009.

25 Sorry. That witness stand just is not designed
26 for this stuff.

1 And do you see the document marked as Exhibit
2 Number 151?

3 A. Yes, Sir.

4 Q. And what is Exhibit Number 151?

5 A. I got it right here.

6 Q. Okay. What is it?

7 A. April 2009.

8 Q. April of 2009 edition of the Electric
9 Transmission Preventative Maintenance Manual?

10 A. Yes, Sir.

11 Q. And this again would have been a manual that you
12 used as a troubleman?

13 A. Yes, Sir.

14 Q. Do you know or do you recall -- if you don't,
15 that's fine. It's been a long time ago. But were there
16 different manuals published in 2007 and 2008?

17 A. Sir, not that I know.

18 Q. Okay. No. It's perfectly understandable.

19 A. Four or five years away from it. Who knows what
20 they're doing.

21 Q. So this 2009 would have been the manual that you
22 would have used in 2009 as a troubleman?

23 A. [Nods head.]

24 Q. So I want to kind of go through a little bit
25 using the 2009 manual that is in front of you, kind of
26 going through the manual itself. And I have up on the

1 big board in front of us pages Roman Numeral 1 or I and
2 Roman Numeral II. It's labeled "Table of contents."

3 A. I don't see a numeral. I see 22409. That's all
4 I see. I see talking points, summary. Is that what you
5 want?

6 Q. No. So it should be on the BAIT stamp 30679.
7 All right. Okay. We got you to the right page; correct?

8 A. Yes.

9 Q. All right. And there is two pages which are
10 PGE-Camp-BC-000030679 and 30680 which labels the table of
11 contents. And you're familiar with that?

12 A. As far as this here (indicating)?

13 Q. Yes.

14 A. Yeah. Just the book. It just tells you what
15 you need to do.

16 Q. Exactly. And it's broke down. This is a --
17 well, can you tell us from your perspective as a
18 troubleman -- as a transmission troubleman what does this
19 manual do?

20 A. This manual gives us guidance to do the job.

21 Q. Okay. And how does it do that?

22 A. Pardon?

23 Q. How does this manual give you guidance?

24 A. When we'd have safety meetings in the morning,
25 they'd bring this book out and we'd all go through it.

26 Q. Okay. So the first section is general

1 information?

2 A. Yes.

3 Q. Definition of terms. That kind of stuff. I
4 want to focus more on Section Two, general inspection and
5 patrol procedures.

6 Do you recall that section?

7 A. Yeah.

8 Q. Was that a section that you used in the normal
9 course of your business?

10 A. Yeah. Everybody had a book. Everybody used it,
11 yeah.

12 Q. I have heard the Electronic -- I always want to
13 call it the Electronic. The Electric Transmission
14 Maintenance -- Preventative Maintenance Manual is
15 referred to as the Bible of the troublemen?

16 A. Yeah.

17 Q. Would you agree with that?

18 A. Yeah.

19 Q. Okay.

20 A. I mean, you can't go out in the dark. You need
21 guidance.

22 Q. Right. And this is a manual that is put out by
23 the company?

24 A. Yes.

25 Q. And it's distributed to all the troublemen?

26 Remember, you have to talk out loud so our court

1 reporter can hear you.

2 A. Yes.

3 Q. Sorry. And then number three, section number
4 three, that deals with inspections?

5 A. Yep.

6 Q. And what are inspections?

7 A. You go out and inspect the line.

8 Q. Okay. Is that something that you did on a
9 regular basis?

10 A. Yes.

11 Q. And section four is patrols.

12 A. Did that too.

13 Q. Okay. What are patrols?

14 A. Pardon?

15 Q. What are patrols?

16 A. Go out and patrol the line.

17 Q. Okay. How is a patrol different from an
18 inspection?

19 A. It was really a combination of both. You
20 inspected the circuit and also patrolled it. You had to
21 go out there and drive it to look at it. You know what
22 I'm saying?

23 Q. Okay. Now, I want to move ahead to page -- and
24 this is down at the bottom. It would be -- it's section
25 two and it's BAIT stamped PGE-Camp-BC-0003742.

26 Did you find that page?

1 A. Yes, Sir.

2 Q. Is that the same page that I have displayed up
3 here on the --

4 A. No, Sir.

5 Q. -- Smart TV?

6 A. No, Sir. You probably have to come find it. I
7 don't know where you're at. Sorry about that.

8 Q. Let me see. There you go.

9 And for the record, when I am referring to the
10 BAIT stamp number or the page number, on the bottom of
11 every single page there is this number that says
12 "PG&E-Camp" whatever. So that is what I'm talking about.
13 It should be in the bottom right-hand corner of every
14 page.

15 A. It is.

16 Q. All right. All right. Going to section two,
17 general inspection of the patrol procedures, do you have
18 that in front of you?

19 A. Yeah, right here.

20 Q. All right. And you're familiar with this
21 section?

22 A. Yeah. I've seen it before, yeah.

23 Q. Yep. And you said this is something that you
24 used all the time when you were a troubleman?

25 A. Yes.

26 Q. Can you read for us the first section of this.

1 A. I think what I'll do, Sir, is stop there. And I
2 respectfully deny to answer based on my privilege under
3 the Fifth Amendment of the Constitution which was
4 designed to protect innocent men who otherwise might be
5 ensnared by ambiguous circumstances.

6 Q. So you're invoking --

7 A. Yes, Sir, I am.

8 Q. -- the Fifth Amendment?

9 A. Yes, Sir.

10 MR. NOEL: Okay. At this time we'll have to
11 summons Judge Deems.

12 GRAND JURY FOREPERSON: Okay.

13 MR. NOEL: So the grand jury will take a break
14 now.

15 Do you have the admonition to give him?

16 MR. FOGG: Regarding the invocation?

17 MR. NOEL: Sure.

18 MR. FOGG: So, Ladies and Gentlemen of the Grand
19 Jury, the Fifth Amendment allows someone to not have to
20 testify against themselves. You're to draw no
21 conclusions about anyone invoking the Fifth Amendment.
22 You're not to consider it, don't think about it. Okay.

23 MR. NOEL: All right. We will be in recess.
24 And we will need the witness, the court reporter, and us.
25 We will summons Judge Deems and convene, I believe, in an
26 adjacent courtroom.

1 THE WITNESS: Thank you, Sir.

2 GRAND JURY FOREPERSON: Do we need to do
3 an admonishment before if we're going to go out of here?

4 MR. NOEL: Sure. That's a good idea.

5 GRAND JURY FOREPERSON: Okay. (WITNESS #1), you
6 are admonished not to discuss or disclose at any time
7 outside of the jury room the questions that have been
8 asked of you or your answers until authorized by the
9 grand jury or the Court. A violation of these
10 instructions on your part may be the basis for a charge
11 against you of contempt of court. This does not preclude
12 you from discussing your legal rights with your attorney.

13 (WITNESS #1), what I have just said to you is a
14 warning not to discuss this case with anyone except the
15 Court, your lawyer, or the district attorney.

16 THE WITNESS: I got it, Ma'am.

17 GRAND JURY FOREPERSON: Okay. Thank you.

18 THE WITNESS: Thank you.

19 MR. NOEL: All right. We can recess outside,
20 and we'll all go find where Judge Deems is.

21

22 (PROCEEDINGS OMITTED.)

23

24 [Recess taken from

25 3:10 until 3:17 p.m.]

26 MR. NOEL: For the record, all 19 jurors are

1 present in their places. It's now 3:17 p.m. We have
2 been in recess since approximately 1:50. 1:45 to 1:50, I
3 believe.

4 And, Madam Foreperson, you have in front of you
5 delivered by the clerk?

6 GRAND JURY FOREPERSON: Yes, yes, I do.

7 MR. NOEL: And that is an immunity order issued
8 by Judge Deems for (WITNESS #1).

9 GRAND JURY FOREPERSON: Okay.

10 **EXAMINATION CONTINUED**

11 BY MR. NOEL:

12 Q. (WITNESS #1), you understand what we've been
13 doing for the last hour and a half. And have you had a
14 chance to talk to your attorney Mr. Shepard?

15 A. Yeah. He just kind of filled me in a little
16 bit. That's what he probably wanted me to know.

17 Q. Okay. And Judge Deems has issued what is known
18 as a 1324 immunity order that says that you are immune
19 from prosecution based upon your testimony.

20 A. Okay.

21 Q. So now you're ready to answer -- go back and any
22 questions; correct?

23 A. Yes, Sir.

24 Q. And you had plenty of opportunity to talk to
25 your attorney?

26 A. Yes, Sir.

1 Q. Okay. Great. All right. We were talking about
2 the Electric Transmission Preventative Maintenance
3 Manuel, the 2009 -- the April 2009 issue of it.
4 Specifically, we are talking about Section Two: General
5 Inspection and Patrol Procedures.

6 A. Yes, Sir.

7 Q. Correct?

8 A. Yes.

9 Q. And the last question that I asked you is to
10 read this. We'll go ahead and skip that at this point in
11 time.

12 Now, let's move on to Section 2.1: Overhead
13 Methodology, Facility Component Types, and Conditions
14 Found.

15 Do you see that in front of you?

16 A. Yes, Sir.

17 Q. And you are familiar with this section?

18 A. I haven't looked in this book in a long time,
19 Sir.

20 Q. Right.

21 A. Sorry.

22 Q. But in 2009 you used this when you were doing
23 stuff?

24 A. So what do you want me to say?

25 Q. No. Is that correct that in 2009 you were
26 using -- this is what you used?

1 A. Yeah.

2 Q. Or what you were using?

3 A. Yes. They would give them to all the
4 troublemen.

5 Q. What I wanted to ask you about on here is this
6 Table 2.1. -- 2.1-1: Inspection Best View Position. If
7 you -- as experienced over 40 years of working on
8 transmission lines, if you could just kind of give us a
9 brief understanding of what that means, what that chart
10 means.

11 A. It's just like I just said. It's the inspection
12 of the best view or position of the helicopter, the
13 ground, or in a vehicle.

14 Q. Okay. So this table lists four different kinds
15 of inspections; correct?

16 A. Yes, Sir.

17 Q. The first is an aerial inspection?

18 A. Right.

19 Q. What is an aerial inspection or what was an
20 aerial inspection?

21 A. Helicopter.

22 Q. Helicopter flying over the lines?

23 A. Yes, Sir.

24 Q. And did you do helicopter inspections of lines?

25 A. Yes.

26 Q. And what is a ground inspection?

1 A. Where you ride or walk on the ground with a
2 vehicle or a quad or whatever they supplied you to run
3 the line on the ground.

4 Q. Now, one of the things is this has two columns;
5 ground inspection below ten feet and ground inspection
6 above ten feet.

7 A. Right.

8 Q. What does that -- what is the difference?

9 A. Self-explanatory. Ten feet for the first part
10 of the tower and ten feet from the -- for the next part
11 of the tower or the pole or whatever we're working on.

12 Q. Okay. So the ten foot refers to the part of the
13 tower you're inspecting?

14 A. Yeah. The tower or pole, yeah.

15 Q. Okay. So then finally is a climbing inspection.

16 A. Self-explanatory.

17 Q. Did you do climbing inspections of towers?

18 A. Yes, Sir.

19 Q. Okay. And then the table goes down and breaks
20 the components down into different types of components.
21 And what type of inspection is the best for viewing
22 those?

23 A. Ground.

24 Q. Okay. All right. Now, I want to move on to the
25 table marked as 2.1.2: Component Types and Descriptions.

26 A. Yeah. Another self-explanatory on hardware and

1 bells and guides and stuff, yeah.

2 Q. I understand for you it's self-explanatory being
3 a troubleman working on these lines for forty-something
4 years, but for most of us that our only experience with
5 the lines is seeing them as we drove down the road it's
6 not.

7 A. Sure.

8 Q. So can you kind of explain to us what we're
9 looking at here and some of the different terms.

10 A. The component issue is anything that is on the
11 tower or on the wood pole. And then you have codes for
12 them. Say, an anchor hardware is fouled or whatever or
13 an anchor is bad, you got AG10, AG05. That's the code
14 that you'd write up a fix-it ticket and turn it in so it
15 could be fixed by the crew.

16 Q. Okay.

17 A. And that's how it goes all the way down the line
18 there.

19 Q. Okay. Let's go even more basic. What is an
20 anchor on a transmission tower?

21 A. Anchors are -- you've all seen on the wood poles
22 where the guides come off the pole and it goes to an
23 anchor in the ground. Sometimes in the heavy angles they
24 run guides to the steel towers to hold them so they
25 don't, you know, kind of tilt over or tip over or
26 whatever you want to call it. Yeah, it holds the tower

1 in position.

2 Q. Okay.

3 A. Yeah.

4 Q. So the next question is what is a guide?

5 A. The guide hooks to the tower, hooks to the
6 anchor.

7 Q. Is it a wire or --

8 A. Yeah. It comes in various sizes. And the
9 engineers call it up what size it should be.

10 Q. Okay.

11 A. It's all in here.

12 Q. What is a connector?

13 A. A connector is where you put two pieces of wire
14 together. And it's got -- it's called the parallel glue
15 clamp, and it's got three to six bolts in it. And you
16 put -- lay the wire on one side and another side and then
17 you bolt it down. And that's a connector. It's called
18 the connector. And they come in various things; copper,
19 aluminum, and so on and so on.

20 Q. What is the difference between the connector and
21 the splice?

22 A. A what?

23 Q. The connector and a splice?

24 A. A splice butts two wires together. In other
25 words, you got a broken wire here and a broken wire here.
26 You take a splice and you put it on the wire and you

1 press it. They use a press on it. And it puts it
2 together.

3 Q. Okay. Just some more basic ones because they're
4 going to come up. What is a conductor?

5 A. A conductor is aluminum or copper, whatever is
6 in the area at the time.

7 Q. Okay. Even more basic, aluminum or copper what?

8 A. You see your service coming into your house?

9 Q. The wire?

10 A. Yeah.

11 Q. Okay.

12 A. That's a conductor.

13 Q. That's what I was trying to get.

14 A. Okay.

15 Q. So when you're talking about conductors from
16 PG&E, from a professional transmission employee
17 standpoint wire -- the wires -- what most of us would
18 refer to as the wire is what you guys refer to as a
19 conductor; right?

20 A. That's correct.

21 Q. Okay. What's a jumper?

22 A. A jumper is where the wire comes in and there's
23 a set of bells on both ends and the jumper goes across
24 and ties two service -- two wires together. That's a
25 jumper.

26 Q. Okay. All right. I want to go ahead now and

1 define some of those terms I expect to come up later.

2 Let's go to the table 2.1-3: Conditions Found.

3 A. Yes.

4 Q. And same thing. If you can just kind of give us
5 a little description as to how to read this and what
6 these things mean.

7 A. Well, the first four is probably really
8 self-explanatory. If something is rusted, it's rusted.
9 If it's rotten, you -- everybody understands that. If
10 it's corroded, you know what corrosion is. And that's
11 basically what --

12 Earth-covered where dirt is stacked on top of
13 some type of guide or anchor, that needs to be cleaned.
14 And then you've got brush and fuel. You're talking about
15 how close the trees and the brush are. And you write a
16 ticket up for that to get that cleared. Or contamination
17 where you got clearance -- wire clearance where the wire
18 is not high enough off the ground to the conductor.

19 Q. And --

20 A. Encroachment means if you had a house or a
21 garage and you wanted to build underneath the tower line,
22 that's called encroachment. And that's a no-no. They
23 ask you to remove it so . . .

24 Q. Okay. And there were a couple I definitely
25 wanted to ask you about. Clearance. You said that has
26 to do with how high the wire is?

1 A. Yes.

2 Q. And there are parameters that are set?

3 A. Yes. What they do is they get a helicopter and
4 they run what they call LIDAR. LIDAR measures the
5 conductor to the ground. And if it's too low -- and it's
6 a federal mandated deal -- the company goes to the towers
7 and raises the conductor.

8 Q. Did you ever do that type of work?

9 A. Yes, Sir, yes.

10 Q. And we talked earlier about inspections. And
11 maybe this is a good time to go back to it. Now, there's
12 ground inspections, there's aerial inspections, and
13 there's climbing inspections?

14 A. Yes, Sir.

15 Q. Are there also LIDAR inspections?

16 A. Yes, there are. They're done by a private
17 company. We don't do that.

18 Q. Okay.

19 A. Okay?

20 Q. And how about infrared inspections?

21 A. A private company does that, too.

22 Q. Okay. So you as the employees of PG&E don't
23 actually do it? You hire somebody else to come in and
24 tell you the results?

25 A. Yes. That's how -- I don't know how it is now.
26 I've been gone for five years so who knows how it goes

1 now.

2 Q. Cool. And then let's see if we've got anything
3 else in here. What does birdcage mean?

4 A. I knew you was going to ask me that. Birdcage
5 is where the wire just completely opens up and you look
6 inside and all the strands just look like a ball of
7 string. It's just all blown up. It's --

8 Q. Have you seen birdcaging in your career?

9 A. Oh, many times, yeah.

10 Q. Do you know what causes birdcaging?

11 A. Trees falling against the conductor, a guide
12 hitting the pole with it, hitting a car with a pole,
13 yanking the conductor around. There's many things that
14 make that happen.

15 Q. Okay. A couple other real quick.

16 A. Sure.

17 Q. Out of plum?

18 A. Out of plum (indicating), plum (indicating), out
19 of plum (indicating), plum (indicating), out of plum
20 (indicating).

21 Q. Okay. Remember, I can see and I know they can
22 see exactly what you're doing.

23 A. Do you understand what I'm saying? You know, if
24 you guys had a little plum bob or put a bolt on a string
25 and looked at something. Well, if it's out like this
26 (indicating), it's out of plum. And then if you're

1 centered, it's in plum.

2 Q. And just for the record for the court reporter
3 because she has to write down everything that we're
4 doing, you're using your arm and your hands to show --

5 A. Yeah.

6 Q. -- straight up and down versus not straight up
7 and down.

8 A. Yeah. All the crews carry plum bobs. You know
9 what that is?

10 Q. Nope.

11 A. Even construction workers use plum bobs --

12 Q. Absolutely.

13 A. -- to make sure that everything is true.

14 Q. Yep. But we can't assume anything in here. And
15 we all have to start off as idiots. For me and some of
16 us it's easier than others.

17 But so we can walk through the basics and you
18 can explain it because obviously you have over 40 years
19 of experience doing this and you know this stuff a lot
20 better than we do.

21 A. I mean, just basic line. I don't know your job
22 and you don't know my job if you want to get technical
23 about it so . . .

24 Q. All right. That's it on this one.

25 Now I'm going to skip ahead to section three.
26 And we have already talked a little bit about the

1 different types of inspections. We are going to the page
2 BAIT stamped on the bottom 30766 and it's Table 3.1-1.

3 Find that table?

4 A. Yeah. Are you in "Guides For Assessing Priority
5 Codes"? Is that where you are?

6 Q. No, no.

7 A. Okay.

8 Q. We're "Overhead Inspection Frequencies."

9 A. That's 2.11.

10 Q. No, no. 3.1. Sorry.

11 A. Sorry. I'm a little behind here.

12 Q. That's okay.

13 A. That might be it right there, I think. Overhead
14 maintenance inspections. Got her. Okay. Got her.

15 Q. All right. We're talking about inspections?

16 A. Right.

17 Q. And you already talked about the difference
18 between an inspection and a patrol; right?

19 A. Yes.

20 Q. So this goes through what? The schedule for the
21 inspections?

22 A. Yeah. It gives you the voltage in the line, it
23 tells you inspection type, structure type, and inspection
24 frequency, and it tells you what -- how long -- what --
25 how many years you have to do steel on the ground and how
26 many years you have to do wood on the ground and then it

1 rolls over to aerial or helicopter.

2 Q. Okay. In your career did you have the
3 opportunity to work on the Caribou-Palermo line?

4 A. Yes.

5 Q. And what's the voltage on the Caribou-Palermo
6 line?

7 A. 115,000.

8 Q. 115,000 or 115 kVs?

9 A. Yes, Sir.

10 Q. So the Caribou-Palermo would fit in right here
11 under 115; correct?

12 A. That's correct.

13 Q. So let's walk through the different types of
14 inspections and the schedule for them for us, please.

15 A. Well, as you can see "detail inspection ground
16 aerial" the steel is five years and then for the wood
17 it's two.

18 Q. Okay. So if the 115 line -- and it's a steel
19 tower structure?

20 A. Yeah, the Caribou-Palermo is steel.

21 Q. Okay. Those have to be -- have to be a detailed
22 inspection every five years?

23 A. That's correct.

24 Q. But if they were a wood structure, every two
25 years?

26 A. That's correct, Sir.

1 Q. Cool. How about -- you talked about climbing or
2 aerial lift?

3 A. Yes. Either.

4 Q. Actually "detailed climbing or aerial lift" is
5 the exact terminology that uses.

6 A. It would be -- the aerial lift would be a bucket
7 and the climbing would naturally be climbing.

8 Q. Okay. So the aerial lift is different than
9 aerial inspection which would be aircraft?

10 A. That's correct.

11 Q. And it says in here for frequency "as
12 triggered."

13 A. Yes.

14 Q. In your experience, what does that mean?

15 A. Well, if they think that we have a problem on
16 it, they'll -- what the trigger mechanism is is it
17 triggers the ground. So we can ride the line all the way
18 out and look at it all. Or if something is down or
19 something, we've been known to fly it in the helicopter
20 to make sure we get right on it.

21 Q. Okay. And finally, again we talked about
22 infrared whether it's steel or wood. And the 115 --
23 those are done "as triggered" it says?

24 A. Yes.

25 Q. And that's done by somebody else?

26 A. Yes.

1 Q. But again, who makes the call on the triggers?

2 A. Usually our supervisor did.

3 Q. Okay. I want to flip over to the next page --
4 because it talks about the triggers -- and have you walk
5 through the triggers for us and educate us on what kinds
6 of things are going to trigger a climbing or aerial lift
7 inspection or infrared inspection on a 115 kV steel
8 structure.

9 A. Well, it could be the steel, it could be the
10 insulation, and it could be the conductor.

11 Q. So the first is component defects. What would
12 be the components of a steel structure or power on a 115
13 line?

14 A. It would be the steel naturally. And -- well,
15 and I forgot the footings. It could be the footings
16 which were concrete. And it could be the conductor or
17 the insulation or it could be the mechanism that holds
18 the conductor which would be a shoe. They call it a
19 shoe.

20 Q. All right. Wire or structure strike?

21 A. Yeah. Lightning or if somebody ran into it.

22 Q. Lightning strikes?

23 A. Yes.

24 Q. Is that a big deal? A big problem?

25 A. Big, big deal. Big deal.

26 Q. Did you have to investigate lots of those?

1 A. Pardon?

2 Q. Did you have to investigate lots of those?

3 A. Yes, Sir, yes.

4 Q. Let's see. Burned area or high fire hazard.

5 A. Yes.

6 Q. Could you explain how -- how that -- why that
7 triggers inspections?

8 A. Well, usually what that does, as you said, is
9 triggers the inspection. They want to make sure that any
10 combustible or flammable material is away from our
11 right-of-ways as far as poles and towers go so if we do
12 have a failure, we -- you know, we don't have a problem.

13 Q. I think everything else we can kind of go
14 through. All right. I think we can put that one away.
15 And I want to run through a couple more with you real
16 quick.

17 A. Are we good on this one?

18 Q. Yep, we're good on this one. You should have
19 another binder back there behind you that says "2010."

20 A. This guy is going to help me. I appreciate it.
21 Thank you, Sir.

22 Got it.

23 Q. All right. And on the first page inside the
24 binder you should see the exhibit tag number 152.

25 A. Yes, Sir.

26 Q. And do you recognize Exhibit Number 152?

1 A. Yes.

2 Q. What is Exhibit Number 152?

3 A. It just tells you what to do on the patrol for
4 the overhead. Typical electrical transmission problems.

5 Q. Okay.

6 A. Inadequate clearance, damaged conductor, broken
7 or leaning poles, missing or bent tower members. That's
8 what I was just talking to you about.

9 Q. Right. Good.

10 Do you recall this specific section or year?

11 A. No, Sir.

12 Q. All right. Do you recall if -- well, let me
13 rephrase that.

14 In your experience with PG&E, did they reissue
15 the entire ETPM if they made changes just to one portion?

16 A. Yes, Sir.

17 Q. Okay. You know, they wouldn't just reissue
18 section four in this case?

19 A. Not that I know of.

20 Q. Okay. But for whatever reason this is the
21 section for the January 2010 ETPM; is that correct?

22 A. I guess so, Sir.

23 Q. Is that what you're looking at?

24 A. Yeah. A lot of stuff I've been gone, like I
25 said. A lot of it I don't recognize.

26 Q. Right. I mean, year to year probably not. But

1 section four is the section that for years dealt with
2 patrol; correct?

3 A. Yes, Sir.

4 Q. And defines what is a patrol, how a parole is
5 different from an inspection, and those types of things?

6 A. Yeah. It gives the procedure and what to look
7 for.

8 Q. All right. Now, let's go on to 153.

9 A. Okay.

10 Q. Let's see. That should be the next one. That
11 will be the 2013 --

12 A. The next book?

13 Q. Yeah. The 2011 book.

14 A. I'm going to have to take a potty break here in
15 a minute.

16 Q. Okay. Just let us know.

17 A. Okay. 153 it is?

18 Q. Yes, 153. You recognize 153?

19 A. No. I'm -- it's just the number. I see the
20 number. I can't help you there.

21 Q. Do you recognize the documents that are in
22 there?

23 A. Yeah, some of them, Sir. Not -- a lot of it I
24 don't remember.

25 Q. What do you recognize it to be?

26 A. I just recognize the general information, the

1 acronyms on what you put down, and stuff.

2 Q. Okay. Which is -- this says on the page
3 "January 2011 Electric Transmission Preventative
4 Maintenance Manuel."

5 A. What's that now?

6 Q. It says on the page that this is -- and we're
7 talking about PGE-Camp-BC-000006866. This is TD1001
8 Electric Transmission Preventative Maintenance Manuel and
9 down at the bottom left corner January 2011; correct?

10 A. Gotcha.

11 Q. So does this appear to be the 2011 --

12 A. You know, Sir, I don't know. I haven't looked
13 at this book in five years. I can't -- you know.

14 Q. You can't distinguish between the years; right?

15 A. Well, I mean, I kind of recognize it a little
16 bit but not all of it. You know what I'm saying?

17 Q. Okay. No. And nobody would expect you to.

18 A. Thank you.

19 Q. We just kind of need -- this appears -- this
20 appears to be what it represents itself to be which is
21 that this would have been the manual that you would have
22 used when you were a troubleman in 2011.

23 A. I recognize some of the acronyms, but that's
24 about it.

25 Q. Can you flip through the rest of the book and
26 see -- just make sure that -- you know, if it looks to

1 you to be correct is the main thing we want to know.

2 A. I just remember just a little bit of it but
3 not -- I can't qualify if it's correct or not.

4 Q. Okay. We wouldn't want you to. Just want to
5 know if that appears to be the 2011 manual.

6 A. Okay.

7 Q. And we can go ahead -- while you're there, you
8 also have in front of you 154 and 155.

9 A. Okay.

10 Q. And if you could do the same thing with them,
11 we'll kind of short circuit all of this real quick.

12 A. Okay. I got 155.

13 Q. Okay.

14 A. I'm at Table of Contents. Is that what you
15 want?

16 Q. I just want to know do you recognize 155 and
17 does it appear to be the 2013 -- I'm sorry. The 2015 --
18 we skipped one. The 2015 Electric Transmission
19 Preventative Maintenance Manuel?

20 A. Yeah. In 2015 I was retired.

21 Q. Okay. When did you retire?

22 A. Hell, I don't even know.

23 Q. Did you retire at the end of '14?

24 A. Yeah, just about where it turned about 2015,
25 yeah.

26 Q. Okay. So you probably didn't use the 2015

1 manual?

2 A. No, Sir. I can't help you.

3 Q. Let's go to 154 then which would be the 2014
4 manual.

5 A. Got it.

6 Q. And same question. Do you recognize that? Does
7 it appear to be the 2014 manual that you used?

8 A. Some I recognize and some I don't.

9 Q. Okay.

10 A. Yeah, it pretty well tells just all the basics
11 of what everybody has done.

12 Q. Okay.

13 A. You know, they tell the insulation district. We
14 have insulation districts like the coast, mid valley and,
15 of course, you know, the upper hill up in the snow
16 country.

17 Q. So reviewing 154 it appears to be what it
18 represents itself to be?

19 A. Yes, Sir.

20 Q. Okay. Do you need a break now?

21 A. Yeah. If you would, that would be great.

22 MR. NOEL: Madam Foreperson, can we take a brief
23 break and let (WITNESS #1) use the restroom?

24 GRAND JURY FOREPERSON: Yes, Yes.

25 [Recess taken from

26 3:47 until 3:53 p.m.]

1 MR. NOEL: Call us back to order.

2 GRAND JURY FOREPERSON: Okay. Back to order.

3 MR. NOEL: All the jurors are present and
4 accounted for?

5 GRAND JURY FOREPERSON: All the jurors are
6 present and accounted for.

7 **EXAMINATION CONTINUED**

8 BY MR. NOEL:

9 Q. All right. (WITNESS #1), I'd like to switch
10 gears now and start talking specifically about the
11 Caribou-Palermo line.

12 Now, if I forget, how long did you work on the
13 Table Mountain Sub?

14 A. Work at Table Mountain? Is that what you said?

15 Q. Yes.

16 A. Ten years. Approximately ten years. I don't
17 really know the numbers, but I'm thinking ten.

18 Q. And did you regularly work on the
19 Caribou-Palermo 115 line?

20 A. No, Sir.

21 Q. As a troubleman did you regularly inspect or
22 patrol the Caribou-Palermo 115 line?

23 A. Yes, Sir.

24 Q. And do you recall how many years you did?

25 A. No, Sir.

26 Q. I have up on the big board and in front of you

1 the actual exhibit marked as Exhibit Number 156. Do you
2 see 156?

3 A. Yes, Sir.

4 Q. Do you understand or do you recognize what is
5 depicted in 156?

6 A. Yes.

7 Q. What is depicted in 156?

8 A. It's tower numbers.

9 Q. Okay. Can you walk us through 156 starting at
10 the top right and let us know what we're seeing.

11 A. Well, they're starting from the Caribou
12 Powerhouse as the name Caribou-Palermo. And it goes all
13 the way down in Palermo sub that you see on the bottom.
14 So the numbers are started from 000001. That would be
15 tower one all the way down to Palermo sub.

16 Q. Okay. So Palermo sub is down here in the
17 bottom?

18 A. Yes, Sir.

19 Q. And Caribou Powerhouse is up here in the top?

20 A. Yes, Sir.

21 Q. And what are all the yellow pins in between?

22 A. That's the color of the transmission line. In
23 other words, the 115s are yellow.

24 Q. Okay. And do you recognize this to be the
25 Caribou-Palermo line?

26 A. Yes, Sir.

1 Q. Now, what do you know about -- in your
2 experience your training about the Caribou-Palermo line
3 when you first started working on it?

4 A. That it was the original Old Bay Line to San
5 Francisco. It's 100 years old.

6 Q. How do you know that?

7 A. Because of the markings and the -- they painted
8 over the other markings. I could see them on the steel
9 on the tower legs. They were the bay lines.

10 Q. All right. Now, I want to move on to Exhibit
11 Number 157, the big packet there in front of you. I'll
12 ask you to take a look and flip through that packet. And
13 I'm going to ask you if you recognize what that packet
14 is.

15 A. Yes. The patrol schedule.

16 Q. Okay. What do you mean by the patrol schedule?

17 A. It's a listing of the towers that you patrol to
18 find if anything is wrong.

19 Q. Okay. And is this a document that you would
20 have filled out?

21 A. Yes.

22 Q. All right.

23 A. In fact, my name is on it, I believe.

24 Q. So let's start with page 1.

25 A. Yes.

26 Q. Which is up here on the big board.

1 A. Okay.

2 Q. And this says -- this is BAIT stamp number
3 PGE-Camp-CF-0000001136.

4 A. Yes, Sir.

5 Q. 7/13/2009. What is that?

6 A. The date that I patrolled it. That's when they
7 probably get the paperwork. These come out of
8 Sacramento, Sir.

9 Q. Okay.

10 A. And they send them to our work headquarters.

11 Q. Okay. There's a handwritten note "detailed
12 patrol."

13 A. Right.

14 Q. Do you recognize that?

15 A. Yes, Sir.

16 Q. And what does detailed patrol mean?

17 A. The same thing as ground.

18 Q. Okay. Going back to when we were talking about
19 the ETPM and the types of --

20 A. Right.

21 Q. So this is a five-year patrol?

22 A. Yes, Sir.

23 Q. Down here in the bottom handwritten "Star, no
24 prior star." Do you know what that means?

25 A. No priors. Because -- the reason why is because
26 they're all wrote up here. Every connector, every tower

1 on that is all wrote up to be repaired.

2 Q. Okay.

3 A. And there's probably about eight or nine pages
4 in here to be repaired.

5 Q. Okay. So that's what we're going to get to here
6 in just a second. But I'm not quite sure how no priors
7 ties in to your data inspection sheet.

8 A. Well, she just looked at it right now and they
9 said that there's no priors. Until I patrol it, then
10 there might be something.

11 Q. And what would be a prior?

12 A. A prior would be right here, Sir. If you come
13 up here, I'll show you.

14 Q. Okay. Are you talking about the data inspection
15 sheet?

16 A. Yeah. This is --

17 Q. Okay.

18 A. You see all this down in here (indicating),
19 that's all priors.

20 Q. Okay.

21 A. There's probably eight or ten sheets of it on
22 that line.

23 Q. Okay.

24 A. Okay?

25 Q. We'll get to that.

26 So next I want you to go -- well, I should not

1 have done that. I have page 48 of 392 from Exhibit 151.

2 A. Page 48.

3 Q. Which is the 2009 manual. And I should not have
4 put that away. So here. I'm going to get you this one.

5 A. You've page 48. Is that what we're working on?

6 Q. No. Page 48 in this one. I want to lay --
7 we're going to lay a little foundation here.

8 A. All right.

9 Q. Let's see. 30717. There we go.

10 A. Okay. Gotcha.

11 Q. Okay. Now we're in Exhibit 151 which is the
12 April 2000 Electric Transmission Preventative Maintenance
13 Manual specifically on page 48 of that which is
14 PGE-Camp-BC-00030717.

15 And you're on that same page; correct?

16 A. Yes, Sir.

17 Q. And this -- tell us what we're looking at here.

18 A. This is just a transmission -- like I said, a
19 transmission line option list. What you see is what you
20 put down.

21 Q. Okay. Is this something that you used as a
22 troubleman?

23 A. Yes.

24 Q. And how would you use this form?

25 A. I'd carry this book with me. And if I saw
26 anything, I'd write it down in the book of loose steel or

1 a loose -- a broken conductor or whatever.

2 Q. So is this a standard PG&E form?

3 A. As far as I know, Sir.

4 Q. Or it was when you were doing it?

5 A. It was when I was doing it, yes.

6 Q. Okay. So now let's go back and let's put that
7 manual back away.

8 A. Okay.

9 Q. I'll get it out of your way.

10 A. Thank you.

11 Q. And let's go back to the 2009 inspection report.
12 And I want you to flip to page 59 --

13 A. Fifty-nine.

14 Q. -- of that which I have up in front of you.
15 I'll refer to it as the transmission line object list.
16 It would be page 46.

17 A. Forty-seven. I was going to say there is no 59.
18 Okay.

19 Q. All right. So tell us what we're looking at
20 here.

21 A. Just the line patrol option list. Every tower
22 you go to if there's something that's -- that's wrong,
23 you put -- like it says right here on this tower
24 "Completed" or it says "Completed, new findings." Okay.
25 We wrote the connectors up on it.

26 Q. Okay. So let's just walk through this first.

1 Who is the listed inspector?

2 A. Me.

3 Q. Is that your handwriting?

4 A. Yes, Sir.

5 Q. And the date of the inspection?

6 A. Correct.

7 Q. What's that date?

8 A. '09.

9 Q. The actual date.

10 A. Eight. It looks like 8/23/09.

11 Q. Okay. Earlier when we were talking and we were
12 looking at the front page of the 2009 inspection, it had
13 the date of July 30th.

14 A. Okay.

15 Q. Or no. July 13th. I'm sorry. Two different
16 dates. Can you explain why we have two different dates.

17 A. Because they give you time to -- a start time
18 and end time, which it shows you right here (indicating).

19 Q. Okay.

20 A. And also there might have been another job where
21 I had to go work so I had to break off the patrol.

22 Q. Even more basic, this is a detailed ground
23 inspection; correct?

24 A. Yes.

25 Q. How long does it take you to do that?

26 A. Well, how long you would think it would go from

1 Palermo sub through the canyon to Caribou Powerhouse.

2 Q. How much -- how many -- well, we'll get to that
3 in a second.

4 How much time do you spend on each structure?

5 A. I spend probably anywhere from 15 to 20 minutes.
6 You've got to understand, Sir. See -- and I don't mean
7 to rattle on here, but here's the deal. It takes me two
8 hours to get in the canyon from Table Mountain and two
9 hours to get out plus I'm dealing with rocks. That line
10 was built with men and mules. So you can imagine what
11 the trails look like. You've got to walk every bit of
12 it.

13 Q. It is pretty amazing to be up there.

14 A. I mean, you have to get in the helicopter, go up
15 there. If everybody has been in Feather River Canyon,
16 you know how rough it gets around the Powerhouse. Them
17 towers are all the way up at the top of the hill. And
18 we've got to go up there no matter how, if we've got to
19 crawl, walk, or whatever we've got to do.

20 Q. So going back to where we started with this,
21 this isn't a one-day or --

22 A. No, Sir.

23 Q. -- one-week job --

24 A. No, Sir.

25 Q. -- when you're on these inspections?

26 A. They give you 30 days right here. They give you

1 30 days like 8/1/19 to 8/30/19. They give you 30 days to
2 complete the work.

3 Q. Okay.

4 A. And they got a little testy if you ran it over
5 so . . .

6 Q. Okay. So you're spending multiple days on this?

7 A. Yeah, multiple.

8 Q. And so when we look back on this inspection
9 report up here on the top on your transmission line
10 object, are there different dates on different pages?

11 A. Yeah. I imagine that there would. I haven't
12 looked at this in a long time. So I imagine there are
13 different dates on here.

14 Yeah, there are. 8/13, 8/27. Yeah. So I might
15 have been switching that day. Because we have to switch
16 with the crews to clear a line so they can work.

17 Q. What does it mean to switch?

18 A. Well, that is to open a big air switch or go in
19 the substation and manipulate the equipment and open the
20 line up. And our areas are so big from when I left Table
21 Mountain, I'd have to go -- like switching I'd have to
22 go -- sometimes go almost all the way into the Eureka
23 area to open switches up to get the crew -- so I could
24 get the crew reported on the line. That would take me
25 anywhere from four to five hours driving up and probably
26 four or five back. So if I'm patrolling that line in the

1 canyon, you can see how that works.

2 Q. It takes a lot of time?

3 A. Yes, Sir.

4 Q. Okay. All right. So let's go back through
5 this. Page 46 "10391 Caribou-Palermo non-wood pole."
6 Can you explain what any of that means?

7 A. Non-wood. Exactly what it means. It's steel,
8 non-wood.

9 Q. Okay. What about the 10391? Are you familiar
10 with that?

11 A. Yeah. That is the designated number for the
12 line.

13 Q. And that is the Caribou-Palermo 115 KV line?

14 A. Yes, as far as I know. Excuse me. I'm wrong.
15 I'm wrong. If you look over in the left-hand corner, it
16 says "ETL." See where it says "ETL"? Where it says
17 "Location ETL"?

18 Q. Yeah.

19 A. That's the line number; 3190 electric
20 transmission line number. I was wrong on that.

21 Q. Okay. So what is the 10391? Do you know?

22 A. No, Sir, I don't.

23 Q. Okay. That's fine.

24 All right. Then we go down into this looking at
25 the individual blocks on here. And the first line across
26 the top, if you could explain to us what all this means.

1 A. Well, all it does it just tells you what every
2 tower of what equipment is on it, how the framing, how
3 the access is. And you go over here and the inspection
4 results and it's just -- and your notes and stuff like
5 that. It tells you how each tower is framed, what kind
6 of conductor it's got on it, what kind of bells and
7 everything it's got on it.

8 Q. Okay. So let's look down here -- the second one
9 town 27/222.

10 A. Yes.

11 Q. It says "lattice steel tower."

12 A. Yes.

13 Q. What is a lattice steel-style tower?

14 A. It just a regular old tower like you'd see out
15 here on the road somewhere.

16 Q. And then we have number 40702271. Do you know
17 what that number is for?

18 A. Yeah. That's -- I believe that 405 or 40559.
19 Is that what you're saying?

20 Q. Yeah, 4070227.

21 A. That is the sap number.

22 Q. What is a sap number?

23 A. The number assigned to the tower. So if you
24 want to bring it up in the computer, you plug that number
25 in and the line name, and it brings that tower up.

26 Q. Okay. So that's an individual identifier for

1 this tower?

2 A. Yeah. Every tower, everything in the system is
3 all identified by the sap numbers.

4 Q. Next it says "trap double dead end."

5 A. Yes.

6 Q. What does that mean?

7 A. The conductor comes into the tower, stops, and
8 then it rotates like this. And then when it goes out,
9 it's different than it's coming in. In other words, the
10 word is called transposition. That's what it mainly
11 means if you've done your math or whatever. The
12 conductor comes in and rolls up like that. When it goes
13 out, this wire -- the field wire would be on the road
14 wire and the middle wire might be on the field wire.

15 Do you know what I'm saying? And that's -- the
16 idea of that that's to break up the corona fields.

17 THE COURT REPORTER: I'm sorry. Break up the
18 what fields?

19 THE WITNESS: Corona.

20 THE COURT REPORTER: Corona. Thank you.

21 THE WITNESS: You know, the sun's got corona
22 rings around them. That's what it is.

23 THE COURT REPORTER: Okay. Thank you.

24 THE WITNESS: Yeah.

25 MR. NOEL: Not the beer.

26 BY MR. NOEL:

1 Q. All right. As you were -- as you were
2 discussing that, just for the record, you were
3 maneuvering with your arms and crossing your arms back
4 and forth as you were discussing how the wires cross over
5 each other on the transposition tower.

6 A. Do you have a picture of one here?

7 Q. I sure do. That is going to be the next -- one
8 of the things we're going to look at.

9 A. That's it. There it is right there.

10 Q. Okay.

11 A. There's a transmission -- transposition tower
12 right there.

13 Q. That is Exhibit 158?

14 A. That's correct, Sir.

15 Q. So let me skip ahead because we're going to get
16 back to some other stuff.

17 A. There you go.

18 Q. We'll come back.

19 This is what you call a transposition tower?

20 A. Yes, Sir.

21 Q. Explain this to us.

22 A. As the wire comes in, you can see it coming in.

23 Q. And feel free if you want. You can come out
24 here and use the board and point all you want.

25 A. But everybody has a picture of it, I take it.
26 Anyway, see the wire come in. See what it does? It goes

1 right up this insulator. And then now going out it's a
2 center wire. Okay. And then this one here is going up
3 and going out, and now this is this (indicating)
4 conductor. It goes like that. And then this lattice
5 goes -- brings this conductor all the way across the
6 tower and goes up. Now it's that wire.

7 And what happens is they -- the reason they do
8 the transmission, like I said, is because it breaks up
9 the corona field. And if you guys remember from school
10 the sun's got the corona rings around it. And that's
11 what it does. Because if they don't do it, it causes
12 really bad radio interference and TV interference.

13 Q. So the photograph 158 you obviously recognize as
14 a transposition tower?

15 A. Yeah.

16 Q. Do you recognize this individual tower?

17 A. Not really, Sir.

18 Q. No. I don't expect you to.

19 Do you recognize what line this tower is on?

20 A. It's the Palermo.

21 Q. Caribou-Palermo line?

22 A. Yes, Sir.

23 Q. Okay. The 115 line?

24 A. Yes.

25 Q. So just so we can -- just as long as we're up on
26 that, are we looking at the front side of this tower or

1 the backside meaning the supply side or the distribution
2 side?

3 A. I would say right now we're looking at the
4 backside of it going forward to Caribou. Because I'm
5 just looking at the numbers. See the yellow numbers on
6 the leg there. Yeah, that's the number of the tower
7 right there. Usually it goes -- like they might be
8 numbered from Puellarum or Caribou or visa versa
9 depending on what engineer is doing it.

10 Q. Okay. And then there's another number up here.

11 A. Yeah. That's the mile number.

12 Q. Okay.

13 A. There are "X" amount of towers in a mile. Maybe
14 10, 20.

15 Q. Explain that for us. We may not have had that.

16 A. What happens is when they were build these
17 lines, say there's ten towers and ten towers and ten
18 towers. Well, it starts off mile 1, mile 2, mile 3, and
19 mile 4 and so on.

20 Q. So let's back up a little bit to our map Exhibit
21 Number 156. And can -- we kind of skipped over it, the
22 naming convention for those towers. You were talking
23 about how the towers are listed there.

24 Can you explain using the map and what we're
25 looking at to how that works.

26 A. Well, what they're doing they are numbering from

1 the powerhouse to the sub. That's how they're numbering
2 what I can see of it.

3 Q. Okay.

4 A. In other words, what happens is if you look down
5 and the numbers say, like, 22, that's the 22 mile and
6 that is the one hundred and eighty-fifth tower.

7 Q. Okay.

8 A. All right.

9 Q. And then, for instance, we have the 27th mile?

10 A. Yes.

11 Q. 27/222?

12 A. Yeah.

13 Q. And so that tower is 27 miles downstream from
14 the source, the Caribou Powerhouse?

15 A. That's correct, Sir.

16 Q. And it is the two hundred twenty-second in line?

17 A. That's correct.

18 Q. And then all of these -- but this line kind of
19 does something where it goes all the way down and we get
20 to 35281 and then not all the towers are in here. And
21 then it goes back to 16.

22 A. The reason for that, Sir, there is a substation
23 right there.

24 Q. Okay. That's exactly what I was going to ask
25 you. There's a substation here?

26 A. That's what broke the numbers up.

1 Q. Okay. So what substation is there?

2 A. I can't think of it offhand.

3 Q. Would that be Big Bend?

4 A. Yes, Sir, that's correct.

5 Q. Okay. So the power comes in from Caribou
6 Powerhouse, gets to Big Bend, and then it's -- the
7 numbering system starts over again?

8 A. Yes.

9 Q. Because Big Bend and Caribou --

10 A. It heads down to Palermo.

11 Q. Okay. Thank you. I probably should not have
12 skipped that earlier.

13 Okay. So let's get back to 157 while we're
14 here. We are talking about 27/222.

15 A. Okay.

16 Q. And just in general for all of these things,
17 what are these numbers in the right corner?

18 A. If you notice, they are longitude and latitude.
19 I can't even talk now. They're long attitude and
20 latitude. They are for GPS.

21 Q. Okay.

22 A. In other words, you put that in the computer, it
23 pulls the tower right up. Tell you exactly where it is.

24 Q. So this is a form -- the transmission line
25 object which is a form that you take out in the field
26 with you when you're doing these inspections?

1 A. Yes, Sir.

2 Q. Do you provide this information that is in
3 the -- the left-hand column or --

4 A. No, Sir. It's already there.

5 Q. Okay. So that -- this left-hand column comes
6 prepopulated?

7 A. Yes.

8 Q. And then what about the right-hand columns?

9 A. That is our responsibility.

10 Q. Okay.

11 A. But I mean, it's all filled out as you see. We
12 just got to do the "X"s and "O"s and write our findings.

13 Q. Okay.

14 A. Like right here where I wrote "Connecters."

15 Q. Right.

16 A. Okay.

17 Q. So we're looking at 27/222. And then in the
18 check boxes can you tell what you checked.

19 A. 27/222?

20 Q. Yep.

21 A. I checked "Completed, new findings." And that
22 was the connectors.

23 Q. Okay.

24 A. So usually every one of these connectors for
25 everything has pictures.

26 Q. Okay. Was that your normal practice to take

1 photographs?

2 A. That's correct of everything, of everything that
3 is broke.

4 Q. So somewhere out there there should be
5 photographs of that?

6 A. That's correct, yeah.

7 Can we 905 again?

8 Q. Pardon?

9 A. Can we 905 again? I mean, I need to go to the
10 bathroom.

11 MR. NOEL: Oh, okay, absolutely.

12 It's 4:15. Do you want to break for the day?
13 Obviously, we're not going to finish this witness and
14 we're going to have to talk about scheduling to get him
15 back in here.

16 THE COURT: I think so.

17 MR. NOEL: Okay. Sir, you go ahead and go to
18 the restroom.

19 THE WITNESS: Thank you.

20 MR. NOEL: Actually, do you want to give him the
21 admonition.

22 GRAND JURY FOREPERSON: I have already done
23 that, but I'll remind him.

24 THE WITNESS: Yes, you have, my dear.

25 MR. NOEL: Go ahead and do it again.

26 GRAND JURY FOREPERSON: Okay. I have to do this

1 again.

2 THE WITNESS: Wonderful.

3 GRAND JURY FOREPERSON: Okay. Good. You are
4 admonished not to discuss or disclose at any time outside
5 of this jury room the questions that have been asked of
6 you or your questions -- or your answers until authorized
7 by the grand jury or the Court. A violation of these
8 instructions on your part may be the basis for a charge
9 against you of contempt of court. This does not preclude
10 you from discussing your legal rights with your own
11 attorney.

12 Do you understand?

13 THE WITNESS: Yes, Ma'am, I do.

14 GRAND JURY FOREPERSON: Okay. I'm sorry. I
15 forgot your last name.

16 THE WITNESS: (WITNESS #1).

17 GRAND JURY FOREPERSON: (WITNESS #1), what I have
18 just said is a warning not to discuss the case with
19 anyone except the Court, your lawyer, or the district
20 attorney.

21 THE WITNESS: Okay.

22 GRAND JURY FOREPERSON: You understand?

23 THE WITNESS: Yes, Ma'am.

24 GRAND JURY FOREPERSON: Okay.

25 THE WITNESS: Thank you.

26 MR. NOEL: Okay. So we will let you go to the

1 restroom, (WITNESS #1).

2
3 (PROCEEDING OMITTED.)

4
5 [Recess taken from
6 4:18 until 4:20 p.m.]

7
8 (PROCEEDING OMITTED.)
9 [Matter adjourned at 4:36 p.m.]

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: (WITNESS #17), before
you have a seat, would you please raise your right hand
so I can swear you in.

(WITNESS #17): Okay.

GRAND JURY FOREPERSON: Thank you.

(WITNESS #17)
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. (WITNESS #17), could you please state your full

1 name and spell your last name for the record?

2 A. It's (WITNESS #17). It's (SPELLING REDACTED).

3 Q. Let's pull this microphone up a little bit
4 closer. You stay where you're comfortable, and we'll
5 pull the microphone to you.

6 (WITNESS #17), are you employed?

7 A. No, I'm not. I'm retired.

8 Q. Retired from what?

9 A. Pacific Gas & Electric Company after 40 years.

10 Q. You spent 40 years with PG&E?

11 A. Yes.

12 Q. When did you start with PG&E?

13 A. 1969, April. And started in San Francisco as a
14 helper in the electric department. Went into apprentice
15 lineman, lineman, eventually went into supervision and --

16 Q. All right. How did you get started with PG&E?

17 A. Well, the way I got the job is the guy I was
18 working with interviewed with them, and I had had like
19 two months left in the Army, and he said, "Hey, this
20 company's looking for employees, you should get on and
21 apply with them." And I did, and then they hired me.
22 Very surprised.

23 Q. So you started in 1970 or 1969 as what?

24 A. Groundman.

25 Q. What is a groundman?

26 A. It's basically a person that helps on the

1 electric crews to pick up all the crap they throw down
2 and anything's broken, burned, whatever; you're the
3 person who digs the holes when they're setting poles,
4 drive stuff up and down the hills. You're the gofer, as
5 many people call them.

6 Q. How long were you groundman?

7 A. Just a little bit over a year.

8 Q. Did you stay with the company at that point?

9 A. Yes. I went into apprenticeship while I was in
10 San Francisco, went through I guess two years, it's a
11 three-year apprenticeship, where you go through training.
12 Some of the training schools are down by Fresno and some
13 of it's basic electric. You go through a lot of how to
14 -- you just kind of progress, go through the early
15 schools, how to tie knots and things like that. And then
16 you progress into learning basic electricity. Then you
17 learn how to do work on energized lines, up to and
18 including 500,000 volts. And at the end of the three
19 years get tested. You have to pass certain tests. Then
20 you become a journeyman. And --

21 Q. Okay. Let's stop you right there. First of
22 all, you've -- around 1970, sometime in 1970, you entered
23 into the apprentice lineman program; correct?

24 A. Correct.

25 Q. What is a lineman?

26 A. Lineman, they're people that do work on

1 electric, both overhead and underground. They train you
2 to -- in San Francisco, if you're there, mostly working a
3 lot of underground work and climbing poles doing 12,000
4 volts or less. If you go out into other areas that have
5 the higher voltage lines, you end up working on those.
6 But when you, when you start out like that, you're
7 getting called in on a lot of emergencies; you know,
8 houses, one house out, car poles, things like that.
9 You respond to a lot of emergencies.

10 And you have an opportunity to move around
11 within the company. And so I went from San Francisco to
12 Oakland, to Richmond, Vallejo, Napa. I like change. I
13 hate things that are always the same. So I moved around
14 to get that change without having to quit the company,
15 because at one point I considered doing that just so I
16 could travel. But ultimately I did it by moving from
17 headquarters to headquarters. But I've always stayed in
18 the Bay Area, loved the Bay Area.

19 Q. Okay. Let's go back to talking about being a
20 lineman.

21 A. Okay.

22 Q. And basically. Correct me if I'm wrong. But
23 it sounds like the linemen are the guys who fix things on
24 the electrical lines?

25 A. That's correct.

26 Q. All right. Do you know, is there a difference

1 between distribution and transmission?

2 A. There's -- the difference is the voltage
3 levels. So anything 60,000 volts and above is
4 transmission; and below that is distribution.

5 Q. So you were talking about working on overhead
6 lines, climbing poles in San Francisco, and working on 12
7 kV lines; correct?

8 A. Correct.

9 Q. So those would be distribution lines?

10 A. Correct.

11 Q. Did you, as a lineman in San Francisco, work on
12 transmission lines?

13 A. No, I did not.

14 Q. At some point in your career did you begin
15 working on transmission lines?

16 A. Yes. When I went in, like three moves later I
17 was in Richmond, we had problems there on the
18 transmission lines where trees took the lines down. I
19 was out at work working putting those lines up. Then I
20 went into Vallejo, and Vallejo had a lot of transmission
21 lines. And whenever they would have a problem, they
22 would call us to go do the repairs on those kind of
23 lines. But that was the extent -- you would only
24 basically go out if they had an emergency. If they were
25 building new lines, doing major modifications, they
26 brought in these crews, other PG&E crews that were hired

1 to move around. They're called general construction
2 crews.

3 Q. Okay. When you started as an apprentice
4 lineman somewhere in 1970, were there divisions within
5 PG&E between transmission and distribution?

6 A. Yeah. It was, it was a total different --
7 well, the local headquarters, they had the responsibility
8 for transmission and distribution maintenance, but if
9 there was any large jobs, then they would bring in these
10 general construction crews to come in and do the work.
11 But --

12 Q. Okay.

13 A. -- we just took care of our area.

14 Q. When you were trained as an apprentice lineman
15 in the early '70s, when you were in San Francisco, were
16 you trained in both working on distribution lines and
17 working on transmission lines?

18 A. The only training I got was through the
19 apprentice program.

20 Q. Right.

21 A. Where they taught us how to replace the
22 insulators on towers while the line's energized. So it's
23 part of a one-month training where you go through this
24 school and do this training. And then later on, when I
25 was in Vallejo, I started training others because I
26 really liked doing it.

1 Q. Right. Let's stick with just talking about
2 when you're an apprentice and what training you were
3 given to work on transmission lines.

4 A. Okay. It was only how to replace the
5 insulators while they're energized.

6 Q. Okay. So eventually did you graduate from the
7 apprentice program and become a journeyman lineman?

8 A. Yes.

9 Q. Approximately what year did that occur?

10 A. It would be '73.

11 Q. And what does a journeyman lineman do?

12 A. You're expected to basically do anything with
13 electric; overhead, underground, transmission,
14 distribution. You were expected to be able to do it all.

15 Q. Jack of all trades?

16 A. Yes.

17 Q. Worked on transmission as well as distribution?

18 A. Yes. Mostly the, like I said, most of the
19 transmission was emergency response stuff or damaged
20 equipment stuff.

21 Q. So you started your career in San Francisco,
22 then you said at some point you moved out to the East Bay
23 to Richmond, Vallejo area?

24 A. Yes.

25 Q. Do you recall when that happened?

26 A. It would have been maybe '76, '7 -- let me

1 think. It might have been '78. It's a lot of years
2 since then. But I would say somewhere in the '77, '78
3 range.

4 Q. Okay. Now, in San Francisco -- excuse me -- in
5 San Francisco, you said most of your work was in
6 distribution and underground?

7 A. Correct.

8 Q. Once you got out to the East Bay, did you do
9 more work on overhead transmission lines?

10 A. Well, most of the work was overhead, wood pole
11 lines, the old, old poles that -- you know, Oakland's
12 been around a long time, so their facility is very old in
13 the old areas. So they need a lot of work. So we did a
14 lot of that, and it was mostly in the, in the
15 distribution. Transmission was only on the emergencies.

16 Q. Okay. Did you at that time as a lineman, were
17 you aware of any kind of inspection program for
18 transmission lines?

19 A. No, not at all. I was never involved in those.

20 Q. So how long were you out in the East Bay as a
21 journeyman lineman?

22 A. Gosh, I'm thinking I went -- well, I was in --
23 if you count Vallejo as part of the East Bay, I was there
24 until around '86; I believe I got, I got promoted into
25 management. But how many years I was in Oakland versus
26 Richmond versus Vallejo, I really don't have that exact

1 number.

2 Q. Okay. Do you remember during that time any
3 training that you received on working on transmission
4 lines?

5 A. No.

6 Q. Now, at some point you said you were promoted
7 into management?

8 A. Yes.

9 Q. Tell us about that, please.

10 A. Well, I had been working in Vallejo for a
11 number of years, went up to Napa, came back to Vallejo,
12 and this guy I was working with had, one of the foremean,
13 had a heart attack. So they asked me to fill in for the
14 guy. And at that point, I really didn't want to be a
15 supervisor, but, you know, you work in small groups and
16 you're going to do what you can to help out. So I
17 started doing some work in management, and I realized I
18 liked it. And there was -- I liked going out in front of
19 the crews, getting everything set up so the crews could
20 do the work as efficient as possible. I started filling
21 in there, and then the perma job came open there. This
22 guy never did come back from his heart attack, and they
23 promoted me into the supervisor job there in Vallejo.

24 Q. What were you supervising at that point?

25 A. It was almost all distribution. You had -- all
26 these transmission lines ran through the area, and if

1 they had any problem, they'd call us and we'd have to go
2 find out what the problem was and work through it. But
3 that was -- and then I was also doing some training of
4 other linemen on how to replace insulators energized.

5 Q. Okay. So let's talk about the teaching that
6 you were doing. Describe that for us.

7 A. Well, we have this trailer that's set up with
8 all these special tools. And so if you have -- you have
9 problems in a lot of country areas where people shoot the
10 insulators out off the towers. So we would go in and
11 replace them. If you don't replace them, it's going to
12 eventually short out you're going to have problems on the
13 lines.

14 So we would go in and, you know, we'd -- a
15 patrolman would report them to us, we'd go in and change
16 them out energized. So we'd pull this trailer out and
17 you'd get all these specialty tools out. Really what
18 they need is somebody who knows where all the tools mount
19 on the tower and how to keep in control of the wire so
20 you can pick it up. You've got these 12-foot long
21 fiberglass sticks with a little hook on the end that pulls
22 the cotter pin out so you can release the insulators,
23 take them out.

24 I mean, it's quite an extensive process, but
25 for some reason it really fascinated me and I enjoyed
26 doing it. So I worked with training; particularly had

1 new apprentices coming through, new linemen that hadn't
2 done it. I would train them on how to change the
3 insulators.

4 Q. You're talking about changing those insulators
5 while the line is energized; right?

6 A. Correct.

7 Q. So you don't have to shut down the line to take
8 all those parts off?

9 A. Many cases. It's not always the case, but I
10 would say in 90 percent of them, yes.

11 Q. You've talked about using a 12-foot fiberglass
12 pole to pull a cotter pin?

13 A. Yes.

14 Q. Can you describe for us what you're talking
15 about?

16 A. Well, in the top of the insulator is like a
17 little hub thing. And the cotter key is -- cotter pin is
18 what keeps the insulator on there in heavy winds and
19 stuff. Without it, it could vibrate and fall off. So
20 you have to pull that pin out, then you pick up the
21 weight of the wire, and using other hot sticks, you lift
22 those insulators out of there, drop them down where
23 they're away from the energized wire, bring new ones up,
24 put them back in place, put the cotter pin back in, and
25 you've got it fixed. It's kind of a -- probably it takes
26 a half a day to just do one insulator string.

1 Q. So what is holding the insulators to the tower?

2 A. There's a -- it starts with the tower itself is

3 steel, it's got a, usually a piece of steel with an eye

4 in it, then there's a hook that goes in that eye. Then

5 depending on the voltage depends on how many of these

6 insulators you put on. So in round numbers, it's, it's

7 like for 60,000 volts, you've got 6 insulators, sometimes

8 7. Depends on the corrosion areas and other factors.

9 But for 115,000, you usually have around 10 insulators,

10 11. And then 230,000, and so it goes.

11 Q. So you said "an eye," and you were holding your

12 fingers up with your thumb and your forefinger, pointing

13 finger, making an O; correct?

14 A. Yeah, kind of looks like a little hook.

15 Q. Okay. First, let's talk about the eye you

16 talked about.

17 A. Yes.

18 Q. There's an eye?

19 A. Right.

20 Q. So we've also heard that referred to as a

21 "hanger hole"; is that correct?

22 A. Yes.

23 Q. Or hanging plate?

24 A. Hanging plate, hanger hole.

25 Q. It's a hole for the hook to go into?

26 A. Correct.

1 Q. And then with your other hand you're making a
2 hook with your, with your pointing finger, index finger;
3 correct?

4 A. Correct.

5 Q. Why not just pull the hook and take down the
6 whole string?

7 A. Well, you have to -- the hook can't come out of
8 that hole while it's attached to the string of
9 insulators. When they fit together, that whole thing is
10 kind of a package where it can't come out, can't fall
11 down. Everything stays in place no matter the vibration.
12 The whole thing stays in place.

13 Q. So you were teaching this to young linemen?

14 A. Yes.

15 Q. Now, you said earlier that when you started as
16 a lineman, that distribution and transmission were
17 together, and as a lineman, you were taking care of both
18 distribution and transmission?

19 A. Correct.

20 Q. And that there was no inspection program that
21 you knew of for transmission lines?

22 A. Correct. None that I was familiar with.

23 Q. At some point in your career, did that change?

24 A. Yes.

25 Q. When?

26 A. It was -- I want to say it was about 1988,

1 somewhere in there. They decided to reorganize the
2 company to align the electric transmission lines with the
3 substations and with the operations, because they were
4 looking at that point -- I don't know how much people are
5 familiar with Cal ISO, but the state runs the
6 transmission systems, for most people's way of thinking.
7 They determine which lines are on and which lines are
8 off. And so we were looking for a method to improve the
9 efficiency of the line and looking for a method to
10 improve the reliability of the system. Because before
11 that we had situations where the substation would shut
12 the line down because they had to do work there on a
13 piece of equipment. Just about the time they turned it
14 back on, along would come the electric lines crews, and
15 they'd want to shut it down to do their work. And we all
16 thought that was a little crazy, we've got the line shut
17 down, everybody should do the work at the same time. So
18 they, they aligned, put the same groups under the same
19 supervision, the substation groups and the line groups.

20 Q. So which way do you go, transmission or
21 distribution?

22 A. I went transmission. When they reorganized,
23 they opened these jobs in the various areas, and I
24 applied for the job in the East Bay area and was awarded
25 the job, and I took over then.

26 Q. Do you remember what your official title was

1 back then?

2 A. Transmission Supervisor. Electric Transmission
3 Supervisor.

4 Q. And when this new Transmission Department was
5 created, do you recall how many transmission supervisors
6 there were in the PG&E system?

7 A. I believe there was seven. There was one in
8 San Francisco; there was one down along the coast south;
9 one along the coast north; then there was inland north,
10 south -- and I'm missing one. I think we had actually
11 three of them in the valley region at the time. Anyway,
12 we ended up with seven of them.

13 Q. South, central, and north?

14 A. Yeah.

15 Q. So would it be fair to say that the new
16 transmission side, PG&E divided their service territory
17 up into districts?

18 A. Correct.

19 Q. And for transmission purposes, that was seven
20 districts; correct?

21 A. Correct.

22 Q. And then named seven supervisors to run the
23 Transmission Departments in each of those districts?

24 A. Yes, they did.

25 Q. And you were one of those first ones?

26 A. Yes, I was.

1 Q. At that time, did PG&E also create a new
2 transmission position apart from lineman?

3 A. Yes. We called them transmission troublemen.
4 There's a lot of debate about the name, but ended up
5 transmission troubleman. The person who kind of was
6 managing the whole system, he wanted to bring on people
7 that were, strictly worked on transmission that would
8 take ownership in the system and make sure that, that we
9 had a system that was reliable and safe to operate.

10 Q. So you were involved in the creation of the
11 troublemen within PG&E; correct?

12 A. Yes.

13 Q. And what was the motivation for the creation of
14 that position?

15 A. You want somebody who knows what they're
16 looking at. When I -- sometimes they would -- before I
17 got into this, like they would send me to inspect a
18 tower. I really -- you know, I knew basic looking for
19 the insulators and the issues that impacted the actual
20 electric operation, but other than that, I really a lot
21 of times didn't understand what I should be looking for.
22 So the intent here was to have people that knew exactly
23 what to look for, how to establish priorities on repairs,
24 and would, would keep it operating.

25 Q. You also said something about ownership over
26 the lines?

1 A. Yeah. They, they wanted people to feel like
2 these are your tower lines. Like in my area, in my area
3 I had three troublemen, and we tried to assign them the
4 same lines. So they're like, "You need to take care of
5 your lines. These are your lines, this is --" and we'd
6 help each other as needed. But they wanted people to
7 feel like they really, that was their section and they
8 should take care of it.

9 Q. Did that system also create a system of
10 accountability?

11 A. I'm not exactly sure what you're asking.

12 Q. Well, you said you wanted to create a system of
13 ownership where you had one person who is doing
14 inspections over a single line and taking care of that
15 line. Is the flip side of that then you have actual
16 accountability that that line is being taken care of?

17 A. Yeah. I mean, every year we were looking, you
18 would see how many outages you had on the lines that you
19 were responsible for. I would -- you know, I was the
20 transmission superintendent, so I'm like ultimately
21 accountable for all the lines in Alameda and Contra Costa
22 counties. And then I had these three guys who were
23 really my eyes in the field, kept me apprised of any
24 emergency issues or routine maintenance, things that
25 needed to be done. And they reported those to me, and
26 then we set the priorities and did the maintenance and

1 repairs.

2 Q. So you said that prior to the creation of this
3 unit, of this new seven-district division of transmission
4 troublemen, you weren't aware of any policy or procedures
5 of inspection of transmission lines. Did that change
6 with the reorganization and the creation of this
7 department?

8 A. Yeah. I mean, we -- I think most of the other
9 people that went into these jobs, like I did, came in
10 kind of the same way. They'd, they came up through the
11 lineman job, had worked at some point on towers, did
12 something with them, whether it was just maintenance or
13 construction, depending on what group they came up
14 through. But we decided we wanted to come up with an
15 inspection template, because if you've never worked on a
16 tower, what are you looking for? How do you know when
17 something's getting bad? How do you know when, you know,
18 it becomes an emergency kind of thing?

19 So we tried to do -- when we first started out,
20 we started looking for any problems that were apparent to
21 any of the troublemen as they started doing their
22 patrols. And maybe the troublemen in Bakersfield would
23 see a particular problem. And we would get together like
24 once a month and share those. We'd have pictures and
25 stuff where we'd kind of share, "Here's the kind of
26 problems we're seeing, are you guys having that problem?"

1 So we were kind of trying to establish kind of
2 what to look for. What's okay? What needs work soon?
3 And, you know, kind of a priority system for everything
4 you found in the towers.

5 Q. Let me stop you right there. You said a lot.
6 Let's back up and kind of piecemeal it here.

7 So when you started, there was no, for lack of
8 a better term, "checklist" on how to inspect a tower?

9 A. Correct. Not that I ever saw or was aware of.

10 Q. Right. At that point, you had been working on
11 towers for what, 14, 15 years?

12 A. Yes.

13 Q. As an apprentice lineman and a lineman?

14 A. Yes.

15 Q. So one of the things that this newly created
16 Transmission Department set out to do was to establish a
17 checklist for inspecting towers; correct?

18 A. Correct. Yes.

19 Q. Out. Now, you said something about you would
20 meet once a month?

21 A. Yes.

22 Q. When you say "you," who are you talking about?
23 Or "we." You're term was "we."

24 A. Well, we probably had more often meetings with
25 the supervisors. And like once a month we started
26 bringing the troublemen together. And then, you know, as

1 we kind of saw what the immediate problems were, then we
2 kind of moved it to maybe once a quarter that we would
3 bring all the troublemen in.

4 Q. Let's define the term "we."

5 A. Okay. It's the seven superintendents would get
6 together for sure every month.

7 Q. When you're talking about the troublemen, who
8 are you talking about?

9 A. The people that had bid into these jobs.
10 They're union jobs. The most senior lineman who is in
11 that area gets preference on the job. So the people that
12 came into these jobs are people that wanted to be
13 transmission troublemen.

14 Q. Okay. When -- you said that when you took
15 over, when this position was created and you initially
16 took over, you were supervising three troublemen;
17 correct?

18 A. Correct.

19 Q. So when you talk about these monthly and later
20 quarterly meetings and all of the troublemen, are you
21 talking about your three troublemen or are you talking
22 something bigger?

23 A. We're talking all of them in the system would
24 come together at least quarterly to share with what are
25 things we're finding, what are the issues that are
26 highlighting, needing repairs.

1 Q. So the troublemen were from all seven
2 districts?

3 A. Correct.

4 Q. And do you recall or have a general estimate or
5 guestimate as to how many troublemen there were to start?

6 A. I would have to guess around thirty some maybe.
7 I mean, I only had three, but I have a compact area.
8 When you get out to areas like this, you're running a lot
9 of miles to patrol the lines. My area was really compact
10 and had a lot. So I only had three troublemen, but I
11 know some of these areas had more, just feels like it was
12 around 30. I really don't remember for sure.

13 Q. Nope. That's fine.

14 So these monthly and later quarterly meetings,
15 you'd have the seven supervisors and all 30 to whatever
16 troublemen from around the PG&E service area?

17 A. Correct.

18 Q. And what was the purpose of these meetings?

19 A. It was to share -- first of all, share kind of
20 high priority maintenance items that they found, various
21 troublemen found. And if others had questions about how
22 did you find that, what did you do about it, how did we
23 take care of it, we kind of shared that information.
24 Then we started accumulating that into like a binder with
25 pictures. Because as with some of these union jobs, the
26 guys would bid in and they would hate it, and they would

1 go back out and a different guy would come in. So
2 realizing we need to be able to train new people as they
3 came in, so we kind of started to create a little book
4 with pictures about what common problems and priorities
5 of those things. So we kind of started creating a
6 maintenance manual.

7 Q. So at the time that you guys started this, was
8 there a manual for --

9 A. Not --

10 Q. -- inspecting, maintaining transmission towers?

11 A. Not when we started. But we started putting it
12 together almost immediately.

13 Q. And you said that one of the things that you
14 found early on was that a lot of people would come into
15 the troublemen position and then very quickly decide they
16 didn't like it?

17 A. Yeah. It -- when you have to start climbing
18 steel towers -- part of the inspection system is every so
19 often you have to climb the tower and do an upclose,
20 personal inspection of it. People found they really
21 didn't like that, climbing towers, all that much, and
22 they would go back to some of the local areas, and other
23 people would bid into it.

24 Q. What kind of towers were they climbing?

25 A. Well, pretty much everything that's out there
26 with electric lines on it. Now, there's different

1 timelines how often different kinds of towers are
2 climbed, but at some point they're all getting climbed.

3 Q. When you -- when this new department was
4 created, were there established timelines for how often
5 that transmission towers should be climbed and inspected?

6 A. In PG&E, there didn't seem to be a consistent
7 time. We started talking with like Southern Cal Edison,
8 San Diego Gas & Electric, other partners here in the
9 state, and trying to see what their, how often they were
10 doing maintenance on lines. And we were trying to get
11 some consistency even between power companies on how
12 often would we do -- what's the priority of different
13 kinds of lines. So we were kind of working with them as
14 well as working internally to establish our own
15 timelines.

16 Q. So you guys were, basically were establishing
17 the policy as to how and when transmission line
18 inspections should be done?

19 A. Yes.

20 Q. The initial policies?

21 A. Correct.

22 Q. Now, going back to these meetings, these
23 monthly and later quarterly meetings, you said that you
24 as a group started putting together a binder with
25 examples, photographs?

26 A. Yes. Yes.

1 Q. And that was for what purpose?

2 A. That was to train particularly the new people
3 coming in. Initially, we are bringing these pictures to
4 the meeting and sharing with the guys who we already had
5 there, but then it was also starting to create a manual
6 that you could train a new person when they would come on
7 board. I mean, you would put them with one of the
8 established troublemen, but at the same time you wanted
9 to give them a visual look at here's the kind of things
10 you should look at if you're looking at this style of
11 tower. We have some transmissions on wood poles, so they
12 would inspect wood poles. So we had a variety of
13 structures, and each one's a little different on what
14 you're looking for.

15 Q. So basically you were establishing a training
16 program for future troublemen?

17 A. Correct.

18 Q. How long were you a transmission supervisor?

19 A. Well, I -- from a technical standpoint, I was
20 the supervisor for a couple of years and then the
21 decision was made to put on some crews that would just do
22 transmission maintenance. And at that point, all these
23 departments expanded, I was promoted to superintendent,
24 and another person was brought in to be the supervisor of
25 those crews.

26 Q. What does a superintendent do?

1 A. The superintendent was responsible for -- the
2 troublemen still reported to me doing the inspections,
3 and then I was responsible to collect and maintain all
4 those records. I was responsible to get the funding to
5 do all the repair work. Because some things are
6 immediate kind of repairs, but there's a lot of other
7 stuff that you're going to fix in a year, two years, five
8 years, and you had to build a case for that funding to do
9 the repair work on those lines. So I spent a lot of time
10 on budgets, too.

11 Q. The fun stuff; right?

12 A. It's part of the deal.

13 Q. At some point did you move out of the
14 transmission --

15 A. Yeah.

16 Q. -- area?

17 A. Yeah, I -- they reorganized again. They kept
18 the transmission group, but then they redid all the local
19 headquarter groups. And I had an opportunity to get a
20 job closer to home, paid more money, I took it.

21 Q. Still within PG&E, though?

22 A. Still within PG&E, but going back into the
23 divisions. I had started working out of Concord, at that
24 Concord, Walnut Creek, Antioch area.

25 Q. And when did you retire from PG&E?

26 A. January 1st, 2010. Nine years ago.

1 Q. Now, I want to go back to when you started with
2 this Transmission Department and created the troublemen
3 position. Prior to that, you said there was no, that you
4 knew of, inspection program for the transmission lines;
5 correct?

6 A. Correct.

7 Q. And you guys created this inspection program?

8 A. Correct.

9 Q. You assembled photographs, you guys would meet
10 and talk about problems and communicate as to what people
11 were seeing and things to look out for; correct?

12 A. Yes.

13 Q. You started to assemble a training manual for
14 those materials?

15 A. Correct.

16 Q. Did you start to assemble or put together some
17 type of systematic approach to doing the transmission
18 line inspections?

19 A. Well, we, we -- we're setting up timelines of
20 how often to do which lines. And some of that's driven
21 by is it generation, is it coming from the dams, and
22 carrying power into the city? Or is it a small line that
23 goes into, you know, a small town out here in the valley
24 somewhere? It depended on the line, depended on how
25 often, how close of inspection, things like that.

26 Q. I'm talking about the mechanics of the actual

1 single-tower inspection.

2 A. Oh, okay.

3 Q. Did you work to find a systematic approach to
4 actually inspecting a tower and looking for these issues?

5 A. We had a checklist that we -- at the same time
6 we're trying to develop computer programs to track this.
7 When I first started in transmission, we didn't have
8 computers. Been a while. So once we got a computer, we
9 started looking for a way of tracking that maintenance so
10 we could set up in a systematic way in a priority system
11 that would make it where we could do the majority of the
12 maintenance at one time.

13 Just like we were talking about with the tower
14 lines working with a substation, we wanted to, if you had
15 crews come in and do this work, just do the whole line.
16 Don't come in and do one, and three weeks later you have
17 to bring another crew in, do another piece.

18 So it was coming up with a computer system with
19 a checklist for when they climbed the tower to mark off
20 what they found. And then that was given to a clerk to
21 type into the computer system in the office.

22 Q. So when you're talking about checklist to check
23 off as they're in the tower, are you talking about
24 specific components of the tower?

25 A. Yes. You're looking at -- might give you a few
26 examples. When you walk up to the tower, the first thing

1 you're looking for is the bolts at the bottom. Are they
2 rusty? Is the steel in good shape? And you just work
3 your way up the tower. You're looking for bent steel in
4 the tower, which is an indication that maybe you got
5 ground movement. You know, here in California we get a
6 fair amount of slides and stuff. So you're looking for
7 twisting in the tower. And you're looking at insulators,
8 are they in good shape? You're looking at these hooks
9 that you mentioned and the plates, are they in good
10 shape? Is the wire itself in good shape? Just kind of
11 work your way usually up the tower until you saw all of
12 the components.

13 Q. You talked about when the inspectors or
14 troublemen are actually doing the inspection having
15 something to check off that ultimately then would go back
16 to a clerk or somebody else to input into the computer.
17 What is that something that they're checking off from?

18 A. Well, I mean, the list was developed by things
19 we found maintenance-wise. The list was developed by
20 talking to -- we have a group just called Tower
21 Department that all they do is work on towers. Because
22 for a lineman, you're never going to know all about steel
23 and strengths all of that. So you work with these
24 different departments to come up with what to look for
25 specifically when you, when you went out there. So it
26 was really getting input from a lot of different people

1 and then going out and testing it out and see if it
2 actually brought us what we thought we needed.

3 Q. So are you talking about establishing a
4 checklist for inspections?

5 A. Yes.

6 Q. And were those checklists distributed to the
7 troublemen?

8 A. Yes. They would use it. They would write the
9 tower number. Every tower has got a number on it. All
10 of them have a line name that's associated. So you can
11 go find -- if somebody says, I'm on this particular tower
12 on this particular line, you can go find that. You know
13 where it's at. And you're not just, well, here I've got
14 this piece of paper saying it needs some work, where is
15 it? So you put that on there, then you'd mark off what
16 issues you found or if everything was okay.

17 Q. Okay. So were there different types of
18 inspections that were being done?

19 A. Well, it's different for like our 500,000 volt
20 lines than it is for 150,000 volt lines.

21 Q. Okay.

22 A. And then the wood pole lines, they're
23 different, too.

24 Q. Okay. What different types of inspections are
25 generally done on transmission lines?

26 A. Well, we do flying patrols. So on -- and

1 pardon me on the numbers -- but on like the 500,000 volt
2 line, on the early stages we were patrolling that every
3 month. Get in a helicopter, you'd fly down the line and
4 look at that tower for any problems. That's our main
5 tie, northern California and southern California. So
6 that would get a certain interval. If you had something
7 coming out of the geysers, something coming out of the
8 dam up here, that had a different interval. But you
9 would fly it -- every line got at least two flying
10 patrols every year. Some got more, some got less. But
11 they all had at least two patrols on them every year by
12 helicopter.

13 Then you also had what they call "ground
14 patrols" where the guys climb the towers. That, again,
15 was on different timelines, depending on voltages and
16 things like that.

17 Q. Was there a third kind of inspection at that
18 time, a ground patrol that they didn't climb the towers?

19 A. Yes. Well, they, they would just -- and that
20 was usually annual. That was once a year. Every tower
21 somebody would drive out, look at the tower, make sure it
22 wasn't in a slide area, things like that. But they
23 didn't climb the tower, they just drove up to it, checked
24 it. Some case you have to take boats to them. You know,
25 they're out on lakes and stuff. But it's -- you really
26 are getting to every tower every year by foot once and

1 typically by air at least twice.

2 Q. So when you were doing this in the late '80s,
3 when this division was created, every tower was being
4 inspected at least three times year; correct?

5 A. Correct.

6 Q. And depending on the voltage, whether it was a
7 65 kV up or 500,000, determined how often somebody was
8 actually going to get up and climb around in that tower?

9 A. Correct.

10 Q. But every tower was going to be climbed every,
11 at least every so often?

12 A. Correct.

13 Q. Now, these inspection checklists that you came
14 up with for your inspectors, for your troublemen, were
15 the troublemen expected to use those checklists --

16 A. Yeah.

17 Q. -- for whatever type of inspection?

18 A. Yes. They were required to turn one in on
19 every -- when they were driving, they turned one in, or
20 climbing, they turned one in on every tower that they
21 looked at. When they would fly, they would just keep a
22 running log usually as they're flying, looking at these.
23 And then in the end they'd sit down and document the ones
24 they found the problem with.

25 Q. When the troublemen were flying the lines, as
26 you referred to it earlier, the aerial patrols, were the

1 troublemen given a list of components of the towers to be
2 looking at?

3 A. I have to be honest, I don't exactly remember
4 how we did that. I know we talked about it before
5 patrols and, you know, went on them, but I think mostly
6 on our, our flying patrols we were mostly looking for
7 damaged wire, broken insulators, and then any sort of
8 distortion in the tower would probably be the main things
9 we were looking for.

10 Q. All right. If I can approach, I forgot to get
11 an Exhibit out of --

12 All right. We're going to skip and come back.

13

14 (Grand Jury's Exhibit 179 was marked for identification.)

15

16 Q. (By MR. NOEL) You have in front of you a
17 photograph?

18 A. Okay.

19 Q. I'm going to ask you if you recognize that
20 photograph.

21 A. I mean, I recognize what it is.

22 Q. Okay. What is that item?

23 A. Commonly called a J hook, it's what attaches
24 the insulators to the tower.

25 Q. Okay. Have you ever heard that referred to as
26 a C hook?

1 A. Yes.

2 Q. Or a suspension hook?

3 A. Yes. They always develop new names.

4 Q. Now I want to go back to what we were talking
5 about a little bit earlier, and you were talking about
6 all the training and everything initially when you were
7 an apprentice, then a lineman, in taking insulator
8 strings off of energized towers or energized lines;
9 correct?

10 A. Correct.

11 Q. Using this photo, which is marked as People's
12 -- or Exhibit 179, can you explain to us the mechanics of
13 how this hook works?

14 A. Well, you have a steel plate on the side of the
15 tower. It's got a hole in, maybe -- that's bigger than
16 three quarters -- maybe an inch in diameter. Then this
17 hook hooks into that plate and then the insulator -- can
18 I walk up there?

19 Q. Sure absolutely. Let's make this easier.
20 Let's skip up to No. 180, and ask you if you recognize
21 180.

22

23 (Grand Jury's Exhibit 180 was marked for identification.)

24

25 A. Okay. So this is the tower piece. And this
26 would be the plate that's on the end of the tower.

1 Normally this hole when it's new looks like this.

2 Q. Okay. Remember, we have to, we have to
3 describe for the court reporter --

4 A. Okay.

5 Q. -- so she can take it down. So you're pointing
6 at a hole in this piece of metal that at this point looks
7 like a key hole?

8 A. Correct.

9 Q. You were using your finger to trace around
10 basically a circle?

11 A. Right. Normally when plate's brand new, this
12 hole is, there's a hole drilled in the plate, and then
13 that is big enough to accept the hook that you have the
14 picture of.

15 Q. And this is the hook right here?

16 A. Right. So this hook, the finger of this hook
17 goes in that plate. And then this is kind of an oval
18 piece of steel. And the insulator is designed to come in
19 and just slip over the top of that and sit on that hook.
20 So when you --

21

22 (Grand Jury's Exhibit 181 was marked for identification.)

23

24 Q. Let me skip forward to 181. Do you see that
25 photograph?

26 A. So up on the top, the C hook, J hook, whatever,

1 is the piece in the steel, and then the base of it is
2 widened out. And these insulators have a groove in them.
3 And the groove just slips in over the top of that and it
4 sits down; kind of a little bevel inside of it, so it
5 sits down on it.

6 Then the cotter key is up here; when you push
7 that back in, and now it can't come apart. This can't
8 come out of the tower. And the hook cannot come out of
9 the insulator. And every insulator is interconnected
10 with this cotter key and that round ball. That's how
11 these are connected all the way down. That's what keeps
12 them together. You have earthquakes, you have strong
13 winds; these stay together no matter what those are like.

14 Q. Can you explain to us briefly the process of
15 installing one of these hooks and insulator strings and
16 the --

17 A. When they're new or when we're doing them
18 energized?

19 Q. Brand new. Let's assume we're putting up a
20 grand new string.

21 A. So if you're putting up a brand new string, you
22 have a lineman goes up the tower, gets out here, we hang
23 a ladder off of this steel. He stands on the ladder.
24 And you have a rope down to a truck, and it pulls his
25 weight up.

26 He's got this thing called the J hook or C

1 hook, a lot of times they have them in their pouch. They
2 usually have a belt with a pouch on; a lot of -- several
3 of them in there.

4 They bring these insulators up, he clips it
5 together, and they release the weight, it drops in here.

6 Then you bring in the wire in, and you're
7 clipping it together. Again, a cotter key holds the
8 whole thing together. They're all beveled, all have the
9 cotter key that makes that connection that holds them
10 into place.

11 Q. So the first thing you would do would be to put
12 this suspension hook, J hook, C hook, into the hole?

13 A. Into the hold and bring the insulators up to
14 it.

15 Q. Then once you lock that in place and cotter pin
16 it in place, now it's locked in the hole?

17 A. It's one unit, yes.

18 Q. How would you remove an insulator string like
19 this?

20 A. Well, when I was talking about doing it with
21 hot sticks, what you do, you turn it to where you can get
22 to this cotter key, take a thing and you push it back.
23 These cotter keys can't fall out. They have a little
24 bend on the end of them. They're spring-loaded. You
25 push it back, you pick up that weight, drop it off, bring
26 the new one up.

1 If you're up here and it's de-energized, you
2 just end up taking a screwdriver and punching that cotter
3 key out. You hold this hook, pick it up, lift it off,
4 drop it down, bring the new one up, clip it back in.

5 Q. So when you replaced insulator strings, did you
6 also replace the hook?

7 A. Most cases, but sometimes -- you may have only,
8 you may have put those insulators up last year, somebody
9 shot a bunch of them out. And so purely out of this
10 you're replacing it, they're probably not going to change
11 the hook at that point. But if you see any wear on it,
12 we always changed the hook.

13 Q. Who makes the decision as to whether or not to
14 change of out hook?

15 A. It would be the lineman who is there up on the
16 tower.

17 Q. So when you were training troublemen when you
18 started the Transmission Department, did you train them
19 to inspect the connection between the insulators and the
20 arms?

21 A. Yes. That's a key component of it.

22 Q. When you were doing the checklists for
23 inspection, were the hooks and holes included in the
24 things to be inspected?

25 A. Yes.

26 Q. All right. Now I want to back up again to

1 number 179.

2 Sometime in 1987, did you have your troublemen
3 embark on an inspection of hooks and holes on the
4 transmission lines in your district?

5 A. Yes.

6 Q. Why did you do so?

7 A. Well, it was -- you know, after talking to
8 people that knew about transmission more than myself,
9 that that's the place that it's going to wear, that
10 you're going to -- over the years it's going to start to
11 wear down. So it's a place that you have to keep, you
12 know, looking at when you go there.

13 If they have areas that have a lot of wind, you
14 get a lot of vibration, you're going to get wear. If you
15 have them, we noticed over time, when the tower is
16 sitting like right on the edge of a hill, you got a lot
17 of updraft. Like you've probably all seen eagles and
18 these birds just kind of floating. Well, that wind
19 really buffets towers, and it causes a lot of vibration.
20 And it will cause wear on these hooks and on the plates
21 they're in.

22 Q. So in 1987 you sent your troublemen out to find
23 worn hooks?

24 A. Yes. To look for them.

25 Q. And worn hanger plates?

26 A. Yes.

1 Q. And you're looking at 179, Exhibit No. 179
2 there in front of you; correct?

3 A. Correct.

4 Q. Is this a photograph of 1987 of one of the
5 hooks that you found?

6 A. I don't know that for sure.

7 Q. Okay. Do you remember what you did with the
8 hooks that you found?

9 A. I had them -- we have a lab. I'm not sure it's
10 even there functional anymore, but we had a laboratory
11 out in the San Ramone area where we did a lot of high
12 voltage testing, but they also had metallurgists and
13 chemists there, and they had the ability to test these to
14 see what it would take to break them.

15 So for me, if I see one like this, I don't know
16 how much that strength is there. Is that half the
17 original? A third? Three quarters? So I sent them in
18 to be tested to see what it would take to break them to
19 give us really an idea on is this a high priority? Is
20 this something we can do within a year? Five years?
21 What does that look like? So it was just trying to get a
22 better understanding of the steel that was there and how
23 long it would last.

24 Q. Did you also submit to the lab for testing the
25 hanger plates to which the hooks were attached?

26 A. I believe so. I'm not 100 percent sure, but I

1 believe so.

2 Q. And now you have up in front of you Exhibit
3 180. Do you remember if this is a photograph of one of
4 the hanger plates that you submitted to the lab in 1987?

5 A. I don't remember.

6 Q. Okay.

7 A. But it very well could have been. I know I
8 submitted stuff to them, I don't know whether this is one
9 or something very similar.

10 Q. So you know that, that in 1987 your crews and
11 you found hooks, J hooks, C hooks, suspension hooks,
12 whatever, with wear patterns in them that you submitted
13 to the lab?

14 A. Correct.

15 Q. And you know that you found hanger plates with
16 wear patterns that you submitted to the lab?

17 A. Correct.

18 Q. And those wear patterns on the hanger plates
19 were consistent with the, for lack of a better term, of
20 keyholing of this hole?

21 A. Correct.

22 Q. And this is the term -- this is the photograph,
23 180, that you were referring to earlier that you said
24 this hole should be a circle?

25 A. Correct.

26 Q. And going back to 179, what is it that you're

1 describing as the wear pattern on that hook?

2 A. Well, it's where this hook was in that hanger.
3 So you're trying to -- I was trying to find out so which
4 one is going to fail first, and how long do you have?
5 How much strength is that, what will -- where we get?

6 Q. So when you talk about the wear pattern where
7 the hook is in contact, are you talking about this
8 channel right here?

9 A. Correct.

10 Q. So this channel is where the hook is in contact
11 with the hole?

12 A. The plate, yes.

13 Q. So going back to this, this photograph number
14 181, we're talking about the area right here, the contact
15 point between the hanger arm and the, and the hook?

16 A. Correct.

17 Q. And you're finding that the, both the hooks
18 were wearing and essentially that the hanger arm was
19 cutting a channel into the hooks?

20 A. Well, they were cutting a channel into each
21 other, because both of them were wearing down, appeared
22 close to the same rate. Looked like maybe the channel
23 was wearing a little faster.

24 Q. And so you sent these items into the PG&E lab
25 for testing and evaluation?

26 A. Correct.

1 Q. Do you recall ever receiving a report from the
2 PG&E lab?

3 A. I, I don't recall receiving it, but I saw a
4 copy of it. I have to believe that I got it, and it --
5 you know, I just -- it's 32 years ago.

6 Q. Exactly.

7 A. I really don't --

8 Q. Exactly.

9 A. -- I don't remember.

10 Q. You don't have a recollection of receiving the
11 report?

12 A. No, I don't.

13 Q. But I showed you a copy of the report
14 yesterday; correct?

15 A. Yes. And I saw my name on it. I have no
16 reason to believe it isn't a true report, but I do not
17 remember.

18 Q. Do you remember what you did in response to
19 that report?

20 A. Well, I know that we would have gone out and
21 changed all of them on that tower to begin with.

22 Q. All of them being the hooks and plates?

23 A. All of the hooks and the plates. That would
24 just be a normal repair for that tower. But then we also
25 used that as a teaching tool for other people who are
26 patrolmen as to, "Here's what we found in our area, this

1 is something you need to be looking for when you do your
2 patrols." They did similar things, brought them to our
3 meetings with insulators or other anchors --

4 Q. Right.

5 A. -- whatever.

6 Q. We talked at length earlier about these
7 monthly, initially monthly then later quarterly meetings
8 of all the seven supervisors and all of the troublemen
9 from across the PG&E service area, and that you would
10 present photographs?

11 A. Yes.

12 Q. Do you recall if you presented a photograph
13 similar to this, 179?

14 A. I do not recall, but I really believe I would
15 have, definitely would have done that --

16 Q. And the same --

17 A. -- seeing that I had that report with my name
18 on it. You know, I'm 99 percent sure, but do I exactly
19 remember that? No, I do not.

20 Q. And same question as to 180. Do you think --

21 A. Yes.

22 Q. -- you would have shared this?

23 A. Absolutely.

24 Q. Okay. And basically for what purpose were you
25 sharing it?

26 A. Well, we want to make sure that all the

1 troublemen in the system knew this is a problem. Because
2 I didn't know this was a problem before I took over this
3 job and started doing this, and so I kind of feel other
4 people were in the same position as me. And so it was
5 like share any issues that you had so we can all learn
6 from them.

7 Q. So this is in 1987 when the transmission
8 troublemen program is in its infancy; correct?

9 A. Correct.

10 Q. This is during the time where you're creating
11 the training manual?

12 A. Correct.

13 Q. You're creating the inspection manuals?

14 A. Yes.

15 Q. You're creating the inspection checklists?

16 A. Correct.

17 Q. Was the wear on suspension hooks as shown in
18 Exhibit 179 and the wear on the hanger holes shown in
19 180, were those identified and added to the list of
20 things that the inspectors should be looking at during
21 their inspections?

22 A. Yes.

23 Q. And that was made specific; correct?

24 A. Yes.

25 Q. When you talked about this checklist that you
26 had that you gave out to the inspectors that they were to

1 run through in every tower --

2 A. Yes.

3 Q. -- did that include looking at the, at the
4 hooks and holes?

5 A. I'm sure it would.

6 MR. NOEL: Madam Foreperson, it's about 9
7 minutes to 10:00. This would probably be a good natural
8 place to take a break. We've been going for an hour and
9 20 minutes.

10 GRAND JURY FOREPERSON: Okay. Can we take a
11 break then, please?

12 MR. NOEL: Absolutely.

13 GRAND JURY FOREPERSON: Everybody ready?

14 (Break taken.)

15 GRAND JURY FOREPERSON: All members of the
16 Grand Jury are present. We can proceed.

17 Q. (By MR. NOEL) All right. (WITNESS #17), we
18 were talking earlier, when you started the Transmission
19 Department troublemen program, there was no manual that
20 you knew of for inspecting and maintaining transmission
21 towers; correct?

22 A. Correct.

23 Q. To your knowledge, has there subsequently been
24 a manual created?

25 A. I know there was one created. I don't know in
26 what format or, you know, how it is now. It's been a lot

1 of years since I was in there.

2

3 (Grand Jury's Exhibit 151 was marked for identification.)

4

5 Q. Okay. You have in front of you that big binder
6 in front of you?

7 A. Okay.

8 Q. What's marked as Exhibit No. 151. Without
9 losing our page, you can flip to the front page, you see
10 the exhibit tag.

11 A. Yes.

12 Q. Okay. That's Exhibit 151.

13 A. Okay.

14 Q. That's what's being displayed up here on the
15 big board?

16 A. All right.

17 Q. Are you familiar with this document?

18 A. No.

19 Q. Okay. This document was not around when you
20 were in the Transmission Department?

21 A. That's correct.

22 Q. And for, just for the purposes of this, this
23 document is labeled the *Electric Transmission Preventive*
24 *Maintenance Manual*. And Exhibit 151 was published in
25 April 2009; is that correct?

26 A. Yes.

1 Q. All right. But you talked about doing
2 checklists and creating basically the codes for the
3 computer system in its infancy?

4 A. Right.

5 Q. And up on the board here I have Page 2.3, Table
6 2.1.2, Component Types and Descriptions. Do you see
7 that?

8 A. Yes.

9 Q. Do you recognize the table?

10 A. No.

11 Q. When you talked about establishing codes and
12 starting to set up the computer system for the
13 transmission inspection program, describe for us what you
14 did.

15 A. Well, I mean, we first started off with a blank
16 sheet of paper, right, and started looking -- sat down
17 with the tower department on what are things we should be
18 looking for on towers? Sat down with the electric
19 maintenance people, what kind of things -- so you started
20 developing categories that you wanted to focus on.

21 And in this checklist that they have here --
22 ours looked, you know, half this size and not anywhere
23 near as complex. But, again, we didn't have computer
24 systems, so we didn't -- we didn't have computer systems,
25 so we really couldn't capture all this stuff. In today's
26 world, this works great.

1 I had worked with a person to use the, what is
2 called "PC file." It was a very early computer database
3 that you could sort and do this stuff with. And I had
4 them just take a piece of -- well, we developed, you
5 know, tower, key things to look for on towers,
6 insulators, key things to look for, and then we gave
7 those codes, they would take those out in the field and
8 start using those. And then the troublemen would
9 suggest, hey, I need something for, you know, maybe we
10 got a jumper wire here. To them that means something.
11 Probably doesn't mean to most of you. They kind of gave
12 us input into here's key things that we think you should
13 be looking for.

14 So we really started developing these
15 checklists, and it became more comprehensive all the
16 time. But when we started, we had nothing. In the first
17 year, you know, is one page. Five years later it's 20
18 pages.

19 Q. Okay. For the record, you're looking at
20 Exhibit 151, the 2009 *Electric Transmission Maintenance*
21 *Prevention Manual*.

22 Looking at, looks like ETPM 002, there doesn't
23 seem to be a page number, but Bates stamp number PG&E
24 Camp, BC, 0000030701; is that correct?

25 A. Yes.

26 Q. Okay. So you're looking at a checklist from

1 the 2009 manual?

2 A. Yes.

3 Q. And I also showed you this list up here of
4 different components. Now, I understand you haven't used
5 the manual, but does the list of components look familiar
6 to you?

7 A. Yes. Those are areas that we started focusing
8 in on when we developed, started developing the manual.

9 Q. Exactly. So you started identifying the
10 different components to the transmission towers and
11 assigning codes to them; correct?

12 A. Correct.

13 Q. And at that time, at the same time as you were
14 building this transmission, this troubleshooters system and
15 the inspection system and the training system, you were
16 also starting to establish a computer system?

17 A. Correct.

18 Q. And so you needed codes for the computers?

19 A. Correct.

20 Q. So you began coming up with these codes?

21 A. Correct.

22 Q. Do you know where among these codes the hooks
23 and holes that we've been discussing this morning would
24 be?

25 A. No. I mean I can look at it and guess, but I'd
26 be guessing.

1 Q. Where would you guess?

2 A. Can I come over there?

3 Q. Absolutely.

4 A. Let's see, so you've got hard wire DE. That
5 means hardware dead end. So when the wire comes in and
6 stops, you have these hooks, and the wire comes in, it's
7 called dead end.

8 And they have hardware suspension. So the
9 pictures that you have with the insulators hanging down,
10 those are suspension insulators. So it's just dictating
11 what exactly configuration does that tower have in its
12 design.

13 Q. So it would be your guess, based upon all of
14 your experience and starting this, that either IHO-1 or
15 IHO-2 would apply to the hooks and holes?

16 A. Correct.

17 Q. So going forward to the hook in 179, if someone
18 were to spot that in a tower and were reporting that,
19 that would be an IHO-9?

20 A. Yes.

21 Q. Great.

22 Go back to a couple more from the 2009, Exhibit
23 151, *Electric Transmission Prevention Manual*.

24 A. Okay.

25 Q. Tables 2.1.3 and 2.1.4, do you recognize the
26 content, not necessarily the --

1 A. Yes.

2 Q. -- table itself?

3 A. Yes.

4 Q. Tell us what you recognize.

5 A. Well, this will -- like on that particular

6 hook, right, it's rusty, so that would apply. It's worn,

7 so that's going to apply. You're going to put all this

8 stuff that shows up as part of the problem. You know, so

9 you would have the code which says it's a suspension

10 insulator problem, and then you would have -- this is the

11 more detailed piece of what is it, so what about it? Is

12 it rotted? Is it worn? Is it broken? What's the

13 status?

14 Q. Okay. And what --

15 A. Kind of a subcode of the first one.

16 Q. What would you consider the hook in Exhibit

17 179?

18 A. Can we go back?

19 So it's corroded and it's worn.

20 Q. Okay. So if you were the troubleman out there

21 doing an inspection on this line and you spotted that

22 hook, you would record that as an IHO-2 and its condition

23 as being CHO-8 and CHO-3?

24 A. Correct.

25 Q. Cool.

26 A. And I don't know, on that same one down at the

1 bottom, it gives you the required action?

2 Q. Right.

3 A. So this is kind of given to you where they need
4 to go from there.

5 Q. Thank you.

6 Now we're back to the photograph in front of
7 you marked as People's 181. We've already kind of talked
8 about this a little bit in general, but do you recognize
9 what type of tower this is?

10 A. It's called a transposition tower.

11 Q. Are you familiar with those types of towers?

12 A. Yes.

13 Q. Did you work on those types of towers?

14 A. Yes. Not specifically this designed one, but
15 on transpositions towers. There's a multitude of designs
16 out there.

17 Q. Did you ever work on the Caribou-Palermo line?

18 A. No, I did not.

19 Q. Are you familiar with it?

20 A. Just I saw it in the thing. I haven't done
21 anything with the line. I haven't worked on it or
22 patrolled it or anything.

23 Q. Do you have any knowledge as to the history of
24 the line?

25 A. Well, I know it, it comes out at one of our
26 very first power plants that they had up here and carried

1 power into the Bay Area.

2 Q. Do you know where it originally went?

3 A. No.

4

5 (Grand Jury's Exhibit 182 was marked for identification.)

6

7 Q. So now we're on to 182, photograph in front of
8 you. I want to go back and talk about the hooks and the
9 holes again.

10 A. Okay.

11 Q. When you were getting your training as a
12 lineman, were you given any training as to the relative
13 size of the hooks in the holes?

14 A. No. I mean, the only thing you knew is the
15 hook barely fit in the hole and, you know, you attached
16 the insulators. I mean, that's really the only training
17 to it.

18 Q. And you knew that from replacing them; correct?

19 A. Correct.

20 Q. We talked about that earlier, that you have to
21 put the hook in first and then you attach the hook to the
22 insulator string?

23 A. Correct.

24 Q. So the hooks fit pretty tightly into those,
25 into those holes; correct?

26 A. Yes.

1 Q. Looking at Exhibit 181, what do you see with
2 those hooks and holes?

3 A. They look to be in good shape.

4 Q. And what makes you say they appear to be in
5 good shape?

6 A. Well, because the hook almost totally fills the
7 hole on --

8 Q. You're talking about right here?

9 A. Right there, yes.

10 Q. There's just a slight crescent of light above
11 the top of the hook?

12 A. Correct.

13 Q. Between that and the top of the hole?

14 A. Yes.

15 Q. So those appear to be --

16 A. Good shape.

17 Q. -- good shape hooks you wouldn't worry about?

18 A. They have rust on them, but that's not that's
19 just surface rust, so they should be fine.

20

21 (Grand Jury's Exhibit 183 was marked for identification.)

22

23 Q. Okay. Moving on to 183, do you see the
24 photograph marked as 183?

25 A. Yes.

26 Q. Do you see a problem with this hook and hole?

1 A. Yeah. This one's well worn. You can see a lot
2 of light between the top of the hook and the top of the
3 hole. So either hook's worn a lot, the tower's worn a
4 lot, or a little bit of both. As we've saw in a couple
5 other pictures, they seem to wear together.

6 Q. So back in 1987, 1988 when you were one of the
7 people foremean that what's now the troublemen and doing
8 the inspection program, what would you have done if you
9 saw this hook and hole while doing an inspection on a
10 transmission tower?

11 A. Well, I'm sure what I wanted them to do is get
12 a hold of me, the supervisor, and we'd get a crew out and
13 replace -- well, first we'd get the tower department out,
14 because we never like trained our linemen on how to fix
15 towers. If the tower itself had work on it, we had a
16 whole department. So we would have the tower department
17 go and take a look, because they needed to find the metal
18 to replace the plate on the end of the tower. And then
19 we'd schedule this for repair as soon as possible.

20 Q. Why as soon as possible?

21 A. Well, it appears that like maybe half of that
22 is gone, if I had to guess from the picture.

23 Q. Half of the hook or half of the hole?

24 A. Both.

25 Q. Both?

26 A. They both look like they're worn.

1 Q. So if you saw this out on an inspection, this
2 would immediately be tagged for work?

3 A. I'd want to get it done soon.

4

5 (Grand Jury's Exhibit 184 was marked for identification.)

6

7 Q. Moving on to 184, do you see any problems with
8 this hook and hole?

9 A. Same, same basic problem it appears.

10 Q. And explain that for us, please.

11 A. Well, the -- again, you can see a lot of light
12 through that hole, which means there's a lot of wearing
13 going on. Because when originally put the hook in, those
14 -- that's a fairly tight fit. But in this case, you've
15 got a lot of space in there. It's almost surely that the
16 tower's worn and the hook is worn.

17 Q. So back when you were training the new
18 troublemen both at the start of the program, then when
19 you were setting up to train the future troublemen, what
20 would you have told them if they saw this hook and hole?

21 A. That it was getting close to needing repair,
22 that we needed to get somebody scheduled and do it.

23

24 (Grand Jury's Exhibit 185 was marked for identification.)

25

26 Q. Next up, 185. Do you see a problem with the

1 hook and the hole reflected in Exhibit 185?

2 A. Yes. It's -- again, it's very much the same
3 type of problem, except when you look at this one, they
4 already have done a repair on the tower, putting this
5 hanger that's there. Someone's already --

6 Q. This bracket right here?

7 A. Yes. Someone has already fixed it, because if
8 you look at the end of the tower, the original arm, that
9 hole is very worn. So this apparently was the type of
10 repair the tower department felt was a good way to repair
11 it. Then I'm sure somebody replaced all the insulators.
12 Well, at least the hook on these.

13 Q. Well, when you look at -- now on this
14 photograph we've got this bracket that we haven't seen in
15 any of the previous photographs that's attached?

16 A. Correct. And I've never actually seen one
17 myself.

18 Q. Right. It looks like that, the hook and the
19 hole in the bracket are pretty well worn, too?

20 A. Yeah. Looks like this tower has got a
21 tremendous amount of vibration associated with it.

22 Q. And you said that, in the background, that hole
23 in the original tower arm, that hanger hole is also
24 pretty well worn; correct?

25 A. Yes. That looks to be almost identical, same
26 condition as when they replaced the last one.

1 Q. I want to go back to something you said
2 earlier. And when you were looking in, back in the '80s
3 these hooks and holes and the issues, and you talked
4 about positioning of towers on hills?

5 A. Yes.

6 Q. Can you go back and kind of expand on that and
7 explain it to the jury, please?

8 A. Well, we, we found is any of the, where a tower
9 sits either like right on the hilltop or just off the
10 edge of it, they get a tremendous amount of vibration.
11 The wind, as it comes up, rises. You get lift on the
12 wire, and you get the vibration in it. And so it would
13 make these more susceptible to wearing.

14 We get a similar kind of issue like up towards
15 Rio Vista where it is just windy as hell up here. You
16 get a lot of, where you get a lot of vibration, you get
17 wear, and these type of issues start to show up.

18 Q. So wind is a major factor?

19 A. Yes.

20 Q. And the topographical positioning of a tower on
21 the hills is another factor?

22 A. Definitely is.

23 Q. How about the positioning of the tower
24 regarding the prevailing winds, is that a factor?

25 A. I can't say if I know that to be a factor.

26 Q. Okay. It's not cross winds as opposed to

1 facial winds or back winds?

2 A. Well, I mean, what we see is when the wind is
3 blowing across the wire, that's when you get the most
4 vibration. So if it's up and across versus in line with
5 it. So I guess that's what you were asking.

6 Q. Okay.

7 A. You get the most vibration when it's going
8 across it and it's not steady. You get the --

9 Q. So this tower we're looking at in 185, that
10 would mean the wind would basically be, if it were coming
11 from, basically following the same path as that
12 conductor, that would be coming across the line, the
13 jumper line?

14 A. Correct.

15 Q. So that, in your experience, wouldn't be a good
16 thing for this tower?

17 A. Correct. It will show the wear faster.

18 Q. All right. Let's move on.

19 A. This particular tower, though, is this tower on
20 a hill? Or is this -- this looks like it's down in the
21 valley.

22 Q. I can't answer that for you right now. We'll
23 provide that --

24 A. Okay.

25 Q. -- later.

26 Now on to 186. Do you see any issues with the

1 hook and hole in this photograph?

2 A. Well, it's started to wear, but it's not really
3 very bad at this point. You see a little bit more light
4 than when you first put it up. But this one I would say
5 has a lot of life left in it.

6 Q. Okay. And, again, this one we're talking
7 about, this, this is -- this arm has had the bracket
8 bolted to it with the --

9 A. Correct.

10 Q. -- hanger hole?

11 A. Correct.

12 Q. And the hook is in the bracket hanger hole?

13 A. Yes.

14 Q. When you say a little bit of light, you're
15 talking about this crescent right above the top of the
16 hook where you can see through?

17 A. Correct.

18 Q. And you would, you wouldn't consider this to be
19 a concern?

20 A. Not yet, no.

21 Q. Okay. How about the original hole in the
22 background?

23 A. Well, you can see that one had problems and,
24 you know, someone, probably a patrolman, picked it up,
25 noticed the problem, and they came out and did the
26 repairs on it.

1 Q. Moving on to 187. And this is a photograph
2 showing both of the jumper arms coming out and both the,
3 both the -- sorry -- insulator strings?

4 A. Yes.

5 Q. You can see the hooks, sort of see the hooks
6 and the holes on both of these. Do you see an issue?

7 A. Well, you're seeing a fair amount of light. I
8 mean, it's a little hard to tell from this photograph for
9 me, but it might be something if I'm in a helicopter
10 patrol, I'm going to see if he can get in closer to get
11 this picture, or maybe come back. Mark this one on my
12 own note -- if I'm the patrolman, I'd make notes on this
13 and come back and climb the tower and check it.

14 Q. Okay. So you actually do patrols on these
15 types of lines from the helicopter?

16 A. Correct.

17 Q. And one of the things you're going to be
18 looking for is those connections from the helicopter;
19 correct?

20 A. Correct.

21 Q. And this would be the type of vision you would
22 see from the helicopter?

23 A. Well, in general, yes. I don't know how many
24 of you have flown in helicopters, but when you get -- one
25 of the problems with helicopter patrols is the wind. You
26 try to schedule these when the wind is down, if at all

1 possible. But it's not always possible. Some areas the
2 wind is blowing pretty much every day. So some of these
3 pilots, they're not going to get that close, you know,
4 because they don't want a gust of wind taking them into
5 the tower. And if I'm riding along, I don't want him
6 going there either.

7 So sometimes these -- this one's at a fair
8 distance, and you can see this light, but if you're not
9 comfortable getting closer, pilot's not comfortable
10 getting closer, this is something that you would write
11 down come back, drive up to check it. A lot of times you
12 can see them from the ground with binoculars. Or if you
13 have any concern, you climb the tower itself and get up
14 close, because you can get right up next to these safely
15 while you're climbing the tower.

16 Q. So you're saying, in your experience, that --
17 let's assume that this photograph, number 187, was taken
18 from a helicopter, but this would be further away than
19 you would generally expect a troubleman to be in a
20 helicopter inspection?

21 A. Yeah, they get up pretty close.

22 Q. But yet you can see daylight in those hooks and
23 holes?

24 A. Correct. You have a good background here with
25 that brown background to be able to see the light through
26 it.

1 Q. So if you saw this when you were doing --

2 A. Patrols.

3 Q. -- inspections and patrols, this would
4 definitely be marked for further investigation?

5 A. Correct.

6

7 (Grand Jury's Exhibit 188 was marked for identification.)

8

9 Q. Now let's get a little closer up. 188.

10 A. Okay.

11 Q. Do you see a problem with the hooks and holes
12 in this photograph?

13 A. Right. This one's, this one I can see for sure
14 that is an issue. It's something that we're going to
15 look to replace.

16 Q. Why is it an issue?

17 A. Again, you're seeing a lot of light between the
18 top of that hook and the top of that hole. So you know
19 it's worn down quite a distance to be able to see that
20 much light through the hole.

21

22 (Grand Jury's Exhibit 189 was marked for identification.)

23

24 Q. And next, 189.

25 A. Yeah, same. Same kind of issue.

26

1 (Grand Jury's Exhibit 190 was marked for identification.)
2
3 Q. Now I want you to look at 190 and tell me what
4 you see there.
5 A. That's a numbering system for the tower. Is
6 that what we're talking about?
7 Q. Yep. What does that mean?
8 A. It's tower 35 over 281. So it's 35 miles from
9 wherever they started this, which was probably the power
10 plant, and it's the 281st tower in that line. So that
11 always becomes a point for, like me as a supervisor or
12 someone else, to go find this. I mean, they're all
13 marked on maps. But I know just right from the get-go,
14 if I'm familiar with this area, familiar with where the
15 power plant is, okay, this thing is 35 miles away from
16 the power plant. I got a good general area to go to
17 right off. Then I can look and be specific where that
18 tower number is.
19 Q. How does that number play into your
20 inspections?
21 A. Well, it's part of the computer. It's how you
22 document what, what's checked on this tower to this
23 number and then it's put in the computer and you can
24 track it. All the maintenance that gets done on this
25 tower, if you pulled up -- I'm hoping, because I haven't
26 been running it, that system, but I know a lot about how

1 computers work -- so you should be able to go into that
2 system, pull up this line name, 35 over 281, and it
3 should tell you every patrol, what they found, and what's
4 going on with it since they started this and had a
5 computer program. Before this we had paper, so I'm sure
6 there's plenty of paper.

7 Q. Do you know what the bottom number is,
8 40591574?

9 A. I'm thinking this is the new numbering system
10 they've put in place.

11 Q. Okay. But you don't know that?

12 A. I do not know what that is.

13 Q. Okay. So if you're flying along in air patrol
14 and you see this hook and hole, you're going to mark that
15 tower using that numbering system, 35281?

16 A. Yes.

17

18 (Grand Jury's Exhibit 191 was marked for identification.)

19

20 Q. Now moving on to 191. Do you see that
21 photograph?

22 A. This one needs some work very soon.

23 Q. Describe it. How?

24 A. That's -- well, the wear. You can see there's
25 a lot of light through this one. And you can see it
26 almost looks at the bottom like this steel is starting to

1 distort on the tower, which means it's not far from
2 failure, in my estimation what I'm looking at.

3 Q. So back when you were in charge of the
4 fledgling troublemen program and you were establishing
5 these, what are you telling your people to do when they
6 see this?

7 A. I want this this afternoon or tomorrow.

8 Q. You want this thing changed this afternoon or
9 tomorrow; correct?

10 A. That's what it feels like to me. This one is
11 bad.

12 Q. This is an urgent problem?

13 A. Yes.

14

15 (Grand Jury's Exhibit 192 was marked for identification.)

16

17 Q. And now on to 192.

18 A. I should say I'm looking at a picture; right?
19 If I'm there on the tower, I might be seeing things
20 slightly different. But this picture is telling me we
21 need some help now.

22 Q. All right. Photograph marked as 192?

23 A. Yes.

24 Q. And what do you see there?

25 A. Is that the same one, just -- or maybe another
26 arm on the same tower? I don't know. Looks like the

1 same issue, looks like the same time, so -- it's a little
2 different design. It's got to be a different one.
3 Anyway, it's another one with a serious problem. But
4 that -- I don't see like the distortion on this one like
5 it looks like on the other one, but I mean they're both
6 -- need repair soon.

7
8 (Grand Jury's Exhibit 193 was marked for identification.)
9

10 Q. All right. Moving on to 193, photograph marked
11 193.

12 A. Okay.

13 Q. Do you see an issue with that hook and hole?

14 A. It is, but it's -- again, there's some steel
15 left there. So it's something you want to get, you know,
16 in your schedule down the road. But this wouldn't be an
17 emergency kind of situation for me.

18 Q. Unlike the last one where you want that
19 replaced tomorrow --

20 A. Yes.

21 Q. -- this one would be get it done soon?

22 A. Probably put in a one year, six months, or some
23 -- I'm guessing a little bit, because I haven't been in
24 the system, but usually have like, okay, we need this in
25 a year, we need this in five years, we need this in a
26 month. You kind of get a priority system going there.

1 I'm guessing they have, but I don't know that.

2 Q. When you were establishing, when you were one
3 of the people that were establishing the troublemen
4 program, the inspection program, did you set up a system,
5 priority system for necessary repairs?

6 A. Yes.

7 Q. And can you describe that for us?

8 A. Well, we started out with immediate, one week,
9 one month, one year kind of priority system. And
10 whenever you start a priority system, you are making a
11 lot of adjustments the first year or so. You know, stuff
12 that looked really urgent, after you see about five
13 hundred of them look just like it, maybe it's not quite
14 as urgent. And, I mean, it -- really, working with the
15 troublemen, I remember a lot of back and forth of this
16 looks really bad. It's like you look at this one, and
17 this one looks like it needs to be done tomorrow until
18 you see this one. And then, well, this is really a month
19 kind of thing. I mean, it changes your perspective after
20 you do it for a while.

21 Q. Do you recall what the definition was that you
22 gave the immediate?

23 A. Well, we felt like if this was something that
24 was -- like if you had like this one, 191 -- if I had
25 that one and it's an area that's getting wind and -- or
26 it got severe weather or something coming in, you want to

1 do this today, because you got 50 mile-an-hour winds
2 projected for tonight. You don't want this thing sitting
3 out there. If your projected weather is calm for the
4 next day, tomorrow is probably the day we're going to do
5 this.

6 I mean, you have to deal with the power, you
7 know, the scheduling people and shutting power plants
8 down or power lines down. So you're trying to not just
9 go out every time you see a problem, shut the town down
10 while you go fix the one problem. So you're trying to
11 work with other systems besides your own. But that was
12 the whole reason to put the transmission part of it
13 together, is that you start to know all these people in
14 the substations, in the operating side, and you could
15 say, "Hey, we really need to get this line out," and you
16 could get it out. Whereas before, "Who are you and why
17 are you calling me?" You know, "Why should I have any
18 confidence in what you're doing?" So it's part of why we
19 set the whole thing up and how we came to the priority
20 system.

21 Q. Well, let me ask you a hypothetical based upon
22 your experience and based upon the system that you helped
23 to set up. Now let's assume that this hook and hole in
24 People's -- or in 191 is on a tower on a ridge line.

25 A. Okay.

26 Q. And that this tower is facing into the

1 prevailing wind. And that there are winds that are so
2 prevalent that they actually have a name. Let's assume
3 that name, for the hypothetical, just is they're called
4 the "Jarbo Winds"?

5 A. Okay.

6 Q. And let's assume that this hilltop where this
7 tower is sitting hasn't had any rain for over six months
8 and is bone dry conditions down underneath. And let's
9 assume that the weather forecast is for sustained winds
10 in the 30s with gusts over 50, coming directly into this
11 tower, right into the face of this tower, across these
12 hooks. Would you consider that to be an immediate threat
13 that needs to be fixed right now?

14 A. Given those conditions, yes.

15 Q. So you, as somebody who helped set up this
16 system, you think this is dangerous?

17 A. That specific one?

18 Q. Yes.

19 A. Is that the --

20 Q. That's 191 that we were talking about earlier.

21 A. Yeah, that's something I would want to get
22 fixed today.

23 Q. Let's go back to 185. And let's assume the
24 same hypothetical on 185. Let's assume that this is a
25 tower, a transposition tower, that's on a ridge line,
26 that we have bone dry conditions, and that we have

1 predictions or forecasts, weather forecasts, of sustained
2 winds 30 miles an hour, above possible, with gusts in the
3 50s. Would you consider this hook and hole to be an
4 immediate threat that needs to be repaired?

5 A. No, I would not.

6 Q. This one you don't?

7 A. No.

8 Q. How come?

9 A. Because I'm seeing more steel underneath the
10 bottom than the other one had. The other one looks --
11 and it could just be the picture in the --

12 Q. Okay.

13 A. -- feels like the distortion I'm looking at.
14 But this one picture, that actually looks like there's so
15 little steel left it's starting to distort. This one
16 does not look that way to me.

17 Q. Okay.

18 A. This one looks like it has some actual steel in
19 it, similar to the hole behind it.

20 Q. All right. I want to switch gears a little bit
21 with you here.

22 A. Okay.

23 Q. After you were promoted to superintendent, did
24 you say you left transmission and went back to
25 distribution?

26 A. Correct.

1 Q. And do you recall approximately what year that
2 would have been?

3 A. '92 maybe. I don't know. It was early '90s, I
4 believe. No, that can't be right. Had to be mid to late
5 '90s.

6 Q. Okay. Did you stay on in distribution as a
7 superintendent of distribution through your retirement in
8 2010?

9 A. For the most part. I did a couple special
10 project things, but, again, I was still a superintendent.
11 So yes.

12

13 (Grand Jury's Exhibit 174 was marked for identification.)

14

15 Q. I want to bring up the photograph that's marked
16 as Exhibit 174 for you. Now I want to ask you about
17 something very specific.

18 A. Okay.

19 Q. Do you recognize what this rectangular silver
20 box, I guess --

21 A. Yes.

22 Q. -- with three --

23 A. Three. They got three bolts in. They're
24 called parallel grooved clamps, PGs for short.

25 Q. Are they also called connectors?

26 A. Yes.

1 Q. You're familiar with those?

2 A. Yes.

3 Q. Now, even though you were out of the
4 transmission world by the mid 2000s -- well, let me back
5 up. How are you familiar with those three-bolt
6 connectors?

7 A. First of all, when I was a lineman, we used
8 them. But they've, they're on distribution and
9 transmission. Those are just with aluminum wire
10 connected to aluminum wire, or aluminum alloy to aluminum
11 wire. We used those kinds of connectors probably early
12 '70s until the mid 2000s maybe.

13 Q. At some point in the mid 2000s, did these types
14 of parallel groove connectors fall out of favor?

15 A. Yes.

16 Q. Do you remember when and why?

17 A. Well, I don't remember exactly when, but the --
18 companies are always developing new connectors and new
19 ways, and this is better than the last way. So one of
20 the problems we had with these connectors is like some of
21 that wire may be all aluminum, some of it may be aluminum
22 with a steel core, and you're connecting that with
23 another piece of aluminum. When, when you put a lot of
24 current through that, it heats. Gets hot, expands,
25 cools, hot, cool. These connectors are not of exactly
26 the same metals that your wires are made of, and so they

1 expand and contract ever so slightly different than the
2 wire does.

3 So this new company came up with, they call it
4 a "wedge connector," that it fires this wedge in there,
5 springs this thing out. And they claim it's a much
6 better connector than these bolted connectors. And
7 after, you know, lots of people testing this stuff, PG&E
8 adopted them as a better connector, so they started a
9 program of all the new connectors were going to be the
10 wedge connectors, and at some point they're going to
11 replace these others. But we've had these others for
12 almost all the time I worked at PG&E, almost 40 years.
13 And they worked well. But you have companies that have
14 something that's better, then we want to do what's
15 better.

16
17 (Grand Jury's Exhibit 194 was marked for identification.)
18

19 (Grand Jury's Exhibit 194A was marked for
20 identification.)
21

22 Q. All right. I'm going to move up to 194. This
23 is a cover page for a publication entitled *Power Line*
24 *Equipment Information Pocket Guide*. Are you familiar
25 with this publication?

26 A. No. Interesting. I'll have to look it up.

1 Q. But we don't care about that.

2 A. Okay.

3 Q. I want to talk to you about page 40.

4 A. Okay.

5 Q. Which is Exhibit 194A.

6 A. Okay.

7 Q. Do you see that?

8 A. Yep.

9 Q. Are those the parallel groove connectors you're

10 talking about?

11 A. Yes.

12 Q. And there are different configurations and

13 different sizes of them?

14 A. Yeah. The smallest one down at the bottom went

15 on the smallest wire. So because it doesn't carry that

16 much current, the connector can be smaller. As you go

17 up, those connectors can carry more and more current

18 through, and are used on bigger and bigger wire. So the,

19 like the largest aluminum conductor we had used those, we

20 called "three-bolt bricks" on the top, and then various

21 sizes depending on which kind of wire you're connecting

22 and the sizes of them.

23 Q. When you were a lineman, did you routinely

24 replace these connectors?

25 A. Well, no. We replaced -- so I'm far enough

26 back that we replaced when they used to just twist wires

1 together. When I worked in San Francisco, a lot of the
2 old copper wires were just twisted together. They had
3 two pieces of wood with holes drilled in them that two
4 guys would be up there twisting them. That's how they
5 made the connections. This is way back. I got a bunch
6 out, but I haven't put them in. They were before my
7 time. But then those had a different connector than
8 these. Those new clamps, you put the two wires together,
9 and this clamp just squeezes them down. But they came
10 loose all the time. And these came along. This was like
11 at least the third iteration that I'm aware of. Then
12 these wedge-fired connectors is the latest version on the
13 perfect connection.

14
15 (Grand Jury's Exhibit 194B was marked for
16 identification.)
17

18 Q. So next I want to move on to 194B from the 2001
19 pocket guide and ask you if you recognize what's depicted
20 in that photograph of page 45.

21 A. Yeah. These are what's called a wedge
22 connector. If I might, maybe I can --

23 Q. Absolutely.

24 A. -- show you a little bit how these things work.

25 So these things, there's like a C-looking is
26 what these are. You place a wire by each side, and then

1 you put this piece of steel in the middle that looks like
2 a wedge. And then you have this, a gun that fires that
3 wedge in there. So it, it just bangs this in. It
4 springs this groove open, but this thing wants to close
5 back. It's trying to go back to its normal shape. So
6 these are real strong spring connectors. You fire that
7 wedge in. They claim this will last forever. But so
8 were the bolt ones. We'll see how it goes over time.

9 But we've had these since mid 2 -- around 2009
10 was it? No. It was older than that. We've had these
11 probably 10 to 15 years, we've had these. So these are
12 relatively new. Seem to be working great. I haven't
13 heard of any problems with them. But these are the
14 newest, and we consider the best connector on the market.
15 Okay.

16 Q. So at some point in the mid 2000s, a decision
17 was made by the company to get rid of the parallel groove
18 connectors and change over to the wedge connectors; is
19 that right?

20 A. Yes.

21
22 (Grand Jury's Exhibit 195 was marked for identification.)
23

24 Q. Now I want to go through one last thing with
25 you. You have in front of you photograph Exhibit No.
26 195. Do you recognize what is depicted in that

1 photograph?

2 A. Yes.

3 Q. What is depicted in that photograph?

4 A. Well, I should probably go back.

5 So in some areas where you have a lot of wind
6 -- what you can't see here is this string of insulators
7 hanging off of the bottom of this wire, there's another
8 string of insulators holding it up to the tower; okay?
9 But in high-wind areas, you would take, put another set
10 of insulators, and then you'd put a cable from here down
11 to an arm that's on the tower to stabilize it. Because
12 in some of these areas, the cross wind is so high that if
13 you don't, it will blow this wire either into the tower
14 or it will get the wires to bang up and, they expand.

15 So this is a system -- I mean, we haven't --
16 you don't see much of anything like this anymore but on
17 very old systems. That's how they tried to adjust the
18 tower to withstand that strength.

19 Q. So it doesn't look like this is connected
20 anymore?

21 A. Right. I can't explain why. Is this on a
22 working line?

23 Q. I can't tell you that. All I can do is say,
24 ask you if in your experience and training would this
25 be --

26 A. No.

1 Q. -- this broken line be an issue?

2 A. It would definitely be an issue. What -- the
3 only thing I'm wondering here, some of these very old
4 lines are no longer in service. And so some of them are
5 sitting out there and they're not carrying any -- you
6 know -- there's no power in them. I'm not saying that's
7 the case here, because I don't know. This could be - if
8 this is an energized line that's being used, then no,
9 this is not an acceptable condition; okay? If this is a
10 line they're getting ready to tear out, maybe it is;
11 okay? But when I first looked at it, it's like, well,
12 no, that absolutely shouldn't be like that. But if this
13 line is idle and, again, going to take it out or upgrade
14 the whole line, then yes, it might be okay.

15 Q. So let's assume that this line was actually
16 energized.

17 A. Okay.

18 Q. And --

19 A. Then this would not be acceptable.

20 Q. And back on the priority scale that you talked
21 about earlier, where would this fit?

22 A. Get it fixed today.

23 Q. This would be one of those immediate --

24 A. Yeah.

25 Q. -- priorities?

26 A. You wouldn't want this sitting -- I mean, it's

1 -- they have this in here because it's a heavy wind
2 vibration area, so you would want to get this thing fixed
3 right away.

4 Q. So that would be on a normal day; right?

5 A. Yeah.

6 Q. How about if that was on an energized line in
7 the middle of a high fire threat area, in the middle of a
8 red flag time with extreme winds forecasted?

9 A. I would really wonder how this is here and,
10 sitting here and not repaired. I mean, I don't -- this
11 -- I would really want to see the records for this to
12 make a decision on -- I mean, on the surface, it looks
13 ridiculous that we have this here, but sometimes there's
14 stuff you don't know about. But if this is a regular
15 energized line carrying power, this is a very concerning
16 problem.

17 Q. Would you say this is dangerous?

18 A. It could be if you get the winds.

19 Q. Yep.

20 A. I mean, this is --

21 Q. Well, we've been talking mainly about the
22 strand that's now disconnected. What other problems do
23 you see at this tower?

24 A. Well, I mean, this is all distorted. This is,
25 this has got a wrinkle in this steel. So this looks like
26 at some point -- looking at this, I would have to say

1 this -- one of these lines went down once before and this
2 thing twisted around. Because I can't think of any other
3 reason you would get this distorted metal.

4 Q. Have you in your career, in your long career
5 with PG&E, seen damage like that previously in a tower
6 arm?

7 A. Only when we had the wire come down.

8 Q. So if this wire --

9 A. -- breaks mid span, you've got several thousand
10 pounds that before is pulling straight down, now it's
11 yanking into the tower. It's going to want to tear this
12 arm around.

13 Now, this particular arm is only here to
14 stabilize this. This is not designed to hold any wire.
15 This is just there as a stabilizer. This steel is
16 lighter than this steel. Total different design why this
17 is here. This is not the kind of arm you would see the
18 wire hanging from normally on this system. This has just
19 been here for stable. The fact that it's all twisted up,
20 something yanked this arm this direction. You're not
21 going to get that from the vibration. That's not -- this
22 distortion is not happening from vibration.

23

24 (Grand Jury's Exhibit 196 was marked for identification.)

25

26 Q. Okay. Let's move on to the next photograph,

1 Exhibit No. 196. Do you see that photograph? You can
2 stay up here with the big board.

3 A. Okay, yes. So this is the bottom. This is how
4 it should have been attached.

5 Q. So what this, this is separate from 195, but
6 that shows you how the wire on 195 should have been
7 attached --

8 A. Correct.

9 Q. -- to the bottom of the suspension -- or the
10 insulator string?

11 A. Yeah. This is a little adjustment to kind of
12 cinch this thing up, stabilize it.

13 Q. Although the wire is obviously connected on
14 this arm, do you see any other problems?

15 A. Well, looks like this one's been distorted,
16 too. I don't think that's just a picture. It looks like
17 it's distorted. But, again, this is not, this is only
18 stabilizing this. This is not carrying any weight. It's
19 not a support piece to this tower.

20

21 EXAMINATION

22

23 BY MR. FOGG

24 Q. (WITNESS #17), I have some questions for you.

25 I don't think we've met before. I'm Deputy Attorney

26 General Nicholas Fogg. I'm helping Mr. Noel in this

1 case.

2 I want to go back to the mid to late 90's, when
3 you're still superintendent in transmission.

4 A. Okay.

5 Q. What geographic area did you cover as
6 superintendent?

7 A. It's called the East Bay. It's Contra Costa
8 and Alameda Counties.

9 Q. Do you remember approximately how many
10 troublemen you had working for you?

11 A. Three.

12 Q. Three?

13 A. When we first put it together, we had three.

14 Q. When you first started as an electrical
15 transmission supervisor, you had three troublemen;
16 correct?

17 A. Correct.

18 Q. Did that number grow by the time you became
19 superintendent?

20 A. Yes.

21 Q. By the time you became superintendent, about
22 how many troublemen did you have under your supervision?

23 A. Well, we had the same amount of troublemen, but
24 what we did is we brought, we added repair crews.

25 Q. Okay.

26 A. Because the sense was we were having -- because

1 they weren't trained the same, we were having to shut
2 lines down by not always being able to get people that
3 were trained to do transmissions. So they decided to add
4 transmission crews. And they did it in all the areas.

5 Q. Now, did the troublemen have a supervisor
6 between you and them as a superintendent?

7 A. For a while the crew worked for the supervisor;
8 the troublemen worked for me. But that eventually
9 transitioned into all of them working for the supervisor.
10 What, what else did I get assigned? Oh, I -- they
11 decided I should supervise some of the gas people, also.

12 Q. Who decided which line the troublemen would
13 inspect?

14 A. The first line supervisor.

15 Q. How -- we talked about inspections, about the
16 aerial inspections, the ground inspections, the climbing
17 inspections. Besides routine scheduled inspections, were
18 there non routine or non scheduled inspections?

19 A. Yes. You would get, just you'd get a call that
20 a line had tripped out of service. Your stations, which
21 are like -- like up here I think it's in an area -- well,
22 it's not too far from here where the main station is.
23 They control all the lines in this area. So if something
24 trips offline, because this equipment is all set up with
25 automatic things. If something happens, you get a
26 lightning strike, you get a tree comes through, hits a

1 line or something, it will cause it to trip off. If it
2 just trips off and comes back on, then they kind of want
3 you to like patrol it the next day. If it trips off and
4 stays off, they want somebody out there right now.

5 Q. Who would decide if a troubleman needs to go
6 out right away as opposed to the next day?

7 A. The first line supervisor.

8 Q. When you say "first line supervisor," is that
9 different from the superintendent?

10 A. Yes. He's the one who works for the
11 superintendent.

12 Q. Okay. And when you were the superintendent,
13 who did you report to? Who is above -- who did you
14 report to?

15 A. He was the -- what was his title? The person
16 above me had all the operators, he had all the
17 electricians, and he had all the lines side. So three
18 groups. I think he was a transmission manager maybe, I
19 believe was the title.

20 Q. So going back from the people that you report
21 to back out to the troublemen, how often -- how much
22 discretion would individual troublemen have in changing
23 -- in -- well, in deciding what they want to inspect on
24 any given day?

25 A. Well, they had -- after we started doing this a
26 couple years, we started setting up like -- you got to

1 know the lines and the access to them and how long it
2 would take to get. So you kind of set up standards of,
3 you know, you're going to do the ground -- you're going
4 to climb 12 towers a day or 8 towers a day, or whatever
5 that number would be. But you have to adjust that for
6 the territory.

7 So in my area, you got a lot of towers and
8 they're fairly close together. Guys up here, you know,
9 when I looked at some of these hills that these guys had
10 to go up, I'm sure they weren't getting as many towers a
11 day. But you get where you wanted the supervisor to kind
12 of see the area, the guy that's working in, and kind of
13 establish that. But, I mean, they had established -- but
14 I can't remember the numbers at all -- but we had kind of
15 established how many towers you wanted to get checked in
16 a day.

17 Q. Would the troublemen have much discretion in
18 deciding what they wanted to check on?

19 A. No.

20 Q. What line transmission line to check?

21 A. No.

22 Q. Was --

23 A. It was scheduled -- I mean, after we got going
24 a couple years, we had a schedule for every line pretty
25 much every week.

26 Q. Okay. Who set that schedule?

1 A. The first line supervisor, I would say.

2 Q. So Mr. Noel covered quite a bit, I just want to
3 jump around to some other subjects, fill in a few gaps I
4 had.

5 You mentioned the tower department. When you
6 were transmission superintendent in the mid 90's, did the
7 tower department inspect the towers independently of
8 anything your people did?

9 A. They, what they would do is if we found an
10 issue, then they would go look at it. You know, if a
11 troublemen saw, geez, these bolts are really looking
12 rusty or -- at the bottom you've got cement, you have a
13 piece of steel sticking up, and you attach the tower to
14 it. If that looked really rusty, you would send a note
15 to the tower department and they'd go take a look at it.

16 Q. And we talked about inspection frequency
17 earlier, and I just wanted to clarify. For the questions
18 I'm about to ask you, can we just focus on 115 kV lines?

19 A. Okay.

20 Q. When you were superintendent, approximately how
21 often would 115 kV line have an aerial patrol done on it?

22 A. I believe the aerial patrols were twice a year.

23 Q. Was that specific to your area or did you --

24 A. No, we established them system-wide.

25 Q. When you say "we" established them, who is we?

26 A. The various -- you know, we had seven

1 superintendents.

2 The thing we really wanted out of this is
3 consistency. So whatever we were going to do in North
4 Valley, we were going to do in the Bay Area, and we were
5 going to do south, as far as patrol times, how often and
6 that kind of thing. It was somewhat driven by is it
7 coming from a generator? Like we had the geysers that I
8 remember was always a -- we did more patrols on the
9 geyser line. We did more patrols on the lines going into
10 Diablo Canyon. Did more patrols on the 500.

11 As the 115s, there's only a few of the bigger
12 power plants that have generation running into the 115.
13 So most of the 115 lines were at the lower end of how
14 often we did them. But even at the lower end, it still
15 was getting like one climbing patrol and two aerial
16 patrols a year.

17 Q. So was it -- let's go from the aerial to
18 climbing and ground. What's the distinction again
19 between a ground inspection and a climbing inspection?

20 A. The ground inspection, the troubleman uses his
21 glasses, his, you know, binoculars, and looks for issues
22 in the tower and checks the base. You know, are there
23 any slides? Is the tower itself distorting? Are there
24 any apparent issues?

25 On the climbing patrol, they wanted you to go
26 up and basically check every nut and bolt that --

1 Q. Right.

2 A. -- that it was in good shape.

3 Q. So when you were superintendent in the 90's,
4 how often would 115 kV line receive a routine ground
5 inspection?

6 A. I think our plan was to do it every five years.
7 I don't believe it was happening before we came along.

8 Q. How about were climbing inspections routinely
9 scheduled?

10 A. Yes.

11 Q. How often would a climbing inspection occur on
12 a 115 kV line?

13 A. Every five years.

14 Q. So --

15 A. Isn't that what I said?

16 Q. Well, let's go back to ground inspections. How
17 often were the ground inspections?

18 A. Ground inspections every year.

19 Q. As for climbing inspections?

20 A. Every five years.

21 Q. Okay. I gotcha.

22 A. Sorry if I confused that.

23 Q. So if it's confusing, it's usually the
24 questioner, not the witness.

25 I want to jump back. You said the seven
26 superintendents, you talked about you came up with a

1 schedule. Was there a formal process that you had for
2 the seven superintendents to work together and create a
3 schedule, or is this something that developed because you
4 worked together?

5 A. It was something that I think our director
6 insisted on, because that's why we were there.

7 Q. So that was a process directed -- well, the
8 seven supervisors -- seven superintendents, sorry,
9 working together to form the schedule was directed from
10 the manager above you?

11 A. Well, as far as they wanted a schedule, and
12 they wanted us to -- like they wanted to compare that to
13 like the schedule Southern California Edison was doing,
14 because they felt there should be consistency across all
15 the power companies in California.

16 Now, we -- I'm sure we never got to everything
17 being consistent, but they wanted us to -- I mean, all of
18 us seven wanted to have the same thing happening. You
19 know, so it was in our best interest to work together.
20 And we really -- I don't remember ever having a problem
21 with any of the superintendents. They were all new, they
22 were all wanting to get into this. But we were looking
23 to have a consistent scheduling system.

24 Q. Okay. Well, you -- we talked about a photo
25 book earlier that was developed for training new
26 troublemen. Did that set of photos, that photo book,

1 have a name?

2 A. No. It was, it was just how we got started.

3 And, you know, our plans were to really -- I don't know

4 that we ever imagined it this thick, but we planned on

5 having something with examples of whenever you have like

6 one of those codes that says check for the eye on -- the

7 eye wear on the arm, what does that mean? So you wanted

8 to have kind of a picture of here's a good one, here's a

9 bad one, kind of with every condition that you had.

10 Twisted seal? When's it twisted, when's it not twisted?

11 How do you determine that?

12 Q. Okay. Now, if we go back --

13 Marc, can you go to Exhibit 181, please? I

14 just wanted to -- a question came to me while we were

15 looking at it. I wanted to circle back to it.

16 You mentioned earlier in your testimony you

17 might not replace a hook if you were replacing insulators

18 that were a year old or so?

19 A. Yes.

20 Q. How would you determine how old an insulator

21 string is, like the insulator strings depicted in Exhibit

22 181?

23 A. Well, what -- how I meant that is if you go out

24 there and that hook is like brand new --

25 Q. Right.

26 A. -- because it just got replaced a year ago,

1 then you're probably not going to replace it. If it's
2 showing any wear -- there was never any, gee, don't
3 replace it until it gets to this level. I mean,
4 typically the linemen had a bag and a -- they carried
5 them in the pouch. And when you go to pop them off, if
6 they showed any wear, you'd put the new ones up. I mean,
7 there was -- you never waited for it to wear to any
8 level.

9 Q. If you wanted to determine how old an insulator
10 string is, like what's depicted in Exhibit 181, how would
11 you go about doing that?

12 A. I don't know.

13 Q. Same question for the tower itself.

14 A. The tower department had pretty good records on
15 when each of those lines were built and any modification
16 that went on. That department had just a wall full of
17 pictures of different towers and sizes. So I'm thinking
18 they would have that information.

19 Q. Do you know if, from your time at PG&E, do you
20 know if insulators had a specified life span?

21 A. No, they did not.

22 Q. Let me clarify that. Did you not know or were
23 you not aware of a life span?

24 A. Well, we asked that question many times, and
25 the response we got back from the manufacturers was there
26 is no life span on them; they can last forever.

1 Q. Did you -- how about the C hooks or the J
2 hooks, did you know if they had a life span?

3 A. I do not know.

4 Q. How about a steel tower?

5 A. I don't know.

6 Q. You mentioned earlier in your testimony that --
7 well, let me take a step back.

8 How did you become aware that hanger plates and
9 hooks were hardware that troublemen should be paying
10 attention to?

11 A. Well, we had -- I know I shouldn't guess.
12 Because -- I know that I -- because of the records, I
13 know I turned in those. I'm just thinking the troubleman
14 was out patrolling, saw them, called my attention to
15 them, we took them down, and I had them tested.

16 Q. You're talking about the 1987 test --

17 A. Yes.

18 Q. -- we discussed earlier?

19 A. Yes. I believe that one of my troublemen just
20 found it in his patrol, and we took them down and had
21 them tested.

22 Q. So before that patrol in 1997, were you aware
23 that hooks and hanger plates could be an issue on
24 transmission towers?

25 A. No. No, I don't think I ever remember seeing
26 that an issue when I was doing change-outs of insulators

1 when we were doing them hot. I don't remember it, any
2 kind of issue with that.

3 Q. I want to jump over to the wind, you mentioned
4 earlier. Did you receive any training from PG&E about
5 the effect of the wind or updrafts on transmission
6 towers?

7 A. It wasn't a training, but we had a -- the
8 company has its own weather forecasters, and we had a guy
9 from the weather bureau come in and talk to the
10 troublemen and supervisors about, well, here's some of
11 the issues that develop around that. That's the only,
12 that's the only time I remember having a weatherman
13 around. So I can remember him coming in and talking to
14 us about it. That's who I'm guessing.

15 Q. Did that, did it happen commonly to have
16 weathermen come talk to troublemen?

17 A. No. That was one time. I asked this guy to
18 come in when I became aware that we had a weatherman. I
19 didn't know we had a weatherman. I became aware of it,
20 and I said, "Hey, how about coming and talking to my
21 troublemen about this?" So one of our monthly or
22 quarterly meetings, he came in and talked to all the
23 troublemen about issues with vibrations.

24 Q. At some point when you worked for PG&E you
25 became aware of the effects that wind can have on a
26 transmission tower; correct?

1 A. Correct.

2 Q. Did you tell other superintendents about --

3 A. Well, like I said, they came and talked to them
4 that one time. That's the only time I can remember.

5 Q. But once you learned about the issues of wind,
6 with issues that wind can cause for transmission towers,
7 did you tell anyone else in the company about those
8 issues?

9 A. Just the other superintendents and our
10 supervisors and troublemen.

11 Q. Do you know, did you ever record in writing the
12 issues that wind can cause with the transmission tower?

13 A. I do not remember ever doing that.

14 Q. Let me take one second to see if I have anymore
15 questions, but I'm about done.

16 A. Okay.

17 Q. I have two more for you.

18 A. Okay.

19 Q. When you worked for, when you were
20 superintendent for PG&E in the mid 90's, do you know if
21 PG&E employed engineers that worked on transmission
22 towers?

23 A. I don't, I can't remember them ever working on
24 the towers. I mean, they, they gave us guidance.

25 Q. Let me try to ask that question differently.

26 Instead of working physically on the towers,

1 inspecting them, how about did engineers consult with you
2 or give you guidance about transmission towers?

3 A. Well, they gave us -- actually, I wasn't --
4 when I was -- later on when I was, when I was
5 superintendent and I had moved on to the division, I had
6 crews that worked for me that, that put it -- relocated
7 towers. So we interacted with transmission engineers
8 when we were doing new tower lines or modifying tower
9 lines. I don't remember having them involved when we
10 were doing this. They may have been, I just don't
11 remember.

12 Q. (WITNESS #17), I have one last question for
13 you.

14 Mr. Noel, if we can go to 185, please.

15 You mentioned during your earlier testimony you
16 thought that -- we're looking at Exhibit 185 -- you
17 thought that the tower depicted in 185 may be subject to
18 "a tremendous amount of vibration," I think were your
19 words. Why do you think -- looking at that image, why
20 would you think that tower would be subject to wind
21 vibrations?

22 A. Well, as I mentioned, I don't know that this
23 one was. This looks like it's down on flat land. May
24 not be. Looks like there's a road right next to it.
25 This all looks flat. So I'm not thinking this one's
26 going to be subject, the ones I'm seeing up on top of the

1 hill --

2 Q. In the background of 185?

3 A. Right. Those look like they're sitting on top
4 of the hill. This looks like it's down in the valley or
5 something here. That's -- it's a little hard to
6 determine, but it doesn't appear to be sitting on a
7 hilltop, so I'm not sure this is subject to wind at all.

8 Q. Okay. I just wanted to clarify that.

9 (WITNESS #17), I don't have any questions for
10 you. I'm going to check with my colleagues to see if
11 they have questions. And if they don't, we'll ask the
12 Grand Jurors if they have questions.

13 (Counsel confer.)

14 MR. FOGG: So we don't have anymore questions.

15 Do any of the Grand Jurors have questions?

16 So we have a couple. Any of the other Grand
17 Jurors have questions?

18 Give us a second to consult.

19 (Counsel and Grand Jury Foreperson confer.)

20

21 EXAMINATION

22

23 BY MR. NOEL

24 Q. All right. (WITNESS #17), we have a few
25 questions from the jurors for you.

26 A. Okay.

1 Q. In your knowledge, do the troublemen still
2 climb the steel towers?

3 A. I believe they probably do.

4 Q. Okay. But you don't know?

5 A. I do not know.

6 Q. You've been out --

7 A. I've been out of that group for ten -- more
8 than that. Quite a few years.

9 Q. Would you say you moved into transmission -- or
10 into distribution in the mid '90s?

11 A. Yeah. So twenty something years. I retired in
12 2010, so --

13 Q. When you were the -- well, who was the
14 supervisor of the seven district supervisors when you
15 initially formed the Transmission Department?

16 A. I do not remember who they were. Somewhere
17 they must have those records, but I cannot, I cannot
18 remember those people's names.

19 Q. You don't remember who you reported to?

20 A. My boss?

21 Q. Yeah, your boss.

22 A. Oh, my boss was Mel Bradley.

23 Q. Mel Bradley?

24 A. Yeah.

25 Q. Do you remember who Mel Bradley's boss was?

26 A. I can picture him, but -- it changed, while I

1 was there, a couple times, but it's a guy who retired
2 while I was -- you know -- while I was working there. So
3 I really don't remember his name.

4 Q. Okay. Were you ever pressured by upper
5 management to cut costs to inspection and maintenance?

6 A. No. When they, when they put this department
7 together, it was like whatever you need to get this
8 working right, you can get it. Now, did that last? I
9 don't know. But when we first organized and put this --
10 we never had any pressure to cut costs on any of the
11 maintenance. No one really knew how much it was going to
12 cost us, but -- so there was really an open mind as to
13 you guys need to do whatever it takes to get it done
14 right. But there was never any pressure on costs.

15 Q. Were you specifically aware of how old
16 transmission line equipment assets were in your district?

17 A. I knew, in general, how old they were. If I
18 needed a specific tower and how old it was, those records
19 were always available. You could go to the engineering
20 group in San Francisco, and they could always get you
21 those records. But I, off the top of my head, no, I
22 wouldn't know. I mean, I'd -- I knew some of the lines
23 were, you know, early 1900s, and some were being built
24 while I was there. So --

25 Q. How about the major components of the
26 transmission towers, or transmission lines?

1 A. Like how old they were?

2 Q. Yeah.

3 A. Again, I would have to have gone to the
4 engineering group and see from when the tower was. That
5 I know of, no one was keeping any records. Like if you
6 changed the insulator string because it was gunshot or
7 lightning strike or something, we weren't keeping records
8 of that. You just went out and did the work and got the
9 line back in service. And we didn't, we didn't have any
10 records before that.

11 Q. How about the conductor itself, were there
12 records of the age of the conductor itself?

13 A. Engineering group would have that.

14 Q. But you didn't have it?

15 A. No, I didn't.

16 Q. At any time were troublemen given any direction
17 on the appropriate specifications of the actual tower
18 hanging hardware?

19 A. I doubt it. I don't know.

20 Q. And finally, when you were in charge of
21 troublemen as district supervisor, were the troublemen --
22 did the troublemen have binoculars to use during aerial
23 inspections?

24 A. Yes. They actually -- we bought these -- this
25 is something we got from Southern Cal Edison. They have
26 these binoculars that stabilize when you're in a

1 helicopter. Because if you try to use regular binoculars
2 in a helicopter, you're going to be sick in about three
3 seconds. It does not take long. But they -- we bought
4 them all these special binoculars, stabilizing
5 binoculars, for every troublemen who came on. I used
6 them; they definitely work better. Because I made the
7 mistake of trying to use regular binoculars in a
8 helicopter, and that motion sensing thing, that was a
9 problem immediately.

10 Q. So going back to 187, we were talking about
11 this earlier, and that this was kind of further away than
12 you would -- the troublemen would actually be when
13 looking at this tower from a helicopter?

14 A. Yeah. Unless the winds howl.

15 Q. Right. And then you'd add binoculars into that
16 equation; correct?

17 A. Well, most cases they weren't using binoculars
18 when they were just flying along.

19 Q. Right.

20 A. It would be like if he couldn't get close, he'd
21 sit back and he'd get the stabilizing binoculars, and he
22 would see a whole lot better than this picture.

23 Q. Right.

24 A. I mean, they were very good binoculars.

25 Q. Right. So you could actually, a troubleman fly
26 along on a helicopter, looks over and sees this daylight

1 here, they all had binoculars that were issued to them,
2 stabilizing binoculars for the helicopter, and they'd
3 actually be able to focus in on that daylight --

4 A. Yes.

5 Q. -- to take a better look?

6 A. Yes.

7 MR. NOEL: Do we have anything else?

8 I see no hands.

9 I believe we are done with this witness.

10 GRAND JURY FOREPERSON: I need to admonish him.

11 MR. NOEL: Yes, ma'am.

12 (WITNESS #17), she's got one more thing to read
13 to you.

14 GRAND JURY FOREPERSON: You are admonished --

15 (WITNESS #17), you are admonished not to discuss or
16 disclose at any time outside of the jury room the
17 questions that have been asked of you or your answers
18 until authorized by the Grand Jury or the Court. A
19 violation of these instructions on your part may be the
20 basis for a charge against you of contempt of Court.
21 This does not preclude you from discussing your legal
22 rights with your own attorney.

23 (WITNESS #17), what I have just said is a
24 warning not to discuss the case with anyone except the
25 Court, your lawyer, or the district attorney.

26 THE WITNESS: Okay.

1 GRAND JURY FOREPERSON: Do you understand?
2 THE WITNESS: Yes.
3 GRAND JURY FOREPERSON: Thank you for your
4 time.
5 THE WITNESS: Will I be notified when I'm
6 released of that thing, or will that maybe never happen?
7 MR. NOEL: Yes, you will be.
8 THE WITNESS: I would be? Okay.
9 MR. NOEL: Yes.
10 THE WITNESS: Just curious.
11 [DISCUSSION OMITTED.]
12 (Lunch break taken.)
13 [DISCUSSION OMITTED.]
14 GRAND JURY FOREPERSON: Mr. Nolt?
15 MR. NOLT: Yes.
16 GRAND JURY FOREPERSON: Before you have a seat,
17 would you raise your right hand so I can swear you in?
18
19 JAMES NOLT
20 having been called as a witness in
21 the matter now pending, having been first
22 duly sworn, testifies as follows:
23
24 THE WITNESS: I do.
25 GRAND JURY FOREPERSON: Thank you. Have a
26 seat, please.

1 MR. NOEL: Did we get all the PowerPoints
2 passed out? Everybody got them?

3 GRAND JURY FOREPERSON: Yes.

4 MR. NOEL: Okay.

5

6 EXAMINATION

7

8 BY MR. NOEL

9 Q. Mr. Nolt, could you please state your full
10 name, spell your last name for the record.

11 A. James Henry Nolt, N-O-L-T.

12 Q. Mr. Nolt, are you employed?

13 A. I'm self-employed.

14 Q. And what kind of business?

15 A. I do, I do consulting engineering with mostly
16 an emphasis on forensic engineering.

17 Q. Are you an engineer?

18 A. Yes. I'm licensed to electrical, mechanical,
19 and corrosion engineering.

20 Q. There's a lot of initials behind your name.
21 I'd like to walk through them and have you define what
22 they are. MS?

23 A. That's the Master of Science Degree in
24 Electrical Engineering.

25 The EE is the Electrical Engineering license
26 from the State Board of Engineers.

1 The ME is the Mechanical Engineering license
2 from the State Board.

3 And the CRE is the Corrosion Engineering
4 license from the State Board.

5 Those three things combined tend to be a fairly
6 synergistic combination of expertise, particularly in
7 forensic work.

8
9 (Grand Jury's Exhibit 197 was marked for identification.)

10

11 Q. You have in front of you a document marked as
12 Exhibit No. 197. Do you see that?

13 A. Yes.

14 Q. Do you recognize that document?

15 A. Yes.

16 Q. What is that document?

17 A. That's my standard CV, or Curriculum Vitae,
18 resume, whatever you want to call it.

19 Q. Does that document state all of your
20 qualifications in each of the engineering fields?

21 A. Doesn't state them all, because there's been a
22 lot -- you know, many, many years of experience and
23 projects, but they are a good summary of my training and
24 education and specific kind of experience broken down
25 into different categories.

26 Q. So let's start with the education component.

1 What education and degrees do you have that qualify you
2 as an engineer?

3 A. My Bachelor of Science Degree is in Electrical
4 Engineering from the University of Washington, in
5 Seattle. And I went from there to Palo Alto, where I got
6 my Master's degree from Stanford in Electrical
7 Engineering. And I've been doing consulting engineering
8 ever since then. So that's a lot, of lot of experience
9 and background.

10 Q. Other than your formal education, your degrees
11 from Washington and Stanford, what training or education
12 do you have that qualifies you as an engineer?

13 A. Well, the process of getting the various
14 licenses from the state requires a lot of experience in
15 doing the kind of engineering under supervision from
16 other licensed engineers and training and classes. And
17 in addition, I was a member of the National, of the
18 California Conference of Arson Investigators and the
19 International Association of Arson Investigators. I've
20 taken a lot of technical fire investigation classes from
21 those organizations as well over the years.

22 Q. Can you describe the licensing process for
23 engineers.

24 A. Well, there are loosely half a dozen different
25 steps, one of which is to -- now, you don't always have
26 to have a degree in engineering, but if you start out

1 with a degree in engineering, then you take an exam with
2 the state board, what's called the Engineer in Training
3 Exam. I think they have a different name for it now.
4 And then you, if you pass that written exam, which is a
5 multi-disciplinary exam on, covering everything you've
6 ever taken in college, and if you pass that exam, then
7 you have, you go into your engineering and training phase
8 where you're supposed to be working with another licensed
9 engineer that's licensed in the discipline that you're
10 seeking a license in for anywhere between two and six
11 years of practical experience with this person. And then
12 at the completion of that various time frame, depending
13 on what degrees you have, they, you get references from
14 engineers that you've worked with and the engineers that
15 know you in that profession.

16 And all of that gets submitted to the board for
17 review. And your experience gets reviewed by other
18 professionals in the board. And then you get approved to
19 take another exam, that's the Professional Engineers
20 Exam, in the discipline that you're applying for. In
21 this particular case, electrical engineering. There are
22 different exams for the mechanical engineers and civil
23 engineers and structural engineers, so they have all
24 different eight-hour exams. All these exams are
25 eight-hour exams. EIT is an eight-hour exam on
26 everything in college. And the EE exam is another

1 eight-hour exam on, focuses just on the discipline that
2 you're seeking a license in.

3 And if you pass that, then your application
4 gets put into the next step, and the board and the other
5 professionals engineers in the board review all that
6 stuff and either grant the license or don't. And that's,
7 that's -- and you have to repeat that process for each of
8 the kinds of engineering licenses that you get. So it
9 can get involved.

10 Q. So you have three separate licenses; correct?

11 A. Yes.

12 Q. Electrical, mechanical, and corrosion?

13 A. Yes.

14 Q. So you've had to go through that process three
15 times?

16 A. Yes. And there aren't many of us around that
17 have.

18 Q. How many different types of engineers are
19 there?

20 A. There are three main types. They're called the
21 Practice Acts. And you can't do the work unless you have
22 a license, and you can't use the title unless you have
23 the license for a Practice Act engineering title. Those
24 are mechanical, electrical, and civil. You've got --
25 those are the -- you can't even do the work. You can't
26 use the title, you can't call yourself that, can't do

1 anything unless you're under the supervision of somebody
2 that is.

3 Then there's another 15 or 16 types of
4 engineering called Title Acts that anybody can do the
5 work if you know enough to be fool enough to do the work.
6 But only the person with the license can use the title.
7 They can't call themselves, in my particular case, a
8 corrosion engineer unless you have the corrosion
9 engineering license. Now, the corrosion engineering
10 license is in the Title Act category, which is sort of a
11 subset. And so anybody can do the work, but only I can
12 use the title because I've got the license. And the
13 mechanical, electrical, civil area, nobody else can do
14 the work unless you have the license and you can't use
15 the title unless you have the license.

16 Q. And what's the third subset?

17 A. Well, those, that's all I was thinking about.

18 Q. Okay. I thought you said there were three
19 subsets, but that's okay.

20 A. There are three main ones and about 16 sub
21 ones.

22 Q. Okay. All right. Misunderstood.

23 A. The sub ones, the Title Act engineers are
24 corrosion, quality, industrial, manufacturing, safety,
25 those kinds of professional engineering, things that used
26 to be granted, but they have they, have lowered the

1 statute a little bit on those.

2 Q. And you're currently a licensed electrical
3 engineer in the state of California?

4 A. Yes.

5 Q. You're currently a licensed mechanical
6 engineering in the state of California?

7 A. Yes.

8 Q. And you're currently a licensed corrosion
9 engineer in the state of California?

10 A. Yes.

11 Q. How long have you been licensed in each of
12 those disciplines?

13 A. Well, I got my electrical engineering license
14 in about 1976, the corrosion license in about 1980
15 something, early '80s, and the mechanical in the late
16 '80s. Because I realized that if I was going to be doing
17 this forensic stuff, because mechanical electrical are so
18 related when it comes to failure -- we'll get into how
19 they're related later, perhaps -- but I thought it would
20 be very helpful to have that mechanical license as well.
21 So I went, jumped through all the hoops to do all of
22 that.

23 Q. Is there a continuing education requirement
24 from the board for you as an engineer?

25 A. In California, they don't have any continuing
26 education requirements. But because I'm licensed in

1 Nevada and Oregon and Hawaii as well, Nevada and Oregon
2 do have continuing education requirements. So I have to
3 satisfy them, which is sort of a default continuing
4 education that California's benefiting from.

5 Q. That -- does engineering change from state to
6 state in terms of the concepts, the theories, the
7 practicality?

8 A. Fortunately, no. Electricity is still
9 electricity and gravity is still gravity. So what
10 changes, though, is some of the ways they want you to
11 report things and the ways they want you to document
12 things and that sort of stuff.

13 Q. You mentioned earlier that you're also a member
14 of some arson groups? California Conference of Arson
15 Investigators, and I think you said the US Conference; is
16 that correct?

17 A. International Association of Arson
18 Investigators.

19 Q. International. How does arson investigation
20 tie into being an engineer?

21 A. Well, that's -- the fact that those
22 organizations call themselves arson investigators, arson
23 investigators' association, doesn't imply that we only
24 look at arsons. It's more broadly fire investigation
25 technologies. And so it ties into engineering because
26 oftentimes when something fails or burns or dies or blows

1 up or sinks, it's an electrical issue, or it could be
2 mechanical issue, or it could be a corrosion issue. You
3 know, we've had natural gas pipelines explode because of
4 corrosion issues. We've had mechanical issues with
5 things fail because they break; they're put into, put
6 under too much load or something like that. Or we have
7 electrical issues because there's, electricity got out of
8 where it's supposed to be kept inside and did something
9 that was not intended to be done.

10 Q. Now, you said that your firm, JH Nolt &
11 Associates, does consulting work?

12 A. Yes.

13 Q. And for whom do you consult?

14 A. I do a lot of work for insurance companies, for
15 the US Forest Service, for Cal Fire, for the park
16 service, for state agencies of all kinds, cities and
17 counties, legal firms, manufacturing outfits that have
18 failures. In the forensic world, I -- they want me to
19 help them figure out what failed and why it failed and
20 what to do about it. And that's for the forensic part.

21 In the design part, I've spent a lot of time
22 when my clients want me to design buildings like this one
23 or lighting systems or air conditioning systems and
24 plumbing systems and that sort of stuff. I don't do so
25 much of that now as I used to, but I did a lot of the
26 building design and work in the past.

1 Q. What kind of jobs does Cal Fire hire you to
2 consult on?

3 A. Two kinds. The majority of it is wildland
4 fires, where they think -- where their fire investigators
5 have narrowed the issue down to an electrical item that
6 they're most interested in. They're not jumping to
7 conclusions yet and saying that this is it, but they've
8 narrowed their focus down to an electrical item and they
9 want me to look at it with my background and help them to
10 figure out whether or not this electrical item could have
11 been the source of ignition for everything else that
12 directed them in that direction.

13 And also they have me looking at -- one of the
14 things I did recently was a bulldozer. They used
15 bulldozers for wildland fires, and it had a big -- it was
16 destroyed by a fire. And they wanted to know what
17 started the fire in the bulldozer, one of those big D9
18 Cats or something like that with a cage around it where
19 the guy was inside there. And so they wanted me to look.
20 They hauled it up from LA to, down to Davis I think. And
21 I was looking at it trying to figure out what's
22 happening.

23 And then I did some, did some work for the fire
24 marshal, California State Fire Marshal. They had a bunch
25 of vehicles they had fires in, Highway Patrol vehicles,
26 and they wanted me to try to figure out what happened

1 with that. Those kinds of things.

2 Q. In November of 2018, were you retained by Cal
3 Fire to consult and assist with the Camp Fire
4 investigation?

5 A. Yes. I think I got a call from Ryan Thin
6 (phonetic), who is a, I think he was a battalion chief at
7 the time. I lose track because they get promoted and out
8 from underneath me. But -- and usually the question is
9 how quick can you get up here? And it can be Saturday
10 afternoon at 2:00 o'clock or Sunday morning at 6:00
11 o'clock, because they've been on duty for a long time
12 already, generally, investigating, because it's already
13 going. And with the Camp Fire, with those winds that
14 were blowing, I think it was a Sunday morning. He called
15 and said, "Well, how quick can you be up here?" So I met
16 him at Home Depot there in Oroville and we went from
17 there up to Pulga.

18 Q. Did you go with the Camp Fire investigators to
19 the area of origin of the fire?

20 A. That's where I -- when we got up, when Ryan and
21 I got up to the general area, which is just off Highway
22 70 there, I met Tom Kluge, who was the principal
23 investigator. He and I hiked up the trail. He took me
24 up to where their area of interest was.

25 Q. What did you observe in the area of interest?

26 A. The area of interest was, the area of interest

1 was one of these towers that you see.

2 Q. Okay. We'll get to that in just a second.

3 A. The area of interest was one of those towers.

4

5 (Grand Jury's Exhibit 198 was marked for identification.)

6

7 Q. So you have in front of you what's marked as
8 Exhibit No. 198. Do you see the exhibit?

9 A. Yes.

10 Q. Do you recognize the exhibit?

11 A. Yes.

12 Q. And what do you recognize 198 to be?

13 A. This is one of my photos. And I can tell my
14 photos because of the orange date stamp on the lower
15 right-hand corner that my camera puts on each photo so
16 that I know when it was taken and more or less in which
17 order they were taken, because keep track of time in the
18 camera.

19 Q. So walk me through your standard operating
20 procedures in a case like this where you're brought in to
21 consult and you're seeing the area of origin for the
22 first time.

23 A. Well, this picture was taken -- this is --
24 Exhibit 198 was taken looking west as I was trying to
25 climb the hills to get up to those towers. And it was a
26 pretty steep, loose gravelly area. It was very difficult

1 to get up to. And -- but my normal operation is to start
2 photographing the overall scene to try to get the context
3 understood, to try to understand where we physically are,
4 sometimes I can locate us on a map, locate the area of
5 interest on a map. You notice I'm not calling it "area
6 of origin" yet, because it's the area of interest.

7 So then I go from the biggest picture I have
8 where you can see the area of interest, and then as we
9 get closer to the areas of interest my point of view gets
10 smaller and smaller. Any structures or houses or
11 buildings, I always walk around the outside. I start
12 with where the power comes into the building and with the
13 circuit breaker panel, meter, then we go to take a tour
14 of the inside of the building.

15 And then the fire investigator and I start
16 working together very closely, and I say to him, "Well,
17 where do we go from here? Where are your areas of
18 interest? And what might there be in those areas of
19 interest that is of interest to me?" Because it's a
20 possible electrical source of ignition. And so that's
21 when I start working really closely with the fire
22 investigators. And in this particular case, it would be
23 the Cal Fire guys.

24 This early picture was just a good contextual
25 picture and shows you that, the tower of interest on the
26 right -- left-hand side there. And the other two towers

1 looking west. So that tells you where you are.

2 And then Tom and I went up further and we
3 finally got up to the base of this tower. And the next
4 picture -- can I talk about the next picture?

5 Q. Sure. Go ahead.

6

7 (Grand Jury's Exhibit 199 was marked for identification.)

8

9 A. 199 is a closeup. And this is typical of my
10 process, because as we got closer to the area of
11 interest, he started, Tom started pointing out this
12 particular tower where the, they had identified as their
13 primary object of interest, because their burn patterns
14 on the ground led them back to this general area. And
15 when you see something as catastrophic as an insulator
16 hanging there by its bottom side up, instead of its top
17 side up, then, then you know you've got something that
18 might be of really interest.

19 Q. That won't work on the big screen.

20 A. Let's give it a try here.

21 Q. For some reason, the screen eats the laser
22 pointers.

23 A. And my battery must be dead. There we go.
24 Yeah, it does. It does eat it, that's for sure.

25 Q. Yep. So you can get up and walk over and point
26 anything out on the big screen that you'd like. You

1 should go around the other way. Don't trip on those
2 cords.

3 A. I was wondering about that.

4 This is the, this is the problem area right
5 here. This insulator here should be hanging like this
6 one, with this end up and that end down instead of this
7 end up and that end down. And we'll see more pictures of
8 this in the future, but this is just my first exposure to
9 what Tom was saying that had happened on this tower.

10 Q. All right. So you can stay there. We're going
11 to move on to No. 200. And tell us what we're looking at
12 in Exhibit 200.

13

14 (Grand Jury's Exhibit 200 was marked for identification.)

15

16 A. Now, No. 200 is a classic example of my
17 process. Again, I want to keep track of where I am and
18 what I'm doing and what I'm looking at. That is the
19 serial number for the tower of interest. Where that
20 broken insulator was hanging. And this is a serial
21 number that PG&E applies to this tower. And so I just
22 documented where I was and what the tower number is,
23 because that kind of stuff is very useful later when
24 you're looking at drawings from the utility circuit maps
25 and the like, because those numbers are on the drawings
26 identifying the tower on the drawing.

1 Q. I skipped a step I want to go back to. On the
2 bottom right corner of those, of these photographs, you
3 had already referred to your, the date and time stamp
4 from your camera?

5 A. Yes.

6 Q. And can you let us know when each of these
7 photos is being taken? For instance, this photograph No.
8 200?

9 A. This one was taken on November 11th, 2018, at
10 13:32.

11

12 (Grand Jury's Exhibit 201 was marked for identification.)

13

14 Q. Great. All right. Let's move on to No. 201,
15 Exhibit 201. And can you tell us what we're looking at
16 in this exhibit?

17 A. Now, this was taken at 13:36. It's just a few
18 minutes later. And I do tend to take pictures in a
19 sequential way so that -- the time frame can be important
20 in determining whether or not that pole, that tower
21 serial number applies to which pole, because it has to be
22 a picture of a tower either before or after the tower
23 number. So these time frames can be important.

24 But the details in this particular picture,
25 this is a detail of the insulator that's hanging upside
26 down. And I was standing next to one of the legs of the

1 tower, looking up at it, trying to get -- this was way up
2 in the air, so I was using a long telephoto lens. And
3 you can see the, these are ceramic discs here that this
4 insulator is made of. And those ceramic discs have
5 broken when the insulator came down and whacked against
6 these metal parts of the tower legs.

7 And this end of it right here is the hook end
8 that where it was hanging from a hole in a piece of metal
9 up above this. And the hook broke, and it -- the
10 insulator came down. It's hanging by its conductor with
11 the bottom end up.

12
13 (Grand Jury's Exhibit 202 was marked for identification.)
14

15 Q. Let's move on to 202.

16 A. This is another picture of the same thing, only
17 with a side view. And this is taken at 11/11/18 at
18 13:51, so just a few minutes later. Here's the insulator
19 that's upside down again. It's hanging there by its
20 conductors. And it's supposed to be hanging like this
21 one is. You see on this one -- I guess we can't do that
22 on this. You can see on this one, there's an arm here
23 that goes back to the center tower. And this horizontal
24 rod, horizontal angle iron comes out and there's a couple
25 holes there in the end, and there's a hook in there, and
26 the insulator is hung in that hook and supports the wire.

1 This one, this horizontal one is the same kind
2 of thing. You can see the hole here at the end. And
3 this insulator was hanging from there just like this one
4 was.

5
6 (Grand Jury's Exhibit 203 was marked for identification.)
7

8 Q. All right. On to Exhibit 203.

9 A. Now, this is taken at 13:58, same day. And it
10 is another picture of the insulator of interest hanging
11 in its upside down mode. And here at the bottom here you
12 can see, get the first indication that there's something
13 wrong with this hook. Again, this is taken with a
14 telephoto lens. I'm not up in the air at all, I'm just
15 taking this from the ground using my tripod and my
16 telephoto lens.

17 And this is where, this is 115 thousand-volt
18 cable touching the steel of the tower. We'll get into
19 that in a little bit, but when you have 115,000 volts, or
20 even 120 volts in your house, and it touches a bare metal
21 pipe that's grounded, then you have issues because of
22 shorting and arcing. And this tower is grounded because
23 this steel structure goes down to concrete pads, footings
24 in the dirt, and so it's, it's got an electrical
25 connection directly to earth. So this is a hot wire
26 that's not insulated. And when it touches something like

1 this, you'll have issues.

2 Q. At this point in time, from this vantage point
3 you took this photo, could you see any damage to the
4 conductor itself?

5 A. Only a little bit. And I've managed to focus
6 into it a little bit later, but you can see there's a --
7 this is a stranded cable, it's probably an inch in
8 diameter. Small strands of aluminum wire that are
9 wrapped around a steel core. The steel gives it the
10 strength, the aluminum gives it the conductivity for the
11 electricity.

12 What we have here, you can see some broken
13 strands sticking out. And beyond that I couldn't see
14 much damage in this picture.

15
16 (Grand Jury's Exhibit 204 was marked for identification.)
17

18 Q. Let's go on to 204.

19 A. This is another one taken at 13:59 on -- I'm in
20 a photo thing here.

21 Now I can start seeing not so much damage, but
22 at least the black marks here that represent an arc mark.

23 This cable is big enough, like I say, it's
24 probably an inch and -- 1.1 inches in diameter, it's big
25 enough that it's covering up anything that's on the steel
26 tower leg itself. And I don't see anything down here.

1 But I do see some black marks here which are typical of
2 the burn damage that you get on wires when there is an
3 arc in that general area. And those broken strands are
4 up off the top edge of the picture here.

5 Now here you see some what's called "bird
6 caging," at least a little bit of it, at the bottom edge
7 of this picture. That happens because the wire gets hot.
8 And we can get into that if we need to.

9 Q. Why don't you go ahead and explain to the
10 jurors what is bird caging, what causes it.

11 A. In wildland fires we see a lot of it,
12 particularly in the horizontal sections of wires that run
13 over areas where you've had very hot fire on the ground
14 below. And because this is, these are aluminum strands
15 of wire that are wrapped around a steel core, much like a
16 big rope, it has smaller strands wrapped around
17 oftentimes a center core, this aluminum expands, because
18 it gets hot, at a certain rate. And the steel core which
19 is at the very center of this and is maybe a quarter inch
20 of diameter expands at a rate based on how hot it gets,
21 too. But the aluminum expands more than the steel does,
22 and the steel is what's at the core.

23 So when the aluminum gets hot, it goes zoot, a
24 lot. And when the steel gets hot, it goes zoot, just a
25 little bit. And the aluminum is twice, gets twice as big
26 as the steel does. And so when you, when you, when you

1 heat up both the wire, heat up the wire and the core
2 because of a wildland fire or other phenomenon that makes
3 the wire get hot, then you'll have this bird caging,
4 because the aluminum doesn't have anywhere to go except
5 out.

6 Q. And, for the record, as you were demonstrating
7 the heating, you were using your hands almost like a
8 balloon to expand in front of you?

9 A. Yes, exactly. And I have seen more dramatic
10 situations where the birth cage is actually 5 or 6 inches
11 in diameter and 18 inches long. If you have a big
12 wildland fire underneath the transmission line, that big
13 source of heat will do that.

14 You've all seen sidewalks that buckle in the
15 sunlight? You've seen maybe railroad tracks that expand
16 and get curlicued because of the heat? That's the same
17 kind of phenomenon here.

18 Q. This would be a good opportunity to go back
19 over some electrical basics so we can understand these
20 terms, such as you've used "volts" and -- explain to us
21 what a volt is.

22 A. Well, one good way to think of electricity is,
23 one good way, one good model for electricity in wire is
24 water in a hose. But we can't take that example too far,
25 but I'll just use it a little bit.

26 So the electricity in the wire are the amps.

1 Amperes of electricity are like gallons of water in the
2 hose. And so what is it that keeps the water in the
3 hose? The plastic of the hose itself. So what is it
4 that keeps the electricity amperes in the wire? But the
5 insulation on the wire. You see on the floor here we
6 have wires that are all insulated? That's what keeps the
7 electricity in the wire.

8 Now, these wires here are not insulated because
9 there's nothing touching them except the insulators
10 themselves. And besides, the voltage is so high that the
11 insulation would have to be about that big around to
12 contain it.

13 Q. Indicating with your hands about 18 inches?

14 A. Or about a foot anyway.

15 Q. Okay.

16 A. So they use just the air as the insulator in
17 these transmission line conductors, that's why they're
18 bare.

19 So we talked about that's what amps are. Amps
20 are like gallons of water.

21 Then there's volts. Volts are like pounds per
22 square inch of water. How much pressure is in the hose
23 pushing the water, or pushing the electricity to go
24 somewhere? And that tells you, that's the volts, or the
25 pounds per square inch of voltage.

26 Q. So what are watts?

1 A. Watts then are units of power. Horsepower is
2 measured in watts. The horsepower of your car, you
3 always think about it in terms of plain old horsepower,
4 but that's in English unit of measure. The universal
5 unit of measure is watts. So electric cars are, engines
6 are measured in watts, but they talk to people about it
7 in terms of horsepower because we all understand what
8 that is. But it's how much work can you get that
9 electricity to do how fast?

10 Q. You've talked about grounding, or the things
11 are grounded. What does that mean?

12 A. Well, on -- with electrical wires -- and these,
13 this orange extension cord here on the floor has got 120
14 volts in it, and it's providing power to this power strip
15 over here. And, I'm sorry, what was the question?

16 Q. What does it mean to be grounded?

17 A. Oh, grounded, yes.

18 The power goes from the plus side of a battery,
19 speaking in terms of DC, batteries, around to the
20 negative side of the battery. The negative side of the
21 battery is the equivalent of ground in the AC word.

22 This, this extension cord here on the floor and
23 this transmission line here is alternating current, which
24 means that it oscillates back and forth at 60 cycles a
25 second. Sixty times every second it changes direction.
26 And so does this wire here. But the DC in your car

1 doesn't do that, it always goes in the same direction.
2 But the commonality is that the DC, minus on the DC side
3 is called "ground." And in this particular case, the
4 ground is actually the ground, earth. And so you need to
5 -- when they generate AC current at the dam or the
6 nuclear generating station or the natural gas generating
7 station, whatever it is they're using, they have a big
8 connection to earth. And so earth is part of the
9 electrical wiring in this system, because all the current
10 goes back in the ground to the source that it came from.

11 Q. What is arcing?

12 A. Arcing is where you have electricity, or water,
13 getting out of the hose that it's supposed to be inside.
14 You know that if you take a needle or a pin or a nail and
15 put it into a garden hose and pull the nail out, you'll
16 have a spurt of water, particularly if the water is
17 turned on.

18 Likewise, this extension cord is similar. The
19 plastic insulation keeps the electricity inside the cord
20 and only on the wire so that it goes to where we want it
21 to go to. And so if that wire gets outside of that or
22 touches something that it's not supposed to, because at
23 the end of the cord we have metal, bare metal prongs
24 where the plug is, and if you're not careful when you're
25 plugging that in, you can get shocked. That's because
26 electricity is jumping off of the conductor onto you

1 because there was no insulator there to protect you from
2 it. And so arcing is when electricity is doing that,
3 jumping from one thing to another, when it's not supposed
4 to generally.

5 And in this particular case, this has no
6 plastic insulation on the cable and so it's relying on
7 the air to provide the insulation that keeps the
8 electricity in the wire. But if that wire gets too close
9 to something that is connected to earth, that's, the
10 electricity says, oh, well, this is a better way to go
11 back to earth, go back to where I came from, so the
12 electricity jumps off this cable and onto this metal here
13 and down to earth. And that jumping is called where the
14 arc is.

15 Q. Why is it bad for electricity, for bare
16 electrical wire like this to come into contact with a
17 metal, piece of metal like this?

18 A. Well, it's very dangerous. It's -- we go to
19 great extremes to try to design electrical systems to
20 keep the electricity inside the wire or on the wire.
21 Just like this extension cord here has been very
22 carefully engineered to keep the electricity inside that
23 extension cord.

24 This tower here, these systems have been very
25 carefully engineered to keep the electricity on this wire
26 and not going where it's not supposed to go, because it

1 creates dangerous problems, electrocutes people, creates
2 fires, and it wastes the company's product. It's just
3 like a leak on your hose. If you have water leaking out
4 your hose, it's costing you money because there's water
5 going where you don't want it to go. In your drip
6 irrigation system, for example. If you have a --
7 irrigating something you don't want to irrigate, then
8 you're wasting water on something you don't want to do.
9 So you need to plug that loop.

10
11 (Grand Jury's Exhibit 205 was marked for identification.)
12

13 Q. All right. Let's go on to photo 205 then, now
14 that we have a basic understanding of the science of
15 this. Do you recognize the Exhibit 205?

16 A. Now this is another one of my photographs that
17 I took on the same day at 14:07, so we're progressing
18 along the day a little bit. And, again, I was using my
19 long lens, trying to get good pictures of the damage on
20 this conductor right here.

21 And here you can see those broken strands that
22 I referred to earlier. And this is Exhibit 205. And so
23 -- and then you can see where the strands used to be
24 connected to the cable before they were broken, because
25 of an arc. And you can see some arc marks here.

26 The jumping of electricity through the air to

1 another piece of metal oftentimes creates either burns --
2 this is paint on here, it will burn the paint. So this
3 black carbon here -- there's a lot of sources for this,
4 but this black mark is typical of the kind of arcing
5 evidence that you'll see around. And if we were to look
6 at this cable in more detail, which we can in a bit,
7 you'll see actually the divots of the metal where that
8 is.

9 Q. All right.

10 A. There you go.

11 Q. This is Exhibit 2 -- or 29, I'm sorry.

12 A. Now, this is not one of my photographs, because
13 this was taken by another person. I think this was taken
14 by PG&E, when they were up there removing this cable and
15 bringing it down off the tower for our keeping as
16 evidence.

17 So what we see here are the black marks around
18 here. And you see these little molten, pieces of little
19 bits of molten material right here and right here. And
20 there are some down here, too.

21 This is typical when you have an arc. I don't
22 know whether you've actually seen an arc, but there are
23 some really good videos on the Internet available that
24 people have said, "Well, what temperature is an arc?
25 What temperature is the electricity when it's jumping
26 from one thing another in the air?" Well, I suspect it's

1 between 5- and 10,000 degrees, because it's a plasma. It
2 has ionized the air to a very high temperature. And this
3 high temperature is high enough to melt this aluminum
4 here. And that, this aluminum melts at about 1,200
5 degrees Fahrenheit. So this is, this is -- that's a good
6 number to know, because that tells you how hot this got
7 to be, at least that hot, 1,200 degrees.

8 So all of whenever you see this molten stuff
9 here, that means it's up to 1,200 degrees. And that's it
10 for that picture.

11
12 (Grand Jury's Exhibit 30 was marked for identification.)
13

14 Q. All right. Move on to Exhibit 30.

15 A. Now, this is another one of those PG&E details,
16 a similar kind of thing. Same kind of damage again.
17 It's just another example of arcing damage and molten
18 aluminum and the burn marks on the aluminum itself. And
19 you see this molten aluminum here? It takes 1,200
20 degrees to do that.

21 But also the interesting thing in this picture
22 here is this, because this is the steel structure of the
23 tower, and what we have here is where the arc jumped from
24 the wire to the tower and damaged the tower. Now, this
25 could be molten steel, which takes 2,700 degrees to melt
26 that. So you know the plasma arc is at least 2,700

1 degrees hot. And you can see the black damage around
2 here, because the paint that's on here has probably
3 burned and other pollutions in the air have burned
4 because of the plasma in the arc.

5 So there was electricity going from this wire
6 to the ground of the tower, and it was landing on --in
7 this area.

8 Q. Okay. Now, the area you're pointing out to, is
9 that part of the tower or is that that metal tube that's
10 attached to the, underneath the conductor?

11 A. Oh, that's a good point. This might be the
12 metal tube that's on the bottom of the conductor.

13 Q. Right.

14 A. Let's get back to some other pictures here.
15 That's the tube right here. So it was, it is steel, too,
16 I think. So we'll get to the tower pictures here in a
17 little bit. This is the tube, not the tower.

18 Q. Okay.

19 A. We have some tower stuff here, too. Here
20 again --

21

22 (Grand Jury's Exhibit 31 was marked for identification.)

23

24 Q. Let me put on -- this is Exhibit No. 31.

25 A. Exhibit No. 31. This is the tube, this is the
26 conductor, this is the tower. And I don't see any tower

1 damage here. This is the PG&E safety rope. And you can
2 see all kinds of molten aluminum here.

3 Oh, here we go.

4

5 (Grand Jury's Exhibit 32 was marked for identification.)

6

7 Q. Now we're on Exhibit 32.

8 A. 32. This is another PG&E photo.

9 Now this shows what I was telling you about,
10 because this is the one with the tower structure members.
11 And you can see this divot right here, and the divot
12 right there, and the little burn mark right there, and
13 the burn mark right here.

14 Q. Now, I'm going to have you do some drawing on
15 this --

16 A. Okay.

17 Q. -- if it comes up.

18 All right. You'd be drawing in red. And if
19 you can circle those.

20 A. Now, these two are the divots of molten steel,
21 2,700 degrees' worth, where either the cable touched the
22 tower directly or the arc went to that point on the
23 tower. I don't know which happened.

24 These black marks here are most likely to be
25 not where there was a physical touch between the wire and
26 the tower, but the arc jumped to the tower.

1 Now on the cable itself, you can -- we have --
2 whenever we have an arc, the arc is going from something
3 to something else. In this particular case, we're going
4 to make the from -- all the to marks are in red. And
5 these circles in blue are the from marks.

6 Here's where the electricity jumped from and
7 then to the tower.

8 Now these broken ones here, if I give these
9 numbers -- 1, 2, 3, 4 -- 3 and 4 are likely to be where
10 the cable actually touched the tower because the strands
11 are broken. Just the arc itself won't break a strand.
12 It will do more like 1 and 2.

13 Then we have more divots down here. And we
14 have more divots down further. Let's give this a 5.

15 Q. So strands that you've labeled as 3, 4, 5 with
16 the blue pen indicate that those are broken?

17 A. Well, no, 3 and 4 are the broken ones and are
18 more likely to have been touched. Well, maybe 5, too,
19 because the divots are so deep, but they're not broken.
20 Whereas 1 and 2 are shallow enough to maybe be just not
21 actually a touching.

22 Now this divot here, the red number 1 -- can
23 you go back to red? There we go. Red number 1, 2, 3,
24 and 4. Red numbers 1 and 2 are deep enough that that's
25 likely to have been where the actual cable touched. And
26 it was -- when the cable is arcing and all this is going

1 on, remember, the winds are going about 40 miles an hour,
2 50 miles an hour, and not only that, the winds are making
3 the cable bounce back and forth, but the arcing does
4 that, too. So that's why we have so much all over the
5 place, because everything is bouncing around. I've seen
6 big cables like this hit the ground that are hot, and it
7 bounces along the ground as it arcs, and it leaves molten
8 dirt on the ground.

9
10 (Grand Jury's Exhibit 32A was marked for identification.)
11

12 Q. All right.

13 And, Madam Foreperson, we're going to save the
14 screen as it is with the drawings on that, and we will
15 have this printed out later and marked as 32A.

16 Let's go on to 33.
17

18 (Grand Jury's Exhibit 33 was marked for identification.)
19

20 A. Now, 33 is a continuation of the kinds of
21 things we were looking at at 32, because we see the black
22 marks here along the structure leg of the tower where the
23 electricity was likely to have been arcing to the tower,
24 but the wire wasn't necessarily touching it because,
25 again, it's bouncing around.

26 Here along this horizontal element of the tower

1 we see some more ragged divots. I think 32 might be the
2 view of this from here. Whereas now we're looking at
3 straight on. Because the two divots in 1 and 2 that are
4 here are on the other -- in the previous picture. But
5 the interesting one about this is the burn marks on the
6 tower right there.

7
8 (Grand Jury's Exhibit 34 was marked for identification.)
9

10 Q. All right. Now let's go on to 34.

11 A. So here's 34 with more burn marks and some
12 actual divots. If you'll turn that back on, please.

13 There we go. That will do. That's a good
14 color, red.

15 Q. Use green. You've used red and blue, let's use
16 green.

17 A. Let's look at the divots. This is the steel
18 part of the tower. And here we have a divot, and here we
19 have one, here's another one, here's another one. See
20 how tiny these are? And they're not -- they're separated
21 and they're not -- this is more likely to be either
22 bouncing around or just the arcing, the electricity going
23 from here to there to there as it find its most
24 conductive path.

25 So that's what we have here is the damage to
26 the tower structure as the electricity goes from the wire

1 into the tower steel, which is connected to earth through
2 the footings in the ground.

3 Q. Are these here, are those all --

4 A. Well, this one here is a good example, also.
5 I'm saying that because you can see on these the little
6 bit of blackness around the edge. Here I don't see so
7 much blackness, but it could be another arc mark, too.

8 Q. So you've circled the arc, or the damage marks,
9 with green circles?

10 A. Correct.

11 Now, let's hypothesize, for example, that we
12 have bullet holes or BB or pellet holes. We wouldn't
13 have the black stuff. We would just have the divot in
14 the paint. So that's why the black stuff is important.

15
16 (Grand Jury's Exhibit 35 was marked for identification.)

17
18 Q. All right. So on to Exhibit 35. This one's a
19 little hard to see; the lighting wasn't very good.

20 A. Now, let's do this again. Now, this, just for
21 your information, this is a steel tower, and steel rusts.
22 So they put a paint on the tower. Sometimes it's
23 generally called a "coating," a "corrosion preventive
24 coating." And that's what this green stuff is here, I
25 think. It's either just plain old paint or corrosion
26 inhibitor. And it's usually fairly thick, but it doesn't

1 provide a whole lot of good electrical insulation,
2 particularly when you're talking about 115,000 volts.

3 So -- but that's why this turns black, because
4 it is something that's not steel. It's, it's something
5 that will -- let's see here, what color do we want to
6 use? Let's, let's just use black, because I'm only going
7 to do one here.

8 Because that's just another black mark. I
9 don't see any divots or damage. I don't see any damage
10 to the coating there, as though the electricity made it
11 all the way down to the steel.

12

13 (Grand Jury's Exhibit 35A was marked for identification.)

14

15 Q. Let's save that, the drawing. That will go up
16 to 35A. Okay. Let's hit cancel. We don't want to open
17 it, we just want to save it.

18 All right. So we've looked at a bunch of
19 pictures of the structure. Let's go back to looking at
20 some of the conductor. And this is Exhibit No. 50.

21 A. This is a good one, because it is an extreme
22 example. Remember we were talking about the broken
23 strand? This is a strand. That's a strand. There's
24 umpteen strands here. And there's about three layers of
25 strands here. This is the outside layer, here's the next
26 inside layer, and there may be another one on the inside

1 of that. And then inside that is where the steel is.

2 But here, because you have broken strands and
3 you've got molten metal at the end of the strand -- this
4 is not a picture in very good focus, but I think this is
5 a molten end here. That's, that all goes to this fact
6 that this was damaged because of an electric arc melting
7 this wire and breaking the wire, because it just melted
8 it.

9 Now, if you were to take this -- we'll get to
10 this perhaps in a bit, but if you were to take these
11 strands and lay them back down as though they were still
12 there, you'd find that you have missing metal. You'd
13 have a little bit of missing metal right here. Because
14 this strand, when you lay it down, is not long enough to
15 touch that end. And that missing metal is critical.
16 We'll get to that in a bit.

17

18 (Grand Jury's Exhibit 51 was marked for identification.)

19

20 Q. All right. Moving on to Exhibit 51.

21 A. Here's more of the black marks, arcing, the
22 electricity jumping around, and the cable hitting the
23 wire. And this is all molten damage to the aluminum. We
24 didn't break any strands here, but that's what's going on
25 there.

26

1 (Grand Jury's Exhibit 52 was marked for identification.)

2

3 Q. And Exhibit 52?

4 A. Here's our broken strands again. And this is
5 just, this is after it was down on the ground. So this
6 is just a stick right here. That's not a strand. But
7 let's go to the next one.

8 Q. Well, from this, one thing I wanted to ask you
9 about, we were talking earlier about bird caging. From
10 this angle, looks like a much better angle to see this
11 bird caging, is that what's going on here?

12 A. Well, it -- maybe and maybe not. Because this
13 got very hot right here because of the arcing. We
14 already know this was 1,200 degrees. And so this little
15 bit of stuff may be the differential expansion because of
16 the heat generated here, but -- this is a possibility,
17 but it's not as good an example of bird caging as can be
18 seen.

19 Q. Right. And then the area we talked about bird
20 caging earlier, a little bit different angle of it here
21 on this side, with the black scorch marks?

22 A. Or right in here, too. That's another
23 possibility for sure. But that's -- what's most
24 important to remember in these closeup pictures is you're
25 looking for missing metal.

26

1 (Grand Jury's Exhibit 53 was marked for identification.)

2

3 Q. And Exhibit 53?

4 A. Same thing. Because we have missing metal
5 here. You see this big divot? And if you were to lay
6 these strands back down, you would not have enough
7 material to make contact.

8

9 (Grand Jury's Exhibit 54 was marked for identification.)

10

11 Q. All right. Let's go on to 54.

12 A. This is a detail of the broken strands one.
13 And you can see missing metal here in this divot. And
14 this is missing metal here. And all of the strands are
15 pointy end, which suggests that it was either melted
16 because -- it had broken because of the divot, or it
17 melted because it pulled apart when it was soft and
18 malleable.

19 Q. All right. So you talked about missing metal.
20 Did you search around the base of the tower for missing
21 metal?

22 A. Absolutely. Because we already know that in
23 order for this to be molten, which this was at one
24 time --

25

26 (Grand Jury's Exhibit 206 was marked for identification.)

1
2 Q. Before you start referring to it, let's -- you
3 now have Exhibit No. 206 in front of you; correct?

4 A. Correct.

5 Q. You recognize that photograph?

6 A. This is one of the pictures I took the same
7 day, 11/11/2018 at 14:24 -- 14:22, sorry.

8 And the reason this one was interesting was
9 because this piece of aluminum here was molten at one
10 time. You can see in the center here, you can see it's
11 niched down. You can see the rounded ends here and here.
12 And, likewise, on this little piece of metal right here,
13 it was molten at one time.

14 So keep in mind that we're looking for missing
15 metal. Well, this is a possibility for where it is now.
16 And if it hits the ground at 1,200 degrees or more,
17 because we know that the arc is -- could be as much as 5-
18 or 10,000 degrees, so we don't know the exact temperature
19 of this wire, but it was at least 1,200 degrees.

20 So let's assume it's 1,200 when it hits the
21 ground. What's on the ground? Well, cellulosic material
22 is the general word for grass. What does grass ignite
23 at? You can remember from the movie *Fahrenheit 451*,
24 remember that old movie? Paper burns at 451 degrees.
25 That's the good rule of thumb, because is 1,200 more than
26 451? Yes. So this 1,200-degree metal will ignite this

1 cellululosic material like this pine needle.

2 Q. Which brings up a good point, because we're
3 looking at an exploded view, a closeup view, of these
4 things without much to scale. Tell us how big these
5 pieces actually are.

6 A. Well, I don't know how long it is, but the
7 diameter of this strand is probably about the size of a
8 pencil lead. It's the same strands we were just looking
9 at on the other cable, on the other photos. So these are
10 maybe a couple inches long. This is maybe an inch or so.
11 And oftentimes I try to throw down a scale for that
12 purpose, but I didn't do that on this one because the
13 wind was howling up there, it was amazing. And we were
14 all cold.

15 One of the questions I was wondering about, I
16 said, "Well, Marc, where is all the -- if there was so
17 much grass up here and it caught fire because of the
18 hypothesis I just shared with you, where is the ash?"

19 And they said, "Well, it all blew away because
20 the wind was so strong."

21 This was very strong winds at a peak, on a
22 ridge, and it was howling through there like nobody's
23 business.

24 MR. NOEL: Jurors, please remember the
25 admonition you've been given about hearsay. It's not for
26 the truth -- to be considered for the truth of the

1 matter.

2 Okay. Let's move on to 207.

3

4 (Grand Jury's Exhibit 207 was marked for identification.)

5

6 A. Here's another example of that missing material
7 we were looking for. I think it's just the same picture
8 of the same piece of metal that we were looking at on the
9 ground.

10 Q. Okay. And 208?

11

12 (Grand Jury's Exhibit 208 was marked for identification.)

13

14 A. This is another one taken at 14:21 or so. And
15 then same piece of metal. Here's the longer one with the
16 melted piece in the middle and the smaller one over here.
17 Trying to get one of the good ones in focus.

18

19 (Grand Jury's Exhibit 208A was marked for
20 identification.)

21

22 Q. And 208A?

23 A. Same thing. All have been blown up a little
24 more. You can see that this was definitely molten at one
25 time.

26 Q. So we spent a lot of time focusing on these two

1 little pieces of metal. What is the significance of
2 these two pieces of wire being down there on the ground
3 in amongst the rocks?

4 A. Well, they are, they are -- first of all, they
5 are one of many, they are two of many little pieces of
6 molten material that was on the ground. And that the
7 significant is the temperature of that metal when it hit
8 the ground was likely to have been high enough to ignite
9 the material that was on the ground, meaning the grass.

10 Q. We'll go back to that. I'm skipping ahead.

11 Okay. Based upon your observations, based upon
12 being up at the scene, the photos that you've taken, the
13 evidence that you saw up there, as well as the
14 photographs that were taken by the PG&E crews as the
15 parts were being taken off of the tower, do you have an
16 opinion as to whether or not that 115 kV line was
17 energized at the time that the hook gave way and dropped
18 the insulator string upside down?

19 A. Yes, it was energized, because when I was there
20 it was not energized and nothing was happening. Had it
21 still been energized, we would have still seen some
22 bouncing around. We would have seen some arcing. We
23 would have seen the electrical flashing between the tower
24 and the conductor. And just for their own safety
25 purposes, I think PG&E turned off the power to that --
26 those lines. And so -- but it was energized at the time

1 it occurred, and it was energized when I was there.

2 Q. How can you tell that the line was energized
3 when the hook broke?

4 A. Because of the -- had the line -- had the hook
5 broken -- let's think through this. Had the hook broken
6 and the line not been energized, nothing would have
7 happened. You'd see that insulator and the wire hanging
8 there. You would not see the burn marks on the structure
9 of the tower. You would not see the molten material on
10 the conductors themselves. You might see some mechanical
11 divots where it hit the tower. You would see a little
12 denting maybe. But you wouldn't see the black burn marks
13 and the molten melted metal around the steel tower area
14 and on the conductor itself had the hook broken when it
15 was not energized. In order for that stuff to have
16 happened, the hook had to break when it was energized.

17 Q. All right. Thank you on that.

18 Now I want to show you a couple other pictures
19 real quick. Number 195. Do you recognize that
20 photograph?

21 A. Yes. This is a picture I took on -- at the
22 early stages of 11:41 on the 11th trying, just trying to
23 characterize what was around me. This is a photograph
24 from the tower of interest, which is where we had that
25 broken insulator.

26 Q. 27/222?

1 A. Correct. This is a photograph from that
2 27/22 --

3 Q. -- 22.

4 A. -- looking east to the next tower along the
5 line. Because I saw what we have here. And I wanted to
6 document it, because it represents to me a repair that
7 needed to be done promptly. Because this is a threaded
8 piece that's supposed to be inside this threaded nut to
9 hold this insulator down. And if the next picture is
10 what I think it is --

11 Q. Yep. Next picture 196.

12 A. This is what it should look like. This is the
13 same tower on the other side of the tower. This is what
14 it looks like. And this wire is here to keep the
15 insulator from waving in the wind.

16 If you could back up again, please.

17 This one is not here, and it's hanging there.
18 And so that needs, needs prompt attention.

19 But the other interesting thing about this
20 picture are these angle irons that form the structure of
21 the tower. This one right here and right here and right
22 here. You can see this particular structure has been
23 bent in the past and maybe straightened out, but not
24 straightened out very well. And certainly not repaired
25 with new material. Because if this -- this can only
26 happen when the wind is blowing out of the picture and

1 bending this wire, bending that angle iron down.

2 Q. Or is it possible, as an engineer, that that
3 damage could have been caused by a conductor failure,
4 that the conductor broke somewhere and it was being
5 yanked?

6 A. I don't think so. Because this is, this is the
7 conductor right here.

8 Q. Right.

9 A. And it could have, but the point is it's not
10 structurally as sound as it should be or as it used to
11 be. And if you look at the next picture, you can see --
12 this is the other side of the same tower -- you can see
13 this is bent, and it should be straight.

14 Q. All right. I believe that is all the questions
15 that I have at this point.

16 Anything?

17 MR. FOGG: Few follow-ups.

18 MR. NOEL: Go ahead.

19

20 EXAMINATION

21

22 BY MR. FOGG

23 Q. Mr. Nolt, how do you know that the conductor
24 you've seen in these pictures today was not -- how do you
25 know the conductor was not insulated?

26 A. How do I know it was not insulated?

1 Q. How can you tell by looking at those pictures?

2 A. Because the bare metal is visible.

3 If -- on this, in the example of this extension
4 cord on the floor here, you can tell that's insulated
5 because of the orange plastic on the outside of it. Were
6 you to take a pocket knife and shave that off, you'd get
7 down to the copper. And if you were to shave it off for
8 its entire length, you'd see bare copper. And so I would
9 say then that that copper is not insulated. Just like I
10 would say on this aluminum up here, on the transmission
11 conductors, that they were not insulated either.

12 Q. So as we're looking at Grand Jury's Exhibit 53
13 behind you, the fact that you can see the bare metal
14 tells you it's not insulated?

15 A. Correct.

16 Q. The last question I have is how do you know the
17 tower was made of steel, transmission tower?

18 A. That's a reasonable hypothesis at my level,
19 because it's most unlikely that it would be anything
20 else.

21 Q. Can you explain for me a little bit why you
22 would make that hypothesis, or why you consider it to be
23 reasonable?

24 A. Well, steel is, steel is really strong. And
25 just in the atmosphere of my work, there are steel
26 towers, period. I haven't gotten into the metallurgy of

1 the tower structure. They've always just been assumed to
2 be steel. I don't know which alloy, I don't know which
3 -- the details of the steel, but it is generally known to
4 be steel.

5 Q. So you're saying that based on your experience
6 in this profession?

7 A. Right.

8 MR. FOGG: No further questions, Mr. Noel.

9 Do any of the Grand Jurors have questions for
10 Mr. Nolt?

11 Must be done.

12 MR. NOEL: I believe that's it.

13 THE WITNESS: Thank you all.

14 MR. NOEL: Mr. Nolt, before you go, there's an
15 admonition the foreperson has for you.

16 THE WITNESS: Thanks.

17 GRAND JURY FOREPERSON: Mr. Nolt, you are
18 admonished not to discuss or disclose at any time outside
19 of the jury room the questions that have been asked of
20 you or your answers until authorized by this Grand Jury
21 or the Court. A violation of these instructions on your
22 party may be the basis for a charge against you of
23 contempt of Court. This does not preclude you from
24 discussing your legal rights with your own attorney.

25 Mr. Nolt, what I have just said is a warning
26 not to discuss the case with anyone except the Court,

1 your lawyer, or the district attorney.

2 THE WITNESS: Okay.

3 GRAND JURY FOREPERSON: Do you understand?

4 THE WITNESS: All right.

5 GRAND JURY FOREPERSON: Thank you for being
6 here with us today.

7 THE WITNESS: You're welcome. Thank you.

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 151

are certified to be a complete transcription of said stenographic shorthand notes.

DATED: THIS 6TH day of JUNE 2022

3 (Confidential Grand Jury Hearing Proceedings)

4
5 (ROLLCALL OMITTED.)

6
7 MR. NOEL: Thank you. The first witness today
8 we'll call would be (WITNESS #2).

9 Sergeant at Arms.

10 [The witness enters the courtroom.]

11 GRAND JURY FOREPERSON: (WITNESS #2), before you
12 sit down, raise your right hand, please, to be sworn.

13 Okay. Do you solemnly swear that the evidence
14 you shall give in this matter pending before the grand
15 jury shall be the truth, the whole truth, and nothing but
16 the truth so help you God?

17 THE WITNESS: Yes, Ma'am.

18 GRAND JURY FOREPERSON: Thank you. Have a seat,
19 please.

20 **EXAMINATION**

21 BY MR. NOEL:

22 Q. (WITNESS #2), would you please state your full
23 name spelling your last name for the record.

24 A. Okay. (WITNESS #2), [Redacted spelling.]

25 Q. And I guess just because there's so many
26 different spellings, could you spell (WITNESS #2) for us.

1 A. [Redacted spelling.]

2 Q. (WITNESS #2), are you employed?

3 A. Yes.

4 Q. By whom are you employed?

5 A. Pacific Gas & Electric.

6 Q. How long have you worked for Pacific Gas &
7 Electric?

8 A. Fourteen years.

9 Q. And what do you do for Pacific Gas & Electric?

10 A. I'm a hydro electrician.

11 Q. What is a hydro electrician?

12 A. A hydro electrician is -- basically we maintain
13 all the water conveyance equipment in the Feather River
14 Canyon along with the powerhouses. The generators,
15 anything that's associated with the powerhouse.

16 Q. Okay. What is a water conveyance?

17 A. That would be like the dams. There's power dams
18 up the Feather River, there's canals, there's trash rakes
19 on the flumes. Anything associated with moving water.

20 Q. When you hear the term "hydro electrician," it
21 seems to be somewhat contradictory. You don't want water
22 and electricity. But you use water to --

23 A. We use water to generate electricity, yeah. So
24 you're right. It sounds odd, but it definitely is --
25 we're generations so we're supporting generations.

26 Q. It's not the hair dryer in the bathtub?

1 A. No, definitely not.

2 Q. You're making electricity as in water?

3 A. Yes, Sir.

4 Q. And how exactly -- what do you do in that chain?

5 A. So basically what we'll do is we'll use water
6 from the Feather River. We'll run it through a unit,
7 generate electricity. And then what we'll do is we'll
8 come in -- on the off times during the outages when we
9 shut the units down, we'll come in and basically just
10 maintain the equipment, pumps, motors and, you know,
11 change the oil. And basically, that's it.

12 And then we're available for any kind of
13 failures. So we will be up there at any hour, you know,
14 in the middle of the night, whatever it takes to keep the
15 units online.

16 Q. November 8, 2018. Do you remember where you
17 were working that day?

18 A. Yes, Sir.

19 Q. Where at?

20 A. So I was at Cresta Powerhouse which is just
21 below Pulga on Highway 70. I was pre-arranged to be
22 there at 4 o'clock. I actually left Chico at 3:00 in the
23 morning to be there at 4:00 to start setting up temporary
24 generators in anticipation of losing station service
25 power to our powerhouses.

26 Q. Was this something unusual?

1 A. No. We've lost power before but not -- not --
2 usually it isn't planned. We were setting up for a
3 planned power shutdown.

4 Q. Was this related to maintenance or was it
5 related to weather?

6 A. Weather.

7 Q. Okay. So you were prepping for the power to go
8 out as part of the public safety shut off?

9 A. Yes.

10 Q. Okay. You said you left Chico at around
11 3:00 a.m.?

12 A. Yes, Sir.

13 Q. And you were at Cresta about 4:00?

14 A. Yes.

15 Q. Where approximately is Cresta located?

16 A. Cresta is probably six miles down Highway 70
17 going east from Pulga, the Pulga turn, the Pulga grade.
18 It's probably 20 miles from Oroville. It's not too far
19 in the canyon.

20 Q. Okay. And you got there at about 4:00 a.m.?

21 A. Yes, yes.

22 Q. At some point did you become aware of a fire?

23 A. Yes, Sir. At about, I want to say, 6:00, maybe
24 6:40 somebody stopped in at the powerhouse. We were
25 basically in the basement setting up pumps. And
26 somebody -- I think it was a contractor who was working

1 in the area -- drove down into the powerhouse and said
2 that did we know there was a fire, you know, downstream
3 of where we were at.

4 Q. Do you know the name of that contractor?

5 A. It was somebody who worked for Syblon Reid, I
6 believe. I don't know the guys's name, but I do know it
7 was definitely a contractor working -- I believe he was
8 working at Poe Dam.

9 Q. Okay. And the contractor's name was Syblon
10 Reid?

11 A. Who he worked for is called Syblon Reid.

12 Q. Do you know how to spell that?

13 A. I want to say S-y-b-l-o-n R-e-i-d. Syblon Reid.

14 Q. Okay. Do you know what Syblon Reid does?

15 A. They are -- basically, they do -- they can do,
16 like, civil engineering work, road work. They work on,
17 like, heavy hydraulic work. Basically just a
18 subcontractor for us that we use. And I've seen them
19 around the canyon for several years. So they weren't
20 new.

21 Q. Okay. So this person shows up at the Cresta
22 Powerhouse and tells you?

23 A. Yeah, there's a fire up -- downstream of where
24 we're at on the hillside.

25 Q. So what did you guys do?

26 A. So the first thing we did is we went upstream of

1 the powerhouse and looked out across the river. And we
2 didn't see anything. And then as we went down onto
3 the -- they call it a tailrace. It's a big concrete
4 structure where the water -- where the tailrace water
5 comes out. And sure enough you could see in the distance
6 down -- you know, downstream you could see just maybe
7 enough flame to fill this room right here (indicating).

8 Q. And could you tell where that flame was located?

9 A. I could tell it was -- it looked like it was
10 about halfway up the hillside from where I was looking.
11 I knew there was railroad tracks down below so I know the
12 railroad had been working. So I didn't know if it was
13 something coming up from the railroad. I really didn't
14 have a very good vantage point to see. I saw where the
15 flames were, but it was like there was hillside to the --
16 down below it. So I couldn't tell if it got to that
17 point or started right there.

18 Q. Okay. Did you have a phone with you?

19 A. Yes.

20 Q. What kind of phone?

21 A. I have a -- just a company cellphone.

22 Q. All right. Smart Phone?

23 A. Yes.

24 Q. Equipped with a camera?

25 A. Yes.

26 Q. Did you take some pictures --

1 A. I did.

2 Q. -- of what you saw?

3 A. Yes.

4 Q. In front of you you have what is marked as
5 People's Exhibit Number 220.

6 A. Okay.

7 Q. Do you see that there in front of you?

8 A. I do.

9 Q. Do you recognize that photograph marked as
10 Exhibit 220?

11 A. I do recognize this photograph, yes.

12 Q. Did you take that photograph?

13 A. I did.

14 Q. Did you take that photograph on the morning of
15 November 8, 2018?

16 A. Yes, Sir, I did.

17 Q. All right. I am going to put that up on the big
18 Smart Board.

19 Can you see the Smart Board from where you're
20 at?

21 A. I can.

22 Q. And this is the same photograph that is marked
23 as 220?

24 A. That is the same photograph, yes.

25 Q. So what are we looking at here in this
26 photograph?

1 A. Well, we're looking at -- basically if you look
2 at that flame you see on the top right, when I --

3 Q. And you can get up and point things out on the
4 board if you'd like.

5 A. Okay. No. It just seems like when I first
6 saw -- because I didn't take pictures right away. When
7 we first saw the flame, it was like down here
8 (indicating). And then I slowly within 45 minutes time
9 watched it come all the way up the hill and then over out
10 of sight.

11 Q. Okay. So you were watching this for a long
12 time?

13 A. Yes. Because, you know, in the meantime I --
14 because basically, I was in charge of several -- you
15 know, like half a dozen people. So basically I was being
16 like, you know, "We've got to be ready for this to come
17 our way. What are we going to do? Are we going to head
18 out upstream in the canyon?"

19 So we were moving vehicles away from the
20 downstream just so that we'd have a good vantage point to
21 get out. Because, you know, usually you see at least one
22 or two fires a year in the Feather River Canyon. At
23 least one. So it wasn't -- you know, it wasn't like
24 unheard of to see a fire.

25 Q. How long have you been working in the Feather
26 River Canyon?

1 A. I've been in hydro about almost nine years.
2 Q. All of it in the canyon?
3 A. No. I was in substation prior to that.
4 Q. Okay. But I mean, once you went into the hydro.
5 A. Yes, in the canyon the whole time.
6 Q. So you've been in the canyon a while?
7 A. Yes, Sir.
8 Q. All right. Let's go on to Exhibit 221.
9 A. Okay.
10 Q. Do you recognize Exhibit 221?
11 A. Yes, I do.
12 Q. Is this another photograph that you took?
13 A. Somebody else took this.
14 Q. Somebody else took this?
15 A. Yeah, yeah.
16 Q. Who is the person in --
17 A. Me. That's me holding my hardhat, yeah.
18 Q. I'm sorry?
19 A. It's so windy right there that I'm holding my
20 hardhat on.
21 Q. Okay. Do you know who took this photograph?
22 A. Yes.
23 Q. Who?
24 A. It was the guy in the next picture.
25 Q. Okay.
26 A. Yeah.

1 Q. We'll get to that in just a second. But this
2 was taken using your phone?

3 A. Yes, yeah.

4 Q. All right. And tell us what we're looking at in
5 221.

6 A. You're looking at basically the same picture.
7 The wind was ripping through the canyon, and I just -- I
8 was basically looking at it. And then the guy behind me
9 took a picture of me turned around holding my hardhat on.

10 Q. So you went up -- you left Chico, you said,
11 about 3:00 a.m. and got up to Cresta about 4:00?

12 A. Yes, Sir.

13 Q. What were the weather conditions like when you
14 got there?

15 A. You know, it was definitely windy coming down
16 through Jarbo Gap but, you know, it didn't seem -- I
17 mean, it wasn't like beyond what I have ever seen. It
18 was definitely windy, but I had been up there before
19 where it was, you know, just as windy.

20 Q. Once you got into Cresta and went to work at the
21 powerhouse, were you somewhere where you were able to
22 feel the weather conditions outside?

23 A. I really wasn't because it's a big -- you know,
24 it's a big underground building the one story up, three
25 down. So really I was busy and I never really paid
26 attention. Once I got there, the wind just wasn't a

1 factor until I went outside. And then I realized that it
2 was still really windy.

3 Q. So with the power shut off and the wind
4 conditions, how does that affect the powerhouses and why
5 were you having to go in there and do work to prep?

6 A. So basically when we lose station power, what
7 happens is our -- there's leakage from the penstock, you
8 know, into our facility. And what happens is if you
9 don't have a sump pump, you will basically flood the
10 powerhouse. You will flood the basement.

11 So there's two things you have to do when you
12 lose power is you have to maintain the sumps. You've got
13 to maintain -- got to have an active sump and you have to
14 be able to charge your battery backup system.

15 So we had already had that all in place. We
16 knew what we were going to have to do the next morning.
17 We had looked at that the night before. So I had, you
18 know, half a dozen guys coming in to help me. And that
19 is exactly what happened is we got the -- we had the
20 pumps ready to be transferred over and our battery backup
21 system ready to be powered up.

22 Q. Just to define what you -- the term you used,
23 the term penstock, what is penstock?

24 A. So the penstock is basically the tunnel or it
25 could be an underground tunnel. It could be an exposed
26 pipe. It's a huge pipe. I don't know if you've ever

1 been up through the Feather River Canyon, but you can
2 see -- that's how they convey the water.

3 What they'll do is take the water out of a --
4 they'll have a dam upstream with an intake, like a big
5 gate, and then the water comes in there. And then, for
6 example, like Cresta's probably got about a five or
7 six-mile penstock that goes above ground and through the
8 mountain and comes out at the powerhouse. And that's
9 how -- that's what they -- the water they use to
10 generate. So it's a pipe probably, I want to say,
11 12 feet around. It's a massive pipe. There's actually
12 two pipes for Cresta. So, yeah.

13 Q. Okay. Now, this may seem stupid to you, but why
14 is the power going to go out in the powerhouse?

15 A. Well, because we use the same -- we use the same
16 power that's running through Pulga basically. That 12 kV
17 power we use as well at our facilities.

18 Q. So the power that runs everything at the
19 powerhouse isn't actually being generated at the
20 powerhouse?

21 A. We actually use -- we generate and supply the
22 line going out. Right? The high voltage line. But we
23 use power that is coming from just local and certain
24 powerhouses, Cresta being one of them, yeah.

25 And we had a huge -- there was a huge 230 outage
26 that we were doing at the time. That is basically what

1 we were working on prior to doing this. And we didn't
2 have any way to back feed any power. So we were pretty
3 much reliant on the -- I think it's the 1101 circuit
4 coming from Pulga. So it just all happened to be that we
5 needed that line.

6 Q. The power running out of your powerhouse, where
7 is that going to?

8 A. That goes out onto the 230 kV structures.

9 Q. Okay. Do you know which line that is?

10 A. I don't not offhand.

11 Q. Okay. All right. Let's move on to Exhibit 222.
12 I will ask you the same question. Do you recognize --

13 A. Yes, Sir.

14 Q. -- Exhibit 222?

15 A. Yep.

16 Q. Did you take this photograph?

17 A. Yes.

18 Q. Okay. And tell us what this photograph shows.

19 A. This is the same. You could tell the flames are
20 getting higher up the mountain, and it's pretty much out
21 of view now. And basically, I think I -- pretty much we
22 were just commenting how it had been -- the fire had been
23 going for quite a while and you don't see any planes or
24 nothing. Because there was a guy that was on the
25 tailrace with us on this deck who used to work for the
26 fire department. And he made the comment that you don't

1 see any planes. And that's one of the reasons why I
2 think on this picture you don't.

3 Q. Okay. And who is the gentleman?

4 A. His name is (WITNESS #3). I think he's going to
5 be doing the same thing I am in the near future.

6 Q. What is your relationship with (WITNESS #3)?

7 A. He was on the crew that was working on the 230
8 upgrade out in the switchyard. And I asked him if he
9 would come in and help me that morning to get set up on
10 the pumps. He's an electrician as well.

11 Q. Okay. Next on to 223. Do you recognize
12 Exhibit 223?

13 A. I do, yep.

14 Q. And what is Exhibit 223?

15 A. That's basically just the same -- you can tell
16 we were watching because you can tell the wind is
17 starting to shift. You can see the upper left hand. We
18 were just basically taking pictures of how it's -- you
19 know, what's going on, basically the winds. And it just
20 was getting, you know, tall and massive. And we were
21 just -- I was just taking pictures.

22 Q. Now, 220 through 222 all seem to be taken from
23 the same vantage point; correct?

24 A. Yes.

25 Okay. Yes, Sir. This is -- this is probably
26 50 feet left of where the last screen was looking

1 straight down the canyon. It's just over. It's in the
2 parking lot.

3 Q. Okay. I was going to ask what this rock
4 concrete structure-looking thing is?

5 A. That is just basically an embankment. There's a
6 parking lot up to the left and the tailrace structure is
7 all down below. I can show you.

8 Q. Go ahead.

9 A. So basically, the end of the powerhouse is here
10 (indicating), the water is coming out like this
11 (indicating), and this (indicating) is just an overflow.

12 The water gets high. You can tell the water has
13 gotten high in the past. See all the debris. So the
14 water actually was raging through here. And so I just --
15 I was here and then I moved over and took the same --
16 basically the same vantage point.

17 Q. And 224?

18 A. I'm standing in the same exact spot. And you
19 can really tell the wind is pushing. I mean, it's
20 starting to really pick up and taking the flames to the
21 left. And you still don't see any planes or anything.
22 We kept expecting --

23 Like, we've seen this in the past. We've been
24 in other powerhouses like Belden or somewhere where
25 they've had fires. And the helicopters will come in and
26 they'll grab a big bucket of water and they'll try to

1 dump. You know. And we just -- I remember taking
2 pictures. And you don't see anybody, any planes
3 anywhere.

4 I was concerned because, you know, if you let a
5 fire burn anywhere for an hour or so, you know, you're
6 probably going to have problems if you don't try to get
7 on top of it. And then when it went over the side --
8 went over the top of the hill eventually. You know what
9 I mean it? I didn't know what was going on. You know,
10 we still had work to do. But we were trying to
11 coordinate getting people out of there if they lived in
12 Paradise, you know, or whatever on the other side. We
13 weren't really sure as a crow flies how close it was to
14 Paradise.

15 Q. Okay. And let's see. Let's move on to 225.

16 A. And that is the same -- I'm standing in the same
17 exact spot and just basically taking a picture of smoke
18 heading basically south.

19 Q. You said -- now, I want to back up a little
20 bit -- that you'd come in early that morning and it was
21 planned; right?

22 A. Yes, Sir.

23 Q. And there was -- you were planning or preparing
24 for a possible shutdown of the power?

25 A. Yeah.

26 Q. And you had to essentially batten down the

1 hatches?

2 A. Yes, Sir.

3 Q. When you went out, you said it was extremely
4 windy.

5 Remember you have to answer out loud so that she
6 can take it down.

7 A. Yeah, yeah, yeah. Sorry.

8 Q. Did the wind conditions ever change?

9 A. No. It didn't seem -- it seemed like it was
10 still windy. Like I said, when I went to work, it was
11 windy. When I came out of the powerhouse three or
12 four hours later, it was still windy.

13 Q. Now, I want to pull something up here for you.
14 And why did that not all of a sudden go off?

15 It's always what happens when I try something
16 new with the computer.

17 A. Oh, yeah.

18 Q. Oh, there we go.

19 All right. You recognize the area depicted up
20 here on the map?

21 A. Yes, Sir, yeah.

22 Q. And you can get up here and look.

23 You have worked up there a long time. You have
24 driven Highway 70?

25 A. Yes.

26 Q. And so I kind of want to get an idea of where

1 you are when you're taking these photographs and what
2 you're looking at.

3 A. Okay. So let's see. This looks like the -- so
4 here (indicating) is Pulga. The turn here (indicating)
5 is the Caltrans yard. So I'm here looking this
6 direction. And I'm assuming the fire is somewhere under
7 in here (indicating) heading over this (indicating)
8 little lip.

9 Q. Okay. I'm going to activate this so you can
10 write on this using your fingers.

11 A. Okay.

12 Q. So when you say "I'm here" --

13 A. I'm at the powerhouse looking that (indicating)
14 direction.

15 Q. Okay.

16 A. Taking photographs.

17 Q. So a red line. You drew a red line on there?

18 A. Meaning I'm looking down the canyon.

19 Q. Okay. Let's put an arrow on there.

20 A. Okay. [Witness complies.]

21 Q. Okay. And is the powerhouse actually --

22 Cresta. Is that a town?

23 A. Cresta is just the name of the powerhouse.

24 Q. Okay. So let's save what you've done there.

25 Now, I want to take a different view here.

26 MS. RICHARDS: It looks like an earth quake.

1 BY MR. NOEL:

2 Q. All right. So I was trying to find the Cresta
3 Powerhouse on here.

4 A. It looks like you're just upstream of it.

5 Q. Just upstream?

6 A. Yeah.

7 Q. So are we still upstream?

8 A. Yes, Sir. You can't miss it once you see it.
9 You're still upstream.

10 Q. Still upstream?

11 A. Yeah.

12 Q. I'm going to exit this and go back here because
13 I thought I tapped right off.

14 Do you see where the powerhouse is on this?

15 A. No, I don't see it. There you go.

16 Q. Is that the powerhouse?

17 A. There it is right there (indicating).

18 Q. Oh, so that's where you were working?

19 A. Yes, Sir.

20 So on the other side looking up the canyon is
21 where I was trying to show you and I drew the arrow. I'm
22 on the other side, you know, looking up here
23 (indicating).

24 Q. Okay.

25 A. Where the railroad tracks are. See the railroad
26 tracks?

1 Q. Yep.

2 It won't let me do it.

3 A. So if you go like this (indicating), you'll see
4 the other vantage point where I was. And it's down in
5 the parking lot. It would be the opposite side.

6 Q. Right on the other side of the building here
7 (indicating)?

8 A. Yes, Sir. Yes, there you go. So here is the
9 wood I was showing you. And the truck was parked here
10 (indicating), and I'm standing right there (indicating)
11 looking up here (indicating).

12 Q. Let's pull our pen out and you can do that.

13 A. So I was standing -- it's not writing.

14 Q. It just popped up.

15 A. Okay. So I am standing here (indicating).

16 Q. You're drawing a red line.

17 A. Where I was standing. And then I am looking at
18 the fire up here (indicating).

19 Q. Okay. And is this the hill you're talking
20 about?

21 A. That is the hill, not this way over here
22 (indicating).

23 Q. So circled over here in the background?

24 A. Yes.

25 Q. That's where you're looking?

26 A. Yes.

1 Q. Okay. So let's save that, and we'll mark that
2 as --

3 A. And I don't know if you want to twist it around
4 or -- you're in control of that. If you want to look,
5 I'll show you where the other vantage point was.

6 MR. NOEL: It will be -- let's go 220-A and B
7 would be the two that I've saved.

8 [Exhibits 220-A and 220-B
9 marked for identification.]

10 BY MR. NOEL:

11 Q. Okay. Let's see now. It's not letting me pull
12 it there. So if you go further downstream --

13 A. Yes.

14 Q. -- and move back?

15 A. Yeah, there you go.

16 Now, unless it's going to let you get over,
17 we're not going to --

18 Q. Yeah, it's not. Let's see if we can exit street
19 view. Okay. Let's see. And there is the powerhouse
20 right in here (indicating)?

21 A. Yes.

22 Q. So we're going to drop the yellow pin on that
23 powerhouse and mark it as the powerhouse, I think.

24 Okay. Can you see on here where --

25 A. So it seems like if you just keep dropping down
26 from where you're at, you might catch it.

1 Q. Okay. All right. We've got the important stuff
2 establishing where you were and what's your vantage
3 point. And I'm going to back this back out. And there
4 we go. And then we can save this one which is great
5 because we make a nice record of what we've been doing
6 here. So we get -- there we go. So we've got the Cresta
7 Powerhouse established.

8 All right. How long did you stay there and
9 watch the fire?

10 A. I was there the rest of the day mostly. I mean,
11 I went down to Poe Dam to take care of an issue they were
12 having there, which is downstream, just downstream. And
13 I was at the powerhouse probably until 6:00 or 7:00 that
14 night. And the fire had already went over. And I
15 couldn't see. You know, you could obviously see smoke,
16 but you didn't see any flames.

17 MR. NOEL: At this point I don't have anything
18 further.

19 Do you have anything?

20 MS. RICHARDS: No.

21 MR. NOEL: Do the jurors have anything for this
22 witness? It looks like we have one.

23 BY MR. NOEL:

24 Q. Mr. (WITNESS #2) -- and this is from one of the
25 jurors -- do you know how old the equipment you maintain
26 and operate is?

1 A. Cresta is like a 1940s powerhouse. I want to
2 say -- I'm assuming '40 to '50s. It's old, old. I don't
3 know exactly, no.

4 Q. It's been around for a while?

5 A. Been around a long time, yeah.

6 Q. And one question after checking my notes one
7 last time that I missed. You said you were in charge of
8 a crew up there that was battening down stuff?

9 A. Yes.

10 Q. Do you remember who all was on your crew besides
11 (WITNESS #3) who was assisting you?

12 A. Yeah, I could probably think of two other -- I
13 think I could think of two other guys.

14 Q. Who would those be?

15 A. One (EMPLOYEE #12) and (WITNESS #4).

16 Q. Okay. Do you know a hydro electrician or did
17 you know a hydro electrician named (WITNESS #14)?

18 A. I did, yeah.

19 Q. Was he on your crew that day?

20 A. Um, I can't remember if he was there or he might
21 have showed up at 7:00 to do our normal work. Because we
22 came in early to get ahead of it. But I can't remember
23 if he was working there or not.

24 MR. NOEL: Okay. That's all I have. Thank you.

25 THE WITNESS: Okay.

26 MR. NOEL: Anything further? Anybody think of

1 anything?

2 Madam Clerk, the question.

3 [Whereupon Mr. Noel gives the grand jury secretary
4 the written questions from the grand jury.]

5 GRAND JURY SECRETARY: Thank you.

6 MR. NOEL: Madam Foreperson will have an
7 admonishment for you.

8 GRAND JURY FOREPERSON: Okay. (WITNESS #2), you
9 are being admonished not to discuss or disclose at any
10 time outside of this jury room the questions that have
11 been asked of you or your answers until authorized by the
12 grand jury or the Court. A violation of these
13 instructions on your part may be the basis for a charge
14 against you of contempt of court. This does not preclude
15 you from discussing your legal rights with your own
16 attorney.

17 (WITNESS #2), what I have just said is a warning
18 not to discuss the case with anyone accept the Court,
19 your lawyer, or the district attorney.

20 Do you understand?

21 THE WITNESS: Yes, Ma'am.

22 GRAND JURY FOREPERSON: Thank you.

23 THE WITNESS: Thank you.

24 MR. NOEL: Thank you, Sir. You're done. Thank
25 you for being here.

26 [The witness exits the courtroom.]

1 MR. NOEL: And that's all we have for this
2 morning. So I tried to stretch it out so you didn't have
3 that long of a lunch. But we can be here at -- back at
4 1 o'clock.

5 [Whereupon the luncheon recess is
6 taken from 11:50 a.m. until 1:03 p.m.]

1 JUNE 18, 2019; 1:03 p.m.

2 (Confidential Grand Jury Hearing Proceedings)

3
4 MR. NOEL: Yes, all jurors are present.

5
6 (DISCUSSION OMITTED.)

7
8 GRAND JURY FOREPERSON: (WITNESS #19), I need to
9 swear you in. So raise your right hand, please.

10 Okay. (WITNESS #19), do you solemnly swear that
11 the evidence you shall give in this matter pending before
12 the grand jury shall be the truth, the whole truth, and
13 nothing but the truth?

14 THE WITNESS: I do.

15 GRAND JURY FOREPERSON: Thank you. Have a seat,
16 please.

17 **EXAMINATION**

18 BY MR. FOGG:

19 Q. Good afternoon, (WITNESS #19). If you could
20 state your full name and spell your last name for the
21 record, please.

22 A. Full name is (WITNESS #19), last name is
23 [Redacted spelling].

24 Q. Now, before you begin I just want to say you're
25 represented by counsel. If you'd like to speak to your
26 attorney, the grand jury will give you reasonable breaks

1 to do so. And that will be determined by the grand jury.

2 A. Okay.

3 Q. (WITNESS #19), where do you work?

4 A. Pacific Gas & Electric.

5 Q. When did you start working for Pacific Gas &
6 Electric?

7 A. 2003.

8 Q. And when you started with them, what job did you
9 have?

10 A. I started as an apprentice lineman.

11 Q. And what's an apprentice lineman?

12 A. Somebody that basically back then started off
13 the street with no knowledge of power lines or anything
14 else.

15 Q. What was your next job for PG&E?

16 A. Journeyman lineman.

17 Q. What's a journeyman lineman?

18 A. Once you've completed your apprenticeship, you
19 have enough hours and things to work on your own.

20 Q. And when you became a journeyman lineman, where
21 were you working for PG&E?

22 A. Oroville, Chico, and in their general
23 construction department.

24 Q. Where did you work in PG&E after that?

25 A. 2013 I took a job at Table Mountain
26 Transmission.

1 Q. What job did you take at Table Mountain
2 Transmission?

3 A. Transmission lineman.

4 Q. What job did you take next in PG&E?

5 A. The electric crew foreman at Table Mountain
6 Transmission.

7 Q. And when did you take that job?

8 A. 2017.

9 Q. And have you taken another job in PG&E since
10 then?

11 A. Yes. I went back to distribution here in
12 Oroville.

13 Q. When was that?

14 A. May; about four weeks ago.

15 Q. So as a lineman at Table Mountain Transmission,
16 what were your job responsibilities?

17 A. Perform insulator change-outs, any of the
18 maintenance on the transmission lines that was deemed
19 necessary.

20 Q. And now you became the -- was it the electric
21 crew foreperson?

22 A. Yes.

23 Q. When you became the foreperson, what were your
24 job responsibilities then?

25 A. You kind of watch the linemen, make sure all the
26 procedures are followed as far as rules and grounding

1 rules and things like that.

2 Q. Okay. I want to follow up something you said
3 about insulator change-outs. Behind you on the screen
4 would be Grand Jury Exhibit 188. Could you tell the
5 grand jury, please, what is depicted in Exhibit 188.

6 A. It appears to be one of the arms on the
7 transposition towers that holds the jumper string.

8 Q. What's a jumper string?

9 A. It would be the insulator string hanging down
10 and the jumper comes down and transitions around the
11 tower to the other side.

12 Q. And what's hanging the string on the steel in
13 this image?

14 A. That would be a C-hook.

15 Q. A minute ago you mentioned insulator change-out.
16 What's an insulator change-out?

17 A. Insulator change-out would be if we received a
18 maintenance tag with damage insulators, flash insulators.
19 Any problems they found we would come out and change that
20 string of insulators C-hook included.

21 Q. Okay. I want to walk through in some detail
22 about how you go about making that change. And I want
23 you to see Exhibit 188 as an example describing how you
24 would use it.

25 So let's say you got the maintenance
26 notification you need to change out an insulator string.

1 What would you do next?

2 A. We would have a tailboard in the morning before
3 we went out to the tower whether we flew there or drove
4 there, get everything grounded. We would hang our
5 rigging, take tension on the phase, slack the bells.

6 Q. Okay. Let's break that up a little bit. What's
7 the rigging?

8 THE COURT REPORTER: I'm sorry. Can you pull
9 your microphone a little closer, please. Thank you.

10 BY MR. FOGG:

11 Q. What is the rigging?

12 A. The rigging depending -- like here it would
13 usually be a light hoist and chain, either a sling or
14 boxing glove is what we call them, and the conductor.

15 Q. Is that a way for someone to hang off the tower?

16 A. No. That just holds the jumper or conductor in
17 place while you're changing the insulators.

18 Q. Okay. So you said then you'd hang the rigging
19 in place. What would you do next?

20 A. Usually hang a ladder so you have access down to
21 the bells. You would un-ding the bells, either use a
22 hand line or helicopter to take slack into the bells, and
23 un-ding the C-hook.

24 Q. Okay. What does it mean to un-ding the line?

25 A. It would be to -- there's a cotter pin in the
26 top. You would knock that out and then undue the bells.

1 Q. So you'd separate the line from the bells at the
2 bottom?

3 A. And then the top.

4 Q. Okay. And you do that by removing a cotter pin?

5 A. Yes.

6 Q. So when the insulator bells were then removed,
7 where is the C-hook?

8 A. The C-hook stays on the steel right there, but
9 you have to hold it because they won't stay in by
10 themselves.

11 Q. Okay. When you replace the insulator string,
12 would you also replace the C-hook?

13 A. Yes.

14 Q. Why?

15 A. Just standard practice.

16 Q. Is that standard practice that only -- is that a
17 practice that PG&E committed to policy in writing that you
18 know of or is it something you're taught on the job?

19 A. Not that I know of. It was more on-the-job
20 training.

21 Q. Were there ever times that you would not replace
22 the C-hook when you were replacing the insulator string?

23 A. No.

24 Q. Besides when you took the hook out of the --
25 when you removed the hook for replacing the insulator
26 string, were there any other times in your job

1 responsibilities when you'd remove the C-hook from the
2 eye on a 115 kV line?

3 A. Not unless we were changing insulators.

4 Q. When you had to change insulators, would that
5 require a PG&E crewman to climb up on top of the tower?

6 A. Yes.

7 Q. Was that work you've done? Climbed on the
8 tower?

9 A. Yes.

10 Q. When you climbed on the tower, let's say, to
11 replace an insulator string, would you inspect other
12 pieces on the tower while you were up there?

13 A. We'd took a general overall look at the tower on
14 the way up looking for bent or missing steel, anything
15 that, you know, could have been damaged prior to us
16 starting our rigging.

17 Q. Would you be looking at -- when you were doing
18 that, would you look at the other attachment points?

19 A. Somewhat. Give them a quick glance and make
20 sure nothing looked bad.

21 Q. Now, the quick look around when you're on the
22 tower, is that something that is taught to you by PG&E in
23 your training?

24 A. Yes.

25 Q. Was that formal training or is it more
26 on-the-job training?

1 A. During our apprenticeship.

2 Q. Okay.

3 A. And also on-the-job training.

4 Q. If you look at -- looking directly back to
5 Exhibit 188, do you see the space between the space that
6 is left open in the eye where the C-hook is hanging?

7 A. Yes.

8 Q. Does that amount of space tell you anything
9 about the condition of the C-hook?

10 A. I'd say judging by that space there it could be
11 possible wear.

12 Q. I want to direct you now to Exhibit 191. Can
13 you tell me what's depicted in Exhibit 191?

14 A. I have an insulator, a C-hook, and then a
15 working eye in the steel.

16 Q. And in this image does the space within the eye
17 that is not taken up by the steel, does that space tell
18 you anything about the condition of the C-hook?

19 A. Possibly the C-hook is worn.

20 Q. If you saw that -- if you saw an attachment
21 point in this condition when you're on the tower for
22 another purpose, would you report that?

23 A. Yes.

24 Q. Would you -- based on your experience and
25 working with your colleagues, would you expect them to
26 report that as well?

1 A. Yes.

2 Q. Now, I want to direct you to Exhibit 178. Can
3 you describe for us, please, what is depicted in
4 Exhibit 178.

5 A. It's a C-hook.

6 Q. Is there anything unusual in that C-hook?

7 A. It appears to have quite a bit of wear.

8 Q. In your time working for PG&E have you ever seen
9 a C-hook with an equivalent amount of wear on it as what
10 is in Exhibit 178?

11 A. Not prior to the Camp Fire.

12 Q. If you had seen a C-hook with that type of wear
13 before the Camp Fire, what would you have done with it?

14 A. More than likely reported it to my supervisor.

15 Q. And based on your experience working with your
16 colleagues at Table Mountain, would you expect them to
17 tell their supervisor if they found a similarly worn
18 C-hook?

19 A. Yes.

20 Q. In your time with PG&E have you personally seen
21 any C-hooks that have broken? This is before the Camp
22 Fire.

23 A. Not that I can recall.

24 Q. In your time at PG&E have you ever seen
25 components -- strike that.

26 Have you ever seen attachment points on a

1 transmission tower that appeared to have been worn down
2 by the wind?

3 A. Yes. There was a time; a re-conductor project
4 down towards Rio Vista.

5 Q. Could you tell us what you saw regarding wind
6 wear during that project.

7 A. There appeared to be some wearing on the working
8 eyes. The C-hook wasn't worn very bad, but the eye was
9 worn quite a bit.

10 Q. In your time with PG&E have you ever received
11 formal training from PG&E about the affect of wind on
12 transmission towers?

13 A. No.

14 Q. All right. Have you had -- have you received
15 informal training or on-the-job training about the affect
16 of wind on transmission towers?

17 A. On the job, yes.

18 Q. Could you tell me about that, please.

19 A. A lot of the older guys that climbed a lot of
20 the towers before we had helicopters would stress looking
21 at the steel. Sometimes they would vibrate and loosen
22 from the wind.

23 Q. And that was from older troublemen?

24 A. Older linemen.

25 Q. Older linemen.

26 You mentioned on the re-conductoring project you

1 saw that wind wear. Do you remember approximately when
2 that project occurred?

3 A. I'd just be guessing, but I'm going to guess
4 around '09 or '10.

5 Q. And so we don't want you guessing. But it
6 sounds like it's a while ago.

7 A. Quite a while ago.

8 Q. Best of your knowledge it was around 2009 or
9 2010?

10 A. Yes.

11 Q. I want to shift now to some questions about life
12 spans of certain components in the transmission tower.

13 If you wanted to determine the age of a
14 transmission line tower, how would you find out?

15 A. I'd have to start by trying to contact
16 engineering.

17 Q. How about for a specific insulator string?

18 A. Probably engineering also.

19 Q. And how about for the age of a specific C-hook?

20 A. Engineering.

21 Q. Your time at Table Mountain did you -- have
22 you --

23 Are you familiar with the Caribou-Palermo line?

24 A. Yes.

25 Q. Do you know approximately how old that line is?

26 A. I think somebody -- again, I'm not positive, but

1 1918 or something.

2 Q. And that's what someone would have told you?

3 A. Yeah.

4 MR. FOGG: So just to direct or remind everyone
5 what we've been saying about hearsay, you're not to
6 consider that hearsay for its truth. So don't consider
7 it the truth when he says 1918, but you can consider it
8 for other reasons such as what he did in response to
9 hearing that information.

10 BY MR. FOGG:

11 Q. So you've heard that the Caribou-Palermo line is
12 older. Did that change how you worked on the line?

13 A. Yes. We were always told by the old linemen to
14 watch your rigging, make sure you weren't overstressing
15 the arm. Things like that.

16 Q. So when you would work on the line, you'd be
17 more careful with the line because of its age?

18 A. Yes.

19 MR. FOGG: And, (WITNESS #19), give me one
20 moment with my colleagues.

21 [Conferring off the record.]

22 BY MR. FOGG:

23 Q. (WITNESS #19), do you know what a three-bolt
24 connector is?

25 A. Yes.

26 Q. What's a three-bolt connector?

1 A. It's commonly referred to as a PG; parallel
2 groove clamp.

3 Q. And how -- would it be necessary to climb a
4 tower to replace a three-bolt connector?

5 A. Either climb it or use a helicopter for access.

6 Q. Do you recall if three-bolt connectors were
7 placed on the Caribou-Palermo line in the past ten years?

8 A. Yes. There was a project approximately three,
9 four, five years ago to replace them.

10 Q. Can you tell me more about that project, please.

11 A. It was done by general construction so . . .

12 Q. So it wasn't done by --

13 A. It wasn't done by Table Mountain.

14 Q. If you were on a tower placing a three-bolt
15 connector, would that be a time when you might look at
16 other things in the tower to see what shape they're in?

17 A. Possibly.

18 MR. FOGG: (WITNESS #19), I don't have any other
19 questions for you, but I need to ask the grand jurors
20 that question.

21 Do any of the grand jurors have questions for
22 (WITNESS #19)? We have one.

23 [Conferring off the record.]

24 BY MR. FOGG:

25 Q. (WITNESS #19), a few questions from the grand
26 jurors. Have you had any formal training regarding

1 standards for replacing C-hooks?

2 A. No.

3 Q. Have you had any formal training about how worn
4 a C-hook can get before it needs to be replaced?

5 A. No. Whenever we replace insulators, the C-hook
6 is replaced.

7 Q. I showed you some images earlier of -- we talked
8 about the amount of daylight visible through an eye. Did
9 you ever receive any training about when to replace a
10 C-hook based on how worn it may appear from the visual
11 inspection of it?

12 A. No.

13 MR. FOGG: (WITNESS #19), I don't have any
14 further questions. Do any of the grand jurors?
15 Appearing not. We have no further questions for you,
16 (WITNESS #19). Madam Foreperson will have an
17 admonishment for you though before you go.

18 GRAND JURY FOREPERSON: (WITNESS #19), you are
19 admonished not to discuss or disclose at any time out of
20 this jury room the questions that have been asked of you
21 or your answers until authorized by the grand jury or the
22 Court. A violation of these instructions on your part
23 may be the basis for a charge against you of contempt of
24 court. This does not preclude you from discussing your
25 legal rights with your own attorney.

26 (WITNESS #19), what I have just said is a

1 warning not to discuss this case with anyone except the
2 Court, your lawyer, or the district attorney.

3 Do you understand?

4 THE WITNESS: Yes.

5 GRAND JURY FOREPERSON: Okay. Thank you.

6 THE WITNESS: Thanks.

7 MR. FOGG: So, Madam Foreperson, we told our
8 next witness to be here at 1:30. We're running a few
9 minutes ahead schedule. I will go out and check to see
10 if that witness is available.

11 GRAND JURY FOREPERSON: Okay. Thank you.

12 [Pause in proceedings.]

13 MR. FOGG: Madam Foreperson, we'd called
14 (WITNESS #11), to the stand.

15 (WITNESS #11), if you could for the record
16 please give your full name and spell your last name,
17 please.

18 THE WITNESS: Yes. It's (WITNESS #11),
19 [Redacted spelling.]

20 BY MR. FOGG:

21 Q. And, (WITNESS #11), I know you are represented
22 by an attorney. If you do need to speak to your
23 attorney, please tell us. The grand jury will give you a
24 reasonable number of breaks to speak with your attorney
25 as determined by the grand jury.

26 A. Okay.

Q. Likewise, if you need a break for the restroom or anything like that, please say so.

GRAND JURY FOREPERSON: (WITNESS #11).

MR. NOEL: You need to swear the witness.

MR. FOGG: I'm sorry. I blew right through that. I apologize, Madam Foreperson.

GRAND JURY FOREPERSON: That's okay.

Would you please stand and raise your right hand.

(WITNESS #11), do you solemnly swear that the evidence you shall give in this matter pending before the grand jury shall be the truth, the whole truth, and nothing but the truth so help you God?

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a seat.

MR. FOGG: Madam Foreperson, I apologize.

EXAMINATION

BY MR. FOGG:

Q. (WITNESS #11), now that you're sworn, has your previous answer about your name and spelling the last name changed?

A. (WITNESS #11).

Q. (WITNESS #11), where do you work?

A. PG&E.

Q. And when did you start working for PG&E?

A. Thirty-four years ago.

1 Q. And what job did you have when you started with
2 PG&E?

3 A. Started out as a groundman.

4 Q. What is a groundman?

5 A. A laborer on the labor crew basically digging
6 holes, doing the beginning classification work.

7 Q. And what job did you take next with PG&E?

8 A. I became an apprentice.

9 Q. An apprentice?

10 A. An apprentice lineman.

11 Q. Okay. And did you eventually become a
12 journeyman lineman?

13 A. Absolutely.

14 Q. When did you become a journeyman lineman?

15 A. Four years after that. Sorry, Guys. I don't
16 even know the date I started.

17 Q. Right.

18 A. Thirty-four years ago.

19 Q. When you first became a journeyman lineman,
20 where were you working at PG&E?

21 A. Northern California.

22 Q. What job responsibilities did you have when you
23 first started as a journeyman?

24 A. Everything from distribution through
25 transmission.

26 Q. At some point in time with PG&E did you start to

1 work specifically on transmission lines?

2 A. Yes.

3 Q. When was that?

4 A. About 16 years ago.

5 Q. And was that still as a journeyman lineman?

6 A. Yes.

7 Q. And where was that?

8 A. Table Mountain Substation.

9 Q. Did you take a later job in PG&E after being a
10 journeyman lineman at Table Mountain?

11 A. Yes.

12 Q. What job was that?

13 A. Transmission troubleman.

14 Q. Okay. What is the difference between linemen
15 and troublemen?

16 A. The lineman you're doing maintenance on the
17 crew, still doing a lot of the line work to whereas a
18 troubleman you're out patrolling the lines, switching the
19 lines, and still working with the crew when available.

20 Q. And how long were you a troubleman at Table --
21 strike that.

22 How long were you a lineman at Table Mountain
23 before you became a troubleman?

24 A. Five years, I think. Four or five years.

25 Q. Are you still a troubleman at Table Mountain
26 today?

1 A. No.

2 Q. What job do you have now at PG&E?

3 A. Right now I currently -- starting about two
4 months ago I work for helicopter operations at PG&E.

5 Q. So overall how long approximately were you a
6 troubleman for PG&E at Table Mountain?

7 A. Probably between temp and actual job ten years.

8 Q. Okay. Did you receive any specific -- well,
9 strike that.

10 Once you became a troubleman, did you receive
11 any additional training from PG&E?

12 A. Mainly for switching.

13 Q. What's switching?

14 A. For shutting off certain sections of line to be
15 worked on or storm damage, going out, getting called and
16 clearing the line so that the crew could ground and go to
17 work.

18 Q. When you -- so we're kind of working in reverse
19 chronology then. When you first came to Table Mountain
20 as a lineman, did you receive any additional training at
21 that point?

22 A. Not much. It's pretty much transmission
23 lineman, which I was a decent lineman at the
24 transmission.

25 Q. And then when you're -- during your
26 apprenticeship did you receive training in transmission

1 lines?

2 A. Yeah.

3 Q. Do troubleshooters inspect transmission lines?

4 A. Yes.

5 Q. What are the different types of -- well, is
6 there a difference between routine and non-routine
7 inspections?

8 A. Yes, very much so.

9 Q. What's the difference?

10 A. A routine patrol is a mandated patrol carried
11 out. A non-routine is reflected from a momentary outage
12 or a lockout outage or there's other variations. But
13 that was -- you know, a lightning storm, the line
14 relays, and then we go out and inspect.

15 Q. What are the different types of routine
16 inspections?

17 A. There's a detailed ground inspection and an air
18 inspection. Air patrol.

19 Q. So let's talk about air patrols. What is an
20 air patrol?

21 A. An air patrol is flying a circuit at whatever
22 the patrolman and the pilot is comfortable at at a
23 certain height and a certain speed looking for -- an air
24 patrol is more looking for something hanging. You're not
25 stopping at every tower and circling it and everything.
26 You're flying and inspecting the line and looking at the

1 tower or poles as you're flying.

2 Q. So for now with these questions let's limit the
3 discussion to towers and not poles.

4 A. Okay.

5 Q. When you say you're looking for something
6 hanging on a line or tower, what do you mean?

7 A. You're looking for any abnormality from
8 insulators that are flash, from a lightening storm or
9 whatever, busted insulators from gunshot, pieces of steel
10 that could be unbolted and hanging. If the insulators
11 are cocked a little out of place, then I'll ask them to
12 stop, inspect it with binoculars, pictures if needed, and
13 create a notification for repair.

14 Q. Okay. During an air patrol how close to the
15 tower does the helicopter get?

16 A. Depending on the pilot, their comfort, and
17 weather conditions you can get pretty close. You know,
18 you can be up to 20, 30 yards. And then some of them --
19 some pilots don't feel comfortable at all doing that. So
20 they're a little bit further away at a safer distance.
21 And at that point then it becomes my responsibility to
22 say "Let's slow down a little so I can get a better
23 look."

24 Q. What equipment would you use to see the line
25 during an air patrol?

26 A. I'm sorry. I didn't hear at all.

1 Q. What type of equipment would you use to help you
2 see the line during an air patrol?

3 A. We have binoculars. Mine happen to be Gyro
4 binoculars where you can hit a button to keep from
5 vibrating. It will actually slow it down to where you're
6 able to see a lot better. A camera and notepad and
7 paper. The less you can have in there the better.

8 Q. How often would you do a routine air patrol on a
9 transmission line?

10 A. Depending on the circuit, every year on a steel.
11 Every year you're going to do an air. Every five years
12 you're going to do a detail. We have a 500,000 kV line
13 that every third year you do a detailed.

14 Q. But for a 115 kV line it would be once every
15 year an air patrol and once every five years a detailed
16 ground inspection?

17 A. Yes. If it's mostly steel, you're going to do
18 that.

19 Q. Just on a normal air patrol how much time
20 approximately would you spend looking at each tower?

21 A. You're looking at it going by it 20, 30 miles an
22 hour. And if you see something that you feel needs to be
23 looked at, then you stop, ask the pilot to circle around,
24 and then you inspect at that point in more detail.

25 Q. So assuming that if you're flying along and not
26 stopping, about how much time would you spend looking at

1 each tower?

2 A. A minute. I mean, you're looking - you're
3 looking at the conductor as you're flying and then you're
4 looking at the tower trying to look at as much of it as
5 you can from the ground up and then as you go by and then
6 back to looking again.

7 Q. How long does it take to complete an air patrol
8 on a normal transmission line?

9 A. Depends. Some of them are hundreds and hundreds
10 of structures and some of them are very few. So at
11 20 miles an hour with 100 towers, you know, it doesn't
12 take very long.

13 Fuel is always a problem. You either have a
14 fuel truck or you've got to go get fuel. So you're
15 pulling off to get fuel. Or weather conditions. So
16 there's many variables.

17 Q. How would the weather condition affect the speed
18 of air patrol?

19 A. In high winds the helicopter's all over the
20 place. You can't hardly -- at some point you pull off.
21 Sometimes you have a -- if you have -- I had certain
22 lines of my own in the north so I knew how long it
23 usually would take me. But sometimes if, say, you're
24 flying from south to north and the wind's blowing the
25 other way and you've got to revert and go from north to
26 south, you've got to completely change your strategy with

1 fuel and everything else. So there's so many variables
2 for different lines. And different troubleshooters do things
3 differently, too.

4 Q. On a day when you did air patrols, how long
5 would you usually spend in the helicopter that day?

6 A. I would try and -- four hours is the most I
7 would ever be in a helicopter, if possible. There was
8 times when we did go more especially in an IR patrol --
9 infrared -- where you're looking at a whole different --
10 different way of patrolling.

11 Q. Let's set the IR inspection aside for a second
12 so I can focus on the routine air. How often were you in
13 the helicopter for more than four hours?

14 A. Not very often. Four hours is enough.

15 Q. And why do you say four hours is enough?

16 A. Because your head hurts from the headset, your
17 rear hurts from the seat. It's -- you start -- your
18 patrol starts tailing off because you can't concentrate
19 because of the irritation of everything that is going on
20 around you.

21 Q. During your patrols in your experience what are
22 the most common problems you would find on a 115 kV line?

23 A. Usually flash insulators from lightening or
24 gunshot insulators. Sometimes you will see a piece of
25 steel that might have come unbolted and is hanging. But
26 for the most part you're finding problems on the

1 insulators themselves. Sometimes you'll find a piece of
2 the conductor that may have been stricken by lightening
3 or shot and a piece of the strand of conductors is
4 dangling. So, yeah, mainly stuff like that.

5 Q. What are the most serious problems you saw on
6 transmission lines during air patrols? And by serious I
7 mean likely to cause damage to property or a threat to
8 someone's life.

9 A. It would be an abundance of a string of
10 insulators broke or flashed or, say, all three phases
11 have taken a hit so they're all damaged. That's some of
12 the ones that the line is still energized.

13 Now, I have gone out, of course, when the line
14 is locked out and the trees have gone through it or the
15 snow has taken it out or the line is down, even collapsed
16 towers and poles.

17 Q. And this would be for -- when you talk about
18 trees and the line or snow or collapsing towers, those
19 would be non-routine patrol?

20 A. Yes. Storm damage.

21 Q. Let's circle back a little bit. In your time as
22 a troubleman has the frequency of the routine air patrols
23 and the line changed?

24 A. No, not that I noticed anyway.

25 Q. Has the amount of time spent on each tower
26 during air patrol changed?

1 A. No.

2 Q. How about the equipment you've used?

3 A. I had pretty much the same equipment. Cameras.
4 I would get new cameras. I think I might have gone
5 through one pair of binoculars but pretty much the same.

6 Q. Does the term "cold-end attachment point" mean
7 anything to you?

8 A. Uh-huh.

9 Q. What does that mean?

10 A. The cold end is the steel end, the hot end is
11 where the conductor is carrying the electric.

12 Q. So what would be the cold-end attachment point
13 on an insulator string? What does that phrase describe?

14 A. It could be a dead-end eye, a suspension eye,
15 dead-end plate, suspension plate basically.

16 Q. So is it fair to say that the place where the
17 insulator is hanging from the tower on the hook is the
18 cold-end attachment point?

19 A. Yes.

20 Q. On a routine air patrol how well could you see
21 cold-end attachment points?

22 A. Not very well. Something would have to trigger
23 it. I would have to see insulators cocked or -- well,
24 even a flash bell I would get my binoculars out and look
25 at it and try to see how much are flashed or broke. And
26 at that point you might stumble upon the attachment

1 point. And it would have to be really, really evident to
2 see it. That's on air patrol.

3 Q. So if you're flying an air patrol and an
4 insulator or a suspension insulator string didn't have
5 any flash bells or anything to draw your attention, would
6 you still examine the attachment points with your
7 binoculars?

8 A. No.

9 Q. I want to shift over now to detailed ground
10 inspections. How are those different from -- let me
11 rephrase that. What is a ground inspection?

12 A. A ground inspection is you go to every structure
13 from the ground and you're looking at everything from the
14 footings, the steel all the way up to everything that you
15 can see on a structure.

16 And at that point same thing. If you see
17 something that you might want to further -- to further,
18 you know, the trail, then you get the binoculars out and
19 examine something that may seem abnormal.

20 Q. How close to the tower would you get during a
21 detailed ground inspection?

22 A. To it. You're looking at every footing now.
23 You're looking at every footing. And it may sound crazy,
24 but it's kind of nice to get right into the middle of a
25 tower and look up to see if anything, you know, is
26 abnormal.

1 Q. And you testified earlier that those were done
2 every five years?

3 A. I believe so.

4 Q. What equipment would you use during a ground
5 inspection?

6 A. It depends. I mean, your trouble truck is
7 completely equipped with everything you need to actually
8 climb the tower, if safe, to get a better look to a
9 razor, a utility vehicle to go out through where you
10 can't get to with your truck.

11 Q. What's a trouble truck?

12 A. It's a truck with everything that you need to
13 perform a patrol and switch conductor lines out and
14 everything.

15 Q. On average how much time would you spend per
16 transmission tower during a ground inspection of a 115 kV
17 line?

18 A. You could -- if you got to the tower and are
19 able to see it, all the footings and everything, you
20 could be done in five minutes. If you start seeing
21 things, that's when you start breaking things out. And
22 it's done a little differently now that I -- I have not
23 done it in a few years. They're using iPads. So they're
24 actually taking pictures with the iPad and creating the
25 notification on site.

26 Q. Let's go into that a little bit. Before the

1 iPads, what would you do during a ground inspection to
2 record your findings?

3 A. I actually used my patrol and I -- a camera
4 taking pictures, writing notes, and then get back to the
5 office with the computer and fill it out in there.

6 Q. And when you say you used your patrol, what do
7 you mean with you say "patrol"?

8 A. When you have a patrol, the clerical support
9 prints it out for you so you've got everything that you
10 need. It will tell you if there's any prior problems on
11 each structure for that circuit. And you just -- it
12 helps you keep track as you're going.

13 Q. And what are the most -- in your time doing
14 ground patrols on 115 kV lines, what types of problems
15 did you see most commonly?

16 A. Bent steel. A lot of mine were -- my lines were
17 more up north. So it's a little different than some in
18 the valley or some up another. A rock may roll down the
19 hill, hit one of the legs, and bend it down low, footings
20 may be cracked.

21 I've seen some where lightening will actually
22 strike insulators and split the footing in half. But for
23 the most part, you're finding busted insulators, maybe
24 high signs missing.

25 Q. What's a high sign?

26 A. It's a high voltage sign that marks one on each

1 side of each structure for the public safety to realize
2 that you're climbing a structure that is carrying voltage
3 or electricity.

4 Q. So what is the most -- what were the most
5 serious types of problems you would see during ground
6 inspections?

7 A. There again a string of busted insulators.
8 Sometimes the ground with all the water has shifted and
9 the tower is cocked. Guy wires, which help support, may
10 be slacked and a pole or tower laying over a little.

11 Q. In your time as a troubleman did the frequency
12 of the ground inspections change?

13 A. No.

14 Q. Did the equipment you used during the ground
15 inspections change?

16 A. Not really. We went from Quad Runners to
17 utility vehicles. But it did change in the fact that at
18 some point it became 100 percent fall arrest. In the old
19 days I could throw on my harness and if I thought there
20 was a flashed insulator or a busted footing that made me
21 think that there is something wrong up there, in the
22 older days I could just go up the tower, belt off, and
23 observe.

24 Well, when they came out with 100 percent fall
25 arrest, then you had to as you're climbing be hooked to
26 the tower all the way up. So it changed even the way I

1 did things. It wasn't as easy for me to go out and say
2 "Hey, I ran up and I was able to take pictures. This is
3 what I found." It became "Pretty sure this is a problem.
4 I'm going to have the crew inspect."

5 Q. How much -- how much harder did it become to
6 climb once it became 100 percent fall arrest?

7 A. A lot. Very, very cumbersome. For one thing
8 the utility vehicle, the Razor that I used, I couldn't
9 haul a lot of this stuff that it would take for me to
10 climb that tower.

11 Q. So once it became harder to do climbing
12 inspections, as far as ground inspections were further
13 climbing inspections done?

14 A. Yes. For me -- yes, but very, very few times
15 did I run up a tower too. I mean, that was just rare
16 cases when I thought it was going to be very beneficial
17 for me to do it rather than the crew knowing that "Yep, I
18 found a problem."

19 So it's not -- and not all troublemen even when
20 it wasn't 100 percent were apt to run up a tower. So
21 different troublemen do it in different ways. You don't
22 have to do that. That was something that I had in my
23 head and my mind that I thought was beneficial.

24 Q. Were there written policies that you're aware of
25 directing when a troubleman should climb a tower during a
26 detailed ground inspection?

1 A. Yeah. There again, it's probably in the ETPM
2 Manual, the Electric Transmission Maintenance Manuel.
3 It's probably described, but I kind of did things my way
4 when it came to -- I think I did my job very well. So I
5 thought about myself more than what other people do.

6 Q. So during the detailed ground inspection, could
7 you see the cold-end attachment points on an insulator
8 string?

9 A. Yeah. But it almost needed -- something needed
10 to trigger it for me to look at it, scrutinize it. Very,
11 very seldom do you have that kind of a problem. So it
12 would have taken something for me to -- with my
13 binoculars or one of the old days climbing up and seeing
14 something for me to see it. It's not something that
15 fails.

16 Q. And if you were standing at the base of a
17 transmission tower during the detailed ground inspection,
18 would you generally be able to see the cold-end
19 attachment point on a suspension plate?

20 A. If you got back to a point with your binoculars,
21 absolutely.

22 Q. So I want to go to IR patrols now. You
23 mentioned those earlier. What is an IR patrol?

24 A. An infrared patrol is where they install a
25 camera on the helicopter that is looking for something
26 hot that's not supposed to be hot on the hot end of the

1 line like connectors, sleeves. And you're flying it at a
2 very -- a lot higher and very fast. The cameras are very
3 high tech. So you can fly at 60 knots, 60 miles an hour
4 at hundreds of feet rather than getting down within 50
5 feet of the line and doing an air patrol.

6 Q. How frequently were IR patrols done?

7 A. Every year on certain lines. They rotate the
8 lines or the critical lines.

9 Q. Which line -- do you know what criteria they
10 used to pick which lines got IR inspections?

11 A. Not really. The critical tie-lines from state
12 to state or 500 line stuff that they're in every year
13 usually. And then I'm not sure what triggers it. Like I
14 could sit here and tell you, but I'm not sure.

15 Q. Do you know who was in charge of picking which
16 lines got IR patrols?

17 A. I'm thinking engineering and then the local
18 supervisor had some control over a line that he might
19 think should be done.

20 Q. Would an IR patrol identify a -- let me strike
21 that.

22 Would an IR patrol be capable of identifying
23 where the cold-end attachment point of an insulator goes?

24 A. No.

25 Q. Why not?

26 A. An IR patrol is for the hot end. It's looking

1 for heat, something that's creating heat on a line, not
2 the cold end.

3 Q. Okay. One follow-up question just to go back to
4 detailed ground inspections. If you had learned that
5 there were C-hook problems or cold-end attachment point
6 problems on other lines, would you have been able to
7 examine those cold-end attachment points during a
8 detailed ground inspection?

9 A. You could most definitely scrutinize it more and
10 possibly spot something. But, yeah, it would take
11 something to trigger it.

12 Q. In your time at PG&E were you ever given any
13 written notice or bulletin about problems with cold-end
14 attachment points?

15 A. Not that I remember.

16 Q. Do you remember being told by any other PG&E
17 employees about problems on cold-end attachment points?

18 A. No.

19 Q. So I want to talk about climbing patrols as the
20 last routine patrol. Let's talk about that. To your
21 knowledge were there routine climbing inspections of
22 115 kV lines?

23 A. Not that I know of. I know that we have a tower
24 department, but how they determine what and when to climb
25 I don't know.

26 Q. So what is the tower department?

1 A. The tower department is -- they basically build
2 the steel and work on the steel. We work on the lines,
3 on the steel. We still would do some minor work on a
4 tower, but for the most part if I found something, I
5 created a notification for the tower department to come
6 and repair it.

7 Q. Okay. Who -- between the tower department and
8 the Table Mountain -- the troublemen at Table Mountain,
9 whose responsibility was it to inspect the cold-end
10 attachment points on insulators?

11 A. I guess it would be all of us. Like I say, for
12 me coming up as a lineman changing insulators, repairing,
13 and everything else, very seldom did you see a lot of
14 huge issues with that attachment point.

15 Tower -- doing a climbing inspection probably
16 would be looking at the suspension plate or the dead-end
17 plate more so than I would. But normally, for me as a
18 lineman changing everything out you didn't see a whole
19 lot of problems there.

20 Q. So whose responsibility would it be within PG&E
21 to inspect those attachment points?

22 A. Like I say, probably all of us. But I think it
23 would take something -- an event to trigger it. And then
24 like you said earlier, "Hey, we're starting to have these
25 issues with this. We probably ought to start taking a
26 peek."

1 Q. So you mentioned non-routine patrols earlier.

2 A. Uh-huh.

3 Q. What are non-routine patrols or inspections?

4 A. The non-routine is usually triggered by
5 lightening, a storm to where the line either goes into a
6 momentary and then is energized back up or it is locked
7 out.

8 So you either go do a ground inspection if it's
9 easy access or a helicopter. Normally, a helicopter is
10 the best because if it's lightening, the flash or
11 whatever on the insulator is going to be on the top.

12 Q. So after you received notification of either a
13 momentary or lock-out outage, how soon would it take you
14 before you started a non-routine inspection?

15 A. It depended. We would -- I get -- I even still
16 get them even though I'm not a troubleman. I get a
17 notification on my phone when one of the lines has a
18 momentary or is locked out.

19 So even in the middle of the night I'm making
20 plans with what I'm going to be doing that next morning
21 to go look at it in the daylight. If it's a critical
22 line and -- if the line is locked out, they're calling us
23 out. We're going normally. But the grid control center
24 can actually get a false location -- it's not always
25 accurate -- of where they feel that that problem is
26 within so many miles in each direction. And like I say,

1 that is not always accurate. Usually the higher the
2 voltage the more accurate it seems to be but . . .

3 Q. So on these routine inspections -- let's talk
4 about the aerial patrols for now. Who set the schedule
5 of when you would go do air patrols?

6 A. They have been in the system before I got there.
7 And we had the ability to change them every -- the end of
8 every year for the following year if we felt the need
9 because of workload or weather, the mountains. You know,
10 in January doesn't get it.

11 So we had that ability, but for the most part
12 it's been pretty much set for quite sometime. You know,
13 I changed a couple but not much.

14 Q. When you say it's in the system, what do you
15 mean by that?

16 A. The people before me and management and
17 everybody determined the lines, how they were patrolled,
18 and when to patrol, and then over time they have evolved
19 into what it is today.

20 Q. How about -- well, now, you said that there is
21 some ability to change the order for the next year. Is
22 that by individual troublemen like yourself or is that by
23 someone like your supervisor?

24 A. We can get together as troublemen. In fact, the
25 supervisor would like us to get together as troublemen,
26 go over the patrols, make sure that they're all in a

1 spreadsheet, make sure we're not missing anything, making
2 sure that it's the right patrol, that it didn't flop from
3 a detailed to air and it should be an air.

4 And then if we needed to -- at that point felt
5 that we needed to move one and we had more time in this
6 month and this or whatever, we could attempt to. In the
7 end the supervisor and his bosses could say "No. We're
8 going to keep it the way it is."

9 Q. How about for a detailed ground inspection? How
10 was the schedule for those lines set?

11 A. Same.

12 Q. Same way?

13 A. Same way, yeah. Yeah, we would have a
14 spreadsheet with arrows and details all in the same.

15 Q. As a troubleman did you have any ability to
16 differentiate from that schedule in doing inspections on
17 some lines sooner rather than others?

18 A. No. Earlier we discussed we have a couple of
19 circuits that are basically just two or three towers or
20 poles. And sometimes it didn't make sense to get a
21 helicopter to try and go buzz those. So I would go out
22 and get the approval. And that wasn't always to go out
23 and do a detail on those rather than a helicopter.

24 Q. But otherwise did troublemen have the ability to
25 differentiate from the schedule in choosing to do one
26 routine patrol before another?

1 A. You could actually go a month ahead. If your
2 workload -- if you finished in February, the February
3 month and you had some -- a busy March, you could move
4 into those patrols. There was a time where you could go
5 even further, but they didn't want us to go more than a
6 month.

7 Q. Did your immediate supervisor have a way to
8 direct troublemen to differentiate from that schedule in
9 doing routine patrols?

10 A. He'd have to get approval from his supervisor.

11 Q. In your experience, was it frequent?

12 A. No.

13 Q. It was not frequent for a supervisor to deviate
14 from that routine?

15 A. Not really, no.

16 Q. How about the superintendent? In your
17 experience, did he or she have the power to have
18 troublemen deviate from that routine patrol schedule?

19 A. You had to get -- the supervisor had to get
20 their approval. And very, very seldom. And I -- I don't
21 know. I really don't.

22 Q. Were there -- besides these routine inspections
23 done by a schedule and these non-routine inspections in
24 relation to some sort of outage, were there any other
25 types of inspections done by troublemen?

26 A. Yeah. There was -- I can't think of the term

1 than they used. But if they overloaded a line -- they
2 overloaded a line over by Orland one time. And when that
3 happens, we need to fly it and make sure everything is
4 okay; that the conductors aren't low and, yeah.

5 Q. What do you mean by overloaded?

6 A. They put too much amperage on the line. And it
7 has to be on there for so long in order for this event to
8 trigger. And that only happened one time. But that's an
9 incident of a non-routine that I can think of. I'm sure
10 there's more.

11 Q. Had the troublemen had concerns about a line,
12 could a troubleman do -- could a troubleman have done
13 extra inspections of a line?

14 A. Could I make that decision myself?

15 Q. Yeah. Well, could a troubleman make that
16 decision to do extra inspections on a line?

17 A. Oh, yeah. If you had the time, yeah, no
18 problem. And I would hope that if you didn't have the
19 time, you'd reach out for help to do it.

20 Q. And likewise, could a supervisor order an extra
21 inspection of a line?

22 A. Absolutely.

23 Q. And same for a superintendent?

24 A. Yeah.

25 Q. We kind of covered this already but I just want
26 to make sure here with the grand jury. What was the job

1 title of your immediate supervisor? The person above you
2 in the order chart, what was their title?

3 A. Supervisor.

4 Q. How about the person above them?

5 A. Superintendent.

6 Q. How often would you interact with your
7 supervisor on an average day?

8 A. Quite a bit. Not necessarily daily but weekly.

9 Q. What type of interactions would you have with
10 your supervisor?

11 A. Daily, daily work. I always kept in contact. I
12 think communication is big.

13 Q. How would a supervisor know that troublemen
14 actually inspect a line they said they inspected?

15 A. You're turning in a patrol saying that you
16 inspected that line. And I think that they do have a
17 certain amount of field checks that they're supposed to
18 do. But yeah, they're -- they're making sure. They're
19 taking your word that you went out and did your job
20 basically.

21 Q. And when you say patrol, you're talking about
22 the printed patrol forms that you fill out?

23 A. Yeah.

24 Q. Would you sign those patrol forms?

25 A. Yes.

26 Q. Would you date the patrol forms?

1 A. Absolutely.

2 Q. What date would you use when dating the patrol
3 form?

4 A. I tried to use whatever sheet that I ended up on
5 that day. And then the next day or whatever if I had a
6 weekend, come back and then that would be that day.

7 Q. And now, when you finished the patrol form and
8 you signed it, did you date it when you're all done with
9 it?

10 A. Yeah.

11 Q. What date would you use when dating the patrol
12 form at the end?

13 A. When it was complete.

14 Q. Okay. So the day it was completed?

15 A. Paperwork and everything complete and hand it in
16 to clerical.

17 Q. How much contact did you have with the
18 superintendent?

19 A. Not much. I had some contact with one because
20 he was my old supervisor and became superintendent. So
21 we still talked.

22 Q. But there wasn't much contact with them on an
23 average ongoing basis?

24 A. No, not really, no.

25 Q. I want to talk now about life spans of some
26 different parts of the transmission towers. If you

1 wanted to find out how old a transmission tower was, how
2 would you go about determining that?

3 A. Knowledge of people. You can actually pull up
4 structure data sheets on lines and figure out sometimes
5 that way. But most of the time you're finding out from
6 your supervisor who will probably ask the superintendent
7 and stuff like that. But I can actually pull up a line
8 and most of the time kind of figure it out.

9 Q. Are you familiar with the Caribou-Palermo line?

10 A. Yeah.

11 Q. Do you know how old the Caribou-Palermo line is?

12 A. I don't. Hundred years.

13 Q. Why do you say 100 years?

14 A. That's what everybody says.

15 Q. Okay. So that's saying you've been told that
16 it's 100 years?

17 A. Yes.

18 MR. FOGG: So I want to advise the grand jurors
19 again that just like the last witness hearsay statements
20 are only for the effect on the listener, not for the
21 truth of the matter.

22 BY MR. FOGG:

23 Q. So if you're saying that the Caribou-Palermo
24 line is approximately 100 years old, how did that affect
25 how you approached inspections at the Caribou-Palermo
26 line?

1 A. It's -- when I do an inspection, I do an
2 inspection. So I -- you know, my particular lines I try
3 and treat them the same. I didn't have a lot of hands-on
4 inspection on the Caribou-Palermo. I actually -- on the
5 crew I did line work on the Caribou-Palermo.

6 Q. When you did line work --

7 Well, let me take a step back. What is line
8 work?

9 A. When I was still on the crew performing the work
10 on the line.

11 Q. So if you needed to, let's say, change an
12 insulator string, would that count as line work?

13 A. Absolutely.

14 Q. When you're doing line work on the
15 Caribou-Palermo line, didn't the age of the tower, age of
16 the line change how you approached the line work?

17 A. Um, yeah. You had to pay attention to your
18 rigging. It wasn't -- they're not as sturdy as some of
19 the newer construction.

20 Q. Did the towers of the Caribou-Palermo line feel
21 different when you climbed them as opposed to more
22 recently built towers?

23 A. A little bit, yeah. They're harder to climb.
24 The lacing and everything, the way they're designed,
25 they're harder to climb. They -- it's a lot flimsier
26 than the newer design. But, yeah.

1 Q. So how about for a suspension -- a string of
2 suspension insulators? If you want to figure out how old
3 a string of those insulators were, how would you go about
4 finding out?

5 A. Some of them will actually have a stamp on it.
6 And then there again, you might -- structure data sheets
7 and stuff like that to figure it out.

8 Q. Are you -- to your knowledge is there a lifespan
9 for a string of suspension insulators?

10 A. I don't know.

11 Q. Do you know if any one or anything in PG&E was
12 tracking the age of specific insulators hanging on lines?

13 A. I don't.

14 Q. How about for a C-hook holding up a string of
15 insulators? If you wanted to know how old it was, how
16 would you go about finding out?

17 A. More than likely you would assume by the look of
18 the insulators and all the hardware that it was probably
19 either changed at one point or it was original. And then
20 you would just find out when the line was built and
21 assume that they've been there since.

22 Q. So your assumption was to assume that the hook
23 was as old as the tower?

24 A. Uh-huh, absolutely.

25 Q. Was that an assumption you were trained to have
26 or is that something you developed on your own?

1 A. I think you develop it on your own, but you also
2 hear -- it's hard to say old-timer because I'm the
3 old-timer now. But you heard the old-timers say it.

4 Q. To your knowledge, was there anyone or anything
5 in PG&E tracking the age of individual C-hooks?

6 A. No.

7 Q. I want to focus on C-hooks a little bit. Before
8 the Camp Fire in your time at PG&E, did you see any
9 C-hooks that had broken on transmission lines?

10 A. Never.

11 Q. Did you see any C-hooks that were particularly
12 worn down?

13 A. No. Usually, the dead-end plate or the
14 suspension plate had wear on it before the C-hook itself.

15 Q. What is a dead-end or suspension plate?

16 A. What we talked about earlier. The eye that
17 holds the hook or the attachment point hooks to.

18 Q. Okay. I want to show you now Grand Jury
19 Number 38, if I could make my iPad work here.

20 So on the board behind you is Grand Jury
21 Exhibit 38. Can you tell the grand jury, please, what
22 we're seeing in that image there.

23 A. That's a suspension eye. And apparently, that
24 must be an add-on of another suspension eye. I don't
25 know.

26 Q. Are the -- is what is depicted in Exhibit 38

1 different from the suspension plate you were just talking
2 about or is it the same thing?

3 A. Same thing.

4 Q. Okay.

5 A. Normally - normally you see wear here
6 (indicating), not on the hook itself.

7 Q. So you're just pointing at Grand Jury
8 Exhibit 38 -- and I need to narrate this because we're
9 writing everything down. You're pointing at the bottom
10 of the eye of the hanging plate?

11 A. Absolutely.

12 Q. And in your experience both as a lineman and
13 troubleman, was it common to see an extra hanging plate
14 added to the arm of a transmission tower?

15 A. No. I've never seen that.

16 Q. Acknowledging you've never seen that, would it
17 be your understanding that the transmission maintenance
18 line troublemen linemen would add that plate or would
19 that be something the tower department would be more
20 likely to do?

21 A. Tower.

22 Q. Why do you say that?

23 A. Steel. Steel to steel. There is a good
24 possibility that the line crew did it, but I would think
25 that tower came, punched new holes in order to attach it,
26 and had the -- I know it looks simple, the bolts and

1 everything. But we don't have the little spacers and all
2 of that up on top of that. So I would just about bet
3 tower made that modification.

4 Q. But you don't know for certain in this
5 particular image? You're speaking generalities based on
6 your knowledge?

7 A. Yeah, absolutely.

8 Q. How about we've talked a little bit about wind.
9 In your time at PG&E have you seen components on a tower
10 that are worn by wind?

11 A. Yeah. The eye itself, like I say, would be more
12 worn, wallerd out a little bit.

13 Q. When you say "wallerd out," what do you mean by
14 that?

15 A. Like how that bottom one that's a little oblong
16 rather than round, that is worn.

17 Q. So the two eyes instead of being originally
18 circular, it starts to elongate at the bottom?

19 A. Yeah.

20 Q. In your time working for PG&E, did you receive
21 any formal training about the affect of wind?

22 A. Not really, not that I can recall. It was
23 instilled in our brain as we grew up as linemen.

24 Q. Instilled that wind could cause wearing on --

25 A. Oh, yeah, yeah. Yeah, wind. As far as
26 everything. You know, damage and . . .

1 Q. Did you receive any -- in your time with PG&E,
2 did you receive any specific warnings from the company
3 either in the version of a safety bolt or notice about
4 wind causing wear on cold-end attachment points?

5 A. Not that I can recall.

6 Q. What is -- in talking about transmission towers,
7 what is vibration with regard to transmission towers and
8 wind?

9 A. The conductor in the wind will vibrate, bounce,
10 and sometimes you can feel the whole tower actually
11 vibrating. And if you're up a tower, you can actually
12 feel it move.

13 Q. How does vibration affect the components on a
14 tower?

15 A. Over time constant. You know, oblong and stuff
16 like that (indicating).

17 Q. I want to jump now to Exhibit 188. Now,
18 (WITNESS #11), looking at Exhibit 188, can you tell us
19 what is depicted in that image.

20 A. It looks like it's a suspension jumper support.

21 Q. Now, do you see is there -- can you see the
22 string of insulators and the steel arm in the image?

23 A. Uh-huh.

24 Q. Do you see where the hook goes through the eye?

25 A. Uh-huh.

26 Q. Does the amount of space you can see in that eye

1 tell you anything about the condition of either the eye
2 or the hook?

3 A. No, not from here.

4 Q. When you say "not from here," what do you mean
5 by that?

6 A. Looking at it from here, there's different --
7 there's different sizes of rigging eyes or dead-end
8 plates, suspension eyes. So no. I mean, to me that
9 could be just fine.

10 Q. Would you need to be -- to figure out by looking
11 at the eye and the hook that there was a potential
12 problem, would you need to be closer?

13 A. Absolutely, yeah.

14 Q. To the hook and what is described in image 188?

15 A. Yeah.

16 Q. Okay. I'd like to draw your attention now to
17 Exhibit 191. Could you tell us, please, what is in
18 Exhibit 191?

19 A. Then I would say I would start looking at it as
20 if it's an issue.

21 Q. What about -- what about what is depicted -- or
22 what is depicted in Exhibit 191?

23 A. To me it looks like the eye itself is wallerd
24 and the C-hook is down into the eye, which would make me
25 worried that the eye itself might be compromised.

26 Q. So if you saw what you see in Exhibit 191 during

1 any type of inspection of a transmission line, would you
2 report that problem?

3 A. If I saw that right there, absolutely.

4 Q. Yeah. Did PG&E have priority tags or ways to
5 rank the priority of different --

6 A. Yes.

7 Q. What was that system?

8 A. "A" tag means you don't leave. It's going to be
9 dealt with now. "B" tag you have -- I think it's
10 30 days. It might be 90 days. And then an "E" tag is a
11 year.

12 Q. What tag would you assign -- what priority tag
13 would you assign in what you see in 191 if you saw that
14 during an inspection?

15 A. A "B." I would probably make it a "B" because
16 it's probably been that way a while. I would probably
17 tell them "Hey, Guys, if you get a chance, let's go take
18 a peek at it from out of the tower."

19 Q. When you say "from out of the tower," you mean
20 by climbing the tower?

21 A. Yeah. I would have the crew go check it for me.
22 And then I might be able to get in a position with a
23 helicopter to determine, you know, "Maybe we better look
24 at this now." But if I was looking at that right there,
25 I would probably say a "B."

26 MR. FOGG: Okay. Madam Foreperson, I notice

1 we're about -- we've been at it for about an hour and
2 20 minutes or so. This is a natural stopping point for
3 me for a break. Would it be a convenient time for the
4 grand jury's break?

5 GRAND JURY FOREPERSON: Okay. Yes. Okay.

6 MR. RAMSEY: Before you go, could you --

7 GRAND JURY FOREPERSON: 15 minutes?

8 MR. RAMSEY: If that works for the grand jury,
9 that works for us.

10 GRAND JURY FOREPERSON: Okay. (WITNESS #11),
11 you are admonished not to discuss or disclose at any time
12 outside of this jury room the questions that have been
13 asked of you or your answers until authorized by the
14 grand jury or the Court. A violation of these
15 instructions on your part may be the basis for a charge
16 against you of contempt of court. This does not preclude
17 you from discussing your legal rights with your own
18 attorney.

19 (WITNESS #11), what I have just said is a
20 warning not to discuss this case with anyone except the
21 Court, your lawyer, or the district attorney.

22 You understand?

23 THE WITNESS: I understand.

24 GRAND JURY FOREPERSON: Okay. Thank you.

25 MR. FOGG: Fifteen minutes, Madam Foreperson?

26 GRAND JURY FOREPERSON: Yes.

1 MR. FOGG: Thank you.

2 [Recess taken from

3 2:20 until 2:36 p.m.]

4 GRAND JURY FOREPERSON: We're ready to resume.

5 MR. FOGG: Madam Foreperson, are we ready to
6 begin?

7 GRAND JURY FOREPERSON: We're ready to begin.

8 MR. FOGG: All right. (WITNESS #11), just to
9 remind you again, you're still under oath.

10 **EXAMINATION CONTINUED**

11 BY MR. FOGG:

12 Q. I want to turn your attention now to Grand Jury
13 Exhibit 178, which will be on the screen behind you.

14 Can you tell us what is depicted in Grand Jury
15 Exhibit 178?

16 A. That is a C-hook.

17 Q. Can I get you to pull that microphone a little
18 bit closer.

19 A. C-hook.

20 Q. Does anything seem abnormal about this C-hook?

21 A. Yeah. It's very abnormal. It's worn.

22 Q. And when you're saying "worn," are you referring
23 to the notch that appears to be at the top of the C-hook?

24 A. Absolutely.

25 Q. Have you seen any C-hooks with this type of
26 wear --

1 A. Never.

2 Q. -- working for PG&E?

3 A. Never.

4 Q. If you came across this C-hook like this on a
5 tower, what would you do?

6 A. I would let it be known that we need to start
7 looking at this.

8 Q. Who would you tell?

9 A. My supervisor.

10 Q. Based on your experience in working with your
11 colleagues at Table Mountain, what would you expect them
12 to do if they came across a C-hood that looked like
13 Exhibit 178?

14 A. There's no question in my mind that it would get
15 pushed to get looked at by testing or whoever. But
16 that's -- normally the stuff that I seen was the eye
17 itself oblong. I have never seen a hook look like that.

18 Q. And I want to go back with some things you said
19 earlier. I didn't do a good job of cleaning up odds and
20 ends. So I want to circle back on a few things.

21 When we're talking about your chronology of the
22 time you spent at PG&E, I found myself a little confused.

23 What job do you currently have?

24 A. I'm currently working helicopter operations with
25 PG&E. And I've been there for a couple of months.

26 Q. Okay. A couple months. What job did you have

1 before that?

2 A. Before that I elected to go into the management
3 side for my pension for my last few years. So I went
4 into contracts. So I was a lead inspector over
5 contractors.

6 Q. Do you remember about when you took that
7 contract?

8 A. July -- two years ago July.

9 Q. So about July 2017?

10 A. Yeah.

11 Q. And before you took the contractor job, were you
12 a troubleman --

13 A. Yes.

14 Q. -- at Table Mountain?

15 A. I was a troubleman out of Table Mountain, but my
16 lines were in the Redding area.

17 Q. And I know we covered this earlier. How long
18 were you a troubleman at Table Mountain?

19 A. About ten years. And that's just a guess. It
20 was about ten years ago.

21 Q. Fair to say it was approximately ten years?

22 A. Yeah, yeah.

23 Q. Approximately how long were you a lineman at
24 Table Mountain before you became a troubleman?

25 A. Five years.

26 Q. So is it fair to say that you were either a

1 lineman or troubleman at Table Mountain for about
2 15 years?

3 A. Pretty close.

4 Q. And you said when you were a troubleman, your
5 lines were somewhere else?

6 A. My lines --

7 Q. What did you mean by that?

8 A. Each -- there's four troublemen out of Table
9 Mountain and each troubleman has an area. My --

10 Q. When you say "area," do you mean type of lines
11 or geographically?

12 A. Geographically.

13 Q. What area did you cover?

14 A. Mine is from mainly on the west side down
15 towards Willows and then all the way up to Shasta Lake.

16 Q. Do you remember what the -- how many other
17 geographic areas were there for troublemen based out of
18 Table Mountain?

19 A. There's four.

20 Q. Do you remember what the other three consisted
21 of?

22 A. There's one that will go from Willows on down to
23 Colusa and over to 99 or so and then one from 99 up to
24 Highway 70 into Quincy. I'm not sure of that boarder up
25 there. But then the third would have been Burney,
26 McArthur, and over to Shasta Lake. And then I would take

1 over from that side.

2 Q. And which of those areas would have covered the
3 Feather River Canyon lines?

4 A. That would have been the troubleman from
5 probably 99 to Quincy.

6 Q. When you first started as a lineman at Table
7 Mountain, do you remember which troubleman had that area?

8 A. I believe his name was (WITNESS #13).

9 Q. Do you remember which -- do you know if (WITNESS
10 #13) is still at Table Mountain?

11 A. No. He's retired.

12 Q. Do you know which lineman -- strike that.

13 Which troubleman took over the area including
14 the Feather River Canyon after (WITNESS #13) left?

15 A. I believe (WITNESS #1).

16 Q. And did (WITNESS #1) eventually retired?

17 A. Yes.

18 Q. Do you know who took it over from (WITNESS #1)?

19 A. I believe it's (WITNESS #6).

20 Q. And that is based on -- when you say it's
21 (WITNESS #6) and (WITNESS #1), that is based on what you
22 experienced and saw when you were working at Table
23 Mountain?

24 A. Yeah. And (WITNESS #6) kind of -- (WITNESS
25 #6) -- I left so I'm doing this all on my -- my thought
26 and my memory I think (WITNESS #6) got that area.

1 Q. Okay. So these different areas, were they
2 written down somewhere describing the different areas?

3 A. Kind of. Everybody knew whose lines was whose
4 for the most part and then we obviously knew our lines.
5 But yeah, it was kind of known that those lines were
6 certain individual's.

7 Q. Does that -- were those areas assigned by the
8 supervisor?

9 A. Pretty much, yeah.

10 Q. And how often would a troubleman inspect lines
11 outside of their usual area?

12 A. It happened quite often when especially the two
13 troublemen up north. We always helped one another. A
14 lot of times on these lines when you run up to the
15 mountains, it's really nice to have somebody drop you off
16 so that you can take off walking over the mountain and
17 he'll pick you up on the other side. So you become a
18 team, the northern team.

19 I'm not exactly sure how the south would work.
20 We actually flew together a lot, too. Guy in the front,
21 guy in the back, one trying to keep an eye on the priors
22 coming up with the computer, the other guy looking and
23 then obviously after so many hours just helping each
24 other. So it's done differently in different, you know,
25 areas.

26 Q. When you say the two northern guys, would that

1 include the troubleshooters with responsibilities over the
2 Feather River canyon?

3 A. No.

4 Q. So the Feather River Canyon would be partly
5 described as the south?

6 A. Yeah.

7 Q. You made reference earlier when we were talking
8 about the age of different components to a document
9 called a structure data sheet. What's a structure data
10 sheet?

11 A. Engineering documents. We have -- on a computer
12 we all -- we actually have a GIS that actually has all
13 the lines. And you can double click on a structure, on a
14 circuit or even the circuit and it will give you -- some
15 of them will give you a description of what is out there;
16 the conductor size, the type of structure. And sometimes
17 it will actually give you a data sheet of the engineering
18 document of how it was built and possibly in the bottom
19 when it was created.

20 Q. Did those documents -- well, let me take a step
21 back.

22 Did the GIS system have a specific name in PG&E?

23 A. I just called it GIS. It's a mapping system.

24 Q. And if I wanted -- who would I ask from PG&E if
25 I wanted to see that mapping system?

26 A. Supervisor. I don't know.

1 Q. I want to ask about -- in your experience as
2 either a lineman or troubleman, did you ever see any
3 incidents when multiple towers fell down in the
4 Caribou-Palermo line?

5 A. I actually worked on -- I believe it was the
6 Caribou-Palermo. There were three -- I think three
7 structures went down, and we replaced them.

8 Q. Do you remember about when that was?

9 A. I don't.

10 Q. Do you --

11 A. Eight years maybe. That's just a guess, too. I
12 don't know. And I think it was the Caribou-Palermo line.

13 Q. Do you remember what time of year?

14 A. Winter because it was -- they -- a slide took
15 them out.

16 Q. And who is responsible --

17 Well, when you say "took them out," the towers
18 fell down?

19 A. Well, the ground moved and they went with it.

20 Q. Whose responsibility within PG&E was it to put
21 the towers back up?

22 A. All of us, tower. We had contractors building
23 roads to the tower and constructing. I think we put up
24 temporary poles until we could get towers built. So it
25 was an effort from all.

26 Q. On that patrol sheet we've talked about, if a

1 series of towers fell down and were replaced by a series
2 of poles, how would the patrol sheet for that line
3 change?

4 A. If it's permanent, it would just -- it would
5 come in as changed through the system.

6 Q. What counts as -- I guess what do you mean by
7 "permanent"?

8 A. If you -- if you replace a structure -- let's
9 say it's a steel tubular structure -- it's going to be
10 documented and imputed into that patrol so that you know
11 in the field that it's no longer a lattice steel tower.
12 It's a steel tube basically.

13 Q. The poles that replaced the towers that were
14 knocked down in the landslide, if those poles were meant
15 to be temporary, would the patrol sheet change to reflect
16 the presence of those poles?

17 A. I don't think so simply because I think normally
18 they're replaced in an amount of time that it shouldn't
19 affect it. And there again, if that was that line, I
20 believe I was still in the north and came down to help.
21 And I actually ended up working on putting it back even
22 as a troubleman.

23 Q. Okay. I want to jump back to Exhibit 188. It
24 should now be on the screen behind you.

25 Earlier we were talking about what you could
26 tell from the amount of daylight you could see in this

1 eye and you talked about other different size eyes and
2 different size hooks.

3 Do you know how many different size eyes there
4 are on a transmission tower?

5 A. I don't know the different size hooks but
6 rigging eyes and working eyes you'll see a different
7 diameter.

8 Q. So the intended -- let me take a step back.

9 So all the working eyes are not all intended to
10 be the same size? There are some that are different
11 sizes?

12 A. I don't think so, no.

13 Q. I'm sorry. I don't think I'm being clear. I
14 didn't understand.

15 Are all the working eyes supposed to be the same
16 eyes?

17 A. I have no idea, but I'm pretty sure. Through my
18 career there's different rigging eyes and working eyes.

19 Q. How about -- we've used the term and have heard
20 from other witnesses "rigging eye" versus "working eye."
21 What is the difference between those two?

22 A. This one has no rigging eye. Normally -- or I
23 shouldn't say normally. The newer structures will
24 actually have another eye in the inside where you can
25 hang your hoist or rigging to work that structure.

26 Q. And so you said the rigging eye. So what we're

1 seeing right now in Exhibit 188 is the working eye?

2 A. No. That's the actual suspension eye or --
3 yeah, that's a suspension eye right there.

4 Q. Okay.

5 A. This has no rigging eye but -- I'm sorry. I
6 keep referring to them, but normally I will see one.

7 Q. And I just ask to help me understand. So in
8 Exhibit 188 there is no rigging eye?

9 A. No.

10 Q. But we see -- what's the name of the eye that
11 the hook is hanging in?

12 A. Suspension eye, suspension plate.

13 Q. Could that also be called a working eye or --

14 A. No. A working eye would be another eye on the
15 other side that you would actually use for rigging.

16 Q. Okay. So rigging eye and working eye are the
17 same ways to describe -- or two terms for the same thing?

18 A. They're very similar. It's two eyes rather than
19 one.

20 Q. Okay.

21 A. And this one here in order to work that tower, I
22 would have to rig over the steel. The newer design you
23 will actually have an eye that you can utilize to hang
24 your rigging.

25 Q. So talking about the suspension eye then -- and
26 I apologize if I was confusing but --

1 A. No. I think I confused everybody. I'm sorry.

2 Q. But talking just about suspension eyes, in your
3 experience were those all meant to be the same size under
4 115 kV lines?

5 A. I don't think so, no. I think there are
6 different eyes.

7 Q. How about C-hooks? In your experience with
8 C-hooks all are roughly the same diameter?

9 A. Yeah.

10 Q. Is there a -- is there a reference or document
11 from PG&E that would list the different diameters of the
12 eyes for the transmission lines?

13 A. I have no idea.

14 Q. We talked earlier about the tower department.
15 To the best of your knowledge, does the tower department
16 do inspections on transmission lines under 500 kV?

17 A. I believe so. I don't know how it's triggered
18 or what schedule, if any, is out there, but they
19 definitely do inspections if triggered.

20 Q. And triggered? What do you mean by triggered?

21 A. If somebody requests it or . . .

22 Q. We talked earlier about age of the
23 Caribou-Palermo line. And you gave a number 100. In
24 your experience, is the age of the Caribou-Palermo line
25 common knowledge among the workers at Table Mountain?

26 A. Uh-huh. Everybody says "The old Caribou line."

1 Q. You mentioned also that you had climbed towers
2 and climbed them less frequently after the -- was it the
3 self arrest?

4 A. I'm sorry?

5 Q. Well, you mentioned climbing towers earlier and
6 there was a change in technology where you did it less
7 frequently. What was the name of that change?

8 A. One hundred percent fall restraint.

9 Q. Fall restraint. Do you remember approximately
10 when that technology came into place?

11 A. Between five and ten years. Probably five,
12 seven. I don't know.

13 Q. Before the fall arrest came in -- became in use,
14 how often in a given year would you say you would climb a
15 transmission tower during an inspection?

16 A. Just a few. Very, very few.

17 Q. How about your -- do you know from your own
18 personal experience if colleagues would climb towers more
19 or less frequently during inspections?

20 A. I would think that -- I would think that I would
21 probably be more apt to do it than most.

22 Q. Why do you say that?

23 A. I just -- that's my work ethic.

24 Q. And then once the -- and it was the --

25 What's the name of the technology again?

26 A. One hundred percent.

1 Q. Okay. The 100 percent fall restraint. Once
2 that came into effect, how often a year would you climb a
3 tower during inspection?

4 A. You know what? After it came into effect, I
5 think I did it one time.

6 Q. Do you know from your own personal observations
7 how often your colleagues would climb towers?

8 A. Let me fix that a little bit.

9 Q. Please do.

10 A. So that's if I wanted to climb up high, install
11 a "High" sign or something like that. Back then I
12 installed "High" signs a lot. But then you're only going
13 up, you know, 15 to 20 feet and you're not having to buck
14 all the way up 100 percent. So yes, quite a few "High"
15 signs. But as far as climbing up, very few. Maybe one
16 time.

17 Q. So how high would you have to climb to reach a
18 point where you can see the insulators and the conductor
19 and the connector?

20 A. Depending on the structure. There's 75-footers
21 to 200-footers. So, yeah.

22 Q. So when we would have been talking about having
23 this conversation, we're referring to climbing up 75 feet
24 or up to 200 feet, not the 15 to 20 feet?

25 A. Right.

26 Q. Thank you.

1 A. Just to the "High" signs. I mean, I'm still
2 using the 100 percent. But you just go on up, install a
3 "High" sign, and be done.

4 Q. So after the 100 percent came into use, did you
5 observe your colleagues climbing towers less frequently
6 or about the same rate?

7 A. I would think less, but I can't say that. I
8 wasn't around.

9 Q. Okay.

10 A. But I would think less. It became very
11 cumbersome. And even just to pack the stuff needed on
12 your utility vehicle was tough.

13 Q. I want to ask you now questions about your
14 colleagues. And when I do, I will be very clear I am
15 only asking about what you personally observed, not any
16 innuendos or rumors or things you have heard. Okay?

17 A. Uh-huh.

18 Q. Did you ever personally see any troublemen cut
19 corners in their inspection work?

20 A. No.

21 Q. Did you ever personally see any lineman cut
22 corners in their line work?

23 A. No. There's different ways of doing line work.
24 So no.

25 Q. How about did you ever see a troubleman skip an
26 air patrol?

1 A. No, no. That's tracked by supervisors and the
2 clerical support in the yard. Nobody is going to be able
3 to skip it. It's going to be -- it's going to be done.

4 Q. Did you ever see a troubleman skip a ground
5 inspection?

6 A. No. It can't be. It has to be done. It's
7 mandated so it has to be done.

8 Q. How would -- do you know how supervisors would
9 verify that a ground inspection did get done?

10 A. Through the paperwork trail.

11 Q. How about did you ever see a troubleman -- and
12 this is your own personal observation. Did you ever see
13 a troubleman falsify inspection documents?

14 A. No, no. We're pretty much doing our own
15 paperwork so . . .

16 Q. I beg your pardon?

17 A. We are pretty much doing your own paperwork. So
18 I wouldn't be able to see anybody falsify.

19 Q. Did you ever -- in your experience did any
20 troublemen find fewer conditions on lines than other
21 troublemen?

22 A. Probably. I don't know. I can't verify it
23 but . . .

24 Q. But from your personal observations?

25 A. I -- there again, I was very anal in my
26 position. And probably some of the stuff I write up a

1 lot of others would not.

2 Q. Okay. The question is did you see any -- from
3 your own personal observation did you see any troublemen
4 who consistently reported fewer conditions on lines than
5 other troublemen?

6 A. No, I can't say that, no.

7 Q. Why can't you say that?

8 A. I never seen them do it.

9 MR. FOGG: Okay. Will you give me just a second
10 so I can consult with my colleagues.

11 [Conferring off the record.]

12 MR. FOGG: (WITNESS #11), we're done with
13 questions, but we want to give the opportunity for grand
14 jurors to ask questions.

15 So are there any grand jury questions for
16 (WITNESS #11)?

17 [Written questions are passed forward.]

18 MR. FOGG: So we have two sheets of questions.
19 Are there any others, Madam Foreperson?

20 GRAND JURY FOREPERSON: No.

21 MR. FOGG: Okay. So we'll take a second now to
22 review the questions, and we'll be right back.

23 [Conferring off the record.]

24 BY MR. FOGG:

25 Q. Now, (WITNESS #11), we have a couple of
26 questions from the grand jurors.

1 A. Okay.

2 Q. First, I want to circle back talking about the
3 detailed ground inspections. How long would it take to
4 complete a ground inspection of a line that consists of a
5 couple hundreds towers?

6 A. Depending on terrain. I could do a ground
7 inspection on a line of mine called the Cottonwood Number
8 One. And a lot of it is on the road so I could complete
9 that patrol really fast.

10 Obviously, the Caribou-Palermo, the line that
11 we're speaking of, that line would take quite a bit of
12 time. Sometimes -- let me use the 500 line. The 500
13 line --

14 Q. When you say "500 line," which line?

15 A. That's our two major state tie lines up in the
16 foothills.

17 Q. Okay. You were saying?

18 A. What's that?

19 Q. Okay. Continue, please.

20 A. Yeah. Well, some of those structures you can
21 actually go in and get to two or three structures. And
22 it'll take you half a day to get to them and then you've
23 got to drive all the way back out and go past a canyon
24 and go to the other side to get to a few more.

25 So there's so many variables to how long it's
26 going to take. That 500 line when I would help patrol on

1 that, we all would try and get everybody to help because
2 we know.

3 You know, the Caribou-Palermo I'm not real
4 familiar with it. But what I do know of the canyon and
5 the little bit that I've been around it, I'm going to ask
6 for help. So it takes a little bit of time.

7 Q. So if you couldn't complete a ground inspection
8 in a day, would you be required to continue it the next
9 day?

10 A. Oh, absolutely. You're talking -- that 500 line
11 that I'm referring to, you're talking a full month.

12 Q. And would you be expected to do just that
13 inspection of that line until it's complete or were you
14 sent out on other assignments?

15 A. There's switching. There is other assignments
16 involved. That's another reason that you're getting
17 help. But usually when you've got a line like these
18 lines, you're looking for somebody to give you a hand
19 because they take time.

20 Q. How about on an air patrol? Are those
21 frequently completed in a single day or do they take
22 multiple days?

23 A. Most of the time you're talking doing a long
24 line in a couple of hours. The 500 line that I've been
25 referring to, there's two lines side by side that run
26 from Table Mountain all the way up to Burney. And with

1 fuel and going back into Red Bluff or wherever your fuel
2 stop is, it's going to take you -- you can do it in a
3 day, but your patrol starts tailing off. Again, like I
4 say, you're tired. You're looking at the same thing over
5 and over again. So you're looking at a day and a half
6 probably to do those two lines.

7 But the Cottonwood one that I referred to
8 earlier, even though it's a long line going from Corning
9 to Cottonwood and it forks out to Gerber and these other
10 locations, you can fly that fairly fast because it's --
11 it's easy and accessible.

12 Q. Whose job was it to make sure that an inspection
13 got done if it wasn't finished in a single day?

14 A. The supervisor. I mean, the troubleman. If I
15 knew that I was in jeopardy of not completing that, I'm
16 going to reach out for help and tell the supervisor "I
17 need help." So he's going to help you get that help.

18 Q. And would the help come -- what form would that
19 help come in?

20 A. Crew member, troublemen, whoever is available
21 that has the experience to do it. A lot of times
22 especially out of Table Mountain you're going to get
23 somebody off the crew because that's where you all are.
24 The other troublemen up in the north would help if needed
25 but would stay up there.

26 MR. FOGG: One second.

1 [Conferring off the record.]

2 BY MR. FOGG:

3 Q. At any time in your career did you receive
4 formal training from PG&E about when the cold-end
5 attachment points on transmission lines should be
6 replaced?

7 A. No.

8 Q. Did you receive any informal or on-the-job
9 training on that?

10 A. Absolutely. Every time I changed a string of
11 insulators it's right in front of you. And you know if
12 it's a problem. And normally, when you change a string
13 of insulators, you reset the clock, we call it, and
14 change all the hardware.

15 Q. So when you say "reset the clock," you mean --
16 so if you change the insulators, you change the C-hook as
17 well?

18 A. Absolutely.

19 Q. Was there an actual clock somewhere?

20 A. No, no, no, no. That's just a term that we use.

21 Q. Okay. On -- when you did an aerial patrol, did
22 you have a checklist of things to look at for each tower?

23 A. No, no. It was just -- yeah, in my mind.
24 Depending on the line, you have shield wire. Some of it
25 doesn't. So I would actually get into whatever groove
26 that I got into whether it started from the base looking

1 up the insulators all the way up to the top to the shield
2 wire or in reverse.

3 You just kind of got into a comfort zone of what
4 you're looking for and how. And that might change after
5 you get fuel just to, you know, try and break things up.

6 Q. But that was a mental checklist, not a ran
7 checklist?

8 A. Yeah. And there is, but it's a mental -- it's a
9 mental thing when you're in a helicopter with patrol,
10 camera, binoculars, and a notepad.

11 Q. So there's -- so if I understand what you're
12 saying, there's a written checklist somewhere that you
13 would have in mind?

14 A. No. I shouldn't have said that. I shouldn't
15 have said it that way. There might be, but for me it was
16 an experience.

17 Q. How about for a ground inspection of the
18 transmission tower? Was there a checklist you had with
19 you?

20 A. It's in the ETPM manual, but I always just had
21 my patrol with me. I knew what I was looking for.

22 Q. Were you ever told in your time at PG&E what the
23 diameter of a suspension eye should be?

24 A. No, no. That's all just me working.

25 Q. How about the diameter of a C-hook?

26 A. No. But a C-hook is a C-hook.

1 Q. Well, what do you mean "A C-hook is a C-hook"?

2 A. There's no other variation. There's different
3 attachments. There's a "Y" ball. There's different ways
4 to attach insulators to a tower, but a C-hook is a
5 C-hook. It looks a little different than the older
6 style, but it's a C-hook.

7 Q. So, (WITNESS #11), I want to direct your
8 attention back up to the screen behind you to
9 Exhibit 191. We talked earlier about that -- that hook
10 would give you -- seeing that hook and the eye would be
11 cause for concern.

12 How would you tell that the state of the hook
13 and the eye is cause for concern and not just a
14 reflection of the hook and the eye diameter?

15 A. Like I say, to me I would have to be probably
16 either really, really close and look at it. And to me it
17 looks like it's down in it. And with my experience over
18 the years normally it would be an oblong eye, not like
19 the hook that you showed me. I've never seen that
20 before. It would be that eye that is worn.

21 And that's another reason in my mind I wouldn't
22 be as concerned to make it an "A" tag. A "B" tag you
23 could -- what I've seen over the years, it's -- normally
24 the eye has that little bit of an oblong to it.

25 Q. And when you say you see the oblong, that's a
26 sign of wear?

1 A. Yes.

2 Q. So the suspension eyes are always round in your
3 experience?

4 A. Yes.

5 Q. But so if you see a C-hook sitting down in it,
6 that would suggest some of the oblong wear?

7 A. That's my opinion, yeah, absolutely. I -- like
8 I say, I have never seen a C-hook like that.

9 MR. FOGG: (WITNESS #11), can I have one more
10 moment with my colleagues, please.

11 [Conferring off the record.]

12 BY MR. FOGG:

13 Q. We were talking earlier about if you needed help
14 to complete an inspection and you mentioned you'd get
15 help from the crew. Who is the crew or crew member?

16 A. In order to get into Table Mountain, it's a
17 bidding system with the union. And there are so many
18 linemen that have bid into the yard. So you're either
19 going to ask for -- there's -- they had a truck driver
20 for a while, but it's all linemen now.

21 You're going to ask for help from one of the
22 qualified linemen or the foreman. You know, sometimes
23 the foreman has some free time, and he'll go. But that's
24 who I'm referring to that would help on a patrol. And as
25 I said before, it could be a couple of them, a few of
26 them.

1 [Counsel conferring off the record.]

2 BY MR. FOGG:

3 Q. And, (WITNESS #11), you mentioned that
4 there's -- that a C-hook is a C-hook, but you also
5 mentioned that there's an older style C-hook, a newer
6 style. What did you mean by that?

7 A. It's probably the same. I wish I had a couple
8 to show you. But I think -- I think that the newer
9 C-hook is a little beefier than the older style, but it's
10 the C-hook.

11 Q. And you say that based on your personal
12 experience handling these?

13 A. Yeah, absolutely. It's just me handling them
14 over time.

15 [Counsel conferring off the record.]

16 BY MR. FOGG:

17 Q. We talked earlier about replacing C-hooks.
18 Well, I want to make sure we talked about this.

19 When you replace an insulator string, you
20 replace the C-hook at the same time; correct?

21 A. Yes.

22 Q. Where did you get the C-hook from that you then
23 used to replace it?

24 A. Material. We either have stock material in the
25 yard. Or if you have a big enough job, the job is
26 ordered and it's included in the material to do the work.

1 Q. Who handles -- when you worked at Table
2 Mountain, who handled the ordering of material?

3 A. It was a collaboration of all of us saying "Hey,
4 we're running low on this" or whatever. And we all kind
5 of work together to make sure that we had especially the
6 stock that we utilized and used a lot.

7 [Counsel conferring off the record.]

8 BY MR. FOGG:

9 Q. So when you ordered the C-hook, would you order
10 directly from manufacturer or tell anyone else in PG&E
11 "Get me more C-hooks"?

12 A. We actually have a warehouse in PG&E. So we
13 have "M" codes and that C-hook has its own code. And it
14 would go to that warehouse. And where the warehouse gets
15 it I don't know. But I think our -- I think most of our
16 stuff comes from Marysville or Fremont, I believe.
17 Through the company.

18 MR. FOGG: So, (WITNESS #11), I think we're now
19 finally done with our questions.

20 Are there any further questions from the grand
21 jurors?

22 Seeing none. I don't think we have any further
23 questions for you at this time, (WITNESS #11). Thank
24 you.

25 THE WITNESS: Thank you.

26 GRAND JURY FOREPERSON: Thank you.

1 MR. MORRIS: Admonition.

2 GRAND JURY FOREPERSON: Again?

3 MR. MORRIS: Yes, please.

4 GRAND JURY FOREPERSON: Okay. Sorry.

5 Okay. (WITNESS #11), you are admonished not to
6 discuss or disclose at any time outside this jury room
7 the questions that have been asked of you or your answers
8 until authorized by the grand jury or the Court. A
9 violation of these instructions on your part may be the
10 basis for a charge against you of contempt of court.
11 This does not preclude you from discussing your legal
12 rights with your own attorney.

13 (WITNESS #11), what I have just said is a
14 warning not to discuss this case with anyone except the
15 Court, your lawyer, or the district attorney.

16 THE WITNESS: Okay.

17 GRAND JURY FOREPERSON: Thank you.

18 THE WITNESS: Thanks. Thanks, Everybody.

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED]

MR. NOEL: (WITNESS #1).

GRAND JURY FOREPERSON: (WITNESS #1), before --

(WITNESS #1): Yes.

GRAND JURY FOREPERSON: -- before you sit down,
we'd like to swear you.

(WITNESS #1)

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: Yes, ma'am.

GRAND JURY FOREPERSON: Thank you. Have a
seat.

EXAMINATION

BY MR. NOEL

Q. Hi, (WITNESS #1). Welcome back.

1 A. Thank you.

2 Q. When we left off, we were talking about the
3 2009 inspection of Caribou-Palermo line; do you remember
4 that?

5 A. Yes, sir.

6

7 (Exhibit 237 was marked for identification.)

8

9 Q. Okay. I want to back up now and start off,
10 then we'll come back to 2009. In front of you you have
11 Exhibit No. 237. Actually --

12 A. 157.

13 Q. Nope. There should be --

14 A. There it is.

15 Q. There you go. Do you recognize Exhibit 237?

16 A. I just know the book. I don't remember about
17 doing it or whatever.

18 Q. Do you recognize what 237 is?

19 A. Yes, sir.

20 Q. What is 237?

21 A. Looks like an air patrol in the Caribou-Palermo
22 line.

23 Q. When?

24 A. 6/07/07.

25 Q. So that would be June 7th, 2007?

26 A. Yes, sir.

1 Q. And who did that air patrol?

2 A. I believe it was me.

3 Q. And this is your report of your air patrol?

4 A. Yes, sir.

5 Q. Air patrol?

6 A. Yes, sir.

7 Q. Did you locate, in 2007, any issues, any

8 problems on the Caribou-Palermo line?

9 A. Wrote down right here, sir.

10 Q. Okay. That's page 3? 2?

11 A. I would say 2, yeah.

12 Q. Okay.

13 A. Looks like about three items I wrote down

14 there.

15 Q. What types of problems did you find?

16 A. All of the insulators on three towers were

17 flashed.

18 Q. Were those three towers, any of them 24/199,

19 27/222 or 35/281?

20 A. No, sir. 6 over 59, 7 over 60, and 7 over 61.

21 Q. Remind us again what it means for an insulator

22 to be flashed.

23 A. It's just the insulators are porcelain, and on

24 that line they're brown. So when the lightning hits the

25 insulator, the porcelain, the brown porcelain turns

26 white. That's the way you can tell it. Or you can see

1 up on the hub where the lightning hit the steel hub and
2 walked right down on the bell. And you can see where --
3 it's like if anybody's ever did any stick welding and you
4 had little burrs, you'd see that from the lightning where
5 it walked down the hub.

6 Q. Okay. Can you flip back through that and find
7 your Transmission Line Object List.

8 A. Well, all this is, the object list, it shows --
9 I don't know, maybe it's in the back. I don't see it in
10 the front here. I don't see it in this book.

11 Q. Well, this, this whole portion right here --

12 A. Yeah. All this paper is object, do you know
13 what I mean? To write down what the problem is with the
14 tower.

15 Q. Right. It's actually entitled top
16 "Transmission Line Object List"?

17 A. Yes.

18 Q. And that's the forty something pages at the
19 back?

20 A. Yes. Yeah. Absolutely.

21 Q. Okay. And can you find tower number 24/199 in
22 there, please?

23 A. Yeah. Lattice steel.

24 Q. Okay. Did you inspect tower number 24/199?

25 A. 197 or 199?

26 Q. 199.

1 A. Yes. It was completed with no problems.
2 Q. Complete. So what does that mean?
3 A. There was nothing a matter with the tower.
4 Q. Okay. Could you flip to tower number 27/222?
5 A. 222. Same thing; nothing found.
6 Q. Okay. This, again, was an aerial inspection?
7 A. Yes.
8 Q. And that means you were flying down the line
9 within a helicopter?
10 A. Yes.
11 Q. And how much time did you say you spent at
12 each?
13 A. We probably spent anywhere from five to ten
14 minutes as we hover over the structure. We hover over
15 every structure.
16 Q. Okay. And any estimation of how far from the
17 structure you are?
18 A. I could probably get on the skid of the
19 helicopter and walk on the tower, that's how close we get
20 in there.
21 Q. All right. Let's finish with the 2007. You
22 can flip that one closed and put it away.
23 A. Okay.
24
25 (Exhibit 238 was marked for identification.)
26

1 Q. Let's move on to Exhibit No. 238. Should be --
2 A. Got it right here.
3 Q. Yep.
4 A. Okay.
5 Q. And do you recognize Exhibit 238?
6 A. Yeah, just from the paper, that's all.
7 Q. Okay. And what do you recognize 238 to be?
8 A. Just says an air patrol.
9 Q. What year?
10 A. Looks like August -- or July 22nd, 2008.
11 Q. All right. Now we're looking at page 1 of
12 this, up here in the corner?
13 A. Yeah.
14 Q. It's written "(WITNESS #1)"?
15 A. Yeah.
16 Q. Who is (WITNESS #1)?
17 A. That's me.
18 Q. Okay. Do you recognize whose handwriting this
19 is on the front page?
20 A. I believe it's the clerk. It's not mine.
21 Q. Okay. Now flip it open and take a look at it,
22 please.
23 A. Second page, or how far?
24 Q. Just go through.
25 A. Okay.
26 Q. Basically the next question is going to be is

1 that an inspection report of yours?

2 A. Yeah. This here's all the problems on the line
3 right here.

4 Q. Okay. But first we need to establish that you
5 recognize that and it's an inspection that you did?

6 A. Yeah, that's all I can help you with, the
7 inspection report.

8 Q. Okay. So in 2008 you again inspected the
9 Caribou-Palermo line?

10 A. Yes.

11 Q. And what type of inspection?

12 A. Should have been another air, yes.

13 Q. Again, in the helicopter?

14 A. Yes, sir.

15 Q. Did you locate any problems?

16 A. Yeah. We have the list right here. We have
17 road work, we have burnt poles, we have road acc. work
18 that needs to be, maintain access roads, all sorts of
19 stuff.

20 Q. Okay. The list you're looking at, is that
21 what's known as the Notification List?

22 A. Yes.

23 Q. And that's the open notifications on the line
24 at the time of your inspection; correct?

25 A. Right.

26 Q. Those are the known problems that are on the

1 line?

2 A. That's right. Yeah.

3 Q. Let's flip back to that real quick.

4 A. Yeah.

5 Q. And you had inspected this line, again, in

6 2007?

7 A. Yes.

8 Q. And you had noted some problems?

9 A. Yes.

10 Q. Are those problems still open, unresolved when

11 you did the 2008 inspection?

12 A. That I don't know, sir.

13 Q. Okay. You said there were three flashed

14 insulators?

15 A. Right here is.

16 Q. Okay. Let's stay on the notification page real

17 quick. You said that the, back in 2007 that you had, you

18 located three flashed insulators -- or flashed

19 insulators --

20 A. Yes.

21 Q. -- on three different towers?

22 A. Yes.

23 Q. Do you see those listed as open notifications?

24 A. No, I don't. I don't, unless it's back in the

25 -- let me look here a minute.

26 Okay. I don't see it on here. They might have

1 done the work and fixed it.

2 Q. Okay. And then how many issues did you find
3 with the line?

4 A. I found one on looks like 8/22/08; tower 12
5 over 106 was insulator gunshots. They were gunshot.

6 Q. Okay. So that was on August 12th, 2008, when
7 you were doing the inspection?

8 A. 22nd.

9 Q. Oh, I'm sorry.

10 A. 22nd.

11 Q. August 22nd?

12 A. Yeah.

13 Q. Okay. 2008 you were doing the inspection and
14 you found insulators with gunshot wounds, for lack of a
15 better term?

16 A. Yeah. You can tell the gunshots.

17 Q. Okay. Now flip back to the notifications page
18 real quick before we go on.

19 A. You want this here or off the front?

20 Q. That page right there.

21 A. Right there.

22 Q. You had indicated something about burning or
23 fire as an open notification --

24 A. Yeah.

25 Q. -- on the Caribou-Palermo?

26 A. On structure 18 over 147, replace burnt pole.

1 Q. Do you remember a fire up the canyon --
2 A. No, sir.
3 Q. -- on the Caribou-Palermo 2008?
4 A. No. Sure don't.
5 Q. Okay. Can you flip back to your Transmission
6 Line Object List to 24/199 and tell us if you inspected
7 24/199.
8 A. Yeah. Complete, no problems found.
9 Q. And 27/222?
10 A. Completed, no problems found.
11 Q. And how about 22/189?
12 A. 22/189?
13 Q. Yeah.
14 A. Says completed, no problems found.
15 Q. Great. Okay. You can put that inspection
16 away.
17 A. This is our next one?
18
19 (Exhibit 157 was marked for identification.)
20
21 Q. Yep. Now we're going to go back to 157.
22 A. Okay.
23 Q. Which is where we left off, the 2009
24 inspection.
25 Now what type of inspection was it in 2009?
26 A. It's a detailed patrol.

1 Q. Remind us again what that means.

2 A. That's -- a ground patrol is a detailed patrol.

3 Q. Okay. What does a ground patrol entail?

4 A. It entails to go to every tower and check the

5 steel, insulators, and all the connectors and everything,

6 make sure that it's, it's up to speed.

7 Q. How long does the ground patrol generally take?

8 A. Depends on our workload.

9 Q. For instance, for the Caribou-Palermo line, how

10 long would it take you to do? How many days to do a

11 ground patrol?

12 A. It might take a month.

13 Q. As opposed to an air patrol, how long does that

14 take you?

15 A. It would take a day.

16 Q. All right. We already talked about the

17 transmission object list, line object list, now I'm

18 showing you up on the board this is page 59 of 69 from

19 your Transmission Line Object List.

20 A. Page 59, really?

21 Q. Oh, 46. I'm sorry. The whole package is 59

22 pages. That's with everything else.

23 A. Page 46?

24 Q. Right.

25 A. Okay.

26 Q. All right. This is page 46, the Transmission

1 Line Object List from the August 20th --

2 A. Yes.

3 Q. -- 2009 inspection, detailed inspection;

4 correct?

5 A. Yes.

6 Q. This is Bates stamp page PG&E Camp

7 CF0000001194; correct?

8 A. Yes, sir.

9 Q. This is the page, the 2009 page for tower

10 number 27/222; correct?

11 A. That's correct.

12 Q. Do you see 27/222 on the page?

13 A. Yes, sir.

14 Q. And did you find any problems this year with

15 27/222?

16 A. We had connectors.

17 Q. And that's this line right here in the middle?

18 A. Yes. Right there I wrote it down,

19 "Connectors," going to have to be changed out.

20 Q. Okay. "Connectors," and then what else does it

21 say there?

22 A. It was no prior on it on the last notification,

23 but you have to put completely new findings. Because

24 management had come up that they wanted to change all the

25 connectors on the line, so we had to write all the

26 connectors up.

1 Q. So any connectors you found on the line had to
2 be changed; correct?

3 A. That's correct. Yeah.

4 Q. So this is kind of an amalgamation of different
5 pages. Is there, other than they needed their connectors
6 changed, is there any similarities between these
7 different towers that are listed up here?

8 A. See the connectors up there? That was wrote
9 up. And I put "no pic," which no picture; okay?
10 Everything else on these connectors has pictures of the
11 connectors on the line. Then I also said needs an EL
12 notification. So an EL notification is a job you write
13 up so the crew has, can charge your time to it and change
14 the -- fix the problem.

15 Q. How about the towers themselves, do they have
16 anything in common?

17 A. The towers are all the same. They're just like
18 twins. They're just the same as one after another unless
19 you come to one that's configured like the tramp tower.

20 Q. Tramp tower?

21 A. This 222 is a tramp double dead end, like we
22 talked about before.

23 Q. That's a transposition tower?

24 A. Right. We discussed that.

25 Q. The other towers on this list, are these all
26 transposition towers?

1 A. No. They're just straight-line towers.

2 Q. No, this list right here that I'm showing you.

3 A. As far as -- no, no. There's --

4 Q. This is different from what you're looking at

5 on the page.

6 A. In other words, here's what you're saying,

7 tramp double dead -- suspension, suspension, suspension,

8 suspension.

9 Q. Right. Okay. But this isn't a copy of your

10 page, this is from different pages. So this is tower

11 number 20/160 listed as a tramp double dead end; correct?

12 A. Okay.

13 Q. That was a transposition tower?

14 A. That's right.

15 Q. 24/199, tramp double dead end?

16 A. You got them condensed, okay.

17 Q. Yes.

18 A. I see now.

19 Q. 27/222, tramp double dead end?

20 A. Right. Right.

21 Q. 32/260, tramp double dead end?

22 A. Right.

23 Q. 35/281, tramp double dead end?

24 A. Right.

25 Q. And all of these transposition towers need new

26 connectors?

1 A. That's correct.

2 Q. We could probably go through all the
3 transposition towers on the Caribou-Palermo that all of
4 them need new connectors?

5 A. Correct.

6 Q. Do you recall why you had to replace all the
7 connectors?

8 A. Because they were failing.

9 Q. Okay. How do you know they were failing?

10 A. We had incidents where we had burn off jumpers,
11 burn off of jumpers.

12 Q. What does that mean?

13 A. In other words, the wire comes over the tower
14 and then the other wire going out, it connects to it.
15 And that connector is right there. So the product is so
16 old that over the years they get corrosion underneath and
17 stuff, and then they, what they do is they start burning
18 on each other. And then they finally burn, and that
19 ultimate line up. I don't know, you have a picture of
20 connector, I could show you.

21 Q. We're going to get to it in just a second.

22 A. Okay.

23 Q. So this was a safety issue; correct?

24 A. Absolutely.

25 Q. And were you -- was this something you did
26 yourself or was this something you were told to do?

1 A. No, direct mandate from management.

2 Q. That you were to identify?

3 A. Identify and write up all the splices and
4 conductors -- and connectors, yes.

5

6 (Exhibit 158 was marked for identification.)

7

8 Q. All right. Showing you what's Exhibit 158.

9 A. Right.

10 Q. Obviously, that's a transmission tower. Do you
11 recognize what kind of tower that is?

12 A. Yeah, it's a tramp. These are the connectors
13 right here. You can see them right here. See them right
14 there. There's another one there. There's one there.
15 There's one there. One there. And there's -- see them
16 there? All up there, up there, and there. They're all
17 connectors.

18 Q. All right. I didn't want to interrupt you, but
19 I want you to do exactly what you just did again.

20 A. Go ahead.

21 Q. Now, you got a pen. Your finger now is a pen.

22 A. This is all connectors right here. What you
23 see is on the backside, that's connectors in there.
24 There's connector, there's connector. There's some
25 there. There's some more there. They're all connectors;
26 okay? There's some right there on the bells there. You

1 see all the connectors up there? These were all, all
2 these on these towers were all wrote up.

3 Q. Okay. So you've just used -- so we can make a
4 record of it -- you've got Exhibit 158 in front of you,
5 the photograph, you've been using the marking, you've
6 marked the connectors on that transposition tower.

7 A. Do you see what the tramp does? There the
8 conductor is coming in, it takes this wire and goes all
9 the way across to the middle. And, like I said, what it
10 does, it breaks the corn fields up. And that's the idea
11 behind it.

12 Q. Okay. Let's save this real quick.

13 And, Madam Foreperson, we'll mark that as 158A
14 and present it over the break.

15
16 (Exhibit 158A was marked for identification.)
17

18 Q. All right. Next up, this is page 3, going back
19 to the front of your inspection.

20 A. Yes.

21 Q. And this is what's entitled the "Transmission
22 Line Inspection Data Sheet"?

23 A. Yes, sir.

24 Q. What is this form?

25 A. This -- these are all the splices I wrote up.

26 Q. Okay. Let's talk more in general about the

1 form itself. What is the form itself?

2 A. The form is just -- if you find a problem on
3 the line, this is the sheet that you fill in to get the
4 work done. And you can see the notifications all wrote
5 out for them. These are the job notifications to
6 complete the work.

7 Q. Okay. Let's see, go up to the top here. We
8 have inspector name?

9 A. Yes.

10 Q. (WITNESS #1). That's you?

11 A. Yes.

12 Q. You completed your inspection on what date?

13 A. 8/31/09.

14 Q. Miles that you inspected?

15 A. Sixty-two.

16 Q. And number of structures?

17 A. Four hundred forty-four.

18 Q. At that time there were 444 structures on the
19 Caribou-Palermo?

20 A. Yeah.

21 Q. Did that change from year to year?

22 A. No. No. No. It should have been the same
23 standard 62-mile and the same structures. And I don't
24 know, does it change different here? I didn't even look.
25 Does it say here?

26 Q. You're going back to --

1 A. This says 445. In other words, it's an error.
2 There's only X amount of structures on that. It doesn't
3 change. What's it say on that one?

4 Q. And there's 237.

5 A. 237. Structures right there, 441. So what,
6 what is deal, what the deal is, the structures don't ever
7 change, it's this sheet just says of what we looked at.

8 Q. Okay.

9 A. Of how many structures we looked at.

10 Q. Okay.

11 A. That's where that comes in to play.

12 Q. And the 237 is the exhibit number?

13 A. Yeah.

14 Q. Not --

15 A. Yeah.

16 Q. All right. So all of the issues listed on this
17 Transmission Line Inspection Data Sheet are issues that
18 you found on the, during the 2009 inspection?

19 A. Yeah. This was another mandated from our
20 supervision. They wanted all splices wrote up.

21 Q. Okay. And we go on to page 10, which is the
22 second page.

23 A. Yes.

24 Q. More splices. No, this is connectors.

25 A. All the splices and stuff, I don't know, looks
26 like maybe between the connectors, splices, probably

1 wrote up maybe 200 items.

2 Q. All right. So on page 10 of 69 here, which is
3 your Data, Transmission Line Inspection Data Sheet, you
4 were replacing the connectors, you have date found. What
5 is that?

6 A. That's the date we found the connector.

7 Q. Okay. Then you have structure number listed?

8 A. Yes.

9 Q. You have connectors listed with a, there's a
10 line, an arrow going down?

11 A. Yes. That's all connectors.

12 Q. So all of this page is connectors?

13 A. That's correct.

14 Q. And estimated hours?

15 A. Forty to work on the line; 40 hours.

16 Q. Per tower?

17 A. Per tower.

18 Q. And then --

19 A. Then you've got to clear the lines, so you'd
20 have to put yes, because they don't work it hot. You
21 work it dead. And the 40 hours, a lot of people get
22 confused about it, but not, because you've got a five-man
23 crew.

24 Q. So that's five men, eight hours?

25 A. Correct.

26 Q. And notification numbers?

1 A. Yes, sir.

2 Q. And what do these notification numbers mean?

3 A. All they are is just, they make them up to get

4 ready to do a job to change connectors out so the crew's

5 got time to charge to.

6 Q. Okay. So we go down almost to the bottom of

7 this. On 8/20/09 -- am I reading this right?

8 A. Yes.

9 Q. You looked at tower 27/222?

10 A. Yes.

11 Q. And had wanted to replace the connectors?

12 A. That's right.

13 Q. Forty hours. And that should be --

14 A. That's notification 543.

15 Q. Or 542?

16 A. 542, excuse me.

17 Q. 542?

18 A. Yeah.

19

20 (Exhibit 159 was marked for identification.)

21

22 Q. Okay. Now let's move on to 159.

23 A. Where's that baby at? 240, 239 -- oh, you have

24 it right there. Are we done with this, Marc?

25 Q. Yes. Thank you.

26 All right. So you recognize Exhibit 159?

1 A. Yes, I do.

2 Q. What is Exhibit 159?

3 A. It's a work order, replace connectors.

4 Q. Explain to us how to read this.

5 A. Well, it gives line name, which is

6 Caribou-Palermo. And then the function location is

7 electric transmission line 30/190. Insulators,

8 Caribou-Palermo insulators. And also tells the

9 insulator, the equipment, is ceramic. And gives a

10 structure number. Main word center is us, Table

11 Mountain. And the planning group is Electric Line out of

12 Sacramento. They were the planning group that sets all

13 this up.

14 Q. Okay. This is standard PG&E form?

15 A. Yes.

16 Q. Is this something that you fill out?

17 A. No.

18 Q. Who fills this out?

19 A. I don't know if my clerk does this or the

20 electric operation in Sacramento does it.

21 Q. All right. So let's walk through this top to

22 bottom.

23 A. Okay.

24 Q. Top, Caribou-Palermo 27/222, replace

25 connectors?

26 A. Yes.

1 Q. And then there's an LC number?
2 A. Yes.
3 Q. Does that number match the notification number
4 on the data sheet that we just looked at?
5 A. It should.
6 Q. 542 being the last three.
7 A. Let's see if it matches. It should. That's --
8 last number is 542. Yeah. We just talked about it,
9 remember?
10 Q. Yep.
11 A. There's 542 right there. Yep, 542.
12 Q. 103995542?
13 A. That's it.
14 Q. All right. So this is a Corrective Work
15 Form --
16 A. That's correct.
17 Q. -- for the work that you noted in your 2009
18 inspection?
19 A. Yeah.
20 Q. Says reported by JTA6.
21 A. That's me, my --
22 Q. That's you?
23 A. My LAN ID for PG&E.
24 Q. What's a LAN ID?
25 A. LAN ID, so you can log into your computer and
26 they know who you are.

1 Q. Okay. Down here, 916091312, (EMPLOYEE #17),
2 AXRU.
3 A. She is our clerk.
4 Q. Okay.
5 A. (EMPLOYEE #17).
6 Q. (EMPLOYEE #17)?
7 A. Yeah.
8 Q. What's AXRU?
9 A. That's her LAN ID, also.
10 Q. "Per (WITNESS #1)"?
11 A. Yes.
12 Q. That's you?
13 A. That's me.
14 Q. "On inspection, needs to replace three-bolt
15 connector with wedge"; right?
16 A. That's correct.
17 Q. Who is Veronica L. Connerly Scott?
18 A. Good question.
19 Q. You don't know?
20 A. No, sir, I don't.
21 Q. All right. Then in 2011, "Per (WITNESS #1) on
22 8/1/11 during patrol, okay to move out two years"?
23 A. Yes. The connector was alive and well, doing
24 fine. They just wanted to change them because they did
25 have problems with them. That's what that's all about.
26 When I reassess these, that's what we do, if it's okay,

1 then we just move them out a little bit so the crew can
2 get to them.

3 Q. So 2012, "Move required end date to 11/30/15"?

4 A. Yes.

5 Q. So now it's moved out to -- doesn't have to be
6 done until 2015?

7 A. That's correct.

8 Q. All right. So you identified the, all of these
9 connectors in 2009?

10 A. Yes.

11 Q. But then they got pushed back so they didn't
12 have to be replaced until at least 2015?

13 A. That's right.

14 Q. And you had retired by that date?

15 A. Yes, sir.

16 Q. Okay. All right. Let's move on.

17

18 (Exhibit 160 was marked for identification.)

19

20 Q. Next one, 160.

21 A. 160. Same thing.

22 Q. Just different tower; correct?

23 A. Yes, sir.

24 Q. 20/160?

25 A. Yes, sir.

26 Q. This is another of the transposition towers?

1 A. Yes, sir.

2 Q. And basically the exact same thing:

3 Notification number, replace connectors, and move out to

4 2015?

5 A. Yes, sir.

6

7 (Exhibit 161 was marked for identification.)

8

9 Q. Move on to the next one, 161.

10 A. I'm missing 161. I've got 162, 163. Did I

11 pile it up already?

12 Q. Yes.

13 A. There it is.

14 Q. Stuck to the back of 160.

15 A. Gotcha. Okay. Same thing.

16 Q. And what tower is this?

17 A. Let's see, it is 24 over 199.

18

19 (Exhibit 162 was marked for identification.)

20

21 Q. 162?

22 A. Yes.

23 Q. Do you recognize 162?

24 A. Same thing.

25 Q. And what tower number?

26 A. That is 32 over 260.

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24
25
26

(Exhibit 163 was marked for identification.)

Q. 163?

A. That is tower 35 over 281.

Q. Okay. So all of these are Corrective Work Forms that were filled out in 2009 based upon your notifications that the connectors needed to be replaced?

A. Yes. Right. Right.

Q. Okay. So we can put all those aside. Skip over that.

All right. Now, you asked earlier, are you familiar with the *Power Line Equipment Identification Pocket Guide*?

A. Yes.

Q. Is that something you used?

A. No. I know the equipment.

(Exhibit 194 was marked for identification.)

Q. Okay. And this is 194, Exhibit 194?

A. Yes, sir.

(Exhibit 194A was marked for identification.)

Q. And next up is page 40 from 194.

1 A. Yes.

2 Q. Which should be the next one on your stack.
3 I'm simply going to ask you if you recognize what those
4 things are.

5 A. Yeah. The connectors. This is three-bolt,
6 three-bolt, single-bolt, two-bolt, two-bolt, and of
7 course single-bolt here. And the part numbers are on
8 that. That's what they're called, PGs, parallel groove
9 connector.

10 Q. Okay. When you talk about the three-bolt
11 connectors, you're talking about one of these top two on
12 194A?

13 A. Yes. This is a three-bolt. This is a smaller
14 three-bolt, then two, two, and one and one. These have
15 all been outdated and gone.

16 Q. Okay. So in your 19 -- or 2009 inspection,
17 this is the stuff, the connectors that you're looking
18 for; correct?

19 A. No. Different connector on that line. It's a
20 six-bolt, not a three-bolt. It's a six-bolt connector.
21 You don't have it on here.

22 Q. Six-bolt or six-volt?

23 A. Six-bolt connector. In other words, if you put
24 two of these together like out here, you'd have six
25 bolts.

26 Q. All right. Going back, and this is 193A, and

1 the long text at the bottom, this is similar to the rest,
2 it says, "Per (WITNESS #1) on inspection, need to replace
3 three-bolt connector"?

4 A. Yeah, there was some out there that, like you
5 said, were three, then some were six, you know. I mean,
6 just there was all sorts of quagmire going out there.

7 Q. All right. So that three-bolt connector is
8 going to be one of these?

9 A. Going to be one of these two right here, yeah.
10 And the reason they say "parallel groove," the -- you see
11 the grooves right there? You open that up, there's just
12 a groove right through here. And the wire lays in there.
13 Like I was saying about a burnt connector, a piece of
14 wire incoming comes into here and outgoing comes in here,
15 then you clamp it down; okay?

16 Q. Okay.

17 A. So when they fail, they burn this. All this
18 burns up -- you can see them all -- because they're
19 aluminum.

20 Q. Okay.

21 A. Okay.

22 Q. So hold on right there, because we've got to
23 put this on the record.

24 A. Okay.

25 Q. So we're talking about 194A, and it's up on the
26 big board. And you're talking about the --

1 A. Parallel groove connector.

2 Q. Parallel groove connector at the top. I'm
3 going to get you your drawing tool back again. And you
4 were using your hands to show us how the wires would come
5 in?

6 A. The connector comes in here like this; okay?
7 And then it could go out on this side, and like coming in
8 here; all right? And now you just use these three bolts,
9 and they run a torque wrench on them to torque them down
10 a certain specs. The book tells you what to torque them
11 down to. So they are lined out with our line standards.

12 Q. Not yet.

13 A. Blue book, in there tells you what the torque
14 connector needs to be at.

15 Q. Okay.

16 A. So anyway, they take a torque wrench and they
17 torque these down. And they also apply a lubricant.
18 It's not a lubricant. It's kind of like an antioxant
19 (phonetic) like you put on your battery cable so you
20 wouldn't get the green stuff growing on it.

21 Q. So you don't get oxidation?

22 A. Thank you. That's what you put in there. Then
23 clamp the deal, and I torque them down. And that's how
24 you do it.

25 Q. All right. So you've drawn two red lines to
26 represent --

1 A. Incoming, outgoing.
2 Q. -- incoming, outgoing conductors?
3 A. That's what you see on the tramp tower.
4 Q. Okay. Then finally you were referring to you
5 crank these down --
6 A. Like a torque wrench if you're doing heads on
7 an automobile or anything.
8 Q. Talking about the nuts?
9 A. Yeah.
10
11 (Exhibit 194A1 was marked for identification.)
12
13 Q. All right. Great. And we'll save this. It's
14 going to be 194A1. And we'll print that out and have it
15 this afternoon.
16 Okay. So when you're looking, looking for
17 connectors when you're doing the 2009 inspection,
18 basically these are what you're looking for?
19 A. That's correct. Yes.
20 Q. And you said there's some bigger ones?
21 A. There's all sorts of -- I mean, it's a, kind of
22 a mirage dealy up there. I mean there's all sorts of
23 stuff that's on that old line.
24 Q. Got to get out of that.
25 All right. Now 235.
26

1 (Exhibit 235 was marked for identification.)
2
3 A. 235, got her. All right. I think I do. Okay.
4 Q. Do you recognize 235?
5 A. Yes.
6 Q. What is 235?
7 A. It's a notification form, Corrective Work Form,
8 electric transmission line.
9 Q. Is this something that you would have
10 completed?
11 A. No.
12 Q. Who would have completed this?
13 A. I believe my clerk does this.
14 Q. And can you tell us, is this for a specific
15 tower?
16 A. Yeah, let me look up here. Looks like 24 over
17 199, replace connectors.
18 Q. All right. There's a purple notification
19 number on there?
20 A. That's correct.
21 Q. That should match with your Data Line
22 Inspection Sheet?
23 A. That's correct.
24 Q. Now, what I want to go back to is actually the
25 last two pages of this. Since we talked last, you told
26 us you took pictures when you --

1 A. Yeah.

2 Q. And I have page 3 of 235. Tell me what you
3 see.

4 A. I can't see nothing. Oh, I took a number of,
5 the tower number, 24 over 199. And this is the sat
6 number. In other words, if you put it in your computer,
7 pull it up, give you the tower location, everything.

8 Q. That's the 40667369 number?

9 A. That's correct.

10 Q. All right.

11 A. That's the sat number. And this is the tower
12 number. It would be the 24th mile, tower 199.

13 Q. Cool.

14 A. All right.

15 Q. And then the next picture, next page behind
16 that?

17 A. Another tramp.

18 Q. This should be the same tower; right?

19 A. Yes. Looks like it anyway.

20 Q. So you said you take pictures to document the
21 problems?

22 A. That's right.

23 Q. So what problems do you see in this picture?

24 A. Well, it's all connectors again. See them
25 there? They're at every, every wire that's dead. You
26 can see right through there. That's all connectors. And

1 there's some in here. There's some right here.

2 Q. Let me activate your pen.

3 A. Can you move the tower to center it up any?

4 Q. Nope. I can't change your photography.

5 A. Well, when you're in a helicopter, it's --

6 you're going -- you know, you're doing all sorts of

7 stuff.

8 Q. You have your red pen up there. If you want to

9 mark your connectors.

10 A. Connector there, one there, one there. I can't

11 really -- looks like one there, one there. I don't know

12 why that -- one there, one there, and that looks like

13 there's one there. And I don't see anymore. Looks like

14 maybe there might be one there. That's about all I can

15 see right now. Like you said, the picture is not very

16 good.

17 Q. So you've --

18 A. I've identified.

19 Q. Shoot. Now we have to do it again.

20 A. I see one there. Now it's black.

21 Q. Black doesn't work too well. Let's go with

22 red. Red stands out.

23 A. Okay.

24 Q. There we go. Red.

25 A. Let's see, there's one there. I can't tell

26 that there. Probably some here. And then there's

1 probably some over there, over on this other phase.
2 That's about all I can do for you.
3 Q. All right. Save that real quick.
4 A. And I want to correct you on this.
5 Q. Okay. Go ahead.
6 A. The transmission troublemen made these out.
7 Q. Okay.
8 A. To change that, to let you know.
9 Q. Okay.
10 A. I thought -- I just remembered that we did do
11 these, but these are old, these are kind of old. I think
12 -- what is this?
13 Q. 2009.
14 A. '09, yeah.
15 Q. Yeah.
16 A. Had been a while back.
17 Q. All right.
18 A. Do you want to know anything about the tower?
19 Q. Other than the connectors, is there anything
20 else you see wrong with this tower?
21 A. Well, you see right here where these steel
22 deals, these are all dead end stuff?
23 Q. Right.
24 A. We always look at them. Okay. Anyway, we
25 always looked at them. And all, all the attachments that
26 were dead ended, we made sure that they were in good

1 shape.

2 Q. In case we haven't done it before, can you tell
3 us what dead ended means?

4 A. It's just where the, these bells here secure
5 here. And then you can see where the conductor comes in,
6 stops right at the bells. That's called dead ending the
7 conductor.

8 Q. Okay. Any other problems that you can see with
9 this tower?

10 A. Not that I know of. I think the steel was all
11 pretty good.

12

13 (Exhibit 236 was marked for identification.)

14

15 Q. Okay. All right. Let's move on to 236. Do
16 you see No. 236?

17 A. Yeah, I got it right here. Same thing.

18 Q. And, again, is this something you would have
19 filled out in 2009?

20 A. Yeah, 27 over 222, replace conductors.

21 Q. And the notification number, that 542 number
22 that we looked at before?

23 A. Yes, sir, that's correct.

24 Q. All right. I want to go to the back page of
25 this --

26 A. Yes.

1 Q. -- tower.

2 A. Okay.

3 Q. And the photograph.

4 A. You can see all the connectors. See them

5 there? There's one there, there's another one. And the

6 bar, all the way across the bar has got connectors. All

7 the way. And there's some here. And probably over on

8 this other, other phase. But we just took a picture to

9 make sure that they could see what, what we had out

10 there. And basically that connector is no different than

11 the one over on this arm. It's all irrelevant. It's all

12 the same thing.

13 Q. Right.

14 A. But, you know, being a lineman, you dial into

15 that, you understand that.

16 Q. Okay.

17 A. And you'll have this on the notification page.

18 Q. So we're looking --

19 A. You can see it right there. There's one

20 connector right there.

21 Q. Right here?

22 A. Yeah. That's it right here. Right there.

23 Q. Going to take a minute to start it up. Won't

24 let me move slides.

25 GRAND JUROR #17: Sir, he's blocking our view.

26 We'd like to be able to see what he's talking about.

1 THE WITNESS: I can't tell because there's
2 steel in the way here. There's probably one there.

3 Q. (By MR. NOEL) Let's step back so they can see.

4 A. There's one there, too.

5 Q. All right. So you're marking again the
6 connectors on 27/222 with your red pen?

7 A. Yeah.

8

9 (Exhibit 236A was marked for identification.)

10

11 Q. And we will save that and print that as 236A.

12 Now, looking at 27/222, which side is going to
13 Caribou Powerhouse?

14 A. That I don't know unless I can see the number.

15 The number tells me -- designates which is going and --
16 you know, I mean, tells me which is closest to the
17 powerhouse or if I'm closest to the substation.

18 Q. Okay. Now I want to focus on this arm and
19 insulator right here.

20 A. Yes.

21 Q. Does that look correct to you?

22 A. Yes, it is. That's the old-style framing.

23 Q. Do you see any issues with that?

24 A. No. The insulators are all intact. In fact,
25 the insulation is over insulated. There's one, two,
26 three, four, five, six, seven, eight, nine, ten. And

1 really in the book it only calls for eight. So
2 everything on this tower is over insulated.

3 Q. Okay.

4 A. Okay? And these here are called prono-shields
5 (phonetic), as I told you before. This is all shielding
6 here.

7 Q. Now, before you became a troubleman, you were a
8 lineman; correct?

9 A. Yes.

10 Q. You were a line foreman?

11 A. Yes.

12 Q. And how long did you do that for?

13 A. I did the line foreman for five years.

14 Q. How long were you a journeyman lineman?

15 A. I was a journeyman lineman for 40 years.

16 Q. As part of that, did you change out insulator
17 strings on transmission lines?

18 A. Yes, sir.

19 Q. You also said you taught at the PG&E?

20 A. I taught five years in Livermore training
21 school, yeah, apprentice linemen school.

22 Q. Did you teach how to change out those insulator
23 strings?

24 A. Yes.

25 Q. Okay. So you know what it looks like, new
26 insulator string looks like, and how it's supposed to

1 fit?

2 A. Yes, sir.

3 Q. Now, we'll put that aside and we'll move on to
4 the 2010 inspection.

5 A. Okay.

6

7 (Exhibit 164 was marked for identification.)

8

9 Q. And that is Exhibit No. 164. It should be
10 right there in front of you.

11 A. Got it.

12 Q. Look at it very briefly for us and tell me if
13 you recognize it.

14 A. Yeah. I just recognize all the connectors. I
15 wrote up on 8/6/2010 on tower 10 over 86 we had flash
16 bells on that tower.

17 Q. Okay. So let's back up and do the basics
18 first.

19 A. Okay.

20 Q. You're looking through the packet, it's 64
21 pages of -- I believe 64 pages?

22 A. Yeah.

23 Q. Exhibit No. 164. And you recognize that
24 packet; correct?

25 A. Yeah, I just, I just recognize the paperwork.
26 I mean, beyond that I don't, you know.

1 Q. Okay. And this is a -- the 2010 inspection;
2 correct?
3 A. Yes.
4 Q. What type of inspection?
5 A. Air patrol.
6 Q. So this is back in a helicopter?
7 A. Yes.
8 Q. 2009 was a ground patrol, now you're back in
9 the helicopter 2010?
10 A. Right.
11 Q. All right. And you did this inspection?
12 A. I see my name on it; I must have.
13 Q. All right. So is that your writing, too?
14 A. Yes, it is.
15 Q. First I want to ask you, up here on the front,
16 who is ESB4?
17 A. That was my supervisor, (EMPLOYEE #3).
18 Q. What was (EMPLOYEE #3's) position with PG&E?
19 A. He's a transmission supervisor.
20 Q. All right. Let's flip through this a little
21 bit.
22 A. Okay.
23 Q. First, you have a, this page that -- several
24 pages that are just a spreadsheet?
25 A. Right.
26 Q. What is that?

1 A. That is all the thing, all the stuff on the
2 connectors and sleeves we wrote up on the line.

3 Q. Is there a term for those?

4 A. As far as what, sir?

5 Q. That, that they would call each one of these
6 individual things, that you can recall?

7 A. There would be just connectors and sleeves.

8 Q. Okay. But each line of this data?

9 A. As far as -- what are you looking for?

10 Q. Have you heard the term "open notifications"?

11 A. Yes.

12 Q. Okay. What is open notification?

13 A. It would be one that's not, it's not completed
14 or whatever, you know, filled out and assigned a job
15 number to it. Like that 30 number where it says "order."
16 That's a job number there.

17 Q. So when you find problems -- and that's going
18 back to 236 and 235 --

19 A. Yeah.

20 Q. -- you fill out a notification sheet?

21 A. That's right.

22 Q. With a notification number?

23 A. Yeah.

24 Q. And then until that notification, until that
25 job is completed, those are considered open
26 notifications?

1 A. That's right.

2 Q. Is that correct?

3 A. That's right.

4 Q. Okay. So 2010, what is this first couple of
5 pages that just list all of these different notifications
6 that you had started in 2009?

7 A. There are, there are things in -- on the line
8 that need to be fixed.

9 Q. Okay. So all of these things are problems with
10 the line that have not yet been fixed?

11 A. That's the way I'm -- see, right here you can
12 see the job number right there. It says "order." Three
13 job numbers to change the insulators out, I believe.
14 Yeah.

15 Q. Okay. So the job -- the order is, means that
16 it's scheduled or that it's being done or what?

17 A. No, it's a work order they give the crew, and
18 the crew goes out and works on it. Like I said, it's a
19 device to charge, charge your time to. It's a job order.

20 Q. And then page 5 of 62, that continues?

21 A. Yeah. It's all the same thing.

22 Q. Right. For instance, down here, here's 27/222?

23 A. Yeah.

24 Q. There's that 542 number again?

25 A. Yeah.

26 Q. What's this date, 8/30/11?

1 A. That might have been the first time we turned
2 it in. I'm not real sure.

3 Q. Okay. So the work had not been done, the
4 connectors had not been replaced on 27/222 by the time
5 you did the inspection in 2010?

6 A. As far as I know, no.

7 Q. And then 24/199, same thing --

8 A. Yeah.

9 Q. -- correct?
10 20/160, up here, same thing?

11 A. Yeah.

12 Q. Now, moving on to page 7 of the 62, this is the
13 Transmission Line Object List.

14 A. Okay.

15 Q. And I guess we already covered it --

16 A. Yeah.

17 Q. -- because we went back to other stuff. But we
18 were talking about the numbering system?

19 A. Yeah.

20 Q. Can you explain the numbers up there?

21 A. Tells you the miles and the tower number.
22 That's all.

23 Q. Okay. So 000, slash, 001, what would that be?

24 A. That would probably be either right out of the
25 substation or right out of the powerhouse. That would be
26 the first tower out.

1 Q. Okay. The very first tower?

2 A. Yes, sir.

3 Q. All right. Now looking again, this is similar
4 to what we did with the 2009 inspection. Each one of
5 these, 20/160, 24/199, 27/222, 32/260, and 35/281, you
6 identified those previously as transposition towers;
7 correct?

8 A. Yes.

9 Q. On each one of these, what were your findings
10 in 2010?

11 A. You see right there, "preexisting condition
12 checked." So the connectors had to still be there or the
13 splices.

14 Q. That is the question. What does that mean,
15 "preexisting condition checked"?

16 A. In other words, it's still there, hasn't been
17 fixed.

18 Q. Okay.

19 A. Like on all this, all this stuff you got here.
20 Probably all this stuff here, too.

21 Q. All right.

22 A. Yeah.

23 Q. Do you know what this "notes 02 survey" with a
24 number means?

25 A. No, sir, I do not.

26 Q. How are you doing this morning?

1 | A. I'm ready to --

2 Q. Ready to take a break?

3 A. Can we take a break?

4 MR. NOEL: Madam Foreperson?

5 GRAND JURY FOREPERSON: Yes.

6 MR. NOEL: Let's go ahead and take a break.

7 THE WITNESS: I appreciate it.

8 GRAND JURY FOREPERSON: Fifteen minutes.

9 MR. NOEL: If you need one, just let me know.

10 THE WITNESS: I definitely will. It's cool;
11 doing fine.

12 MR. NOEL: Going by pretty quick. So let's
13 take a 15-minute break.

14 (Break taken.)

15 GRAND JURY FOREPERSON: All members of the
16 Grand Jury are present and ready to proceed.

17 MR. NOEL: Back on the record?

18 GRAND JURY FOREPERSON: Back on the record.

19 Q. (By MR. NOEL) All right. (WITNESS #1), before
20 we go forward, I need to clear up a couple of things. We
21 have up on the screen 236, the photograph you took that
22 was attached to the 2009 notification, correct, of
23 27/222? I want to make sure we understood this. Did you
24 take this photograph from the ground or the air?

25 A. That's from the ground.

26 Q. Okay. So 2009 was a ground inspection?

1 A. Yeah.

2 Q. So the photographs that were 235 and 236 would
3 have been taken from the ground?

4 A. That's right.

5 Q. I think maybe one of us misspoke earlier and
6 said helicopter, so created some confusion.

7 Now going back when we were talking about
8 helicopters earlier and the helicopter inspections and
9 you said you'd probably spend 10 to 15 minutes on each
10 tower?

11 A. Yeah.

12 Q. And -- but you say you do the inspections in
13 one day?

14 A. Yes.

15 Q. Okay. Just doing the quick math while we were
16 gone, I think you said there's somewhere around 445
17 towers on --

18 A. Yeah.

19 Q. -- on the --

20 A. (Nods head.)

21 Q. So --

22 A. Yeah, it's probably -- we'd spend 10, 12 hours
23 in that helicopter.

24 Q. Okay.

25 A. Yeah.

26 Q. All right. So I wanted to make sure the math,

1 because I'm not very good at math, but it seemed like a
2 real high, 445 would be four thousand --

3 A. It takes time, you know. It takes, it takes
4 time to do it. It depends on what kind of weather we run
5 into. The canyon, too; usually there's high wind in
6 there and tough to hover over one, one structure.

7 Q. Instead of putting a time, minutes, on it,
8 instead of saying we spent 5 minutes, 10 minutes, 15
9 minutes at each structure, can you describe basically or
10 summarize how much time you spent at those structures?

11 A. It could vary on what we see, what we find, you
12 know. It could be 1 minute, 10 minutes, 20 minutes, you
13 know. Depends what we find. After a while, after over
14 the years you fly the line so much, I mean, you get to
15 know it, do you know what I mean? You get to know where
16 all the problems are and where, you know, so you can
17 pretty well zero in on things.

18 Q. Okay. Now, you said that you were looking,
19 that one of the things you'd look at, especially from the
20 helicopter, is the cold end attachments?

21 A. Yeah.

22 Q. What about the suspension attachments?

23 A. We look at all that stuff, everything.
24 Everything is -- we cover everything. The shoes, the
25 connectors, all the hardware. We look at all the
26 hardware, see if any of the bracing is loose or bolts are

1 missing. We cover it all.

2 Q. Okay. Real quick, back to 164, the 2010
3 inspection.

4 A. Okay. All right.

5 Q. And the Transmission Line Inspection Data
6 Sheet, page 2.

7 A. Yes.

8 Q. How many problems did you find with the line in
9 2010?

10 A. I found one.

11 Q. And what was that?

12 A. That was flashed bells.

13 Q. And then going back to the top up here?

14 A. Sixty-two miles; 440 -- 444.

15 Q. 444?

16 A. Yeah.

17

18 (Exhibit 165 was marked for identification.)

19

20 Q. All right. So let's move on now to 165.

21 Should be next up on that stack right there in front of
22 you.

23 A. 64 --

24 Q. Okay. Go ahead, take a minute to look at 165.

25 A. Okay.

26 Q. I'm going to ask you if you recognize the

1 exhibit.

2 A. I just, I just recognize the paper, that's --

3 you know.

4 Q. Okay.

5 A. I've seen it before.

6 Q. You recognize what it is?

7 A. Yeah, that's all.

8 Q. What is Exhibit 165?

9 A. Just Transmission Line Inspection Data Sheet.

10 Q. Okay. Is this another transmission line

11 inspection of the Caribou-Palermo line?

12 A. Yes.

13 Q. And is this another inspection that you did?

14 A. Yes.

15 Q. And what year is this?

16 A. That's '11.

17 Q. So this is the 2011 inspection?

18 A. Yeah.

19 Q. What type of inspection was 2011?

20 A. I know it looks like an air.

21 Q. All right. Let's go back to page 1, if you

22 could. And does this indicate what type of inspection it

23 is?

24 A. Yes.

25 Q. What does it indicate?

26 A. Says air patrol.

1 Q. And who is (EMPLOYEE #5)?

2 A. He is our relieving supervisor.

3 Q. What kind of supervisors?

4 A. Relieving.

5 Q. Relieving supervisor? What does that mean?

6 A. That means when our local supervisor goes on

7 rotation or vacation, this gentleman here took the yard.

8 He was a supervisor, temporary supervisor for the yard.

9 Q. Okay. Now skipping to page 3 of 165, again,

10 the notifications, the open notifications page?

11 A. Okay.

12 Q. Do you see that?

13 A. Yep.

14 Q. Now, all of these are notifications that are

15 still open from your 2009 inspection; correct?

16 A. Yep. That's correct.

17 Q. And specifically what I want to know is on the

18 right-hand column it says notes?

19 A. Yes.

20 Q. What do these notes mean?

21 A. We moved them out two years.

22 Q. Moved what out?

23 A. The replace bells, as far as -- as far as I

24 know, that's what it was for. Beyond that, I don't know.

25 Q. All right.

26 A. It's been so long since I looked at all this

1 stuff.

2 Q. So middle line for 6, tower 653, replace

3 connectors, looks like it says three years?

4 A. It could -- it's two.

5 Q. Is that two?

6 A. Yeah.

7 Q. Okay. And then down two years, two years, two

8 years. Do you remember why you pushed those repairs out

9 two years?

10 A. No, sir, I don't.

11 Q. And on to page 6, same thing?

12 A. Yeah, I don't know.

13 Q. Again, this page has our 27/222 on it?

14 A. Yeah.

15 Q. And do you know what this L-type shape there

16 means?

17 A. Just an arrow. That's all it is.

18 Q. Okay. So what does the arrow indicate?

19 A. Just two years. It's coming down all the way

20 down from the top notes, two years.

21 Q. The other one, 24/199, same thing?

22 A. Yeah, same thing.

23 Q. 35/281 -- no, we're not to that page yet.

24 20/160. So all of these replace connectors got kicked

25 out another two years?

26 A. That's what I understand. I really don't know.

1 It's been so long, like I said, since I've seen all this
2 stuff, so --

3 Q. Okay. You don't remember why, you just
4 remember that your notes indicate that it was kicked
5 out --

6 A. Yeah.

7 Q. -- another two years?

8 A. Pretty much, yeah.

9 Q. And this is your Transmission Line Object List?

10 A. Yes.

11 Q. And what was the date that you did this
12 inspection?

13 A. Look it over. Page 48, is that what it is?

14 Q. Page 46.

15 A. Forty-six. Looks like '11, 2011.

16 Q. Yep.

17 GRAND JUROR #2: Can you fix his microphone?

18 MR. NOEL: Absolutely.

19 THE WITNESS: How is that?

20 GRAND JUROR #2: Thank you.

21 Q. (By MR. NOEL) All right. And this is page,
22 page 46 of the Transmission Line Object List, which is
23 page 53 of 63 in Exhibit 165. And looking at the line
24 there for 27/222?

25 A. Yes.

26 Q. And you inspected 222 this, in this cycle?

1 A. Yep. Preexisting, connectors again.

2 Q. So that's the ones that you noted back in 2009;
3 correct?

4 A. Yeah. As the books go along, as you write this
5 stuff up, you've seen this and you're in this book, if
6 nothing has been done, it's preexisting condition.

7 Q. How do you know about the preexisting
8 conditions?

9 A. Because I ran the line.

10 Q. Okay. How about going back in 2007, which
11 appears to be the first time you inspected this line?

12 A. Yes.

13 Q. When you went up to do your inspection, how did
14 you know about any of the preexisting conditions?

15 A. Because I've worked on the line with General
16 Construction before.

17 Q. How about the person that came in after you,
18 took your place after you retired?

19 A. No idea who the gentleman was.

20 Q. But how would they know about these preexisting
21 conditions?

22 A. I have no idea.

23 Q. Okay. All right. Now let's go back to page 2
24 of Exhibit 165, the Deadline Inspection Data Sheet. And
25 did you locate any issues on the Caribou-Palermo line in
26 2011?

1 A. Yeah, there was broken flash bells on tower 8
2 over 68.
3 Q. Okay.
4 A. And it has a notification number.
5
6 (Exhibit 137 was marked for identification.)
7
8 Q. Okay. Now let's go ahead to 137, which I have
9 to get out of this different stack. Wrong one.
10 I'm sorry, I forgot to pull that one.
11 Now if you could look at Exhibit 137.
12 A. Yeah.
13 Q. Glance through it and let me know if you
14 recognize 137.
15 A. Yeah, that's my writing. No, (WITNESS #20's)
16 writing. Excuse me, that is, that's (WITNESS #20),
17 (WITNESS #20).
18 Q. Okay. Keep going through it.
19 A. So where are we going, back to all of it, list?
20 Okay.
21 Q. Go to the Transmission Line Object List, look
22 through it. And specifically -- here, let me show you.
23 A. Had to stop due to the Poe fire.
24 Q. Okay.
25 A. Yeah.
26 Q. There we are.

1 A. Okay. Got it. I'm not real sure how this went
2 down, you know, but (WITNESS #20) got in a motorcycle
3 accident and lost a leg.

4 Q. Okay. First, let's identify what 137 is.

5 A. Just another air patrol, another air patrol on
6 the same line.

7 Q. That's the question for you.

8 A. Yes.

9 Q. Okay. And what year is this?

10 A. It says 2012.

11 Q. Okay. Was this an inspection done by you?

12 A. I don't even remember. I see my name on there,
13 so I must have did part of it.

14 Q. Okay. What makes you think you did part of it
15 as opposed to --

16 A. I'm just saying I remember (WITNESS #20) got
17 hurt, he got ran over on his motorcycle and lost a leg.

18 Q. Who is (WITNESS #20)?

19 A. Pardon?

20 Q. Who is (WITNESS #20)?

21 A. (WITNESS #20), he was my fellow transmission
22 troubleman.

23 Q. So you looked through the exhibit, and at some
24 point in the inspection it switches from (WITNESS #20's)
25 name to your name?

26 A. Yeah.

1 Q. But you don't remember why it's --
2 A. You know --
3 Q. -- you would have taken this over?
4 A. Sure don't.
5 Q. Do you remember completing this inspection?
6 A. No, I don't even remember completing any of
7 these inspections, to be honest with you.
8 Q. All right. So we're looking at the
9 Transmission Line Object List. About page 19 is where it
10 switches to your name --
11 A. Okay.
12 Q. -- correct?
13 A. Yeah, I think so. Yeah.
14 Q. Then on all the previous years you wrote your
15 name?
16 A. Right.
17 Q. This year looks like that name is stamped on
18 there. Do you remember why?
19 A. The only thing I can think of is they got us
20 stamps because the paperwork is just really over and over
21 and over, whatever you want to call it. Repetitive,
22 whatever.
23 Q. Do you remember during your career having a
24 stamp?
25 A. Yeah, they got me a stamp, then they took them
26 back because they said that we couldn't use stamps

1 anymore, we had to use our name and put the date down.

2 Q. Okay.

3 A. Everything had to be handwritten.

4 Q. Now, going to page 45 of the Transmission Line

5 Object List, which is page 52 of 63 on Exhibit 137.

6 A. Okey dokie.

7 Q. All right.

8 A. Still back on 222 again?

9 Q. Yep.

10 A. Now, what's the scoop there?

11 Q. What do you see on 222?

12 A. Preexisting conditions exist.

13 Q. Okay. And what would that preexisting

14 condition be?

15 A. Probably splicer connectors.

16 Q. Okay. Did you do this, the inspection?

17 A. My name's on it.

18 Q. And what date?

19 A. Looks like '12.

20 Q. Looks like what?

21 A. '12, 2012.

22 Q. Okay. No, the date.

23 A. The date?

24 Q. Yeah.

25 A. Says 2012 on it.

26 Q. The actual day that it was done.

1 A. It doesn't say. Oh, it says 06. Yeah, 6.
2 8/6.
3 Q. So August 6th, 2012?
4 A. Yeah.
5 Q. And this is going backwards, page 4 of 137,
6 that notification list?
7 A. Yeah.
8 Q. That's all the open notifications?
9 A. Yes.
10 Q. Continue with the connectors and sleeves?
11 A. Yep.
12 Q. And page 7, continuing with the open
13 notifications?
14 A. (Nods head.)
15 Q. Right up here at the top, that's 27/222 again?
16 A. Yep.
17 Q. So shows that it's still open for the
18 connectors?
19 A. Yep.
20 Q. Down here we have 35/281. Same thing; is that
21 correct?
22 A. Yep.
23 Q. 32/260?
24 Remember, we have to answer out loud so she can
25 take it down.
26 A. Yes. It's all the same of what you put in all

1 before.

2 Q. So all of those notifications that you did in
3 2009 are still open in 2012?

4 A. Yes. Yep.

5 Q. And then there's page 2, going back forward,
6 the Data Inspection -- Line Inspection Data Sheet?

7 A. Yeah. Says no problem found, by (WITNESS #20).

8 Q. Do you see your writing on there anywhere?

9 A. Yeah. (WITNESS #20) filled the top out as he
10 started the line, I believe, and then I finished it, and
11 I put no problems found.

12 Q. Okay. So the "no problems found" is your
13 writing?

14 A. Yes.

15 Q. Okay. Do you know whose signature that this
16 is?

17 A. No, I sure don't.

18 Q. The 8/28/12?

19 A. No, don't know.

20 Q. Do you know who your supervisor was? Do you
21 remember who your supervisor was?

22 A. You know, I don't know. Could have been
23 (WITNESS #12), but I'm not real sure.

24 Q. Okay. And do you know who EEP4 is?

25 A. Yeah, that's (WITNESS #21) 4. That was our
26 clerk.

1 Q. What was her name?
2 A. (WITNESS #21).
3 Q. (WITNESS #21). Her last name was?
4 A. (WITNESS #21), I think it's (WITNESS #21), but
5 I am not real sure. I don't remember.
6 Q. Do you remember (WITNESS #21)?
7 A. Yeah, there you go. That's her name.
8 Q. Same person?
9 A. Yeah, same thing.
10 Q. All right. And, let's see, so 2012 you found
11 no problems with the line?
12 A. No. No. Nope.
13
14 (Exhibit 166 was marked for identification.)
15
16 Q. All right. Let's skip forward to 2013. This
17 is Exhibit 166. Do you see Exhibit 166?
18 A. Got it.
19 Q. Again, do you recognize what Exhibit 166 is?
20 A. Yes, an air patrol.
21 Q. And is this an air patrol that you did?
22 A. What's that?
23 Q. Is this an air patrol that you did?
24 A. Yep.
25 Q. And an air patrol what of?
26 A. Of Caribou-Palermo 115.

1 Q. Do you remember -- or does it reflect when you
2 did this air patrol?

3 A. Yeah. Says '13, 8/15/13.

4 Q. All right. So August of '13?

5 A. Yes.

6 Q. Going to page 3, the open notifications, and
7 skip ahead to page 4 and page 5, I think. Go through it
8 really quickly. All the notifications from 2009 still
9 open?

10 A. Sure.

11 Q. So when you get to page 5 and go down that list
12 and you find 27/222, it shows that the "replace
13 connectors," that that is still open; correct?

14 A. Yep.

15 Q. So right here, 24/199, same thing?

16 A. Yes. It's just getting repetitive, that's all.

17 Q. All right. Now, we're page 51 of 62, and your
18 Transmission Object Line List. And I'm trying to
19 shortcut this as much as possible, believe me.

20 A. 51?

21 Q. I'm sorry, that would be page 45 of the object
22 list.

23 A. Okay.

24 Q. 51 of 62 for the exhibit.

25 A. Okay.

26 Q. 27/222. Can you find that tower on this list?

1 A. Sure.

2 Q. What's the condition of 27/222?

3 A. Same thing, preexisting.

4 Q. All right. So you inspected this tower again?

5 A. Yes.

6 Q. Go back to page 2 of that, the Data Line --

7 Inspection, Transmission Line Inspection Data Sheet, very

8 front, take a look at that and tell me if you filled that

9 sheet out.

10 A. Yes, I did.

11 Q. And what problems did you find on the

12 Caribou-Palermo?

13 A. We had bell replacements and aerial markers

14 installed.

15 Q. What does bell replacements mean?

16 A. Insulators.

17 Q. And what are aerial markers?

18 A. Towers and the miles.

19 Q. And, again, this time 445 structures?

20 A. Yeah.

21 Q. Do you know where the extra structure came

22 from?

23 A. No, I don't. I sure don't.

24 Q. And who is your supervisor? Whose signature is

25 on there?

26 A. I have no idea who it is. Oh, (EMPLOYEE #16).

1 Q. Who is (EMPLOYEE #16)?
2 A. He's one of the transmission troublemen. He's
3 another relief supervisor.
4 Q. How long was (EMPLOYEE #16) your supervisor?
5 A. No idea. They kind of come and go.
6 Q. What date did you complete this inspection?
7 A. It says that we did it -- looks like '13.
8 Q. Specific day and month?
9 A. 8/15.
10 Q. So August 15th, 2013?
11 A. Yeah.
12 Q. Cool.
13 All right. Last one. You retired at the end
14 of 2014; right?
15 A. Yep.
16 Q. So 2014 is going to be the last inspection of
17 the Caribou-Palermo line that you did?
18 A. Yes.
19
20 (Exhibit 167 was marked for identification.)
21
22 Q. You have in front of you Exhibit No. 167. Do
23 you recognize 167?
24 A. Yes.
25 Q. What is 167?
26 A. It's, I believe, a ground patrol. Yeah.

1 Q. All right. Is this a -- you said it's a ground
2 patrol?

3 A. Or detail, whatever you want to call it.

4 Q. Okay. Well, I want to use your terms.

5 A. Well, it says right there, sir. "Transmission
6 detail inspection." See that right there?

7 Q. You're talking about the handwriting on the
8 front page?

9 A. No, talking about right there. Detailed
10 inspection, overhead. O-H is overhead.

11 Q. You're talking about on page 1 of 60?

12 A. Yeah.

13 Q. This is a detailed inspection. Do you remember
14 when this was done?

15 A. No, sir.

16 Q. Did you do this inspection?

17 A. I think I did half of it and (WITNESS #23) did
18 the other half.

19 Q. Who is (WITNESS #23)?

20 A. He's another lineman at Table Mountain on the
21 crew.

22 Q. Why did (WITNESS #23) help you with this
23 inspection?

24 A. Because up in the canyon is rugged country, and
25 at 65 I don't think I can crawl over many more rocks.

26 Q. So how did (WITNESS #23) help you?

1 A. He took the tough stuff and I had the easy
2 stuff.
3 Q. What do you mean the tough stuff?
4 A. Well, rocks, you know. If you've ever been in
5 the Feather River Canyon, you know what's up there.
6 Q. Problem is we got to explain it. We have to
7 put it in words where the lady over here with the
8 typewriter can --
9 A. Well, I did the easy stuff from Table Mountain
10 to Palermo sub, and he did the tough stuff from Table
11 Mountain to Caribou Powerhouse, which is nothing but
12 rock. It's pretty tough up in there.
13 Q. Does that involve hiking?
14 A. Walking. Everything you got to walk to.
15 Q. Okay.
16 A. You can't get a vehicle to it.
17 Q. How come?
18 A. Because when the line was built, it was built
19 with manpower and mules. That line's 105 years old.
20 Q. What about Camp Creek Road?
21 A. Yeah, you can drive a little bit over Camp
22 Creek Road, that's about it.
23 Q. This was the last year of your career; right?
24 A. Yes.
25 Q. About the last four months of your career?
26 A. Yes.

1 Q. You said that, that you needed help just
2 because at the age at this time?

3 A. Yeah. I was getting old. I couldn't -- I
4 don't have no more wheels.

5 Q. Were you having other health problems?

6 A. Yeah. I had two knee replacements, two back
7 operations, and a hip replacement. I think I'm kind of
8 wore out.

9 Q. All right. So let's walk through this.

10 A. Sure.

11 Q. Page 4, the notifications page again -- or
12 we're back to notifications. There's several pages of
13 notifications; correct?

14 A. Yes.

15 Q. The open notifications?

16 A. Should be still the same. Okay.

17 Q. And these are still your 2009 notifications?

18 A. Yep, still there.

19 Q. 27/222, still haven't replaced the connectors?

20 A. Still there.

21 Q. 24/199, still haven't replaced connectors;
22 correct?

23 A. Yes.

24 Q. 35/281, still haven't replaced the connectors?

25 A. Yep.

26 Q. So --

1 A. Yeah, the books don't lie, that's for sure.

2 Q. So now we're five years down the line and those

3 connectors that you were told to identify to replace in

4 2009 are still on the poles?

5 A. Sure.

6 Q. Or on the towers?

7 A. Yep.

8 Q. Okay. And now, going to object list -- we

9 already talked about (WITNESS #23).

10 A. Yes.

11 Q. You had said (WITNESS #23) was a lineman;

12 correct?

13 A. Yes.

14 Q. (WITNESS #23) wasn't a troubleman?

15 A. No. He was a lineman.

16 Q. So what training and experience did he have

17 that qualified him, to your knowledge?

18 A. He was a journeyman lineman. We have to go

19 through multi schools. I went through multi schools.

20 I'm also certified, most of the guys are, by the State of

21 California Mastership Apprentice Program. So we pretty

22 well have done it all.

23 Q. All right. But is there more training to be a

24 troubleman? I mean, not all linemen were troublemen?

25 A. No. No. To be a troubleman, I mean, all we

26 were doing was inspecting lines. As far as all the other

1 deals, it's switching and stuff that he's not qualified
2 for.

3 Q. Okay.

4 A. In other words, he couldn't go out and switch
5 lines around or kill lines or stuff like that. He has to
6 be trained on stuff like that.

7 Q. So when (WITNESS #23) was completing the
8 inspection, were you supervising him in that?

9 A. Yes. I was with him most of the time, yeah.

10 Q. And this was a detailed inspection?

11 A. That's correct.

12 Q. That is a ground inspection?

13 A. That's right.

14 Q. Do you remember or do you recall or is it
15 written down in your report on your inspection how long
16 it took you to complete this inspection?

17 A. No. I don't even know. Don't even remember.

18 Q. Okay. Well, for instance, we're on page 17 of
19 your Transmission Line Object List. And this is a page
20 completed by (WITNESS #23)?

21 A. Yes.

22 Q. It shows August 14th, 2014; correct?

23 A. Sure.

24 Q. So we'll use that as a baseline. One of the
25 other reasons I wanted to ask about this, on this page,
26 page 17, it goes 16/128, 16/129, 16/130, don't know what

1 that says, then 0001.

2 A. We talked about that before.

3 Q. Yes, we did, but I want to put it in context so

4 it's understood.

5 A. Probably where it came into a substation and

6 that broke the line and then they started renumbering

7 again.

8 Q. Okay. You talked about the substation

9 previously being at Big Bend?

10 A. Yes, sir. You brought it up.

11 Q. Cool. So I thought this was a good opportunity

12 to show that's the numbering system.

13 A. Absolutely.

14 Q. Cool.

15 All right. Going back to page 2. Page 2 of

16 167. This is the Transmission Line Inspection Data

17 Sheet?

18 A. Yes.

19 Q. And who completed this data sheet?

20 A. Both of us. You see both signatures right

21 there. There's (WITNESS #23), then there's mine.

22 Q. Okay.

23 A. Okay.

24 Q. So completed on 8/28/14?

25 A. That's (WITNESS #23), and the next is mine.

26 Q. (WITNESS #1), 8/28/14?

1 A. We both signed it off.

2 Q. Cool. What problems did you find with the
3 line?

4 A. As you see right there in front of you, flash
5 bells, broken insulators. That's the majority of the
6 work right there.

7 Q. This is page 6 of that exhibit. This is the
8 notifications page.

9 A. Okay.

10 Q. And shows open notifications, 22/188 and
11 22/189; correct?

12 A. Yes.

13 Q. 22/188, replace the connectors; 22/189, replace
14 the sleeves?

15 A. Right.

16 Q. So those were open notifications when you did
17 the 2014 inspection?

18 A. Yes.

19 Q. And this is, going back to 166, page 41 of the
20 Transmission Line Object List for the year 2012
21 inspection --

22 A. Correct.

23 Q. -- that you've done. And this is 22/189,
24 22/190. 22/189, you see it right here?

25 A. Yep.

26 Q. And what did you find on 22/189 -- 22/188 and

1 22/189?

2 A. Preexisting, and 189 was completed no problems.

3 Q. Okay. Now, on these Transmission Line Object

4 Lists, this left-hand column --

5 A. Okay. Before you ask me this question, come

6 here.

7 Q. Okay.

8 A. All right. This is from a heat gun.

9 Q. Okay. I'm going to get back to that in just a

10 second. We're going to get back to that in just a

11 second, but I want to go through something more basic.

12 This left-hand column here, this information --

13 A. Yeah.

14 Q. -- tell us again what this information is.

15 A. Just tells about the structure. Tells tower 22

16 over 187, lattice steel tower. This is the sat number,

17 this is suspension tower, these are the GPS coordinates,

18 the lats and longs. So if you get on your computer, you

19 put the lat-long in or put that number in, it will bring

20 the tower right up, tell you exactly where it's at. On

21 every structure this company has, that number right there

22 will tell you where that structure is, what the line name

23 is, and where to find it.

24 Q. So going back to --

25 A. Yes.

26 Q. -- one of the places we started at last time --

1 A. Yes.

2 Q. -- which is a Google Earth map of --

3 A. Yeah. But you remember, you brought the

4 substation up. I had forgot it. That's why the numbers

5 are broke. In other words, they started, stopped,

6 started again.

7 Q. Right.

8 A. That's what the two colons mean right there.

9 Q. Okay.

10 A. Okay?

11 Q. And then -- but you're able to track the

12 entirety of this line based on --

13 A. Oh, absolutely.

14 Q. -- the GPS?

15 A. Absolutely, every one.

16 Q. Okay.

17 A. The -- say I pull a GPS coordinate on the one

18 tower out of the, out of the powerhouse. When I get in

19 the helicopter, I can punch that right into Garmin GPS,

20 and it will fly right to it every time.

21 Q. So did you ever have an occasion when the

22 information in this left-hand column of the Transmission

23 Line Object List was wrong?

24 A. No.

25 Q. Now that you get these GPS coordinates and you

26 get there and there's no tower there?

1 A. No. Never. Never. We might have been off
2 maybe -- you know, it might have been off maybe one or
3 two degrees, but usually it's right on the money.

4 Q. Now, you did the inspections and everything on
5 the Caribou-Palermo basically from 27 -- 2007 through
6 2014; correct?

7 A. Yes.

8 Q. Did you get to know that line pretty well?

9 A. Absolutely.

10 Q. While you were assigned to that line, were
11 there any major incidents on the line?

12 A. Yeah, we only -- one only I know of. That was
13 across from Buck's Powerhouse. We had -- there was one
14 wood structure in the whole line, and it caught fire and
15 burnt down and we had to repair it.

16 Q. Okay. Do you know when that occurred?

17 A. No, sir, I don't.

18 Q. You were still with PG&E in 2012; correct?

19 A. Yes. Well, as far as I know.

20 Q. Was there a major incident on the
21 Caribou-Palermo line in 2012?

22 A. You know, I don't know.

23 Q. Okay. You don't have a memory of anything
24 major happening?

25 A. No, sir.

26

1 (Exhibit 239 was marked for identification.)

2

3 Q. I'm going to show you -- and this is an exhibit
4 that's marked for identification only as a record to
5 refresh recollection. This is 239.

6 A. Okay.

7 Q. And I want you to read that, not -- to
8 yourself, and then once you're done -- just read the
9 first two pages, and specifically page 2.

10 A. Well, it's --

11 Q. Nope. Don't talk about it, just read it to
12 yourself. Then when you're done, let me know.

13 A. Okay. Okay.

14 Q. All right. Just go ahead and put it down,
15 upside down, so you can't see it.

16 Now, reviewing Exhibit 239, does that refresh
17 your recollection as to what happened in 2012?

18 A. The only reason why is (WITNESS #20) told me.

19 Q. Okay.

20 A. And he was the troubelman on call that night.
21 And, and what happened, there was a massive storm in the
22 canyon, and it knocked about four or five of the towers
23 down there on the Palermo line. And they replaced them
24 with wood.

25 Q. Okay. And you were aware of that?

26 A. Not until maybe a couple days later, because

1 (WITNESS #20) told me. Like I said, he was the on-call
2 transmission troubleman.

3 Q. Did you take part in the --

4 A. No.

5 Q. -- the repair efforts?

6 A. No, GC line.

7 Q. Do you know what replaced those towers that
8 were lost?

9 A. They went to wood, I believe.

10 Q. Do you know what a shoo-in is?

11 A. No, it's not. It's a shoo-fly.

12 Q. Or shoo-fly?

13 A. Yes.

14 Q. What's a shoo-fly?

15 A. Shoe fly is a temporary piece of construction
16 that will be removed later.

17 Q. And was a shoo-fly common for, at PG&E?

18 A. Yes. We did them all the time.

19 Q. And so what recollection do you have, absent
20 anything from anybody else, what anybody else told you,
21 what recollection do you have of the 2012 incident?

22 A. None.

23 Q. Now, when you did your inspection in 2013, that
24 inspection should have reflected those towers that were
25 lost; correct?

26 A. I don't know. I don't even remember. All I'm

1 saying is I'm just getting hearsay from (WITNESS #20) --

2 Q. Okay.

3 A. -- that he told me about them and what was
4 going on up there.

5 Q. Well, let's just assume that there were six
6 towers lost, okay, in December of 2012, that were gone
7 and they no longer existed and they were replaced by a
8 shoo-fly?

9 A. Okay.

10 Q. Should that have been reflected in your 2013
11 inspection?

12 A. I would have thought so.

13 Q. So going back to your 2013 inspection, which is
14 166 right here in front of you, and first to the open
15 notification list. And the open notification list still
16 lists open notifications at 22/188 and 22/189; correct?

17 A. I don't know. Like I say, you're, you're
18 running years where the structures went down, and I don't
19 know. I might not have even patrolled them or been
20 there. I can't help you on that.

21

22 (Exhibit 240 was marked for identification.)

23

24 Q. Right. Well, let's look at something else. I
25 want you to look at a few other things. Read 240 for me
26 real quick.

1 A. Okay. Just want to replace the stuff --
2 Q. Don't talk about it, just please look at it and
3 read it.
4 A. Okay.
5
6 (Exhibit 241 was marked for identification.)
7
8 (Exhibit 241A was marked for identification.)
9
10 (Exhibit 242 was marked for identification.)
11
12 (Exhibit 242A was marked for identification.)
13
14 (Exhibit 243 was marked for identification.)
15
16 (Exhibit 244 was marked for identification.)
17
18 (Exhibit 245 was marked for identification.)
19
20 Q. And then there's 241 through 245.
21 A. Okay.
22 Q. And 241A, 242A --
23 A. They're all notifications.
24 Q. I want you to look at them briefly. When
25 you're done, turn them over. Let me know when you're
26 done.

1 A. All righty. Like I said, I was told they were
2 replaced by wood. From there, I don't know.

3 Q. Okay. Does reviewing those reports refresh
4 your recollection on, as to the number of towers that
5 went down in 2012?

6 A. Yeah, I don't even know that. I was just told
7 that there was towers that went down and they were going
8 to replace them with wood. That's all I was told.

9 Q. So when you did the 2013 inspection, there's
10 nothing to note that those wood towers -- that those
11 steel structures had been replaced by wood towers;
12 correct?

13 A. Yeah, I don't know.

14 Q. And let's assume that among the towers that
15 went down in 2012 are 22/188 and 22/189. Those are still
16 listed as open notifications on your paperwork; correct?

17 A. I see them here.

18 Q. Okay.

19 A. But, I mean, that could have been -- the towers
20 went down in the wintertime, I believe. That's what the
21 guys told me. They told me it was a big snow storm up
22 there and they went down.

23 Q. Okay. That was in December of 2012?

24 A. Okay. So what's this patrol? It's -- this
25 patrol, this air patrol went down in 8, 8. That was
26 August. So them structures were still there.

1 Q. August of 2013?

2 A. Them structures were still there.

3 Q. No, this is August of 2013. They went down in
4 December of 2012; correct?

5 A. No, I don't know. I mean, I don't think -- if
6 they would have not been there, then I wouldn't have
7 wrote them up.

8 Q. Okay. That's where I'm going. This is your
9 Transmission Line Object List --

10 A. Okay.

11 Q. -- page 41. And this shows 22/188 and 22/189;
12 correct?

13 A. Okay. Right. If they were with wood, then I
14 would never -- I would have made that note or comment.
15 It says right down there, you can put notes down on what
16 you see, a bird or an airplane or whatever going on up
17 there. I would have wrote that down, "replaced with wood
18 poles."

19 Q. Okay. So what did you record for 188?

20 A. 188. 77 -- there it is.

21 Q. 188 is partially underneath the hole punch.

22 A. It see it there. It says preexisting
23 conditions checked, double dead end tramp.

24 Q. 189?

25 A. Yep. Same thing. All I'm just saying is --

26 Q. That goes back to the open notifications?

1 A. Yeah. I don't -- like I said, I don't know
2 when all that stuff went down, what winter it was or
3 whatever it was. That -- (WITNESS #20) took care of all
4 of that.

5 Q. Okay. And now we're to 167, which is back to
6 your --

7 A. '13.

8 Q. 167 is '14.

9 A. Okay.

10 Q. And page 5, which is the notification list.

11 A. That's when me and (WITNESS #23) shared it.

12 Q. That shows 22/188 and 22/189 still with open
13 notifications on it?

14 A. Yep.

15 Q. And then on page 41 and 42, now this is the
16 part that was completed by (WITNESS #23)?

17 A. Yes. Okay.

18 Q. And what does the Transmission Line Object List
19 reflect for 188 and 189?

20 A. It says completed, no problems. Completed, no
21 problems.

22 Q. And you started to volunteer this to me
23 earlier --

24 A. Yeah.

25 Q. -- there are notes on here?

26 A. That's just --

1 Q. Explain those.

2 A. Just conductor height; 32 feet, 78 degrees, at

3 12:00 o'clock. We carry heat guns with us.

4 Q. Okay. Explain that to us.

5 A. We just want to make sure that the conductor

6 was legal limit off the ground.

7 Q. So what do those numbers mean?

8 A. That means the conductor is 32 feet from the

9 ground to the conductor, at 78 degrees, at 12:00 o'clock

10 noon.

11 Q. Okay. 78 degrees is the temperature of the

12 conductor or the ambient temperature?

13 A. Outside ambient temperature.

14 Q. Okay. So see if we can read this right. This

15 is on tower 23/193, the conductor is 32 feet above the

16 ground, at 78 degrees, and you did that at 12:00 o'clock?

17 A. That's right.

18 Q. Then at 22/186, your conductor is 61 feet, at

19 80 degrees?

20 A. Yes.

21 Q. And that's at 12:20?

22 A. That's right.

23 Q. So you've moved seven towers in 20 minutes?

24 A. Uh-huh. I guess he did. He's the one that did

25 it.

26 Q. Okay. But you were out there supervising him?

1 A. At times, too, you know, he didn't hold my hand
2 while I went to the potty room or anything, do you know
3 what I'm saying? But yeah, (WITNESS #23) is a very smart
4 individual, and he could, he could think.

5 Q. And this is a five-year detailed inspection;
6 correct?

7 A. Yes.

8 Q. And at least right here you've basically got
9 seven towers being inspected in 20 minutes?

10 A. Right.

11 Q. Which is less than three minutes a tower?

12 A. Right. I mean, he did it, that's what he wrote
13 up.

14 Q. Do you have a recollection as to how far those,
15 how far apart those towers are?

16 A. No.

17 Q. All right. And this is the comparison, 2012,
18 2013, 2014, Transmission Line Object List, page 41. Do
19 you see those? Here, you want to stand up at the big
20 board? It's three different numbers, three different
21 reports.

22 A. What do you need?

23 Q. Each of these pages is pretty much identical in
24 terms of the prepopulated information; correct?

25 A. Yeah.

26 Q. The description of the type of tower?

1 A. Sure.

2 Q. The location of the tower?

3 A. It's all generic.

4 Q. Right.

5 A. When you started in 2009, it's the same thing.

6 Q. Okay. And then you just checked the boxes as

7 to what you do?

8 A. What we see. And we put down what we see and

9 what needs to be fixed.

10 Q. So there's no indication in any of these that

11 any of these towers are missing; correct?

12 A. No, not that I know of.

13 Q. So if these towers, if some of these towers

14 disappeared, they wouldn't be reflected?

15 A. Everything I always saw was there. I mean, if

16 -- I don't know what went away or what was there. That I

17 can't help you with.

18 Q. Right. Let's just assume that in the 2012,

19 188, 189, 190, 191, and 192 fell down and went away.

20 A. Okay.

21 Q. And disappeared for good.

22 A. Okay.

23 Q. There's no indications in your '13 or '14 lists

24 that there's any changes; correct?

25 A. No. (WITNESS #23) wrote it up.

26 Q. Okay. But the '13 one is yours.

1 A. Yeah.

2 Q. But even in the company records, assuming those
3 towers are gone, they're still listing those as towers
4 that are still there; correct?

5 A. I guess. I don't know.

6 Q. Well, they're still here on the page, aren't
7 they?

8 A. I know, Marc, but I said I don't know. I've
9 been away from it a long time, so --

10 Q. That's the point.

11 A. Yeah.

12 Q. You're still listing --

13 A. What I can't tell you is the rhyme or reason
14 what anything happened or how it went down.

15 Q. That's a perfect point.

16 All right. I want to move away from that now.
17 I want to talk about suspension hooks with you. And you
18 talked about earlier that you were a, you were -- you've
19 been a journeyman lineman since what, 1972?

20 A. '77.

21 Q. '77?

22 A. Yeah.

23 Q. And you replaced a lot of insulator strings?

24 A. Yeah.

25 Q. And on suspension hooks?

26 A. Yes.

(Exhibit 37 was marked for identification.)

Q. Can you tell us what we're looking at here on Exhibit 37.

A. Suspension bells. These are all the bells here. There's the porcelain bell. They call this the hub. That's the C hook that goes into the plate there. Right there.

Q. Do you see anything wrong with that?

A. No, I don't. Except it's old, that's all.

Q. Okay.

A. I don't see any flashing or anything. Usually you see where the lightning hit the hub, had walked down. There would be a big white spot like right on the glass there.

Q. Now, I do want to illustrate one other thing on this. Do you recognize this, what's depicted in this photograph?

A. Yeah. It's way up on the hill. I don't know. I don't even -- that might be the road, the old Camp Road, I'm not really sure.

Q. That's what I was going to ask, this road below, is that Camp Creek Road?

A. That could be Camp Creek Road. And these are all up on the hill here.

1 Q. Do you recognize what tower line that is?
2 A. Yeah, it's Caribou-Palermo. I believe. It
3 looks pretty antiquated.
4 Q. Right.
5 A. And the old copper wire.
6 Q. So when you were a troubleman, did you get any
7 instruction, any guidance to look --
8 A. Yeah, we looked at all that.
9 Q. We're talking about the hook and hole --
10 A. Yeah.
11 Q. -- on the suspension.
12 A. Yeah. But the only way that you could possibly
13 look underneath that situation there was take it apart.
14 And, you know what, that's a generation line, they're not
15 going to let you have it.
16 Q. Okay.
17 A. So all that, all that stuff, you can see how
18 old it is. It's been up there -- I don't know if this is
19 copper or aluminum. Looks like aluminum. It's so black
20 I can't really tell. But, yeah, it's pretty bad.
21 Q. We started off originally when you were here
22 talking about the *Electric Transmission Preventative*
23 *Maintenance Guide*; do you remember that?
24 A. Yeah.
25 Q. And I think this is a page from the 2011 *ETPM*?
26 A. Yeah.

1 Q. We talked about it a little bit, talked about
2 priority codes and what you're supposed to be looking at?

3 A. Sure.

4 Q. And where would you fit that hook and hole that
5 we just looked at, Exhibit No. 37?

6 A. Well, you just have to look at all of them down
7 through there. But see, here's the deal, here's all
8 switches and hardware. That's switching stuff. Here's
9 the steel structure. Then you have the mark and the
10 right-of-way, which trees contact and all that stuff.
11 Then you just start coming down through here, about your
12 corrosion, your contamination, burnt, broken, loose,
13 missing, or your rust. And this tells you how many
14 months that you think that that will last.

15 Q. So where would the hook and the hole fit into?

16 A. It might be right in here: Rust, 10 to 30
17 percent material loss, cracked, corrosion, contamination.
18 It would be right there.

19 Q. How do you determine 30 percent rust or 10
20 percent wear?

21 A. I mean, I can't -- I'm no scientist, so I can't
22 -- all I can do is look at it --

23 Q. Right.

24 A. -- and make an educated guess that when it will
25 fail. That's all I can tell you.

26 Q. Okay. But you don't think that this one

1 here --

2 A. What?

3 Q. -- is an issue?

4 A. Well, you see, you've still got three inches,
5 almost three inches of meat right there. And that hook
6 is solid steel. See how the hub's -- there's a cotter
7 key. That goes in the deal. This whole arm would
8 collapse before that would ever separate. That's how
9 strong that is.

10 Q. During your career with PG&E, did you ever hear
11 about any of these hooks breaking?

12 A. No.

13 Q. Were you ever provided any information about
14 any studies of, as to wear and breakage of those hooks?

15 A. No.

16 Q. Were you aware that any studies were done on
17 those hooks?

18 A. Not that I was aware of.

19 Q. As a troubleman, were you given any information
20 by PG&E that wear patterns had been studied in the hooks
21 and holes and tests had been done?

22 A. No. I ain't never got any of that information.

23 Q. And did you ever get any specific guidance to
24 specifically look at the hooks and the holes and to
25 replace?

26 A. No guidance.

1 Q. Now, you were told back in 2009, "We're having
2 a problem with some of these connectors"?

3 A. Yes.

4 Q. "So you need to identify every one of the
5 connectors, and we need to change those out"; correct?

6 A. We did.

7 Q. Well, as of when you retired at the end of
8 2014, none of them had been changed; correct?

9 A. Sir, I'm just a lineman, do you know what I
10 mean? What does Mike Ramsey tell you every day?

11 Q. But I'm saying we looked at the notification --

12 A. Help me here. What I'm saying, I can only do
13 what I know.

14 Q. Oh, no. Absolutely. Absolutely. But unlike
15 the connectors, you never got any bulletins telling you
16 to specifically look at those things and change out those
17 things?

18 A. Not that I was aware of. I never seen one.

19 Q. Now, we're looking at table 2 in the 2011 *ETPM*.
20 This talks about best view to inspect certain things.
21 Which one of these categories would you fit the hook and
22 hole and the suspension C hooks and --

23 A. Right there, "Insulators and hardware."

24 Q. Insulators and hardware. So what's the best
25 methods, best view to inspect those components of the
26 towers?

1 A. Climbing.

2 Q. Did you ever climb any of the --

3 A. Oh, yeah. I climbed them to look at them.

4 Q. The Caribou-Palermo?

5 A. Oh, yeah. Sure.

6 Q. When?

7 A. Oh, hell, I don't know. No idea.

8 Q. When you were a troubleman or when you were a

9 lineman?

10 A. Troubleman and sometimes probably when I was a

11 lineman. But that goes way back. No recollection of

12 that stuff.

13 Q. Okay. Do you remember when would have been the

14 last time potentially as a troubleman you would have

15 climbed the Caribou-Palermo line?

16 A. It would have been on the ground, ground

17 patrol, a detailed patrol.

18 Q. Why would you have climbed it?

19 A. Because there was maybe something I couldn't

20 see. I could go up there, get a closer look.

21 Q. Was there anything documenting that you climbed

22 it?

23 A. No.

24 Q. Or any specific towers?

25 A. No.

26 Q. This is from the 2014, this is table 3 of the

1 *Electric Transmission Preventative Maintenance Guide,*
2 "Facility codes and Descriptions"?

3 A. Sure.

4 Q. Can you tell us where those hooks and holes
5 would fit?

6 A. Might be down, down in hardware. That's about
7 all I see.

8 (Court reporter interrupts proceeding.)

9 A. Dead end hardware, ma'am. That's crossarms,
10 wood. That's about all I see right there.

11 Q. Okay. Dead end hardware?

12 A. Yeah.

13 Q. So anything related to the hooks and holes
14 shown in 37, the suspension hooks, the insulators, you'd
15 expect to be dead end hardware, that's where you'd put
16 it?

17 A. You know, I would just probably write it out.
18 That's what I always did was just write it out. If there
19 was -- like the splices and connectors, I wrote them out.

20

21 (Exhibit 168 was marked for identification.)

22

23 Q. All right. I'm showing you a picture, 168.
24 Should be in your stack there. There it is.

25 A. There it is right there. Okay. And --

26 Q. You recognize what's shown in 168?

1 A. Yes. C hook.

2 Q. And you've seen those before?

3 A. Yes.

4 Q. You've replaced them before?

5 A. Yes.

6 Q. Anything you notice about that C hook depicted

7 in 168?

8 A. It's just got a small, where it's been working

9 in the plate.

10 Q. What do you mean "working in the plate"?

11 A. Well, the wind swings, swings the bells, and so

12 that, that hook and right there where it goes into the

13 eye, it works.

14 Q. So let's back up to 1 -- back to 37 here.

15 A. You can see it right there. As the wire swings

16 back and forth in the canyon there, the wind is blowing

17 it.

18 Q. So you're talking about as this insulator

19 swings --

20 A. Yeah.

21 Q. -- swinging back and forth?

22 A. It's working the eye and the hook, yeah. Right

23 there.

24

25 (Exhibit 169 was marked for identification.)

26

1 Q. Okay. Showing you what's marked as 169. You
2 can take that clip off.

3 A. Okay. 68, 69. There we go. Okay.

4 Q. You recognize what's depicted in 169?

5 A. Yeah. It's a plate.

6 Q. What is it that you call that?

7 A. It's a plate. It's an eye plate. I call it an
8 eyelet plate.

9 Q. Eyelet plate?

10 A. Yeah.

11 Q. Okay.

12 A. Everybody's got their own words for them.

13 Q. Do you know, is there anything unusual about
14 that --

15 A. Yeah.

16 Q. -- eyelet?

17 A. Yeah. I can see the wear on it. Yeah.

18 Q. What do you mean "the wear"?

19 A. The wear where the C hook's been rocking in it.

20 Q. Okay. And can you show us on here what we're
21 talking about there?

22 A. Well, it's just not -- it's oblong. You can
23 see it right here. You can see the rust pattern and
24 stuff. But it's still not in failure mode. You've still
25 got two inches of steel. That steel is probably
26 two-inch, inch-a-half steel.

1 Q. What do you mean by two-inch?

2 A. That's the size of the plate, the thickness of
3 it. Right through here. Look how far it goes back on
4 the arm.

5 Q. Thickness in terms of cross-section?

6 A. No, flat. Probably be an inch, inch and a
7 half.

8

9 (Exhibit 170 was marked for identification.)

10

11 Q. All right. Moving up to 170 here.

12 A. Yes.

13 Q. And this is a, what kind of tower is this?

14 A. Tramp.

15 Q. And do you recognize this tower?

16 A. Not really.

17 Q. Do you know what line this is on?

18 A. Well, it's on Caribou-Palermo. I mean, we've
19 have been on it since -- I'm sure you haven't went to the
20 Caribou-Cottonwood or something, I take it.

21 Q. Do you see anything about this, the tower shown
22 in this photograph, that you would notice being a
23 problem?

24 A. Well, you see the connectors again. You can't
25 miss them. They're all along the bar right here. There.
26 See there? There's a whole, totally different connector

1 there. That's a "transmission connector" they call it.
2 There's one there. There's another one. Probably some
3 up in the top. Yeah.

4 Q. Do you see any of the old 2009 connectors left
5 in this tower?

6 A. Yeah, they're still there. Yeah. I don't
7 think they ever changed them out.

8
9 (Exhibit 171 was marked for identification.)
10

11 Q. Now 171, now we're specifically going in on the
12 arms --

13 A. Okay.

14 Q. -- on this tower.

15 A. Right.

16 Q. Do you see any issues with the hooks and the
17 holes and the eyelets and the insulator strings?

18 A. Yeah. They're rusty and worn. Wore, worn.

19 Q. Now, when you're doing a helicopter patrol and
20 you're looking at these arms with these connector points,
21 what are you looking at to determine wear?

22 A. Just seeing how much the C hook is wore on the
23 plate.

24 Q. How do you do that?

25 A. Well, usually I had the motion binoculars with
26 me, and I could get right with -- I could see a fly on

1 it, because we'd get in so close. Because the helicopter
2 we flew in, they had small rotor blades so we could
3 really press and get in close to the tower.

4 Q. So what, what about this connection point would
5 you look at to determine --

6 A. We look at all the strings, the conductor, the
7 bells, everything, all bolts, steel, everything, the
8 whole tower.

9 Q. Right. But with this connector point right
10 here, the hook in the hole, the hook is holding the
11 suspension --

12 A. Yeah.

13 Q. -- these insulators, and the hole in this
14 crossarm and jumper arm. How would you look at that to
15 determine wear? What would you, what would you be
16 looking for to show wear?

17 A. Well, you've just got to look surface to
18 surface; right?

19 Q. Explain it.

20 A. Surface to surface. The C hook to the plate.
21 That's surface to surface.

22 Q. Okay. But how would that show you wear?

23 A. You could see it. You could see the wear.

24

25 (Exhibit 172 was marked for identification.)

26

1 Q. Okay. Now, we're going up to 172. This is a
2 separate tower. Do you recognize what type of tower this
3 is?

4 A. Yeah. Looks like another transposition.

5 Q. Do you recognize that line?

6 A. Same line.

7 Q. Okay. Anything that you notice about that
8 tower that would --

9 A. Same thing.

10

11 (Exhibit 139 was marked for identification.)

12

13 Q. This is Exhibit 139. Recognize what type of
14 tower that is?

15 A. Yeah. This is the one you just looked at.

16 Q. And what type of tower?

17 A. Transposition.

18 Q. Okay. Do you see anything wrong with this?

19 A. Same as before, as all of them.

20 Q. What do you mean?

21 A. Wow.

22 Q. Remember, we've got to explain this for the
23 record.

24 A. I know. We have only covered sleeves and
25 connectors a hundred times. You've been on the four or
26 five transposition towers for the last two hours. They

1 never changed. They're just like brother and sister.
2 They all look the same. They got all the same hardware,
3 they got all the same conductor and makeup on them.

4 Q. Okay.

5 A. I mean, you can go through every one of these
6 goddam things right here, and they're all the same.

7 Q. Right.

8 A. Okay? So what are you after? Maybe the C hook
9 failed in the plate or what? Or the bells failed? Or
10 the pins come apart? Or the conductor went on the
11 ground?

12 Q. Okay.

13 A. What would you like?

14 Q. I want to know what's wrong with this tower.

15 A. The same as in this book that we all wrote up
16 right here. You've read it over and over from 2009,
17 Marc, to 2014.

18 Q. Right.

19 A. Okay.

20 Q. But do you see anything in this photograph
21 depicting that there's anything wrong with this tower
22 that you would write up?

23 A. It's already wrote up.

24 Q. I mean, this is --

25 A. It's already wrote up, Marc. All the
26 connectors and all the problems with the tramp towers

1 were all wrote up from my eyeballs from 2009 to 2014.

2 Q. This -- for instance, the connectors are like
3 this right here?

4 A. Yes. There's all sorts of connectors up there.

5 Q. The connection points between the tower arms
6 and the insulator strings, those aren't connectors;
7 right?

8 A. No, they're C hooks. They're C hooks to
9 plates.

10 Q. Right.

11 A. Yes.

12 Q. So if you're doing an inspection of this, you
13 look at this tower from a helicopter, and do you
14 recognize there's a problem with this tower with the C
15 hooks and the plates?

16 A. If they were, we would write them up.

17 Q. Okay. But would you, looking at this
18 photograph?

19 A. Yes, I would, if I saw a problem. But what
20 you're doing, you're looking at years of wear, and
21 they're not ready to fail yet of what I see. And the
22 book gives you guidance on if you see that it's under two
23 inches or inch or whatever, then you need to write it up.

24 Q. Okay. Does this tower look familiar to you?

25 A. No. I've been gone for five years, Marc.

26 Q. Yep. I know. But let's go back to your 20 --

1 2009. Where did we put it?

2 A. That's all your -- might be right here. That's
3 '14 here. That's '14.

4 Q. I was looking for your 2009, your pictures that
5 you took.

6 A. I don't know. I have no idea.

7 Q. There it is.

8 A. Okay.

9 Q. This is Exhibit 235.

10 A. Okay. Okay. Tower 24 over 199.

11 Q. And go back to the next picture.

12 A. Okay. All right.

13 Q. Now, does this tower on this picture look
14 familiar?

15 A. They're all the same.

16 Q. How so?

17 A. Every tramp tower is the same.

18 Q. Right. But is there anything unusual about
19 this tower that's different from all the other tramp
20 towers?

21 A. Not that I see. If you look at it, Marc --
22 we've been over this a hundred times now. Don't make me
23 lose it. I'm telling you right now. The same bar, the
24 same kind of configuration, the same eye hooks,
25 everything, same bells, same configuration as that right
26 there. All them towers are all the same.

1 Q. Okay. How many of the other towers have we
2 looked at that have a curved insulator string like that?
3 A. There's tons of them out there.
4 Q. Okay.
5 A. Yeah.
6 Q. Remember last -- two weeks ago --
7 A. The curved insulator doesn't mean no shit.
8 Q. Do you remember two weeks ago we talked about
9 you were telling me about you had a plumb line out there,
10 you talked about being out of plumb?
11 A. Yes.
12 Q. That's one of the things that's actually on
13 your inspection forms?
14 A. Yeah.
15 Q. Insulators out of plumb?
16 A. Yes.
17 Q. Wouldn't that be out of plumb?
18 A. It is out of plumb, but it's not, it's not --
19 electrically or mechanically, it's not a problem.
20 Q. Okay.
21 A. And we're talking not steel, we're talking wood
22 when you're saying out of plumb.
23 Q. Okay. And then isn't this a three-bolt
24 connector?
25 A. Yes. Same thing you saw here. Come over here,
26 Marc. Look.

1 Q. Absolutely.

2 A. There's that one, too. And that one. And that
3 one. And that one. They're all the same.

4 Q. These are the three-bolt connectors that were
5 supposed to be replaced back in 2009?

6 A. Did they replace them, Marc? Apparently they
7 didn't. I don't know what you want from me, do you know
8 what I mean? I'm losing faith here; okay?

9 Q. There it is. There's 235.

10 A. Look at it. Check this out. The bar, the same
11 tramp configuration on top, same tower.

12 Q. Right. We got this out-of-plumb insulator
13 string?

14 A. Yes. Absolutely. It's --

15 Q. That's the bolt connector?

16 A. Thank you.

17

18 (Exhibit 174 was marked for identification.)

19

20 Q. Okay. And this is Exhibit 174. That's
21 another, another view of it; correct?

22 A. Yes, sir.

23 Q. This is the three-bolt connector?

24 A. Yep, that's it.

25 Q. You marked in 2009 that needed to be replaced?

26 A. That's right. I wrote them all up.

1
2 (Exhibit 175 was marked for identification.)
3
4 Q. All right. 175?
5 A. Okay.
6 Q. Do you see anything wrong with that tower?
7 A. Same thing as all the tramp towers. Got the
8 bar, got all the lattice work, same thing.
9 Q. Okay. But do you see anything on that that you
10 would mark down as being a problem?
11 A. No, not really. No. Got all the same
12 connectors all down through the bar. Connectors out
13 there. Bolts. There's some more connectors. Got
14 connectors everywhere. Then there's some guy standing
15 there.
16 Q. And you've replaced these insulators multiple
17 times --
18 A. Yes.
19 Q. -- throughout your career; right?
20 A. Yeah.
21 Q. You know what it looks like when you put a
22 brand new insulator in and --
23 A. Yeah.
24 Q. -- all new equipment on here?
25 A. They're glass.
26 Q. Is there supposed to be daylight like that

1 through that hole?

2 A. Yes. Oh, yeah.

3 Q. You're sure about that?

4 A. Well, if there's not, Marc, you can't get the C
5 hook in.

6 Q. Okay.

7 A. I mean, you're talking mechanical. See, if
8 that doesn't have that type of hole there --

9

10 (Exhibit 176 was marked for identification.)

11

12 Q. Now we're on to 176.

13 A. You can't get the C hook in through there.

14 Q. So you're telling me that this is the way this
15 is supposed to --

16 A. That's the way they built it back in a hundred
17 years ago, Marc; okay?

18 Q. Okay.

19 A. I don't engineer the stuff, pal, you know? I
20 just work on it.

21 Q. I want to give you a couple hypotheticals.
22 Showing you a picture of that C hook we looked at earlier
23 that you --

24 A. Got it right here.

25 Q. This C hook. And this is Exhibit 168A.

26

1 (Exhibit 168A was marked for identification.)

2

3 A. Right here.

4 Q. Hypothetical. I want you to assume that the
5 width of this at the apex of this C hook where it makes
6 contact is 15/16 of an inch.

7 A. That's quite a bit.

8 Q. You know that?

9 A. Yeah. That's quite a bit.

10 Q. Oh, okay. That's quite a bit. I thought you
11 said you knew that.

12 A. I said that's quite a bit. Have you ever held
13 one of these in your hand?

14 Q. I have, yes.

15 A. You have?

16 Q. Yes.

17 A. They're heavy.

18 Q. Yes, sir.

19 A. They're all steel.

20 Q. Remember, I got to ask the questions.

21 A. Yes. They're all steel, galvanized. So to
22 destroy one, you'd have to pull it apart with two
23 Caterpillars, that's how tough them things are.

24 Q. All right. So that, that's 15/16 of an inch of
25 steel?

26 A. Right.

1 Q. That's your hole?

2 A. Yes.

3 Q. The eyelet. This is 169A. This is the same
4 picture you looked at beforehand.

5

6 (Exhibit 169A was marked for identification.)

7

8 A. Yeah.

9 Q. I want you to assume for the purposes of this
10 hypothetical, based upon all of your experience as a
11 troubleman, as a lineman, that that hole when it was
12 designed, the diameter of that hole is 1 1/8 of an inch.

13 A. That I don't know. That was --

14 Q. I want you to assume that. I'm not asking you
15 if you know that.

16 A. Okay.

17 Q. You've already told us you don't know what it's
18 supposed to be.

19 A. I don't. It's oblong. You can see that.

20 Q. Okay. But that hole is not, that's not the way
21 that hole is designed; right?

22 A. That's right.

23 Q. When you put new ones in, new, those are round
24 holes; correct?

25 A. Sure.

26 Q. I want you to assume that the diameter of that

1 round hole is designed as 1 1/8 of an inch.

2 A. That I don't know.

3 Q. No, no. Assume that.

4 A. Okay.

5 Q. So if the hole is 1 1/8 inch diameter and the
6 hook is 15/16 of an inch, how much space should there be
7 between the top of the hook and the top of the hole?

8 A. I don't know. I'm no carpenter. I don't know.

9 Q. Okay. Well, what is the difference between 1
10 1/8 and 15/16?

11 A. I don't know. I don't know my math anymore.
12 Don't know it. Don't know fractions and the common
13 denominator, whatever you're after.

14 Q. So let's do this. 1 1/8. 1/8 would be -- in
15 sixteenths, so 1 would be 16/16, 1/8 would be 2/16. So
16 you're talking about 18/16; is that right?

17 A. I don't know.

18 Q. Minus 15/16. So you should have 3/16 of an
19 inch space between the top here.

20 A. Okay.

21 Q. Does that -- you changed a lot of these
22 insulators --

23 A. Yeah.

24 Q. -- in the years?

25 A. Yeah, but they're already engineered, Marc.
26 You put the plates up and you put the C hooks in, you go

1 to the next tower.

2 Q. Right.

3 A. I don't get my tape measure out, say, "Gee,
4 somebody messed up, it's only 15/16."

5 Q. Let me put it this way. There's only a sliver
6 of light at the top, between the top of the hook and the
7 top of the hole when you put a new one in; correct?

8 A. What are you after, Marc?

9 Q. Well, that's where we're going.

10 A. Okay. Where are you going with this? Help me.
11 I don't --

12 Q. Why is there so much, why is there so much
13 daylight in this and why is that not being recorded and
14 reported?

15 A. I don't know. That's the way it was engineered
16 a hundred years ago. My mother and dad didn't even meet
17 then, so I can't tell you.

18 Q. I'm telling you as a hypothetical, that's not
19 the way it's engineered.

20 A. I'm sorry, I don't know. I'm not an engineer.
21 I'm a lineman.

22 Q. I know. And that's what we're trying --

23 A. You know, you guys got to understand that
24 everything in this company they have engineers, and they
25 engineer everything that we do. And to pass that on,
26 they have a line standards book, an underground book, and

1 all this stuff that we go by that the engineers have
2 designed that, and that's how we build them.

3 Q. Right. And the question is, you're the
4 troublemen, you're the guys that are out there inspecting
5 it, you're the ones supposed to be finding the wear and
6 tear and the problems and --

7 A. That's right.

8 Q. -- getting them replaced before they --

9 A. That's right. Yes.

10 Q. So the question is, why weren't those hooks and
11 holes reported as problems and wear?

12 A. That's a factory -- that, to me, that is --
13 looked like that was done by a factory punch. That
14 wasn't done by wear. That's my take on it.

15

16 (Exhibit 178 was marked for identification.)

17

18 Q. I'm going straight to 178, to the end.

19 A. Okay.

20 Q. Do you see that hook?

21 A. Yeah.

22 Q. Do you see a problem with that hook?

23 A. Sure. It's got -- it's, well, probably about
24 half gone.

25 Q. Half?

26 A. Yeah.

1 Q. Do you not consider that hook worn?

2 A. Yeah, it is worn. Yeah.

3 Q. Would you say that that hook needs to be

4 replaced?

5 A. Yeah, I'd turn it in if I saw it like that.

6 Yeah.

7 Q. Okay. So let's assume -- and there's the

8 eyelet for that same hook.

9 A. Well, you still got plenty of room on it.

10 Q. Let's assume that's that hook hanging in that

11 tower.

12 A. Okay.

13 Q. Is that something that you would report as

14 being a problem?

15 A. Anything that I saw that looked bad or rusted

16 out, yeah, I would definitely write it up and turn it in.

17 Q. Let's assume that's that hook.

18 A. Okay.

19 Q. Are you going to report that, what you're

20 seeing right there, all that daylight, all that wear?

21 A. It depends on how bad it was worn. It was worn

22 that it could fail, then I would write it up.

23 Q. Well, you're looking at what that hook looks

24 like when it was taken off.

25 A. When did you take it off?

26 Q. That doesn't matter.

1 A. I haven't been on that line in five years,
2 Marc. Help me. Marc, I haven't been on that line in
3 five years. When did you take the hook off? You took it
4 off the 19th, I saw the date on it. So how can I write
5 it up when I'm not even working, I'm retired?

6 Q. I'm saying if you saw this in the field --

7 A. If I saw it --

8 Q. -- when you did your inspection --

9 A. I would probably write it up.

10 Q. Okay. The question is why -- you've patrolled
11 this line for seven years?

12 A. Right.

13 Q. This wear didn't occur in a year or two;
14 correct?

15 A. Oh, no. It probably occurred over its
16 lifetime.

17 Q. There were other troublemen doing this line and
18 continue to do this line?

19 A. Yes. Still do.

20 Q. The question is why wasn't that being reported
21 and why weren't those problems being fixed?

22 A. Hey, you see all the sleeves there, Marc? Why
23 don't you go ask PG&E. Right? That's the answer you
24 want. I only -- I wrote up everything that I saw that I
25 could possibly physically write up. Everything else is
26 out of my hands. I mean, I can only do so much. And you

1 see all the connector problems and sleeve problems from
2 2009 to '14, and guess what, they were on the books and
3 they never repaired them; all right?

4 Q. (WITNESS #1), thank you. I don't have any
5 further questions for you.

6 Do any members of the jury have questions for
7 (WITNESS #1)?

8 (Counsel and Grand Jury Foreperson confer.)

9 MR. NOEL: All right. (WITNESS #1), these are
10 questions from the jurors themselves.

11 Q. (By MR. NOEL) In your professional experience,
12 have you or any of the linemen or troublemen with whom
13 you were familiar, to your knowledge, filed any
14 fraudulent reports minimizing or -- minimizing the
15 maintenance condition for a problem on any line?

16 A. No, we never did. Every day we fought them.
17 I've been fired once already for fighting them.

18 Q. Them being who?

19 A. Pardon?

20 Q. Them being who?

21 A. Pacific Gas and Electric.

22 Q. Are you aware of the actual age of the
23 Caribou-Palermo line?

24 A. Pretty close; hundred years old.

25 Q. In air patrols, how do you inspect the tower?
26 Up to down, left to right?

1 A. We do up and down and left to right. We do --
2 we cover it all. And also we go over the top of the
3 tower and also get the opposite side of the tower, too.

4 Q. Do you take a meal break or any breaks during
5 air patrols?

6 A. Potty breaks, that's all we do. Usually
7 anywhere 10 to 12 hours flying time.

8 Q. How many breaks are normal for an air patrol?

9 A. Depends how much water I drink.

10 Q. How many miles round-trip is the line, the
11 Caribou-Palermo line?

12 A. It goes Palermo sub -- if you know where that's
13 at -- and it goes all the way up to the Caribou
14 Powerhouse up in the Feather River Canyon. It's quite a
15 bit of miles. It's probably maybe 60, 70 miles of line
16 all the way from Palermo to Caribou.

17 Q. If the PG&E policy is spending around 5 to 15
18 minutes to inspect each tower on air patrols once a year
19 to note any observed problems, in a ten-hour shift, 600
20 minutes to inspect -- 600 minutes, you inspect each tower
21 in less than 90 seconds for 444 towers. If flight time
22 is one hour out and one our back --

23 A. No, it's not.

24 Q. -- it's not enough time to inspect each tower.

25 A. Takes us a little over an hour to get,
26 especially get in the canyon. Then depends on the

1 weather. The weather is pretty bad sometimes. Sometimes
2 we get a little quick on the towers, sometimes we don't.
3 Depends on the weather. It can be real rough in there.
4 Canyon Creek creates its own weather. I've seen the
5 valley be clear and snowing and raining up there. Pretty
6 tough.

7 Q. I guess actual -- sounds like the actual
8 question, correct me if I'm wrong, from the jurors --

9 A. She just probably wanted to know what the
10 minute time.

11 Q. I think -- actually, I think what it's asking,
12 do you feel that PG&E actually gives you enough time to
13 do an actual inspection from a helicopter?

14 A. They only give you X amount of time on the air
15 patrols. And you have to complete that. They don't like
16 you running the jobs over. They never did. So, I mean,
17 we just tried to do the job to the best of our ability.
18 That's all I can say.

19 Q. You did this for a long time?

20 A. Yes.

21 Q. As, both as a lineman, journeyman lineman, as a
22 troubleman, do you feel that you had enough time with
23 each tower to do actually a meaningful inspection?

24 A. On some no, and some yes. I mean, it's kind of
25 a 50/50 deal. Especially that line. It's all about --
26 it's really tough in there to get up in some of them

1 towers. Really tough.

2 Q. The last question, you said the lines were over
3 insulated in terms of the insulators?

4 A. Yeah.

5 Q. That there should have been eight bells?

6 A. Yeah. Every line is called a kV, a kilovolt,
7 115, 230, 500. The National Code, and the company goes a
8 little bit by the National -- Electrical Code Book.
9 Every kV -- or 12 kV is an inch. So all you need is --
10 if this was a 12 kV line right here, you'd only need one
11 bell, because it's only 12 inches. So you can see how
12 many bells there are; one, two, three, four, five, six,
13 seven, eight, nine, ten. There's ten there. Usually it
14 stops at seven on 115 line. See how it's over insulated?
15 They've added three or four more bells. Might have been
16 because they have quite a few lightning strikes in the
17 canyon. There's a lot of lightning that goes on in
18 there. It works the bells and beats the conductor up
19 pretty good.

20 Q. In your experience, could the extra bells cause
21 a problem?

22 A. No.

23 Q. For instance, too much weight on it?

24 A. No. No. That's -- everything that you see
25 here, and I'm just the workee guy, when they tell me to
26 put this up, I do. Everything -- in San Francisco, they

1 have one old building that's completely engineering
2 department. They engineer the lines, the towers, they
3 engineer the gas. They engineer everything they have.
4 It's all engineered. So --

5 Q. All right. Anything else? Any further
6 questions out there?

7 A. Anything gentlemen? Ladies?
8 Got one more?

9 Q. You had mentioned -- and here's the follow-up
10 question -- earlier with regard to the time spent on
11 target on the helicopter?

12 A. Yeah.

13 Q. Or on anything?

14 A. Sure.

15 Q. You said that PG&E doesn't like jobs running
16 over?

17 A. They have -- everything is budgeted. I mean, I
18 know you guys probably at work out there and someplace,
19 and you have a budget you have to go by. Then when you
20 run that budget over, I don't care who you work for, they
21 don't really -- they're not jazzed up about it, do you
22 know what I'm saying? So that's -- they have -- every
23 department is allotted money, and that's over -- totally
24 over my head. But everybody has money that they are
25 given to spend, and if they go over that, they, that --
26 it just kills the budget. So it reflects back on the

1 supervisor because he didn't do the budget right or get
2 enough money or whatever. So you can see how that all
3 works, just keeps going up to the top until somebody
4 starts yelling and screaming and all of the above, so --

5 Q. So if you spent too much time --

6 A. I'd hear about it. I'd hear about it.

7 Q. But from who?

8 A. My supervisor.

9 Q. Okay. Who were your supervisors?

10 A. My supervisor would be (WITNESS #12). Then
11 he'd have to go to Sacramento to the other supervisor to
12 get permission for me to charge extra time for the line.
13 And sometimes they did because there was stuff that I
14 needed to watch or there was times when I'd go in the
15 canyon and the helicopter, the weather would be so bad
16 that we'd have to stop, fly back out to Richvale where
17 this company is at, and set down for a while, let the
18 weather try to clear a little bit, then try to get back
19 in there again. So there's been times when I've been up
20 in the rain and the snow in an aircraft. It's not really
21 too much fun. It's kind of scary.

22 Q. Have you ever had, for instance, experience
23 where because of problems on one line you have to borrow
24 from the budget from another line?

25 A. I've never done that. I just tell them I'm
26 going to run my line over. That's all I ever did.

1 Q. You said that that has to go all the way to
2 Sacramento for permission?

3 A. Oh, yeah. You have to get permission when you
4 start doing that.

5 Q. What happens if Sacramento says no?

6 A. Then you don't do it. Like I say, I'm just the
7 workee, you know.

8 Q. Okay. Let's say you were doing an inspection.
9 And your inspection, because of all kinds of different
10 factors, ends up taking way too long and you go over your
11 -- the helicopter budget for doing an inspection.

12 A. Then I get chastised for it.

13 Q. Okay. Then that money, say -- any idea how
14 much a helicopter is per --

15 A. They're running anywhere from about 500 to \$800
16 an hour.

17 Q. So --

18 A. Depends what aircraft you're flying in.

19 Q. So you go, you go over budget by an hour in
20 your helicopter doing an inspection, that's \$500?

21 A. Right.

22 Q. Where is that \$500 going to come from?

23 A. I have no clue, sir. You're asking me way
24 above my head.

25 Q. Well, did you ever see it, them tell you,
26 "Okay, tomorrow's the inspection, you've only got seven

1 hours to do an eight-hour job," or anything like that?

2 A. Marc, all I can tell you, it's out of my pay
3 grade. That's all I can tell you, sir.

4 Q. Thank you, (WITNESS #1).

5 Anything else?

6 We're going to let (WITNESS #1) go here.

7 Madam Foreperson, she's going to have an
8 admonition for you.

9 THE WITNESS: My hand up?

10 GRAND JURY FOREPERSON: No.

11 THE WITNESS: Okay.

12 GRAND JURY FOREPERSON: (WITNESS #1), you are
13 admonished not to discuss or disclose at any time outside
14 of this jury room the questions that have been asked of
15 you or your answers until authorized by the Grand Jury or
16 the Court. A violation of these instructions on your
17 part may be the basis for the charge against you of
18 contempt of court. This does not preclude you from
19 discussing your legal rights with your own attorney.

20 (WITNESS #1), what I have just said is a
21 warning not to discuss this case with anyone except the
22 Court, your lawyer, or the district attorney.

23 THE WITNESS: Yes, ma'am.

24 GRAND JURY FOREPERSON: Thank you. Thank you
25 for your time.

26 THE WITNESS: Thank you.

1 MR. NOEL: We've been going about an hour 15
2 minutes, but we have one witness out there that will be
3 about a 10-, 15-minute witness. Is it okay if we bring
4 him in, get him on, get him done, then break for lunch?

5 GRAND JURY EN MASSE: (Answers in the
6 affirmative.)

7 MR. FOGG: Did everyone get a handout for
8 (WITNESS #3)?

9 GRAND JURY FOREPERSON: (WITNESS #3), would you
10 raise your right hand, please.

11
12 (WITNESS #3)
13 having been called as a witness in
14 the matter now pending, having been first
15 duly sworn, testifies as follows:

16
17 THE WITNESS: I do.

18 GRAND JURY FOREPERSON: Thank you. Have a
19 seat.

20 MR. NOEL: Before we start, can you state your
21 full name, spelling your last name for the court
22 reporter?

23 THE WITNESS: (WITNESS #3), (SPELLING
24 REDACTED). That's loud. Sorry.

25 MR. NOEL: Some people need it, some of us
26 don't.

1
2 EXAMINATION
3

4 BY MR. NOEL

5 Q. What do you do for a living, (WITNESS #3)?

6 A. I'm -- obviously, I work for PG&E. I'm a
7 foreman in GC hydro. So all the powerhouses and dams.

8 Q. Tell us what GC hydro means.

9 A. So basically we tear apart the big generators,
10 work on the dams. Basically everything that generates
11 power with water we work on. So electrical, mechanical,
12 everything inside the powerhouse and outside.

13 Q. Are you an electrician?

14 A. I was an electrician, but now I'm a foreman.

15 Q. What's the difference between an electrician
16 and a foreman?

17 A. I run a crew, so --

18 Q. Okay.

19 A. I'm there in the morning, do the tailboards,
20 you know, lay out what we're going to do for the day,
21 make sure everyone is safe, has their right tools, PPE,
22 stuff like that.

23 Q. Do you know a guy named (WITNESS #2)?

24 A. Yeah, I know him. He's in maintenance.

25 Q. What's the difference between your two
26 positions?

1 A. I believe their title is crew lead, if I'm not
2 mistaken. They just do maintenance. So they maintain
3 stuff on the powerhouse. We actually rip stuff out
4 that's, you know 50, 60 years old and rebuild it.

5 Q. Okay. Just trying to figure out the different
6 terms. You're a foreman?

7 A. Yeah.

8 Q. But, like you said, the crew lead, but you're
9 both basically in charge of a group of workers?

10 A. Well, I guess the difference is I get paid
11 more.

12 Q. That's what I was looking for.

13 A. GC is a different title. So he's title 200,
14 I'm title 300.

15 Q. What's GC?

16 A. General construction. So I travel. I'm not
17 just in one watershed either.

18 Q. Now, you only work on hydro?

19 A. Hydro only, yeah. Some substation stuff, but
20 it's within the hydro facilities.

21 Q. Do you remember November 8th, 2018?

22 A. Yep. Yeah, I do.

23 Q. Do you remember what you were doing that day?

24 A. Yes, I do.

25 Q. Tell us what you were doing.

26 A. So I got -- the plan was to get to the

1 powerhouse very early in the morning, I believe.

2 Q. Which powerhouse?

3 A. Cresta Powerhouse. We were currently working
4 there. So we had -- the powerhouse is fed off an
5 alternate source, which is 12 kV line. And there was a
6 chance that that may get shut off that day, so we went to
7 work at 3:30, roughly, 4:00 o'clock in the morning to set
8 up generators to -- if the powerhouse didn't have any
9 power, it can potentially flood inside if there's pumps
10 that pump the water out, keep everything going. So we
11 went there to set up for that. So that's how my day
12 started. Then it was very windy, obviously, so that made
13 things interesting.

14 Q. What do you mean by very windy?

15 A. Well, you can't really see in the pictures on
16 the paper, but from the videos that I took, that was just
17 -- the way we do everything, too, just the reason why we
18 have all these pictures is everything that we do every
19 day we document on a time card. And we basically show
20 our work for the day. And that's just the way that, that
21 GC hydro does their work. They can kind of track how
22 much jobs are going to cost, what, you know, the
23 challenges were.

24 Q. How do photographs help you to keep track?

25 A. So say you have a piece of equipment sitting
26 there, you know, like an exciter we say, or a

1 transformer. And you start by tearing that down, at the
2 end of the day, you can show how much progress you made.

3 Q. How do you know that you did it on that
4 particular day?

5 A. Because the time card gets sent in every day.

6 Q. But how do the photos help you to show that you
7 did it on that particular day?

8 A. They're attached to the time card.

9
10 (Exhibit 222 was marked for identification.)

11
12 Q. Okay. All right. I want to go on showing you
13 what's, exhibit that's marked as 222. Do you recognize
14 that, that guy in that picture?

15 A. Yeah. Yeah.

16 Q. Who is the guy in the picture?

17 A. That's me.

18 Q. Do you remember when that picture was taken?

19 A. November 8th.

20 Q. And do you remember who took that picture?

21 A. I don't. I didn't even know that picture was
22 taken of me, to be honest with you.

23 Q. What is that in the background?

24 A. Big fire.

25 Q. Did you realize at the time what it was?

26 A. No. I don't think anyone did, actually.

1 Q. Obviously.

2 A. Actually, before this even, this fire got this
3 big, I sent guys from my crew that actually lived in
4 Paradise so that they could go try to get their families
5 out.

6 Q. All right.

7 A. And they didn't realize what it was going to be
8 either until they got there.

9 Q. You had your camera with you, too, right, or
10 your phone?

11 A. Yep.

12 Q. And did you take photographs?

13 A. Yeah.

14 Q. Did you take videos?

15 A. Yep.

16

17 (Exhibit 209 was marked for identification.)

18

19 Q. Showing you what's marked as 209 up there, do
20 you recognize that?

21 A. Yeah. That's, that's like right until the
22 beginning roughly around 6:30 probably. I think we
23 called the fire in just before that.

24 Q. Who called the fire in?

25 A. I probably sent one of my guys, obviously.

26 Q. Do you remember who you sent?

1 A. No.

2 Q. Did you know (NAME REDACTED)?

3 A. Yeah, I did know him. Yeah.

4 Q. And was he one of your guys?

5 A. No, he's on maintenance. Yeah.

6 Q. All right. So do you remember shooting this

7 video?

8 A. Yep.

9 Q. What is all that background noise?

10 A. Wind.

11 Q. That wind is howling, isn't it?

12 A. Howling.

13 Q. And can you actually see the wind in your video

14 playing on the water?

15 A. Yeah. So that water is running downhill, but

16 it's actually so windy that it's blowing the current

17 upstream.

18 Q. Do you remember approximately what time you

19 took this video?

20 A. Judging by the size of the smoke, probably

21 right after 6:30, 6:40, somewhere in there.

22

23 (Exhibit 210 was marked for identification.)

24

25 Q. All right. Now, do you recognize 210?

26 A. Yeah.

1 Q. Another video?

2 A. Yeah. And that's, that's the fire starting to
3 come the direction of the wind.

4 Q. Do you know what time you shot this video?

5 A. Maybe 10, 10 or 15 minutes after the other one.

6 Q. What did you use to shoot these videos and
7 pictures?

8 A. Just an iPhone.

9 Q. Your own iPhone?

10 A. My personal.

11 Q. Do you still have the photos and videos on it?

12 A. Yes.

13 Q. Do you have the phone with you today?

14 A. No.

15 Q. Okay. Do you know how to check the metadata on
16 photos and videos on your camera?

17 A. For like the time stamp?

18 Q. Yes.

19 A. Actually, if you click the picture on iPhone,
20 it will tell you the time right there on it.

21

22 (Exhibit 211 was marked for identification.)

23

24 Q. Okay. All right. Number 211, this video, tell
25 me if you recognize -- or if this is another video you
26 shot.

1 A. Looks like it, I mean.

2 Q. Wind is still howling?

3 A. Yep. Didn't change.

4

5 (Exhibit 212 was marked for identification.)

6

7 Q. Go on to picture number 212.

8 A. So that's probably one of the first pictures

9 right there.

10 Q. One of the first pictures you took?

11 A. Yeah. Yep.

12 Q. You really can't see anything in the background

13 in this, can you?

14 A. It was very small. The fire was very small at

15 that point, yes.

16 Q. You can stand up and use the board if you want.

17 A. I'm good.

18 Q. Okay.

19 A. But, yeah, you can -- in the, right in the

20 bottom of that valley, you can see, and just a little bit

21 of smoke.

22 Q. Where I come from we call this a "saddle."

23 Right here in this saddle, is that what you're talking

24 about?

25 A. Yep.

26 Q. That's just where the fire is when the fire is

1 starting?

2 A. Yep.

3 Q. Later in the videos you see the fire running
4 right up that ridge?

5 A. Yes. Same direction as the wind. And that --
6 I'll stand up I guess. This area is actually pretty much
7 clear. I mean, it's a low, low grass area. It's
8 cleared. But the thing is once it got up into where the
9 trees are, it had all that fuel. And then that's --

10 Q. Okay.

11 A. Once it got up to there, that's when I sent all
12 my crew members that live in Paradise out.

13 Q. So --

14 A. Which that's also where our GC hydro yard was,
15 too, in Paradise.

16 Q. And that -- explain to us what the yard is.

17 A. It's no longer.

18 Q. No, but what was --

19 A. So it's our assembly point. It's a place where
20 we have all our tools, our trucks, everything. So --

21

22 (Exhibit 213 was marked for identification.)

23

24 Q. All right. Moving on to 213, recognize what's
25 depicted in that photograph?

26 A. Yep. Yep.

1 Q. What does this photograph show, 213?

2 A. That -- I mean, you can see the red, so that's
3 actually where it started to get into the trees, and the
4 flames started to get taller.

5
6 (Exhibit 214 was marked for identification.)

7
8 Q. 214?

9 A. Pretty much the same, with more smoke. Yeah.

10
11 (Exhibit 215 was marked for identification.)

12
13 Q. 215?

14 A. Same, same thing pretty much.

15 Q. You're just clicking pictures up there?

16 A. Yeah. So we were told to stay there. And
17 that's another thing to keep in mind, we were told to
18 stay there because we needed to have all the generators
19 hooked up and everything because we knew about this point
20 or maybe a little bit after this that this fire was going
21 to not -- obviously not going to be put out for a while
22 just because of the wind and the conditions. So we had
23 to make sure that -- I'm actually calling my supervisor
24 and sending him stuff, giving him updates on this. And
25 so we stayed there and basically until the power burned
26 out and then hooked up those generators and left.

1 Q. How long was that?
2 A. I don't even think we left until maybe after
3 10:00. 10:30 maybe, 10:15.
4 Q. That morning?
5 A. Yeah. Yep.
6 Q. And --
7 A. And we drove that way.
8 Q. You drove down the canyon?
9 A. Yep.
10
11 (Exhibit 216 was marked for identification.)
12
13 Q. And this is photo number 216. What can we see
14 here?
15 A. It's actually a lot more smoke. So getting
16 closer up this ridge.
17
18 (Exhibit 217 was marked for identification.)
19
20 Q. 217, if you can kind of narrate these.
21 A. A lot of it, just more smoke.
22
23 (Exhibit 218 was marked for identification.)
24
25 Q. 218?
26 A. So that, that photo that I said was the

1 beginning, this was like one of the last. And that's in
2 basically one hour --

3 Q. So from --

4 A. -- from that. From that.

5 Q. From 212 to 218?

6 A. That's about an hour. So that kind of gives
7 you -- and if you saw a fire that small in the beginning,
8 you would never think that it would look like that in one
9 hour. Nobody would. So --

10

11 (Exhibit 219 was marked for identification.)

12

13 Q. Then finally, 219?

14 A. Yep.

15 Q. And was this taken from the same vantage point?

16 A. No. So from the backside of the powerhouse
17 where the water goes through to the river is called the
18 tail race. So the tail race is actually around the
19 corner. This is up in the parking lot.

20 Q. Okay. And that's it. You took all those
21 photographs that morning as you were standing there
22 watching the fire?

23 A. Yep. Basically just waiting on instructions
24 what we were supposed to do.

25

26 EXAMINATION

1
2 BY MR. FOGG.

3 Q. (WITNESS #3), why did you send the Paradise
4 residents and your crew home?

5 A. So I sent, I sent them home because I also have
6 family members that live in Paradise, and they said they
7 could see the fire from the edge of the canyon where they
8 lived. So I knew that I needed to get them there.

9 MR. FOGG: Do any of the Grand Jurors have
10 questions for (WITNESS #3)?

11 MR. NOEL: Almost done. They get to ask you a
12 question or two.

13 (Counsel and Grand Jury Foreperson confer.)
14

15 EXAMINATION
16

17 BY MR. NOEL

18 Q. (WITNESS #3), one of the jurors asks, how did
19 you know the fire was burning towards Paradise?

20 A. Well, I might have answered that when we were
21 sending it up. So my wife's family lives in Paradise,
22 and they called her, she called me, and they said they
23 could already see the fire coming towards Paradise. So
24 that's why I made the call to send the guys out of there,
25 the ones that lived in that area.

26 Q. Did all your guys and their families make it

1 out safe?

2 A. They did.

3 Q. All your family make it out safe?

4 A. Yes.

5 MR. NOEL: Anything further?

6 That's all we have. She's going to have an
7 admonition and then you're going to be done.

8 THE WITNESS: Okay.

9 GRAND JURY FOREPERSON: (WITNESS #3), you are
10 admonished not to discuss or disclose at any time outside
11 of this jury room the questions that have been asked of
12 you or your answers until authorized by this Grand Jury
13 or the Court. A violation of these instructions on your
14 part may be the basis for a charge against you of
15 contempt of court. This does not preclude you from
16 discussing your legal rights with your own attorney.

17 (WITNESS #3), what I have just said is a
18 warning not to discuss this case with anyone except the
19 Court, your lawyer, or the district attorney. Do you
20 understand?

21 THE WITNESS: I understand.

22 GRAND JURY FOREPERSON: Okay. Thank you so
23 much.

24 MR. NOEL: Thank you, sir.

25 THE WITNESS: Thank you.

26 MR. NOEL: Thank you for being here.

[DISCUSSION OMITTED.]

(Lunch Break taken.)

GRAND JURY FOREPERSON: We're ready. All the jurors are present.

MS. RICHARDS: The People are now calling (WITNESS #14).

GRAND JURY FOREPERSON: (WITNESS #14), before you proceed, can you -- before you're seated, would you raise your right hand to be sworn, please.

(WITNESS #14)
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a seat, please.

EXAMINATION

BY MS. RICHARDS

Q. Good afternoon, (WITNESS #14).

A. Good afternoon.

Q. Can you please state your full name for the record.

1 A. (WITNESS #14).

2 Q. Do you also go by (WITNESS #14)?

3 A. Yes.

4 Q. And where do you currently work?

5 A. I work at PG&E in Redding, California.

6 Q. What is your current position with PG&E?

7 A. Lineman.

8 Q. And when did you first start to work for PG&E?

9 A. It will be February 4th, 2002.

10 Q. What was your first position with PG&E?

11 A. It would be utility worker.

12 Q. And, briefly, what did you do as a utility

13 worker?

14 A. Any kind of ground work; digging holes,

15 flagging, anything that wasn't in the air, labor work.

16 Q. Would you -- would it be fair to characterize

17 that as "unskilled labor"?

18 A. Yeah, I'd say.

19 Q. Okay. And what was your next job with PG&E?

20 A. An apprentice lineman.

21 Q. When did you begin as an apprentice lineman?

22 A. It would have to be around 2004, 2005, that

23 neighborhood.

24 Q. What kind of training did you have for your

25 working as an apprentice lineman?

26 A. It was a three-year apprenticeship and

1 on-the-job training.

2 Q. Okay. And during that apprenticeship, did you
3 have training on how to perform inspections?

4 A. No.

5 Q. How to perform -- or training on how to perform
6 overhead patrols?

7 A. No.

8 Q. And what was your next position with PG&E?

9 A. It would be journeyman lineman.

10 Q. Okay. When did you become a journeyman
11 lineman?

12 A. Offhand, I'd want to say '06, '07, right in
13 there. I don't know exactly, the exact year.

14 Q. And what division of PG&E did you work in when
15 you were a journeyman lineman?

16 A. General construction and then transmission
17 line.

18 Q. How long were you in general construction?

19 A. Oh, as a journeyman I'd say five years or so,
20 roughly. In that neighborhood.

21 Q. And what was your main duties in general
22 construction?

23 A. New construction of power lines; rebuilding,
24 replacing poles, towers, anything of that nature.

25 Q. Did you do inspections as part of general
26 construction?

1 A. No.

2 Q. And what was your next position within PG&E?

3 A. It would be journeyman lineman and transmission
4 line department, or grid.

5 Q. And approximately when did you become a
6 journeyman lineman in the transmission department?

7 A. It would have to be 2011, 2012, in that
8 neighborhood.

9 Q. Where were you located at that point?

10 A. Initially Eureka for one year, and then Table
11 Mountain in Oroville.

12 Q. And so approximately what, approximately what
13 year did you come to Table Mountain?

14 A. 2012, 2013.

15 Q. And what were your main duties as a lineman at
16 Table Mountain?

17 A. Any kind of maintenance on power lines;
18 energized work, insulator change out, just the whole
19 scope of line maintenance repair, replacing.

20 Q. Did you ever -- oh, actually let me ask you
21 another date question. When did you leave your position
22 as journeyman lineman at Table Mountain?

23 A. Oh, it would be, I want to say 2016.

24 Q. Okay. And is that the time when you went to
25 your current position?

26 A. Yes.

1 Q. So I'm going to ask you questions mostly about
2 your time at Table Mountain as a journeyman lineman
3 there.

4 A. Okay.

5 Q. During your time as a journeyman lineman, did
6 you ever perform any kind of inspections?

7 A. Yes.

8 Q. Okay. Did you have any additional training
9 when you became a transmission lineman on how to perform
10 detailed ground inspections?

11 A. No, not on the inspection aspect of it.

12 Q. Okay. Did you have any training regarding air
13 patrols?

14 A. No.

15 Q. Okay. Did you have any additional training, in
16 general, for transmission work when you came to work on
17 transmission lines?

18 A. It would be when I went to the T-man role. It
19 would be a switchman training, how to operate equipment.

20 Q. Okay. Is that related to how to turn on and
21 off lines?

22 A. Yes.

23 Q. Did you ever have any occasion at Table
24 Mountain to perform air patrols?

25 A. Yes.

26 Q. Okay. And were you, were you ever -- did you

1 ever take on the role of a troubleman?

2 A. Yes.

3 Q. Okay. What were the circumstances?

4 A. There was a, one of the troublemen was retiring
5 and one had retired, so I filled in on a temporary basis
6 as a transmission troubleman.

7 Q. And other than switching training, did you have
8 any additional training for that role?

9 A. No, just on the job.

10 Q. Okay. I'm going to ask you about air patrols.

11 Now, you said you conducted air patrols?

12 A. Yes.

13 Q. What kinds of problems were you taught to look
14 for during an air patrol?

15 A. During an air patrol would be a low-level
16 flight where we would look for any obvious problems with
17 the tower, with the lines, vegetation, anything of that
18 nature. Anything you could see from the air properly
19 with a helicopter.

20 Q. Can you give me some examples of the problems
21 you most commonly saw during an air patrol?

22 A. Most common on an air patrol would either be
23 conductor issues or -- actually, the most common would be
24 insulators, broken insulators, flashed insulators, things
25 of that nature.

26 Q. How close to the towers were you able to get

1 during an air patrol?

2 A. It was honestly as close as the ground
3 conditions and adjacent towers would allow you to get to
4 the structures you were looking at. You could get as
5 close to landing on top of them sometimes, or sometimes
6 you were a hundred feet plus above them.

7 Q. Are you familiar with the Caribou-Palermo 115
8 kV line?

9 A. Yes.

10 Q. Do you know approximately how many towers are
11 in the Caribou-Palermo 115 kV line?

12 A. Four- to five hundred.

13 Q. How long would you expect -- or how many hours
14 would you expect to spend patrolling a line of that size,
15 400 to 500 tower transmission line, like the
16 Caribou-Palermo line?

17 A. It would be a good solid full day of flying, an
18 eight-hour day I would say to really look at that one.

19 Q. How long would you be able to spend looking at
20 each tower?

21 A. There wasn't a time limit. If there was any
22 problems or anything suspect, they could take as much
23 time as needed. But on average, you, you're just looking
24 at each tower for a minute or two maybe.

25 Q. When you would perform an air patrol, for most
26 towers would you stop and hover or would you be able to

1 keep going at a slow pace?

2 A. It would be move at a very slow pace unless
3 there was something suspect, then I would have him hover,
4 use binoculars -- if I was too high above the structure
5 and couldn't see with the naked eye very good, I would
6 have them hover and use binoculars, get a better vantage
7 point, if possible.

8 Q. Okay. Did you ever perform ground inspections?

9 A. Yes.

10 Q. Okay. And, in your opinion, based on your time
11 at Table Mountain and also at Eureka, what is the
12 difference in your duties when you perform a ground
13 inspection as compared to an air patrol?

14 A. Ground inspection was more detailed looking at
15 the structures, the surrounding areas. You're on foot,
16 you're walking to each structure or driving, and then you
17 have to inspect the span of wire. It would be a more
18 detailed look at the structures. More time spent.

19 Q. Okay. And how much time on average would you
20 spend on a 115 -- 115 kV tower like the Caribou-Palermo
21 towers?

22 A. Not counting -- if -- a lot of it was
23 inaccessible -- not counting hiking, once you're at the
24 structure, you'd get a good five to seven minutes or so
25 actually just sitting there looking at things on the
26 tower.

1 Q. And you said that that time estimate doesn't
2 include getting to the towers. Are there any specific
3 considerations or any specific environmental conditions
4 that would make it hard to get to some towers --

5 A. Yes.

6 Q. -- on the Caribou-Palermo line?

7 A. Yes. The steep terrain, lack of roads,
8 vegetation. Just the location of it. And a lot of spots
9 made it more difficult, so that would take you some time
10 to get from tower to tower.

11 Q. Okay. And what were the most commonly found
12 problems for you during ground inspections?

13 A. Commonly found problems would be insulators
14 again. We would look at the footings on the towers, some
15 deterioration on that; the lower side of the insulators
16 that you could see from the ground, connectors, things of
17 that nature.

18 Q. Okay. And did you ever perform infrared
19 inspections?

20 A. Yes.

21 Q. Okay. Can you tell the Grand Jury what an
22 infrared inspection is.

23 A. It's a flight. We flew in the helicopter,
24 there was an infrared camera on the tin bubble of the
25 helicopter, and the contractor sitting in the backseat.
26 And it would give a heat signature of any hot spots in

1 the conductors, connectors, any point like that. The guy
2 would have a heat signature there. And if they were
3 suspect or there was a problem, then I would be there to
4 write the tag on it and make sure it got fixed.

5 Q. Did you, did you have any other role during the
6 infrared inspection?

7 A. No. No. Mainly I was a tour guide; show them
8 the lines, and then if they did find any problems, my
9 duty was to write a notification to get the problem
10 repaired.

11 Q. Would an infrared inspection usually take,
12 would an infrared inspection for a line like the
13 Caribou-Palermo line generally take more time, less time,
14 or the same amount of time as a routine air patrol?

15 A. It would take less time, because they could
16 move at a steady pace over the tower. He was looking
17 probably three or four towers ahead while he was doing
18 it. And we were at a higher level. Camera would pick up
19 the hot spots.

20 Q. Okay. And so I've asked you about air patrols,
21 ground inspections, infrared inspections. Did you ever
22 do any kind of climbing inspections?

23 A. No.

24 Q. Did you schedule your own patrols and
25 inspections?

26 A. No.

1 Q. Who scheduled those?

2 A. That would come from I believe the, I believe
3 the supervisor. Or they each had their own, they had
4 their own schedule based on their time between patrols,
5 but I was allotted them from the supervisor and the
6 clerk.

7 Q. Were you allotted a certain amount of time or
8 certain amount of days to perform a patrol?

9 A. Yes.

10 Q. And did you have the ability to decide to
11 substitute one type of patrol over another type of
12 patrol?

13 A. No.

14

15 (Exhibit 188 was marked for identification.)

16

17 Q. Okay. I'm going to show you Grand Jury Exhibit
18 No. 188. Can you see the exhibit behind you?

19 A. Yes.

20 Q. Okay. Do you recognize what this is a picture
21 of?

22 A. Yes. String of insulators.

23 Q. Okay. And can you tell where this picture was
24 taken from?

25 A. This one was either taken from the tower,
26 possibly a helicopter if it can get in low enough.

1 Q. Okay. And does this look like a string of
2 insulators that you would see on the Caribou-Palermo
3 line?

4 A. Yes.

5 Q. And I'm going to ask you just a few questions
6 about what you would call different parts of this. If
7 you -- I'm going to zoom in right here on the top of the
8 insulator.

9 A. Uh-huh.

10 Q. Do you see the curved piece that's hanging in
11 the hole?

12 A. Yes.

13 Q. What would you call the curved piece?

14 A. C hook.

15 Q. What would you call the hole that it's in?

16 A. Rigging eye. Rigging eye.

17 Q. Would you call this the hot end or the cold
18 end, or some other thing?

19 A. This would be the cold end.

20 Q. Why is it called the cold end?

21 A. Because the energized conductor is the hot end.
22 This is the part you can touch.

23 Q. All right. And do you see these hooks and eyes
24 regularly on the Caribou-Palermo line?

25 A. Yes.

26 Q. And do you see them regularly in your work just

1 on transmission towers?

2 A. Yes.

3 Q. In your experience, do the hooks come in very
4 many different sizes?

5 A. No. No. I think there's two different sizes,
6 but it's a pretty standard size. The difference would be
7 in the socket size actually on the insulator. But other
8 than that, no.

9 Q. And then in your experience do the eyes that
10 the hooks hang in come in a lot of different sizes?

11 A. Yes.

12 Q. Okay.

13 A. Depending on the towers, the strain they see,
14 the voltage; different variables.

15 Q. On the Caribou-Palermo, did you, in your
16 experience, did the eyes come in a lot of different sizes
17 on that particular line?

18 A. No.

19 Q. Okay.

20 A. It would be, roughly, the same.

21 Q. Okay. I'm going to have you look again at this
22 picture. And looking at that picture, do you see the gap
23 between the hook and the eye?

24 A. Yes.

25 Q. Okay. Can you tell us, can you tell anything
26 from that gap looking at the picture?

1 A. Looking at that picture, you can see there's
2 wear.

3 Q. Okay.

4 A. Either the hook or the eye is sitting lower
5 than would be normal.

6 Q. Okay. And how can you tell that?

7 A. The amount of space on the top side of that, of
8 that rigging eye.

9 Q. Have you ever seen wear like this during your
10 work at PG&E?

11 A. No, not to that extent.

12 Q. Okay. Could you have seen this wear during a
13 ground patrol?

14 A. You'd have a hard time seeing that wear during
15 a ground patrol.

16 Q. If somebody had told you to look for this type
17 of wear during a ground patrol and asked you to focus on
18 seeing this type of wear, do you think you would have
19 been able to look for it?

20 A. You'd have to climb the tower to really see it.
21 What you'd need to see there from the ground, it would be
22 very hard.

23 Q. Okay. And do you think you could see this type
24 of wear from a helicopter?

25 A. You could possibly see it if you could get in
26 close enough to catch it.

1 Q. Okay. Were you ever told to look for this type
2 of wear during any of your training, either formal
3 training or informal training?

4 A. Not specifically. I mean, it was part of what
5 we looked at, or we could try to see, but it wasn't a
6 specific thing I would say. It's more of an overview of
7 anything that can go wrong on the tower.

8 Q. So were you generally told to look for this
9 type of wear?

10 A. You're looking for that type of thing, yes, but
11 not really told to. I mean, that's just kind of the job.
12 So you're looking at the attachment points on the tower,
13 steel, down low, so you should be looking for something
14 like that. It's a matter of seeing it, though, would be
15 the hard part.

16 Q. Let's see, could you identify this type of
17 problem during an infrared patrol?

18 A. No. No, not during infrared.

19 Q. Why not?

20 A. You're flying too fast at too high of a level.

21 Q. Were you ever instructed on how to monitor wear
22 in attachment points --

23 A. No.

24 Q. -- during inspections?

25 A. No. Just do visual.

26 Q. And were you ever told, were you ever told that

1 there was a potential for these type of hook and eye
2 connection points to fail?

3 A. No, I was never told that there could be, there
4 could be wear. In my experience, though, I never saw any
5 kind of wear like this.

6 Q. Have you ever replaced an insulator string?

7 A. Yes.

8 Q. Okay. Can you tell me whether a hook would be
9 taken out of the eye when you replace an insulator
10 string?

11 A. Almost always.

12 Q. Okay.

13 A. Yes. If you're putting new insulators on
14 there, unless the hook looked good, most of the time,
15 almost 90 percent, we replace the hook and everything.

16 Q. When would you have an occasion to reuse the
17 hook?

18 A. If the hook wasn't damaged and if we didn't
19 have another one, which is almost never the case, and
20 only if the hook looked like it was -- you know -- didn't
21 have the wear, looked good.

22 Q. One moment.

23

24 (Exhibit 226 was marked for identification.)

25

26 Q. Okay. I'm going to show you a document, Grand

1 Jury Exhibit 226. First page. Do you recognize this
2 document?

3 A. Yes. That would be the cover page for the
4 patrol.

5 Q. What year was this patrol done?

6 A. 2015.

7 Q. All right. I'm going to turn now to page 3.

8 I'm going to zoom into the top corner. It says inspector
9 name (WITNESS #14). Is that you?

10 A. Yes.

11 Q. Okay. It says date completed, 7/20/15?

12 A. Yes.

13 Q. What date would that correspond to?

14 A. As far as?

15 Q. Well, let me ask you -- let me back up. Did
16 you complete this air patrol?

17 A. Yes.

18 Q. And is this handwriting yours in the, on the
19 form in front of you?

20 A. Yes.

21 Q. Okay. Did you fill out the date, date
22 inspection completed, 7/20/15?

23 A. Yes.

24 Q. Okay. What date would you use to fill in that
25 spot on the form? Would it be the date you started the
26 inspection or would it be the date that you finished

1 flying the tower?

2 A. The completion of everything, paperwork and all
3 tags.

4 Q. Okay. And can you tell me just a little bit
5 about how you would complete the patrol?

6 A. Oh, I would, I would fly the line, I would make
7 my notes, and then I would compare my notes to the prior
8 problems on that line, and then fill it out accordingly
9 in the office. And then write my notifications on the
10 problems that I found.

11 Q. So we're still looking at the Transmission Line
12 Inspection Data Sheet. And there's a box for inspection
13 findings data. Did you make any inspection -- did you
14 make any findings during this air patrol?

15 A. Yes.

16 Q. Okay. What did you find during this air
17 patrol?

18 A. That would be the three broken, three sets of
19 broken insulators there.

20 Q. Did you find anything else during this air
21 patrol?

22 A. No.

23 Q. Okay. I'm going to go down to the next page.
24 Can you tell me what this sheet is on the next page?

25 A. This would be the priors. They call it the
26 "priors." This would be any problems that were already

1 previously found on this line.

2 Q. And where would the sheet come from? Did you
3 put together this, this chart of priors?

4 A. No, this was already put together and in the
5 patrol packet.

6 Q. Okay. And did you receive that -- who did you
7 receive that from?

8 A. From the clerk.

9 Q. Okay. And would you take this sheet up with
10 you when you were completing the air patrol?

11 A. No. No.

12 Q. Okay.

13 A. No.

14 Q. When would you get this sheet?

15 A. Oh, it was in the packet, but I would do my own
16 notes when I made a patrol. And I found that to be a
17 better way to do it, so that I didn't have a tendency to
18 just look at the priors, looking for new problems and
19 then compare them afterwards on what I found.

20 Q. Okay. And if you look at this sheet, do you
21 see dozens of priors listed on this sheet?

22 A. Yes.

23 Q. Okay. What, do you see one type of prior
24 repeated over and over again?

25 A. Yeah. I mean, that's a connector issue.

26 Q. Do you know what that refers to?

1 A. They, they were the connectors on the line.
2 They were a bolted-style connector which PG&E is wanting
3 to get away from. So they were wanting to go with a
4 press connector, fired wedge connector on all those
5 locations right there.

6 Q. Okay. All right. I'm going to take you down
7 to the transmission object list, and we're going to go
8 all the way down to page 45 of this document.

9 Okay. We're on page 45 of this exhibit. We're
10 on the Transmission Line Object List. It's actually page
11 39 of the object list. Do you recognize this document?

12 A. Yes.

13 Q. Okay. Is this something that you would use
14 during your air patrol?

15 A. Yes.

16 Q. Okay. What is it?

17 A. It's -- all it is is each location of each
18 tower, gives you tower number. And if you had any
19 findings, then you would note it completed no problems,
20 completed new findings, or preexisting, or not patrolled
21 in this cycle. So I filled out, which I did or found.

22 Q. Is there a space on this Transmission Line
23 Object List that corresponds to each steel tower?

24 A. Yes.

25 Q. And let me ask you, is the Caribou-Palermo line
26 predominately made up of towers or poles?

1 A. It's predominately lattice steel towers.

2 Q. And does an air patrol change depending on

3 whether you're inspecting steel towers or wood poles?

4 A. No.

5 Q. Okay. Why not?

6 A. The patrol criteria is the same. Wood poles --

7 let's see, so steel -- if you're looking at wood poles,

8 you'd see deterioration. You'd be looking for things of

9 that nature versus just insulators and obvious problems

10 that you could find on the steel.

11 Q. Okay.

12 A. If that makes sense.

13 Q. All right. Let me -- I'm going to ask you a

14 hypothetical question. If you were conducting a routine

15 air patrol and you came across a section of the line

16 where the transmission tower was no longer there, but

17 there was a wood pole there instead, what would you do?

18 Would you note that on your air patrol sheet?

19 A. I can't say that I would.

20 Q. Okay. And why?

21 A. I would inspect the structure the same.

22 Q. Okay. How would you go about inspecting the

23 structure?

24 A. I would inspect it like I was inspecting the

25 steel structure, but looking the poles over for

26 deterioration that I could see.

1 Q. Okay. And you said you don't think you would
2 note it on your Transmission Line Object List. Why is
3 that?

4 A. The ones in case were temporary. That's where
5 I would be with that, is a temporary construction.

6 Q. Okay. And then we talked earlier today; is
7 that right?

8 A. Uh-huh.

9 Q. Okay. And I showed -- and did we talk about
10 this Transmission Line Object --

11 A. Yes.

12 Q. -- List right here? And I asked you if you
13 recalled a time when some transmission towers on the
14 Caribou-Palermo line had been replaced by wood poles?

15 A. Yes.

16 Q. And do you recall that happening?

17 A. Yes.

18 Q. Okay. And were you a part of that?

19 A. Yes.

20 Q. Okay. And what was your role in replacing the
21 towers with the poles?

22 A. I was a lineman up there working on them. The
23 towers collapsed and did temporary wood poles get the
24 line back on.

25 Q. And are you familiar with the, which specific
26 poles were actually replaced?

1 A. As far as by number, not really.

2 Q. Okay. I'm going to point you towards tower
3 22/188. Oh, next page. All right. 22/188. Do you see
4 the entry for 22/188?

5 A. Yes.

6 Q. Okay. Can you tell what box you checked there?

7 A. "Preexisting condition" checked.

8 Q. Okay. I'm going to ask you to assume that that
9 box is one of, that box corresponds to 22/188, which was
10 one of the towers that was replaced by wood pole.

11 A. Yes.

12 Q. Do you know why, sitting here today, you would
13 have checked preexisting condition checked when this
14 lattice steel tower was no longer there?

15 A. Either I marked the box wrong or they actually
16 still used those same connectors when they swung the wire
17 over for the jumpers, which is possible due to the fact
18 they didn't, that's a different size wire and it's hard
19 to get connectors for. It would be one of those two
20 reasons.

21 Q. Okay. And sitting here today, do you know the
22 answer to that?

23 A. No. That was a few years ago now. Without
24 going up there, I wouldn't know offhand.

25 Q. Okay.

26 That will be the rest of the questions for me.

1 I have to leave for another court appearance. Mr. Fogg
2 is going to take over with a few more questions.

3 THE WITNESS: Okay.

4 MS. RICHARDS: Thank you.

5

6 EXAMINATION

7

8 BY MR. FOGG

9 Q. Afternoon, (WITNESS #14). What's a three-bolt
10 connector?

11 A. A three-bolt connector?

12 Q. Yeah.

13 A. It is -- so it's a two-piece connector with two
14 grooves on one side, two grooves on the other, and it
15 goes on and sandwiches the conductors. So if you have a
16 main conductor running, you want to run a jumper to it,
17 it will sandwich that together. And it tightens with
18 three bolts down on the bottom.

19 Q. Have you ever replaced a three-bolt connector
20 on 115 kV line?

21 A. Yes.

22 Q. How long does it take from when you first get
23 to the tower, you're standing at the base of it, to when
24 you're all done replacing the three-bolt connector? How
25 long does that take?

26 A. Shoot, the base of the tower on up, get the

1 connectors, it could take anywhere from two to four hours
2 by the time you get the ladders and everything up there
3 to do them.

4 Q. So on a line like the Caribou-Palermo where the
5 terrain is pretty hilly --

6 A. Yes.

7 Q. -- how many three-bolt connectors could a crew
8 replace in a day, approximately?

9 A. That would be hard to say. If they're using a
10 helicopter, if they were using a helicopter maybe four
11 towers' worth or so.

12 Q. And how many guys do you need on a crew to
13 replace a three-bolt connector?

14 A. They would call for probably three.

15 Q. And to replace it do you actually have to climb
16 up the tower?

17 A. Yes.

18 Q. So if you're in a tower for a couple hours
19 replacing a three-bolt connector --

20 A. Uh-huh.

21 Q. -- do you do a climbing inspection at the same
22 time?

23 A. It wouldn't be a formal inspection. Things
24 would probably catch your eye, I would say.

25 Q. Were you formally trained by PG&E when you were
26 replacing a three-bolt connector to look at, inspect the

1 rest of the tower, or at least give it a look?

2 A. No formal training. It would be just kind of
3 a, what you would do on your own.

4

5 (Exhibit 191 was marked for identification.)

6

7 Q. I want to switch now to Grand Jury Exhibit 191.
8 Okay. Before I show you 191, you've testified earlier
9 that to find some of the wear in C hook you need to do
10 climbing and such? I apologize for re-covering some
11 ground again, but why would you need a climbing
12 inspection to see that, this wear on a C hook?

13 A. Just a better vantage point. The whole thing
14 is you're looking at maybe an inch hole, inch and a
15 quarter hole with another piece of metal that's maybe 7/8
16 of an inch or so going through it. With a naked eye from
17 the ground, even with binoculars, it would be hard to
18 see.

19 Q. I want to show you now Grand Jury Exhibit 191.
20 What's in Grand Jury Exhibit 191?

21 A. This would be a C hook in the cold end
22 suspension on the tower.

23 Q. From that image can you tell anything about
24 whether the C hook or the eye is worn?

25 A. There's definite wear.

26 Q. What vantage point would you need to have to

1 take a picture like Grand Jury Exhibit 191?

2 A. That would be, you'd have to be in the tower
3 for that one.

4 Q. So you couldn't get this picture from a ground
5 inspection?

6 A. Not a ground inspection, I would say, unless
7 you were at a hill right there where you were looking
8 directly at it.

9 Q. How about an air inspection?

10 A. That would even be a tough one on an air
11 inspection.

12 Q. Why would that be a tough one on an air
13 inspection?

14 A. If you could -- all depends how close you could
15 get the helicopter to it to really get in there and see
16 it, get a picture of it like that.

17 Q. When you say close, is that a function of both
18 how close and also what angle?

19 A. That, that's -- yeah, exactly. Because from
20 the ground, if you're looking at it from a ground angle,
21 the insulators are covering it up pretty good. So you'd
22 almost have to get a straight-on angle at it.

23 Q. (WITNESS #14), one more second to check my
24 outline and then we'll see if the Grand Jurors have any
25 questions after that.

26 Do you know how old the Caribou-Palermo line

1 is?

2 A. Hundred years, possibly.

3 Q. How do you know that?

4 A. Just from what I've heard. And then mainly --
5 mainly, from what I've heard, when it was built, it was
6 built with the railroad. And then that would be the main
7 way. We've taken insulators down, but they weren't quite
8 a hundred years back.

9 MR. FOGG: So to the Grand Jury, you've heard
10 me say this before, but when you have a hearsay statement
11 such as "I heard the line is a hundred years old," please
12 don't take that to prove that it's a hundred years old,
13 but you can take it to understand (WITNESS #14)' answers
14 to the next couple of questions I ask him.

15 Q. (By MR. FOGG) So, (WITNESS #14), how would the
16 age of the line change how you'd conduct an aerial
17 inspection of the Caribou-Palermo line?

18 A. I don't think it would.

19 Q. Why not?

20 A. You're supposed to look at everything kind of
21 the same. And I don't know if the age necessarily.
22 Terrain and environmental factors, but the age of the
23 line is still --

24 Q. We'll get to terrain, environment in just a
25 second.

26 A. Yeah.

1 Q. How would the age of the line affect how you
2 would climb the tower to do repairs on it?

3 A. In the case of this line right here, not so
4 much the age, but just the way the towers were built,
5 they were built, engineered right up, there's not a lot
6 of thick steel on them. So as you're rigging, your
7 moving conductors, changing weight or strains on them,
8 you have potential to collapse the tower. So you would
9 definitely be a little more cautious and make sure you,
10 your attachment points and rigging points and everything
11 were, were on the up and up for sure.

12 Q. Okay. Let's end now with my questions on
13 you've mentioned terrain and environmental factors. What
14 was the terrain like along the Caribou-Palermo line?

15 A. It's on the wall of the Feather River Canyon.

16 Q. How does, how does that terrain affect how you
17 conduct an air patrol?

18 A. As far as what I'm looking at or as far as what
19 I can see?

20 Q. Clarification. How does the terrain affect
21 what you can see in the line during an air patrol?

22 A. It has a pretty good affect on it. Depending
23 on how close I can get down due to hillside, adjacent
24 structures, things of that nature.

25 Q. So is it fair to say that the more constrained
26 or tight the area, the harder it is to get close in the

1 helicopter?

2 A. Yes. Yes. Definitely.

3 Q. What -- you've also mentioned environmental
4 factors on the Caribou line. What were those
5 environmental factors?

6 A. Just the area it was built in, pretty much
7 where it was. It's pretty steep and rugged country.

8 Q. (WITNESS #14), those are the questions I have
9 for you. I'll take a moment to consult my colleague.

10 And if any of the Grand Jurors have questions,
11 we'll ask you for those in a second.

12 (Counsel confer.)

13

14 EXAMINATION

15

16 BY MR. NOEL

17 Q. (WITNESS #14), my name is Marc Noel. I'm the
18 deputy DA.

19 A. All right. Good to meet you.

20 Q. Did you say that you worked on fixing the
21 Caribou-Palermo line after the 2012 collapse?

22 A. Yes.

23 Q. Do you remember how many towers collapsed?

24 A. I want to say -- I would say five or six, in
25 that neighborhood.

26 Q. Pretty major incident; correct?

1 A. Yes.

2 Q. And those were replaced by what?

3 A. At that point, it was temporary wood

4 structures. And the last that I had heard, they were

5 going back to steel structures on that section of line.

6 Q. Is there a name for the type of temporary

7 wooden structure?

8 A. It would be a wooden structure.

9 Q. The entire thing -- have you heard the term

10 "shoo-fly"?

11 A. Yes. And that's, that would be the temporary

12 part of it.

13 Q. Do you remember how many temporary wooden

14 structures replaced the five or six downed towers?

15 A. That would be five or six, maybe a couple more.

16 I'm not a hundred percent positive. That was a little

17 time ago.

18 Q. Okay. Are you familiar with the *Electric*

19 *Transmission Preventative Maintenance Manual* guide?

20 A. Yes.

21 Q. You've used it before?

22 A. Yes.

23 Q. Is it something that you're issued as a PG&E

24 lineman?

25 A. I don't think I have had issued it.

26 Q. Patrolman?

1 A. It was in our bull room.

2

3 (Exhibit 155 was marked for identification.)

4

5 Q. Showing you what's been marked as Exhibit No.
6 155, ask you to take a quick look at that and tell me if
7 you recognize it.

8 A. Okay. Yeah, I recognize that.

9 Q. Do you want to look through the inside? You
10 don't have to read it all, but --

11 A. Yeah, it's just a criteria, criteria on what
12 you're supposed to be looking at.

13 Q. That's the 2015 version of the *Electric*
14 *Transmission Preventive Maintenance Manual*; correct?

15 A. Yes.

16 Q. And PG&E issues, reissues that every so often
17 with updates; correct?

18 A. Yeah.

19 Q. Okay.

20 A. Revised.

21 Q. I want to flip to the pages marked, looking at
22 table 1. -- what is it, 1.3?

23 A. Table 13.

24 Q. Thirteen, I'm sorry. And the section of the
25 Caribou-Palermo line fell down in the winter of 2012;
26 correct?

1 A. Yes.

2 Q. And you were one of the guys who were up there
3 that replaced the metal structures with temporary wooden
4 poles in 2013 --

5 A. Yes.

6 Q. -- correct?

7 Now, this table defines the inspection
8 schedules for different types of transmission lines;
9 correct?

10 A. It does.

11 Q. And for a 115 line, for a wooden structure,
12 what is the inspection schedule?

13 A. Your frequency would be at two years.

14 Q. So detailed inspections every two years?

15 A. Two years.

16 Q. And you did the '15 inspection?

17 A. I did a '15 air patrol. I did not do a
18 detailed on that one.

19 Q. Are you aware of if anybody did a detailed
20 inspection?

21 A. I do believe so. I'm not aware of who, but I
22 did not have the detailed inspection in that line.

23 Q. But you did the air patrol?

24 A. Yes.

25 Q. So you don't have any idea who would have done
26 the detailed in '15?

1 A. No. Maybe (WITNESS #1). I'm not positive on
2 who. I know I didn't do it, that's all I know.

3 Q. Do you remember who were the troublemen at
4 Table Mountain in '15?

5 A. Yeah, I was a temporary troubleman, (WITNESS
6 #1), (WITNESS #11), (WITNESS #10).

7 Q. I think (WITNESS #1) testified -- he retired at
8 the end of the '14, so he wouldn't have been around, but
9 either (WITNESS #11) or (WITNESS #10) were also there?

10 A. It's possible.

11 Q. So there's a detailed inspection between one of
12 those guys?

13 A. It's possible. Or someone on the crew. I
14 can't recall that at this point. But I know that it
15 wasn't me.

16 Q. Okay. Thank you, sir.

17 A. All right.

18 MR. NOEL: That's all I have.

19 MR. FOGG: Do any of the Grand Jurors have
20 questions of (WITNESS #14)?

21 (WITNESS #14), the Grand Jurors write down
22 their questions, so we'll take a second, take a look at
23 those, and then ask you the questions.

24 (Counsel and Grand Jury Foreperson confer.)

25 MR. FOGG: Okay. (WITNESS #14), I have a few
26 follow-up questions from the Grand Jury.

1
2 EXAMINATION
3

4 BY MR. FOGG

5 Q. The first one is did you ever receive any
6 training about standards for the size of rigging eyes on
7 transmission towers?

8 A. No. There wouldn't be a formal training on
9 that, I don't believe. Size of rigging eyes?

10 Q. Yeah. The diameter of rigging eyes.

11 A. It would only be bigger on, how your 500 kV
12 lines and some of the bigger 230s, bigger conductors,
13 there would be a difference in the size.

14 Q. Did you ever receive any specific training from
15 PG&E about the size of a, what would be the proper size
16 of rigging eyes on a 115 line?

17 A. No. No normal training on that.

18 Q. How about did you ever receive any formal
19 training about how large a C hook should be?

20 A. No. No formal training on that.

21 Q. Did you ever receive any on-the-job training
22 about how big a rigging eye should be?

23 A. No. They're pretty standard size. We're
24 talking size from wear, or just their normal size?

25 Q. How they should be.

26 A. Oh, yeah. No. Deterioration would occur. It

1 would be obvious if there was deterioration in it.

2 Q. By that do you mean they would start as, the
3 holes would start as round?

4 A. Round, yes.

5 Q. Then become oblong --

6 A. Exactly.

7 Q. -- with more wear?

8 A. Exactly.

9 Q. You mentioned that when replacing an insulator
10 string you had, I think you said 90 percent of the time
11 you'd replace the C hook --

12 A. Yes.

13 Q. -- at the same time?

14 What would you do with the C hook once you took
15 it off the tower?

16 A. It either went in a grunt sack or got air
17 mailed off the tower.

18 Q. What is a grunt sack?

19 A. Just a bag that we put our tools in and, tools
20 and rigging in.

21 Q. You said "air mail." I take it there's not a
22 post office on the tower?

23 A. No.

24 Q. So just -- we got to put on the record what you
25 mean.

26 A. Thrown.

1 Q. I gotcha.

2 So if you replaced the C hook every time --
3 let's say you usually replaced the C hook when you
4 replaced the insulator string. How often would the
5 rigging eye be replaced?

6 A. Only if it was, seemed to be elongated, then
7 you would write a tag on that and tower department would
8 come put a new arm tip or put new re-rigging steel out
9 there on the tower itself.

10 MR. FOGG: Do the Grand Jurors have any other
11 questions?

12 Seeing none, (WITNESS #14), we have no further
13 questions for you.

14 Madam Foreperson will have an admonition for
15 you before you leave.

16 THE WITNESS: Okay.

17 GRAND JURY FOREPERSON: (WITNESS #14), you are
18 admonished not to discuss or disclose at any time outside
19 of this jury room the questions that have been asked of
20 you or your answers until authorized by the Grand Jury or
21 the Court. A violation of these instructions on your
22 part may be the basis for a charge against you of
23 contempt of court. This does not preclude you from
24 discussing your legal rights with your own attorney.

25 (WITNESS #14), what I have just said is a
26 warning not to discuss the case with anyone except the

1 Court, your lawyer, or the district attorney. Do you
2 understand?

3 THE WITNESS: Yes.

4 GRAND JURY FOREPERSON: Okay. Thank you for
5 your time.

6 MR. FOGG: Madam Foreperson, we have one
7 witness left, (WITNESS #10), who will be a similar
8 witness to what we just heard from (WITNESS #14). Does
9 the Grand Jury need a break before we continue with
10 (WITNESS #10)?

11 GRAND JURY FOREPERSON: Need a break?

12 We're good.

13 MR. FOGG: Well, Madam Foreperson, the People
14 would call (WITNESS #10) to the stand, please.

15 GRAND JURY FOREPERSON: (WITNESS #10), would
16 you raise your right hand, please.

17

18 (WITNESS #10)

19 having been called as a witness in
20 the matter now pending, having been first
21 duly sworn, testifies as follows:

22

23 THE WITNESS: Yes.

24 GRAND JURY FOREPERSON: Thank you. Have a
25 seat, please.

26

EXAMINATION

BY MR. FOGG

Q. Now, (WITNESS #10), before we begin, I know you're represented by an attorney. If at any point you feel like you need to consult your attorney, please say so and the Grand Jury, at the Grand Jury's discretion, will allow you a reasonable break to do so. Do you understand?

A. Yep.

Q. (WITNESS #10), can you please state your full name and spell your last name, please.

A. (WITNESS #10), (SPELLING REDACTED).

Q. (WITNESS #10), where do you work?

A. PG&E.

Q. How long have you worked for PG&E?

A. Thirty-six years.

Q. And what, what did you do when you first started working for PG&E?

A. I was a second faller. Trimmed trees for new right-of-ways and stuff.

Q. How long, about how long were you a second faller?

A. Little less than six months.

Q. What did you do after that?

A. Became an apprentice lineman.

1 Q. Is that a three-year apprenticeship?

2 A. Yes.

3 Q. During that apprenticeship, did you receive any

4 training in how to inspect transmission lines?

5 A. No. That was no part of that.

6 Q. So after the apprenticeship, what did you do

7 next?

8 A. I became a lineman and --

9 Q. What, were you a lineman working transmission

10 or distribution?

11 A. Little bit of everything.

12 Q. Did that unit you were in have a specific name?

13 A. Yeah, General Construction.

14 Q. And how long were you with General

15 Construction?

16 A. For 19 years.

17 Q. I want to show you now on the -- before I do, I

18 have one other question. We'll finish up your

19 experience, the rest of it in a minute, but while we're

20 on general construction, I wanted to run through a few

21 questions about it.

22 A. Okay.

23 Q. Before we do, what's the cold end attachment

24 point on a 115 steel transmission tower?

25 A. That's where it connects the top bell to the

26 tower itself.

1 Q. So on the screen behind you, (WITNESS #10), is
2 Grand Jury Exhibit 188. Can you tell us what's depicted
3 in that image?

4 A. Yeah. Looks like a jumper string, with a C
5 hook and eye in the steel and jumper going across from
6 the arm from the tower.

7 Q. Is there a cold end attachment point in that
8 image?

9 A. Yeah. It would be the C hook.

10 Q. Okay. And what's the name of the hole in that
11 arm that the C hook is going through?

12 A. Sometimes they call it "rigging eye," sometimes
13 we just call it "attachment point."

14 Q. Okay. So when you were in General
15 Construction, what did the General Construction Unit do?

16 A. We did all the overflow work that the local
17 crews couldn't handle. So we'd travel all over the north
18 part of the state mostly, and once in a while down to the
19 Bay Area every few years to help them down there.

20 Q. Would you do repairs on transmission lines?

21 A. We'd do repairs, we would string new wire in,
22 we would do whatever it took.

23 Q. So when in General Construction did you ever
24 replace an insulator string?

25 A. Oh, yeah.

26 Q. And when you replaced insulator string that was

1 attached by a C hook like in Exhibit 188 --

2 A. Uh-huh.

3 Q. -- what would you do with the C hook?

4 A. Most of the time we threw them away, put new
5 ones in, but sometimes we'd use the old one again because
6 it just, they weren't wore out or anything. We'd just
7 use them again sometimes, depending on how handy the new
8 ones were. If we had some right there with us, we'd put
9 a new one in, but sometimes you just don't have new ones
10 with you that day or forgot to spot one or something, so
11 just use the old ones.

12 Q. Did you ever receive any formal training from
13 PG&E about how to gauge whether or not a C hook could be
14 reused?

15 A. No. We'd just look at them and see if there's
16 any wear or anything on them.

17 Q. Would you be able to estimate for me what
18 percentage of the time you reused the C hook when
19 replacing an insulator string?

20 A. Yeah. Just guessing, 5 percent of the time
21 maybe.

22 Q. Okay.

23 A. Most of the time we had new ones, but once in a
24 great while we'd just use the old one.

25 Q. Five percent of the time you reused the C hook,
26 rest of the time you'd replace a new one?

1 A. Yeah.

2 Q. How about -- I want to turn now to three-bolt
3 connectors. When you were working general construction,
4 did you ever replace three-bolt connectors?

5 A. Yeah, all the time. That's what we used for
6 connectors at that time.

7 Q. On 115 kV line, a steel lattice tower, how long
8 would it take to replace a three-bolt connector?

9 A. It depends on where it is. I mean, sometimes
10 you could reach it right from the tower; other times you
11 had to hang ladders and do different work to get out
12 there to reach the connectors. So the connector itself
13 is just, you know, five minutes.

14 Q. So it would be how long it would take you to
15 get to the connector?

16 A. Yeah. That would be the most of the time. So
17 if you had to hang a ladder and doing all the ropes, you
18 know, would take a half hour or so to get a ladder and
19 get it ready.

20 Q. Standing on the ground below the tower to start
21 the job, all the way to standing on the ground and you're
22 done with the job, how long would it take to replace a
23 three-bolt connector in the best possible situation as
24 fast as you can?

25 A. Depends on how many they were and where they
26 were on the towers and everything. But if you had a

1 double dead end and you had to replace connectors on both
2 sides of the tower and stuff, it could take a couple
3 hours.

4 Q. How about the worst case scenario, where you
5 have to use ropes and the connector is hard to get to,
6 how much longer would it take from beginning to end of
7 that project?

8 A. It could take an extra hour, hour and a half.

9 Q. To change an insulator string like what's
10 depicted in Exhibit 188 or change a three-bolt connector,
11 would you have to climb up the tower to do so?

12 A. Yeah.

13 Q. Did you receive any training for -- let me ask
14 that question differently.

15 When you're up on a tower doing repair work,
16 did you inspect the rest of the tower while you were up
17 there?

18 A. You look at stuff. I mean, you don't want to
19 be walking out on some of the steel and have the bolts
20 missing out of it and stand on it or something. But
21 yeah.

22 Q. Were you trained by PG&E to do any sort of
23 formal inspection while you were doing a repair job on a
24 tower?

25 A. No, it was just a safety inspection for what
26 you were doing. And depending on what you were doing,

1 whether you were unloading or loading a tower, taking
2 wire off or out of it, you'd look at it a little bit more
3 closely to make sure it wasn't going to collapse on you,
4 make sure all the bolts were in it and stuff.

5 Q. If you were on a tower doing a repair job and
6 you saw something that you know was broken, would you
7 report it?

8 A. Well, if we knew it was broken, we'd fix it
9 right there.

10 Q. I want to now move past General Construction.
11 You said you were in the General Construction about 19
12 years?

13 A. Yeah.

14 Q. What did you do in PG&E after you left General
15 Construction?

16 A. I bid into Table Mountain yard there for doing
17 transmission line maintenance.

18 Q. You were a lineman at Table Mountain?

19 A. Yeah.

20 Q. How long were you a lineman at Table Mountain?

21 A. I don't know. It's hard for me to remember. I
22 was running a crew most of the time as soon as I got in
23 there. But yeah, I think I was a lineman probably three
24 or four years maybe before I took the job permanent. I'm
25 just guessing; I don't remember the certain dates.

26 Q. What job did you take after you were a lineman

1 at Table Mountain?

2 A. Took the crew foreman job.

3 Q. After the crew foreman job?

4 A. I went and did some work for a while as a
5 T-man, patrolman.

6 Q. When say a "T-man," you mean troubleman?

7 A. Yeah.

8 Q. That's at Table Mountain?

9 A. Yeah.

10 Q. How long were you a troubleman at Table
11 Mountain?

12 A. Between two and three years.

13 Q. Were there a specific group of lines that you
14 were charged with inspecting or focusing your inspections
15 on?

16 A. Yeah, I worked up north. I had a little office
17 kind of up in Redding, and I did most of the Burney area,
18 up in that area.

19 Q. So that doesn't include Feather River Canyon?

20 A. No.

21 Q. When you became a troubleman, did you receive
22 any new training from PG&E about how to conduct
23 inspections of transmission lines?

24 A. No, not really. Most of what we did was just
25 went off our experience, what we'd been doing our whole
26 career, and what we'd been fixing working there, so we

1 knew what was the actual problem and what wasn't.

2 Q. I want to ask you a couple questions now about
3 air patrols. In real quick summary, what is an air
4 patrol?

5 A. That's out of a helicopter. We inspect the
6 lines from the helicopter.

7 Q. What are you looking for on the lines during an
8 air patrol?

9 A. We're looking for anything that could cause us
10 trouble. It's a pretty quick patrol there. Air patrols
11 are a lot faster than a ground patrol, so you're looking
12 for major items that -- maybe trees hanging over the,
13 that can fall on the line, maybe flashed insulators, and
14 stuff like that. Most of the stuff is going to be pretty
15 obvious if you're -- but that's the best way you can see,
16 on a air patrol, is flashed insulators and stuff because
17 you cannot see that from the ground.

18 Q. Why can't you see a flashed insulator from the
19 ground?

20 A. The top of those insulators -- you can see the
21 top of the glass comes down.

22 Q. You're now pointing at Grand Jury Exhibit 188?

23 A. Yeah. You can see big white marks where
24 lightning or something had hit those bells. And you can
25 only see that from the air. You can't see the top of the
26 insulators from the ground.

1 Q. So you'd commonly see flashed insulators during
2 air patrols?

3 A. Yes.

4 Q. About, about how much time would you be able to
5 spend looking at each tower during an air patrol?

6 A. You're moving along, just guessing, between,
7 anywhere between 20 to 40 miles an hour, and you're just
8 watching the towers as you're going by. You're not
9 stopping at the towers or anything like that.

10 Q. So would you be able to estimate for me
11 approximately how much time you can spend on each tower?

12 A. Yeah. As you're coming up to it, once you've
13 been doing it for quite a while, you can see stuff that
14 doesn't look right real quick. So when you're coming up
15 to a tower, you're watching it, you're looking at all the
16 insulators, then it goes by, and you look at it as you go
17 by it. So you're looking at probably, probably 20, 20
18 seconds or so you're getting the whole look of the whole
19 tower. And then if you see something wrong, then you
20 stop and you hover, you circle around until you can get a
21 structure number, and you get some pictures of what you
22 found that was wrong, and then you go on again.

23 Q. Did you feel like you had enough time to --
24 well, let me ask that question differently.

25 When you were assigned air patrols, did you
26 feel like the company gave you enough time to complete

1 them?

2 A. Yeah. We could fly slower if we wanted to, you
3 know, but that was just how much time with your
4 experience and stuff of looking, how much time you
5 thought it took to get a good look at each tower when
6 you're going by. So, yeah, I never, I was never told
7 that I was flying too slow or nothing like that.

8 Q. So if you had 115 kV line that, let's say it's
9 400 structures, can you give me an estimate how long it
10 would take to do an air patrol of that whole line?

11 A. Like I said, depending on where it was and how
12 fast you could fly, you know, but, you know, 400
13 structures, you could do that in four hours or so, maybe
14 five.

15 Q. During an air patrol, how well could you see a
16 cold end attachment point like the image depicted in
17 Grand Jury Exhibit 188?

18 A. A lot of times you couldn't. Because if you
19 look at that picture, above that C hook you got a flat
20 piece of steel there, and you're up above stuff, so most
21 of the time you can't see the C hooks from an air patrol.
22 And a lot of the towers aren't like they are down here in
23 the valley where you can fly alongside them more and get
24 a sideways picture. You're up there, and then the towers
25 are going down in between trees, and you're straight up
26 above them, so it's a little bit harder to see. So very

1 rarely could you get a real good look at the cold end.

2 Q. And is Grand Jury Exhibit 188 an angle that you
3 would typically get during an aerial inspection?

4 A. No, not at all.

5 Q. Where would the helicopter typically be
6 relative to a transmission tower during an air patrol?

7 A. You'd be up above it. And say if you are
8 looking at the clock, depending on what side of the
9 helicopter you're sitting in, but you'd probably be up at
10 like 10:00 o'clock or 2:00 o'clock above the tower, off
11 to the side just a little bit like that. So you can get
12 a pretty good look at the whole tower as you're going by.

13 Q. Okay. I want to shift gears now and go to
14 ground patrols. Just in real just generic summary, what
15 is a ground -- let me ask that question differently.

16 What's a ground inspection?

17 A. We call that a detail inspections. And we
18 would go to each tower on the ground. And on poles we
19 would, you know, take a good look at them, beat on them
20 with a hammer, make sure they weren't too rotten and
21 stuff. And just take it, take a look at the whole, whole
22 structures. And anywhere we could walk around, check any
23 down guides, making sure they're tight, and making sure
24 they have all the equipment on they're supposed to have.

25 Q. So for a detailed inspection on a -- you
26 mentioned poles there. Is that also true for towers?

1 A. Yes.

2 Q. How much -- what would you be looking for on a
3 transmission tower, on a 115 transmission tower, during a
4 detailed inspection?

5 A. You'd be looking at the steel going up the
6 tower, you know, just like if you're going to go work on
7 it, looking if anything's loose or anything. Be looking
8 at the footings, making sure the footings were all in
9 good shape. Be looking at the conductor, make sure the
10 conductor's in good shape going into the shoes. A lot of
11 stuff we'd see on the detailed patrol would be like the
12 dampers on the line, making sure they were all in good
13 shape. Looking for pins loose on the hot end of the
14 attachment to the bells. And so you could see most of
15 that stuff pretty well from the ground.

16 Q. You just mentioned a dampener or damper?

17 A. Yes.

18 Q. What is that?

19 A. That is a, it's a weight that hangs out just
20 outside the attachment where the conductor attaches to
21 the tower. And it reduces the vibration on the wire that
22 comes into the shoe so that the tower and the hot end
23 hardware doesn't see as much vibration. Because
24 vibration is bad with wire and stuff, and it will wear it
25 out pretty quick. So those dampers, when they get wore
26 out, the weights start to hang down like a 45-degree

1 angle and stuff, so it's time to change them.

2 Q. What would cause that vibration you just
3 described?

4 A. Wind and stuff on the conductor.

5 Q. Back to the detailed inspections, how much time
6 would you spend on average per tower in a detailed
7 inspection?

8 A. On an average, probably four or five minutes is
9 all probably.

10 Q. Did you feel like the company gave you enough
11 time to complete the detailed inspection?

12 A. Yeah, I think so. I mean, I never, I never --
13 all those patrols have times on them for how many man
14 hours that that patrol should take and stuff, but I never
15 really worried about that much, I just did what I thought
16 was the good patrol and they were just going to have to
17 live with it at that point. I always thought that if you
18 wanted to get a good idea how long a patrol was supposed
19 to take, you could take the last four or five times I
20 patrolled that line and just see how much time it took
21 and then divide it, and you'd have an accurate depiction
22 on how much time that patrol takes, which I always
23 thought would be a better way to do it than just giving
24 you a certain amount of time per structure, because you
25 don't know how long it takes to get to -- some structures
26 it takes two hours to walk to.

1 Q. And is that a function of the lines up in the
2 mountains as opposed to being in the valley?

3 A. Yeah.

4 Q. How long would it take -- well, I'll ask you to
5 give an estimate. About how long would it take to do a
6 detailed inspection of 115 kV line of steel lattice
7 towers that had about 400 structures, and as I'm --
8 mountainous terrain?

9 A. It could take as much as a month.

10 Q. What's the difference in what you're -- well,
11 comparing an air patrol to a detailed inspection, how do
12 they differ in what you're looking for during the patrol
13 or the inspection?

14 A. When you're doing a detail patrol, or a ground
15 patrol, you're looking at a lot more stuff. If you're
16 doing an air patrol, you're looking at major stuff that's
17 going to cause us a problem pretty quick. On a detailed
18 patrol, you can spend more time walking around a
19 structure and really looking for stuff that would cause
20 us a problem instead of just looking for quick stuff.

21 Q. Did you ever climb a structure during a
22 detailed inspection?

23 A. Yeah, I have. If I seen something like a
24 bird's nest or something and I thought might have been a
25 problem, or if I saw something on an insulator I didn't
26 like, I've climbed it.

1 Q. What do you mean when you said something on an
2 insulator you don't like, what do you mean by that?

3 A. Well, sometimes you can see the edge of an
4 insulator from the ground, if you can get up on the side
5 hill a little bit, and might have a big white mark on it,
6 you're not sure if it's a flash from lightning or if it's
7 just bird dirt. So a lot of times it's better you just
8 run up there, take a quick look at it, and make sure
9 before you write a tag and send a crew out there to
10 change a bell that's bird dirt. So that's a little
11 embarrassing.

12 Q. So I wanted to go back to Grand Jury Exhibit
13 188 now. Just to use 188 as a reference, how well could
14 you check a cold end attachment point, like what's in the
15 188, during a detailed inspection?

16 A. Not very well. Not unless you could get right
17 at the right angle and could see it. Because if you were
18 right below that, the insulator would be in the way. So
19 you can get off to the side sometimes and see that, but
20 you know, not great.

21 Q. Did you ever receive any formal training -- no,
22 let me ask that question differently.

23 Did anyone in the company ever tell you to
24 specifically look at cold end attachment points during
25 detailed inspections?

26 A. Not that I remember.

1 Q. Hypothetically, if you were told to look at a
2 cold end attachment point during a detailed inspection,
3 would you have been able to, generally, without climbing
4 the tower?

5 A. Probably not.

6 Q. Why not?

7 A. Just because the angle you'd have to get at to
8 see it, depending on where it was and how the bells would
9 be in the way. I mean, like you'd see -- if this tower
10 here was on a side hill, you could walk up that side hill
11 and get almost straight across from it and see it. But
12 if you're out in the flats or something like that, you're
13 not going to be able to see it.

14 Q. So if you, if you had to see the cold end
15 attachment point, let's assume you're told you have to do
16 that, what kind of inspection would you need to do?

17 A. Probably have to do a climbing inspection if
18 you're going to look at all the cold end hardware.

19

20 (Exhibit 38 was marked for identification.)

21

22 Q. I want to shift now to Grand Jury Exhibit 38.

23 Now, (WITNESS #10), Grand Jury 38 is on the
24 board behind you. Can you tell me what's in that image?

25 A. Yeah, looks like someone's put an extra rigging
26 eye up there for I don't know.

1 Q. In your experience in PG&E, how often would you
2 see an extra rigging eye added to the arm of a tower like
3 that?

4 A. Never.

5 Q. (WITNESS #10), do you know how old the
6 Caribou-Palermo line is?

7 A. Not exactly. I know it's close to a hundred
8 years.

9 Q. How do you know it's close to a hundred years?

10 A. Because of, I knew where it went to. That line
11 actually went all the way to the Bay Area at one time.

12 Q. How would the age of the -- would the age of
13 the line affect how you would climb the towers and the
14 line to do repairs?

15 A. Yeah. Those towers are pretty old, so they
16 don't have a lot of the safe working factor on them like
17 our new towers do. So we had to watch when we climbed
18 them and how we rigged on them and stuff, so we didn't
19 add extra weight to them, because just the conductor
20 weight alone on them was pretty much at their weight
21 limit.

22 Q. When you say "these towers," are you referring
23 to the Caribou-Palermo line?

24 A. Correct.

25 Q. All right. (WITNESS #10), I want to go back to
26 Grand Jury Exhibit 188 one last time. Now, see it on the

1 screen behind you? The cold end attachment point that
2 I've highlighted from that image, can you tell us
3 anything about whether or not the C hook or the rigging
4 eye might be worn?

5 A. Yeah, now that we know about it, you might be
6 able to see this more, but --

7 Q. But just from the picture, looking at just this
8 image?

9 A. No, the holes are different sizes on the
10 towers and stuff, so even though you can see light
11 through, that doesn't necessarily mean that it's really
12 wore.

13 Q. Did you -- have you ever received any training
14 from PG&E about what the diameter of those rigging eyes
15 should be on a transmission tower?

16 A. No.

17 Q. But the rigging eyes should all be round;
18 right?

19 A. Yeah.

20 Q. But you're telling me also that different
21 towers could have different sized eyes?

22 A. Right.

23 Q. How about the C hooks, are the C hooks all
24 about the same size?

25 A. Yeah.

26 Q. So I want to jump now to Grand Jury Exhibit 19

1 -- 191. Can you tell me what's depicted in Grand Jury
2 Exhibit 191?

3 A. Yeah, that, that C hook is definitely worn
4 pretty good. Or the tower. I can't really tell which
5 one it is.

6 Q. Why do you say that the C hook or tower
7 depicted in Grand Jury Exhibit 191 is worn?

8 A. Because you can see the diameter of the hole
9 is, isn't really round anymore.

10 Q. To get a vantage point like what's depicted in
11 this image, what would you need, what type of inspection
12 would you need to do?

13 A. You'd have to be on the tower or a drone or
14 something where you can see it.

15 Q. But you're not going to get this image of a
16 ground inspection or helicopter inspection?

17 A. No.

18 Q. I want to end now, or at least my questioning,
19 (WITNESS #10), on Grand Jury Exhibit 178. Can you tell
20 us what's in this, this image?

21 A. Yeah, it's a C hook with a wear mark right in
22 the center of the hook.

23 Q. In your time at PG&E, had you ever seen a C
24 hook with that type of wear?

25 A. No.

26 Q. If you saw a C hook, if you encountered a C

1 hook like this with that kind of wear during your work,
2 what would you do with it?

3 A. Not only ought to change it out, but I would
4 get in touch with some of the engineers and stuff and
5 have them check the other towers that were like this and
6 see if there was something messed up.

7 Q. (WITNESS #10), now I'll need a moment to check
8 with my colleagues, if they have any questions, then I'll
9 ask the Grand Jurors if they have any questions.

10 MR. NOEL: I've got a few things. If I could
11 have just a second, I'm trying to find one thing in
12 particular.

13 MR. FOGG: Do any of the Grand -- while
14 Mr. Noel is taking a look at the document, do any of the
15 Grand Jurors have questions for (WITNESS #10)?

16 Madam Foreperson, may we approach?

17 (Counsel and Madam Foreperson confer.)

18 Q. (By MR. FOGG) All right. (WITNESS #10), I
19 apologize for the delay.

20 A. No problem.

21 Q. The Grand Jurors did point out to me that I
22 missed a topic. I know they're on top of it. Before I
23 get to this other topic, I have a clean-up question,
24 something I already asked you about.

25 Why would a transmission tower have, why would
26 they have different sized rigging eyes if the C hooks are

1 all a pre-uniformed size?

2 A. I don't know. Some of the, some of the towers
3 have different attachment points. Some of them don't use
4 C hooks. Some of them use like a Y ball. You can get
5 away with a little bit smaller hole with a Y ball,
6 because it has a pin that slides through the hole in the
7 tower instead of just that hook. I have just seen
8 different sizes on different towers. It could be
9 manufactures who manufacture the towers put different
10 sizes in them. I don't know the whole reason.

11 Q. Okay. Where were you working in 2012?

12 A. 2012, I was in Table Mountain.

13 Q. Do you recall around the end of 2012 or 2013
14 any towers falling down because of a landslide?

15 A. I don't remember for sure. I know somewhere
16 around that time some towers on the Caribou-Palermo fell,
17 but I wasn't really on that job. I think we were, we
18 were working something else at the time and some of the
19 GC crews went and handled it. So I wasn't really
20 involved in it too much.

21 Q. So I want to show you what has been marked
22 Grand Jury Exhibit 226. We'll start at the top and work
23 our way through this real quick.

24 What's a Transmission Line Object List?

25 A. That's what we take on our patrol and we mark,
26 mark those at each location we come to whether we found

1 no problems or --

2 Q. Okay. And now you see the name in the upper
3 right corner is (WITNESS #14). Are you (WITNESS #14)?

4 A. No.

5 Q. But do you recognize this type of form even if
6 you don't recognize this exact footage?

7 A. Oh, yeah.

8 Q. I want to take just an example of a couple and
9 ask you a hypothetical question.

10 So if we're, just for the sake of this whole
11 context here, we see one -- I'm looking at page -- sorry
12 -- page 49 of Exhibit 226. It says, one row says 25,
13 slash, 210. What does that mean?

14 A. That is the structure number; 25 miles out from
15 the, from the feed and 210th tower.

16 Q. Then below it says 25/211, what does that mean?

17 A. That's the next tower.

18 Q. So is it fair to say that each column in this
19 sheet -- I'm sorry -- each row in this sheet represents a
20 different steel tower?

21 A. Correct.

22 Q. So I'll ask you a hypothetical. Let's say
23 tower 210 and 211 fell down and are replaced by, let's
24 say, four wooden poles. They're there temporarily. If
25 you then did an air inspection of those wooden poles,
26 would you, would you expect the object list to reflect

1 that there are temporary wooden poles there now instead
2 of steel towers?

3 A. Yeah, I would think so. I would have done it
4 on my patrol. I would have made remarks.

5 Q. One second, (WITNESS #14). I think I called
6 you (WITNESS #14). (WITNESS #10). I apologize.

7 A. That's okay. I know who I am.

8 Q. Apparently I don't, so I apologize.

9 So let's say you were doing an air inspection
10 -- air patrol, I apologize, and you came to -- tower 210
11 here is not there anymore, it's two wooden poles. How
12 would you reflect -- well, would you use the object line
13 list to reflect that to note that the tower wasn't there
14 and there are wood poles instead?

15 A. Yeah, I would put that in the notes.

16 Q. So, (WITNESS #10), not (WITNESS #14), I don't
17 have any further questions for you.

18 Do any of the Grand Jurors have other
19 questions?

20 Appears not.

21 Mr. Noel, do you have any questions?

22 MR. NOEL: Yes, really quickly.

23

24 EXAMINATION

25

26 BY MR. NOEL

1 Q. Going back to the hypothetical Mr. Fogg asked
2 you, if five towers disappeared and were replaced by 15
3 wooden poles, would you document that on your
4 transmission object list?

5 A. Yeah.

6 Q. Would you document that on your data, your
7 inspection data sheet?

8 A. I don't know since it was temporary. I
9 probably would. I might go talk to my supervisor and see
10 how he wanted me to put it on there.

11 Q. Would you ask him, "Why are these structures
12 that are no longer there still listed on here?"

13 A. No, we got that stuff from the clerk's all the
14 time, and it was out of date and stuff was different.
15 And we'd try to, try to fix it and give it back to them,
16 because even stuff that wasn't temporary sometimes in
17 those patrols it was wrong, had wrong numbers on it or
18 whatever. So we'd get with the clerk and say, "Hey, this
19 is wrong on this patrol, this needs to be fixed." And
20 sometimes it would, sometimes it wouldn't next time we
21 had a patrol. So --

22 Q. How about, for instance, the priors or the open
23 notifications on a line, the fact that those are still
24 showing up as open notifications and towers are gone,
25 does that happen?

26 A. If it had open notifications and the towers

1 were gone, I don't know. Maybe. But --

2 Q. Well, if you had open notifications such as
3 replace connectors on a tower that fell down --

4 A. Tower wasn't there, or not there?

5 Q. Yeah.

6 A. I don't know. It depends on what we, how we
7 get our stuff back sometimes.

8 Q. What are frog plates?

9 A. Those are -- we call the frog plates the plates
10 with the holes in them.

11 Q. So, for instance --

12 A. We do. Tower department calls frog plates
13 something completely different. So --

14 Q. So, for instance, Mr. Fogg had showed you a
15 photograph, and I don't know if I still have that up. I
16 think it was -- 39 I think is what it is. It's off of --
17 yep.

18 Is that a frog plate?

19 A. That's not what we really call the frog plate,
20 but -- that's just a repair, so.

21 Q. Okay. What would you consider a frog plate?

22 A. On the towers, on some of the towers we did
23 they have a plate that slides in between the arm where
24 the arm comes out and connects. And it just has a plate
25 there that has the hole through for the cold attachment.

26 Q. Somewhat of a different configuration?

1 A. Correct.

2 Q. You wouldn't see that on the jumper arms on a
3 transposition tower like this?

4 A. No, not usually.

5 Q. Okay. I need to come around, hook this up real
6 quick because I want to show you a picture. And I will
7 get this marked as next in order.

8 The picture up there, that will be marked as
9 the exhibit next in order.

10 Do you recognize that picture?

11 A. As a, as one of our towers, or that picture
12 itself?

13 Q. That picture itself.

14 A. I'm not sure.

15 Q. When you do work on towers, do you take
16 pictures to -- of your work?

17 A. Yeah. A lot of times.

18 Q. So if you did a Corrective Work Form to fix
19 something on a tower, would it be normal for you to take
20 a picture of it?

21 A. Now it is. But it wasn't before. We never
22 took pictures of the completed work. We had pictures of
23 the problems and stuff, but not of the completed work.

24 Q. Okay. Do you see any problems in this picture?

25 A. I can't really tell from that picture.

26 Q. Okay. And, by the way, this is Bates stamp

1 number PG&E Camp BC0000024261. Let's go up. That's a
2 Corrective Work Form; correct?

3 A. Yeah.

4 Q. And is that your name on it?

5 A. Yep.

6 Q. And that's for 35/281 on the Caribou-Palermo
7 line; correct?

8 A. Yep.

9 Q. And so that's a picture of 35/281?

10 A. That's the before?

11 Q. Yes. Well, I'm asking you I guess is what I'm
12 asking. Do you see an issue on that?

13 A. No, I can't tell.

14 Q. Okay. It's not going to let me do it. There
15 it is. Awful lot of space in that hole, isn't there?

16 A. Yeah, maybe. Depends on how big the hole was
17 before.

18 Q. Well, do you know what the designed diameter of
19 those holes were on the Caribou-Palermo?

20 A. No.

21 Q. Do you know what the design metrics of the
22 hooks are?

23 A. No.

24 Q. Have you replaced hooks on the Caribou-Palermo,
25 suspension hooks?

26 A. Yeah.

1 Q. Do you know how they fit when you put in a new
2 hook into an unworn hole?

3 A. Pretty much, yeah.

4 Q. Is there that much space, that much daylight
5 showing?

6 A. I don't know.

7 Q. This is a --

8 A. Not usually.

9 Q. This is a photograph that you or your crew
10 would have taken from the ground under 35/281; correct?

11 A. Yeah.

12 MR. NOEL: Okay. Do you want to pull up that
13 188? 188.

14 Q. (By MR. NOEL) Now we're back to 188, that
15 you've been looking at before.

16 Do you know what tower that is?

17 A. Nope.

18 Q. Would it surprise you if I told you that that's
19 35/281?

20 A. Nope.

21 Q. That's basically the view you just -- the view
22 you've just been looking at from your report was taken
23 from the ground, and very clearly shows that space;
24 correct?

25 A. Yep.

26 Q. So you can see on a lot of these towers that

1 space?

2 A. Yeah, maybe.

3 Q. Well, your crew took that photograph, it's
4 attached to your Corrective Work Form; correct?

5 A. Yep.

6 Q. That was taken from the ground, and it very
7 clearly shows that same distance.

8 That's all I have.

9 MR. FOGG: Okay. Now before -- (WITNESS #10),
10 I've got to let you go eventually.

11 Do the Grand Jurors have any other questions?

12 Seeing none, we have no further questions for
13 you, (WITNESS #10). Thank you for your time. Before you
14 leave, Madam Foreperson will have an admonition for you.

15 THE WITNESS: Okay.

16 GRAND JURY FOREPERSON: (WITNESS #10), you are
17 admonished not to discuss or disclose at any time outside
18 of this jury room the questions that have been asked of
19 you or your answers until authorized by the Grand Jury or
20 the Court. A violation of these instructions on your
21 part may be the basis for a charge against you of
22 contempt of court. This does not preclude you from
23 discussing your legal rights with your own attorney.

24 (WITNESS #10), what I have just said is a
25 warning not to discuss this case with anyone except the
26 Court, your lawyer, or the district attorney. Do you

1 understand?

2 THE WITNESS: Yep.

3 GRAND JURY FOREPERSON: Okay. Thank you for
4 your time.

5 MR. FOGG: Thank you, (WITNESS #10).

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 204

are certified to be a complete transcription of said stenographic shorthand notes.

DATED: THIS 6TH day of JUNE 2022

1 OROVILLE, BUTTE COUNTY, CALIFORNIA

2 JULY 16, 2019; 8:40 a.m.

3 (Confidential Grand Jury Hearing Proceedings)

4
5 (PROCEEDINGS OMITTED.)

6
7 [Whereupon proceedings are returned
8 back to Courtroom 9 before the
9 grand jury at 9:30 a.m.]

10
11 (ROLLCALL OMITTED.)

12
13 MR. FOGG: Good morning. Deputy Attorney
14 General Nicholas Fogg for the People and Deputy District
15 Attorney Mark Noel.

16 Mark, you ready?

17 MR. NOEL: Yes.

18 Ready for (WITNESS #11)?

19 GRAND JURY FOREPERSON: We're ready.

20 [(WITNESS #11) enters the courtroom.]

21 GRAND JURY FOREPERSON: (WITNESS #11), raise
22 your right hand to be sworn, please.

23 Do you solemnly swear that the evidence you
24 shall give in this matter pending before the grand jury
25 shall be the truth, the whole truth, and nothing but the
26 truth so help you God?

1 THE WITNESS: I do.

2 GRAND JURY FOREPERSON: Thank you. Have a seat.

3 **EXAMINATION**

4 BY MR. NOEL:

5 Q. For the record, can you state your full name and
6 spell your last name.

7 A. Yes. (WITNESS #11), [Redacted spelling.]

8 Q. Welcome back, (WITNESS #11).

9 Just to review, you testified before that you
10 were a PG&E troubleman for quite a few years; correct?

11 A. Yes.

12 Q. And we didn't have at the time but now we have
13 what is in front of you Exhibit Number 258. You see
14 Exhibit 258?

15 A. Uh-huh.

16 Q. You recognize Exhibit 258?

17 A. Yes, as best I can from 2006.

18 Q. And what is Exhibit 258?

19 A. A patrol that I had performed in 2006.

20 Q. Patrol on what?

21 A. On the Caribou-Palermo.

22 Q. The Caribou-Palermo 115 kV line?

23 A. Yes. Yes, Sir.

24 Q. And what type of patrol did you do?

25 A. An aerial.

26 Q. So you're flying in a helicopter?

1 A. Yes, Sir.

2 Q. Now, this is a report that you did in the
3 regular course of your employment with PG&E?

4 Remember, you have to answer out loud.

5 A. Yes. Sorry, Guys. Out of my element.

6 Q. I can see you shaking your head and they can see
7 you shaking your head, but she (indicating) can't write
8 that down.

9 A. Yes.

10 Q. So, yes, you prepared this report in the regular
11 course of your employment with PG&E?

12 A. Yes, Sir.

13 Q. And did you make this report or author this
14 report at or near the time of which the events occurred?

15 A. Yes.

16 Q. Can you kind of explain to us again just as a
17 brief reminder for us on how you actually prepared the
18 report.

19 A. We have certain lines. And this is probably one
20 of the first lines that I did as a troubleman in 2006.
21 Just a guess. But we have certain lines that need to be
22 completed at certain times of the year; routine patrols.
23 This is an actual routine patrol of the Caribou-Palermo.
24 Air, not a detail or a non-routine. This here is a
25 routine air patrol.

26 Q. Okay. How do you actually make your report?

1 A. On an air patrol you're flying the line, a lot
2 of the line. So before you fly the line, you look at
3 what I call priors which is stuff that was already
4 written up by myself or another troubleman. So I prepare
5 myself to look at those and to inspect the line by air
6 and complete the document when completed.

7 Q. Okay. Now, I guess where I'm trying to go with
8 this is when you say "complete the document," how do you
9 note or how do you notate or record your inspection?

10 A. When I do -- or when I did my air patrols, I
11 actually had a notepad and on that notepad I had the
12 priors written down and then I had a camera, binoculars,
13 and my notepad. And I would fly the line.

14 If I found something that was a defect, a broken
15 insulator, piece of steel hanging or anything, I would
16 take a picture, get a structure number, write all that
17 information down and then get back and fill this out.
18 Because this is too cumbersome to have in the helicopter
19 to try and follow something this small to do an air
20 patrol.

21 Q. And "this" being 258?

22 A. Yes.

23 Q. And 258 is almost 100 pages long; correct?

24 A. Yes, yes.

25 Q. So you make notes as you're going through the --
26 through your inspection?

1 A. Uh-huh.

2 Q. And then when you get done with it, you get back
3 to the office and you fill out your paperwork?

4 A. Yes. That's how I did my air patrols.

5 Q. And the paperwork that you fill out is what
6 we're looking at as 258?

7 A. Yes, Sir.

8 Q. All right. And that's done -- that is something
9 that is kept by PG&E in the normal course of business?

10 A. Yes.

11 Q. Something that's required to be kept; correct?

12 A. Yes.

13 Q. All right. Now, other than that, I want you to
14 flip to -- I believe it's page 2 of 258, the transmission
15 line inspection data sheet.

16 A. Yes.

17 Q. Do you see that? Is that your handwriting on
18 there?

19 A. Yes, it is.

20 Q. The name "(WITNESS #11)" on the top line?

21 A. Yep.

22 Q. Date completed 8/22/06?

23 A. Uh-huh.

24 Q. Miles inspected?

25 A. Uh-huh.

26 Q. How many miles did you inspect?

1 A. Sixty-two.

2 Q. Now, the question is structures inspected? How
3 many structures did you inspect?

4 A. This particular document back then is actually
5 double, but you're actually only flying the four hundred
6 and whatever and a half.

7 Q. Right.

8 A. The reason is if you look at the page --

9 Q. Okay. Let's -- first, let's lay the foundation
10 for it.

11 A. Okay.

12 Q. What is the number of structures that it says
13 you inspected on this -- on this patrol?

14 A. Eight hundred and seventy-four.

15 Q. Okay. That's significantly more than, for
16 instance, in the other inspections that you did and
17 listed; correct?

18 A. Yes.

19 Q. Do you know why that number of structures is
20 significantly higher than it is in other inspections?

21 A. Yeah. If you look at the following page.

22 Q. I didn't put up the following page. If you can
23 explain it.

24 A. This actually has ought over one ceramic
25 insulators, ought over one lattice steel tower. The
26 ceramic insulators on a tower actually has a separate SAP

1 number, a separate number than the steel tower itself.
2 So at a point in time they changed it to where you just
3 had ought over one and the ceramic insulators were tied
4 in with the steel structure.

5 Q. And you're looking at the transmission object
6 list; correct?

7 A. Yes.

8 Q. So that's breaking every tower into two
9 components; correct?

10 A. Exactly right.

11 Q. Structures and insulators?

12 A. Exactly.

13 Q. At some point, PG&E was doing that?

14 A. Yeah. And to be honest, this is so long ago.
15 But to be honest, I think it's still -- I think it's
16 still a separate SAP number in the system but not on the
17 patrol.

18 Q. Like I say, it's a long time ago; right?

19 A. Yeah, yeah.

20 Q. There have been a lot of changes?

21 A. Absolutely.

22 Q. I'm sure in your time as a troubleman with PG&E
23 you've seen lots of changes in the way inspections are
24 done?

25 A. Yes, some. But the way I tried to perform an
26 inspection using my expertise as a lineman, becoming a

1 troubleman and patrolman, I changed a few things. But
2 for me myself when I patrol, I patrol.

3 MR. NOEL: Okay. All right. That's all I have
4 for this witness.

5 And do the jurors have any questions for this
6 witness? Seeing no hands we'll admonish (WITNESS #11)
7 again. And we're done with (WITNESS #11) for the day. I
8 appreciate it.

9 THE WITNESS: Thank you, Guys.

10 GRAND JURY FOREPERSON: (WITNESS #11), you are
11 admonished not to discuss or disclose at any time outside
12 of this jury room the questions that have been asked of
13 you or your answers until authorized by the grand jury or
14 the Court. A violation of these instructions on your
15 part may be the basis for the charge against you of
16 contempt of court. This does not preclude you from
17 discussing your legal rights with your own attorney.

18 (WITNESS #11), what I have just said is a
19 warning not to discuss this case with anyone except the
20 Court, your lawyer, or the district attorney.

21 THE WITNESS: Okay.

22 GRAND JURY FOREPERSON: Thank you.

23 THE WITNESS: Thanks again, Guys.

24 MR. NOEL: Thank you.

25 [(WITNESS #11) exits as (WITNESS #6)
26 enters the courtroom.]

1 MR. NOEL: (WITNESS #6).

2 GRAND JURY FOREPERSON: (WITNESS #6), before you
3 have a seat, raise your right hand to be sworn.

4 (WITNESS #6), do you solemnly swear that the
5 evidence you shall give in the matter pending before the
6 grand jury shall be the truth, the whole truth, and
7 nothing but the truth so help you God?

8 THE WITNESS: Yes.

9 GRAND JURY FOREPERSON: Thank you. Have a seat,
10 please.

11 **EXAMINATION**

12 BY MR. NOEL:

13 Q. (WITNESS #6), can you please state your full
14 name spelling your last name for the record.

15 A. My name is (WITNESS #6). Last name is [Redacted
16 spelling.]

17 Q. Before we get to it, (WITNESS #6), you are
18 represented by an attorney?

19 A. Yes.

20 Q. Is that correct?

21 And prior to your testimony, you indicated that
22 it's your intention on the advice of counsel to invoke
23 your Fifth Amendment rights; correct?

24 A. Yes.

25 Q. So first thing this morning we met with
26 Judge Deems and you were given immunity; correct?

1 A. Yes.

2 Q. You understand that?

3 A. Yes.

4 Q. Okay. Do you understand that the main condition
5 of the immunity is that you just tell the truth?

6 A. Yes, Sir.

7 MR. NOEL: Madam Foreperson, once the order is
8 processed by the clerk -- oh, there it is. It's already
9 here. You should already have it.

10 We'll lodge that with -- the original should be
11 lodged in the grand jury file.

12 GRAND JURY FOREPERSON: Do you have it?

13 GRAND JURY SECRETARY: No.

14 MR. NOEL: Do we have the original?

15 MR. FOGG: No. Only copies.

16 MR. NOEL: We'll figure that out. Ms. Dionne
17 was supposed to give you the original. Okay. So we'll
18 figure it out at the break.

19 BY MR. NOEL:

20 Q. Mr. (WITNESS #6), by whom are you employed?

21 A. Pacific Gas & Electric.

22 Q. In what capacity?

23 A. I'm a transmission troubleman.

24 Q. How long have you been employed by Pacific Gas &
25 Electric?

26 A. A little over 18 years.

1 Q. Walk us through your career with Pacific Gas &
2 Electric where you started and how you ended up as a
3 troubleman?

4 A. Okay. I hired on in April of 2001 in Cupertino
5 down in the Bay Area as an apprentice lineman. And I
6 worked in Cupertino as an apprentice lineman until 2003,
7 got a transfer to Marysville in September of 2003. I
8 finished my apprenticeship, topped out as a lineman in
9 October of 2004 and worked in Marysville as a lineman
10 until May, I believe, of 2012.

11 I took a transfer to Oroville, worked in
12 Oroville for, oh, until September of 2012 and transferred
13 back to Marysville as a lineman. Worked in Marysville as
14 a lineman until June of 2014 when I took a compliance
15 inspector job back in Oroville. That compliance
16 inspector job is -- you still perform your duties as a
17 lineman. You work with the crew when they need extra
18 help, but you also patrol a distribution line.

19 Q. Go ahead.

20 A. Okay. Held the compliance inspector position
21 until November of 2015 which is when I took the
22 transmission troubleman job at Table Mountain. Was a
23 transmission troubleman at Table Mountain. The first six
24 or seven months I worked with the crew basically learning
25 the service territory, learning the lines. That sort of
26 thing.

1 In October of 2017 I took a lineman bid at Table
2 Mountain and worked that job until -- oh, I think until
3 probably May or June of 2018 and then I went back to the
4 troubleman job. And I have been at that troubleman
5 position since then.

6 Q. So May or June of '18?

7 A. Yes.

8 Q. You have been a troubleman?

9 A. Yes.

10 Q. Okay. So when you were a lineman prior to --

11 Were you a transmission lineman or distribution
12 lineman?

13 A. I was a distribution lineman.

14 Q. Okay. So prior to becoming a transmission
15 troubleman in November of '15, what experiences did you
16 have with transmission lines?

17 A. I had -- I had some experience during my
18 apprenticeship on re-conductors and re-insulating down in
19 the Watsonville/Moss Landing area. And as a lineman in
20 Marysville we used to maintain some of the 60 kV lines in
21 the area. But other than that, I had limited
22 transmission experience.

23 Q. So when you became a transmission troubleman,
24 what kind of training did you receive?

25 A. The first six months, like I said, I worked with
26 the crew. So basically that -- you learn basically the

1 area because it's a very large area. And then in the
2 spring of 2016 you get -- I started -- I went to like a
3 substation switching course, which is a two-week course
4 where you learn all those switches inside the
5 substations. I went to a two-day -- a field switching
6 course which is operating the switches just out in the
7 field along the roadways and that sort of thing, not
8 inside the confines of a substation.

9 You receive, oh, your tower climbing training,
10 which we used to climb towers with no fall restraint.
11 You free-climbed it until you got to where you're going
12 to work and then you belted off. Now the new rules are
13 you have to be attached to the tower at all times. So
14 that requires some new training.

15 Helicopter long-line training. A lot of the
16 structures are pretty remote and hard to get to. We use
17 helicopters to transport personnel and material.

18 I received ETM Manual training which
19 basically -- it just gives you some guidelines on what
20 you're looking for out in the field as a troubleman and
21 kind of how you would classify those issues, which is how
22 long you feel before repairs need to be made on that.

23 Q. When you say "ETM," is that the same as the
24 ETPM; the Electric Transmission Preventative Maintenance
25 Manual?

26 A. Yeah.

1 Q. Did you receive any actual training in the
2 hardware of the towers themselves? The transmission
3 towers themselves?

4 A. During the training, they do have some images of
5 some towers with issues. It's mostly Bay Area stuff with
6 the corrosion down there, steel that had rusted through
7 and stuff like that.

8 Q. Which training are we talking about here?

9 A. The Electric Transmission Preventive
10 Maintenance.

11 Q. Okay. So when you went to training on the ETPM,
12 you said they used photographs demonstrating issues in
13 towers?

14 A. Yes. Towers and wood poles.

15 Q. Okay. How about the actual structures that you
16 were going to be inspecting here out of Table Mountain?

17 A. I'm not quite sure. Are you asking if my
18 training had specifically anything to do with, like, the
19 actual towers like in the canyon?

20 Q. Yes.

21 A. Not specifically.

22 Q. Well, we'll get to that in a second.

23 Good thing you have in front of you that binder
24 that is marked on the inside as number 248. Open that
25 binder up. And see the exhibit tag there 248?

26 A. Yes.

1 Q. Do you recognize what's marked as Exhibit 248?

2 A. Yes.

3 Q. What is Exhibit 248?

4 A. It is the Electric Transmission Preventative
5 Maintenance Manual.

6 Q. And is this the training that you said you went
7 to?

8 A. Yes. As I remember it, yes, it is.

9 Q. And are you familiar with the Electric
10 Transmission Preventative Maintenance Manual?

11 A. I -- I haven't looked at it too much since my
12 training.

13 Q. Okay. So this isn't something that you use on a
14 regular basis?

15 A. No.

16 Q. I want to go through a few things in it. And,
17 for instance, Table 1.4. Do you see Table 1.4?

18 A. Yes.

19 Q. Are you familiar with Table 1.4?

20 A. No, I am not.

21 Q. Okay. So this is entitled "Inspection Best View
22 Position." Or actually, it's Table 2 in section 1.4.
23 We're saying that wrong. Correct?

24 A. Yes.

25 Q. And that is "Inspection Best View Position." So
26 this isn't something that you're familiar with?

1 A. No, it's not.

2 Q. How about section 1.6? See 1.6?

3 A. Yes.

4 Q. Are you familiar with section 1.6?

5 A. I'm familiar with -- well, I'm familiar with
6 completing the inspections but not familiar with this
7 section, no.

8 Q. Okay. Are you familiar with the documents --
9 the records that are in blue on that page?

10 A. I am -- I am familiar with the data sheet and
11 the object list, yes. I am not familiar with creating or
12 closing inspections.

13 Q. Okay. So the data sheet and the object list are
14 forms that you routinely use in doing your inspections?

15 A. Yes.

16 Q. All right. Let's move on to Table 13. It
17 should be section 2.1.

18 A. Okay.

19 Q. Are you familiar with Table 13?

20 A. I am familiar with the dates, the timeline with
21 the inspections, but I am not familiar with this table
22 itself.

23 Q. Okay. What is your understanding of the
24 timelines for inspections?

25 A. The wood -- the wood pole lines we do a ground
26 inspection every other year and an air inspection every

1 other year. The steel lines we inspect every five years
2 and do an air patrol on those annually. The 500 kV lines
3 we do quarterly air patrols on those and a ground
4 inspection every three years.

5 Q. What is the difference between an air patrol and
6 an inspection?

7 A. An inspection you're looking for a ground
8 inspection. You're looking for basically everything.
9 You're -- it's a very fine detailed inspection where, you
10 know, on a wood pole you're going to hammer test it,
11 you're going to look for any woodpecker damage, any shell
12 rot type stuff using, you know, using binoculars and
13 really inspecting everything looking for small details
14 like numbering, the structure number, high voltage signs.
15 That sort of thing.

16 And also looking for the bigger issues as well,
17 of course; flash insulators, damaged conductors, the
18 presence of dampers. It's like more of a fine tooth comb
19 type of inspection.

20 An air patrol is more of looking for glaring
21 issues, something, you know, obviously broken, damaged.
22 That sort of thing. Usually on a ground patrol you
23 can -- obviously you spend a little bit more time on each
24 location. And you can -- you can easily -- you can more
25 easily position yourself to get a good view of the
26 structure and all the facilities on it.

1 Q. Okay. You talked about doing the detailed
2 ground inspection for wooden poles. Describe for us what
3 it's like for a steel tower.

4 A. Oh, okay, yeah. So as I'm approaching the tower
5 on a ground patrol, I'm looking basically just getting an
6 overall picture of the tower, looking for things that are
7 obvious; a piece of steel hanging down, the presence of
8 high voltage signs, maybe a tower number, vibration
9 dampers on the wire. I'm looking at that stuff as the
10 overall picture of it as I'm approaching it.

11 When I get there, I'm literally going to put my
12 hands on the tower, shake the tower. If there is loose
13 steel, you can hear it. I'm going to look at the
14 footings.

15 In the Feather River Canyon oftentimes in the
16 wintertime we get landslides. So I'm looking at anything
17 like that, if any of the ground has shifted or anything.
18 And then just working my way up with the tower. I'm
19 going to look at the conductors. If there's any sort of
20 conductors, I'm looking at those. I'm looking at the
21 insulators. And, oh, just basically using my binoculars
22 and just getting the best view as I can on the actual
23 shoe that attaches the conductor to the insulator and, if
24 possible, positioning myself for multiple angles.

25 Depending on the style of the tower, a
26 suspension tower just has three strings of insulators

1 hanging straight down. A dead-end tower has insulators
2 going out both sides because the wire is actually dead on
3 both sides of the tower so it creates a lot more to look
4 at.

5 Q. How much time would you estimate you spend at
6 each tower doing a detailed ground inspection?

7 A. It kind of varies depending on the terrain. If
8 it's a spot where I can -- if it's a double dead-end
9 tower and I can position myself to get real good views,
10 then I spend longer than if it's on the edge of a cliff
11 and I can only look at it from one side.

12 I would say anywhere from ballpark ten minutes
13 on each tower probably.

14 Q. And how many ground inspections -- detailed
15 ground -- detailed ground inspections have you done?
16 Inspections such as that?

17 A. I've been doing the detailed ground inspections
18 since May of 2016 and probably -- I don't know -- 10 to
19 15 different circuits. Maybe up to 20 a year. It varies
20 some months or the workload is heavier than others. And
21 that's both wood pole and steel tower lines.

22 Q. Okay. And during your detailed ground
23 inspections, do you actually climb the towers?

24 A. No.

25 Q. Why not?

26 A. That's -- it's my understanding that that is

1 something that the tower department does.

2 Q. And where do you get that understanding?

3 A. Just through hearsay of the tower department
4 doing the climbing inspections.

5 Q. Okay. Now, the ETPM actually talks about doing
6 climbing inspections in towers; correct?

7 A. Yes.

8 Q. But as far as you as a troubleman, you have
9 never done a climbing inspection of any tower?

10 A. No, I never have.

11 Q. Now, let's talk a little bit about the air
12 patrols. Describe for us an air patrol.

13 A. Okay. An air patrol you're basically getting in
14 a helicopter and flying the line. And so looking for,
15 you know, conductor -- me personally looking for
16 conductor damage, insulator damage, can be looking for
17 the presence of vibration dampers.

18 I'm not paying attention to some of the smaller
19 details like if there's a high voltage sign present or if
20 there's a number on the tower. And you just start at one
21 end, fly from one end of the circuit to the other.

22 There are various things that kind of determine
23 how you're going to fly. It could be your position in
24 the helicopter. The lines in the Feather River Canyon,
25 there's multiple transmission lines. And some are lower
26 on the hill and some are higher on the hill that. That

1 will determine kind of what side of each circuit you
2 could fly. Depending on where you're at in the ship will
3 determine if you're going to go up river or down river or
4 toward the wind or the sun. But basically just starting
5 at one point and flying from tower to tower.

6 Speed varies depending on conditions in the
7 terrain. And just looking for anything that looks out of
8 the ordinary. When you -- when you look at so many
9 structures, after a while anything that is different it
10 will catch your eye. And so you do do your best to get,
11 you know, as good a look as you can at everything. But
12 it's something that after -- oh, it's just a certain
13 amount of time anything different will catch your eye.

14 And at that point when you see something that
15 you want to take a look at, you ask the pilot to circle.
16 He'll circle back around. You know, kind of conditions
17 permitting he'll hover and you can use your binoculars
18 to -- we use image-stabilizing binoculars to look at
19 whatever issue you might have seen.

20 At that point if it is, if you do confirm that
21 it's a problem, you get pictures of it, take down some
22 notes documenting what the issue is, access if you know
23 it, if you can see a road nearby, you know, tower
24 structure number and that sort of thing.

25 Q. Going back, you said you're looking for anything
26 out of the ordinary. What training do you have to tell

1 you what these towers are supposed to look like to begin
2 with?

3 A. Oh, I feel like you get that through time in the
4 field for sure. You know, just as a lineman you come to
5 know what a flashed insulator looks like. On -- you
6 know, on a conductor anything shiny, like any sort of
7 discoloration or shine that you see might indicate that,
8 you know, there's an issue right there. Basically just
9 experience, on-the-job experience.

10 Q. Okay. All right. We talked about that. Let's
11 skip ahead. Section 2.1.4 of 258, the Electric
12 Transmission Preventative Maintenance Manual. Are you
13 familiar with that section?

14 A. I am familiar with once again the data sheet and
15 the object list, not specifically with this document
16 right here (indicating).

17 Q. Okay. So let's move ahead. Section 2.2. Are
18 you familiar with section 2.2?

19 A. No, I am not.

20 Q. Okay. How about Appendix E: Line patrol file
21 guidelines. It would be way at the back. Actually, all
22 the way to the back. Out of 85 pages it starts on
23 page 83.

24 A. Okay. I'm not familiar with this.

25 Q. Okay. So have you ever inspected or patrolled
26 the Caribou-Palermo 115 kV line?

1 A. Yes, I have.

2 Q. On how many occasions?

3 A. I don't know the exact number. I've done two or
4 three complete air patrols of the line. That's as best
5 as I can remember. And I have done, I believe, an
6 infrared patrol on the line. And I've also done
7 non-routine patrols on that line, air patrols, and --

8 Q. Okay. So let's break that down. When you say
9 you've done two to three air patrols of that line, what
10 does that entail?

11 A. That entails, as I was describing earlier, when
12 you're starting at one end of the circuit and fly the
13 entire circuit looking at every structure.

14 Q. Okay. Do you remember what years?

15 A. I don't remember if I did that patrol in 2016,
16 but I'm pretty certain I did 2017 and 2018.

17 Q. Okay. Were you doing it yourself or were you
18 doing it partnered with somebody else?

19 A. I believe -- I think in 2017 I did it by myself
20 and then in 2018 I did it with another troubleman.

21 Q. Who was that? Who was that?

22 A. (WITNESS #18).

23 Q. Okay. How about 2016?

24 A. I don't remember if I did it in 2016.

25 Q. Okay. You said you did RI on the line. Can you
26 explain to us what "RI on the line" means?

1 A. Yeah. That's an infrared patrol where an
2 actual -- a special camera is mounted on the helicopter.
3 There's a contractor that PG&E uses that sits in the back
4 seat of the aircraft looking at an actual television
5 screen. The line has to be energized. And basically,
6 the camera picks up the temperature of the line. And any
7 area that is above normal out of a temperature range will
8 show up on that camera and then that gets identified and
9 a work order gets issued.

10 Q. Finally, you talked about you did non-routine
11 air patrols. What are those?

12 A. A non-routine is if we have an outage or even a
13 momentary outage where -- a momentary outage is if
14 something happens, the protective equipment at the
15 generation or the substation senses it, de-energizes it
16 for just an instant, and then re-energizes it. And the
17 problem is gone and it holds safe during a momentary
18 outage.

19 Whenever we have a momentary outage, we have to
20 do a patrol on the line. With most of the lines in the
21 canyon access is extremely difficult. So we usually use
22 a helicopter for our non-routine patrols up there. And
23 you can -- the substation can give you, oh, kind of a
24 target area of where the equipment sensed the issue at.
25 And you kind of can concentrate your efforts in that
26 area.

1 Q. Do you use helicopters to do non-routine patrols
2 in the middle of winter?

3 A. Yes. Weather permitting we will use
4 helicopters. If you can't use a helicopter, then it
5 would be a ground.

6 Q. For instance, on the Caribou-Palermo during the
7 wintertime, is it accessible by road most of the time?

8 A. It's -- it's not. You can get close, but it
9 would -- it's not very effective to do a non-routine
10 patrol in the Caribou-Palermo by ground. It's more
11 effective by air.

12 Q. So usually by air?

13 A. Yes.

14 Q. No matter what the time of year we're talking
15 about?

16 A. Yes. Whether permitting it's best to do it by
17 air.

18 Q. I guess we've never asked this before, but is
19 there kind of a season for when you do your annual air
20 patrols or your ground inspections?

21 A. Yes, there is. Most of -- yes. The seasons
22 they are set up to be able to access them for sure.
23 Because we do have -- we have lines that in the
24 wintertime, you know, there might be six or eight feet of
25 snow in there. And so definitely the early part of the
26 year most of the inspections are done here in the valley

1 and then this time of year most of the inspections are up
2 in the canyon up by Lake Almanor.

3 Q. So summer, early fall are the inspection seasons
4 for the mountain transmission lines; is that right?

5 A. Yes.

6 Q. Okay. All right. Now, I want to draw your
7 attention to what is marked as 249. It should be right
8 here on this file on your right.

9 Do you recognize what is marked as Exhibit 249?

10 A. Yes, I do.

11 Q. What is Exhibit 249?

12 A. It is a Caribou-Palermo -- let's see. It's a
13 Caribou-Palermo air inspection.

14 Q. Go ahead. And you can look all through it.

15 A. Yeah. It's a Caribou-Palermo air inspection.

16 Q. All right. For what year?

17 A. For 2017.

18 Q. And who was the troubleman doing this
19 inspection?

20 A. I was.

21 Q. All right. Let's start off -- we have up on the
22 big board for the jurors to see the front page. Can you
23 explain to us what we're looking at.

24 A. Yes. Basically, it's the cover sheet for the
25 Caribou-Palermo. It tells you it is, in fact, the
26 Caribou-Palermo. It tells you when it needs to be done

1 by. Those are the things that I look at.

2 Q. Is this a form that you fill out or something
3 that you're given?

4 A. This is something that -- this packet right here
5 is something that I'm given before the patrol.

6 Q. Okay. Who determines when you're going to do
7 these patrols?

8 A. I don't know that.

9 Q. You're just -- you're told when to do it;
10 correct?

11 A. Yes. At the beginning of every year I get a
12 list of all my patrols for the year and what months that
13 they will be due in.

14 Q. Okay. I was just wondering do you know what it
15 means when it says "PATR/INSP 10391 Caribou-Palermo." Do
16 you understand what that means?

17 A. I understand the patrol inspection. I don't
18 know what that number is.

19 Q. Okay. And how about this "Quarterly patrol Q3
20 move date to end of September"?

21 A. I don't know what that is. I'm not sure.

22 Q. Do you do quarterly patrols on the
23 Caribou-Palermo?

24 A. We do. Our air patrols are quarterly. So if --
25 I don't know if maybe the Caribou-Palermo -- I'm just
26 speculating here. I don't know. The Caribou-Palermo

1 line might have been --

2 Q. Okay. We don't want speculation. We just want
3 to know how often do you patrol when you do air patrol on
4 the Caribou-Palermo?

5 A. Every year.

6 Q. How many times a year?

7 A. Once.

8 Q. One time. Okay. So you're not doing quarterly
9 patrols on the Caribou-Palermo?

10 A. No.

11 Q. How often do you do air patrols on other 115 kV
12 lines?

13 A. It's -- it's -- we do have -- it varies on the
14 steel lines. It's every year. On the wood pole lines
15 it's every other year.

16 Q. Okay. The same question: How often do you do
17 air patrols on 230 kV lines?

18 A. That we do have some wood pole 230 lines. I
19 don't have any in my area. But that would be the same --
20 the wood poles are getting looked at every other year.
21 One year ground, the next year air. The steel would be
22 looked at every year by the air.

23 Q. Okay. You said your area. Do you have a
24 defined jurisdictional area that you're in charge of?

25 A. Yes. I have Butte County up the Feather River
26 Canyon to Plumas County and a little bit up in Lassen

1 County.

2 Q. Okay. So are you in charge of inspecting and
3 patrolling all of those transmission lines?

4 A. Yes.

5 Q. Do you have any 500 kV lines?

6 A. I don't have any 500 kV lines in my area, but we
7 do have 500 kV lines in our area.

8 Q. How many different transmission lines do you
9 have in your area in Butte County up the Feather River
10 Canyon?

11 A. I don't know off the top of my head. I could
12 count them up, but I don't know right now.

13 Q. Go ahead. We've got time.

14 A. Okay. I've got the Colgate-Palermo. I've got
15 the Palermo-Colgate. I have the Poe Rio Oso, the Cresta
16 Rio Oso, the Rock Creek Poe, the Bucks Creek, Rock Creek
17 Cresta, the Belden tap, the Grizzly tap, the
18 Caribou-Palermo, the Caribou Table Mountain, the Butt
19 Valley Caribou, the Caribou Number Two, the Caribou
20 Plumas Junction, the Plumas Sierra tap. I have a portion
21 of the Hat One Westwood. And I believe that's it.

22 Q. Let's focus on the lines running up the Feather
23 River Canyon. How many lines are there that run up the
24 Feather River Canyon?

25 A. There is the Caribou-Table Mountain is a 230
26 line. There is -- the Cresta Rio Oso coming out of there

1 is a 230 line. The Poe Rio Oso coming out of there is a
2 230 line. The Caribou-Palermo is a 115 kV line. The
3 Grizzly tap is a 115 kV line. The Belden tap is a 230
4 line. The Butt Valley Caribou is a 115 line. Caribou
5 Number 2 and the Caribou Plumas Junction are both 60 kV
6 lines. And those are all in the canyon.

7 Q. And those are all lines that you're in charge of
8 inspecting and patrolling?

9 A. Yes.

10 Q. Correct?

11 Are there -- well, do you know the history of
12 the Caribou-Palermo line?

13 A. I don't. I'm not exactly sure what your
14 question is there.

15 Q. Let me make it easier. Do you know how old the
16 Caribou-Palermo line is?

17 A. I do. I have an idea. I don't know exactly.

18 Q. Okay. How about the other three lines that run
19 parallel to the Caribou-Palermo up the canyon? The 230
20 lines?

21 A. The only other -- I don't know their dates. I
22 have an idea of the Bucks Creek Rock Cresta.

23 Q. Okay. Well, would it be -- I know you don't
24 know the dates. So would it be fair to say that the 230
25 lines that run parallel to the Caribou-Palermo were
26 significantly younger than the Caribou-Palermo?

1 A. Yes.

2 Q. In terms of your inspection plans or the
3 inspections themselves or the patrols, do you take into
4 account the age of the lines you're inspecting?

5 A. Yes.

6 Q. And how so?

7 A. I feel like you just -- you see some differences
8 probably more specifically on the wood pole lines. You
9 see just some different issues than on the newer, yeah.

10 Q. Well, let's just talk about the way that you
11 inspect, and let's stick to the steel towers.

12 Do you inspect more often an older line such as
13 the Caribou-Palermo than you would a line that was built
14 in the '60s or '70s?

15 A. No.

16 Q. When you're doing your air patrols, are you
17 changing the way that you do your air patrols to take a
18 more detailed look at older lines like the
19 Caribou-Palermo than you would for younger lines?

20 A. No. They are -- my inspection process is going
21 to be the same. You could -- there are certain
22 insulators in the canyon that are harder to see flashes
23 on. The newer insulators are easier to see flashes on
24 so, but the inspection process is the same.

25 Q. Okay. So it would be safe to say that in terms
26 of the inspection process itself in terms of cycles of

1 inspections and the inspections themselves, there is no
2 difference between the Caribou-Palermo and a line that
3 may have been built in the '60s or '70s?

4 A. It would be the same.

5 Q. Okay. All right. Let's flip over 249 to the
6 third page. I'm asking you to explain what we're looking
7 at.

8 A. Okay. This page is a listing of prior tags
9 written on the line that you're looking at. So basically
10 it shows you the circuit, it shows you the tower number,
11 and what the issue that they found was. So if while
12 you're doing your air patrol you spot an issue, you can
13 refer back to your list of priors and determine if it's
14 already been identified. And if it has, then you don't
15 create another work order to have it fixed.

16 Q. All right. So these are the open notifications
17 at the time of your patrol?

18 A. Yes.

19 Q. And the top one up here says "Caribou-Palermo
20 NERC Project." Do you know what that means?

21 A. I know a lot of NERC projects were like
22 tower-raising type projects.

23 Q. So you're not familiar with that project?

24 A. No.

25 Q. That's not tied to any specific tower; correct?

26 A. No. It does not list the tower number.

1 Q. Okay. All right. Let's flip to the next page
2 on the transmission line inspection data sheet.

3 Do you recognize that page?

4 A. Yes, I do.

5 Q. And why don't you tell us about this page.

6 A. Okay. On this page you basically -- you list
7 the issues that you found, structure number, what was
8 wrong, if it was an insulator or what have you, the
9 priority. That can be A, B, or E. And that is a
10 timeframe that it needs to be fixed in.

11 "A" is an emergency that needs to be fixed
12 immediately, "B" you have 90 days, and "E" you have one
13 year to fix it. And then you just put in the comments of
14 what the issue was.

15 Q. Okay. Let's go up to the top right corner. It
16 says "Inspector name." Did you write that in?

17 A. Yes.

18 Q. "Date inspection completed."

19 A. Yes, I wrote that.

20 Q. September 13, 2017, is the date you completed
21 your inspection?

22 A. Yeah.

23 Q. Miles inspected. How many miles did you
24 inspect?

25 A. Oh, 54.8.

26 Q. And the number of structures that you inspected?

1 A. Yes. Oh, 456.

2 Q. Four hundred fifty-six. And what does that
3 number represent?

4 A. That represents the number of towers on this
5 line.

6 Q. Okay. Now, you have your inspections finding
7 data?

8 A. Yes.

9 Q. Who fills that out?

10 A. I fill this out.

11 Q. And describe for us what is in there.

12 A. Okay. So, yeah, I put the date that I found the
13 issue, the structure number, what facility it was, the
14 damage. These terms are all predetermined. We don't
15 have a lot of -- you know, it's already -- basically, you
16 can either repair or replace is the action. And then the
17 priority. These are one-year tags. And then the comment
18 is actually what needs to be done.

19 Q. Okay. And what is the number at the end?

20 A. That is when the tag is created. That number
21 gets assigned to that tag. And then our clerk can use
22 that number to look up the tag and assign it a PM number
23 which is used to charge the crews time.

24 Q. So going backwards back to what you said was
25 your priors page, the far left column, it's yellow. See
26 that?

1 A. Yes.

2 Q. What are those?

3 A. Those are the notification numbers you get when
4 you create the tag, yeah.

5 Q. Okay. So the numbers that are in the far right
6 column on the transmission line inspection data sheet?

7 A. Yeah. That's the same thing.

8 Q. Okay. And then you signed it down at the
9 bottom?

10 A. Yes.

11 Q. You dated it?

12 A. Yes.

13 Q. And then it says LanI.D.

14 A. Yeah. That's our -- kind of like our company
15 I.D.

16 Q. What is your LanI.D.?

17 A. "dpci."

18 Q. Any idea how they came up with those letters?

19 A. It's your initials and then they add a letter or
20 a number at the end.

21 Q. Okay. Supervisor signature. Do you know who
22 the supervisor was?

23 A. Yes.

24 Q. Who is that?

25 A. (WITNESS #12).

26 Q. Is (WITNESS #12) still your supervisor?

1 A. No.

2 Q. And his LanI.D.?

3 A. Well, you know what? This one I can't --
4 honestly, I can't tell if this was (WITNESS #12) or
5 (WITNESS #22) to be honest with you.

6 Q. Okay. It's hard to read.

7 Who is your current supervisor?

8 A. (WITNESS #22).

9 Q. Okay. All right. Let's go to the next page.
10 What is this page?

11 A. This page basically we put down the date that we
12 did our patrol and you write down where you started and
13 where you finished and then at the bottom you write down
14 the problems that you found.

15 Q. Okay. So let's walk through this. "Inspected
16 by." That is your name at the top?

17 A. Yes.

18 Q. And then there's descriptions of the
19 Caribou-Palermo?

20 A. Yes.

21 Q. Okay. "Date inspected." When did you inspect
22 it?

23 A. On September 13th of 2017.

24 Q. And what structures did you inspect?

25 A. I started at ought over one Caribou Powerhouse
26 and ended at ought over one at Palermo Sub and looked at

1 everything in between.

2 Q. Okay. So you started clear up in Caribou and
3 you worked your way all the way down to Palermo?

4 A. Yes.

5 Q. Caribou-Palermo. That's the entire line;
6 correct?

7 A. Yes.

8 Q. That's where it gets its name; right?

9 A. Yeah.

10 Q. It goes from Caribou Powerhouse Number One to
11 Palermo?

12 A. Yes.

13 Q. And then at the bottom under "notes" what does
14 it say?

15 A. It says "Patrolled the entire line with three
16 problems found."

17 Q. And is that referring to the problems that you
18 list on your data inspection sheet?

19 A. Yes.

20 Q. So this is the last page of your report;
21 correct?

22 A. Yes.

23 Q. There is no transmission object list attached to
24 your report; is that correct?

25 A. That's correct.

26 Q. How come?

1 A. At some point -- and I don't know -- I don't
2 know exactly why. At some point the air patrols used
3 to -- the documentation used to look like the ground
4 patrols as far as the object list. The problem -- in my
5 mind the problem was there's a lot of priors so -- oh,
6 let's not get complicated.

7 It's -- when you look at a structure and you
8 have a ground patrol object list, you have boxes that are
9 options to check. "No problems found." Or if you found
10 a new problem, you check that. If you check "previous
11 conditions," you can check that.

12 On the air patrols oftentimes there are previous
13 conditions you can't verify from the air. You might not
14 be able to tell if the tower has been painted. A lot of
15 them look painted. You can't tell if it's been recently
16 painted. You might not be able to tell if a footing had
17 been fixed or if a piece of steel had been tightened
18 down.

19 So you can't -- you couldn't really go through
20 your air patrol and check, you know, preexisting
21 condition check and that sort of thing. So in my mind
22 that is why we switched to this type of documentation.
23 It's just a more accurate way to kind of document the
24 patrol.

25 Q. So you're not actually keeping track of every
26 structure as you fly over them anymore?

1 A. No, no. You can't. When I do an air patrol,
2 I'm bringing my list of priors with me. And that is --
3 and when I see an issue, I'll reference that and see if
4 it's already been documented. If not, at that point I'm
5 determining -- I'm getting my pictures, I'm confirming
6 the tower number, and that sort of thing.

7 Q. Okay. Now, I want to switch it up a little bit.
8 And you should have in this stack up here Exhibit
9 Number 250.

10 A. Yes.

11 Q. Recognize Exhibit Number 250?

12 A. Yes.

13 Q. What is Exhibit Number 250?

14 A. This is a tag to replace some insulators on the
15 Caribou-Palermo.

16 Q. Okay. What do you mean by "tag"?

17 A. When you find an issue -- this is an older tag.
18 There's the kind we used to create on a desktop computer.
19 And so when you find an issue, you would fill out this
20 tag with, you know, structure number, location, access,
21 notes if needed, and basically send it off to the clerk.

22 Q. Okay. Up here in the far right we have again
23 that notification number.

24 A. Yes. That is a number that is -- I don't
25 know -- when these tags were created, I don't know who
26 came up with that number. Now, when I create tags, I do

1 it on an iPad and the iPad generates a number. I don't
2 know where this number got generated on this one.

3 Q. So since 2017 the process has changed?

4 A. Yes.

5 Q. Is that correct?

6 A. Yes.

7 Q. Okay. But this is a tag or notification that
8 you created yourself?

9 A. Yes, that's correct.

10 Q. And for demonstrative purposes going back to
11 when you were doing your annual air patrol, when you
12 found problems -- for instance, for three problems that
13 you found, would you create one of these notifications or
14 tags for each one of those?

15 A. Yes.

16 Q. All right. Tell us about this tag itself.

17 A. Okay. At the top you have the circuit which is
18 Caribou-Palermo. The 24/200 -- that is a structure
19 number. And then the next is the insulators that is the
20 problem. And then down here where it says "insulator" --
21 or "facility insulators on steel," there are no good and
22 they need to be replaced. The priority is an "E" tag,
23 which is one year.

24 My LanI.D. is in the box. Once again down here
25 we have the line name. It's a 115 kV line for the
26 voltage on a steel tower. Also the structure number

1 again. The nearest road. Excuse me. Camp Creek Road
2 and Dixie Road. And then the nearest town. It says
3 "Twain" there.

4 Down here it says "Identified during crew work."
5 I don't recall -- this tag specifically I don't remember
6 it. It's got the lat/long on it. Basically, down here
7 it says "Clearances required to change" which means the
8 line needs to be de-energized.

9 "Going to replace all the insulators on the
10 tower." The insulators were flashed. It could have
11 probably -- it was probably during a lightening storm.
12 "There's no access to this tower" meaning no ground
13 access and it's going to require a helicopter to get
14 personnel and equipment there.

15 Q. Is there a date somewhere that indicates when
16 this occurred?

17 A. Let's see here. Yes. Okay. January 10th of
18 2017.

19 Q. So this was a notification that you generated?

20 A. Yes.

21 Q. All right. Let's flip the page behind there.

22 A. Okay.

23 Q. Go back to the back page.

24 A. Okay.

25 Q. Skip page 2. There's not --

26 Do you recognize what is on page 3?

1 A. Yeah. Pictures from the helicopter.

2 Q. Okay. Who took these pictures?

3 A. I would have.

4 Q. So walk us through how you get -- how you are to
5 take these pictures?

6 A. Okay. Basically, I just -- I bring a Sony
7 camera with me. And now I will bring the iPad and the
8 camera. If it's something that's a picture that I can
9 actually capture with the iPad, I will. If it's
10 something that I need to zoom in more, then I will use my
11 Cannon.

12 Q. Okay. So top picture we have picture 200. Is
13 that the structure number?

14 A. Yes, it is.

15 Q. And then we have another picture. It looks like
16 one picture is a close-up and one picture is far away;
17 right?

18 A. Yes, that's correct.

19 Q. And this thing you see on the bottom of the
20 bottom picture, is that the skid on the --

21 A. That is the skid from the ship, yes.

22 Q. -- on the helicopter?

23 So January of 2017 you were flying over this
24 tower trying to look for a problem; is that correct?

25 A. Yes.

26 Q. And what was the problem you were looking at?

1 A. This was flashed insulators.

2 Q. And what does that mean?

3 A. Oh, when -- it's usually due to lightening hits
4 the line. That is oftentimes where the lightening will
5 go to ground over the insulators. They are insulating
6 for 115 voltage, not for the voltage that lightening will
7 put on it. So it will actually burn a spot on the
8 insulator where it went to ground through the tower.

9 Q. You can stand up and use the board if you want
10 to.

11 Explain to us how you can see from a helicopter
12 that insulators are flashed.

13 A. Okay. Well, most of the time it will be right
14 here (indicating) where the insulator is flashed near the
15 steel. These are non-ceramic. So this is -- you know,
16 this is like porcelain. Some of them are glass. These
17 are like rubberized. But most of the time the flash will
18 be right about here (indicating), and it just looks like
19 a white spot on the insulator.

20 Q. How big?

21 A. It varies. It can be the size of a quarter or
22 they could be the size of a softball.

23 Q. Okay. How close do you have to get to see
24 flashed insulators?

25 A. That also varies. Sometimes you can see them as
26 you're approaching just depending on the lighting and

1 that sort of thing. Other times you get a real good look
2 and you have to have the pilot hover and look at it with
3 binoculars to tell.

4 Q. Okay. All right. Let's move on to Exhibit 251.
5 Do you see Exhibit 251?

6 A. Yes.

7 Q. Do you recognize Exhibit 251?

8 A. I don't remember it but, yeah. I mean, this is
9 a form that we used for sure.

10 Q. Okay. So what is this form marked as
11 Exhibit 251?

12 A. This is a tag for the same tower on the
13 Caribou-Palermo 24/200, and it has a damaged conductor.

14 Q. And what is the date on this one?

15 A. This one is the same date; January 10, 2017.

16 Q. So same tower, same date, two separate
17 notifications?

18 A. Yes.

19 Q. Can you explain to us why.

20 A. I don't know why. It's an accounting thing.
21 But, yeah, I don't know why. It has to be -- each
22 facility needs its own tag. So if you have damaged
23 insulators, damaged conductor, and it needs high voltage
24 signs, that's three different tags.

25 Q. Okay. So you don't just generate one tag to
26 cover everything in the tower?

1 A. No.

2 Q. So there's multiple problems in the tower and
3 you generate multiple tags?

4 A. Yes.

5 Q. All right. And this, as you said, is another
6 tag for 24/200?

7 A. Yes.

8 Q. Same date. And what is this tag for?

9 A. It is to -- that is the middle phase conductor
10 is damaged.

11 Q. Okay. So let's skip back again to page 3, I
12 think. Do you recognize the photographs on page 3?

13 A. Yes.

14 Q. And what are those photographs?

15 A. They are of the center phase and the condition
16 of the conductor.

17 Q. Okay. Describe for us real briefly what you
18 mean when you say "the center phase."

19 A. There's a three phase on a tower line. So two
20 of them on the Caribou-Palermo and two of them on the
21 outside of the tower and one of them is in the center of
22 the tower. So this is the center or the middle
23 conductor.

24 Q. So explain to us what we're looking at in these
25 photographs.

26 A. Basically, on this -- on this style of tower

1 there's insulators that are above the conductor. So we
2 have a set of insulators attached to the tower coming
3 down. The conductor is on the bottom of the insulator
4 there and then we have another set of insulators going
5 from the conductor down but basically holding that center
6 conductor because it literally goes through the middle of
7 the tower from swaying side to side.

8 Here the bottom insulator string had come loose
9 from the conductor and basically allowed that conductor
10 to swing and come in contact with the tower. And that is
11 where you see the --

12 Q. Feel free to get up there.

13 A. -- the damage here and here (indicating).

14 Q. Okay. Let me give you one more tool here to
15 play with. Come on. It takes a minute.

16 What color would you like?

17 A. Any color is fine.

18 Q. All right. You got red. So your finger is now
19 a pen. You can draw all over this.

20 A. Okay. So here we have damage, here we have
21 damage here, and this right here (indicating) we have
22 damage here as well. Those are things you can see that,
23 you know, have some strands missing there.

24 Q. Okay. So you believe based upon what you're
25 seeing that this conductor -- this energized conductor
26 came in contact with the tower structure itself?

A. Either -- that would be my guess. I don't know for sure, but that's with the -- with the bottom insulator string coming loose. It just allowed that conductor too much movement.

Q. What makes you think that the conductor came into contact with the structure?

A. The amount of damage.

Q. How so?

A. Usually, if it was lightening, you don't see the conductor damaged. It's mostly insulator damage. So this looks like to me something that it went straight to the ground.

Q. Okay. Let me save this, and we will get that marked as 251-A.

[Exhibit 251-A marked
for identification.]

BY MR. NOEL:

Q. Now, the photographs -- are these again taken from the helicopter?

A. I don't know.

Q. Okay. Well, let's move on. There is one more picture. I'm sorry. The last page.

Can you tell us what we're looking at in the last picture.

A. It looks -- it's the insulator string. I can't tell if maybe those are -- if that is arcing on the tower

1 or not. Where the conductor may have contacted that I
2 don't know.

3 Q. What do you mean "arcing"?

4 A. I can't tell if it's the leg. It may be this
5 discoloration right here (indicating). I can't tell if
6 that is just the tower drying off or if that is somewhere
7 that the conductor contacted. I'm not sure.

8 Q. So if the energized conductor contacted the
9 tower, the tower would be scarred by that?

10 A. Yes.

11 Q. Okay. All right. Let's move on to 252. Do you
12 recognize the document marked as 252?

13 A. Let's see here. I don't -- I mean, if -- this
14 looks -- this looks like one of our newer tags, but it
15 says "10/28/18 end date."

16 Yeah, it looks like one of our newer tags
17 whereas the ones with the yellow on them were our older
18 tags. This looks like one of our newer tags.

19 Q. Okay. And which tower structure was this?

20 A. This is also 24/200.

21 Q. Okay. And what I'm looking at specifically is
22 "reported by."

23 A. Yes. That is my LanI.D.

24 Q. And January 10, 2017?

25 A. Yes.

26 Q. So same date as the other two that we were just

1 looking at; correct?

2 A. Yes.

3 Q. And this is for conductor damage?

4 A. Yes.

5 Q. All right. Do you understand how this fits in
6 with the other -- the corrected work forms that you
7 actually fill out?

8 A. This -- to me this looks like a copy of the
9 actual tag that the foreman filled out when he completed
10 the repairs.

11 Q. Okay. So this isn't something that you
12 completed or that you necessarily know anything about?

13 A. No.

14 Q. Okay. So let's move on from that.

15 So now I want to talk a little bit about the
16 mechanics and the helicopter inspection itself.

17 A. Okay.

18 Q. We have talked about the inspection that you
19 actually did on the Caribou-Palermo line in 2017 and
20 other lines that you've done.

21 How many helicopter inspections do you think
22 you've done as a troubleman?

23 A. I couldn't count. I don't have an idea. A lot.

24 Q. You have quite a few lines that you're
25 responsible for; correct?

26 A. Yes.

1 Q. Explain to us the process of how you arrange a
2 helicopter for the aerial patrols.

3 A. Okay. At the beginning of the year we get
4 our -- we get our quarterly patrols so we know what is
5 due in first, second, and third quarter. Probably about
6 a month out you fill out a helicopter request form. And
7 it will have basically the dates that you'd like to fly
8 and what lines you're flying and if you have a specific
9 type of helicopter that --

10 You know, the higher elevation -- warm weather,
11 higher elevation you need a helicopter with more power
12 than if it's cool weather down here in the valley. So
13 you basically give them all that information and you
14 submit a request to Heli Ops.

15 Q. Okay. Helicopter request form. Describe it for
16 us.

17 A. It's just a form I bring up on the computer. It
18 asks when I want to fly, what lines I want to fly. It
19 asks how much I weigh, what equipment I'm going to be
20 bringing with me, if I have a preferred vendor to use,
21 and where I want to be picked up or where I want to meet
22 the pilot. That sort of thing.

23 Q. Okay. What do you mean a preferred vendor?

24 A. Well, we have multiple companies that we use.
25 So usually I will try to fly with someone that is here
26 local just to eliminate basically ferry time. I don't

1 want to have a pilot flying two hours before he picks me
2 up if possible.

3 Q. Okay. Is there a company that you normally fly
4 with?

5 A. I try to fly with A&P.

6 Q. And where is A&P located?

7 A. They are in Richvale just east -- or west of
8 Oroville.

9 Q. You said that you tell them what date you want
10 to fly?

11 A. We have to look at our schedule depending on how
12 our ground patrols are coming and what kind of switching
13 that we have.

14 Q. Excuse me a second. And then you indicate where
15 you want to be picked up?

16 A. Yes.

17 Q. Explain, please.

18 A. Well, if I'm going to use the A&P, for instance,
19 I will drive to their hanger and get in the ship there.
20 If it's another vendor, I usually get picked up at the
21 Oroville Airport. So that is something -- they just want
22 something -- basically an idea of where you're going to
23 meet the pilot.

24 Q. Okay. And all of this is put into a form that
25 you said is submitted to where?

26 A. To helicopter operations.

1 Q. And what is helicopter operations?

2 A. It's a department within PG&E. They are down in
3 Vacaville. They kind of oversee basically, you know,
4 when -- who's flying where and what ships are in the area
5 for safety reasons.

6 Q. Okay. All right. Is there some process for
7 requesting the helicopters?

8 A. That form. For me that is the process. Once it
9 goes to Heli Ops, they will check and see what ships are
10 available or if any at all.

11 Q. All right. How many helicopter aerial patrols
12 do you do at a time?

13 A. Do you mean how many lines at one time?

14 Q. Yes, Sir.

15 A. They would vary. It just depends on how many
16 you're assigned right then. And also you can have so
17 many that you can't do it in one day. Usually it takes
18 two or three days to complete them all.

19 Q. Okay. So I want to go to Exhibit 253 which is
20 next in order there. Now, do you recognize Exhibit 253?

21 A. I don't. I recognize the lines on it, but I
22 haven't seen this before.

23 Q. Okay. This is an e-mail; correct?

24 A. Yes.

25 Q. And it was sent from someone named (WITNESS
26 #21)?

1 A. Yes, that's correct.

2 Q. And do you know (WITNESS #21)?

3 A. Yes, I do.

4 Q. Who is (WITNESS #21)?

5 A. She's our clerk at Table Mountain.

6 Q. Okay. And to someone named Aja Lodigiani?

7 A. Yes. She's a lady that works at Heli Ops.

8 Q. Okay. Down in Vacaville?

9 A. Yes.

10 Q. And it's cced to (WITNESS #22). Who is (WITNESS

11 #22)?

12 A. He is my supervisor.

13 Q. And (WITNESS #18)?

14 A. (WITNESS #18) is also a transmission troubleman.

15 Q. Okay.

16 A. Myself. (WITNESS #10) is a transmission

17 troubleman. (EMPLOYEE #16) is also a transmission

18 troubleman. And I don't know what Stacie Doyle does.

19 Q. Okay. And this is an e-mail from September 22nd

20 of 2017; correct?

21 A. Yes.

22 Q. Now, specifically what we're talking about is

23 this (indicating) down here in green; right? "Flown on

24 9/13/17."

25 A. Yes.

26 Q. There's three entries in there.

1 A. Yes, that's correct.

2 Q. Caribou-Palermo, Caribou-Westwood, and Butt
3 Valley Caribou?

4 A. Yes.

5 Q. Correct?

6 A. Yes.

7 Q. What are Caribou-Westwood and Butt Valley
8 Caribou?

9 A. Caribou-Westwood is a 60 kV line. It's a wood
10 pole line. It runs from Caribou Powerhouse to Westwood
11 Substation.

12 Q. And where is Westwood Substation?

13 A. Westwood Substation is in between Chester and
14 Susanville. It's in the town of Westwood. The Butt
15 Valley Caribou is a 115 steel tower line that runs from
16 Butt Lake to Caribou Powerhouse.

17 Q. Okay. And these were on 9/13 of '17?

18 A. Yes.

19 Q. So that is the same date that you did the 2017
20 aerial patrol of the Caribou-Palermo; correct?

21 A. Yes.

22 Q. So you actually patrolled three lines that day?

23 A. Yes, that's correct.

24 Q. And the day before you did three other lines; is
25 that correct?

26 A. Yes.

1 Q. So this e-mail is just showing the schedule of
2 lines that you're doing?

3 A. Yes.

4 Q. Okay. How long does it take generally to fly
5 the Caribou-Palermo?

6 A. Oh, I would say depending on conditions three to
7 four hours.

8 Q. All right. So I want to talk about things
9 you're looking for. You said earlier -- let me make sure
10 I got it right. When you're doing an aerial patrol, you
11 are looking for glaring issues; is that correct?

12 A. Yes.

13 Q. You also said you're not paying attention to
14 smaller details. What would you consider smaller
15 details?

16 A. Smaller details to me are, you know, like the
17 markings, the tower number, the high voltage signs. That
18 sort of thing.

19 Q. What about connection points?

20 A. I think connection points are very important.
21 Unfortunately, it's not -- it's not something that you're
22 going to be able to, oh, kind of really dissect in an air
23 patrol.

24 Q. How come?

25 A. There's various reasons. Depending on the
26 proximity of the other transmission lines, trees,

1 mountains, weather, sun angle, sometimes you can't hover.
2 Sometimes the best you can do is make a very slow pass.
3 All those things just make it difficult to see something
4 in great detail.

5 Q. Okay. So how would you look at connection
6 points?

7 A. I would -- I would look at them as we went --
8 you know, on the patrol the same as I would look at an
9 insulator. And if I saw something that caught my
10 attention, at that point I would ask the pilot to
11 position himself the best he can and I would look at it
12 with binoculars.

13 Q. In your experience as a troubleman now, what do
14 you think would be the best way to inspect towers for
15 issues of wear of the cold-end connection points?

16 A. The best way to look at the cold-ends? Ground
17 patrols are good. You can be limited sometimes by
18 terrain. And the drone inspections that they're doing
19 are getting some really good pictures as well.

20 Q. Okay. What about climbing?

21 A. Yeah, the climbing inspections are kind of a
22 different department. So I'm sure that climbing
23 inspections are great as well.

24 MR. NOEL: Okay. Do you guys want a break? I
25 was going to try and finish this up as quick as I could.

26 GRAND JUROR NUMBER FIVE: Finish.

1 GRAND JUROR NUMBER EIGHTEEN: Finish.

2 MR. NOEL: Finish? All right.

3 BY MR. NOEL:

4 Q. You say climbing inspections are a different
5 department?

6 A. Yes. To my knowledge, the tower department does
7 the climbing inspections.

8 Q. So to your knowledge troublemen aren't supposed
9 to climb towers?

10 A. I wouldn't say that. I've climbed lots of
11 towers.

12 Q. To inspect or to repair?

13 A. To repair.

14 Q. To repair. So let me rephrase that. Troublemen
15 are not supposed to climb towers to inspect towers;
16 correct?

17 A. I don't know that.

18 Q. But you've been doing this for a couple of years
19 now?

20 A. Yes.

21 Q. Have you ever climbed a tower to do an
22 inspection?

23 A. I've climbed a tower to get a better picture of
24 something that I saw from the ground.

25 Q. Okay. Do you recall when and what tower?

26 A. It was -- I don't remember the tower. It was on

1 the Bucks Creek Rock Creek Cresta.

2 Q. Have you ever climbed a tower on the
3 Caribou-Palermo?

4 A. Yes, I have.

5 Q. As a troubleman or as a lineman?

6 A. As a lineman.

7 Q. And why did you climb the tower on the
8 Caribou-Palermo?

9 A. We were making repairs. We were changing
10 insulators and also repairing hold-downs.

11 Q. Okay. Do you remember what towers you were on?

12 A. I don't remember specific numbers, no.

13 Q. Do you remember when that occurred?

14 A. Oh, the last time I worked on the
15 Caribou-Palermo was probably April of 2018.

16 Q. As a lineman?

17 A. I was -- as a troubleman I assist the line crew
18 when they need extra help.

19 Q. And what were you doing in April of '18?

20 A. We were changing insulators and also making
21 repairs to the hold-downs.

22 Q. Okay. But you don't remember exactly what
23 towers?

24 A. I don't remember specific numbers, no.

25 Q. Do you remember if it was upstream from Big Bend
26 or downstream?

1 A. Oh, it was upstream from Big Bend for sure,
2 yeah.

3 Q. Okay. Closer to Caribou or closer to Big Bend?

4 A. Closer -- oh, oh, like closer to Belden. Just
5 down river from Belden. So that's closer to Caribou.

6 Q. Okay. Somewhere between Belden and Rock Creek?

7 A. Yes.

8 Q. Do you remember why you were changing out
9 insulators and tie-downs?

10 A. Oh, the insulators were flashed and the
11 tie-downs had come loose.

12 Q. All right. Switching gears again now I want to
13 go through a series of photographs with you starting off
14 with 254, Exhibit 254.

15 Do you see Exhibit 254?

16 A. Yes, I do.

17 Q. Do you see anything in that photograph that
18 would concern you?

19 A. Yes, I do.

20 Q. What's that?

21 A. Oh, this -- the closest C-hook here is well worn
22 into that piece of iron.

23 Q. How can you tell that?

24 A. I can just tell by the picture that it is worn
25 in there. I can see it worn in the metal and there is
26 quite a bit of the hole exposed above the C-hook.

1 Q. When you say "quite a bit of the hole," you're
2 talking about up here at the top?

3 A. Yes.

4 Q. There's not supposed to be that much hole
5 exposed?

6 A. No. That would not be desirable, no.

7 Q. Okay. Is that something you can see from a
8 helicopter?

9 A. In my opinion, that's not something I could see
10 from a helicopter.

11 Q. Okay. Let's move on to 255. Do you see
12 anything wrong in that photograph?

13 A. I would say again it looks like -- it doesn't
14 look as extreme as 254, but it does look like it is worn
15 into the steel again.

16 Q. "It" being what?

17 A. The C-hook.

18 Q. Let's move on to the next one which is actually
19 193. Did they get out of order? There you go.

20 So now you're looking at the photograph marked
21 as Exhibit 193?

22 A. Yes.

23 Q. And do you see an issue in that photograph?

24 A. It does. The C-hook does look worn into the
25 plate.

26 Q. How can you tell that?

1 A. If you look at the bottom of the C-hook, it's
2 lower than where the circle in the plate -- the bottom of
3 the circle in the plate should be.

4 Q. Okay. So does the amount of space at the top --
5 between the top of the C-hook and the top of the hole --
6 is that significant in your experience?

7 A. I would pay attention to that amount of space,
8 but that does vary sometimes. What I'm more looking at
9 is the C-hook. Like how far it is seated into that hole?

10 I've looked at lots of these towers since the
11 investigation started. And when I look at a C-hook from
12 back -- from the back of the C-hook -- not the open side
13 of the C-Hook. I can't -- for some reason I can't see it
14 from the open side of the C-hook. But from the back of
15 the C-hook from the ground, I could see that the C-hook
16 was seated deeper in the eye than it would have been
17 originally. The reason that -- the space on top of it,
18 that would, you know, be something to look at.

19 But it does vary. Different generations --
20 well, different generations of C-hooks are built
21 differently. Some of them are -- you know, the newer
22 ones are thicker, they're beefier, and they take up more
23 of the eye in the plate.

24 Lots of those towers have multiple coats of
25 paint. And that actually takes up some space as well on
26 some of the towers. T when I can get a view of the back

1 of the C-hook, that's when I get my best view if it's
2 been wearing into the plate.

3 Q. Okay. Now, you mentioned that you've seen lots
4 of this during the investigation. What investigation are
5 you talking about?

6 A. The investigation over the Camp Fire.

7 Q. Okay. So have you been out reinspecting the
8 Caribou-Palermo since the Camp Fire?

9 A. No, I have not. I -- just for access and
10 knowing where the towers are I have taken people out
11 there.

12 Q. Okay. But you yourself weren't inspecting them?

13 A. No.

14 Q. All right. Let's move on to 183. It should be
15 2160. There you go.

16 Looking at the photograph marked 183, again do
17 you see anything that would be a problem?

18 A. It looks worn in. It doesn't look as severe as
19 some of these other ones, but it does look like it has an
20 oblong hole a little bit.

21 Q. Okay. And would that be something that would be
22 visible from a helicopter?

23 A. In my opinion, that kind of detail is not -- it
24 would have to be perfect conditions. That kind of detail
25 wouldn't catch my eye in a helicopter.

26 Q. Okay. Next is number 256.

1 A. Is that the number of the photo?
2 Q. The number on the tag.
3 A. Oh, okay.
4 Q. Should be right there.
5 Do you see the photograph marked as Exhibit 256?
6 A. Yes.
7 Q. And anything in this photograph that would catch
8 your attention?
9 A. No. I mean, I can't -- I can't -- that's not
10 something I'm going to catch from a helicopter.
11 Q. Okay.
12 A. You know.
13 Q. Moving on now we're at 184. Do you have 184?
14 A. Yes, I do.
15 Q. Anything on that photograph that would catch
16 your attention from a helicopter?
17 A. No, not that I can -- not that I can see.
18 Q. Looking at the photograph is there anything that
19 catches your attention?
20 A. Yes. It also looks worn into the steel.
21 Q. And when you say "it, what --
22 A. The C-hook.
23 Q. The C-hook?
24 A. Yes.
25 Q. All right. Let's move on to Exhibit Number 37.
26 A. Oh.

1 Q. Exhibit 37 is easy to find because it's the only
2 one on photo paper.

3 Are you looking at Exhibit 37?

4 A. Yes, I am.

5 Q. Anything that you see on that photograph that
6 would concern you?

7 A. I can't tell on this one. It looks like it
8 might be -- the C-hook might be worn into the plate a
9 little bit, but I can't tell.

10 Q. One other thing unusual. This plate -- have you
11 ever seen that before?

12 A. No, I cannot say that I have.

13 Q. Okay. Anything about the string -- the
14 insulator string that is unusual?

15 A. No, not that I see.

16 Q. Let's move on to 257. Do you have Exhibit
17 Number 257?

18 A. Yes, I do.

19 Q. This is a photograph marked "Tower 243."

20 A. Yes.

21 Q. Anything that you see in that photograph that
22 would concern you?

23 A. Yes. This one is very concerning. It's
24 severely worn.

25 Q. What's severely worn?

26 A. The C-hook is severely worn into the plate.

1 Q. Let me -- let's use our Smart Board up here
2 again and tell me what you're talking about.

3 A. So we have the hole -- the round hole here. And
4 you can see that it just continues straight down to not a
5 lot of steel left.

6 Q. So you're talking about right in here
7 (indicating); right?

8 A. Yes.

9 Q. This hole is -- it's almost like a keyhole
10 shape, isn't it?

11 A. Yes.

12 Q. Is that the way it's supposed to be?

13 A. No.

14 Q. So that is pretty extremely worn?

15 A. Yes.

16 Q. And can you tell what type of tower this is or
17 which phase we're looking at here?

18 A. I would assume this is a middle phase. I can't
19 tell for sure, but I don't see an end of the tower on
20 either side. Some of my assumption would be this is a
21 center phase or maybe a jumper support of some kind.

22 Q. Okay. Is this something that would have been
23 visible from a helicopter?

24 A. No. This is completely on the underside of this
25 beam right here (indicating).

26 MR. NOEL: Okay. Let's save that one. And that

1 will be 257-A.

2 [Exhibit 257-A marked
3 for identification.]

4 BY MR. NOEL:

5 Q. All right. Let's move on to 175. I'm sorry.
6 Those got out of sequence. There's 175.

7 Do you see anything in the photograph marked as
8 175 that would concern you?

9 A. I can't see with enough detail to tell anything
10 on this.

11 Q. Okay. Can you see the connection points for the
12 insulator strings, the jumper strings?

13 A. Yes.

14 Q. Actually, let's back up. I should probably ask
15 you about that. What kind of tower is this?

16 A. That is a transposition power.

17 Q. Okay. And that's different from most of the
18 other towers?

19 A. Yes.

20 Q. And we're talking about the left phase here and
21 the connection point between the insulators, the C-hook,
22 and the tower arm; correct?

23 A. Okay.

24 Q. Do you see anything about that connection point
25 that would raise concerns?

26 A. I can't tell. It looks like there's more air,

1 more space, but the underside is down in the shadow. The
2 top one is up in the sunshine. So I mean, I can't see
3 with enough detail.

4 Q. Right. But there's an awful lot of light
5 showing through that hole, is there not?

6 A. Yes.

7 Q. And that would be something that would be
8 visible from a helicopter, wouldn't it?

9 A. Possibly.

10 Q. Okay. Let's go on to 187. Is there anything in
11 187 that concerns you?

12 A. One eighty-seven makes it look like the other
13 side is worse now, but I can't -- I can't see with enough
14 detail to tell if it's worn. But there is a space with
15 light in there.

16 Q. Okay. Let's go to 188.

17 A. One eighty-eight looks like it could be worn a
18 little bit. It doesn't look too severe to me, but it
19 looks like it could be worn down.

20 Q. Okay. Could that be something that you could
21 see from a helicopter?

22 A. I'm sure it's possible. These pictures look
23 like drone pictures to me. So drone pictures are -- you
24 know, they get quite a bit closer than a helicopter can,
25 but I'm sure that, you know, it could be possible.

26 Q. So when you're up in the helicopter, you have

1 stabilizing binoculars; correct?

2 A. Yes.

3 Q. And you have a camera?

4 A. Yes.

5 Q. An actual camera, not a cellphone; right?

6 A. Yeah, an actual camera.

7 Q. And do you have any type of telephoto lenses or
8 anything to use?

9 A. The camera has a zoom on it. The lenses aren't
10 detachable, but it does zoom.

11 Q. Okay. So you can get much closer --

12 A. Yes.

13 Q. -- then you actually are?

14 Okay. All right. Let's move on to 176. Do you
15 see anything in 176 that concerns you?

16 A. The closest C-hook looks like it could be worn
17 into the steel a little bit.

18 Q. Again, is this something that would be visible
19 from the helicopter?

20 A. Possibly.

21 Q. And other than a helicopter how would you be
22 able to see this?

23 A. This looks like it's taken -- because of how far
24 that hillside is on the other side, I know that is across
25 the canyon. So if I was on a ground patrol, I could be
26 on this side of the hill. You know, get myself up high

1 to where I'm looking straight across at this and get a
2 good view of it.

3 Q. All right. Let's look at 247. Nope. It should
4 be the last one in there, I think. Where did it go?

5 A. I'm not sure.

6 Q. Maybe -- I thought I pulled it. We can use the
7 photograph on the board. We've got the photograph of
8 Exhibit 247 with the exhibit sticker on it signed by the
9 foreperson dated June 25, '19.

10 Anything on the photograph marked as 247 that
11 would catch your attention?

12 A. No, nothing I can see.

13 Q. Okay. Let's move on to 191.

14 A. That -- I have 191. That C-hook does look worn
15 into that steel.

16 Q. And is that something that you could see from
17 the helicopter?

18 A. I don't think so.

19 Q. And let me rephrase that. Is that something
20 that you can see from the helicopter as you do patrols?

21 A. In my opinion, this is not something that I'm
22 going to catch in an air patrol.

23 Q. The way that you're flying; correct?

24 A. The way that -- yeah, the way that air patrols
25 are done.

26 Q. Okay. 192.

1 A. I can't really tell. I mean, it looks like it
2 could possibly be worn in but -- yeah, it looks worn a
3 little bit. There's quite a bit of a hole at the top,
4 but I can't see underneath.

5 Like I said, this -- I don't know why. The
6 opening side of the C-hook I can't see it the way I can
7 see the backside, but it does look worn.

8 Q. Okay. But normally, the backside that you were
9 looking at, that would be the outside of the hole or
10 outside the tower; correct?

11 A. It varies depending on who put the C-hook there.
12 They will go in from either direction. Usually, if it's
13 a helicopter that is bringing you the insulators, then
14 you want, you know, the outside of your C-hook facing out
15 so when the helicopter brings you the insulator, you
16 slide it right on. But, yeah, it can vary.

17 Q. All right. And finally, I believe 185. Do you
18 see anything about that photograph that --

19 A. It looks like it could be worn in a little bit.
20 It doesn't -- there's a lot of steel underneath that
21 C-hook still, but it looks like it could be worn down.

22 Q. Okay. And again, have you ever seen these
23 brackets before?

24 A. I -- I have not noticed those type of brackets
25 specifically.

26 Q. Okay. And I was wrong. There is one more. We

1 have 186. There should be 186 up there someplace.

2 A. I could look at it on the screen.

3 Q. Awe-huh. I left it in there. Sorry.

4 All right. And there's Exhibit 186.

5 A. So it looks like the plate was added. The
6 previous hole is reamed out for sure.

7 Q. When you're talking about the plate, you're
8 talking about this two-bolt bracket that is bolted on the
9 end of the tower arm?

10 A. Yes.

11 Q. And you're talking about the previous hole would
12 be the hole in the arm itself in the background?

13 A. Yes.

14 Q. That hole is not supposed to be that shape?

15 A. No.

16 Q. Which shape is that hole supposed to be?

17 A. It's supposed to be round.

18 Q. All right. And then what about the C-hook
19 itself?

20 A. It looks like a newer style C-hook to me. It's
21 hard to tell. It looks beefier than the older style. I
22 mean, it's discolored, but the C-hook looks fine.

23 MR. NOEL: All right. That's all the questions.

24 MR. FOGG: I have some questions.

25 MR. NOEL: Go ahead.

26 **EXAMINATION**

1 BY MR. FOGG:

2 Q. Mr. (WITNESS #6), I have a couple questions for
3 you. I won't make you go through the whole thing again
4 though, I promise.

5 Exhibit 257; is that a typical perspective you
6 could see from a ground inspection?

7 A. It would vary upon terrain.

8 Q. How would it vary given the terrain?

9 A. Sometimes in the canyon it literally could be
10 just super rocky, super steep. There's also areas where
11 there's lots of brush. So that can dictate where you can
12 stand and look at it. But I think that it would be
13 fairly reasonable to get this view from a ground patrol.

14 Q. Is it fair to say though that the only way to
15 see this cold-end attachment point like 257 on a ground
16 patrol would depend on the terrain around the tower and
17 how well you can get a vantage point of the cold-end
18 attachment plate? Is that fair?

19 A. Yes.

20 Q. Before the Camp Fire in your work with PG&E, had
21 you seen a worn C-hook on a transmission tower?

22 A. I had -- when we change insulators, we install
23 new C-hooks. I had seen C-hooks that were lightly worn.
24 I'd never seen anything with like an obvious groove in
25 it, no.

26 Q. Before the Camp Fire, had you received any

1 training from PG&E about C-hooks wearing out?

2 A. No. I had not -- I had not ever heard of a
3 C-hook failing.

4 Q. Before the Camp Fire, did you know that a C-hook
5 could fail?

6 A. No, I did not.

7 Q. And before -- in the pictures you've seen today
8 you mentioned a couple of times various things in the
9 pictures that caught your attention; is that correct?

10 A. Yes, that's correct.

11 Q. Before the Camp Fire, would these pictures have
12 caught your attention?

13 A. Yes.

14 MR. FOGG: Okay. I don't have any other
15 questions.

16 Do the grand jurors have any questions for
17 Mr. (WITNESS #6)?

18 So, Mr. (WITNESS #6), we'll need a minute to
19 gather the questions and take a look at them and I'll ask
20 them.

21 THE WITNESS: Would it be all right if I go get
22 a drink real quick? Or is it going to be quick?

23 MR. NOEL: It should be quick.

24 THE WITNESS: Okay.

25 MR. NOEL: It should be quick.

26 [Counsel conferring off the record.]

1 MR. NOEL: All right. We have a few questions
2 from the jurors for you. It's just like questions we
3 asked you, only better.

4 **FURTHER EXAMINATION**

5 BY MR. NOEL:

6 Q. Did you receive any official training on how to
7 determine the priority of a repair; for instance, "A"
8 now, "B" 90 dates, or "E" one year?

9 A. I did receive some training on, you know, how
10 we're going to categorize issues. It's the training that
11 you receive. The examples are very obvious. So
12 extremely broken -- a broken pole laying in the road, you
13 know, a tower down, those are obvious "A" tags. There
14 was some -- as I remember, there was some good examples,
15 but for the most part you're giving -- you know, giving
16 your opinion on how long something is going to last is
17 exactly that. It's just your opinion.

18 And if -- the more experience you have, the more
19 you understand, like, how long something will last even
20 though it could look, you know, fairly damaged. But it's
21 just something that comes with experience. It's
22 something that you're going to take into consideration
23 the circumstances.

24 If it's something that is going to fall down
25 across a major highway, then it's going -- you know, it's
26 going to get a pretty good priority to get changed out

1 quickly. If it's something that has a large consequence,
2 it's going to get scrutinized more and get a quicker fix
3 date.

4 But for the most part, you're getting -- or
5 you're determining the time factor by your experience and
6 just all the surrounding conditions that you can kind of
7 put together.

8 Q. Just a couple follow-ups from me on that. Did
9 any of your training include how to determine how long
10 it's going to go?

11 A. I can't say I was trained to determine that.
12 There are conditions that, you know, if you have to use a
13 snow cat to get there, if you have to use a helicopter to
14 get there, you know, that could determine, oh, kind of
15 the timeframe that you would do it in. Just -- oh, just
16 overall conditions. You just take a lot of things into
17 consideration.

18 Q. Okay. Like we still have 257 up here on the
19 board this photograph. We're talking at this wear, this
20 keyhole in the connection eye in the C-hook. Any
21 training at all in how long it takes for that weld --
22 that metal to wear?

23 A. No.

24 Q. Since you've been a troubleman, have you
25 received anything from PG&E indicating how long it takes
26 metal to wear like that?

1 A. No.

2 Q. And have you received anything at all with
3 regards to the age of towers and the life expectancy of
4 towers?

5 A. No, I haven't.

6 Q. Okay. All right. When done with PG&E training,
7 are you required to take a test?

8 A. Some training, yes. Some training it's -- it's
9 a written test or on the computer. Some training it's
10 actually a practical test. Not all of them but most of
11 them there's some sort of a test.

12 Q. Okay. To become a troubleman did you have a
13 test?

14 A. I didn't have a specific test. You have to be a
15 journeyman lineman for two years and there are numerous
16 classes that you have to -- every training that I had
17 there was -- well, for instance, the switching training I
18 had, there's testing at the end of those. The climbing
19 classes, those are all practical. You're climbing during
20 the classes and stuff like that.

21 Q. Okay. And do you receive a certificate at the
22 end of the training?

23 A. You do for those. I didn't receive a
24 certificate for becoming a troubleman, but I did get
25 certificates for my trainings, yes.

26 Q. And was there -- again, no specific training on

1 how to do inspections?

2 A. Not other than the Electric Transmission
3 Preventative Maintenance Manuel.

4 Q. As a sedgeway are you required to read the
5 manual completely?

6 A. No. I used to carry my manual with me. I carry
7 multiple manuals with me and refer to them when I have
8 questions. For the most part for me when it comes to
9 actual rules and regulations, you know, I learned those
10 during the class and from my supervisor in that. When I
11 come across stuff that I'm unsure of in the field, I
12 contact other troublemen or foremen and bounce ideas off
13 of them.

14 Q. During your training, does PG&E go over the
15 policy manuals completely?

16 A. Not completely.

17 Q. Do you know the size of the hole where the
18 C-hook goes through?

19 A. I do not know the exact dimensions.

20 Q. Do you know the diameter of the C-hook?

21 A. No, I don't.

22 Q. That wasn't part of your training?

23 A. No.

24 Q. On a non-routine inspection do you inspect the
25 entire line or just the area where the error occurred?

26 A. That varies. If it's -- if you have a good day

1 just weather-wise and you look at the -- you start in the
2 target area and you don't find anything, then oftentimes
3 you will look at the whole circuit.

4 There are some circuits that -- well, you'd
5 still look at the whole circuit if you had time. There
6 are some circuits that take hours and hours to look at.
7 So there are times the weather permitting when you're
8 only going to look at your target area and then you might
9 get blown out or whatever. And there are other times
10 when you will look at the whole circuit.

11 Q. Did you receive any training for size, age,
12 metal fatigue, characteristics, structural hardware, and
13 attachments to the towers?

14 A. No.

15 Q. During air inspections do you routinely look for
16 out-of-ordinary wear or hanging hardware in tower arms
17 and braces?

18 A. During an air inspection as I'm finishing the
19 tower we're leaving, when we're approaching the next
20 tower, I am looking for anything obvious, anything that
21 might be hanging down, any loose steel or something like
22 that. But for the most part, on air inspections I am
23 mostly looking at conductors and insulators.

24 Q. And for insulators that's flashing; correct?

25 A. Flashing or broken insulators.

26 Q. Not the connection points?

1 A. No.

2 Q. Does the list of previously written tickets
3 indicate whether the issue has actually been fixed?

4 A. Most of the time if it's on the prior sheet, it
5 has not been completed. There are circumstances
6 sometimes where the prior might be listed and the work
7 has already been done. But for the most part, if you
8 receive the priors, then that particular item hasn't been
9 worked yet.

10 MR. NOEL: Okay. Anything further?

11 I don't think we have anything further for you
12 today. Madam Foreperson is going to have an admonition
13 for you.

14 GRAND JURY FOREPERSON: Mr. (WITNESS #6), you
15 are admonished not to discuss or disclose at any time
16 outside of this jury room the questions that have been
17 asked of you or your answers until authorized by this
18 grand jury or the Court. A violation of these
19 instructions on your part may be the basis for a charge
20 against you of contempt of court. This does not preclude
21 you from discussing your legal rights with your own
22 attorney.

23 Mr. (WITNESS #6), what I have just said is a
24 warning not to discuss this case with anyone except the
25 Court, your lawyer, or the district attorney.

26 Do you understand?

1 THE WITNESS: Yes, I do.

2 GRAND JURY FOREPERSON: Okay. Thank you.

3 MR. NOEL: You're free to go. And thank you
4 very much, Sir.

5 THE WITNESS: All right. Thank you.

6

7 (PROCEEDINGS OMITTED.)

8

9 [Whereupon the luncheon recess is taken
10 from 11:38 a.m. until 1:38 p.m.]

1 AFTERNOON SESSION

2 JULY 16, 2019

3
4 (ROLLCALL OMITTED.)

5
6 MR. NOEL: Are we prepared for this afternoon?

7 GRAND JURY FOREPERSON: We are prepared. All
8 members of the jury are present and ready to go.

9 MR. NOEL: Thank you.

10 Next witness will be Investigator Nick Moore.

11 GRAND JURY FOREPERSON: Mr. Moore, before you
12 have a seat, would you mind raising your right hand to be
13 sworn in, please.

14 Mr. Moore, do you solemnly swear that the
15 evidence you shall give in the matter pending before the
16 grand jury shall be the truth, the whole truth, and
17 nothing but the truth so help you God?

18 THE WITNESS: I do.

19 GRAND JURY FOREPERSON: Thank you. Have a seat,
20 please.

21 **EXAMINATION**

22 BY MR. NOEL:

23 Q. For the record, could you please state your name
24 spelling your last name.

25 A. Nicholas Moore, M-o-o-r-e.

26 Q. By whom are you employed?

1 A. I am employed by the Butte County District
2 Attorney's office as an investigator.

3 Q. And what is an investigator?

4 A. An investigator is a peace officer in the State
5 of California.

6 Q. What are your duties as an investigator?

7 A. I'm currently assigned as the environmental
8 investigator specifically investigating environmental
9 crimes. And at the moment I have been tasked with the
10 investigation of the Camp Fire and PG&E's involvement.

11 Q. How long have you been an investigator with the
12 Butte County District Attorney's Office?

13 A. Been employed full-time for approximately
14 14 months and worked two years prior to that as an extra
15 help investigator.

16 Q. How long have you been a peace officer?

17 A. Been a peace officer since 2004.

18 Q. Prior to coming to the Butte County District
19 Attorney's Office, where did you work?

20 A. Prior to that I worked in the state of Colorado
21 as a deputy sheriff in Routt County for two and a half
22 years and then I moved to the Steamboat Springs Police
23 Department in Routt County where I worked for
24 approximately another eight and a half years before
25 moving to California.

26 Q. You said your current assignment is the Camp

1 Fire?

2 A. That is correct.

3 Q. Describe your duties as an investigator on the
4 Camp Fire.

5 A. As a lead investigator in the Camp Fire I have
6 been helping to coordinate a multi-agency investigation
7 into the cause and origin of the fire and various
8 responsibilities of multiple agencies both state, local,
9 and federal into the matter understanding their complex
10 dynamics of both the regulatory and the legal system and
11 how it may apply to PG&E's involvement and maintenance of
12 their electric transmission lines.

13 Q. As an investigator do you also review documents
14 received from PG&E?

15 A. I do.

16 Q. And can you explain that process for us.

17 A. Over the last several months we have made a
18 series of data requests in cooperation with PG&E's
19 attorneys as well as the grand jury to obtain documents
20 on a variety of topics. In particular of late we have
21 been reviewing the documents that pertain to maintenance,
22 the schematics, and overall understanding of the
23 different components in the electric transmission system.

24 Q. Pull the microphone over in front so it's a
25 little easier to hear you.

26 How are those documents stored?

1 A. We receive a hard drive from PG&E that contains
2 several gigabytes, if not terabytes of data. We receive
3 multiple downloads of information which we refer to as
4 data dumps. Those data dumps are received here at the
5 court in a sealed envelope with an encrypted hard drive.
6 Those hard drives are then taken and downloaded into
7 servers both here and at the attorney general's office.

8 They are all Bates stamped by PG&E so they have
9 a number that correlates to each and every document. And
10 then through the use of the attorney general's software
11 we are able to search those documents for different terms
12 and things that may be found on those documents and begin
13 reviewing each of those documents.

14 Q. I want to go back to the Bates stamp. What is a
15 Bates stamp?

16 A. A Bates stamp is a number that is provided by
17 PG&E to reflect the document's authenticity. There's
18 only one correlating Bates stamp per document. And so
19 it's a way to track each of those documents.

20 Q. We've gone over this. We've heard this before
21 but never had an explanation for it. The number that is
22 generally somewhere on the margin of every page
23 "PG&E-Camp-CF-000000001," is that what you're referring
24 to as the Bates stamp?

25 A. Yes.

26 Q. And that is something that PG&E puts on the

1 documents before they turn them over to us?

2 A. That is correct.

3 Q. Okay. We've seen several different variations
4 "PGE-Camp-CF, PGE-Camp-BC, PGE-Camp-GJ." Do you know the
5 difference?

6 A. I don't know all of the exact designators. I
7 know for sure those that are marked "GJ" refer to
8 subpoenas SDTs from the grand jury itself.

9 We received documents in a variety of different
10 configurations both through formal requests through our
11 office, and I believe each of those designators reflect a
12 different portion of time in the investigation.

13 Q. Now, as part of your duties as an investigator
14 were you asked to mine the documents provided by PG&E for
15 documents pertaining to the age of the Caribou-Palermo
16 line?

17 A. Yes, I was.

18 Q. What were you able to find?

19 A. In both my review of those documents and the
20 information provided by PG&E and that of my fellow
21 investigative team, we were able to determine that the
22 Caribou-Palermo line was built circa 1920. So
23 approximately in the 1920 date range is when construction
24 was ensuing and these towers were designed and put
25 together.

26 Q. What kind of documents did you locate in the

1 documents received from PG&E indicating that this tower
2 or these towers were built around 1921?

3 A. We received legal letters from their attorneys
4 outlining the request and the production of the data and
5 then kind of a synopsis of each of those data dumps. And
6 in particular, we received different schematics that had
7 different dates on them. There are different material
8 lists and things of that nature that date back to that
9 timeframe.

10 Q. You have in front of you what is marked as
11 People's Exhibit 259. And that is also being displayed
12 on the big board.

13 Do you recognize Exhibit 259?

14 A. Yes, I do.

15 Q. What is Exhibit 259?

16 A. Exhibit 259 is a Bates stamped PG&E-Camp-CF and
17 the last four digits are 1493. It is a schematic. In
18 particular, it has kind of in the center -- lower center
19 right a picture of a suspension hook which is used to
20 hold the insulator string onto the towers. And it gives
21 a dimension of that suspension hook as well as a part
22 number.

23 Q. Okay. We have a big board up here and you can
24 use it if you want to if you want to use the pen to
25 circle and tell us what you're talking about.

26 A. This particular --

1 Q. Oops. It takes a minute to kick in. There we
2 go.

3 A. This particular image right here (indicating) is
4 that of a suspension hook. I will actually refer to --

5 Do you want to take it off the marker?

6 Q. Okay. That's not going to let us blow it up.

7 A. I'll just go back to the piece of paper here.
8 If you look at the image itself, it's a little too blurry
9 to read.

10 There's a series of numbers on the document
11 you've been provided. If you look at this particular
12 portion of the hook and the corresponding number, there's
13 a measurement of 15/16ths indicating the diameter of the
14 hook at that portion. And there's also several other
15 diameters including the gap between the hook which is
16 15/16ths as well. And the hook from right to left is
17 approximately 2 and 13/16ths in measurement.

18 Q. So at its apex here this hook is 15/16ths of an
19 inch?

20 A. That's correct.

21 Q. Okay. All right. Let's move on to 260. It
22 needs to be rotated. There you go.

23 Do you recognize Exhibit 260?

24 A. I do. Two sixty is Bates stamped
25 PGE-CampFire-CF -- excuse me. Camp-CF-1342. It is a
26 schematic of the support arm for a transposition tower

1 with a snow-bearing load.

2 Of particularly note on it you'll see there are
3 dimensions for the hole size of the drilled hole in the
4 suspension arm where the hook is supposed to suspend the
5 insulator string.

6 Q. Let's back up for just a second. Have you been
7 up to the towers?

8 A. Yes, I have.

9 Q. Have you investigated -- physically gone up and
10 investigated the Caribou-Palermo towers?

11 A. I have. I've done a variety of different visits
12 to the area. They've included both ground review of
13 different towers on aerial inspections of the towers from
14 different vantage points trying to locate towers that
15 were similar to the tower that failed; the 27/222. And
16 these are -- these are the schematics for those type of
17 towers which were referred to as transposition towers.

18 Q. Okay. And so you're familiar with what the
19 transposition towers look like?

20 A. Yes, I am.

21 Q. And PG&E provided pursuant to a data request the
22 schematics for those towers?

23 A. That's correct.

24 Q. Okay. So 260 is actually schematics for the
25 tower?

26 A. That's correct.

1 Q. All right. Before we get into it, do you know
2 what Great Western Power Company was?

3 A. Great Western Power Company was the original
4 company that constructed the Caribou-Palermo line. They
5 drew up the plans and executed the actual construction of
6 the Caribou-Palermo electric transmission line.

7 Q. And what is the date for this schematic for the
8 transposition tower?

9 A. It's dated 2/2 of 1921.

10 Q. Okay. Now, you started talking about the holes.
11 Tell us about what you can ascertain about the holes from
12 the schematics.

13 A. If you look at the center of the drawing -- and
14 I'll step up here real quickly.

15 Q. Here we go.

16 A. In particular, this schematic here, the
17 schematic with the crossarm with the drilled hole for the
18 eye hook -- it's the C-hook or J-hook or suspension hook
19 depending on the terminology used mounted onto the tower
20 itself to hold the insulator string on the jumper line.

21 Q. And is there anything in the schematics that
22 indicate how big that hole was designed to be?

23 A. Yes. There's a measurement of 1 and 1/8th inch.

24 Q. So we know from 259 that the hook was designed
25 to be 15/16ths of an inch wide at its apex. And the
26 holes are designed to be 1 and 1/8th inch?

1 A. That's correct.

2 Q. How's your math?

3 A. Pretty good.

4 Q. Well, what would 1 and 1/8th inch minus 15/16th
5 of an inch be?

6 A. 3/16ths of an inch.

7 Q. All right. So armed with that knowledge did you
8 venture into the Feather River Canyon?

9 A. I did. I used coordinates that were provided on
10 all of the aerial and ground inspection forms that we
11 received from PG&E. And each of those forms listed the
12 towers with their GPS coordinates. Using Google Earth I
13 was able to insert those GPS coordinates into the mapping
14 system and pin the locations of those various towers.

15 I then contacted our pilot Jake Hancock who is a
16 fellow investigator. And we coordinated an air flight
17 over the Feather River Canyon particularly looking at a
18 multitude of different transposition towers.

19 On the day that we went out, which was
20 January 31st of this year, we flew over tower 24/199,
21 tower 27/222, tower 32/260, and tower 35/289. And I took
22 various photographs of those towers.

23 Q. Okay. So let's back up because that was a lot.
24 You were able to locate GPS locations for certain towers;
25 correct?

26 A. That's correct.

1 Q. And what types of towers did you choose for the
2 GPS locations?

3 A. I specifically wanted to focus on transposition
4 towers which were the same configuration as tower 27/222.
5 The reason for that is the transposition towers have
6 different hardware. They have what is called a jumper
7 spring which transposes the line from one phase, for
8 example, the right phase of the line. There are three
9 lines coming in. And it moves the current to a different
10 phase to help maintain balance on the electrical -- the
11 electric physics of the current as it runs down the line.
12 You have it keep it balanced in order to have a steady
13 flow of energy down the line.

14 Q. Now, you obtained these GPS coordinates from
15 PG&E documents?

16 A. That's correct.

17 Q. Would those have been the transmission object
18 lists that are attached to all of the annual reports?

19 A. That's correct.

20 Q. Both the detailed ground inspection reports and
21 the aerial patrols?

22 A. Yes.

23 Q. Okay. So you used PG&E's own coordinates to
24 plot out a map of the transposition towers?

25 A. Yes, that's correct.

26 Q. In front of you you have 261. It's up on the

1 board. Do you recognize Exhibit 261?

2 A. Yes, I do.

3 Q. And what is Exhibit 261?

4 A. Two sixty-one is a map which I used to plot
5 those coordinates along the Feather River Canyon.
6 Whenever we do aerial observations, it's very helpful to
7 know where we're going. So this is a map that I used to
8 kind of lay out our flight path. And each of those
9 yellow pins represents the coordinates that were on the
10 information that we received from PG&E and pinpoint each
11 of the locations of the towers throughout the canyon.

12 Q. And you said you flew the line?

13 A. That's correct.

14 Q. On January 31st?

15 A. Yes.

16 Q. Are you a pilot?

17 A. I am not.

18 Q. Can you fly?

19 A. I flew in the helicopter next to the pilot.

20 Q. You need the helicopter and you need a pilot;
21 right?

22 A. That's correct.

23 Q. So where did you get the helicopter?

24 A. The helicopter is owned by the sheriff's office,
25 and it's used by multiple agencies here in Butte County.
26 We have an agreement that allows us to use that

1 helicopter. And one of the pilots happens to be an
2 investigator in our office as well.

3 Q. Next question is where did you find a pilot?

4 A. Jake Hancock is a fellow investigator. I
5 coordinated the flight with him, and we went on out the
6 31st.

7 Q. Describe the weather conditions in the 31st.
8 January 31st.

9 A. January 31st was a pretty cool morning, clear,
10 pretty ideal conditions. And we try to leave at times in
11 the day when the light in the canyon is good to be able
12 to see. If you go too early, it's very dark in the
13 canyon. And depending on the weather conditions of the
14 day, wind can be a factor in flight. Knowing that we
15 wanted to take detailed photographs we tried to pick the
16 best time of day where we could get into the area and
17 fly.

18 There was also -- I believe there was a forecast
19 of some weather coming in that afternoon, which also kind
20 of helped determine what time we flew. So we try to fly
21 within all the safe parameters to make sure that we have
22 a safe flight and follow all the FAA rules in doing so.

23 Q. What were the wind conditions?

24 A. It was moderately windy on the day in question.

25 Q. Have you flown in the canyon before?

26 A. Multiple times.

1 Q. Is there general -- in your experience general
2 wind conditions in the canyon?

3 A. Yes. There is what's called the Jarbo Gap
4 effect. What typically happens in steep terrain like
5 this is you have high mountain valleys like Lake Almanor
6 and depending on the day and the weather inclementation
7 you have -- cold air will move down the valley, and it
8 funnels in those canyons and is closed in by the
9 topography of the mountains. That can increase the wind
10 speeds.

11 And in effect this region is known for the Jarbo
12 Gap winds which are -- what was experienced on the
13 morning of November 8th.

14 Q. I'm just talking about your personal experience
15 with the wind.

16 A. I'm not sure I understand.

17 Q. Is it always windy when you fly up there?

18 A. It's not always windy, but it can typically be
19 very windy. Whether you're standing on the ground or up
20 in the air there, it's a high-wind area. So when you're
21 on top of the ridge tops or down in the valley, it can
22 play a big difference in whether it's calm or you're up
23 in the top of a windy peak and there's a constant wind.

24 Q. And on -- what was the weather or the wind like
25 on January 31st compared to other occasions you've been
26 up there?

1 A. I would say a pretty average day for the wind.
2 The winds were forecasted to pick up as the day and the
3 storm increased, but we managed to beat all of the
4 elements. It was a little bit -- a little bit windy at
5 certain times of the day in different areas of the
6 canyon.

7 As that air is forced down the canyon, it
8 bounces off the canyon walls. And so when you're in a
9 helicopter, again safety and trying to get the picture in
10 mind you have to be very delicate in how you position the
11 aircraft.

12 And so there were times where our pilot did
13 struggle to keep the helicopter in the right place to
14 take a photograph. However, for the most part it was a
15 very safe and normal flight.

16 Q. What was the purpose of your photography that
17 day?

18 A. The purpose was to document the condition of the
19 various transposition towers. In investigating this
20 particular incident in order to make a fair and impartial
21 investigation I believe that you need to compare apples
22 to apples. For that reason, transposition towers were
23 chosen. And in order to get a good sample of whether
24 this was a single incident involving an equipment failure
25 or to show a pattern of equipment, we had to go out and
26 document what the different states of the transposition

1 towers were throughout the canyon.

2 Q. All right. So we're going to go through a
3 series of photographs starting with 262.

4 Do you have 262 in front of you?

5 A. I do.

6 Q. And do you recognize Exhibit 262?

7 A. I do. Exhibit 262 is a photograph I took of
8 tower 24/199.

9 Q. And this is one of the transposition towers?

10 A. That is correct.

11 Q. And you took this from what?

12 A. I took this from the helicopter.

13 Q. Okay. Move on to 263. Or no.

14 A. Two eighty-three.

15 Q. Two eighty-three. And ignore the little yellow
16 tag that says "Exhibit 223." We just remarked it.

17 A. Exhibit 283 is a closer-up photograph a little
18 lower in elevation but particularly focused in on the
19 arms, the suspension arms of the tower and the jumper
20 insulators and the hoods holding those insulator strings
21 to the tower.

22 Q. Now, focusing in on this picture right here, how
23 close to the tower were you to take this picture?

24 A. If I had to guess, I would say probably within
25 150 feet of the tower to 200 feet. Part of -- because of
26 the windy conditions, the pilot focuses on flying the

1 airplane and I'm looking through a camera and trying to
2 focus in on the different parts so . . .

3 Q. Now, that's where I want to go with this. What
4 kind of camera are you using?

5 A. I use a digital Cannon \$500 Costco camera.

6 Q. Any special equipment on that camera?

7 A. I have a telephoto lens that comes with two
8 lenses. Kind of a standard set. In this particular case
9 I used the stronger of the two lenses.

10 Q. Okay. So you're sitting probably 100 to 150
11 feet off the tower with a camera and photo lens and
12 taking these photographs?

13 A. That's correct.

14 Q. Can you stand up and show us the significance of
15 this photograph.

16 A. So as you are looking down canyon, this is up
17 canyon on the right side. The terminology that's used is
18 right phase and left phase of the -- of the arms on the
19 suspension towers or the transposition towers.

20 So this would be the left phase insulator string
21 on the jumper. There is a bolted-on bracket, which if we
22 were to go back to the schematics on the second image
23 that we showed, you will see that the original design did
24 not have these bolt-on brackets on them. They just
25 showed a straight arm with the hole drilled into them.

26 Q. Now, let's stop right there real quick. In your

1 perusal of the records -- the age-of-tower records from
2 PG&E, have you located any records regarding those
3 bolt-on brackets?

4 A. To date I have not. As I continue to
5 investigate, I continue to find places where we may look.

6 Q. Pointing out a good thing. You're referring to
7 this as the left phase and this is the right phase.
8 Describe it for the record as you're --

9 A. So the left phase would be the insulator string
10 on the lower right corner of the image and on the kind of
11 upper center it would be -- that would be the right phase
12 and this would be the left phase.

13 Q. So what exactly are we looking for when you're
14 taking this photograph?

15 A. Some of what I'm looking for is this exact
16 attachment point here.

17 Q. Yep. We can do it right here.

18 A. This image is a little hard to see. I've got a
19 couple of other pictures that we'll see in a moment. But
20 in particularly the focus is right here on the hanger
21 plate and the suspension hook in this (indicating) area.

22 Based on the dimensions that were provided in
23 this schematic and that 3/16ths size, I'm just using that
24 information to determine how much wear there potentially
25 could be on the hanger plate and in the hook.

26 Q. So correct me if I'm wrong, you're looking at

1 daylight between the top of the hook and the top of the
2 hole?

3 A. That's correct. A lot of factors. I'm looking
4 at the shape of a hook and the hole. I'm looking at the
5 distance between the top of the hole and the top of the
6 hook. You can depending on the angle look at where that
7 hook seems to set on a hanger plate whether it seems to
8 be lower down or higher up.

9 Q. Prior to November 2018, did you ever see a
10 suspension hook or a transposition tower arm?

11 A. I'm sure I had driven by them unknowingly many
12 times, but I had never drawn my attention to them.

13 Q. Have you ever had any training in inspecting
14 transmission lines?

15 A. No, I have not.

16 Q. Have you ever inspected a transmission line
17 before?

18 A. Not until this investigation have I begun to
19 understand both the engineering and the design concepts
20 behind the electrical transmission grid and the function
21 of the towers and the different components on it.

22 Q. So you looked at the schematics for the tower,
23 got a helicopter and a pilot, and went out looking at the
24 hooks and the holes?

25 A. That's correct.

26 Q. And found space?

1 A. Yeah. Based on the different towers that we
2 looked at, we were able to make a fairly educated guess
3 that if we were to go and get those hooks as an example,
4 that we were very likely going to find wear similar to
5 what we had observed in the malfunctioning components of
6 tower 27/222.

7 Q. So prior to this had you actually seen the
8 components that were taken off the 27/222 under the
9 supervision of Captain Tom Kluge?

10 A. I reviewed both photographs and the actual
11 physical evidence.

12 Q. All right. Let's move on to 263.

13 A. Exhibit 263 is a photograph of tower 260.
14 Excuse me. 32/260. This particular tower sits in the
15 bottom of the canyon approximately 75 yards upstream or
16 uphill from the Feather River Canyon, the river itself,
17 but it's very well protected down at the base of the
18 canyon.

19 Q. And 260 is again a transposition tower?

20 A. That's correct.

21 Q. And this photograph was taken when?

22 A. On the 31st of January 2019.

23 Q. And how did you take this photograph?

24 A. Via helicopter.

25 Q. Let's go to 264. Do you recognize 264?

26 A. I do.

1 Q. What is 264?

2 A. Two sixty-four is a close-up photograph of the
3 suspension arms and jumper insulator strings on tower
4 32/260.

5 Q. How did you take this photograph?

6 A. I took this photograph with the helicopter as
7 well.

8 Q. How far from the tower were you?

9 A. About 100 feet directly across from the tower.

10 Q. And using what kind of camera equipment?

11 A. The same Canon digital camera.

12 Q. So were there any obstructions that got in your
13 way of taking photographs of this tower?

14 A. This is kind of a tight area in the canyon, and
15 the wind does -- just upstream there is a little bit of a
16 formation in the rocks. So the wind does kind of buckle
17 around there and swirl a bit. So this was a difficult
18 position for the pilot to get into and maintain the
19 aircraft safely for photographs. However, we were able
20 to take multiple pictures safely from that vantage point.

21 Q. When you said the 32/260 was very well
22 protected, protected from what?

23 A. Because it sits at the bottom of the canyon, the
24 winds can be significantly less as well as the topography
25 of that particular location. With the upstream
26 topography it formed kind of a leeward side of the wind

1 coming down the canyon where this particular tower sits.
2 So it tends to deflect the wind away from the tower.

3 The other image that you saw of tower 24/199 and
4 tower 27/222 -- and later on you'll see photographs of
5 tower 35/281. Those are all in the ridge tops so they're
6 much more exposed to the wind and there's not a lot of
7 shelter for them.

8 And those other towers are also very near
9 confluences of different canyons within the Feather River
10 Canyon. So there is typically a convergence of wind in
11 those areas.

12 Q. So you can step up to the big board. And I've
13 got it all set up for you to zoom and everything.

14 Describe the significant areas of this
15 photograph.

16 A. In particular, we're looking here at the
17 curve -- excuse me, the curve in the hole and the support
18 arm. I'm looking at how does that particular hook sit
19 within that support arm.

20 In this case, there's not a lot of daylight but
21 still has daylight that you can see through. And from a
22 different angle this is kind of the inside of the arm.
23 From the outside of the arm is a little easier to see
24 just how much space sits between the two.

25 Q. So when you're talking about the inside of the
26 arm, you're talking about the right phase which basically

1 goes through the center of the photograph and ends with
2 the hook in the hole on the right-hand center of the
3 photograph; right?

4 A. That's correct.

5 Q. And when you're talking about the outside,
6 you're talking about the left phase which is in the lower
7 left of the -- of the photograph?

8 A. That's correct. And the other significance of
9 this particular photograph is that you see that there are
10 not bolt-on brackets. This indicates to me that this is
11 some of the -- both the original suspension arm from the
12 tower and, without knowing any of the maintenance history
13 of that particular tower, I do understand through my
14 conversations with various linemen and troublemen that
15 these brown insulator bell strings are very similar to
16 the original era equipment that was used on these towers.

17 MR. NOEL: Again, remember the admonition on
18 hearsay. And I will leave it at that.

19 BY MR. NOEL:

20 Q. All right. On to photograph number 265.

21 A. This is a photograph of tower 35/281.

22 Q. And when was this photograph taken?

23 A. This photograph was taken January 31st of 2019.

24 Q. Anything around 35/281 that obscured the tower
25 or made it difficult for you to photograph this tower?

26 A. This tower sits just below the road at the top

1 of the canyon. It's a fairly open and easy location to
2 get to. It is at the confluences of two canyons. But as
3 far as approach from the aircraft, it was a very simple
4 approach.

5 Q. No trees growing up? No rocks? No cliff faces?

6 A. Nothing that obscured my vision from this.

7 Q. Going on to 266, do you recognize 266?

8 A. I do. This is also a -- this is a photograph of
9 the right and left phase suspension arms and insulator
10 string. On the center right side of the image is the
11 right phase insulators and then the left side of the
12 center is the left phase insulator string.

13 Q. Okay. What do you see as significant in this
14 photograph?

15 A. Particularly looking at the right phase eye
16 hook, you can see a lot of daylight and you can see the
17 hill right here in that photograph. And this is just
18 like a clear straight image. And you're able to zoom in
19 with a lot of clarity. These images are very crystal
20 clear and not as grainy as they are in the pdf format
21 here.

22 Q. Okay. Going on to 267.

23 A. Exhibit 267 is a close-up of the left phase of
24 the tower and the insulator string hook and the eyelet
25 where it is suspended from on the suspension arm. If
26 you'll take a look at that picture, the significance

1 there is again keeping in mind the schematics that this
2 hole is 1/18ths inch in diameter and the hook is
3 15/16ths. This hook --

4 Q. Let me -- you said 1/18ths of an inch. It's
5 1/8th of an inch?

6 A. 1/8th of an inch from the diameter of the hole
7 and 15/16ths of the hook. If you look at the top of that
8 hook, it's below center of that eyelet. To me that's an
9 indication that there is a lot of wear on that particular
10 component and it is not as tight as the original
11 tolerances were built when it was placed there.

12 Q. Now, again you're taking these photographs from
13 a helicopter?

14 A. That's correct.

15 Q. And at a distance of how far?

16 A. In this particular case, again approximately
17 150, 200 feet away.

18 Q. So you're still taking it with a Costco camera
19 and the telephoto lens?

20 A. That's correct.

21 Q. Next up is 268.

22 A. Two sixty-eight is again a photo of tower
23 35/281. This is the right phase and similar to the left
24 phase and again focused on the eyelet.

25 And so we switch to the next. That is 267.

26 Q. Oh, shoot. I forgot.

1 A. So there's the eyelet and the insulator string
2 on the kind of left center of the image again focusing in
3 on that diameter of that hole and the hook and how that
4 hook sits in there. It's hard to see in the light a
5 little bit here.

6 But when you start looking at these images and
7 start seeing the shape of the round hole where that hook
8 sits, it's very easy to start seeing the increase in the
9 space. You're looking at the daylight, the foreground,
10 the background, the shade.

11 With the benefit of digital imagery it's very
12 easy to kind of see what's going on with that hook.

13 Q. Now, these photographs were taken after the Camp
14 Fire; right?

15 A. That's correct.

16 Q. You were able to survey the areas around each of
17 these towers; correct?

18 A. That's correct.

19 Q. Any evidence that you could see of large trees
20 or any other obstructions that had been removed?

21 A. When you fly over this particular area and many
22 of the locations, the three different tower lines are
23 next to each other within 75 yards of one another to
24 100 yards. And so they're -- especially when you look at
25 Google Earth image you will see a very large swath of
26 trees that were removed as part of the vegetation

1 management plan that PG&E does to stay in compliance with
2 the CPUC. And so these areas typically are much more
3 open because trees are removed and shrubbery is kept to a
4 minimum.

5 Q. But I'm just trying to figure out if -- I know
6 after the fire there is nothing obstructing you. Is
7 there any evidence before the fire there was anything
8 that would have obstructed a helicopter from being able
9 to fly in and take images like that?

10 A. No. I did not see in any of the towers that I
11 went to any evidence that there would be anything that
12 would prevent a helicopter from mirroring our flight path
13 and having access to the towers as we did.

14 Q. All right. Moving on to -- well, let me --
15 let's back up on that for a second.

16 All right. So on January 31st you flew the line
17 and you took the photographs that we've been looking at?

18 A. That's correct.

19 Q. And put together the data?

20 A. Yes.

21 Q. What was the next step?

22 A. The next step was to attempt to obtain these
23 hooks and the eyelets as further evidence so that we
24 could examine them and see if there was similar wear that
25 we had observed from the components that we received from
26 tower 27/222.

1 That was a lengthy process. The inner workings
2 of trying to take components off of an electric
3 transmission line, something that had never been done
4 before in terms of a coordinated investigation like this.
5 Typically, when there's a fire, Cal Fire works with PG&E
6 to have their employees take the components off of the
7 towers.

8 Given the nature of this particular incident, we
9 had to weigh the benefits and the potential pitfalls of
10 using PG&E employees to take equipment off of their own
11 towers. We researched if there were other entities that
12 could, in fact, do this for us. At the end of that
13 lengthy process, we determined that the best course of
14 action and safest way for both us as law enforcement
15 trying to obtain these items and the public safety was to
16 work with PG&E and have their personnel under our
17 supervision remove those items in a very controlled
18 manner.

19 Q. How long -- well, was there a -- a name given to
20 this project?

21 A. We called it kind of the exemplar towers project
22 within our group.

23 Q. Okay. How long did it take to set up the
24 exemplar towers project to obtain the evidence from each
25 of these towers?

26 A. I flew the line on the 31st of January and by

1 the 28th and 29th of March we were able to complete those
2 tasks and take possession of those items.

3 Q. Between when you flew the line on the 31st of
4 January and March 28th, did you physically go up into the
5 canyon and visit all of these towers on foot?

6 A. On multiple occasions myself and other members
7 of the investigative team began to research the different
8 options. Coordinating an effort like this could be
9 costly. The use of the helicopters is not an inexpensive
10 tool. And we also recognized that PG&E primarily uses a
11 helicopter in their maintenance of these towers.

12 So we had to survey and reconnoiter around these
13 areas, pinpoint the location, check the access in and out
14 of them. And as part of that I asked Captain Tom Kluge
15 of Cal Fire to check this particular tower out. He had
16 brought up a crew of --

17 Q. Okay. Well, we can talk about that later.

18 At some point between January 31st and
19 March 28th you physically visited these towers?

20 A. Yes.

21 Q. And I've gone back to 265. Exhibit 265 you said
22 is a photograph. It's the first photograph we showed of
23 35/281.

24 A. Yes.

25 Q. When you physically went up to visit 35/281 in
26 February, what did you find?

1 A. I did not physically go there. I asked
2 Captain Kluge to go there and to coordinate the effort
3 and --

4 Q. Okay. I don't want to talk about what
5 Captain Kluge did. You actually physically visited this
6 tower; correct?

7 A. I did not physically visit that tower until the
8 day that I -- actually, I did not physically visit that
9 tower. When did I do that? I did physically visit that
10 tower, but it was not until, I believe, the day that we
11 removed the items on the 28th or 29th.

12 Q. Okay. Do you know Jon McGormley?

13 A. I do, yes.

14 Q. Who is Mr. McGormley?

15 A. All right. I did visit the tower earlier. I
16 could not recall the exact date.

17 Mr. McGormley is an engineer who specializes in
18 failure analysis. Prior to the collection of the
19 evidence on the 28th and the 29th, we had visited tower
20 27/222, tower 32/260, and tower 35/281. And we were able
21 to drive to this tower within 50 yards of it and walk up
22 to it.

23 On that date we observed that the insulator
24 strings were no longer on the tower. They had been
25 replaced with a new set of insulator strings of a
26 different style.

1 Q. Using the photograph -- well, let's back up and
2 lay the foundation.

3 When you went to visit this tower sometime in
4 February or March, this tower had been changed; right?

5 A. That's correct.

6 Q. What had been changed about this tower?

7 A. The insulator strings that you'll see, the
8 suspension insulator strings both the right and left
9 phase and the dead-end up above had all been changed.
10 The new insulator strings were a modern composite
11 insulator string. They're gray in color and they attach
12 completely different than the hook and eyelet style.
13 They are actually bolted on to the arm. And the arms had
14 been modified to receive a different set of insulator
15 strings.

16 Q. Did you attempt -- sorry. Did you make attempts
17 to find the insulator strings that came off 35/281?

18 A. Yes. Through correspondence with PG&E's
19 attorneys we were able to learn that they had removed
20 those suspension arms and the insulator strings including
21 the hooks.

22 We coordinated to meet with them on March 8th in
23 the Berkley area and obtain those items from them. They
24 had taken those items and secured them and had them
25 packaged up. And we secured them through a chain of
26 evidence and brought them back to Cal Fire's evidence

1 locker.

2 Q. Now, referring you to Exhibit Number 269, do you
3 recognize 269?

4 A. I do.

5 Q. What is 269?

6 A. Two sixty-nine is a photograph of the right and
7 left phase insulator hooks that were removed from tower
8 35/281.

9 Q. These were recovered from what? From where?

10 A. These were recovered from the contractor that
11 PG&E had hired to secure the evidence and analyze the
12 components to see what their failure -- basically to
13 analyze what the wear and their failure on these systems
14 with these different components are. So these were
15 exemplar hooks that they were going to use in their
16 analysis of the Caribou-Palermo line.

17 Q. All right. Next, we talked a little bit about
18 you said at the end of March, the 28th and 29th, you were
19 finally able to remove components from the tower?

20 A. That's correct.

21 Q. The towers. I'm sorry.

22 Explain briefly for us the process and how this
23 was accomplished over these days?

24 A. On the 28th we were able to go to 20/160, which
25 we were able to drive to. That was kind of an all-day
26 process. From that process we used a ground crew to

1 drive to the tower and remove the dead-end insulator
2 string, the right and left phase insulator strings, the
3 jumper cable, and the right and left support arms for the
4 left and right phase of the towers.

5 Q. Moving on to the 29th, what was the process that
6 was followed on the 29th?

7 A. On the 29th the towers in question were much
8 more remote and difficult to get to. There were roads
9 that accessed both of those over time. However, there
10 was a washout on the line that -- on the road that
11 accessed tower 24/199. And we had to use multiple
12 helicopters to access the area, one by PG&E to bring
13 their crew and equipment in that ultimately was used to
14 remove all of that equipment and fly it to a landing zone
15 below the tower along the Feather River Canyon.

16 Q. So this is evidence; correct? The things that
17 are being removed from the towers are evidence?

18 A. That's correct.

19 Q. What precautions were taken to establish a chain
20 of evidence?

21 A. I flew into the area and set up before the
22 equipment was removed. I began to take photographs as
23 the crew did their work. I had sat and observed from the
24 ground as the crew dismantled the different components on
25 the tower and watched as the helicopter flew in. The
26 items were attached to a long line on the helicopter and

1 flown off.

2 I then radioed to Captain Kluge with Cal Fire
3 who was waiting at the landing zone. I would watch the
4 bird move towards him, he would pick up the bird, and the
5 bird would drop down out of the view, lower down in the
6 landing zone where he was waiting to receive those items.

7 Q. So I want to back up a little bit. You flew
8 into the area. You flew to the tower. Please describe
9 to the jurors how you flew into the tower.

10 A. Part of my job I routinely train with the
11 helicopters in the marijuana enforcement unit. So we are
12 trained in STABO. STABO is basically a system in which
13 we wear a harness and we are hooked onto the long line.
14 The helicopter will pick us up. We basically dangle
15 below the helicopter, and they will lower us into a safe
16 place. We unhook from the helicopter and can proceed on
17 foot from close proximity to the towers.

18 Q. So do you know how long the line was that you
19 were STABOed on?

20 A. I believe it was about a 120 foot line.

21 Q. Okay. So were you able to STABO into 24/199?

22 A. That's correct.

23 Q. A helicopter was able to carry you and put you
24 down on the road in the area?

25 A. That's correct.

26 Q. How about the PG&E personnel?

1 A. The PG&E personnel were also on the long line.
2 The difference is they were flown in to the top of this
3 tower. You'll see there in the center top of the picture
4 is this particular structure here on the steel on the
5 tower.

6 They're basically lowered in. The first
7 individual is brought in. He secures himself on the
8 tower and then they start to bring in ladders and
9 different pieces of equipment. And then the crew starts
10 to show up kind of in ones and twos depending on the
11 weight to get the entire crew in.

12 And then I just sat and observed that whole
13 process and then watched as they took each component
14 apart and would hook it to the helicopter and fly it off.
15 And then I would receive confirmation from Captain Kluge
16 that he received that. And then the helicopter just kept
17 making multiple trips until all the components that we
18 needed were taken away and secured.

19 Q. And Mr. Ramsey is raising a good question in my
20 ear. Were these power lines energized?

21 A. No. That was one of our biggest concerns about
22 this. To my knowledge, the Caribou-Palermo has not been
23 re-energized since the Camp Fire. And at the time that
24 this was going on the lines were de-energized. However,
25 the crews still take precautions to ensure -- even
26 knowing that the line is de-energized, they still ground

1 out the lines and do everything to practice a safe
2 working environment.

3 Q. All right. So let's move on to photograph
4 marked 271.

5 A. Two seventy-one is a photograph of the right
6 phase insulator string as it's being lifted by the
7 aircraft and taking the weight off of that line. In
8 particular, if you kind of look to the left center of the
9 photograph, you can see the two eyelets and where the
10 hook sits in the eyelet.

11 You can see just how much of that hook does not
12 sit in the round hole as it's sitting there in its
13 original state as it's being taken off of the tower.

14 GRAND JUROR NUMBER FOUR: Which tower is this?

15 THE WITNESS: This is tower 24/199. And there
16 is the right phase insulator string.

17 BY MR. NOEL:

18 Q. And you're taking these photographs from where?

19 A. About 100, 150 yards away on the ground. The
20 ground topography is such that the -- it was kind of
21 uphill, but there's a little bit of a plateau above the
22 base of the tower that sits probably 15 to 20 feet up and
23 then the hill slopes up and away. So I was at a safe
24 vantage point away from the work that was being done
25 overhead.

26 As a precaution in case something was dropped

1 from either the helicopter or by the workers, it would
2 not be safe to observe from below.

3 Q. Next photograph 272.

4 A. Two seventy-two shows the string and the hook as
5 it is just coming off of the tower. When you're able to
6 zoom into this particular photograph -- it's a little bit
7 grainy, but you can see this dark shadow here. On the
8 actual digital image of this particular photograph you
9 can observe the wear in that hook that is coming out of
10 the bracket.

11 Q. And you can also see the holes?

12 A. That's correct. And you can observe right --
13 here are the two -- the - this would be the original
14 bracket hole and this is the bolt-on hanging plate. And
15 the hole where the hook had been was replaced at some
16 point.

17 Q. And photograph number 273.

18 A. Photograph number 273 shows the right phase
19 insulator string being lifted out of the tower area in
20 route to the landing zone.

21 Q. And 274.

22 A. EXhibit 274 is a photograph of the crew as they
23 are starting to unbolt and loosen the right phase support
24 arm on tower 24/199.

25 Q. And 275.

26 A. Exhibit 275 is a photograph of the helicopter

1 removing the right phase support arm from tower 24/199.

2 Q. And 276.

3 A. Exhibit 276 is the crew working to unbolt or
4 remove the support arm of the left phase of the tower
5 from 24/199.

6 Q. And 277.

7 A. It's a photograph of the helicopter taking off
8 with the left phase support arm in tower 24/199.

9 Q. And 278.

10 A. Exhibit 278 is a photograph of tower 32/260.
11 This is the tower that sits down in the bottom of the
12 Feather River Canyon.

13 Q. Okay. Let's spend a little bit of time on this
14 photograph. Whose helicopter is that?

15 A. I believe that is PJ Helicopters that was
16 contracted by PG&E to assist them in the removal of the
17 components off the towers that day.

18 Q. So we see lots of trees in the background.

19 A. Correct.

20 Q. Where are those trees in relation to the tower?

21 A. Those are across the canyon on the other side of
22 the river.

23 Q. So it's quite a distance away?

24 A. That's correct.

25 Q. Is there anything that you saw that is
26 obstructing the helicopter from getting in close to that

1 tower?

2 A. No. The pictures that I took on the 31st would
3 have been taken -- you see the helicopter at the top
4 center of this photograph. If you were to remove that
5 helicopter and lower its position down to approximately
6 the center right of the photograph and out of the tower,
7 that's where we took the photographs from on the 31st.

8 Q. So you were taking the photographs on the 31st
9 actually from the canyon side of the tower looking back
10 towards the tower?

11 A. That's correct.

12 Q. And how far is this tower from the road?

13 A. It's probably 300 yards downhill from the road.

14 Q. But it looks like -- well, where are you taking
15 this photograph from?

16 A. I am below the second set of lines on the -- in
17 that particular area. So I am approximately -- oh, given
18 the angle I'm not as -- the actual distance if you were
19 to walk on that very steep angle was probably closer to
20 200 yards away, but actual distance from the tower was
21 probably closer to 100 yards, 75 yards away.

22 Q. And how did you get to that location?

23 A. I drove down and then hiked from the road down
24 to the tower.

25 Q. Moving on to photograph 279.

26 A. Photo 279 shows the left phase insulator string

1 being lifted off of tower 32/260.

2 Q. Oh, sorry. There we go.

3 A. The insulator string is right here (indicating)
4 in the lower center of the photograph. And you can see
5 the long line to the helicopter. If you look at the very
6 bottom center of the photograph, you will see the support
7 arm, left phase where the insulator was removed from.

8 Q. And photograph number 280, what are we looking
9 at here?

10 A. Photo 280 is the right phase insulator string
11 being lifted off of tower 32/260 on the 31st of January.

12 Q. And photograph 281.

13 A. Photo 281 is the right phase support arm being
14 removed from tower 32/260 on January 31st of 2019.

15 Q. Photograph 282.

16 A. Photo 282 is the left phase support arm being
17 removed from tower 32/260 on January 31st of 2019.

18 Excuse me. The removal occurred on the 29th of March,
19 not January. I apologize. For all of those components
20 on that tower.

21 Q. And all of the hardware, the components that
22 were taken off the three towers we talked about -- 2160,
23 24/190 and 32/260 -- what were done with all of the
24 components?

25 A. As each of those components were removed from
26 the tower, we had assembled an evidence team from the

1 Federal Bureau of Investigation that assisted us in
2 photographing, cataloging, and collecting these items.
3 They documented those items for us and photographed them
4 in the photograph log and helped us take measurements and
5 very detailed photographs of each of those components in
6 the condition they were in as they were removed. The
7 items were then packaged and transported to Cal Fire's
8 evidence storage facility and logged into evidence with
9 Cal Fire.

10 MR. NOEL: I believe that's all I have. Anybody
11 else have any questions?

12 Go ahead.

13 **EXAMINATION**

14 BY MR. FOGG:

15 Q. Mr. Moore, how many towers did you photograph on
16 the 31st of January?

17 A. On the 31st I did 24/199. I took photos of
18 27/222 just because we were flying over that particular
19 area. I took photographs of tower 32/260 and tower
20 35/281.

21 Q. How long did you spend on each tower
22 photographing?

23 A. Anywhere from a minute to two minutes.

24 Q. And how long does the whole flight take?

25 A. You know, travel time from the airport, up the
26 canyon and back was probably approximately an hour and a

1 half.

2 MR. FOGG: Thank you.

3 MR. NOEL: Jurors have any questions for this
4 witness?

5 [Counsel conferring off the record.]

6 BY MR. NOEL:

7 Q. Investigator Moore, the one question we have
8 from the jurors is were the components of 27/222 also
9 removed? And if so, where are they?

10 A. Those components were removed by Cal Fire
11 shortly after the fire. I don't know the exact date. I
12 know it was within the first couple days of the fire they
13 had used their investigative techniques to work their way
14 back using their cause analysis of the fire. They
15 secured those -- that equipment off the tower and
16 subsequently logged it into their evidence.

17 Some of those components have subsequently been
18 turned over for processing to the Federal Bureau of
19 Investigation laboratory.

20 MR. NOEL: Any other questions?

21 I think that's all we have for
22 Investigator Moore today and those are all of the
23 witnesses that we have for today.

24 Madam Foreperson.

25 GRAND JURY FOREPERSON: Mr. Moore, you are
26 admonished not to discuss or disclose at any time outside

1 of this jury room the questions that have been asked of
2 you or your answers until authorized by the grand jury or
3 the Court. A violation of these instructions on your
4 part may be the basis for a charge against you of
5 contempt of court. This does not preclude you from
6 discussing your legal rights with your own attorney.

7 Mr. Moore, what I have just said is a warning
8 not to discuss this case with anyone except the Court,
9 your lawyer, or the district attorney.

10 Do you understand?

11 THE WITNESS: I do.

12 GRAND JURY FOREPERSON: Okay. Thank you so
13 much. Thank you for your time.

14 MR. NOEL: If you will wait out there, you can
15 help me bring everything back to the office.

16 Madam Foreperson, that is all we have for today.
17 I think depending upon what you guys want to do we're
18 done for today.

19 GRAND JURY FOREPERSON: Okay. So next week
20 8:30?

21 MR. NOEL: Yes.

22 GRAND JURY FOREPERSON: Next week 8:30. Thank
23 you.

24 [Matter adjourned at 2:45 p.m.]

25 --oOo--

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: (WITNESS #13), before
you have a seat, would you raise your right hand please
to be sworn.

(WITNESS #13)
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you.

Have a seat, please.

EXAMINATION

BY MR. NOEL

Q. (WITNESS #13), can you please state your name,
your full name, and spell your last name for the court
reporter, please.

1 A. (WITNESS #13), (SPELLING REDACTED) .
2 Q. Are you currently employed?
3 A. Yes.
4 Q. By whom are you employed?
5 A. I'm employed by a company called Cannis
6 (phonetic) .
7 Q. How long have you been with Cannis?
8 A. Since 2014.
9 Q. Prior to 2014, were you employed?
10 A. For a year I was off.
11 Q. Okay. And were you employed prior to that?
12 A. With PG&E.
13 Q. What did you do for PG&E?
14 A. I was on a line crew most of the time.
15 Q. What was your job when you retired?
16 A. When I retired, I was a T-line supervisor for
17 Transmission in Bakersfield.
18 Q. When did you start with PG&E?
19 A. 1976.
20 Q. How did you come to work with PG&E?
21 A. I bugged them until they couldn't stand me
22 anymore.
23 Q. So when you started with PG&E, what position
24 did you begin in?
25 A. I started out as a groundman.
26 Q. What's a groundman?

1 A. It's kind of a learning position. You get
2 material and do other odd jobs on the ground for the
3 crew.

4 Q. How long were you a groundman?

5 A. About a year.

6 Q. What did you do after you were a groundman?

7 A. Then I took an apprentice job.

8 Q. Apprenticing to what?

9 A. Apprentice lineman.

10 Q. Are we talking transmission or distribution?

11 A. Distribution.

12 Q. So you became an apprentice distribution
13 lineman --

14 A. Correct.

15 Q. -- is that correct?

16 Do you remember how long it took you to
17 complete your apprenticeship?

18 A. My apprenticeship was three years.

19 Q. So somewhere around 1980 you became a
20 journeyman lineman?

21 A. Yes.

22 Q. How long were you a lineman in the Distribution
23 Division?

24 A. About ten years.

25 Q. So from approximately 1980 to 1990?

26 A. Approximately.

1 Q. After being an apprentice -- journeyman lineman
2 for ten years, what job did you assume next?

3 A. I took a crew foreman job in Coalinga.

4 Q. Again was that the Distribution side?

5 A. On Distribution, yes.

6 Q. How long did you do that job?

7 A. I was there about three years.

8 Q. At some point did you switch over to the
9 Transmission side?

10 A. After I was a crew foreman, I took a lineman
11 job in Transmission in Sacramento.

12 Q. Okay. So sometime approximately 1993?

13 A. Approximately.

14 Q. What position did you take in Sacramento?

15 A. Lineman.

16 Q. That's a transmission lineman?

17 A. Transmission lineman, yes.

18 Q. What training did you receive before becoming a
19 transmission lineman after all those years as a
20 distribution lineman?

21 A. Training as in?

22 Q. Any specialized training for transmission?

23 A. It's just on-the-job training.

24 Q. Okay. And can you explain to us what you mean
25 by that?

26 A. I went out and worked with other linemen that

1 had been working in the Transmission for quite some time,
2 and they showed me how to do it.

3 Q. So you said you were a transmission lineman in
4 Sacramento for a year, for about a year. What was your
5 next job?

6 A. I was a transmission troubleman.

7 Q. Where was that?

8 A. That was in the same yard there in Sacramento.

9 Q. Before you became a transmission troubleman,
10 did you receive any training to qualify you for the
11 troubleman position?

12 A. No.

13 Q. Did you receive any training at all in being a
14 troubleman?

15 A. No.

16 Q. How long were you a troubleman in Sacramento?

17 A. About two years.

18 Q. What was your next job?

19 A. I took a six-month rotation as a supervisor,
20 transmission supervisor, in that same yard in Sacramento.

21 Q. How long did that job last?

22 A. About three years.

23 Q. Heard the term "temporary-permanent"?

24 A. Yes.

25 Q. So were you a temporary-permanent supervisor?

26 A. Yes.

1 Q. All right. So approximately three years, that
2 leads us up into the late '90s about; right?

3 A. Right.

4 Q. So you were the T-line supervisor in Sacramento
5 for about, you said about three years?

6 A. About three, three and a half, something like
7 that.

8 Q. Three, three and a half years. What was --
9 your job was a T-line supervisor, just what were, what
10 were your duties? Describe them for us.

11 A. I was in charge of the tree trimming. I also
12 was in charge of the maintenance and the patrolling and
13 everything of the lines, too.

14 Q. Patrolling, you mean the troublemen
15 inspections?

16 A. Yes.

17 Q. How many troublemen were you supervising in
18 Sacramento?

19 A. Three.

20 Q. So after approximately three to three and a
21 half years as the temporary T-line supervisor in
22 Sacramento, what was your next job?

23 A. I took a permanent supervisor job as the
24 T-lines supervisor in Table Mountain.

25 Q. Do you remember what year?

26 A. I think it was around 2000. It was around

1 2000, 2001, something like that. I can't remember
2 exactly.

3 Q. So you became the T-line supervisor at Table
4 Mountain?

5 A. Yes.

6 Q. Had you ever been to Table Mountain prior to
7 that?

8 A. Yes.

9 Q. How many times?

10 A. I couldn't tell you exactly. Quite a few.

11 Q. And for what reasons?

12 A. We came up to help the crews up here.

13 Q. So you were somewhat familiar with Table
14 Mountain?

15 A. Yes.

16 Q. When you'd come up prior to becoming the T-line
17 supervisor at Table Mountain, had that, had any of those
18 jobs that you helped with included the Caribou-Palermo
19 transmission line?

20 A. I don't remember.

21 Q. Once you got up here as the T-line supervisor
22 of Table Mountain approximately 2000, 2001, did you
23 receive any training on the specific lines, transmission
24 lines, you'd be supervising at Table Mountain?

25 A. No.

26 Q. How long were you the T-line supervisor at

1 Table Mountain?

2 A. One year.

3 Q. What was your next job after that?

4 A. I took a lineman job. I went out of management
5 and took a lineman job at the same yard.

6 Q. How long were you a lineman at Table Mountain?

7 A. I was a lineman for about two years, but I was
8 upgraded to a T-man almost immediately.

9 Q. Okay. So you were a troubleman at Table
10 Mountain?

11 A. Yes.

12 Q. And do you remember, were there certain lines
13 that you were in charge of?

14 A. I was in charge of the Feather River Canyon.

15 Q. So any of the transmission lines running up and
16 down the Feather River Canyon?

17 A. Yes.

18 Q. That would include the Caribou-Palermo 115 kV
19 line?

20 A. Yes.

21 Q. How long were you a troubleman at Table
22 Mountain?

23 A. I think I was a troubleman for three years.

24 Q. What was your next job?

25 A. I took a supervisor job back in Sacramento as a
26 T-line supervisor again.

1 Q. Back in the same division that you had been
2 prior?

3 A. Yes.

4 Q. How long did that last?

5 A. I was the supervisor there for about two years,
6 but I never actually sat at that desk. They put me in
7 Eureka and a whole bunch of different other spots.
8 Basically I just moved around.

9 Q. So you were technically the supervisor in
10 Sacramento, but you were actually all over the north
11 state?

12 A. A roving supervisor.

13 Q. Roving. That's a good word for it. That's
14 what I was looking for. Roving?

15 A. Yes.

16 Q. An itinerate supervisor?

17 A. Yes.

18 Q. How long did you do that job?

19 A. About two years.

20 Q. And what was your next job?

21 A. I took the supervisor job in Bakersfield as a
22 transmission supervisor.

23 Q. How long did you hold that job?

24 A. Until 2013, October 2013, when I retired.

25 Q. So you retired out as a T-line supervisor in
26 Bakersfield?

1 A. Yes.

2 Q. So going through it, by my calculation, you
3 were a T-line supervisor almost 20 years? I'm horrible
4 at math, but looks like probably somewhere around 1996 or
5 so, '95 or '96, you became a T-line supervisor?

6 A. Yes.

7 Q. Is that about right? And with the exception of
8 the four years in Table Mountain, you were T-line
9 supervisor until 2013?

10 A. Yes.

11 Q. So, let's see, '96, that's 17 -- so about 13
12 years you were T-line supervisor? Does that sound about
13 right?

14 A. Sounds close.

15 Q. And you supervised transmission lines and
16 troublemen in Sacramento?

17 A. Yes.

18 Q. In Eureka?

19 A. Yes.

20 Q. Table Mountain?

21 A. Yes.

22 Q. And Bakersfield?

23 A. Yes.

24 Q. And anywhere else you can think of?

25 A. Metcalf, Petaluma.

26 Q. So when you were in charge as a T-line

1 supervisor and you were a T-man for those three or four
2 years in the early 2000s, do you recall the policies that
3 you had that were in place with respect to inspections
4 and inspections of transmission lines?

5 A. I don't know what you mean by policies.

6 Q. Well, when you were a troubleman, especially in
7 the early 2000s, was there an *Electric Transmission*
8 *Preventative Maintenance Manual*?

9 A. No.

10 Q. Do you remember any written policies that told
11 you how often you were supposed to do different types of
12 inspections and which, what you were supposed to look at,
13 those kinds of things?

14 A. Not that I recall.

15 Q. So what was your policy with regard to the
16 frequency of inspections of transmission lines?

17 A. I did a ground patrol and an aerial patrol
18 alternating each year.

19 Q. So ground patrol one year, aerial patrol the
20 next? Ground patrol, aerial patrol?

21 A. Yes.

22 Q. Describe for me, from your experience, what you
23 mean by ground patrol.

24 A. I would travel along the line in a, either a
25 pickup or I had a quad runner that I would ride for some
26 of the smaller trails. And you would go to each

1 structure and look it over as best you could with a pair
2 of binoculars.

3 Q. How close would you get?

4 A. As close as I could.

5 Q. And what in particular were you looking at?

6 A. Just for anything wrong on the tower.

7 Q. What would you do during a ground patrol if
8 there was parts of the tower you couldn't see?

9 A. I don't know. On a tower it's basically -- I
10 mean, you just look at one side. I didn't usually circle
11 the tower to look at it. You can pretty much see what
12 you need to see from one side or the other.

13 Q. Okay. Did you ever climb towers during --

14 A. No.

15 Q. -- during your inspections?

16 A. No.

17 Q. When you were a supervisor, did you ever have
18 your crews do any climbing inspections?

19 A. No.

20 Q. Are you familiar with climbing inspection of
21 towers?

22 A. Yes.

23 Q. And during your time as a troubleman and as a
24 transmission line supervisor, to your knowledge who was
25 doing climbing inspections?

26 A. Usually the Tower Department would do the

1 climbing inspections.

2 Q. How would the tower department make the
3 decision to climb, do you know?

4 A. If it was at my request they would do it.

5 Q. Why would you request the Tower Department to
6 do climbing inspections?

7 A. I don't recall that I ever did, but that would
8 have been one trigger. And I don't know any other reason
9 why they would do it.

10 Q. So when you were doing your ground patrol --
11 let me back that up. Are you familiar with the term
12 "cold end attachments" from the insulators?

13 A. Yes.

14 Q. When you did your ground patrols and
15 inspections of the towers, was one of the things you were
16 looking at the cold end connections of the insulators?

17 A. As best I could from the ground.

18 Q. Okay. And how would you look at those things?

19 A. With binoculars.

20 Q. And what would you be looking for?

21 A. Just anything out of the ordinary. Rust.
22 That's about all you could really see from the ground
23 usually, if it was rusty.

24 Q. Did you look for wear on the C hooks or the
25 hanger bolts?

26 A. You couldn't see it.

1 Q. From the ground?

2 A. No.

3 Q. Do you know what I'm talking about when I use

4 the term "C hook"?

5 A. Yes.

6 Q. In your experience with PG&E, did you ever see

7 a, what you would consider a worn C hook?

8 A. Yes, I have.

9 Q. Tell us about that.

10 A. We were changing all the insulators on the

11 line, it was a 115 line in the Cordelia area, and one of

12 the insulators we took off the C hook had a worn spot in

13 it.

14 Q. What type of worn spot?

15 A. Where the insulators had been swinging back and

16 forth in the wind, and it had worn a groove in the C

17 hook.

18 Q. Like a channel?

19 A. Yes.

20 Q. About the size of the hanger plate or the

21 hanger?

22 A. Yeah, looked like somebody had sawed it.

23 Q. Do you remember when that was?

24 A. No, I don't. It was when I was a new lineman

25 in the Transmission Department.

26 Q. So we're talking about way back in the '80s?

1 A. Yes.

2 Q. What did you do with that C hook?

3 A. We gave it to our supervisor.

4 Q. Do you remember who that was?

5 A. John Handy.

6 Q. Do you know what Mr. Handy did with it?

7 A. No.

8 Q. So you said this was in Cordelia?

9 A. Yes.

10 Q. Where is Cordelia?

11 A. It's out -- if you go out to 80 and through

12 Vacaville, and Cordelia is the last little town before

13 you go across the straight into the Bay Area.

14 Q. Okay. Are you familiar with the junction of

15 Interstate 80 and Highway 680?

16 A. Fairly.

17 Q. Okay. Is Cordelia somewhere around there?

18 A. It's -- that's on the other side, I believe.

19 So this would be on the Vacaville side.

20 Q. Okay. You said the wind had caused this to

21 rock back and forth?

22 A. Yes.

23 Q. In your experience, was that a windy area?

24 A. Yes.

25 Q. And what type of tower, if you remember?

26 A. I couldn't tell you exactly. It was just a 115

1 tower, single circuit.

2 Q. Suspension tower?

3 A. Yes.

4 Q. Transmission?

5 A. Suspension.

6 Q. Suspension tower.

7 So you guys took off this C hook, saw the

8 groove. That seem unusual to you?

9 A. Yes. That's the first time I had ever seen it.

10 Q. Okay. And so you pulled it and gave it to your

11 boss?

12 A. Yes.

13 Q. And you never heard anything more about it?

14 A. No.

15 Q. How far worn do you think that C hook was that

16 you saw?

17 A. Probably a third of the way through.

18 Q. Now, let's talk about your air patrols. Tell

19 us your procedure for doing air patrols when you were a

20 towerman -- or troubleman and again as a T-line

21 supervisor.

22 A. You would start at one end of the line and you

23 would fly extremely slow, I would say probably about like

24 at a fast walk. And --

25 Q. How close to the towers?

26 A. Probably about 30 feet, depending on how the

1 wind was blowing. If the wind's blowing, then you have
2 to fly a little farther away.

3 Q. Okay. So it would be safe to say that you
4 wanted to fly as close to the towers as safe?

5 A. Yes.

6 Q. How many transmission lines do you inspect
7 through air patrols on -- per day?

8 A. It was generally just one. Maybe even partial.

9 Q. And what were you looking for when you were
10 doing air patrols?

11 A. Flashed insulators, conductor damage, anything
12 basically you could see a problem with it, top of it,
13 tower.

14 Q. How about the cold end attachments, the
15 connectors, the insulators?

16 A. You would be able to see if they were rusted or
17 something like that, but you wouldn't be able to see the
18 wear.

19 Q. Okay. As a lineman, later as a troubleman or a
20 T-line supervisor, did you ever get any training on what
21 the cold end connectors were supposed to look like new?

22 A. Other than the fact I saw them new, that was
23 about it.

24 Q. Let's go specifically to the Caribou-Palermo
25 line. Did you get any training on what those were
26 supposed to look like, those cold end attachments were

1 supposed to look like when they were new?

2 A. No.

3 Q. So you've got the holes and you've got the

4 hooks. Did anybody tell you to look for daylight between

5 the top of the hook and the top of the hole?

6 A. No.

7 Q. Would that have been something that would have

8 been visible to you from the air?

9 A. Probably not.

10 Q. Okay. What if there was a lot of space between

11 the two?

12 A. I wouldn't have thought anything about it.

13 Q. Okay. Because nobody told you?

14 A. No. And those holes are all different sizes

15 sometimes. They can be big; they can be small.

16 Q. Yeah. Were you given any special instructions

17 for inspecting the Caribou-Palermo 115 line?

18 A. Not that I recall.

19 Q. Did you give any special care to the

20 Caribou-Palermo 115 line?

21 A. No more than any other line.

22 Q. Were you familiar with the history of the

23 Caribou-Palermo 115 line?

24 A. I knew that it was old.

25 Q. Did you know how old?

26 A. No.

1 Q. So in your other jobs when you were the T-line
2 supervisor in Sacramento, when you were a roving T-line
3 supervisor in Eureka and Metcalf and I think you said
4 Petaluma, and then finally T-line supervisor in
5 Bakersfield, did you have any old transmission lines?

6 A. There's a lot of old lines in PG&E, so I would
7 say yes.

8 Q. All right. And let's define old as pre-World
9 War II.

10 A. Yes.

11 Q. Were there ever any special instructions on
12 inspecting and maintaining those lines?

13 A. No.

14 Q. Were you ever instructed to give any special
15 care to maintaining or inspecting those lines?

16 A. Not that I recall.

17 Q. Were you ever told to do climbing inspections
18 of those lines?

19 A. No.

20 Q. Were you ever told to do enhanced inspections
21 of those lines?

22 A. No.

23 Q. Were you ever told to do increased frequency
24 inspections on those lines?

25 A. No.

26 Q. Now, you were a T-line supervisor in 2010;

1 correct?

2 A. Yes.

3 Q. I want to talk just post 2010. Starting in
4 2011, were any changes made to the inspections for the
5 older transmission lines, those that were at that time
6 70, 80, 90 years old?

7 A. Not that I recall.

8 Q. So no changes 2011 in terms of how you were
9 inspecting, the frequency that you were inspecting, what
10 you were looking for?

11 A. Not that I remember.

12 Q. Now, as a T-line supervisor, how much influence
13 did you have on the budget for your unit?

14 A. None.

15 Q. What was your role in the budget?

16 A. I was just tasked with keeping my costs down
17 and staying within whatever budget they gave me.

18 Q. So you were given a budget?

19 A. Yes.

20 Q. And told to stay within it?

21 A. Yes.

22 Q. Did that, was that difficult in some years?

23 A. Sometimes.

24 Q. What kinds of things could you do in those
25 years where keeping within your budget was difficult to
26 save money?

1 A. Road work was always my pet peeve. We never
2 had enough money to maintain our roads.

3 Q. Okay. How about the helicopter inspection, the
4 air patrols?

5 A. Never had a problem with that.

6 Q. All right. How were those covered in your
7 budget?

8 A. The money was allotted for patrols. And, yeah,
9 I didn't really have any control over that either.

10 Q. How much influence, or how much control did you
11 have over which lines got inspected which years?

12 A. None.

13 Q. How did you know what which lines to inspect in
14 which years?

15 A. It was just depending on what happened last
16 year; you swapped it around.

17 Q. Was there somebody else giving you a schedule?

18 A. We were told how often we were supposed to do
19 it, I guess. I don't recall anyone ever giving me a
20 schedule and saying, "Hey, here do this."

21

22 (Grand Jury Exhibit 284 was marked for identification.)

23

24 Q. All right. You have in front of you three
25 packets of documents. Top one should be number 284.

26 A. Okay.

1 Q. Do you recognize that document?
2 A. Yes.
3 Q. What is that document?
4 A. This is a ground patrol of the Caribou-Palermo
5 line.
6 Q. Is that a ground patrol that you did?
7 A. Yes.
8 Q. When did you do it?
9 A. I completed it on 8/11 of '03.
10 Q. When did you start it?
11 A. I don't know.
12 Q. Can you look through it and tell?
13 A. Probably not. I don't think they kept dates on
14 it. This was before we started dating them. So no, I
15 can't tell you when I started it.
16 Q. How long did it generally take you to complete
17 the ground inspection of the Caribou-Palermo line?
18 A. I'm not sure.
19
20 (Grand Jury Exhibit 286 was marked for identification.)
21
22 Q. Well, let's skip over from there, from 284.
23 Let's go to 286. Should be on -- there you go. Do you
24 have 286?
25 A. Yes.
26 Q. Do you recognize 286?

1 A. Yes.

2 Q. What is 286?

3 A. It is the same thing, ground patrol of the
4 Caribou-Palermo line done in 2005.

5 Q. And this, again, was a ground patrol that you
6 did?

7 A. Yes.

8 Q. That's your name on the front?

9 A. Yes.

10 Q. Now, this was after you had started keeping
11 dates on each page; correct?

12 A. Yes.

13 Q. So can you tell us when you started this
14 inspection and when you finished it?

15 A. I started it in June 28th of '05.

16 Q. And when did you finish it?

17 A. I completed it 8/1 of '05.

18 Q. So it took you quite a while to do?

19 A. Yes.

20 Q. Why so long?

21 A. Because I didn't just stay on this patrol and
22 do it. They often had me, pulled me off and go do other
23 things.

24 Q. Okay.

25 A. So I would work on it one day, then come back
26 three days later and work on it again, so on so forth.

1 Q. But in '05 you dated it every day --
2 A. Yes.
3 Q. -- as to what work you did on that day?
4 A. Yes.
5 Q. And how many different days did you work on
6 that inspection?
7 A. I'd have to count them.
8 Q. Go ahead.
9 A. So I started at 6/28.
10 Q. You can just tell us the dates that you worked
11 on those.
12 A. Separate the pages here. Then 7/1, 7/8, 7/9,
13 7/12, 7/14, 7/15, 8/10, 8/11, 8/12, and I go back to 8/1.
14 Q. So that sounds like about 14 or 15 days that
15 you spent completing this inspection?
16 A. Close. I wasn't counting how many.
17 Q. I was trying to count as you went through.
18 It's all in the record. So we can count them later.
19 Why did it take you so long, so many days to
20 inspect the Caribou-Palermo?
21 A. Probably because they were pulling me off to go
22 do other things.
23 Q. Do you remember how long the Caribou-Palermo
24 line was?
25 A. In miles you mean?
26 Q. Yeah.

1 A. Not off the top of my head, no.

2 Q. Or the structures?

3 A. No.

4 Q. Would those be in your report?

5 A. It should be in here, yes.

6 Q. Somewhere in here.

7 A. It says 62 miles and 432 structures.

8 Q. What's the topography of the Caribou-Palermo

9 line?

10 A. It runs along the side of a canyon.

11 Q. So those things have anything to do with the

12 reason it took you so many days to actually complete the

13 inspection?

14 A. Some of them are very hard to get to.

15 Q. Let's talk about that. Did you have processes

16 or procedures for how to, how to get to and inspect

17 hard-to-reach towers?

18 A. I don't know if I would call it a process or

19 procedure, I would just get to it in my truck as best I

20 could. And if I couldn't get to it in a truck, I would

21 take the quad runner. If I couldn't get to it in that,

22 I'd try to walk to it.

23 Q. How about helicopters?

24 A. I didn't use helicopters there.

25 Q. Did you ever -- in your experience, did you

26 ever use helicopters to help with ground inspections?

1 A. Yes, if you were able to actually land a
2 helicopter somewhere. Up that canyon, you can't.

3 Q. Explain to us how you would use a helicopter to
4 assist with a ground inspection.

5 A. Well, there's a 500 line that I used to have my
6 crew that I would put like four guys in a helicopter and
7 the helicopter would stop at each tower and drop somebody
8 off, and then we'd just hopscotch them along.

9 Q. So you'd actually use the helicopter to insert
10 the troublemen to inspect that tower?

11 A. Actually, that was linemen doing that.

12 Q. Linemen?

13 A. Yes.

14

15 (Grand Jury Exhibit 285 was marked for identification.)

16

17 Q. All right. We talked about 284 and 286. Let's
18 go to the middle, 285.

19 Do you recognize that document?

20 A. Yes, I do.

21 Q. What is that document?

22 A. This is an air patrol of the Caribou-Palermo
23 completed on 9/1 of '04.

24 Q. And you completed that patrol?

25 A. Yes.

26 Q. And that's your report?

1 A. Yes.

2 Q. So 2003 you do a ground inspection of the
3 Caribou-Palermo; correct?

4 A. Yes.

5 Q. 2004 an air patrol of the Caribou-Palermo?

6 A. Yes.

7 Q. 2005 we're back to ground inspection?

8 A. Yes.

9 Q. Do you know when that changed?

10 A. No. No. Not that I remember.

11 Q. Just a couple more.

12 Do you remember who your predecessor was as the
13 supervisor at Table Mountain?

14 A. (EMPLOYEE #9). No, take that back. Yeah, it
15 was (EMPLOYEE #9). No, it wasn't. It was (EMPLOYEE #3).

16 Q. Okay. And do you remember who your successor
17 was?

18 A. It was (EMPLOYEE #9) who came in afterwards. I
19 moved around so often it's hard to remember.

20 MR. NOEL: I think that's all I have.

21 GRAND JURY FOREPERSON: Okay.

22 MR. NOEL: Jurors have anything?

23 The jurors, if they have questions, they write
24 the questions down and we will ask them to you.

25 (Grand Jury Foreperson and counsel confer).

26 Q. (By MR. NOEL) (WITNESS #13), these are

1 questions from the jury.

2 When in your career did you first see a
3 maintenance inspection policy manual?

4 A. I don't remember the exact date. It was when I
5 was in Bakersfield.

6 Q. Would it surprise you to learn that there's a
7 standard of specifications for the components to cold end
8 connectors that define specific and regular sizes for
9 those components?

10 A. Would it surprise me?

11 Q. Yeah.

12 A. No.

13 Q. Did you ever see those?

14 A. No.

15 Q. As part of your job as either a lineman or a
16 towerman, or a T-line supervisor, did anyone ever show
17 you the specs for the things that you were supposed to be
18 inspecting?

19 A. No. I was never a towerman, though.

20 Q. Okay.

21 Anything else?

22 All right. I'll give this back to Madam Clerk.

23 I have nothing further of this witness.

24 GRAND JURY FOREPERSON: (WITNESS #13), you are
25 admonished not to discuss or disclose at any time outside
26 of this jury room the questions that have been asked of

1 you or your answers until authorized by the Grand Jury or
2 the Court. A violation of these instructions on your
3 part may be the basis for a charge against you of
4 contempt of court. This does not preclude you from
5 discussing your legal rights with your own attorney.

6 (WITNESS #13), what I have just said is a
7 warning not to discuss this case with anyone except the
8 Court, your lawyer, or the district attorney. Do you
9 understand?

10 THE WITNESS: Yes.

11 GRAND JURY FOREPERSON: Okay. Thank you.

12 [DISCUSSION OMITTED.]

13 GRAND JURY FOREPERSON: (WITNESS #22), before
14 you have a seat, would you please raise your right hand
15 to be sworn.

16
17 (WITNESS #22)
18 having been called as a witness in
19 the matter now pending, having been first
20 duly sworn, testifies as follows:

21
22 THE WITNESS: Yes.

23 GRAND JURY FOREPERSON: Thank you. Have a
24 seat, please.

25 THE WITNESS: Thank you.
26

EXAMINATION

BY MR. NOEL

Q. (WITNESS #22), can you please state your full name, spelling your last for the record.

A. My name's (WITNESS #22), (SPELLING REDACTED).

Q. Are you employed, (WITNESS #22)?

A. Yes, sir.

Q. By whom?

A. Pacific Gas & Electric.

Q. What capacity?

A. I am the Table Mountain area maintenance transmission line supervisor.

Q. How long have you had that job?

A. Since July of 2017; so two years.

Q. Who was your predecessor?

A. (WITNESS #12).

Q. All right. When did you start PG&E?

A. 2007. July of 2007. I started at PG&E down in Fremont in the Materials Department for the company.

Q. What were you doing in Materials Department?

A. I was what they called a "material handler," so it was loading/unloading packaging up material for distribution to local yards.

Q. How long did you do that job?

A. I was there until July of 2009, at which point

1 I took a position with our Tower Department group out of
2 Davis.

3 Q. What position did you fill with the Tower
4 Department?

5 A. I took a position as a utility worker, which
6 turned into a towerman position probably within nine
7 months to a year after that.

8 Q. What is the Tower Department?

9 A. Tower Department, it's a division within PG&E
10 that they do maintenance and construction of all steel
11 transmission structures. So anything from 60 kV on up,
12 anything that has a concrete foundation. We do new tower
13 installation, new LSP -- lattice steel pole -- basically
14 a pole made out of angle iron, and new towers. So we do
15 everything from the excavation to the foundation,
16 installing foundation and building the structure.

17 Q. What about existing structures, does the Tower
18 Department deal with those?

19 A. Yeah. So they'll do the maintenance,
20 construction. We'll do inspections. So Tower Department
21 inspects the 500 kV climbing inspections. That's part of
22 their job duties, also.

23 Q. When you say 500 kV, are you talking about the
24 big 500 kV transmission lines?

25 A. Correct.

26 Q. What about the 115 line, does the Tower

1 Department do inspections on those?

2 A. We can do inspections, yeah, as they're
3 triggered. There's no cycle for doing inspections on
4 those, but, you know, sometimes we'll have a reconductor
5 project, we'll pull new wire through an existing circuit.
6 And a lot of times we'll preinspect it before the job
7 takes place.

8 Q. So you said you started off in the Tower
9 Department as a utility worker. What's a utility worker?

10 A. Utility worker is basically what we call a
11 "groundman." They're there to -- it's entry-level job.
12 You know, you learn the basics. All ground-related
13 activities, because you're not climbing yet. So you do
14 the concrete work, mostly excavations, that type of work.

15 Q. You said that after spending about a year as a
16 utility worker you became a towerman?

17 A. Correct.

18 Q. What's a towerman?

19 A. So a towerman is essentially somebody who
20 climbs and does the aerial work.

21 Q. What do you mean by "aerial work"?

22 A. Work off the ground. So within the structure.

23 Q. So actually going up into the structure,
24 climbing the structure itself, as opposed to flying over
25 it in a helicopter?

26 A. Yeah. Towerman doesn't fly. They won't, they

1 won't fly over it.

2 Q. Right.

3 A. They'll fly to it, land on it, but yeah,
4 they're not --

5 Q. Just trying to make -- we've heard the term
6 over and over again, aerial, aerial, aerial in terms of
7 air patrols.

8 A. Right.

9 Q. When you're talking about towermen --

10 A. Aerial, off the ground.

11 Q. -- aerial, off the ground, you're talking about
12 them actually climbing up into the structure itself?

13 A. Correct. They can do either way. They can fly
14 underneath the helicopter. We call it long-lining, where
15 they're attached to the line. So a towerman can be
16 trained to do that, where he will be landed on a
17 structure, or at the base of a structure.

18 Q. How long were you a towerman?

19 A. I was a towerman until I took the tower
20 supervisor job I believe in January of 2015.

21 Q. So basically went to Tower Department '09, you
22 became a towerman about 2010. So to about 2015; is that
23 about right?

24 A. Correct.

25 Q. So about five years that you were a towerman.

26 While you were a towerman, did you ever work on

1 the Caribou-Palermo line?

2 A. Yeah. Yeah, I was a -- Caribou-Palermo was one
3 of the first circuits I did some climbing on right after
4 climbing school. And then we, you know, we've done
5 various work. We had some foundation erosion issues. We
6 put a new structure in at one location. We had several,
7 we had five towers fall down, we put five towers in to
8 replace those. Or actually they were TSPs. But we
9 definitely did some work during my time as a towerman.

10 Q. Why were you climbing towers in the
11 Caribou-Palermo?

12 A. I believe it was for an upcoming NERC project.
13 NERC is where they'll go through and LIDAR the circuit to
14 ensure we have proper ground clearance at every location.
15 They do it with a helicopter and some sort of lasers or
16 something that measures very accurately the distance from
17 the conductor to the ground. And we've had these
18 projects go through where they'll raise certain
19 structures to get additional height out of them. So I'm
20 pretty sure that was on the books and we were doing a,
21 just a sample inspection of the structures to see what we
22 saw.

23 Q. So you were going up and inspecting to find out
24 if you could raise the height of towers?

25 A. I'm assuming that's what it was, right. Like I
26 said, this was day four out of climbing school, and I was

1 barely a towerman, so I just did what I was supposed to.

2 Q. All right. So let's go back. You said
3 foundation erosion. What is foundation erosion?

4 A. So we had one tower out there where the entire
5 hillside was sliding. The tower moved, you know, a
6 certain amount of feet. So we had to replace a structure
7 uphill from it where the conditions were still stable.
8 We had a pretty large rock go through another one about
9 the size of a Volkswagen Beetle. Those kind of
10 foundation problems.

11 Q. Okay. You said you did a tower replacement on
12 the Caribou-Palermo?

13 A. Correct.

14 Q. Do you recall what tower?

15 A. No.

16 Q. Why replace the tower?

17 A. Because a boulder had gone through it.

18 Q. Okay. That's the one that got hit by the
19 Volkswagen-sized boulder?

20 A. Correct.

21 Q. Then you said you had to replace five towers?

22 A. Correct.

23 Q. That was during 2012?

24 A. Must have been right around there.

25 Q. Okay. And what was your job with regard to the
26 tower replacement?

1 A. I was a towerman when we tore them out. So we
2 flew out all the damaged structures. And then at the
3 time, Line Department came and put a temporary wood pole
4 shoo-fly in.

5 Q. So you actually physically took the towers
6 that, the fallen towers, out of the canyon prior to the
7 installation of the shoo-fly?

8 A. Yeah. We had to get them out of the way at
9 least for the wood pole structures to go in. So the ones
10 that were flew out, we flew out, and the ones that
11 couldn't, we couldn't flew out, we moved them uphill so
12 we they could get wood poles in there.

13 Q. What kind of training did you receive to
14 qualify you as a towerman?

15 A. We go to climbing school. It's down in
16 Livermore. They teach, you know, the basics of climbing.
17 We do a hundred percent fall protection where we, they
18 train us on using our hundred percent climbing tools to
19 mitigate any fall hazards. We go to grounding school
20 where they teach us how to ground, deenergize circuits.
21 A lot of on-the-job training, too. But we have tower
22 foundation course where we learn how to put in
23 foundations.

24 Q. Did any of your training include specs for the
25 towers you were going to be working on?

26 A. I don't understand the question.

1 Q. Specific measurements, what things are supposed
2 to look like, how they're supposed to fit together?

3 A. No.

4 Q. What size things went in which towers?

5 A. No. I mean, you might be referring to like
6 drawings. We have drawings for pretty much all of our
7 tower types, which is where you would find dimensions,
8 steel size, hole distances, if that's what you're asking
9 about.

10 Q. Right. Is that part of your training?

11 A. Yeah, that's probably the on-the-job portion of
12 the training where we build a lot of, whether it be tower
13 extensions, and part of it's print reading.

14 Q. So, for instance, when you were doing the, the
15 NERC project on the Caribou-Palermo, in looking at towers
16 for the possibility of raising them, did you look at the
17 written, the documented, printed specifications for that
18 tower before going in?

19 A. No. We were looking more at access to each
20 structure and, you know, conditions of the structure in
21 the areas around the structures. You know, as a
22 towerman, we're not engineers, we can't tell, you know,
23 what type of extension or if the tower can be extended or
24 anything. That all comes from our engineering group.

25 Q. When you're climbing around up in the towers,
26 obviously, you have a specific job you were going up

1 there for; right?

2 A. Right.

3 Q. Are you also, as you're climbing around,
4 looking around in the tower for signs of wear or
5 corrosion or rust?

6 A. Yep.

7 Q. Any of those things?

8 A. Definitely looking at the condition of the
9 tower.

10 Q. So how can you determine wear if you don't know
11 how the things are supposed to fit together in the first
12 place?

13 A. I don't understand.

14 Q. Well, using the example of a hook in the hole,
15 how can you determine if there's wear on the hook in the
16 hole, if you don't know how they're supposed to fit
17 together in the first place, how much space there's
18 supposed to be?

19 A. Well, I mean, you can look at a piece of steel
20 and determine if it's wearing or not.

21 Q. Okay. How?

22 A. By missing metal.

23 Q. And how would you see that?

24 A. Well, because the steel's going to be a certain
25 thickness all the way into a point where it's not that
26 thickness anymore.

1 Q. Okay. So if you're looking at things like
2 hooks in holes, you'd be able to see those when you're
3 climbing around up in the tower?

4 A. Oftentimes, yeah.

5 Q. And so when you were climbing around the
6 Caribou-Palermo towers, were you looking for those
7 things?

8 A. I was looking at conditions, condition of the
9 steel, yes. We were looking for bent steel, rusted
10 steel, missing bolts, damaged hardware. Like I said,
11 foundation issues, yes.

12 Q. All right. So after you were a towerman you
13 said you became a supervisor in the Tower Department?

14 A. Correct.

15 Q. Around 2015?

16 A. Correct.

17 Q. And what did you do as a supervisor in the
18 Tower Department?

19 A. I -- the -- my first tower supervisor job was
20 in the north coast area. So we did -- my first large
21 project was a reconductor Contra Costa, Moraga. So it
22 went from Antioch down to Moraga. It was a series of
23 tower extensions working in conjunction with Line
24 Department to pull new wire through.

25 Q. What was -- you said you did that job until
26 2017?

1 A. Yeah. We did a re-org. So at one point the
2 north coast was no longer north coast. We went to a
3 north, central, south region, at which point I became the
4 north tower supervisor. So that happened probably 2016;
5 sometime in there. So I sort of changed jobs, but I kind
6 of didn't because it was still a lot of the same area,
7 but --

8 Q. Okay. And 2017 you became the transmission
9 line supervisor at Table Mountain?

10 A. Correct. Yeah, I did some temporary
11 assignments with Sacramento maintenance, and then with GC
12 line, then I ended up at Table Mountain in July.

13 Q. So what training did you get to qualify you as
14 a T-line supervisor at Table Mountain?

15 A. We do -- you know -- we do annual training on
16 our preventive maintenance. You know, we have a manual
17 that we -- is pretty much our Bible in the maintenance
18 world. And it's a lot of the similar training to what we
19 have in the Tower Department, too. We're going to do
20 the, you know, structure rescue, that type of training.
21 But -- does that help? Is that clear?

22 Q. Actually was a great segue into our first
23 slide. You have in front of you a binder that's marked
24 as Exhibit No. 248. It's the top blue binder. Flip open
25 to the first page. You should see a sticker that says
26 248.

1 A. Okay.

2

3 (Grand Jury Exhibit 248 was marked for identification.)

4

5 Q. Do you recognize Exhibit 248?

6 A. Yes.

7 Q. What is Exhibit 248?

8 A. The *ETPM Manual*.

9 Q. That's the *Electric Transmission Preventative*
10 *Maintenance* that you just mentioned?

11 A. Correct.

12 Q. Which version of this?

13 A. 2016.

14 Q. Are there multiple versions?

15 A. Yes. They are continually coming out with new
16 versions of this.

17 Q. Okay. So I want to flip through this and look
18 at a few things.

19 First off, there's Table 2, section 1.4. You
20 said you received regular training in *ETPM*?

21 A. Yeah, they do -- we do an initial training
22 where we cover pretty much everything in here that
23 happens, once; then they do refreshers yearly, and that
24 covers any new information. And this manual has been
25 continually updated more oftentimes recently than it has
26 been historically. So it changes quite often these days.

1 Q. How important is this manual to what you do at
2 Table Mountain?

3 A. This manual is pretty important to what my
4 troublemen do.

5 Q. So drawing your attention to section 1.4.1,
6 Table 2, do you see that table?

7 A. Uh-huh.

8 Q. What is this table?

9 A. The "Inspection Best View Position."

10 Q. What is this table for?

11 A. It's a, basically the best view of how you're
12 going to see different facilities from which angle.

13 Q. Okay. Can you give us some of the context of
14 this table?

15 A. Yeah. So take, for example, foundations;
16 right? You're not going to be able to look at a
17 foundation from ten feet above. The optimal position is
18 going to be at ground level.

19 Q. Right.

20 A. Structure, it's going to be a combination.
21 Arms, you're not going to look at the arms from
22 the ground level.

23 Q. So in this left-hand column here, description,
24 all the things that are listed in there, are those things
25 you're supposed to be looking at during your inspections
26 and patrols?

1 A. Correct.

2 Q. And then what type of inspection or patrol is

3 the best to look at those things; correct?

4 A. Correct.

5 Q. What are insulators and hardware?

6 A. Exactly that, insulators and the attachment

7 point. A lot of times it's a C hook, or it could be a Y

8 ball, different types of connections that basically will

9 hang a string of insulators onto the structure.

10 Q. So cold end attachment points?

11 A. Right, on towers.

12 Q. So that would be the hardware that they're

13 talking about in this section?

14 A. Correct.

15 Q. All right. So according to the *ETPM*, what are

16 the best ways to inspect the hardware, the cold end

17 attachment points?

18 A. From an aerial inspection, ground inspection,

19 or climbing inspection.

20 Q. What type of ground inspection?

21 A. Above ten feet.

22 Q. What does that mean?

23 A. Climbing or being elevated.

24 Q. Being elevated how?

25 A. Really we don't have many options. It could be

26 just the nature of the terrain is probably the only way

1 you're going to get above ten feet without climbing.

2 Q. So according to the book, the only way that you
3 can look at the cold end hardware attachments -- yeah,
4 cold end attachment points, is either by the aerial
5 inspection or by the climbing inspection?

6 A. Correct. That's the best view position.

7 Q. Now, what's the --

8 A. It's --

9 Q. Go ahead.

10 A. I was going to say it's not the only way. I
11 mean, this table is kind of a guideline for how you're
12 going to get the best view.

13 Q. Okay. You've worked in the Tower Department,
14 you've worked now the Transmission Line Department.
15 Where is the line between the two jurisdictions?

16 A. I don't understand.

17 Q. Where does the Tower Department duties end and
18 the Transmission Line Department's --

19 A. For like maintenance and construction?

20 Q. Yes.

21 A. Okay. So towermen will work from the
22 foundation, anything up to the steel, out to the arms,
23 and pretty much to the working eye, however that
24 insulator is attached to the structure. Line Department
25 is responsible for the insulators down to the shoes out
26 to the wire.

1 Q. So who is in charge of those attachment points,
2 that cold end attachment point, the hook and the hole?

3 A. What do you mean who is in charge of it?

4 Q. Who is responsible for it, the towermen or the
5 troublemen or the T-line?

6 A. I don't understand. I don't understand what
7 you mean, who is responsible for?

8 Q. Who is responsible for looking at it and
9 determining wear?

10 A. Troublemen or towermen, it could be either.
11 When a towerman's doing a climbing inspection, he's
12 looking at everything. And when you said "jurisdiction,"
13 I mean, I think what you're referring to is who is
14 responsible for doing maintenance on these things. So a
15 lineman isn't going to be changing out a working eye
16 plate. A towerman isn't going to be changing out
17 insulators. But both of them are responsible for looking
18 at the entirety.

19 Q. Okay. All right. Let's go on. Table 13,
20 "Overhead Inspection Frequencies."

21 A. Page number?

22 Q. No, I didn't put the page number on there.
23 Should be section 2.1.3, I believe.

24 A. Got it.

25 Q. Was that right, 2.1.3?

26 A. You nailed it.

1 Q. Describe Table 13 for us.

2 A. This is our inspection frequency. So it has
3 500 kV, 230 kV, 115 kV, and our 60 and 70 kV, and the
4 structure type and the frequency at which we do various
5 inspection types.

6 Q. How often do you inspect steel 115 line?

7 A. Every five years.

8 Q. All right. Next section, 2.1.4. "Inspection
9 Documentation." Are you familiar with this section?

10 A. Yes.

11 Q. As a supervisor, is this a section that you
12 have to deal with a lot?

13 A. Not so much this section of the manual, but the
14 forms that it's alluding to.

15 Q. This section talks about which forms the
16 troublemen or the inspector -- let me back that up.

17 The terms that's used in there is "QCR." Do
18 you know what a QCR is?

19 A. I believe the acronym is Qualified Company
20 Representative.

21 Q. Okay. So QCR should have these certain
22 documents before they do an inspection?

23 A. Correct.

24 Q. And it's the responsibility of the QCR,
25 yourself, and the clerk to make sure that they have all
26 the correct documents?

1 A. Correct.

2 Q. Who is the clerk?

3 A. Who is my specific clerk?

4 Q. Yep.

5 A. (WITNESS #21).

6 Q. So the documents: The Transmission Line

7 Inspection Data Patrol Data Sheet?

8 A. Uh-huh.

9 Q. That's one of the documents? Remember, we have

10 to talk out loud for her.

11 A. Yes.

12 Q. She can't type head nods.

13 A. There's no button for that?

14 Q. And then the object list?

15 A. Correct.

16 Q. Now, what's the Transmission Line Inspection

17 Data Patrol, or Inspection Patrol Data Sheet, what kind

18 of form is that?

19 A. It's a sheet where they will document any

20 findings that they have during their patrol and

21 inspection.

22 Q. What's the object list?

23 A. The object has every structure on that patrol

24 in its own sort of box where you mark whether they found

25 anything there or not.

26 Q. All right. 2.2, "Climbing Inspections."

1 Familiar with this section?

2 A. Sure.

3 Q. What kinds of things would trigger a climbing
4 inspection of a 115 line?

5 A. Pretty much, you know, like I said, projects,
6 upcoming project work, could. That's historically what
7 I've seen. We did an inspection on a circuit that ran
8 from Vacaville to Lakeville because they were going to do
9 some NERC work on it, raising some structures,
10 reconductor, whatnot. That will trigger a climbing
11 inspection. We went out there and looked at every
12 structure to make sure it was in good condition before
13 they added on top of them.

14 Q. So you don't just do climbing inspections to
15 get up there and look around and see what kind of
16 condition this tower is in; correct?

17 A. Unless it is a trigger, right.

18 Q. Right. So let's say something, you've got a
19 tower line and something goes wrong in one tower, would
20 that trigger a climbing inspection for the rest of those
21 towers?

22 A. It's case by case. It's hard to say that. We
23 have -- you know -- we do maintenance on all of our
24 structures quite often, and that doesn't necessarily
25 trigger a climbing inspection.

26 Q. And, finally, the Appendix, "Appendix E," "Line

1 Patrol File Guidelines." Are you familiar with this?

2 A. Sure.

3 Q. What does that section tell us?

4 A. This is how we file our, our patrols. We have

5 air patrols, we have the detailed ground patrols, and

6 this covers how we file them.

7 Q. And set up your files?

8 A. Correct.

9 Q. Crossovers. Are -- all of your detailed

10 inspections, you should have an operational control

11 ticket; is that correct?

12 A. Yeah, I'm not horribly familiar with the

13 filing. That's more of a clerical issue, but --

14 Q. All right. The Line Inspection Data Sheet?

15 A. Uh-huh.

16 Q. You have to use words.

17 A. Yes.

18 Q. The Transmission Line Object List?

19 A. Correct.

20 Q. The Existing Notifications?

21 A. Correct. Call it "priors."

22 Q. Priors. And a map of the line, the specifics?

23 A. Not my area.

24 Q. All right. And then air and ground patrols,

25 your Operation Control Tickets, your Transmission Line

26 Inspection Data Sheet, the object list, coversheet, and

1 the Existing Notifications; correct?

2 A. Correct.

3 Q. So as a supervisor are you the one that's
4 actually doing the inspections?

5 A. No.

6 Q. Who is doing the inspections?

7 A. The troubleman does the inspection.

8 Q. What part do you play in the inspection
9 process?

10 A. Ultimately just collecting paperwork toward the
11 end, or at the end of their patrols. And, you know, they
12 have -- we have months that a patrol has to be done by,
13 so that's part of my job is to ensure that when we have a
14 patrol that's due in March, it's completed by March. So
15 I'd say, you know, completing it as scheduled, but not --
16 we don't -- as a transmission line supervisor, we don't,
17 we don't schedule the inspections when they're in, but we
18 ensure that they're done when they're supposed to be
19 done, if that makes sense.

20 Q. Okay. Then once they're done, what is your
21 responsibility?

22 A. Oh, just sign off the paperwork and ensure it
23 gets filed.

24

25 (Grand Jury Exhibit 249 was marked for identification.)

26

1 Q. So in front of you is Exhibit 249. Should be
2 right there. In this stack right here.

3 A. This one?

4 Q. Yep.

5 A. Okay.

6 Q. Do you recognize Exhibit 249?

7 A. Not specifically, no.

8 Q. Why don't you go ahead and flip through it;
9 several pages long.

10 A. Okay.

11 Q. Do you recognize 249?

12 A. Yeah.

13 Q. What is 249?

14 A. It's an inspection that (WITNESS #6) did.

15 Q. Is this an inspection that you signed off on as
16 supervisor?

17 A. Yes. Let me make sure. Yes.

18 Q. What page?

19 A. The fourth page.

20 Q. Is that the Transmission Line Inspection Data
21 Sheet?

22 A. Correct. The inspection, yep.

23 Q. And this down here, is this your signature?

24 A. Yes.

25 Q. All right. And your LAN ID is JP -- actually,
26 might as well have you tell us. It's hard to read.

1 A. JPWI.

2 Q. JPWI is your LAN?

3 A. Correct.

4 Q. All right. Let's back up and go through this.

5 First back to the front page. And what kind of document

6 is the front page?

7 A. The control ticket. I'm -- yeah, this is just

8 basic information on the circuit.

9 Q. Now on there in the middle it says "quarterly

10 patrol, move date to end of September." Do you

11 understand what that means?

12 A. No.

13 Q. But this is an inspection of the

14 Caribou-Palermo line; correct?

15 A. Correct.

16 Q. And you said by (WITNESS #6). Page 2 of the

17 document, anything --

18 A. No.

19 Q. -- of substance?

20 A. There's no information on there.

21 Q. So then page 3, what is page 3?

22 A. Page 3 is a list of the priors.

23 Q. And in terms of the names the *ETPM* gives to it,

24 what would this be called?

25 A. The -- I don't understand.

26 Q. The forms, the names that the *ETPM* gives right

1 here in the appendix that we were looking at, what would
2 this form be called? This form is referred to where in
3 here?

4 A. I'm not sure of the official name. We just
5 call it "priors."

6 Q. Right. Would this be the notification page?

7 A. No.

8 Q. The Open Notification?

9 A. That would be this one. Oh, the Open
10 Notification? Yes.

11 Q. Priors are the open notifications?

12 A. Existing notifications.

13 Q. Then the next page is the Transmission Line
14 Inspection Data Sheet; correct? We already talked about.

15 Then the next page, what is that?

16 A. This is just where he documents what days he
17 made it to which structures.

18 Q. That's the last page; correct?

19 A. I have one more page.

20 Q. Yeah, what's that page?

21 A. This is just the mat codes and just like a
22 legend.

23 Q. One of the things that we noticed is that this
24 report is substantially smaller than every other report,
25 or every previous report. There's no Transmission Line
26 Object List. Do you know why that is?

1 A. No, because -- I don't know, honestly.

2 Q. I mean, you took over as supervisor in 2017;
3 right?

4 A. Correct.

5 Q. You had been with the Tower Department all the
6 way up to when you took over as supervisor, T-line
7 supervisor; correct?

8 A. Uh-huh.

9 Q. Remember, we've got to use our words.

10 A. Yes.

11 Q. When you started, this is the way they were
12 being done; is that --

13 A. Yeah, so the air patrols, you know, in the *ETPM*
14 *Manual*, it states that you check preexisting conditions,
15 but I don't believe it has in there that we need the
16 object list. So it's --

17 Q. Well, in the appendix it actually lists the
18 object list as being something that you're supposed to
19 have in your file; correct?

20 A. Right. And I don't know if this is complete.

21 Q. Okay. Then when we went back here into your
22 forms, it talked about for the aerial inspection it
23 listed a Transmission Line Object List as being something
24 to be pulled for all inspections?

25 A. Yeah, he pulls it to utilize it during the
26 patrol. That's what I'm getting at.

1 Q. Okay. All right. So let's move on. Forgot an
2 exhibit number on this one. Should be Exhibit 287.
3 Should be up next.

4
5 (Grand Jury Exhibit 287 was marked for identification.)
6

7 A. I see it.

8 Q. All right. Do you recognize 287?

9 A. Yes.

10 Q. What is 287?

11 A. 287 was patrol performed by (WITNESS #18) in
12 September of '18.

13 Q. On what line?

14 A. The Caribou-Palermo.

15 Q. And this, again, something you signed off on?

16 A. Yes.

17 Q. So the front page, again, page 1?

18 A. The priors, the existing notifications.

19 Q. No, the very cover page.

20 A. Yep, the control ticket.

21 Q. Page 2?

22 A. Priors.

23 Q. Notification page?

24 A. Yes.

25 Q. Page 3?

26 A. The findings.

1 Q. Transmission Line Inspection Data Sheet?

2 A. Correct.

3 Q. And that's your signature down on the bottom?

4 A. Yes.

5 Q. You signed it 9/25/18?

6 A. Correct.

7 Q. And then this untitled form?

8 A. Uh-huh.

9 Q. Remember, you have to say "yes."

10 A. Yes.

11 Q. All right. And then, again, the last page is

12 what?

13 A. This one?

14 Q. Yeah.

15 A. Just documents what day he went to which

16 structures.

17 Q. Okay. No object list with this?

18 A. Correct.

19 Q. So let's talk about the '18 inspection itself.

20 The Transmission Line Inspection Data Sheet. What

21 problems were found on the Caribou-Palermo?

22 A. He found a damaged insulator at structure 2

23 over 22; and a hold down, repair hold down insulator

24 anchor at 27 over 221.

25 Q. When a troubleman doing an inspection finds a

26 problem on the line, explain to us the process that that

1 initiates.

2 A. So if a troubleman finds a problem on the line,
3 he'll fill out this form, he'll get photographs of it.
4 These days we use iPads to document and upload all of our
5 information into a notification. At which point, it goes
6 to a gatekeeper process, which means -- back then it was
7 myself would look at the photos, his information he
8 supplied with the notification. The troubleman assigns
9 the priority, which is how soon the work needs to take
10 place. That can be altered by myself if I feel it
11 necessary. That happens during the gatekeeping process.
12 A tag will be released. And that's when it gets put into
13 the maintenance cue for work to be completed.

14 Q. Okay. So let's talk about the problem on
15 27/221.

16 A. Okay.

17
18 (Grand Jury Exhibit 288 was marked for identification.)
19

20 Q. Moving on to the next, which would be 288.
21 Should be right there next in line.

22 A. Uh-huh.

23 Q. Do you recognize 288?

24 A. It's an LC tag, yes.

25 Q. What does that mean?

26 A. It's just a notification that we use to

1 complete maintenance work.

2 Q. And walk us through that.

3 A. So this is basically the document that our crew
4 would receive when they are tasked with going out to
5 complete this work. Tells them the circuit, structure
6 number. It's got the due date, the date it was written
7 up, who wrote it up. And a brief, what we call a "long
8 text," a brief information on what actually is to be done
9 out there.

10 Q. All right. And the next page?

11 A. It's a photograph, and another photograph.

12 Q. Two photographs? I think this is the third
13 page, the photograph that I have up on the board?

14 A. Yep.

15 Q. What does that photograph show?

16 A. That's the broken hold down.

17 Q. You can always get up and demonstrate on the
18 board if you need to. Just show us what, what a broken
19 hold down is.

20 A. Okay. So a hold down -- here is a lower arm on
21 this particular tower. And what it is, it has a piece of
22 guide wire that kind of went up to the bottom of that
23 insulator and back down, and it basically would hold that
24 string of insulators.

25 Q. Okay. So going back to the front page of the
26 form itself, what was the priority of this?

1 A. This was an E priority.

2 Q. What does that mean?

3 A. Twelve months to make the repairs.

4 Q. Why so low?

5 A. I don't understand "low." What do you mean?

6 Q. Why so low priority? You've got an insulator

7 that's swinging free out there. Why isn't that something

8 urgent to do?

9 A. Well, this, this particular hold down, it's

10 kind of a redundant piece of the structure. If you want

11 to go back to that photograph, that insulator string

12 above the wire is what we would install these days

13 anymore. We wouldn't even have that lower string on

14 there, and it wouldn't be tied back to the tower like

15 this, this one was at one point. So, yeah, it's just

16 kind of a redundant string of insulators right now.

17 Q. This tower line is old; right?

18 A. Yes. As relative, yes.

19 Q. These towers were designed a long time ago;

20 correct?

21 A. Yes.

22 Q. Science has evolved as our knowledge has

23 evolved, the construction design of these towers has

24 evolved; correct?

25 A. Correct.

26 Q. So what they did when this tower line was built

1 is not necessarily what's done anymore?

2 A. Correct. Yeah. We have several different ways
3 to build and design towers. We don't have many that are
4 alike, actually.

5 Q. But yet this is the way this tower line was
6 built; correct?

7 A. Correct.

8 Q. With something from both, to hold that line,
9 those insulators, in place from both top and bottom?

10 A. Correct.

11

12 (Grand Jury Exhibit 195 was marked for identification.)

13

14 Q. Okay. I want to show you photo number 195.
15 Should be next in order right there under your --

16 A. Got it.

17 Q. See 195?

18 A. Yes.

19 Q. What's wrong with that picture?

20 A. That's the broken hold down.

21 Q. Okay. See anything else wrong with that
22 picture?

23 A. That bottom steel looks like it could be
24 damaged.

25 Q. What makes you think it's damaged?

26 A. Oh, just the bent, the bent steel. You can see

1 it's bent on the top part and little wrinkle down at the
2 bottom.

3 Q. We're talking about right here where this is
4 bent?

5 A. Correct.

6 Q. Twisted right there?

7 A. Yes.

8 Q. How come that wasn't noted in that aerial
9 patrol?

10 A. I'm not sure.

11 Q. Let's go on to 196. This is a photograph
12 that's already in evidence. What do you see wrong with
13 that photo?

14 A. Well, looks like there's some slack in that
15 hold down, which is similar to the other side. It could
16 have been how it came out. And then the steel looks a
17 little bit bent as well.

18 Q. And this has previously been identified as the
19 other side of 221. Does that look familiar?

20 A. No, I'm not familiar with the other side.

21 Q. Shouldn't something like that, the bent steel
22 on both sides on the arms, be caught by your troublemen
23 when they're doing patrols?

24 A. Yeah, I would hope so.

25 Q. But there's no, nothing in there saying that
26 that was noted; correct?

1 A. Correct.

2 Q. All right. I want to back up now a little bit.
3 Did I skip it over, or did we talk about the new *ETPM*
4 here? I don't think we -- I think I skipped it.
5 Probably because I forgot to put a tag on it. Give me a
6 second.

7 All right. There. Now it's got a tag on it.

8 A. There it is.

9

10 (Grand Jury Exhibit 298 was marked for identification.)

11

12 Q. Showing you what's marked as 298. Do you
13 recognize that document?

14 A. Yes.

15 Q. What is that document?

16 A. That's the 2018 version of the *ETPM Manual*.

17 Q. When was that published?

18 A. November 20th.

19 Q. Any revisions between the 2016 version we were
20 looking at before and the 2018 version?

21 A. Not to my knowledge.

22 Q. Okay. So the 2016 version was in place from
23 2016 all the way up to November 20th, 2018?

24 A. To my knowledge, yeah.

25 Q. Okay. All right. Now, I want to talk a little
26 bit in general about your aerial patrols. Tell us about

1 the aerial patrol procedure, or the aerial patrol, how
2 you set up aerial patrols.

3 A. Which part?

4 Q. How do you decide which lines get patrolled per
5 year?

6 A. Our schedule, our patrol cycle, is given to us
7 from our asset strategist. So our Asset Management group
8 dictates what patrols we're doing when.

9 Q. What is the Asset Management group.

10 A. It's the division within PG&E who kind of
11 oversees our structures, our steel structures, our wood
12 poles.

13 Q. How often are you inspecting every line?

14 A. Well, it depends on the line really.

15 Q. Okay. Different cycles for different lines?

16 A. Right. We'll do quarterly air patrols on our
17 500 kVs. We'll do annuals on our steel structures.
18 We'll do -- our wood pole circuits, we ground patrol
19 every other year and air patrol it on the off year.

20 Q. So how often would you be patrolling the 115 kV
21 steel structures?

22 A. Air patrols?

23 Q. Yep.

24 A. Every year.

25 Q. How do you determine when to do each structure,
26 each transmission line?

1 A. Each circuit?

2 Q. Each circuit.

3 A. That schedule is given to us by our asset
4 strategist. So they come out quarterly.

5 Q. How do you determine who does which
6 inspections?

7 A. I have four troublemen, and they each have
8 their own area within Table Mountain's headquarters. So
9 each troubleman will air patrol circuits within their
10 area most often. Sometimes they'll, you know, help each
11 other out. But overall, that's -- it's broken up into
12 different areas.

13 Q. So who would be the troubleman doing the
14 Feather River Canyon?

15 A. (WITNESS #6).

16 Q. What's (WITNESS #18) do?

17 A. He's the Chico-Oroville area. So I basically
18 have my area. My area goes from Oroville up to Burney,
19 you know, over halfway to Eureka. And so I have it kind
20 of split into quadrants. So I have a, I have a lower
21 right, lower left, upper right, upper left section,
22 roughly.

23 Q. How many transmission lines approximately are
24 in your area?

25 A. I'm not sure. I believe around a hundred.

26 Q. And those are to be inspected by four

1 troublemen?

2 A. Correct.

3 Q. So explain to us how you set up an aerial
4 patrol of the Caribou-Palermo.

5 A. I don't understand. Which part?

6 Q. Asset Management tells you, "Okay, it's time to
7 do your aerial patrol of the Table Mountain." So what
8 happens from that point? Or Caribou-Palermo, I'm sorry.

9 A. Yes. So it just has to happen within a
10 quarter. So, you know, basically our troubleman will
11 look at his switching schedule, because that's one of the
12 large tasks our troublemen do is switching circuits for
13 clearances for crew work, contractor work. If they see a
14 gap where they don't have switching for a few days,
15 they'll schedule air patrols and they'll fly patrols
16 during those non-switching times. So it's really, it's
17 really a fluid schedule. Oftentimes it changes if
18 something comes up and they need to do switching, which
19 is why we have to fit it within a quarter and not
20 necessarily a day or a month.

21 Q. Now, where do you get the helicopters to do
22 your patrols?

23 A. Different, we have different vendors we
24 utilize.

25 Q. Does PG&E have its own helicopters?

26 A. We don't do -- we have helicopters for like our

1 hydro division, but we don't have our own helicopters,
2 no.

3 Q. Okay.

4 A. Not for doing patrols.

5 Q. So is there a specific company that does a
6 specific area, or is it just --

7 A. No.

8 Q. What are the helicopter companies you deal
9 with?

10 A. Mostly Sac Executive out of Sacramento, A&P,
11 PJ's and, Redding Air.

12 Q. Who sets up the helicopters for these patrols?

13 A. We have the department within PG&E who you will
14 call to request a helicopter, and they schedule the
15 vendor.

16 Q. What's the name of that department?

17 A. Helicopter Operations.

18 Q. So how do the troublemen do all of the
19 inspections that they need to do on the transmission
20 lines per year? How are, how are they able to do that?

21 A. I don't understand.

22 Q. You have four troublemen; right?

23 A. Correct.

24 Q. Somewhere around a hundred lines. How is it
25 that the troublemen are able to inspect 25 lines per year
26 on --

1 A. Air patrol.

2 Q. -- on air patrol?

3 A. If you spend a day on each one, that's 25 days.

4 That's --

5 Q. But they also have ground patrols that they

6 need to do; correct?

7 A. Correct.

8 Q. And all of their switching?

9 A. Uh-huh. Yes.

10 Q. When you say "uh-huh" or "huh-uh," she gives me

11 a dirty look, and then I give it to you.

12 A. Go easy on him. I'm new.

13

14 (Grand Jury Exhibit 253 was marked for identification.)

15

16 Q. All right. So in front of you you have a

17 document marked as Exhibit 253.

18 A. I see it.

19 Q. Go ahead and look at that document and tell me

20 if you recognize it.

21 A. Okay.

22 Q. Do you recognize that document?

23 A. No. I mean, I'm not familiar with it, but I

24 understand it's an email.

25 Q. Okay. Who is the email from?

26 A. My clerk, (WITNESS #21).

1 Q. Who is the email to?
2 A. Aja Lodigiani. She's in Helicopter Operations.
3 Q. Who is the email CC'd to?
4 A. Myself, (WITNESS #18), (WITNESS #6), (EMPLOYEE
5 #10), (EMPLOYEE #16), and Stacie Doyle.
6 Q. Who are those people?
7 A. My four troublemen. And Stacie Doyle is within
8 our Records Management group.
9 Q. What I want to talk about here is the email
10 itself talks about scheduling of helicopter air patrols;
11 correct?
12 A. Correct.
13 Q. So on 9/8/17, looks like (EMPLOYEE #16) is
14 doing five separate lines?
15 A. On 9/6/17?
16 Q. Is that 9/6 or 9/8?
17 A. Yes. Yes.
18 Q. And then 9/12, (WITNESS #6's) doing three
19 lines; is that correct?
20 A. Correct.
21 Q. 9/13, (WITNESS #6's) doing three lines?
22 A. Correct.
23 Q. 9/14, (WITNESS #18's) doing four lines?
24 A. Correct.
25 Q. Is it common that your troublemen are
26 inspecting, doing air patrols of more than one line per

1 day?

2 A. Yes.

3 Q. And how long is a day?

4 A. Helicopter can fly for eight hours.

5 Q. So in eight hours they're doing multiple lines,
6 inspecting multiple lines?

7 A. Sometimes, yeah. And this is -- it would be
8 hard to distinguish what exactly is happening based on
9 this, because just because they flew something on one day
10 doesn't mean they completed it.

11 Q. Okay.

12 A. So, and the other thing that you should note,
13 too, is they -- Malacha Tap, that third line from the
14 top, that's two structures.

15 Q. Okay. So they're varying lengths?

16 A. They're in varying lengths.

17 Q. We know that generally the name denotes the
18 starting point and ending point of every line; right?

19 A. Usually, yes.

20 Q. For instance, (WITNESS #6) on this day did the
21 Caribou-Palermo, the Caribou-Westwood, and the Butt
22 Valley-Caribou?

23 A. Correct.

24 Q. Where is Westwood?

25 A. Near Chester.

26 Q. Okay.

1 A. So --

2 Q. Now that, you said the helicopter can fly for

3 eight hours --

4 A. Yes.

5 Q. -- correct?

6 Does that include the ferry time?

7 A. Yes.

8 Q. So generally where would your troublemen start

9 their day?

10 A. There's no pattern. It could be at a hangar or

11 it can be at an airport. It depends on the day, it

12 depends on the vendor.

13 Q. Okay. Do you know what helicopter company

14 provided --

15 A. No.

16 Q. -- the --

17 A. No.

18 Q. Is it anywhere on your paperwork what

19 helicopter company provided the helicopter on this?

20 A. No.

21 Q. Is there anything related to how long it took

22 to do any of these individuals?

23 A. No.

24 Q. So, for instance, let's assume say it's A&P.

25 Where is A&P based out of?

26 A. I believe they're in Richvale, near Durham.

1 Pretty close to Chico.

2 Q. So let's assume that you started with A&P.
3 You'd either have to fly all the way to Westwood and come
4 down, or fly to Palermo and fly all the way up to
5 Westwood; correct?

6 A. Correct.

7 Q. And either way, you're flying all the way
8 between Table Mountain or Richvale and Westwood; is that
9 correct?

10 A. I believe so. You're losing me.

11 Q. So what I'm trying to figure out this
12 eight-hour schedule, eight-hour day, between three lines
13 and with all your ferry time how much time they're
14 actually spending doing inspections?

15 A. Like I said, I'd hate to make assumptions,
16 because this doesn't mean they completed these circuits
17 these days.

18 Q. Well, you have the '18 -- or '17 inspection
19 there in front of you. If you can flip back to it.
20 It's, I believe, the first exhibit I showed you.

21 A. Okay.

22 Q. So did (WITNESS #6) finish the inspection of
23 the Caribou-Palermo that day?

24 A. Yes, he did the Caribou-Palermo that day.

25 Q. Nowhere on there it says what helicopter
26 company; correct?

1 A. Correct.

2 Q. No records as to the time spent actually
3 inspecting the Caribou-Palermo?

4 A. Not here, no.

5 Q. So talk to us about the mechanics of a
6 helicopter inspection itself, an air patrol, walk us
7 through how you do them.

8 A. How a troubleman would do them?

9 Q. Yes.

10 A. Troubleman would, obviously, utilize a
11 helicopter patrol to look for more obvious issues; right?
12 We're looking for broken insulators, damaged structures,
13 we're looking for ground erosion problems, encroachment.
14 Say somebody built something underneath our circuit that
15 shouldn't be there. That type of work. He'll fly, you
16 know, from sub to sub typically. Is that what you're
17 asking for?

18 Q. How high, how close, how fast?

19 A. I mean, that's -- there's lots of variables
20 there. We have -- you know, how high they fly is
21 dependent on the weather, the pilot, how comfortable the
22 pilot is flying close to the lines, the terrain around
23 it. You know, we have some structures that run right
24 down the valley, they're easy to fly right next to. We
25 have structures up on the Caribou, too, that are heavily
26 wooded and you can't get very close to them at all.

1 Q. How about the Caribou-Palermo line, how high,
2 how close, how fast would you be flying?

3 A. I'm not sure. I have never flown that line.

4 Q. Okay.

5 A. But, you know, the canyon has some interesting
6 wind patterns that I know it's difficult to fly in a lot
7 of times. I've long-lined up there a lot, but I've never
8 flown inside of a helicopter. So I don't have experience
9 there.

10 MR. NOEL: I think we've been going a little
11 over an hour. You ready to take a break?

12 THE WITNESS: I could use some water.

13 GRAND JURY FOREPERSON: Yes.

14 MR. NOEL: Let's take a 10- or 15-minute break,
15 and then we'll get this finished up.

16 GRAND JURY CLERK: Do we need to admonish?

17 MR. NOEL: We need the admonishment.

18 GRAND JURY FOREPERSON: (WITNESS #22), you are
19 admonished not to discuss or disclose at any time outside
20 of this jury room the questions that have been asked of
21 you or your answers until authorized by the Grand Jury or
22 the Court. A violation of these instructions on your
23 part may be the basis for a charge against you of
24 contempt of court. This does not preclude you from
25 discussing your legal rights with your own attorney.

26 (WITNESS #22), what I have just said is a

1 warning not to discuss the case with anyone except the
2 Court, your lawyer, or the district attorney.

3 THE WITNESS: Got it.

4 GRAND JURY FOREPERSON: Okay. Thank you.

5 THE WITNESS: Thanks.

6 (Break taken.)

7 GRAND JURY FOREPERSON: All the Grand Jurors
8 have returned, and we're ready to begin.

9 MR. NOEL: All right. Ready to proceed; back
10 on the record.

11

12 (Grand Jury Exhibit 193 was marked for identification.)

13

14 Q. (By MR. NOEL) (WITNESS #22), you have in front
15 of you what is marked as Exhibit 193.

16 A. Yes.

17 Q. Also displayed up here on the big board. What
18 do you see in that picture?

19 A. This is a C hook and a working eye from
20 structure 11 over 88.

21 Q. And do you see any problems with this picture?

22 A. Yes. It was taken because it was identified as
23 possibly having worn C hooks or working eyes or both.

24 Q. Was this, to your knowledge, identified in
25 either the '17 or '18 air patrols?

26 A. No, I'm not sure what circuit this is from.

(Grand Jury Exhibit 183 was marked for identification.)

Q. Okay. How about the next one, 183, do you see that photograph?

A. No.

Q. Did they get out of order again?

A. 183?

Q. Yep.

What do you see in this picture?

A. Same scenario. Worn working eye, possibly C hook.

Q. Would this have been something you would have expected to have been picked up in the '17 or '18 air patrols?

A. I would hope it would be able to be seen from the air patrols.

Q. To your knowledge, assuming this is on the Caribou-Palermo line, was this picked up in the air patrol?

A. To my knowledge, it was not.

(Grand Jury Exhibit 184 was marked for identification.)

Q. Next up is 184. Do you have that photo in front of you?

1 A. Yes.

2 Q. Do you see any problems with that, what's
3 depicted in that photograph?

4 A. Same issue; possibly a worn working eye,
5 possibly worn C hook.

6 Q. Would that be something you'd expect to be seen
7 in an air patrol?

8 A. It would be -- I would hope it would be seen,
9 but it would be difficult.

10 Q. To your knowledge, was that documented in the
11 '17 or '18 air patrols, assuming this is the
12 Caribou-Palermo line?

13 A. To my knowledge, no.

14

15 (Grand Jury Exhibit 191 was marked for identification.)

16

17 Q. Next up is 191.

18 A. Yes, it is.

19 Q. Do you see a photo marked as 191?

20 A. Yes.

21 Q. Do you see a problem with that photograph?

22 A. Yes.

23 Q. What do you see?

24 A. This one's very damaged.

25 Q. Assuming that that's a tower on the
26 Caribou-Palermo line, would that be something you would

1 expect to be seen by an air patrol?

2 A. I would hope it would be seen.

3 Q. To your knowledge, assuming this was on the
4 Caribou-Palermo line, was that picked up in either '17 or
5 '18 aerial patrols?

6 A. To my knowledge, no.

7

8 (Grand Jury Exhibit 192 was marked for identification.)

9

10 Q. Moving on to 192. What do you see in the
11 photograph marked as 192?

12 A. This one's very difficult to make out, but it
13 looks pretty worn.

14 Q. And, again, assuming that's on the
15 Caribou-Palermo line, is that something that you would
16 expect to be noted, expect to be picked up during an
17 aerial inspection?

18 A. I would hope it would be picked up.

19 Q. To your knowledge, was this picked up, assuming
20 it's on the Caribou-Palermo line, during the 2017 or 2018
21 inspections?

22 A. To my knowledge, it wasn't.

23

24 (Grand Jury Exhibit 185 was marked for identification.)

25

26 Q. Next we have 185. Tell us what you see in that

1 photograph.

2 A. Same issues.

3 Q. And would that be something that you would
4 expect to see picked up in a aerial inspection?

5 A. Same answer; I would hope so.

6 Q. To your knowledge, was that problem discovered
7 during the --

8 A. To my knowledge --

9 Q. -- '17 or '18?

10 A. -- it was not.

11 Q. Assuming that it's on the Caribou-Palermo?

12 A. Correct.

13 Q. And this says that, on the type on there, that
14 it's 199?

15 A. Uh-huh. Yes.

16 Q. Is that correct?

17 A. That's what it says.

18 Q. And from this photograph can you tell anything
19 about which line, which transmission line, this is on?

20 A. No, not definitely.

21 Q. Now, you spent quite a few years in the Tower
22 Department; correct?

23 A. Correct.

24 Q. Pointing out this bracket, have you ever seen
25 one of those before?

26 A. Not to my knowledge, no.

1 Q. Do you have any idea of when or how that was
2 installed or why?

3 A. No idea. No, I've -- like I said, to my
4 knowledge, I've never seen something like that bolted on
5 to the end of an arm.

6
7 (Grand Jury Exhibit 186 was marked for identification.)

8
9 Q. Okay. Next up, 186, another view of 199. What
10 do you see in photograph 186, Exhibit No. 186?

11 A. The same as Exhibit 185.

12
13 (Grand Jury Exhibit 247 was marked for identification.)

14
15 Q. Now, 247?

16 A. Going to have to do some digging.

17 Q. Sorry.

18 A. Let me just use your screen. Are these paper
19 clipped?

20 Q. Yeah, those are paper clipped together. I'm
21 pretty sure pulled that out when we were pulling it.
22 Maybe we missed it. We can use the screen up here. We
23 have the screenshot of the exhibit with the exhibit tag
24 that's been filled out, dated, and signed by the
25 foreperson.

26 247, do you see anything, catches your eye, any

1 problems in this photograph?

2 A. No. It's real difficult to see.

3 Q. What about this gap right here, is that an
4 issue?

5 A. The gap, I don't understand "the gap."

6 Q. Between the top of the hook and the top of the
7 hole, all of that daylight that you can see through
8 there.

9 A. Oh, it's kind of hard to tell. I mean, we
10 could assume, but it's -- this picture is not very good
11 at all.

12 Q. Okay. Would that be an indication of wear?

13 A. Not always.

14 Q. Do you know how big that hole is supposed to
15 be?

16 A. No.

17 Q. Do you know how big that hook is?

18 A. As far as --

19 Q. In terms of at its apex, where the hook --

20 A. No, I'm not familiar with the dimensions of it.

21 Q. So let's assume that that hole is 1 1/8 of an
22 inch in diameter, and that hook at its apex right there
23 where it's making contact is 15/16 of an inch wide.

24 A. Uh-huh.

25 Q. Got that?

26 A. Yes.

1 Q. How is your math skills?

2 A. Normally would probably be better than it is

3 right now.

4 Q. $1 \frac{1}{8}$ minus $\frac{15}{16}$, do you know what measurement

5 that would be?

6 A. Let's see, $\frac{3}{16}$?

7 Q. Bingo. Does that gap look to be appreciably

8 larger than $\frac{3}{16}$?

9 A. It could. It's hard to tell.

10 Q. And do you know what tower this is on?

11 A. No.

12 Q. This has been identified previously as 35/281

13 on the Caribou-Palermo 115.

14 A. Okay.

15 Q. So is that something, would that gap be

16 something that would be looked at during an air patrol?

17 A. I don't know if so much the gap would, but the

18 shape; right? You can tell a lot more of the hole if

19 it's worn by the shape of the hole, not necessarily the

20 diameter of the hole. So --

21 Q. Go ahead.

22 A. We have several different structure types with

23 several different hole diameters. It's hard to say that,

24 if that hole, if you can see more or less than $\frac{3}{16}$ of an

25 inch, you have a problem.

26 Q. To your knowledge, did anybody tag this as a

1 problem during the '17 or '18 air patrols?

2 A. To my knowledge, no.

3

4 (Grand Jury Exhibit 139 was marked for identification.)

5

6 Q. Moving on to Exhibit 139.

7 A. See if I can find this one. Did you take half
8 of mine or what?

9 Q. No.

10 (Discussion off the record.)

11 Q. Okay. Well, we can just use the one on the
12 board. You have the exhibit tag up on the right.

13 Do you see any problems with that structure?

14 A. Hard to tell from the photos. I see that
15 insulator string isn't hanging exactly plumb, which may
16 or may not be an issue. No, it looks like it has those
17 extra pieces on the working eyes that you had in the
18 earlier photos. But I don't see any damaged insulators.

19 Q. What about the hanger holes and the hooks?

20 A. I mean, you can't see that one. The picture is
21 too bad. You can't.

22

23 (Grand Jury Exhibit 181 was marked for identification.)

24

25 Q. Okay. Moving on to 181.

26 A. I got it.

1 Q. So what do you see in 181?

2 A. What am I looking for?

3 Q. Any problems.

4 A. Nothing stands out to me.

5 Q. Okay. So let's look at the connection points

6 between the hooks and the holes again on this one. Do

7 you see a difference in this photograph from some of the

8 other ones that we've been looking at before?

9 A. No. Can you be more specific?

10 Q. Okay. First off, do you see those hanger

11 plates mounted on --

12 A. No, no hanger plates on this one.

13 Q. Do you see any light, any daylight, between the

14 top of the hook and the top of the hole --

15 A. Yes.

16 Q. -- on this tower?

17 A. Yes.

18 Q. On which one?

19 A. Both.

20 Q. Both of them?

21 A. You can see dirt in the one and then dirt in

22 the other, not so much daylight.

23 Q. Substantially less than some of the other

24 towers we've been looking at; correct?

25 A. It's a photo; it's hard to tell.

26 Q. Okay. But, I mean, you can best see the

1 daylight up here on the top, what would be the right
2 phase cross arm; correct?

3 A. What's the question?

4 Q. Well, you can best see the relationship between
5 the hook and the hole on the right phase?

6 A. Out of the two, yeah. Yes.

7 Q. How much daylight can you see in there?

8 A. I don't know like a -- you can't get
9 measurements off photos.

10 Q. Okay. I bet if we were talking about -- let's
11 talk about, used the word "phase," let's talk about the
12 phases of the moon. When we go back to say -- let's talk
13 about 247. How much of the moon would you be able to see
14 on this phase?

15 A. It's real hard to, it's really hard to tell. I
16 mean, I don't want to say the wrong thing here, because
17 we're talking about a different angle here. You're
18 looking at the sky.

19 Q. Okay. But ultimately we're looking at the
20 space between the hook and the hole; correct?

21 A. Right.

22 Q. And there's significantly less space between
23 the top of the hook and the top of the hole --

24 A. It would appear.

25 Q. -- in 181 than there is in 247?

26 A. It would appear from the photos that way, yes.

(Grand Jury Exhibit 171 was marked for identification.)

Q. Let's move on to 171.

A. Got it.

Q. Same question. What do you see -- or do you see anything in this picture that would concern you?

A. It's hard to say, but no.

(Grand Jury Exhibit 187 was marked for identification.)

Q. Move on to 187. Do you see anything in this photograph that would concern you?

A. Yeah, these ones appear to have larger moons. That insulator is not plumb. Clear that might be a problem.

Q. Is there any reason why that space couldn't be seen from an air patrol?

A. Which space?

Q. The space between the top of the hook and the top of the hole.

A. Yeah. I mean, it's, it's all dependent on which structure, which -- where you're at, where you're at, how low you can fly near the structure. It's really hard -- the one thing we learn, it's hard to see the C hooks and the connection points from above the

1 structures.

2

3 (Grand Jury Exhibit 175 was marked for identification.)

4

5 Q. Okay. So this one's already been identified
6 as 35/281. Again, multiple pictures of the, of 35/281.

7 Move on to 175, another picture of 35/281,
8 another angle.

9 A. Got it.

10 Q. If you were flying this, if you were looking at
11 this, is there anything that would cause you concern,
12 anything that you would tag on this structure from what
13 you see in this photograph?

14 A. I'd get a closer look at those working eyes.

15 Q. Okay. To your knowledge, '17 or '18 was this
16 structure ever tagged?

17 A. To my knowledge, no.

18 Q. Go on to 187.

19 A. Share yours.

20 Q. Okay. Again, another view of 35/281. Is there
21 anything that you can see from this view that you would
22 tag?

23 A. Yeah, I would get a closer look at those
24 working eyes.

25 Q. How would you get a closer look?

26 A. Climbing. Climb the structure.

1 Q. Okay. When you're doing a helicopter patrol,
2 what kind of equipment are the towermen equipped with?

3 A. Towermen don't do helicopter patrols.

4 Q. I'm sorry, troublemen.

5 A. Troublemen? Cameras; cameras, iPads. So a lot
6 of times they'll take detailed photos with their -- you
7 know -- we have 50 times zoom digital cameras they can
8 get photos with.

9 Q. How about binoculars?

10 A. Yeah, and binoculars.

11 Q. Is it common to equip the troublemen doing
12 their air patrols with stabilizing binoculars?

13 A. Yes.

14

15 (Grand Jury Exhibit 188 was marked for identification.)

16

17 Q. Now we're on to 188.

18 A. Got it.

19 Q. What does it appear that 188 is to you?

20 A. What's that?

21 Q. What do you think 188 is? What do you think it
22 shows?

23 A. I think we're looking at the working eye again.

24 Q. Got it. And what do you see?

25 A. It looks like you should get a closer look at
26 it.

1 Q. This is a pretty close look; correct?

2 A. It's not as close as you can get.

3 Q. How do you get closer?

4 A. One thing we learned after, after finding these

5 is they're very deceiving until you pull them apart from

6 each other. So we changed out some of these that we

7 thought were significantly worn, to get them apart and

8 find it was just the nature of how they were sitting

9 together, the angle at which the photo was taken that

10 made it look like it was severely worn. So really the

11 only way to see exactly what's going on is to replace it.

12 Q. To your knowledge, when you've been a

13 transmission line supervisor at Table Mountain, have you

14 replaced any of these hooks?

15 A. Have I replaced any C hooks?

16 Q. Yeah. Have any of the C hooks been replaced?

17 A. Yeah, we replace C hooks every time we replace

18 insulators.

19 Q. On the Caribou-Palermo?

20 A. Probably, yes.

21 Q. To your knowledge?

22 A. To my knowledge.

23 Q. I don't want you to speculate.

24 A. To my knowledge, I mean, based on that 2017

25 findings that (WITNESS #6) had in September, those two

26 structures he wrote up were worked. So --

1 Q. But none of these conditions were tagged?

2 A. Right. This is a -- one thing we also learned
3 after this is --

4 Q. Let's not talk about what we learned after,
5 let's talk about -- I don't want to get into that stuff,
6 what you learned from after; okay? Let's move on.

7 176.

8

9 (Grand Jury Exhibit 176 was marked for identification.)

10

11 A. Got it.

12 Q. Another view of 35/281?

13 A. Correct.

14 Q. From this view, anything that would have caused
15 you concerns?

16 A. That hole diameter looks to be larger than the
17 other arm over there. And it does look worn.

18

19 (Grand Jury Exhibit 261 was marked for identification.)

20

21 Q. All right. I'm showing you a map marked as,
22 it's an Exhibit 261. This is a map showing, a Google
23 Earth map, showing the locations of the transposition
24 towers on the Caribou-Palermo line starting at 20/160 and
25 going to 35/281.

26 Are you familiar with that section?

1 A. Sure. Yes.

2 Q. Okay. So aerial patrols, you were talking
3 about all the things that go into how close, how low the
4 helicopters can fly. Can you repeat those for us again
5 so we can remember them?

6 A. Can you repeat the question?

7 Q. What factors go into determining how, how close
8 the helicopters can fly, how low the helicopters can fly?

9 A. Probably how comfortable the pilot is flying in
10 the conditions that are identified that day, tree lines,
11 other circuits. We can't get too close to a circuit if
12 there's another circuit behind us. You've got to have a
13 constant view of the surrounding circuits. Canyon winds
14 play a part. A lot of times you can only fly one
15 direction. The pilot won't be comfortable flying into
16 the wind or along with the wind. So there's several
17 factors.

18 Q. Are you familiar with Google Earth?

19 A. Yes.

20 Q. Do you use Google Earth regularly for your
21 employment?

22 A. Yeah.

23 Q. And the different functions of Google Earth?

24 A. I don't know, was that --

25 Q. Familiar with all the functions?

26 A. No, I'm --

1 Q. Some of the functions?

2 A. I know you can see the earth.

3 Q. Well, you can plug -- did you ever plug GPS

4 coordinates into Google Earth?

5 A. Yes.

6 Q. Now, going back to where we started, we talked

7 something about a transmission object list; correct?

8 A. Uh-huh.

9 Q. Remember that?

10 A. Yep.

11 Q. And the transmission object list you said lists

12 all the structures on the line; correct?

13 A. Correct.

14 Q. What else does the transmission object list

15 tell you about each structure?

16 A. Can you be more specific?

17 Q. Doesn't it give the GPS coordinates of each

18 structure?

19 A. Yes.

20 Q. So you can use those GPS coordinates and plug

21 those into Google Earth to plot all the structures on the

22 line?

23 A. Okay.

24 Q. Is that correct?

25 A. I'm sure you could.

26 Q. Do you guys do that?

1 A. No, we have our own GIS system which has all
2 these already on the map, so we don't need to get GPS
3 coordinates off our object list to do that.

4
5 (Grand Jury Exhibit 261A was marked for identification.)
6

7 Q. Okay. All right. So what I want to do, I want
8 to start at the top of 21/160. Do you see -- the
9 photograph should be 261A, it's in that
10 paper-clipped-together packet. Should be at the bottom.

11 A. Got it.

12 Q. Is -- now, this is a closeup of 2060 -- 20/160,
13 I'm sorry. Are you familiar with the tower?

14 A. Yes.

15 Q. You said earlier that you're also, part of your
16 job is the vegetation management?

17 A. No.

18 Q. Okay. Who runs vegetation management for
19 transmission lines?

20 A. We have a different Vegetation Management
21 Department with their own leads.

22 Q. Okay. Do you do any part of inspections for
23 vegetation management for transmission lines?

24 A. They do their own inspections.

25 Q. Okay. What type of inspections?

26 A. Do they do? I'm not familiar with.

1 Q. Okay. Well, the point is -- we're looking at
2 261A. Go to 261B. That would be -- what happened to
3 261C?

4 A. I got it.

5
6 (Grand Jury Exhibit 261B was marked for identification.)

7
8 (Grand Jury Exhibit 261C was marked for identification.)

9
10 (Grand Jury Exhibit 261D was marked for identification.)

11
12 Q. 261C and 261D. Look at those. And can you
13 tell me what kind of -- do you see any conditions on
14 there that would hinder a pilot's ability to get in and
15 get a closeup view of 20/160?

16 A. I'm not certain on what you're asking.

17 Q. Well, you said that the things that go into
18 determining, the factors that go into determining how
19 close and how low the pilot can fly are -- basically my
20 summary of what you said would be topography and
21 meteorology; is that correct?

22 A. Yeah. Well, the first thing I think is how
23 comfortable the pilot is.

24 Q. Okay. So you employ helicopters that do this
25 for you all the time; right?

26 A. Correct.

1 Q. If -- you're flying these patrols constantly;
2 correct?

3 A. Correct.

4 Q. And in addition -- what other uses do you have
5 for helicopters besides flying in the aerial patrols?

6 A. They do lift work for us, also.

7 Q. What's lift work?

8 A. So they're either transporting personnel or
9 material by long-line.

10 Q. What about non-routine patrols?

11 A. They do those, too, which is pretty much an air
12 patrol.

13 Q. Okay. What's the difference between a routine
14 patrol or an annual patrol and a non-routine patrol?

15 A. A non-routine patrol is when you have a
16 problem, say a relay, maybe a circuit was struck by
17 lightning and it momentarily went out, you'll do a
18 non-routine air patrol to try to find that problem.

19 Q. Is it common to have to do non-routine air
20 patrols after storms?

21 A. It could be.

22 Q. Are the pilots up and flying the canyon when
23 problems occur during the wintertime?

24 A. They can be. It's very dependent on the
25 conditions.

26 Q. But your air patrols are being done, at least

1 on the Caribou-Palermo, in August or September; is that
2 correct?

3 A. They have been last few years, yep.

4 Q. Okay. So do you see anything around 160 that
5 would hinder a pilot's ability to get in low and close to
6 take a closeup look and for your troublemen to be able to
7 look at the connectors, the cold end hardware, the hooks
8 in the holes?

9 A. Like I said, topography I would say.

10 Q. Okay. What about the topography?

11 A. Well, it's very hard to tell by this flat image
12 here, but that vegetation on the right-hand side, those
13 are trees and they're very tall.

14 Q. Well, Vegetation Management makes sure that the
15 trees aren't a danger to the line; correct?

16 A. They aren't a danger to the line, but you can't
17 -- they're on the side of the line where the helicopter
18 can't drop down below them. And this hill goes up very
19 steep. And there's two circuits to the uphill part of
20 this, too.

21 Q. Right. But off here to the right, on the
22 canyon side, you've got lots of wide open air; correct?

23 A. Have you been out to this location?

24 Q. Doesn't matter whether I've been there or not.

25 A. Okay. No, it's -- what Google Earth, it takes
26 a flat image and contours it to look like it's a hill,

1 but these could be 40-, 50-, 60-foot tall trees.

2 Q. Okay.

3 A. So I know, I've been here, and there's, there's
4 definitely vegetation downhill from here. So I'd hate to
5 assume on whether the pilot can get down low over there
6 or not based on this here.

7 Q. Well, the law mandates that the trees not be a
8 danger to the power line; correct?

9 A. Correct.

10 Q. So the trees can't be taller than the power
11 line?

12 A. Oh, they can be taller than the power line.

13

14 (Grand Jury Exhibit 261E was marked for identification.)

15

16 Q. Okay. Let's move on, and do the same thing
17 with 24/199. Picture 261E, which shows the location of
18 24/199.

19 A. Got it.

20

21 (Grand Jury Exhibit 261F was marked for identification.)

22

23 (Grand Jury Exhibit 261G was marked for identification.)

24

25 (Grand Jury Exhibit 261H was marked for identification.)

26

1 Q. And then we have 261F, shows it from the south;
2 261H, from the north; then 261G from the east.

3 So do you see anything in these photographs
4 that would hinder the ability of your troublemen during
5 an aerial patrol to get down to a level where they could
6 actually look at the hooks in the holes?

7 A. Like I said, it's difficult to tell from here,
8 but -- and I don't want to assume on the pilot's
9 abilities. And, again, those are trees, those aren't
10 bushes.

11
12 (Grand Jury Exhibit 261I was marked for identification.)

13
14 (Grand Jury Exhibit 261J was marked for identification.)

15
16 (Grand Jury Exhibit 261K was marked for identification.)

17
18 (Grand Jury Exhibit 261L was marked for identification.)

19
20 Q. Same questions with regard to 27/222. Let's
21 look at 261L, 261M -- I'm sorry -- 261I through 261L,
22 photographs of the Google Earth images 27/222.

23 What do you see that would hinder the pilot's
24 ability so that your troublemen could not get in and take
25 a look at the hooks in the holes?

26 A. I'm not, I'm not sure what the question is.

1 Q. Well, do you see anything that would hinder
2 their ability? We're talking about why aren't your
3 people seeing those issues with the hooks in the holes.

4 A. Okay. So, yeah, I mean, like I said, it's hard
5 to tell on this. And I don't know -- I'm not a pilot, I
6 don't know how to fly a helicopter, and I don't know how
7 comfortable he would be flying to these various
8 locations.

9 Q. I guess the question then would be, if you're
10 in charge of inspecting this line, this hundred-year-old
11 line, and making sure that this line is maintained and
12 repaired correctly, why would you hire pilots that aren't
13 going to be able to put your people, or won't put your
14 people in a position where they can actually take a look
15 at that?

16 A. I'm -- it could be a safety issue. You know,
17 might not be -- there might not be a pilot out there who
18 is comfortable enough to put our employees in, and their
19 own lives, at danger to try to get to a certain vantage
20 point.

21
22 (Grand Jury Exhibit 236 was marked for identification.)
23

24 Q. Let's move on to -- I guess this is Exhibit
25 236. This is from Exhibit 236. This is the 2009
26 Inspection Report of 27/222. Looks like the trees are

1 kept lower than the transmission lines; is that true?

2 A. It's hard to tell. Those look like -- I'm not
3 sure those are even trees. Those could be bushes.

4

5 (Grand Jury Exhibit 261M was marked for identification.)

6

7 (Grand Jury Exhibit 261N was marked for identification.)

8

9 (Grand Jury Exhibit 261-O was marked for identification.)

10

11 (Grand Jury Exhibit 261P was marked for identification.)

12

13 Q. Okay. Let's move on to 32/260, 261M, N, O, and
14 P. Looking at those photos, same question I've been
15 asking, can you see anything that would hinder a pilot's
16 ability to get your people in a position where they could
17 actually see and review the hooks in the holes?

18 A. Same answer I've been giving, it's hard to tell
19 on this.

20

21 (Grand Jury Exhibit 261Q was marked for identification.)

22

23 (Grand Jury Exhibit 261R was marked for identification.)

24

25 (Grand Jury Exhibit 261S was marked for identification.)

26

1 Q. Finally, let's go to 281 -- 261P through T --
2 S, I'm sorry.

3 Do you see anything that would hinder your
4 pilot's ability to get your people in to actually take a
5 look at that tower?

6 A. Same answer, it's hard to determine.

7 Q. Well, what's the difference between 35/281 and
8 the other four towers that we looked at?

9 A. What's the difference?

10 Q. Right.

11 A. Are you referring to the vegetation?

12 Q. Physically the difference.

13 A. That is a two dimensional photo. It's hard to
14 tell where the other circuits are and in relationship to
15 the hillside. I mean, we're asking to do a lot of
16 speculating on --

17 Q. First off, is 281 in the mountains?

18 A. Is it in the mountains?

19 Q. No. Yes.

20 A. Yeah, it's up the Feather River Canyon.

21 Q. Okay. What area is 281?

22 A. This is off Big Bend Road.

23 Q. Right. This is Big Bend. This is down at lake
24 level; correct?

25 A. No.

26 Q. So we're not up on mountain peaks anymore;

1 right?

2 A. The terrain is not much different, if that's
3 what you're getting at.

4 Q. Okay.

5 A. We are very far from the lake here.

6 Q. So, so you're saying that it's similar train
7 and that would impede your pilots from --

8 A. Yeah, I know this structure's pretty difficult
9 to access by foot.

10 Q. Well, it's right off the main street, isn't it?
11 Here's Big Bend Road. Isn't that Big Bend Road up here?

12 A. Yep.

13 Q. That's a public, public roadway?

14 A. Right.

15 Q. And then there's a dirt road that goes right
16 out to the structure, and right at the base of the
17 structure. So -- isn't that correct?

18 A. Yeah. So something that our design engineers
19 and folks in maybe our headquarters in San Ramon have
20 learned, that it's very difficult to tell access and
21 topography from this versus what's really out there. I
22 feel like that's what we're doing. I hear it all the
23 time, "Well, it's right off the road," but it's 200 foot
24 up an 80-degree hill.

25 Q. And you said the other lines in this
26 photograph, that's 261S, you can very clearly see the

1 other lines; correct?

2 A. Yes, you can.

3 Q. So what is there to the left that would affect
4 the ability of a pilot to get in and be able to see the
5 wear?

6 A. I'm not sure; I'm not a pilot. Those are
7 trees. I mean, it's very difficult to tell from this
8 image.

9 Q. How high above the lines are your pilots, are
10 your troublemen flying?

11 A. It's dependent. We go as low as we can.

12 Q. And how low is that?

13 A. Sometimes you can fly underneath the bottom
14 phase on a dual circuit tower if you wanted to. Other
15 times you don't have that option.

16 Q. How fast are they going?

17 A. There's no set speed. It's dependent on the
18 pilot. We go as slow as he can go.

19 Q. How long is the Caribou-Palermo line?

20 A. I'm not sure.

21 Q. Does the paperwork, the inspection report, tell
22 how long, how far that -- how long that line is?

23 A. It's 330 towers on the canyon side of the Big
24 Bend, and I believe 130 towers on the Big Bend to Palermo
25 section. So --

26 Q. Okay.

1 A. Probably about 460 towers.

2 Q. What is it in mileage?

3 A. I'm not sure.

4 Q. If I can approach you real quick, showing you

5 the Transmission Line Inspection Data Sheet from the 2017

6 aerial patrol, does that list the length in miles of the

7 Caribou-Palermo line?

8 A. It has 54.8 on here. Oftentimes, we found that

9 these aren't very reliable. I'm not sure where they pull

10 that information from.

11 Q. So your troublemen are providing that

12 information; correct?

13 A. No.

14 Q. That handwritten information that says 54.8

15 miles?

16 A. That's not handwritten.

17 Q. Right there.

18 A. He's utilizing that printed number right there.

19 Q. Okay. So you're telling us that the

20 pre-printed information that PG&E provides is inaccurate?

21 A. I think a lot of times, say, the line

22 configuration changes and maybe this, however this is

23 pulling this information, is now different than it had

24 been historically. So sometimes it's very accurate and

25 sometimes we've seen it where it's not accurate. But as

26 far as the patrol, it doesn't seem to be too relevant to

1 getting the patrol done.

2 Q. How long does it generally take your troublemen
3 to patrol the Caribou-Palermo line from the air?

4 A. I'm not sure.

5 Q. Well, if you had an eight-hour day and you're
6 patrolling three lines from Westwood to Caribou, Butt
7 Valley to Caribou, and then Caribou to Palermo, how much
8 time is there in a day to patrol the Caribou-Palermo?

9 A. I'm not sure. I'm not sure how much of those
10 other circuits he completed, so it's hard to speculate.

11 MR. NOEL: I think I'm done.

12

13 EXAMINATION

14

15 BY MR. FOGG

16 Q. Good afternoon. Good morning, almost good
17 afternoon, (WITNESS #22). My name's Nicholas Fogg, I'm a
18 Deputy Attorney General. A couple questions.

19 Have you done an air patrol before?

20 A. Yes.

21 Q. How many have you done?

22 A. Probably around a dozen.

23 Q. How many ground inspections have you done?

24 A. None.

25 Q. You saw some pictures earlier of worn C hooks
26 and hanger plates. Would you expect that type of problem

1 to be identified during a ground inspection?

2 A. I would hope so, but, like I said, it's hard to
3 see those working eyes from that angle.

4 Q. So, and the question I'm about to ask, let's
5 limit it to before the Camp Fire. Is the inspection
6 program laid out in the *ETPM* meant to find problems like
7 worn C hooks?

8 A. Yes.

9 Q. What -- of the different types of inspections
10 and patrols laid out in the *ETPM*, which, in your
11 understanding, which is meant to find a worn C hook?

12 A. Which is your best opportunity to find a worn C
13 hook?

14 Q. Sure. Let's say that.

15 A. It's hard to say. Really, like depending on
16 the topography, again, right, like in the canyon you can
17 be at some locations on the ground and be eye level with
18 the C hooks, that which would obviously be a great time
19 to be able to see that. But it goes the other way, too,
20 where some locations you can get really down low in an
21 air patrol and find it. You know, this, these
22 tramposition towers, there's only 13 of them on the
23 Caribou-Palermo out of the 456 structures on there. So,
24 you know, that being said, it wasn't like it was
25 something that we came across very often. And it was a
26 very small sample of structure types that this kind of,

1 these photos even came from.

2 Q. Do you know the Tower Department was conducting
3 any climbing inspections on the Caribou-Palermo line in
4 the months before the Camp Fire?

5 A. Yes, they were.

6 Q. Can you tell us more about those inspections?

7 A. To what I know, they, they were asked to
8 identify about I think six different circuits in the
9 north, which is Sacramento up over to Eureka that we
10 would like to do detailed climbing inspections on with
11 the Tower group.

12 Q. Were you asked? Or the Tower Department was
13 asked?

14 A. The -- my boss asked me to give input, but
15 ultimately it was him and the tower supervisors making
16 that decision.

17 Q. So who is your boss and who is the Tower
18 Department supervisor?

19 A. (EMPLOYEE #11) is my boss and (EMPLOYEE #14) is
20 the tower supervisor.

21 Q. (WITNESS #22), those are the questions I have.
22 The Grand Jurors will have a chance to ask questions.
23 Before they do, I have to give the reminder on hearsay
24 admonishment that you've heard before.

25 He mentioned hearsay where people were asked to
26 do climbing inspections. Please disregard that hearsay

1 coming from (WITNESS #22).

2 MR. NOEL: Can I follow-up with one?

3 MR. FOGG: Sure.

4 MR. NOEL: Do you know what triggered the all
5 of the sudden 2018 climbing inspections?

6 THE WITNESS: No.

7 MR. FOGG: Do any of the Grand Jurors have
8 questions for (WITNESS #22)?

9 (WITNESS #22), we'll take a second to review
10 these with the foreperson, then we'll ask you questions.

11 (Counsel and Grand Jury Foreperson confer.)

12

13 EXAMINATION

14

15 BY MR. NOEL

16 Q. Okay. (WITNESS #22), these are questions from
17 some of the jurors.

18 If both the Tower Department and the line
19 Transmission Department are responsible for inspection of
20 cold end hardware, who is responsible for making the
21 decision to actually replace or leave in place cold end
22 components noted by one or the other as worn?

23 A. Would you repeat that?

24 Q. If both the Tower Department and the line
25 Transmission Department are responsible for inspection of
26 cold end hardware, who is responsible for making the

1 decision to actually replace or leave in place cold end
2 components noted by one or the other as worn?

3 A. Okay. So if the Tower group or the Line group
4 identifies what they think is a worn working eye or C
5 hook or yolk plate or a Y ball, then that generates a tag
6 right there. They're actually the ones doing it. We
7 don't get identified issues and kick them back, because
8 they're not a problem typically. Does that question --
9 the person doing the inspection is the one who creates
10 the notification.

11 Q. Okay. But who makes the decision whether or
12 not you're going to replace it and how quickly?

13 A. That person. Well, you know, they're, like I
14 said before, they'll denote a priority, right, if they
15 think it's an E tag, which is 12 months; a B tag, which
16 is 90 days; or an A tag, which is right now. Then it
17 would go to a gatekeeper, which historically was me, now
18 we have a gatekeeper department where it's several folks
19 with a line that, reliability experience, and they're the
20 ones who, they go over the photos, the documentation, and
21 assign the priority.

22 Q. When did that change occur?

23 A. Relatively lately. After the Camp Fire.

24 Q. In your training, were the standard dimensions
25 of the cold end connector hardware ever mentioned as a
26 means of determining where on hanger eyes and C hooks?

1 A. No. There is no standard. That's the issue.
2 We have some working eyes that are larger than others.
3 We have some that are chamfered. Some of the working
4 eyes are 1/8 inch thick, some are 3/8 thick, 1/2 inch
5 thick. It all depends on the structure type.

6 Q. If aerial inspection patrols are so dependent
7 on pilot comfort for perspective and detail, do you have
8 a professional opinion as to how reliable such
9 inspections are in the Feather River Canyon?

10 A. Yeah. You know, one thing that, you know, I
11 wasn't hardly familiar with being in Tower Department was
12 the air patrols. But after I came over to this group, it
13 was very shocking what these troublemen can find on an
14 aerial patrol. I mean, it blew me away. They find some
15 cracked insulators; right? It's hard to see from
16 anywhere, let alone from a moving helicopter. But that
17 sort of, I guess, bought me into the whole aerial patrol
18 part of it. Between the troublemen's experience and
19 skill, the pilot's experience and skill, and knowing what
20 to look for and where, these guys can see some pretty
21 small, minute issues.

22 Q. With insulators; correct?

23 A. With anything.

24 Q. Okay. Well, you had talked about the post-fire
25 inspections; correct?

26 A. I had talked about the post-fire inspections?

1 Q. Yeah, several times many of those pictures were
2 post-fire inspections, and you brought up and said,
3 "Well, we found these post-fire," and you were going to
4 talk about what you learned from them, and I told you no;
5 right? Do you know how many problems were found on the
6 Caribou-Palermo line during the post-fire inspections?

7 A. No.

8 Q. Do you have a range?

9 A. No. I have no idea.

10 Q. But over and over and over again, worn C hooks,
11 worn hanger holes were found that weren't seen
12 beforehand; correct?

13 A. Right. Once we learned the configuration where
14 this tends to happen, it was a lot easier to determine
15 where they could be issues.

16 Q. As a supervisor, how do you make sure that
17 patrols are actually happening?

18 A. Anymore with technology, they can't not happen;
19 right? These helicopters are tracked every, every minute
20 of the day from when they're flying to when they land
21 again. So that's all documented, their routes, as far as
22 air patrols.

23 Q. How about for ground?

24 A. Ground patrols? The way we do it is basically
25 we do verifications. We'll take a sample, a size of
26 locations that were to be inspected by the troublemen,

1 and we'll go out there and do our own inspection to
2 ensure that, you know, we don't see anything that they
3 might have missed.

4 Q. Have you ever experienced a troubleman
5 falsifying inspection documents?

6 A. No.

7 MR. NOEL: That's all.

8 Any further?

9 We have one more.

10 (Counsel and Grand Jury Foreperson confer.)

11 Q. (By MR. NOEL) All right. We do have one more.

12 If there is no standard for components, how do
13 you determine wear or if it should be replaced? Is there
14 a log that identifies which size component is used for a
15 specific tower?

16 A. Yeah, all of our towers have prints. I might
17 have mentioned that, you know, briefly. We do have
18 basically, you know, whether it be arm dimensions, hole
19 dimensions, how far a hole is from another hole, steel
20 thicknesses, that type of information. And, really,
21 we're looking for any kind of wear; right? It's not
22 necessarily -- if a component's wearing out, it's going
23 to be kind of obvious that it's wearing out because, you
24 know, material will be missing. That's going to be the
25 easiest way to tell. It's not so much a material loss
26 percentage. That, that's how we identify the priority,

1 but not necessarily if something's wearing or not.

2 Q. But how can you tell -- well, going back to the
3 *ETPM* that was in front of you, and it sets up standards
4 -- you were looking at the May 2016 *ETPM*.

5 A. Yeah.

6 Q. And the table that talks about things --

7 A. Material loss?

8 Q. Material loss; 30 percent, 50 percent.

9 A. Right.

10 Q. How can you determine that if you don't know
11 the specifications of the parts?

12 A. Well, it's for tower steel; right? This is
13 what this is indicating. So say I have a piece of steel
14 that's 3/8 thick, and a portion of it is worn down to
15 3/16, I mean, you're the math guy, how much is that?

16 Q. I'm not a math guy, believe me.

17 A. You know, that would make it 50 percent wear.

18 Q. Okay.

19 A. So you don't need to know how -- you know, you
20 don't need to know specifics, you've got the dimensions
21 right there, so you can determine what's missing.

22 Q. So you know that that crescent-shape, half-moon
23 shape, above -- between the hook, the top of the hook and
24 the top of the hole, should be 3/16 of an inch?

25 A. If you know the hole diameter, yes.

26 Q. So that's available to you; correct?

1 A. Sometimes, yeah. So, you know, we got -- we
2 bought this circuit from another utility back in the
3 '20s, so we may or may not have drawings for it.
4 Anything we build nowadays, within the last 20 years,
5 we'll have these dimensions.

6 MR. NOEL: Do you happen to remember -- do you
7 have the full list?

8 GRAND JURY CLERK: I think what you're looking
9 for is 259. This one?

10 MR. NOEL: Yep.

11

12 (Grand Jury Exhibit 259 was marked for identification.)

13

14 Q. (By MR. NOEL) I'm putting up on the board in
15 front of you Exhibit 259. If I can ever get it
16 right-side up.

17 Do you recognize what 259 is?

18 A. It's a print.

19 Q. A print of what?

20 A. Appears to be a transposition arm for an SB
21 tower type.

22 Q. Let's assume this is the print for the
23 transposition towers on the Caribou-Palermo line
24 originally done in 1921.

25 A. Uh-huh.

26 Q. You have access to these; correct?

1 A. Now we do, yes.

2 Q. Okay. So, for instance, that hanger hole right
3 there says it should be 1 1/8 inch. Okay. So you
4 possibly could have known the dimensions of what that
5 hanger hole is supposed to be?

6 A. Right.

7 Q. And this is 259. Do you recognize what's on,
8 what 259 depicts?

9 A. Some hardware dimensions.

10 Q. And specifically down here in the lower right,
11 do you know what that is?

12 A. C hook.

13 Q. That defines the C hook as 15/16 of an inch at
14 its apex; right?

15 A. That particular one, yes.

16 Q. So you've never seen this before?

17 A. No, I've never seen this.

18 Q. You were put in charge of this line, of the
19 maintenance and inspection of this line, but you're not
20 familiar with the components and how they're supposed to
21 fit together and their specs?

22 A. This is probably a spec from a 1921 C hook,
23 which may or may not be different. These drawings
24 weren't discovered until December or January of this
25 year.

26 Q. Well, how do you know that?

1 A. How do I know that?

2 Q. Yeah. How do you know when these documents
3 were discovered?

4 A. Oh, I guess it's hearsay.

5 Q. So --

6 A. You know, an interesting thing about this,
7 though, is we can't -- you know -- it's great that you
8 have a hole diameter and a C hook dimension, but we can't
9 go out to the cold or hot end of a circuit to take
10 measurements.

11 Q. But it would help to know what those
12 measurements were supposed to be in making a
13 determination as to 30 percent, 50 percent, or higher
14 wear; correct?

15 A. Yeah, it could help, but really it's the shape;
16 right? I mean, that's -- you can have all the dimensions
17 in the world, but if your round hole is still round, it's
18 probably not wearing out.

19 Q. And those holes weren't round?

20 A. No.

21 MR. NOEL: I have nothing further.

22 Anything? Any further follow up?

23 Dismiss the witness?

24 GRAND JURY FOREPERSON: Yes.

25 You have a final admonishment that you are not
26 to discuss or disclose at any time out of this jury room

1 the questions that have been asked of you or your answers
2 until authorized by the Grand Jury or the court. A
3 violation of these instructions on your part may be the
4 basis for a charge against you of contempt of court.
5 This does not preclude you from discussing your legal
6 rights with your own attorney.

7 (WITNESS #22), what I have just said is a
8 warning not to discuss this case with anyone except the
9 Court, your lawyer, or the district attorney.

10 THE WITNESS: Got it.

11 GRAND JURY FOREPERSON: Okay. Thank you.

12 THE WITNESS: Thank you.

13 GRAND JURY FOREPERSON: Thank you for your time
14 today.

15 THE WITNESS: Thank you.

16 MR. NOEL: Thank you, sir.

17 THE WITNESS: Thank you guys.

18 MR. NOEL: Lunch break until 1:30. And we have
19 one more witness this afternoon.

20 (Lunch break taken.)

21 [DISCUSSION OMITTED.]

22 [ROLL CALL OMITTED.]

23 [DISCUSSION OMITTED.]

24 GRAND JURY FOREPERSON: Mr. Wines, before you
25 get seated, we'd like to swear you in.

JASON WINES

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: Yes, I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. Please state your full name, spelling your last
for the record.

A. Jason Wines, W-I-N-E-S.

Q. Lieutenant Wines, by whom are you employed?

A. Butte County District Attorney.

Q. In what capacity?

A. As an investigative lieutenant.

Q. Are you a peace officer?

A. I am.

Q. How long have you been a peace officer?

A. Almost 25 years, broken service.

Q. Could you walk us through your career, when you
started to where you are now as an investigative
lieutenant.

1 A. I started in 1994 with the Butte County
2 Sheriff's Office. I worked with them until 1997, when I
3 lost my mind and decided to join the military. I did a
4 six-year term in the military, and in 2003 came back to
5 the sheriff's office. And then in 2005 I was asked to
6 come to the District Attorney's office, where I've been
7 since, working in various capacities.

8 Q. Would you like to tell the jurors what you did
9 with the military?

10 A. I was a Navy SEAL.

11 Q. Where do you live -- or where did you live on
12 November 8th?

13 A. 1843 Dean Road in Paradise.

14 Q. How long have you lived in Paradise?

15 A. I was born there. Grew up in the town called
16 Hayfork in Trinity County, then I moved back with my
17 family in 2003 when I got out of the military.

18 Q. So I'm guessing you didn't live in Paradise
19 when you were a Navy SEAL?

20 A. No.

21 Q. Not a whole lot of oceans near Paradise?

22 A. No.

23 Q. What year did you come back from the Navy?

24 A. 2003.

25 Q. Okay. And you've lived in Paradise, or lived
26 in Paradise from that point on to November of 2018?

1 A. Yes.

2 Q. Have other family members and friends living in
3 Paradise?

4 A. Yes.

5 Q. Do you use, in the course of your employment,
6 Google Earth?

7 A. I do.

8 Q. Can you explain for us your experience using
9 Google Earth?

10 A. It's a -- Google owns the system. It's
11 basically software that takes satellite imagery, and you
12 can navigate the globe, find different locations. And
13 the resolution's quite good, and you can see huse
14 descriptions, sometimes even vehicle descriptions,
15 street. You can zoom in, see the street and see the
16 color of a building. Very useful tool to navigate the
17 country, or different countries.

18 Q. In preparation for your testimony, did I ask
19 you to put together a Google map of the Paradise area?

20 A. You did.

21 Q. And did you do so?

22 A. I did.

23 Q. What type of information did you include in
24 that map?

25 A. Generic pin marks basically where my house was,
26 my neighbors were, friends and family that had lost their

1 homes.

2 Q. Explain to us how you went about that process
3 in Google Earth.

4 A. Most of it I can go from just an aerial view,
5 which is like a bird's-eye view looking down, and basing
6 it off of street corners and different landmarks I know
7 right where the house is. Sometimes if it was hard to
8 see because of trees, I would use what's called street
9 view, which is like you're looking at the front of the
10 house, to find my landmarks, to be able to put a pin on
11 it, or best representation of where I knew that house to
12 be.

13 Q. So I'm showing you a map of Paradise. Do you
14 recognize this map?

15 A. Yes. Just to clarify, what I have here is a
16 duplicate --

17 Q. Yes.

18 A. -- up there?

19

20 (Grand Jury Exhibit 290 was marked for identification.)

21

22 Q. I'm sorry. This should be exhibit number --
23 and I forgot to get my exhibit list out before I started
24 -- 290.

25 A. Yes.

26 Q. You have 290 in front of you?

1 A. I do.

2 Q. 290 up on the board?

3 A. Yes.

4 Q. What is Exhibit 290?

5 A. That is an aerial view of the majority of the
6 town of Paradise. And it's marked with a pin, J and D
7 Wines, for Jason and Debbie Wines. And that is where my
8 house is located.

9 Q. Walk us through the process of how you got the
10 pin to that specific location.

11 A. Once I found the geographic location, there's a
12 tool actually in Google Earth that you can click on the
13 pin, and you can just move the pin to where you want it,
14 and then you can label it whatever you choose to.

15 Q. So as you started filling out this map, you
16 started pinning locations. You said you'd find them on
17 the map and pin them. What's the significance of each of
18 those pins?

19 A. These are the addresses, the locations rather,
20 of family and friends that I know lost their house during
21 the fire.

22 Q. So people, persons you're personally familiar
23 with and knew where they lived at the time of the fire?

24 A. Yes.

25 Q. And subsequently lost their houses?

26 A. Yes.

(Grand Jury Exhibit 291 was marked for identification.)

Q. Okay. Let's move on to 291. Do you recognize Exhibit 291?

A. I do.

Q. What is 291?

A. That looks like the most recent Google image that I've seen of my house.

Q. Most recent in what terms?

A. We just started building a pool in -- well, we started in December of 2017, but it's a long process. So they finally dug the hole and got the concrete in around March, April time frame. And so I can see that the hole up there is where it's still in concrete, hasn't gone to plaster yet.

Q. You can always get up and use the board. You know how to use all the functions on this board?

A. No, I don't.

The light gray area that appears to be a pit, that is the pool that's still in concrete. I know it hasn't gone to plaster yet because the plaster was a bluish hue, so I know it was prior to July.

Q. Does Google Earth have a function that allows you to look at the same picture from different years?

A. Yes. It has a historical feature. Every time

1 Google updates their maps they don't delete the old map,
2 so you can actually go in and do a timeline back to the
3 very original photo that Google took of your property.

4 Q. So this photograph, Exhibit No. 290 -- 291, I'm
5 sorry, is pre-fire, pre-November 8th, 2018?

6 A. Correct.

7 Q. Now I want you to walk us through the morning
8 of November 8th, 2018. Start around 7:00 a.m., tell us
9 where you're at, what you were doing.

10 A. Normally I leave the house about 5:00 o'clock,
11 but on this morning the office needed to borrow my
12 utility trailer to move boxes. So I was sitting back
13 home, drinking some coffee, talking with neighbors at
14 around 7:00 o'clock, hooking up my utility trailer.

15 And while I was talking with the neighbor, I
16 kind of saw this smoke popping up over the horizon. It
17 just -- I didn't notice much about it other than smoke.
18 It's November, it's a little bit late in the season, but
19 it was dry. Turned around, talked to my neighbor, looked
20 back, and the smoke had moved quite a bit. And so at
21 that point, with the winds that were already starting to
22 go that morning, I just went and told my wife, "Hold off
23 on taking the kids, I don't like the look of this smoke."
24 Told the neighbor, you know, "Don't take the kids right
25 now. I want to see where this is going." And when I
26 came back, I noticed that the smoke had moved

1 significantly again, so I started taking pictures. And I
2 told my office, "Hey, I might be a little late, I just
3 want, I just want to double check this fire, it's not
4 doing what I think it's doing right now.

5 It then became moving so rapidly that I took a
6 sequence of pictures over a short period of time up until
7 it was starting to drop fire ash into the back property.
8 And that's when I just made my family get out.

9 Q. So who else was living with you at the
10 residence on the morning of November 8th?

11 A. My wife and two children.

12 Q. You said you started taking pictures of the
13 fire --

14 A. Yes.

15 Q. -- and smoke?

16

17 (Grand Jury Exhibit 292 was marked for identification.)

18

19 Q. Draw your attention to 292. It's in front of
20 you. Do you see Exhibit 292?

21 A. Yes.

22 Q. What is Exhibit 292?

23 A. That's the first picture that I took of the
24 smoke that I was starting to see moving a little too
25 quick for my liking.

26 Q. Do you recall what time you took that picture?

1 A. It was before 7:30, and it was after quarter
2 after 7:00, so around 7:20-ish.

3 Q. Okay. Let's move on to 292. Do you have 292?

4 A. 293. I just had 292.

5
6 (Grand Jury Exhibit 293 was marked for identification.)

7
8 Q. 293. You're right.

9 A. Yes. 293?

10 Q. Yep.

11 A. This is -- I had just turned to my neighbor and
12 said, "Hey, I don't like the look of this fire, hold off
13 on taking your kids." When I turned back, I noticed the
14 smoke had moved. So this was just maybe a minute later.

15
16 (Grand Jury Exhibit 294 was marked for identification.)

17
18 (Grand Jury Exhibit 295 was marked for identification.)

19
20 (Grand Jury Exhibit 296 was marked for identification.)

21
22 Q. Now, because I forgot, we're going to skip to
23 296 and come back to 295. Actually, you have them in
24 order. They're in order on there, they're out of order
25 on the PowerPoint. Okay. So 295.

26 A. I have this one as 294. I think on the initial

1 they were inverted.

2 Q. Okay. Yep. You're right. 294.

3 A. And this is two or three minutes later. By now
4 I was going to the backyard to kind of see if there was
5 any -- I was noticing some heavy ash dropping, I just
6 wanted to kind of look in the backyard to see if there
7 was anything that was actually hitting the ground that
8 was smouldering.

9 Q. And 295?

10 A. And, again, this is just a couple minutes later
11 after that. I think this was the last picture I took and
12 I was like, "Okay, this is moving way too fast." This
13 was, again, a couple minutes later.

14 Q. After taking the pictures, what did you do?

15 A. It's the modern age, I had to take a video.

16 Q. You have a thumb drive in front of you marked
17 Grand Jury's Exhibit 296?

18 A. I do.

19 Q. Do you recognize that thumb drive?

20 A. Yes.

21 Q. What is that thumb drive?

22 A. This is the one I had them put the video from
23 the camera on.

24 I don't want to do that. Don't open it all the
25 way.

26 Q. All right. Miracles of modern technology. I

1 do not know why that signal just stopped.

2 (Discussion off the record.)

3 (Video plays).

4 Q. (By MR. NOEL) Is this the video you shot?

5 A. It is.

6 Q. Describe it for us, for the record, what we're
7 seeing.

8 A. Well, I had the camera regular, and I thought
9 it would be better to get panoramic, which didn't work
10 out. Just the way it was moving so fast -- my dad used
11 to be a firefighter, and it was always intriguing the way
12 fire moves. So -- and at this time, I didn't think we
13 were going to be dealing with what we were, so I was just
14 going to send it to my office, say, "Hey, check this out;
15 it's kind of cool in its own way."

16 Q. And approximately what time are you taking this
17 video?

18 A. Right from the beginning photo to the video, it
19 was only about 13 minutes.

20 Q. All right. So explain to us what happens after
21 you took the video.

22 A. At that point, I was seeing that it was moving
23 a lot faster, so I told my family, "It's time to go,
24 stop." They were already trying to pack up, but I have a
25 10-year-old and 13-year-old. Trying to get them to work
26 is sometimes difficult. Again, in our mind, it was back

1 to 2008 where, you know, just go through the motions, get
2 everything out and come right back. So at that point, it
3 was moving so fast I said, "It's time to go now."

4 Q. So did you get your family out?

5 A. I sent my wife and my children and then I still
6 had to -- I wanted to see if I could get my travel
7 trailer out just in case.

8 Q. So do you recall what time you sent your wife
9 and children out?

10 A. Probably around 7:40, 7:35-ish, 7:40-ish.

11 Q. What about your neighbors?

12 A. In between, I think in between the last picture
13 and the video, I had actually gone over and there was
14 kind of an older gentleman, I was trying to beat on his
15 door to get him awake to make sure he was aware of what
16 was going on. And the other neighbors were already out
17 and about. So I was pretty comfortable with everybody,
18 except for Richard, was aware.

19 Q. So how long did you stay at the house after
20 your family left?

21 A. Probably five minutes.

22 Q. Describe the conditions.

23 A. It started getting really high winds, and it
24 was throwing pretty good size branches, flaming branches,
25 down on the orchard behind me, and it was catching some
26 of the orchard on fire. So I don't know why, I have a

1 plow blade on my quad, so I jumped on the quad and used a
2 plow blade trying to put out the fires that were starting
3 out in the orchard.

4 When I was doing that, I saw some firefighters
5 coming up from Apple View, it kind of intersects in the
6 orchard. And as I looked around, the orchard was spot
7 fires everywhere, and the firefighters were walking back
8 to their truck. So it was kind of pointless at that
9 time.

10

11 (Grand Jury Exhibit 297 was marked for identification.)

12

13 Q. So in front of you you have Exhibit 297?

14 A. Yes.

15 Q. Explain to us what we're looking at on 297.

16 A. That shows pinpointing my house and kind of
17 shows the area of the orchard. And you can see Apple
18 View.

19 Q. You can go ahead and get up and point things
20 out.

21 A. So this is an easement that has access to the
22 back property and Apple View back up in here. So where I
23 was, I was seeing it kind of open in this area, and then
24 they came from Apple View.

25 Q. They being the firefighters?

26 A. Firefighters.

1 Q. What direction was the fire coming from?

2 A. Well, it started coming here, but as the wind
3 started moving, it started rapping up here. And when the
4 flames actually starting hitting Deal, it was actually
5 coming this direction. And then later on it was coming
6 this way. But mostly where I was at before I left was
7 coming from this direction.

8 Q. So explain that for the record so that the
9 court reporter can take it down. You're saying it
10 started coming from the right-hand side, lower right-hand
11 side, and then kind of moved up towards the top
12 right-hand corner, and then turned left and going towards
13 the center?

14 A. Would it be better if I referenced the screen
15 or cardinal better?

16 So the smoke pictures that came in were coming
17 from the lower right, the southeast, area of what this
18 would be the map, but the flames were coming from the
19 northeast, almost the north, from the top of the monitor.

20 Q. And where were you on your quad with your plow
21 blade?

22 A. Upper left quadrant here into the orchard.
23 Almost right in line with Apple View.

24 Q. And what was the purpose of being out in that
25 area with your quad and the plow blade?

26 A. I thought I could get some dirt on the fires

1 that were spotting up and just keep that from burning out
2 there.

3 Q. How did that work out?

4 A. Not very well.

5 Q. So what did you do when you saw the
6 firefighters leaving?

7 A. It's time to go.

8 Q. So did you evacuate, also?

9 A. Yeah. I knocked on Richard's door one more
10 time, because I wasn't getting a response, so I was
11 hoping that he was already out by that time. And then
12 after no response, then I jumped in my truck and was
13 trying to haul my trailer out.

14 Q. What about the rest of your neighbors?

15 A. They were already gone.

16 Q. Describe the conditions as you were leaving
17 your house.

18 A. As I was leaving the house, you know, Dean was
19 empty. It wasn't until I got to Pentz Road that things
20 kind of went sideways again.

21 Q. How so?

22 A. Just blocked traffic. There was -- I had a
23 36-foot trailer on my Duramax. I take up a lot of room.
24 Trying get along, they had traffic blocked on both sides,
25 so you couldn't go south and you couldn't go north. So I
26 was kinds of just stuck there.

1 Q. While you were stuck there, did you continue to
2 watch the fire behind you?

3 A. At that point, the fire had actually now
4 started coming before me. I didn't see what was going in
5 behind, but I had just made a left on Pentz, and I could
6 see the flame coming from basically right, almost
7 crossing Pentz Road.

8 Q. Okay. Let's go back a few exhibits. Back to
9 where we started, on 290. And can you explain for us the
10 path that you were taking and what you are seeing?

11 A. So initially I turned left. And this is Pentz
12 Road here, one of the three main arteries that goes
13 through the town of Paradise. So I turned left and was
14 trying to get out to Wagstaff, but we were stopped right
15 about in between what's Dean and Merrill Road. And it
16 was just a long line, and it looked like there was a lot
17 of fire right here. And it looked like there was a
18 patrol car with its lights on and looked like everybody
19 was being turned the opposite direction.

20 Q. So when you say "right here," you were pointing
21 at the area just to the south of the intersection of
22 Pentz and Merrill?

23 A. Right at the intersection is where the patrol
24 vehicle was.

25 Q. And at that point could you see what was going
26 on behind you, where you had left?

1 A. I couldn't see anything behind me still.
2 There's a lot of trees right around here. And at that
3 point, it was getting a little dark. And this was quite
4 a bit ablaze already, so that's -- obviously it was, it
5 drew my attention toward the fire to figure out how am I
6 going to get this truck turned around with this trailer.

7 Q. So what did you do?

8 A. The patrol officer was right there, but there
9 was a tree that was going to almost come down on top of
10 his car. I said, "Hey, you better move your car." When
11 he moved his car, I was allowed, I was able to get into
12 Merrill and use a driveway to pull up and back around, so
13 I could start heading north on Pentz.

14 Q. What were the conditions that you observed on
15 Merrill?

16 A. Merrill was pretty empty, looked like everybody
17 was pretty much gone out of there, similar to Dean. So
18 all the feeder streets here, there was not much coming
19 in. Just packed on Pentz.

20 Q. Okay. What about fire?

21 A. The fire was pretty much right here. That's
22 the last place I saw it. I don't remember seeing much
23 fire coming along here on the way back.

24 Q. Okay. So most of the fire you were seeing
25 still is southeast of the intersection of Merrill and
26 Pentz, and you didn't see any on east of Pentz as you

1 proceeded back up Pentz?

2 A. Correct.

3 Q. Okay. Tell us, show us your continued route.

4 A. So at that point, I continued north on Pentz,
5 and I made it to Gate Lane, which is up here. So that's
6 when the traffic started getting blocked. And they
7 actually had just routed me off into Gate. And then --
8 so it was packed beyond Gate, and looked like they were
9 trying a different pattern for traffic. So I turned on,
10 and all the cars started to turn on basically just in
11 front of me and just behind me.

12 Q. Were you eventually able to get out of
13 Paradise?

14 A. Not at that point, no.

15 Q. Okay. How did you get out of Paradise?

16 A. I made it to about right here. I was looking
17 in my rear view. I was watching the smoke coming from
18 behind me. And, again, my dad being a firefighter for
19 the forest service, he kind of taught me how to read
20 smoke. And it looked like there was three heads of the
21 fire going on; one down in here, looked like another one
22 up here, and one starting somewhere up over in here.
23 Based on that, I didn't think with the way traffic was I
24 was going to be able to get out, so I found an address on
25 Gate Lane, they had -- it was a wide spot in the road, it
26 had a bunch of rock on it. And I figured that is the

1 best place I'm going to have. I'm not going to be able
2 to get this trailer out, so I'm going to find the biggest
3 area I can to fight fire and keep it away from my truck.
4 I kind of like my truck.

5 Q. So did you stop at that area?

6 A. I did.

7 Q. And what did you do in that area?

8 A. We were stalled there for quite a while. As I
9 moved my truck off, people were saying, "Get your truck
10 moving, get your truck."

11 I said, "No, I'm going to stick here. I think
12 you're going to get blocked right there. I can't tell
13 you what to do, but I think you're just going to get
14 blocked."

15 So I stayed off, and one other gentleman stayed
16 with me. And then pretty soon it was -- they had blocked
17 all the road off in front of us. So we stopped and
18 fought fire.

19 As the fire came over, it was those three
20 heads, and then soon to be joined with the fourth. And
21 we just fought fire, trying to keep them away from
22 houses, keep them away from my truck really.

23 Q. How were you fighting the fire?

24 A. Broke into a garage, grabbed a shovel and a
25 rake, and we were just trying to do whatever we could to
26 get as much leaves and debris away from the house. There

1 was a, one guy, an old gentleman, that he didn't want to
2 leave, and his trees were on fire, so we were trying to
3 put the trees out so we could at least get him calmed
4 down a little bit.

5 Q. How long were you at that location fighting the
6 fire on that day?

7 A. Six hours, seven hours.

8 Q. How did your day end on November 8th?

9 A. Once the fire was past and we could do no more
10 good where we are, the gentleman who was with me, we were
11 getting the truck turned around, and behind us
12 miraculously there was no cars. All the cars had gone
13 by. And the last car was stopped right in front of my
14 truck. So we were able to back -- I was able to back up
15 in my driveway, turn around.

16 I still thought my house was going to be fine,
17 because I just spent all the time clearing it. I was
18 just going to drop the trailer off, grab this guy that
19 was with me, go check on his house. That's when I found
20 out my house was gone. At that point, we had lost cell
21 phone connection, so I really didn't know where my wife
22 was. Because she, the last communication I had with her
23 is they had turned on the bike path, and she was thinking
24 that they were going to have to get out of the car and
25 run. So I told her, "Stay in the car, just do what you
26 need to do," and then the line went dead. So I was

1 trying to get down and find out what happened to her.

2 Q. So you were able to make it back to your house?

3 A. Yes.

4 Q. And what did you find?

5 A. My house was burned. Well, pretty much the
6 neighborhood was burned. My immediate neighbor across
7 from the easement was scorched, but it was still
8 standing. But the fire had already come through.

9 Q. Next up you have in front of you 298,
10 photograph marked as 298?

11 A. Yes.

12 Q. Do you recognize that photograph?

13 A. I do.

14 Q. What does that photograph 298 depict?

15 A. That's where -- that's after the fire. That's
16 the house.

17 Q. Where is the house?

18 A. Kind of in the center. So this is the house
19 right here.

20 Q. What was left of your house?

21 A. My shop and the new pool.

22 Q. The new pool sort of changed colors?

23 A. It definitely changed colors.

24

25 (Grand Jury Exhibit 299 was marked for identification.)

26

1 Q. All right. So we asked you to put together a
2 list of your neighbors. And you have 299 in front of
3 you?

4 A. Yes.

5 Q. And explain to us what 299 shows.

6 A. These are our neighbors across the street. My
7 son's best friend from across, Nypls.

8 Q. The Nypls, is that how it's pronounced?

9 A. Yes.

10 Q. And the Nypls lived in that house on November
11 8th?

12 A. Yes.

13 Q. How do you know that?

14 A. My son and their daughter are best friends.
15 Well, actually I saw them that morning getting their cars
16 out and leaving, and we talked briefly.

17 Q. So this photograph obviously was taken before
18 the fire?

19 A. Yes.

20 Q. And next up?

21 A. That's after the fire.

22

23 (Grand Jury Exhibit 300 was marked for identification.)

24

25 Q. 300?

26 A. 300 is after the fire.

1 Q. So the Nypls lost their home, also?

2 A. Yes.

3

4 (Grand Jury Exhibit 301 was marked for identification.)

5

6 Q. Let's go to 301.

7 A. That's my immediate neighbors. That's Fred and
8 Joan.

9 Q. Do you have personal knowledge that Fred and
10 Joan lived at that house on November 8th?

11 A. Yes. I see them every day.

12 Q. This is another pre-fire Google Earth image of
13 the houses?

14 A. Yes.

15

16 (Grand Jury Exhibit 302 was marked for identification.)

17

18 Q. And 302?

19 A. That's after t he fire. Their home was also
20 burned.

21

22 (Grand Jury Exhibit 303 was marked for identification.)

23

24 Q. Moving on, 303. What does 303 depict?

25 A. That's Forrest.

26 Q. Who is Forrest?

1 A. He's a little guy down the street. Good guy.

2 Q. This is before the fire?

3 A. Yes.

4

5 (Grand Jury Exhibit 304 was marked for identification.)

6

7 Q. And then 303. I'm sorry, 304.

8 A. That's a closeup of his house before the fire.

9 Yes.

10 Q. Was Forrest living in that house on the morning
11 of November 8th?

12 A. He was.

13

14 (Grand Jury Exhibit 305 was marked for identification.)

15

16 Q. And 305?

17 A. The house after the fire.

18 Q. Now, I noticed that you, when we started
19 talking about Forrest you became a little bit emotional.

20 Why is that?

21 A. He died in the fire.

22 Q. So Forrest is one of the 84?

23 A. He's my neighbor.

24

25 (Grand Jury Exhibit 306 was marked for identification.)

26

1 Q. All right. Moving on to 306. What is 306
2 showing us?

3 A. That's Wetlands' (phonetic) property.

4 Q. Who are the Wetlands?

5 A. He was former town mayor. He was a contractor.
6 I've known him for many years. He helps me with projects
7 around the house.

8 Q. You know that the Wetlands were living at that
9 residence on November 8th?

10 A. Yes.

11 Q. Do you have personal knowledge of that?

12 A. I do.

13 Q. This is a photograph before the fire of the
14 house?

15 A. Yes.

16

17 (Grand Jury Exhibit 307 was marked for identification.)

18

19 Q. 307?

20 A. That's after the fire.

21

22 (Grand Jury Exhibit 308 was marked for identification.)

23

24 Q. 308.

25 A. Overview of the property. Now includes

26 Dr. Stewart's property.

1 Q. Who is Dr. Stewart?

2 A. He's a friend of mine, neighbor. You know, you
3 get to know your neighbors. And he just lived kind of
4 kitty-corner across the orchard. And we'd just stop and
5 talk every once in a while when he came in.

6 Q. Do you have personal knowledge if Dr. Stewart
7 was living at that residence on November 8th?

8 A. I do.

9

10 (Grand Jury Exhibit 309 was marked for identification.)

11

12 Q. 309.

13 A. That's more of a closeup of just his area
14 there.

15 Q. Okay. And this is pre-fire?

16 A. Pre-fire.

17

18 (Grand Jury Exhibit 310 was marked for identification.)

19

20 Q. And 310?

21 A. Post-fire, same property.

22 Q. And house gone?

23 A. House is gone.

24

25 (Grand Jury Exhibit 311 was marked for identification.)

26

1 Q. All right. 311.

2 A. That's Ron's place there, pre-fire. Another
3 neighbor. He lives -- this strip of the orchard here I
4 was able to buy a couple years ago, so as I was cleaning
5 the property, I got to know a couple of these neighbors.
6 Ron was one. He'd get bored and tell his wife he needed
7 to help me clean my property. That was his excuse to get
8 out.

9 Q. So you have personal knowledge that Ron was
10 living in that residence on November 8th?

11 A. Yes.

12

13 (Grand Jury Exhibit 312 was marked for identification.)

14

15 Q. And now to 312.

16 A. That's post-fire.

17 Q. And Ron's house was destroyed in the fire,
18 also?

19 A. Yes.

20

21 (Grand Jury Exhibit 313 was marked for identification.)

22

23 Q. 313?

24 A. This is adjacent from my house. And this is a
25 elderly lady named Bobbie.

26 Q. You had mentioned Bobbie earlier, I think,

1 didn't you?

2 A. I don't think we talked about Bobbie yet.

3 Q. Okay. Who is Bobbie?

4 A. Bobbie is a little old lady. She lived by
5 herself. Her partner died a couple years ago. So she
6 was just there by herself.

7 Q. And do you have personal knowledge that Bobbie
8 was living at that residence on November 8th?

9 A. Yes.

10 Q. Did you see Bobbie on November 8th?

11 A. I didn't. I checked with Marissa, and she had
12 told me that Bobbie had already left.

13 Q. Who is Marissa?

14 A. Marissa Nypl, I'm sorry.

15 Q. Okay. So this 313 is pre-fire?

16 A. Yes.

17

18 (Grand Jury Exhibit 314 was marked for identification.)

19

20 Q. And then 314?

21 A. Post-fire.

22 Q. And Bobbie's house also was destroyed?

23 A. Yes.

24

25 (Grand Jury Exhibit 315 was marked for identification.)

Q. 315?

A. That's Richard's house.

Q. Who is Richard?

A. Richard is another gentleman that lived kitty-corner to me that we just kind of -- he just kind of lived by himself. Little mobile home there. Nice guy.

Q. Personal knowledge Richard was living there on November 8th?

A. Yes.

Q. Did you have any contact with Richard on November 8th?

A. I did.

Q. Describe that.

A. I couldn't ever wake him up, or I never met him at the door, but when I was stopped at Gate, he was also stopped at Gate, and we talked briefly.

Q. So you had personal knowledge that Richard was living there on November 8th?

A. Yes.

Q. What happened to Richard's house?

A. It also burned.

(Grand Jury Exhibit 316 was marked for identification.)

Q. Moving on to 316, what is depicted in 316?

1 A. That is Richard's place, burned.

2

3 (Grand Jury Exhibit 317 was marked for identification.)

4

5 Q. 317. What are we looking at in 317?

6 A. That's Kellie's, my kids' dental hygienist.

7 Q. Is Kellie a first name or last name?

8 A. Kellie is a first name.

9 Q. Male or female?

10 A. Female. I always forget her last name.

11 Q. All right. And do you have personal knowledge
12 that Kellie was living in that residence on November 8th?

13 A. I do.

14 Q. What happened to Kellie's house?

15 A. It also burned.

16

17 (Grand Jury Exhibit 318 was marked for identification.)

18

19 Q. On to 318. What does that show?

20 A. That's after the fire.

21 Q. Post-fire, showing the destruction of Kellie's
22 house?

23 A. Yes.

24

25 (Grand Jury Exhibit 319 was marked for identification.)

26

1 Q. All right. 319. What are we looking at in
2 319?

3 A. It's the Neff's (phonetic) house next to
4 Kellie's.

5 Q. Who are the Neffs?

6 A. Some family friends from church. Our kids grew
7 up together.

8 Q. Do you have personal knowledge that the Neffs
9 lived in that residence on November 8th?

10 A. I do.

11 Q. What happened to the Neffs' house?

12 A. Their house also burned.

13

14 (Grand Jury Exhibit 320 was marked for identification.)

15

16 Q. Going to 320. What is 320?

17 A. Google image after the fire.

18 Q. Showing the destruction of the Neff house?

19 A. Yes.

20

21 (Grand Jury Exhibit 321 was marked for identification.)

22

23 Q. 321?

24 A. Johnson place.

25 Q. Who were the Johnsons?

26 A. He owns air conditioning repair, installation

1 in the area.

2 Q. Busy man this week?

3 A. Yes. I think he actually is now retired.

4 Q. Do you have personal knowledge that the
5 Johnsons were living at the house on November 8th?

6 A. I do.

7 Q. And did you see them on November 8th?

8 A. I did not.

9 Q. What happened to the Johnson house on November
10 8th?

11 A. It also burned.

12

13 (Grand Jury Exhibit 322 was marked for identification.)

14

15 Q. Moving on to Exhibit 322. What does 322 show?

16 A. Google image showing the burned.

17

18 (Grand Jury Exhibit 323 was marked for identification.)

19

20 Q. All right. 323. Now we've added the Steele.

21 A. Friend of mine, also reserve deputy, owns a
22 propane company in Paradise.

23 Q. Do you have personal knowledge that Mr. Steele
24 lived at that residence on November 8th?

25 A. Yes.

26 Q. Do you know what happened to the Steele house

1 on November 8th?

2 A. It also burned.

3

4 (Grand Jury Exhibit 324 was marked for identification.)

5

6 Q. Now moving on to 324. What does 324 show?

7 A. That's the picture after the fire.

8

9 (Grand Jury Exhibit 325 was marked for identification.)

10

11 Q. 325, somebody named J Wines. I'm going to
12 guess you know that person?

13 A. That would be my brother.

14 Q. And you have personal knowledge that your
15 brother was living at that residence on November 8th?

16 A. I do.

17 Q. What happened to your brother's house?

18 A. His burned.

19

20 (Grand Jury Exhibit 326 was marked for identification.)

21

22 Q. Moving on 326?

23 A. Google image showing the burn.

24 Q. The house is no longer there?

25 A. Nope.

26

1 (Grand Jury Exhibit 327 was marked for identification.)

2

3 Q. 327?

4 A. Can't tell you if the spelling is right, but
5 that's Sachonnen's. He retired from the pest control
6 service.

7 Q. Another neighbor?

8 A. Yes.

9 Q. Just because this one we don't have very good
10 -- I guess on your brother and on Sachonnen, what's the
11 street right here?

12 A. He's at the corner of Dean, which is the
13 horizontal. Then Pentz is the vertical.

14 Q. Okay. So you have personal knowledge that
15 Mr. Sachonnen was present?

16 And we believe the spelling is
17 S-A-C-H-O-N-N-E-N.

18 COURT REPORTER: Thank you.

19 Q. I guess you can see that, can't you?

20 Then Mr. Sachonnen was living at that residence
21 on November 8th?

22 A. Yes.

23 Q. And what happened to Mr. Sachonnen's house?

24 A. It burned as well.

25

26 (Grand Jury Exhibit 328 was marked for identification.)

Q. Now we're looking at 328. What is depicted in 328?

A. A Google image after the fire showing the burns.

(Grand Jury Exhibit 329 was marked for identification.)

Q. 329. Who are the Nobles?

A. They're the co-owners of Noble Orchard. That's Jim Noble and his wife were living there. Orchard is actually owned by all the kids, but they live there.

Q. And let's give some perspective. What is this road?

A. That is Pentz Road.

Q. Okay. So now in terms of the relationship to your house?

A. If you drew a 45-degree angle to the bottom right of the screen, you would kind of tie into my house over there.

Q. Do you have personal knowledge if the Nobles were living in that house on November 8th?

A. Yes.

Q. Do you know what happened to the Nobles' house?

A. Their house also burned.

1 (Grand Jury Exhibit 340 was marked for identification.)

2

3 Q. Showing you 340. Tell me, what is 340?

4 A. That's the Google image showing the destruction
5 after the fire.

6 Q. 345. Who is Lea?

7 A. I have 341.

8

9 (Grand Jury Exhibit 341 was marked for identification.)

10

11 Q. Oh, 341. Yep. You're right. I skipped.

12 341?

13 A. That's the last name of Lea.

14 Q. Oh, last name of Lea?

15 A. Yes. That's a lady that works also with the
16 DA's office.

17 GRAND JUROR #4: Isn't that Exhibit 331?

18 MR. NOEL: I can't count.

19 GRAND JURY CLERK: It's 341.

20 MR. NOEL: 341. Somehow I skipped the entire
21 330 to 339. If I could count, I wouldn't have gone to
22 law school.

23 Q. (By MR. NOEL) So 341 is who?

24 A. That's -- her name's Jenny Lea. She works for
25 the District Attorney's office.

26 Q. And do you have personal knowledge that Ms. Lea

1 lived in that house on November 8th?

2 A. I do.

3 Q. What happened to Ms. Lea's house?

4 A. It also burned.

5 Q. This is 341.

6 GRAND JURY CLERK: 42.

7 MR. NOEL: 342. I'm sorry. I told you I can't
8 count.

9

10 (Grand Jury Exhibit 342 was marked for identification.)

11

12 Q. (By MR. NOEL) What does 342 depict?

13 A. That's the Google image after the fire showing
14 the destruction.

15

16 (Grand Jury Exhibit 343 was marked for identification.)

17

18 Q. 343. Who is Ross?

19 A. That's a last name. That's Jodi Ross. She's a
20 friend of mine who lives kind of just north of that last
21 photo.

22 Q. Do you have personal knowledge that Ms. Ross
23 lived in that residence on November 8th?

24 A. I do.

25 Q. And what happened to Ms. Ross's house?

26 A. Her house also burned.

(Grand Jury Exhibit 344 was marked for identification.)

Q. Which would be 344?

A. Yes.

Q. What are we looking at in 344?

A. Google image after the fire showing the
destruction of the home.

(Grand Jury Exhibit 345 was marked for identification.)

Q. 345? Who were the Knifong? Or who is Knifong?

A. This is actually the father of a realtor that
lives in Paradise. This is where the elder senior
Knifong was living.

Q. Do you have personal knowledge that Mr. Knifong
was living at this address on November 8th?

A. Yes.

Q. Do you know what happened to Mr. Knifong's
house?

A. It burned.

(Grand Jury Exhibit 346 was marked for identification.)

Q. Showing you 346. What does 346 depict?

A. A Google image after the fire showing the

1 destruction.

2 Q. The destruction of the Knifong house?

3 A. Yes.

4

5 (Grand Jury Exhibit 347 was marked for identification.)

6

7 Q. 347. What is Niarz?

8 A. Another friend of mine, who is a blacksmith in
9 Chico. It shows before the fire, where his house was.

10 Q. Personal knowledge Mr. Niarz was living in that
11 residence on November 8th?

12 A. I do.

13 Q. Do you have personal knowledge as to what
14 happened to his house?

15 A. Yes, I do.

16 Q. What happened?

17 A. It also burned.

18

19 (Grand Jury Exhibit 348 was marked for identification.)

20

21 Q. Showing you 348. Tell us what that shows.

22 A. Google image showing the Niarz home burned.

23

24 (Grand Jury Exhibit 349 was marked for identification.)

25

26 Q. 349. Thonton.

1 A. Actually Thornton. I missed the R.
2 This is a lady from church. She just lost her
3 husband to cancer a couple years ago.

4 Q. Do you have personal knowledge Ms. Thornton
5 lived in that house on November 8th?

6 A. I do.

7 Q. Do you have personal knowledge as to what
8 happened to that house on November 8th?

9 A. I do.

10 Q. What happened?

11 A. It also burned.

12

13 (Grand Jury Exhibit 350 was marked for identification.)

14

15 Q. Going to 349 -- 350. What does 350 depict?

16 A. Google image after the fire showing the
17 destruction to the Thornton house.

18

19 (Grand Jury Exhibit 351 was marked for identification.)

20

21 Q. 351, Halgren.

22 A. This is my wife's cousin. That's his place.

23 Q. Do you have personal knowledge that Mr. Halgren
24 lived at that residence on November 8th?

25 A. Yes. This is one of those that because of the
26 tree canopy and the way Google -- this is a

1 representation of the area. I got it as close as I can
2 be. I can't say that underneath that pin is the house,
3 but doing street view, this is the best capture of, I can
4 get of where his house was.

5 Q. But -- you can't really see anything in there,
6 but you personally know that there was a house there?

7 A. Yes.

8 Q. Under the top of the canopy?

9 A. Yes.

10 Q. Before the fire there was a house?

11 A. Yes.

12 Q. Then it was lived in by Mr. Halgren?

13 A. Yes.

14 Q. And what happened on November 8th?

15 A. It burned.

16
17 (Grand Jury Exhibit 352 was marked for identification.)

18
19 Q. Moving on to 352.

20 A. That's a Google image after the fire showing
21 the destruction of the Halgren house.

22
23 (Grand Jury Exhibit 353 was marked for identification.)

24
25 Q. 353. Who is Blaine?

26 A. Blaine is my flooring guy. And he lived right

1 next to my wife's cousin.

2 Q. Do you have personal knowledge that Blaine
3 lived somewhere under the canopy on November 8th?

4 A. Yes.

5 Q. And do you have personal knowledge as to what
6 happened to Blaine's house on November 8th?

7 A. I do.

8 Q. What happened?

9 A. His house burned.

10

11 (Grand Jury Exhibit 354 was marked for identification.)

12

13 Q. Moving on to 354. What is 354 depicting?

14 A. Google image post-fire showing the destruction
15 to Blaine's house.

16

17 (Grand Jury Exhibit 355 was marked for identification.)

18

19 Q. 355, Dean?

20 A. Dean. That's actually the gentleman that was
21 stuck on Gate with me. He decided to pull over with me.
22 After I dropped off my trailer, we went to check on his
23 house here. So this is a picture of his house before the
24 fire.

25 Q. So Mr. Dean was the person who was fighting
26 fires with you out there?

1 A. Yes.

2 Q. And did you drive with him, or did he ride with
3 you, or follow him?

4 A. No. I jumped in his truck at my house. I went
5 over in his truck.

6 Q. And when you arrived at Mr. Dean's house, what
7 did you observe?

8 A. His house was burned.

9

10 (Grand Jury Exhibit 356 was marked for identification.)

11

12 Q. 356. What does 356 show?

13 A. The Google image post-fire showing the
14 destruction to Ed's house.

15

16 (Grand Jury Exhibit 357 was marked for identification.)

17

18 Q. And 357. McDonald?

19 A. Friends of -- he's a friend of mine. His kids
20 go to school with my kids.

21 Q. And you have personal knowledge that
22 Mr. McDonald and his family lived in this house on
23 November 8th?

24 A. I do.

25 Q. What happened to Mr. McDonald's house?

26 A. His house burned.

(Grand Jury Exhibit 358 was marked for identification.)

Q. 359? 358? Sorry.

A. It's the Google image post-fire showing the destruction to the McDonald house.

(Grand Jury Exhibit 359 was marked for identification.)

Q. 359, Mackenzie?

A. That's a former sheriff. This was --

Q. Scott Mackenzie?

A. Scott Mackenzie. That's a picture of his house before the fire.

Q. And you have personal knowledge that Sheriff Mackenzie lived at that residence --

A. Yes.

Q. -- on November 8th?

A. Yes.

Q. And what happened to Sheriff Mackenzie's house?

A. It burned.

(Grand Jury Exhibit 360 was marked for identification.)

Q. Number 360?

A. That is the Google image post-fire that shows

1 the destruction to the Mackenzie house.

2

3 (Grand Jury Exhibit 361 was marked for identification.)

4

5 Q. 361?

6 A. That is the Dally residence. Long-time
7 friends. He, his son and I grew up together. We started
8 at the sheriff's department together.

9 Q. So this would be older Dally?

10 A. This is Jim Dally, the principal of Paradise
11 High back in the day.

12 Q. Do you have personal knowledge that this
13 Mr. Dally was living at this residence on November 8th?

14 A. I do.

15 Q. Do you have personal knowledge as to what
16 happened to this residence in November 8th?

17 A. I do.

18 Q. What happened?

19 A. His house burned.

20

21 (Grand Jury Exhibit 362 was marked for identification.)

22

23 Q. Moving on to 362?

24 A. That is the Google image post-fire that shows
25 the destruction to the Dally house.

26

1 (Grand Jury Exhibit 363 was marked for identification.)

2

3 Q. 363, Campbell?

4 A. That is some long-time acquaintances of mine
5 through my aunt.

6 Q. Do you have personal knowledge that the
7 Campbells lived at that residence on November 8th?

8 A. I do.

9 Q. Do you have personal knowledge as to what
10 happened to that house on November 8th?

11 A. I do.

12 Q. What happened?

13 A. It burned.

14

15 (Grand Jury Exhibit 364 was marked for identification.)

16

17 Q. 364?

18 A. That is the Google image post-fire that shows
19 the destruction to the Campbell house.

20

21 (Grand Jury Exhibit 365 was marked for identification.)

22

23 Q. 365, Abrams?

24 A. This is my aunt's house. This is a picture
25 before the fire.

26 Q. And do you have personal knowledge that your

1 aunt was living in the residence on November 8th?

2 A. I do.

3 Q. Do you have personal knowledge as to what
4 happened to the residence on November 8th?

5 A. I do.

6 Q. What happened?

7 A. It burned.

8

9 (Grand Jury Exhibit 366 was marked for identification.)

10

11 Q. Moving on to 365 -- 366. What does 366 depict?

12 A. That is the Google image post-fire that shows
13 the destruction to the Abram's house.

14

15 (Grand Jury Exhibit 367 was marked for identification.)

16

17 Q. 367, Lippencott?

18 A. This was the son of the original Lippencott
19 that, survey company, that actually gave my dad his first
20 job in surveying. His granddaughter goes to school with
21 my son.

22 Q. So you have personal knowledge that
23 Mr. Lippencott was living there --

24 A. Yes.

25 Q. -- on November 8th?

26 A. Yes.

1 Q. Do you have personal knowledge as to what
2 happened to the house on November 8th?

3 A. I do.

4 Q. What happened?

5 A. It burned.

6

7 (Grand Jury Exhibit 368 was marked for identification.)

8

9 Q. 368?

10 A. That's the Google image post-fire that shows
11 the destruction to the Lippencott house.

12

13 (Grand Jury Exhibit 369 was marked for identification.)

14

15 Q. All right. Exhibit 369, Ennes?

16 A. This one's a little more difficult because
17 there was two houses. I'm pretty sure this is the
18 location. But on the image I had on my computer it
19 didn't upload the most recent. But when I saw this one,
20 Dave has a long driveway, he has a Jeep and a truck, but
21 it looks like there's a truck here and maybe a Jeep under
22 here. So it's either this house or this house.

23 Q. So the pin is on a house that looks like a
24 light-colored roof?

25 A. Yes.

26 Q. And then directly above that is another house

1 with a dark-colored roof?

2 A. Yes.

3 Q. So one of those two houses belongs to somebody
4 named Ennes?

5 A. The next one above. So not the darkest roof in
6 between.

7 Q. Okay.

8 A. Ennes is marked with the pin. You have one
9 house, and then there's a second one, but because of the
10 street view I wasn't able to tell exactly which one was
11 which. And I don't have his address, I just know I drive
12 to his house and I look for his truck. He's only moved
13 there within the last couple years. And we used to be
14 detectives together.

15 Q. Who is Mr. Ennes?

16 A. He's a deputy with the sheriff's office -- now
17 a sergeant with the sheriff's department.

18 Q. Sergeant Dave Ennes with the sheriff's
19 department?

20 A. Yes.

21 Q. And do you have personal knowledge that
22 Sergeant Ennes lived at that residence on November 8th?

23 A. Yes.

24 Q. And you have personal knowledge as to what
25 happened to Sergeant Ennes's house on November 8th?

26 A. It burned.

(Grand Jury Exhibit 370 was marked for identification.)

Q. Now we're going to 370. 370, I'm sorry. What is 370?

A. It shows houses, either one of those houses burned.

Q. Right. Doesn't matter which one of them was Sergeant Ennes', all three of them are gone?

A. Correct. And I have since spoken with Sergeant Ennes, and he confirmed that his house was burned.

(Grand Jury Exhibit 371 was marked for identification.)

Q. All right. 371, Kohler?

A. These are my parents' best friends. My parents actually sold them that property. And I grew up with their children. This was a Google image of their house before the fire.

Q. Do you have personal knowledge that the Kohlers were living in that residence on November 8th?

A. I do.

Q. Do you have personal knowledge what happened to that house on November 8th?

A. It burned.

1 (Grand Jury Exhibit 372 was marked for identification.)

2

3 Q. 372, what is that showing?

4 A. Google image showing post-fire destruction to
5 the Kohler residence.

6

7 (Grand Jury Exhibit 373 was marked for identification.)

8

9 Q. 373, Granneman?

10 A. This is a picture of, pre-fire, of one of my
11 daughter's close friends in school.

12 Q. Do you have personal knowledge that the
13 Grannemans lived in that residence on November 8th?

14 A. I do.

15 Q. Do you have personal knowledge what happened to
16 that house on November 8th?

17 A. I do.

18 Q. What happened?

19 A. It burned.

20

21 (Grand Jury Exhibit 374 was marked for identification.)

22

23 Q. 374?

24 A. That's the Google image post-fire showing the
25 destruction to the Granneman house.

26

1 (Grand Jury Exhibit 375 was marked for identification.)

2

3 Q. 375, Stuermer?

4 A. This is a residence of -- Google image of the
5 Stuermer residence before the fire. She and my wife were
6 friends, and her kids grew up with my daughter.

7 Q. Do you have personal knowledge as to whether
8 the Stuermers resided in that residence on November 8th?

9 A. I do.

10 Q. And do you have personal knowledge as to what
11 happened to that residence on November 8th?

12 A. I do.

13 Q. What happened?

14 A. It burned.

15

16 (Grand Jury Exhibit 376 was marked for identification.)

17

18 Q. 376?

19 A. That's the Google image post-fire showing the
20 destruction to the Stuermer home.

21

22 (Grand Jury Exhibit 377 was marked for identification.)

23

24 Q. 377, Freitas?

25 A. This is a Google image showing the Freitas',
26 what he refers to as his "ranch." This is our pastor's

1 place.

2 Q. Do you have personal knowledge that Mr. Freitas
3 lived there on November 8th?

4 A. I do.

5 Q. Do you have personal knowledge as to what
6 happened to the house on November 8th?

7 A. I do.

8 Q. What happened?

9 A. It burned.

10

11 (Grand Jury Exhibit 378 was marked for identification.)

12

13 Q. 378. What is depicted in 378?

14 A. That's the Google image post-fire that shows
15 the destruction to the Freitas house.

16

17 (Grand Jury Exhibit 379 was marked for identification.)

18

19 Q. And finally, 379?

20 A. This is an overview of the town of Paradise,
21 where all those houses are located and the labeling of
22 the family names.

23 Q. So each one of these yellow pins represents a
24 house that we just looked at?

25 A. Correct.

26 Q. And those are all persons that you know?

1 A. Correct.

2 Q. Families that you know?

3 A. Correct.

4 Q. People you know lived in those locations on
5 November 8th?

6 A. Correct.

7 Q. And let's talk a little bit about the post
8 November 8th. Once you were able to get out of the fire
9 with Dean, what were you doing?

10 A. Trying to find out where my wife was.

11 Q. And how long did it take you to find your wife?

12 A. Got a little delayed because as I was going
13 down the hill realized that the truck was on fire, so I
14 had to stop and put my truck out. Then probably -- as
15 soon as I got down about the lookout on Skyway, I could
16 get cell phone signal again.

17 Q. Why was your truck on fire?

18 A. Apparently got too hot. I have a rubber mat
19 that I throw all my tools and everything on, and
20 apparently some embers had fallen in there and lit the
21 thing up.

22 Q. In the days following the Camp Fire, what was
23 your assignment?

24 A. It was on recovery mode to take teams in and
25 start searching for, looking for people that were
26 unaccounted for.

1 Q. So you lost everything in the fire; right?
2 Correct? Or everything but what you could carry out of
3 there on, quickly on November 8th?

4 A. Lost my house, yeah.

5 Q. But in the days that followed it, you're a law
6 enforcement officer, you were out in the community;
7 correct?

8 A. Yes.

9 Q. And describe for us the recovery efforts.

10 A. Unfortunately, it was trying to sift through
11 and trying to find people that didn't make it, so that we
12 can get their families some closure, so we can figure out
13 who else was out there.

14 Q. Did you personally recover bodies?

15 A. No.

16 Q. Did you supervise the recovery of bodies?

17 A. Yes.

18 Q. During the recovery efforts, did that give you
19 access to all of Paradise and Magalia?

20 A. Yes.

21 Q. And were you able to go around and check
22 friends', family members' houses?

23 A. Yes.

24 Q. And all of the, all of the houses that are
25 depicted in here by yellow pins you were able to go check
26 and found that they had been burned?

1 A. I didn't physically check these addresses. I
2 was trying to help others that were trying to call in and
3 get some closure. Most of these people I knew, had
4 talked to beforehand, so these were not addresses I went
5 and checked on.

6 Q. Okay. But at some point you were able to go
7 looking at all these residences, all of your friends' and
8 families' residences, and the fact that they were gone?

9 A. Correct.

10 Q. I mean, there were only a very few people up
11 there, and a lot of people wanted to know what happened
12 to their houses at that time; right?

13 A. Correct.

14 Q. Everybody was calling all the law enforcement
15 officers to check and see what happened to their house or
16 the family?

17 A. Correct.

18 MR. NOEL: I have nothing further at this
19 point.

20 GRAND JURY FOREPERSON: Nick, anything?

21 MR. FOGG: (Shakes head.)

22 MR. NOEL: We have a question.

23 (Counsel and Grand Jury Foreperson confer).

24 Q. (By MR. NOEL) All right. Lieutenant, these
25 are questions from the jury.

26 Have you been able to move back to your home?

1 A. No.

2 Q. And you found a new place to live?

3 A. Yes.

4 Q. In another area?

5 A. Yes.

6 Q. Have any of your neighbors, to your knowledge,
7 been able to return to their homes?

8 A. Nobody has been allowed to return home yet in
9 my neighborhood.

10 Q. Going back to where we started, and this is --

11 GRAND JURY CLERK: 299.

12 Q. 299. How many of these houses in your
13 neighborhood there survived?

14 A. So the Critchfields' (phonetic) house here
15 survived, and Kleins' survived here. But she's a little
16 old lady; I don't think she's going to come back. And
17 the Kleins, their house was damaged but it wasn't burned,
18 and with smoke damage, so they decided to leave.

19 Q. The friends and family members who lost their
20 homes, have they relocated to other areas?

21 A. Most of them have.

22 Q. Is anybody planning on rebuilding in Paradise?

23 A. I know my brother's rebuilding. And I know --
24 I just was up there. Not Ron's house. If you can
25 remember where the easement was, not his place, but the
26 house just north, I see fresh construction going on

1 there. So this was Ron's house. I see new construction
2 going on right there.

3 Q. You're referring to, I believe --

4 A. I've met them, I just, I can't remember their
5 names. And I really don't know --

6 Q. 303?

7 A. I don't know where they're at.

8 Q. Just to make clear, that's what exhibit you
9 were referring to.

10 A. Okay. So I know they were living there, I just
11 can't remember their names. And I don't know if they
12 sold the property and somebody else's building. I don't
13 know this.

14 MR. NOEL: Does that answer questions?
15 Anything else? Any other questions?

16 I believe that's all we have for you,
17 Lieutenant.

18 The foreperson will read you the admonition.

19 GRAND JURY FOREPERSON: Lieutenant Wines, you
20 are admonished not to discuss or disclose at any time
21 outside of your juror room the questions that have been
22 asked of you or your answers until authorized by the
23 Grand Jury or the court. A violation of these
24 instructions on your part may be the basis for a charge
25 against you of contempt of court. This does not preclude
26 you from discussing your legal rights with your own

1 attorney.

2 Lieutenant Wines, what I have just said is a
3 warning not to discuss this case with anyone except the
4 Court, your lawyer, or the district attorney. Do you
5 understand?

6 THE WITNESS: I do.

7 GRAND JURY FOREPERSON: Thank you.

1 OROVILLE, BUTTE COUNTY, CALIFORNIA

2 JULY 30, 2019; 8:35 a.m.

3 (Confidential Grand Jury Hearing Proceedings)

4
5 (PROCEEDING OMITTED.)

6
7 (ROLLCALL OMITTED.)

8
9 (PROCEEDING OMITTED.)

10
11 MR. NOEL: Dennis Bitle.

12 GRAND JURY FOREPERSON: Mr. Bitle, before you
13 sit down, I'd like to swear you in, please.

14 THE WITNESS: Will you speak louder, please.

15 GRAND JURY FOREPERSON: Yes. I'd like to swear
16 you in before you sit down. Could you raise your right
17 hand.

18 THE WITNESS: Okay.

19 GRAND JURY FOREPERSON: Can you hear me just
20 fine now?

21 THE WITNESS: No.

22 GRAND JURY FOREPERSON: Okay. Can you hear me
23 now?

24 THE WITNESS: Yes.

25 GRAND JURY FOREPERSON: Okay. Good.

26 Okay. Mr. Bitle, do you solemnly swear that the

1 evidence you shall give in this matter pending before the
2 grand jury shall be the truth, the whole truth, and
3 nothing but the truth so help you God?

4 THE WITNESS: Yes.

5 GRAND JURY FOREPERSON: Thank you. Have a seat,
6 please.

7 **EXAMINATION**

8 BY MR. NOEL:

9 Q. Could you please state your full name spelling
10 your last name for the record.

11 A. Dennis Michael Bittle, B-i-t-l-e.

12 Q. Mr. Bittle, are you employed?

13 A. No.

14 Q. Have you ever been employed?

15 A. Yes.

16 Q. How long have you been unemployed?

17 A. About eight years.

18 Q. And why are you unemployed?

19 A. Retired.

20 Q. You're retired from what?

21 A. Pacific Gas and Electric Company.

22 Q. Okay. Can you move up and speak into your
23 microphone so --

24 A. It's hard to hear, isn't it?

25 Q. Well, I can hear you fine, but those people all
26 the way in the back row need to hear you.

1 A. Thank you for speaking louder.

2 Q. Okay. Are you having trouble hearing me?

3 A. Not anymore.

4 Q. Okay. How long did you work for PG&E?

5 A. Forty-one years.

6 Q. When did you start?

7 A. 1970.

8 Q. And what did you do for PG&E?

9 A. In what years?

10 Q. Okay. Let's start with 1970. Where did you
11 start?

12 A. As a utility man equipment to maintenance.

13 Q. Okay. Explain to us what a utility man does?

14 A. I repaired broken windows in the building we
15 were in. I changed out ballasts and lights and the
16 fluorescent lights that we had. I would rebuild walls
17 that got cracks or had damage done. I would generally
18 just do maintenance.

19 Q. You said "in the building we were in." Was
20 there a certain department or building to which you were
21 assigned?

22 A. Yes.

23 Q. What building?

24 A. It was Department of Engineer and Research, a
25 building on Hollis Street. I can't remember the address.
26 4740 or something like that Hollis Street in Emeryville.

1 Q. Okay. How long were you a utility clerk for
2 engineering and research?

3 A. I don't remember exactly.

4 Q. Just in general do you recall?

5 A. Almost ten years. No. Wait. I'm wrong. We
6 moved out to San Ramon in '75, I think. So that's when
7 the utility ended. Whenever we moved to San Ramon was
8 when I stopped as a utility engineer person and began as
9 a D clerk.

10 Q. Okay. So somewhere around 1975 you became a D
11 clerk?

12 A. Yes.

13 Q. With what department?

14 A. With the department.

15 Q. Which department?

16 A. It was still the Department of Engineer and
17 Research.

18 Q. Okay. And the only change other than your job
19 title was that the department moved from Emeryville to
20 San Ramon?

21 A. Yes.

22 Q. Okay. What were your job tasks as a D clerk?

23 A. I handled purchase orders and requisitions for
24 purchase orders. I handled the cars making sure they had
25 gas and they were in sufficient order to drive. I did a
26 lot of clearing of different bookkeeping actions for the

1 company.

2 Q. How long were you a D clerk?

3 A. Oh, that I don't remember exactly. I mean five,
4 six years. I'm guessing. It's been a long time.

5 Q. What was your next job within PG&E?

6 A. I became a machinist.

7 Q. What is a machinist?

8 A. But they didn't call it a machinist. They
9 called it Tech 1.

10 Q. Tech 1?

11 A. Uh-huh.

12 Q. Are you -- remember you have to speak out loud
13 so the court reporter can take that down.

14 THE WITNESS: Can you hear me?

15 THE COURT REPORTER: Yes.

16 THE WITNESS: Even when I talk this way?

17 THE COURT REPORTER: Yes.

18 BY MR. NOEL:

19 Q. When you say "uh-huh" or "huh-uh," she can't
20 take that down. It has to be "yes" or "no."

21 A. I am very sorry. I will try to do better.

22 Q. Don't worry. Everybody has a problem with it.

23 So what were your job assignments as a Tech 1
24 machinist?

25 A. Excuse me. Do you have a Kleenex or does
26 someone have a Kleenex here? My eyes water. I'm old,

1 I'm told, because I have dry eyes.

2 Q. You know, usually we have boxes of Kleenex in
3 here.

4 A. Give me a moment.

5 [Grand jury foreperson supplies a
6 package of Kleenex to the witness.]

7 THE WITNESS: This is beyond me in technology.
8 Okay. Thank you.

9 GRAND JUROR NUMBER SIX: Mr. Bittle, could you
10 move the microphone a little closer.

11 THE WITNESS: Yeah. Are you having trouble?
12 Okay, Sir. Thank you.

13 Did I do that? Can you hear me now?

14 GRAND JUROR NUMBER SIX: Yes.

15 THE WITNESS: Okay.

16 BY MR. NOEL:

17 Q. So what were your duties as a Tech 1 machinist?

18 A. I was under a journeyman machinist that was also
19 a technician. He was a senior engineering technician.

20 Q. And what kinds of things did you do?

21 A. Made parts for testing, made fixturing for
22 testing. In general, I did machining with a lathe and a
23 mill and metal and then plastic and then various
24 materials.

25 Q. And how long were you a Tech 1 machinist?

26 A. I think the progress was two years from Tech 1

1 to Tech 2. And from Tech 2 I think it's senior
2 technician. I'm not sure. Some things were held up
3 because of education. You had to have an AA to make
4 senior technician. So I'm not sure when I finished my AA
5 degree in night school.

6 Q. All right. So --

7 A. Does that matter?

8 Q. I'm just walking through the timeline. You were
9 a Tech 1 --

10 A. Well, I'm trying to do what I remember, and I
11 remember very little --

12 Q. Right.

13 A. -- of that many years ago.

14 Q. So you were Tech 1 for approximately two years?

15 A. I think so, yes.

16 Q. And then you ascended to a Tech 2 position?

17 A. Yes.

18 Q. And you said that was --

19 A. Still in the machine shop.

20 Q. Okay. And that was about another two years or
21 so?

22 A. I -- I'm not sure how long I stayed as a Tech 2.

23 Q. Okay. The next step was you said senior --

24 A. Engineering tech.

25 Q. Engineering tech.

26 A. Yeah.

1 Q. And to reach that step you had to get an AA; is
2 that correct?

3 A. Yes, yes.

4 Q. And did you achieve an AA?

5 A. Yes.

6 Q. And what was your AA in?

7 A. General education.

8 Q. So it wasn't necessarily related to what you
9 were doing?

10 A. No.

11 Q. You just needed an associates degree?

12 A. It was an associates degree in general education
13 with a -- what do you call it? -- a certificate in
14 police science. I was going to be a police officer back
15 then.

16 Q. So at some point you became a senior engineering
17 tech?

18 A. Yes.

19 Q. And what does a senior engineering tech do?

20 A. They kind of have the -- mentor the Tech 1s and
21 Tech 2s and we write our own reports at that point
22 usually with engineering's backing.

23 Q. And were you still working at engineering and
24 research at this point?

25 A. That I don't remember when it changed to TES,
26 Technical and Ecological Services. I'm not sure when

1 that transition occurred.

2 Q. Okay. So at some point Engineering Services
3 became Technical and Ecological Services; correct?

4 A. I have no idea what you mean by Engineering
5 Services. It was Department of Engineering and Research.

6 Q. That's what I said.

7 A. Engineering -- you said Research Services or
8 something.

9 Q. You said environment -- now I'm forgetting. You
10 said you started --

11 A. Yes.

12 Q. You started off in 1970 in Emeryville working
13 for the Department of Engineering and Research?

14 A. Yes.

15 Q. And at some point -- well, and then about 1975
16 the Department of Engineering and Research moved to San
17 Ramon?

18 A. Yes.

19 Q. And you moved with that -- with them --

20 A. Yes.

21 Q. -- to San Ramon? And you became a D clerk?

22 A. Yes.

23 Q. And then you became Tech 1 and Tech 2 and
24 ultimately a senior engineering tech?

25 A. Yes.

26 Q. So at some point the Department of Engineering

1 and Research changed its name and became --

2 A. Technical and Ecological Services.

3 Q. Okay.

4 A. After Department of Engineering and Research.

5 Q. Okay. Right. Same department, just different
6 name; right?

7 A. Yes.

8 Q. Same physical location?

9 A. If it's in San Ramon.

10 Q. Yep.

11 A. Okay.

12 Q. Do you recall when that name change took effect?

13 A. Thirty-two years ago when I first started
14 with -- or when I started working 41 years ago. And then
15 we started going back or regressing to up until now.
16 It's very hard to remember years let alone hours and days
17 so . . .

18 Q. Right. But going back to the question that
19 started all of that, I guess whether you call it the
20 Department of Engineering and Resources --

21 A. Research --

22 Q. Research. I'm sorry. Or Technical --

23 A. -- and Ecological Services.

24 Q. -- and Ecological Services.

25 A. Yes.

26 Q. Essentially, it's the PG&E lab; correct?

1 A. Yes.

2 Q. Big round white building in San Ramon; right?

3 A. It had a geodesic dome.

4 Q. A geodesic dome?

5 A. Okay. Yes, you're right. And it was an
6 aluminum color, not white. Okay.

7 Q. So that's where you spent the entirety of your
8 41 years with the company; correct?

9 A. Emeryville and San Ramon.

10 Q. In that department; the lab?

11 A. In the department.

12 Q. Okay. So in the mid '80s, late '80s, what were
13 you doing at the lab?

14 A. I was testing physical -- doing physical tests
15 in the physical test department.

16 I'm sorry. Oatmeal is coming back up.

17 Q. What kind of physical testing?

18 A. I broke things.

19 Q. Why did you break things?

20 A. To see what the strength of the thing I broke
21 was, the ultimate strength.

22 Q. Why was that important?

23 A. It was a test to qualify material that we used
24 to hang insulators and conductors from and to check the
25 tensile strength of gas pipes or the threads on gas pipes
26 or the pressure that gas pipes would withstand. I did

1 mainly gas testing back in the early '80s, but some -- I
2 did some hardware testing of -- on the electric
3 department side.

4 Q. All right. In 1987 were you still with the --
5 working at the lab as a senior engineering tech?

6 A. Yes.

7 Q. Were you asked to do some tests on some
8 suspension hooks and hanger plates?

9 A. I was asked -- if you're referring to the test
10 report that you had brought before me in our conversation
11 yesterday, if it's that report, yes, I was asked to do a
12 test on some J-hooks that hold insulators up.

13 Q. You have in front of you what's been marked as
14 Exhibit Number 380. It's the packet right there in front
15 of you on the desk.

16 A. Uh-huh.

17 Q. Do you recognize Exhibit 380?

18 A. That is called Exhibit 380?

19 Q. Well, you have the actual exhibit right there in
20 front of you.

21 A. Yeah. Well, to me it's report number 500-87.
22 So you're saying -- you're qualifying report number
23 500-87.25 as exhibit --

24 Q. Exhibit 380?

25 A. Yes. Okay.

26 Q. There's an exhibit tag on the front page. Turn

1 to the front page.

2 A. Oh, the very front. Okay. Three eighty.

3 Q. So you recognize Exhibit Number 380?

4 A. I do now. This is yours, not mine. So I'm
5 trying to keep this very concise for you.

6 Q. What is Exhibit 380?

7 A. I have no idea what Exhibit 380 is. Are you
8 saying the exhibit is this test report?

9 Q. Okay. Sir, we're in a court of law.

10 A. Yes.

11 Q. Everything has to have an exhibit number and a
12 tag number.

13 A. Thank you for explaining that.

14 Q. This is Exhibit Number 380.

15 A. Yes.

16 Q. So Exhibit Number 380 is what?

17 A. Why don't you tell me and then I'll agree or
18 disagree.

19 Q. Sir, I ask the questions. You don't ask me
20 questions. I ask you questions. So I have to go through
21 certain questions. You can talk to your attorney about
22 that.

23 A. Can I have a break?

24 Q. It's called --

25 Sure.

26 A. Thank you.

1 [Mr. Bittle exits the courtroom.]

2 MR. NOEL: For the record, the witness has left
3 the courtroom to talk to his attorney.
4

5 [Recess taken from
6 9:11 until 9:15 a.m.]
7

8 THE WITNESS: That is not my report.

9 BY MR. NOEL:

10 Q. Right.

11 A. Okay.

12 Q. And that's not on the actual exhibit copy that
13 you have.

14 A. Okay. We're going -- sorry.

15 Q. The question is what is Exhibit Number 380?

16 A. This -- I'm learning -- is the way you are
17 introducing my test report is by Exhibit 380.

18 Is that correct? Am I correct?

19 Q. That is the way exhibits and the way evidence is
20 marked in a courtroom.

21 A. Okay. We're in agreement.

22 Q. So what is Exhibit 380?

23 A. It's my lab test report that I did -- oh, I'm
24 sorry. -- that I did when I tested what I thought to be
25 J-hooks.

26 Q. When did you do the tests on the items you

1 thought were J-hooks?

2 A. 1987.

3 Q. And how was it that you came to do these tests?

4 A. I was asked by (WITNESS #17) to do testing on
5 two J-hooks that he brought me. They were actually
6 C-hooks.

7 Q. Okay. You called them J-looks at the time, but
8 you now know them to be C-hooks?

9 A. Yes.

10 Q. Flip to page 2 of that document. That's what is
11 up on the big board here.

12 A. Oh, I'm sorry. 380 page 2. Okay.

13 Q. And what you have in front of you is your
14 report?

15 A. Uh-huh.

16 Q. First page of your report?

17 A. Uh-huh.

18 Q. Remember, you have to answer out loud.

19 A. Yes. Yes on both questions.

20 Q. Okay.

21 A. Okay.

22 Q. And you wrote this report?

23 A. I wrote this report.

24 Q. And you wrote this report based upon what?

25 A. On my test results.

26 Q. Okay. So let's flip over and let's go back to

1 the fourth page. On the fourth page there are pictures,
2 figure one and figure two.

3 A. The third page?

4 Q. Is it the third page? Okay. I'm sorry.

5 A. One, two, three.

6 Q. Well, actually there's a cover sheet on there;
7 correct?

8 A. Oh, you're counting -- yes, Sir. It's hard to
9 get used to.

10 Q. So the fourth page of the packet.

11 A. Okay.

12 Q. So it's the way PG&E gives them to us. That's
13 the way it is.

14 A. Okay. So you understand why I'm having trouble
15 with this?

16 Q. You've never done this before.

17 A. That's true.

18 Q. And it's confusing. I understand.

19 So third page of the report, fourth page in the
20 packet, two pictures, figure one and figure two. See
21 those?

22 A. Yes.

23 Q. Did you take those photographs?

24 A. Yes.

25 Q. Why did you take photographs of the items?

26 A. Why did I? Usually to show before and after.

1 Q. Just documentation?

2 A. Yes.

3 Q. Is that correct?

4 Okay. So the top photograph, figure number one,
5 what are we looking at in that photograph?

6 A. I was emphasizing the bowl saddle of the J-hook.
7 That's what I thought was a J-hook at the time.

8 Q. And what's a bowl saddle?

9 A. It's an ANSI explanation of where the -- the
10 other part of the hook, whatever latches onto the hook
11 should set or should ride.

12 Q. And why was that a concern?

13 A. I had no -- I wanted to show that it had some
14 wear on it. I mean, from the looks of it.

15 Q. Okay. So you took this to show there was wear
16 on the hook?

17 A. I took this to show the hook.

18 Q. Okay.

19 A. If there's wear on it, yes.

20 Q. That is one of the hooks that you were using;
21 right?

22 A. Was using, was testing.

23 Q. Okay. And is this the wear right here
24 (indicating)? This channel?

25 A. This is it right here (indicating). I can't see
26 that.

1 Q. Okay. You can come on up to the board if you
2 want. They can't see what you're looking at.

3 A. Yes, that's the bowel saddle.

4 Q. Okay. And how would you describe that wear
5 pattern?

6 A. I wouldn't.

7 Q. You wouldn't?

8 A. No.

9 Q. Why not?

10 A. Would you repeat the question.

11 Q. How would you describe the wear pattern?

12 A. I did not describe it then. It had wear, I
13 could say.

14 Q. Okay.

15 A. But that's all I can say.

16 Q. Did you ever hear the term "channeling"?

17 A. Maybe in metallurgy.

18 Q. Okay. Going on to figure two, what is figure
19 two?

20 A. This figure shows the keyhole wear in the plate
21 caused by the J-hook while in service.

22 Q. What do you mean by "keyhole wear"?

23 A. It looks like a keyhole, the old-time keys.

24 Q. Okay. So again using the big board up on the
25 board, what are we talking about in terms of --

26 A. Right there (indicating).

1 Q. So --
2 A. So this --
3 Q. So that whole area?
4 A. Yes.
5 Q. So it appeared that the hole used to be a
6 circle?
7 A. Yes.
8 Q. And then it's worn down into a --
9 A. That I can assume because normally they wouldn't
10 put a keyhole in a machined hole, yes.
11 Q. All right. So what kind of testing did you do
12 on these items?
13 A. I pulled them in tension until they broke.
14 Q. Do you have a certain machine for doing so?
15 A. It's a Tinius Olson Universal Test Machine.
16 Can you still hear me?
17 Q. I've gone up to the next page. I think it's
18 page 4 of your report, page 5 of the document.
19 A. Okay.
20 Q. And you see figure three?
21 A. Yes.
22 Q. Is that a photograph that you took?
23 A. Yes.
24 Q. What does figure three depict?
25 A. The fixture holding the plate and the J-hook.
26 Q. What fixture?

1 A. The Tinius Olsen Universal Test Machine.

2 Q. So this is actually the test machine that we're
3 looking at in this picture; correct?

4 A. You're looking at the fixturing that is inside
5 the test machine. The test machine is that table down
6 below with those big hydraulic rams on both sides.

7 Q. Okay.

8 A. Okay. And what's covered in the retractable
9 sleeve there is the threads for raising and lowering the
10 table to get it in position to pull the thing in tension,
11 pull whatever thing we test in tension.

12 Q. Okay.

13 A. Or in compression depending on how we set it up.

14 Q. So explain to us how this test works.

15 A. Well, we pull a graduated movement slowly in
16 tension up until it breaks. Okay.

17 Q. Okay. So let's back up a little bit. Let's
18 make it little bit more basic.

19 A. Okay.

20 Q. What is this (indicating) thing up here? You
21 can come up to the board.

22 A. Okay.

23 Q. This right here (indicating)?

24 A. That is the actual plate that had the keyhole in
25 it from page -- whatever page.

26 Q. Right. From figure two?

1 A. Okay. And underneath it is the hook that was
2 in --

3 Q. Figure one?

4 A. -- figure one. If you say so. Let's make it
5 real. Figure one, yes.

6 Q. So are the hook and the plate attached in some
7 way in the machine?

8 A. Attached to the machine you're saying?

9 Q. I . . .

10 A. They're attached to a fixture that was put in
11 the machine. These are the jaws that come up and close
12 on whatever I put in the lower part. There's jaws that
13 look just like this (indicating) that come up and close
14 on what's up here, too.

15 Q. Okay. So the two were attached to something
16 that is part of the machine; is that correct?

17 A. It was holding them to take away the part that
18 was holding them so if something really big put on both
19 sides that we know wasn't going to break or distort or
20 cause anything else to happen to that -- the product. We
21 call it "the product."

22 Q. Okay.

23 A. So it did not influence the breaking strengths
24 when pulled in tension.

25 Q. Okay. So would figure three show all the parts
26 ready to be tested?

1 A. Yes.

2 Q. Okay. So this would be the test?

3 A. That would be it.

4 Q. All right. Now, explain the test for us,
5 please.

6 A. Okay. The Tinius Olsen is a hydraulic machine
7 controlled by valves, and the valves are on a turning
8 wheel that increase more or less flow through the valves
9 into the pistons that places the part in tension. You
10 can control the rate of tension and watch the gauge going
11 up, which is a big face dial about that (indicating) big
12 around. And it was a big dial that goes up. And it has
13 a follower -- or a follower needle -- well, it's actually
14 a leader needle that goes up. And whenever it breaks and
15 this falls, that stays where it is so that we can read on
16 the -- on the dial face at what point it failed or broke.

17 Q. Okay. Just a couple things for the record.
18 When you were describing the pressure gauge or whatever
19 you said, the big face and you held your hands out --

20 A. It's a board on -- board on to gauge.

21 Q. Okay. And you were holding your hands out with
22 your arms spread --

23 A. That's how big it was.

24 Q. -- probably three and a half feet wide?

25 A. About three, yeah.

26 Q. Okay.

1 A. It was easy to read.

2 Q. And so how would you get measurements from that
3 device?

4 A. You would look and read the number that it broke
5 or failed at.

6 Q. Okay. So when you say "apply tension," what are
7 you talking about?

8 A. Load.

9 Q. Okay. What does that mean?

10 A. In pounds. I'm sorry. In pounds. Load in
11 pounds until it breaks. Is that what you're --

12 Q. Well, I'm looking for something more basic as to
13 what you're doing that is putting this thing under
14 tension or under load that is measuring pounds.

15 A. I don't understand.

16 Q. Okay. Are you pulling in opposite directions on
17 the --

18 A. Yes.

19 Q. Okay. So that's what you mean by putting it
20 under tension --

21 A. Yes.

22 Q. -- is pulling in opposite directions from both
23 sides?

24 A. Uh-huh.

25 Q. And the point is to see when it breaks?

26 A. Yes.

1 Q. Okay. And how many hooks did you test in 1987?

2 A. It looks like three but not -- one of them was
3 not from the -- one of the hooks were given to me by
4 (WITNESS #17).

5 Q. How many hooks did (WITNESS #17) give you?

6 A. I think two.

7 Q. And would you test both of those hooks?

8 A. Yes.

9 Q. And you test them both using the Tinius Olsen --

10 A. Yes. There were two. And both hooks failed at
11 11,500 pounds.

12 Q. Okay.

13 A. Broke at 11,500 pounds.

14 Q. So you tested both of the hooks that were given
15 to you by (WITNESS #17) in the Tinius Olsen machine;
16 correct?

17 A. Yes.

18 Q. By applying pressure or tension to them?

19 A. Yes.

20 Q. And both broke; correct?

21 A. Both broke.

22 Q. And what pressure levels or pounds?

23 A. Poundage. Pounds force.

24 Q. Pounds force.

25 A. It was 11,500 according to the Tinius Olsen Test
26 Machine.

1 Q. Now, were you provided anything on who made the
2 hooks?

3 A. I was given literature that I put in the
4 appendices.

5 Q. Okay. Let's go back to that.

6 A. And I'm unsure if I was -- I think it was
7 (WITNESS #17) that gave me the literature. I'm not sure.

8 Q. So let's go back through the appendices. And
9 you said this was literature that you were given.

10 A. Okay. Sorry. Some of these are upside down.
11 They're not in the place they're supposed to be and so
12 forth and so on. So this is kind of tough for me
13 remembering 32 years back and also looking at something
14 that isn't the way it was when I first did it.

15 Does that --

16 Q. No. You take all your time you want to look at
17 your appendices. And I have one of them up on the board.

18 A. Okay. That's a PG&E drawing. That is not a
19 manufacturer's --

20 Q. Okay. And what do you mean by it's a PG&E
21 drawing?

22 A. Just what I said. It's a PG&E drawing. It's
23 not a manufacturer's drawing. So it may be what the
24 manufacturer said. They may have copied it, cloned it,
25 or whatever, but it's still a PG&E drawing. It's not a
26 manufacturer's drawing.

1 Q. Okay. And why would this document be important
2 to your testimony?

3 A. I have no idea.

4 Q. Okay. Let's go on to the next one.

5 A. Okay.

6 Q. That should be the Lindsey document.

7 A. Okay.

8 Q. And why would this document be important to your
9 report?

10 A. It tells you -- it gives you a description of
11 the ball hook which they call the ball hook which is
12 actually a C-hook. Right? That's what we call it.
13 Okay.

14 Q. What you refer to as a J-hook?

15 A. J-hook and the C-hook, yes. Lindsey calls it a
16 ball hook. I imagine it's because of the ball. I'm not
17 saying I know the reason they do. It's just most
18 insulators have a ball and socket. The ball is the male
19 end. The socket is the female end of the -- of the
20 insulator as you can see.

21 Q. Okay. Why would this be important to your
22 report?

23 A. It gives a description of the hook and gives
24 strength and materials. So that would be of interest to
25 someone probably.

26 Q. Okay. Let's move on to the next appendices.

1 A. Ohio Brass.

2 Q. The Ohio Brass page.

3 A. Yes. The same thing, it looks like.

4 Q. Okay. Were you given any information as to
5 whether or not the hooks you were testing were Ohio Brass
6 or made by some other company?

7 A. No. It doesn't say in my report so I can't say.
8 I usually put the manufacturer if I have that data. And
9 that's the only reason I remember that. I was taught to
10 do that.

11 Q. Okay. So that would indicate that you didn't
12 know the manufacturer of the hooks that you were testing?

13 A. Yes. I'm sorry. Yes.

14 Q. Going back to the first one, the one you said is
15 a PG&E drawing --

16 And actually, down in the right-hand corner it
17 says "Anderson Electric Corporation." Is that correct?

18 A. Yes, I guess. Give me a copy of the Lindsey,
19 okay, or Anderson. Where is Anderson?

20 Q. The first one.

21 A. Okay. Oh, okay.

22 Okay. What would you like me to . . .

23 Q. That's a third company; correct?

24 A. I don't know.

25 Q. Okay. But the document says on the bottom it
26 says "Anderson Electric Corp leaves Alabama." Is that

1 correct?

2 A. It says that, yes.

3 Q. Okay. So you have schematics for these hooks
4 from three different companies attached to your report;
5 is that correct?

6 A. I can only assume.

7 Q. Well, they're attached to your report; correct?

8 A. Yes.

9 Q. And you don't remember why; is that correct?

10 A. Thirty-two years ago.

11 Q. No. I'm just saying you don't know why they're
12 attached.

13 A. Not today.

14 Q. Okay. But in your report it never states the
15 manufacturer of the hooks that you were testing?

16 A. Yes.

17 Q. Okay. All right. So I want to go back a few
18 pages to figure four. Is figure four also a photograph
19 that you took?

20 A. Yes.

21 Q. And what does figure four depict?

22 A. Well, it says "This hook shows the point of
23 failure to be in the worn section of the bowl saddle."

24 Q. So what does that mean?

25 A. It means it was in the worn section. It bent
26 and broke.

1 Q. Okay.

2 A. As it says it should in ANSI for standard hooks,
3 the way hooks should fail.

4 Q. Okay. Good point. You said --

5 A. Do you want to go to ANSI?

6 Q. Well, do you have Appendix B attached to your
7 report?

8 A. Yes, I do.

9 Q. And what is Appendix B?

10 A. ANSI P30.10-1975.

11 Q. What is ANSI?

12 A. American National Standards Institute.

13 Q. And what is ANSI -- what did you say? P30-1975?

14 A. It's hooks, I guess. Yes, hooks.

15 Q. What is that document?

16 A. It's a means of testing that the manufacturer --
17 all the manufacturers of hooks in rigging and chain
18 hoists, et cetera. The people that manufacture such as
19 Campbell and -- who else? -- Crosby, back then those were
20 the two leading manufacturers of chain and wire rope and
21 hooks and shackles and so forth and everything used in
22 rigging. They -- most of the people in this ANSI that
23 are responsible for the testing are some of those
24 manufacturers.

25 Q. Okay.

26 A. So that's how this came about, ANSI came about,

1 I'm told. So it's a guideline. We use it when we're
2 doing our tests. It doesn't necessarily mean that we
3 are -- we have our own tests. It's usually more thorough
4 and more exacting on the product we're testing than ANSI
5 is. ANSI is kind of giving a general testing of hooks.

6 Q. So why is the ANSI standard for hooks attached
7 to your report?

8 A. A long time ago I probably thought something
9 that I can't remember today. I gave you my best thoughts
10 on it, but that would be an opinion and that may not be
11 true.

12 Q. Okay.

13 A. So I'd rather not go with opinions and my
14 thoughts of 32 years ago.

15 Q. On the -- on the copy of the ANSI hook standards
16 that were attached to your report, there are notes -- not
17 really notes. There are brackets and handwritten
18 brackets and underlining --

19 A. I don't know who put those there.

20 Q. Okay. You don't know if that was you or
21 somebody else?

22 A. Right.

23 Q. But for some reason you photocopied the ANSI
24 standard and attached it to your report; correct?

25 A. The typing pool did it. And I asked -- I put
26 the original of what I had in the report.

1 Q. Okay. All right. So let's go back and talk
2 about figures five and six.

3 A. Okay.

4 Q. Figure five is a photograph that you took?

5 A. Yes.

6 Q. And what does figure five depict?

7 A. The hook failed in the heel.

8 Q. What does that mean?

9 A. I'm unsure.

10 Q. How is the heel different from the saddle?

11 A. I am unsure. I know that if you look at ANSI,
12 it will probably tell you where the heel of the hook is.
13 And maybe that's how I found ANSI usable. I don't know.

14 Q. Okay. And how about figure six? Is that a
15 photograph you took?

16 A. Yes.

17 Q. And what does figure six depict?

18 A. It looks like I broke the keyhole.

19 Q. So figure six is the after picture for figure
20 two?

21 A. No. It wasn't what was used. It did not break
22 when I was pulling the others.

23 Q. Okay.

24 A. Which is obvious.

25 Q. Okay. Explain.

26 A. Didn't it break at a higher ultimate?

1 Q. Okay. We haven't gotten there yet. You said
2 you took before and after photographs; right?

3 A. Yes.

4 Q. So figure two is a before photograph of the
5 hanger plate, correct, with the keyhole in it?

6 A. Yes.

7 Q. And then figure six, the after -- is that the
8 after photo of the same plate?

9 A. In the plate. It says right here that it's the
10 same plate.

11 Q. Okay.

12 A. Okay. I only had one plate evidently to test.

13 Q. Okay.

14 A. So . . .

15 Q. The point is that figure six and figure two are
16 the same plate?

17 A. Yes.

18 Q. Remember, we have to establish all of this. I
19 know --

20 A. I'm going by the report, and the report says
21 that says that. So, yes. Do I remember? No.

22 Q. Okay. Now, you said that your plate failed at a
23 higher pressure than the hooks?

24 A. Higher tensile.

25 Q. Higher tensile?

26 A. Pressure usually indicates compression which is

1 the other way.

2 Q. Okay. So what amount of tensile did the plate
3 fail at?

4 A. 19,600 pounds.

5 Q. I'm going back to your report itself. Under
6 "Objective" it says "The ultimate rating for 115 kV lines
7 is 30,000 pounds." Correct?

8 A. Yes.

9 Q. And you then in parentheses "See manufacturer's
10 literature and Appendices A."

11 A. Yes. That was yes.

12 Q. And in Appendice A can you show us where the
13 ultimate strength rating is?

14 A. It's number one, item number one.

15 Q. Okay.

16 A. Would you like me to point?

17 Q. Sure.

18 A. (Indicating).

19 Q. Okay. So we have a column on the -- and this
20 that we're looking at --

21 A. PG&E drawing.

22 Q. -- is the Anderson Electric Corp schematic. And
23 there's a column that says "ULT, period, STR period,
24 pounds." Is that correct?

25 A. Yes.

26 Q. Okay. And that's what you said is the ultimate

1 strength rating?

2 A. Yes. That's what it says, yes.

3 Q. And then there's --

4 A. But it references ASTM.

5 Q. Okay. We'll get to that in a second. And then
6 there's the Lindsey document.

7 A. Yes.

8 Q. Do you see an ultimate strength rating on the
9 Lindsey document?

10 A. Right there. The ball hook. The ball hook.

11 Q. Okay. But do you see an ultimate strength
12 rating here someplace?

13 A. Thirty kip.

14 Q. Thirty kip. What does that mean?

15 A. One thousand pounds. The "K" is a thousand.
16 It's kind of -- it usually means pounds per square inch.
17 Kips are usually a shortcut to saying pounds per square
18 inch tension.

19 Q. Got it. And finally, the Ohio Brass schematic.
20 Do you see an ultimate strength rating on there?

21 A. Was it -- is it -- oh, wait a minute. Right
22 here (indicating).

23 Q. Okay. So again, you're pointing to the chart in
24 the middle of the page and the column. The third column
25 from the left says "ULT, period, STR" and then has a list
26 of numbers down below; correct?

1 A. Numbers down below?

2 Q. In the column under "ultimate strength" or
3 "ULT/STR."

4 A. Ultimate strength is what that normally stands
5 for.

6 Q. Okay. And you identify the hook as being part
7 A?

8 A. "A."

9 Q. And how do you recognize the look as being part
10 A?

11 A. It says it in the drawing.

12 Q. Okay. Explain.

13 A. They usually use letters or numbers alphanumeric
14 to describe. "A" in the drawing would be A item.

15 Q. Okay.

16 A. "B" would be B item, C, D, E. Where's F? Up
17 here (indicating) which you showed me.

18 Q. So when you're talking about in the drawing,
19 you're talking about the drawing of what we'd call the
20 suspension hanger assembly on the left?

21 A. Right.

22 Q. And at the top there's a circle A pointing to a
23 part?

24 A. Uh-huh.

25 Q. You have to answer out loud.

26 A. Yes.

1 Q. So again, the ultimate strength rating on this
2 is 30,000 pounds?

3 A. On what?

4 Q. That is for the Ohio Brass. That's what it
5 lists for the hook?

6 A. The hook. It says 30,000 pounds.

7 Q. Okay.

8 A. With a reference to A-576 of the ASTM standard.

9 Q. All right. The test results we went over,
10 conclusions.

11 This is where we talk about the third hook. You
12 said you tested a third hook. Where did you get a third
13 hook?

14 A. Out of some bin.

15 Q. What bin?

16 A. That's the only thing I can think of because I
17 don't know where it came from either now. But the bin is
18 where we kept all of our old fixturing and stuff we've
19 tested in the past that didn't fail at a given load that
20 we were testing something else using an existing product
21 that you saw on those lists there.

22 Do you understand that? Did I make myself
23 clear?

24 Q. Yep. Why did you test a third hook, something
25 other than what Mr. (WITNESS #17) gave you?

26 A. I was trying to get a statistic, and I couldn't.

1 I didn't have enough. I had no other J-hooks or C-hooks
2 to test. I would like to find out what the normal
3 breaking strength is of a new one, for instance.

4 Q. So what happened when you tested the hook that
5 you got out of the bin?

6 A. It broke lower.

7 Q. At what?

8 A. Sixty-nine hundred pounds of force.

9 Q. Did you seek out any further hooks for testing?

10 A. No. I should not have put that one in there
11 because I had no idea what it was used for in the past.
12 It could have already been yielded from a prior test.

13 Q. What does it mean to be yielded?

14 A. Beyond going back to its original form. Micro
15 yielding is yielding so you don't necessarily see it, but
16 it's already in plastic which means it's flowing where
17 it's not going to go back to its original shape. Even
18 though it's just my cost, it still failed. And that's
19 the extent of my metallurgy.

20 Q. Right. And the two worn hooks failed at 11,500
21 pounds?

22 A. Yes.

23 Q. And the comparison, the exemplar hook failed at
24 6,900 pounds?

25 A. Yes.

26 Q. And the hanger plate failed at 11,000 -- or I

1 mean 19,000 pounds; right? 19,600 pounds?

2 A. Yes.

3 Q. Now, as you sit here today is there -- looking
4 back at your report --

5 A. Do you guys have time? I'd like to go use the
6 facilities.

7 MR. NOEL: Madam Foreperson.

8 GRAND JURY FOREPERSON: Yes, that's fine.

9 THE WITNESS: Can I take a break?

10 GRAND JURY FOREPERSON: Yes.

11 THE WITNESS: This is nothing. It's just --

12 MR. NOEL: Go ahead.

13 THE WITNESS: Thank you.

14 MR. NOEL: Yep.

15 Everybody can take a quick bathroom break if
16 they need it.

17 What time is it?

18 GRAND JURY FOREPERSON: Want to do 15 minutes?

19 MR. NOEL: It's almost break time anyway.

20 GRAND JURY FOREPERSON: Want to do fifteen
21 minutes? Okay.

22 [Recess taken from

23 9:52 until 10:10 a.m.]

24 GRAND JURY FOREPERSON: All members of the grand
25 jury are back and ready to proceed.

26 **EXAMINATION CONTINUED**

1 BY MR. NOEL:

2 Q. Just a few more questions for you, Mr. Bitle.
3 When you did this test, what was your position with the
4 lab?

5 A. I think Tech 2. That's the thing because I
6 don't remember what I was at that point.

7 Q. The people down in the distribution list on the
8 far bottom corner, who are those people?

9 A. Ed Elliott was a mechanical engineer that was my
10 direct supervisor. Carl Paquin was his boss. He was a
11 mechanical engineer also. (WITNESS #17) was our client,
12 and CB Scott -- Brian Scott was the head of our whole
13 section of mechanical testing, physical testing.

14 Q. Okay. And then over here on the right side of
15 the first page of your report --

16 A. My signature and Ed Elliott's signature.

17 Q. Okay. So whose signature is under "approved"?

18 A. That's Ed Elliott.

19 Q. Okay. And yours is "tested by"?

20 A. And tested by.

21 Q. So your report was approved by --

22 A. Ed Elliott.

23 Q. -- Mr. Elliott.

24 A. Ed. Only I may be wrong. It went to the --
25 only to the first tier when it was just a lab report.

26 Q. Describe the level of supervision you were

1 receiving at that time from the engineers?

2 A. They gave me the test and they corrected
3 anything on my test report that they saw as incorrect.

4 Q. Corrected how?

5 A. They did not change the results, the loads, and
6 so forth but on how it was presented usually.

7 Q. Okay. How would you know that they corrected
8 things on your reports?

9 A. Red ink.

10 Q. The dreaded red ink?

11 A. It looked like someone bled on my report.

12 Q. So your original draft of your report would have
13 gone to your supervisor Mr. Elliott?

14 A. Yes.

15 Q. He would have reviewed it, red penned it, given
16 it back to you. And ultimately this would have been the
17 final copy after he had approved everything?

18 A. Yes.

19 Q. Okay. So I know it's been 30, 40 years almost
20 since you reviewed this, thirty-two years since this
21 report, but you'd indicated that, you know, now that
22 you're reviewing it in hindsight that there's some issues
23 that you had with your report; is that correct?

24 A. Yes.

25 Q. And what are those issues?

26 A. One of the issues I had on the drawings they --

1 they referenced the 30,000 pounds to ASTM standard.

2 A-576, I think. There we go. Okay. ASTM.

3 Q. We're looking at the Anderson Electric
4 Corporation drawings.

5 A. Okay. I'm -- what does it say?

6 Q. It looks like it says "ASTM." And this is for
7 the item one, HB30, the hook ball galvanized steel,
8 30,000 --

9 A. Oh, hold on a minute. That is a different --
10 forged steel is different. So that's another error.

11 Q. Okay.

12 A. That may not have been an Anderson, and it may
13 have been an Anderson. So now I have to --

14 Thank you for bringing that to my attention.
15 Because they also said 30,000 pounds. So that's really
16 got me confused now.

17 Q. Okay.

18 A. That's very interesting.

19 Q. So it says right here under material "Galvanized
20 forged steel." Well, let me ask you.

21 A. Yes.

22 Q. Make sure I'm getting this right because I'm
23 assuming. "G-A-L-V.forged steel."

24 A. Yes.

25 Q. And that would mean what?

26 A. I will try to explain. Oh, this is going to be

1 fun. Okay. As you see, the Ohio Brass drawing says
2 30,000 K, which is the hook. It says "30,000 pounds
3 referenced to ASTM 8576." And 8576 references to the
4 material test being ductile iron, not steel.

5 Does that clarify?

6 Q. What is the difference?

7 A. Steel is steel. Iron is iron.

8 Q. Okay.

9 A. And I would have to be a metallurgist to break
10 that down for you. I'm not.

11 Q. Okay. So the Ohio Brass identifies this as
12 what?

13 A. As reference to 8576 --

14 Q. Okay.

15 A. -- on the ASTM standard. That would be
16 different than ductile iron. It would be -- I guess
17 because they said steel, that it would be steel. I'm not
18 sure at this point.

19 Q. Okay.

20 A. I would have to look up "A" whatever.

21 Q. The 8576.

22 A. A2 -- I can't even see it. That's me.

23 Q. You're back on the Anderson page?

24 A. Anderson page.

25 Q. Now, the Anderson page under material "GLV,"
26 that would stand for galvanized; right?

1 A. Right.

2 Q. So it lists this as galvanized forged steel?

3 A. Right.

4 Q. And you're talking about the column that says
5 "SPEC.NO."?

6 A. Yes.

7 Q. SPEC --

8 A. I'm sorry. I was reading the whole thing.

9 Q. I guess that's spec number?

10 A. Spec number, yes. Spec number, correct.

11 Q. And underneath you're trying to read it says
12 "ASTM." It looks like "4-272-64."

13 A. It looks like --

14 Can you please enlarge that.

15 Q. I'm not sure it's going to make any -- oops.

16 GRAND JUROR NUMBER SEVENTEEN: Oh, better.

17 THE WITNESS: It looks like 273.

18 BY MR. NOEL:

19 Q. Okay. 273.

20 A. I'm unsure about the four or eight. But looking
21 at the "AS" here, it looks like the ASTM is the same
22 typo. I don't know.

23 Q. Okay.

24 A. It could be four. It could be eight.

25 Q. What different would it make?

26 A. It would be steel instead of iron. It would be

1 steel instead of iron.

2 Q. So what difference would that make in your
3 testing?

4 A. We would have to go back to strength of
5 materials.

6 Q. Okay. And is that the ultimate strength in
7 pounds?

8 A. Per square inch according to ASTM. ASTM is the
9 standard that tests the material the product was made out
10 of. The product is what we had that we pulled in
11 tension.

12 Q. Okay. So how would that affect the results of
13 your testing or analysis and the results of your testing?

14 A. They would be different.

15 Q. Okay. Any other issues that you have with your
16 report?

17 A. That's a major one right there. That would be
18 the most important one. I don't know.

19 Did I speak to you of another that I had
20 uncertainty about? I don't remember. Did I yesterday?

21 Q. The only other one you brought up to me
22 yesterday is that you used the term J-hook instead of
23 C-hook.

24 A. That's it. That would be the other item.

25 Q. Okay. So in hindsight there's some things that
26 you believe were mistakes in your report; correct?

1 A. Yes.

2 Q. But yet your report was reviewed by the
3 engineer, the mechanical engineer Mr. Elliott?

4 A. Yes.

5 Q. And signed off on by the engineer?

6 A. By Ed Elliot.

7 Q. And finally, the last section of your written
8 narrative report is the recommendation; correct?

9 A. Yes.

10 Q. Now, what was your recommendation based upon the
11 testing that you did?

12 A. That we test new hooks.

13 Q. Did that ever occur?

14 A. Not from me.

15 MR. NOEL: That's all I have, Your Honor or
16 Madam Foreperson. It's funny how the old habits come
17 back in.

18 GRAND JURY FOREPERSON: Yes.

19 Does anyone have any questions?

20 MR. NOEL: All right. Mr. Bittle, the jurors
21 have some questions for you.

22 BY MR. NOEL:

23 Q. "Exhibit 380 shows a recommendation that a
24 random sampling of J-hooks and attachment eyes failure as
25 well below manufacturer's ratings even to equipment with
26 no visible damage. Was such random sampling done?"

1 A. I don't understand that at all.

2 Q. Well, your recommendation we just talked about
3 was that there be further testing on a random sampling of
4 J-hooks.

5 A. That I can -- yes. Okay.

6 Q. And the juror's question was: Was such random
7 sampling ever done?

8 A. Not by me.

9 Q. In your professional opinion would a failure
10 rate from such random testing be significant enough to
11 require general testing and recall of such equipment
12 currently in service in PG&E systems?

13 A. Let's go to the professional opinion first. At
14 that point, I was the last thing to a professional there
15 was. I was the tester. I broke the part and the
16 engineers decided whether and the client, who had a lot
17 better grasp on things than me, would decide whether more
18 samples needed to be tested. I can only recommend.

19 Q. Your recommendation was to do additional
20 testing?

21 A. Yes.

22 MR. NOEL: Anything further?

23 Madam Foreperson will have an admonition for
24 you.

25 GRAND JURY FOREPERSON: Okay. Mr. Bittle, can
26 you hear me?

1 THE WITNESS: Yes. I'm going to get closer to
2 make sure.

3 GRAND JURY FOREPERSON: Okay. Okay. Mr. Bitle,
4 you are admonished not to discuss or disclose at any time
5 outside of this jury room the questions that have been
6 asked of you or your answers until authorized by the
7 grand jury or the Court. A violation of these
8 instructions on your part may be the basis for a charge
9 against you of contempt of court. This does not preclude
10 you from discussing your legal rights with your own
11 attorney.

12 THE WITNESS: Question on that. That means
13 everything that we discussed here today I can talk to my
14 attorney about?

15 GRAND JURY FOREPERSON: Yes.

16 THE WITNESS: Okay.

17 GRAND JURY FOREPERSON: Mr. Bitle, what I have
18 just said is a warning not to discuss this case with
19 anyone except the Court, your lawyer, or the district
20 attorney.

21 Do you understand?

22 THE WITNESS: Yes, totally.

23 GRAND JURY FOREPERSON: Okay. Thank you. Thank
24 you for your time today.

25 MR. NOEL: All right. You're done. Thank you.

26 Next up will be David Hernandez.

1 [Mr. Bittle exits the courtroom and

2 Mr. Hernandez enters the courtroom.]

3 GRAND JURY FOREPERSON: Mr. Hernandez, before
4 you have a seat, would you please raise your right hand
5 and be sworn.

6 Mr. Hernandez, do you solely swear that the
7 evidence you shall give in this matter pending before the
8 grand jury shall be the truth, the whole truth, and
9 nothing but the truth so help you God?

10 THE WITNESS: I do.

11 GRAND JURY FOREPERSON: Thank you. Have a seat,
12 please.

13 MR. NOEL: Extras. Thank you.

14 **EXAMINATION**

15 BY MR. NOEL:

16 Q. Mr. Hernandez, could you state your full name
17 and spell your last name for the record, please.

18 A. David A. Hernandez, H-e-r-n-a-n-d-e-z.

19 Q. Mr. Hernandez, are you employed?

20 A. Yes, I am.

21 Q. By whom are you employed?

22 A. Pacific Gas & Electric.

23 Q. And what capacity are you employed by Pacific
24 Gas & Electric?

25 A. I am the senior employee evaluator. Senior
26 employee evaluator.

1 Q. What is a senior employee evaluator?

2 A. There's a group of journeymen subject matter
3 experts, and we go to all the different yards like
4 Oroville, Buellton. And we do evaluations of our
5 employees' safety and work procedures to make sure that
6 they are following not only safe work practices but have
7 a good understanding of the project that needs to be
8 performed.

9 Q. How long have you been in that position?

10 A. Since March of this year.

11 Q. So about four months?

12 A. Correct.

13 Q. What was your position prior to becoming a
14 senior employee evaluator?

15 A. I was a Bay Area transmission supervisor for the
16 Bay Area. That consists of everything from Vallejo over
17 the Pakinus (phonetic) Pass all the way to Moss landing.
18 I covered everything in Oakland, Richmond, San Francisco,
19 and I covered all the way out to Tracy.

20 Q. When you say you covered, what do you mean?

21 A. My responsibilities, my circuits. There was 318
22 circuits and 8,000 megawatts of power. I handled all the
23 maintenance and any type of emergency repairs that needed
24 to be done.

25 Q. How long have you been with PG&E?

26 A. It'll be -- it's going to be seven years now.

1 Going on seven years.

2 Q. Now, since your title -- your current title is
3 senior, I'm guessing you have some experience prior to
4 coming to PG&E?

5 A. I have over 39 years in the -- 38 years in the
6 industry.

7 Q. Which industry?

8 A. Say again.

9 Q. Which industry?

10 A. The utility industry.

11 Q. Where did you work before you worked for PG&E?

12 A. I worked for Florida Power and Light. When I
13 got out of the Marine Corps in 1981, I worked there for
14 21 years and then went into the private sector working
15 for utility contractors via helicopter.

16 Q. Now, you were telling me yesterday that you were
17 part of a specialized group working on helicopters. Do
18 you want to explain that to the jury.

19 A. I'm an instructor and I also worked for
20 helicopter contractors that work on the energized power
21 lines while they're still up in the air. We would
22 energize the helicopter and ourselves to the same
23 voltage. We would get off the helicopter onto the wire
24 and we would do -- perform our job functions if need to.

25 Q. What type of transmission lines are we talking
26 about here?

1 A. From 500,000 to 765,000 volts.

2 Q. So the big lines. You would fly up to those
3 lines in a helicopter and then get off the helicopter
4 onto the line?

5 A. Yes, Sir. Transfer.

6 Q. Can you just -- this is interesting. Could you
7 just explain to us how that is done.

8 A. Carefully. Basically, we would -- we'd be
9 called to perform emergency maintenance whether it's a
10 gunshot or -- without getting into too much of the
11 details, you know, just maintenance. Or also we would
12 come and do quality inspections of the lines. And the
13 only way to deliver us was in a bucket if it's
14 inaccessible, and we would use the helicopter.

15 And so we would do that, gunshots. We would
16 help fix, you know, gunshots on the conductor and things
17 like that too if needed.

18 Q. I'm guessing that to step off a helicopter onto
19 a 500 kV transmission line you need some specialized
20 equipment?

21 A. You need -- yes. You need to have good
22 situational awareness. You have to have a good
23 understanding of your duties, of what is expected, and
24 most of all safety to not turn that into a carnival show.

25 Q. Did you have specialized clothing and equipment
26 to use?

1 A. Right. We would wear what's called a Faraday
2 suit. It's actually a steel mesh suit with socks and
3 boots. We would put it on over our clothes. And that
4 way we'd become energized at the same potential of that
5 circuit. So I become like a bird on a wire. I become
6 500,000 volts or 765.

7 Q. All right. Let's get back to your employment
8 with PG&E. When you came to work for PG&E in 2013, what
9 did you do?

10 A. Hired on for PG&E I was the emergency night
11 supervisor. I took care of all the emergencies, hazards
12 that would happen at night. I would be the one to go out
13 there to respond along with one of our troublemen who's
14 out there. And if there's a fatality, a car accident, a
15 pole got hit late at night, I was the first responder
16 just like I was a first responder at the Napa earthquake
17 that morning. So I would respond to emergencies.

18 I had the -- what they call the Diablo Division.
19 And the Diablo Division of PG&E was basically Concord and
20 Antioch. And that was part of the Bay area region. And
21 that would encompass Oakland, Richmond, Napa, and Marin
22 for North Bay.

23 Q. When did you become a transmission line
24 supervisor?

25 A. 2017. I can't remember the exact date, but it
26 was either September or -- it was probably more likely

1 September of 2017.

2 Q. And as the T-line supervisor, were you
3 supervising the troublemen in the East Bay?

4 A. That's correct.

5 Q. And who else were you supervising?

6 A. I had my immediate reports which was three
7 linemen, a foreman, five troublemen. I was -- the
8 engineering department, the environmentalists, veg
9 management. Everybody would fall underneath my area of
10 responsibility.

11 Q. Now, in 2018 were your crews tasked to do some
12 work on an East Bay line known as the Parkway-Moraga
13 line?

14 A. Correct. It was a Parkway-Moraga 230 suspension
15 where the conductor is hanging down the tower. It
16 actually goes across the 24. So as you go through the --
17 before you go through the Caldecott, just to get you guys
18 familiar with the area, it's that last circuit that goes
19 over the top before you enter into the tunnel.

20 Q. What kind of work was your crew doing on that
21 line?

22 A. The immediate work was to change out insulators
23 on that tower on that Parkway-Moraga 230 -- 230,000 volt
24 line.

25 Q. Okay. Let's back it up. We're not just talking
26 about the one tower. We're going to talk about in a

1 minute.

2 Was your crew doing a bigger overall project on
3 the Parkway-Moraga line?

4 A. We had a landslide that affected two towers down
5 from that location, and it was during our heavy peak
6 rainy session at that time. And the tower foundation's
7 mountain gave away and it gave a landslide. So that
8 tower started to drift down. So we immediately made
9 corrections on that tower and then -- but that's what we
10 were out there for is for that immediate project.

11 Q. Did you have to de-energized the Parkway-Moraga
12 line?

13 A. Yes, we did.

14 Q. While the line was de-energized, did you conduct
15 inspections or have your crew conduct inspections of the
16 rest of the line?

17 A. What we had was we had a -- what we call a work
18 tracker that tracks all the different towers that we have
19 inspected. And this one project was due to be done to
20 change out these insulators. So what I did is I pulled
21 the work forward since we had all the -- the land part.
22 You know. There's a lot that goes on to get up into
23 these hills. There's a lot of rock that is brought in, a
24 lot of environmental recovery, you know, whether it's hay
25 bales or whatever. But we had a lot of work there. So
26 when I pulled the work up to change out, that's when I

1 worked on this line in question.

2 Q. Okay.

3 A. This tower in question.

4 Q. In your experience in almost 40 years in
5 utilities, when you have problems like you had on the
6 Parkway-Moraga where you have the couple of towers that
7 slide, is it common to go around and inspect the other
8 towers surrounding that?

9 A. Yes, yes. If we had an event like this, me -- I
10 can only speak for myself personally. But we would check
11 adjacent structures to make sure that the engineering
12 hasn't been changed, let's say, to different load
13 calculations and maybe finding something else. So
14 typically in our tailboards we always -- and I insure
15 that of my employees to always check adjacent structures.

16 Q. Also in your experiences is it common when a
17 line has to be shut down for some reason to take
18 advantage of that to do other inspections and maintenance
19 on the line?

20 A. Within the scope of the tower that slid we
21 changed out the additional two sides. And then this was
22 like the last one going to the -- going across the road.
23 So we would check the adjacent structures.

24 Q. You said that you were changing out the
25 insulators on the surrounding structures; correct?

26 A. Yes, Sir.

1 Q. And those insulators had been flashed?

2 A. No, Sir.

3 Q. Were they shot?

4 A. No, Sir.

5 Q. Were they cracked?

6 A. No, Sir.

7 Q. Why were you changing out the insulators?

8 A. Well, we change insulators just because they
9 were due to be changed out. They were there. I wanted
10 to make sure we put everything new back up there. And I
11 had this job already in the queue to work on another date.
12 But there was no immediate hazards with those insulators.
13 We just changed them out for routine maintenance.

14 Q. When you say that those insulators were due to
15 be replaced, why were they due?

16 A. PG&E makes an effort to try to update as much
17 hardware and equipment that they can. And that was just
18 one that was there. It was due to change out. There's a
19 lot more than just the age of the insulators and other
20 things like that. So we were there and I had all of that
21 matting roadwork done up on the hill. So I just wanted
22 to get done with that one also.

23 Q. Have you heard the term "If it's brown, take it
24 down"?

25 A. Yes.

26 Q. So what does that refer to?

1 A. That's that we are changing out as many brown
2 insulators as we can just to bring them -- get new
3 insulators put up in the air.

4 Q. What is the significance to the brown on the
5 insulators?

6 A. It's just the way the manufacturer made them
7 years ago. They used brown porcelain. You'll see towers
8 with clear or you'll see them as a white, but they're
9 actually a light gray. And then you will see some brown
10 insulators.

11 Q. So brown means they are old?

12 A. Pretty much.

13 Q. And if they're old, they need to be replaced?

14 A. In time, yes, they will need to be replaced.

15 Q. And so on the -- on the line that you were
16 working on, the Parkway-Moraga had brown insulators. And
17 so you had made a determination that those insulators
18 needed to be replaced; is that correct?

19 A. It was in the que to get done. They were brown
20 so we changed them out.

21 Q. Perfect. Do you know the age of the
22 Parkway-Morga line by chance?

23 A. No, I don't.

24 Q. So in the course of changing out the insulators,
25 did your crews bring something to your attention?

26 A. Right. My foreman -- after he changed out the

1 insulators, he called me and said the yoke plates looked
2 like they were a little worn. I said "Let's get them
3 changed out and get everything changed out on that and go
4 ahead -- I'm going to send those off to --

5 I didn't speak to the gentleman. ATS did our
6 training facility to do analysis on the steel and the
7 wear on them. And so I initiated a CAP report that I
8 think all of you may know.

9 Q. Okay. Let's walk back and break that down now.

10 MR. NOEL: Remember, hearsay can't be considered
11 for the truth of the matter. So what the foreman is
12 telling him -- telling Mr. Hernandez is hearsay. You
13 can't consider that as the truth, but you can consider
14 what Mr. Hernandez felt and what Mr. Hernandez saw.

15 BY MR. NOEL:

16 Q. So let's back this up. Your foreman calls you
17 and says something to the effect of "There's a problem
18 with the yoke plates"?

19 A. They look worn, yes.

20 Q. Okay. And so did you ask the foreman to remove
21 those yoke plates?

22 A. Yes.

23 Q. And did you ask the foreman to preserve those
24 yoke plates for you?

25 A. Yes.

26 Q. And did the foreman bring you yoke plates?

1 A. Yes.

2 Q. Now, what are the yoke plates?

3 A. The yoke plates are the plates that attach to
4 the end of the arm. So if you're looking at the tower as
5 it comes to a peak, the yoke plates fit in between them.
6 They are bolted in. And that is where the suspension
7 bells hang from.

8 Q. So they have a hole -- the yoke plate has a hole
9 in it for the hooks?

10 A. Yes.

11 Q. Okay. So you said you initiated a CAP; is that
12 correct?

13 A. Yes, Sir.

14 Q. And what is a CAP?

15 A. That is Corrective Action Program.

16 Q. All right. You have in front of you -- I forgot
17 to mark it on mine -- I believe what should be 381.

18 Exhibit 381. Do you see that exhibit?

19 A. Yes.

20 Q. And do you recognize that document?

21 A. Yes.

22 Q. And what is that document?

23 A. It's a CAP report.

24 Q. Is this the CAP report you initiated based upon
25 the yoke plates on the Parkway-Morga line?

26 A. Yes.

1 Q. Explain to us how to read this. And you can use
2 the big board where it's displayed.

3 A. Well, on first thought you have to fill out a
4 CAP report when you send things to the testing facility.
5 So in this discretion here back in March 28th when I did
6 the job, I initiated a CAP report to have the -- the
7 steel tested to see if there's a -- get more information
8 about the steel that I replaced.

9 Q. Okay. Go ahead. You can explain to us how to
10 read this.

11 This is something that you wrote; correct?

12 A. Correct.

13 Q. All right. So explain to us -- can you explain
14 to us how to read it.

15 A. So basically, I submitted a CAP report and I
16 also mentioned some other things that we have up there
17 like mud events, asking for equipment on short notice.
18 It's one of those lines -- 230 line that I want to be
19 prepared in case we have another event up there to
20 respond to.

21 Then on the -- on March 9th it went to Forest
22 Aneo (phonetic), and he submitted it to make the CAP
23 request more of a local event. And that's his
24 recommendation.

25 And the CAP was to be -- I went out there. I
26 inspected the plates on the other tower that crosses

1 the 24. That one had not the same tension because it was
2 a 400-foot -- minimum 400-foot drop from the tower that I
3 replaced down so that there wasn't that much down
4 pressure on that tower. Most of the pressure was on the
5 tower that I replaced the --

6 So I went out there just to double-check myself
7 and inspected it. And with that I waited for the CAP
8 report to come back. So I saw there was no hazard or
9 immediate hazard so I continued to wait for the program
10 to take its course.

11 They had a small delay on testing my evaluation
12 so they moved the date back to June 29th in order to
13 accommodate ATS to give me time to get me the report back
14 on the steel.

15 On June 22nd I got a tentative report that was
16 put into the CAP report that the life of the plates were
17 calculated to be another 28 to 25 years depending on load
18 and that those plates would have -- would have managed
19 for another 25 years with 4,000 pounds of pressure down
20 on them.

21 The wear of that is because of wind in that
22 crossing right there going back and forth over a period
23 every day for -- I'm not sure how many years since it was
24 installed. It appears to be within -- when I read the
25 report, I felt that there was no other follow up. We
26 already had changed out the other towers.

1 And so we changed out the other towers, and I
2 didn't see any immediate issues to move further. And of
3 the five towers I was planning on inspecting in large
4 scale was already included in the three to four towers.
5 So that covered the five towers plus the one I inspected
6 and replaced.

7 I inspected similar towers. I found no wear on
8 those and there was no further actions needed on that.
9 And the issue had been evaluated so I saw no more issue.
10 So I closed the CAP report.

11 Q. Okay. And you're on page 2 of 6 in your CAP
12 report?

13 A. On the next page.

14 Q. All right. Now, let's move on to 3 of 6. What
15 is 3 of 6 in the CAP report?

16 A. Three of six. You want to show me three of six?

17 Q. Yeah. See that. You should be down in the
18 bottom of the page. It says page 3 of 6.

19 A. From Franklin Lou?

20 Q. What is this page is basically what --

21 A. Let me see if I can find it. "ATS reports the
22 insulators from the 230 Parkway-Moraga structure and
23 three from Bahia-Moraga 230 transfer line is completed.
24 ATS reports the wear attributed to wind-driven swing, as
25 I mentioned earlier. And in the most severe worn plates
26 the thickness of the load-bearing ligament measurement,"

1 without getting into the numbers there, "design value of
2 .75. Plates believed to be stalled in 1946."

3 So these plates had a wear rate estimated of
4 remaining life in design calculations of -- I said
5 earlier -- another 25 years.

6 Q. Right. So this is your summary of the report
7 that you were provided by ATS?

8 A. That is the summary from Dan Tilly. On the next
9 page if you go back to the next page on 621.

10 Q. Okay.

11 A. He does our analysis. His name is on the very
12 bottom.

13 Q. Oh, okay.

14 A. You see him right down there?

15 Q. Yes. Dan Tilly.

16 A. Dan Tilly is very, very thorough. And I really
17 enjoy working with him on his recommendations and his
18 thought process when he did the factual -- not hearsay
19 but factual analysis of the plates.

20 Q. Okay. And then on to page 4 of 6. There's a
21 photograph in the top corner.

22 A. Right. That's the wear on that yoke plate. The
23 picture that is shown there is the wear on the yoke
24 plate.

25 Q. Are you familiar with the term "keyholing"?

26 A. Yes.

1 Q. And is that a description of the wear you saw?

2 A. That is definitely keyholing.

3 Q. And then page 5 of 6.

4 A. Five of six is the tower that I was working on.

5 Q. All right. Describe how to find the tower on
6 page 5 of 6.

7 A. It's in the middle there. There is -- you can't
8 see it. But if you actually look at the paper, in dark
9 letters you'll see the tower number in black with the
10 tower number right there (indicating). And that gives
11 you proximity of the tower.

12 Q. And are you referring to a Goggle Map or some
13 type of satellite?

14 A. That's what we have is an app that's called Map
15 Plus. It's an app that we have at PG&E. It's a great
16 app. It shows you -- if you go down even to lat lines to
17 where a transformer might be or the transmission, it
18 shows the line segment on our app. It's called Map Plus,
19 not Goggle Map.

20 Q. There's a blue circle and then there's kind of a
21 blue balloon. What do those represent?

22 A. That blue balloon I have no idea what that
23 balloon is. The dot is the location of maybe a -- of a
24 unit where you're parked at to that tower or where your
25 GPS location is.

26 Q. Okay. And then there's a red -- what looks like

1 a hand-drawn red circle or oval.

2 A. I have no idea who drew that red circle in
3 there.

4 Q. Okay. All right. Finally on page 6 of 6.

5 A. Yes, Sir.

6 Q. What are we looking at?

7 A. We're looking at three plates on the three
8 conductors, three phases going across. And that's the
9 finding on them. They all three were sent to get tested.

10 Q. So you sent those off to be tested, like you
11 said, to ATS?

12 A. Yes, Sir.

13 Q. And eventually you said you received a report
14 from ATS?

15 A. Yes, Sir.

16 Q. Direct your attention to what's marked as
17 Exhibit 382.

18 A. Yes, Sir.

19 Q. Point of view. And ask you if you recognize the
20 document marked as 382.

21 A. That's the results, a more in-depth thorough
22 with all the documentation in there showing -- yes, this
23 is the document.

24 Q. Okay. So 382 is the report on the testing for
25 the yoke plates that you sent in?

26 A. Correct.

1 Q. Now, you said that several times that ATS
2 estimated the life on those yoke plates as 25 to
3 28 years?

4 A. Correct.

5 Q. And you said that the -- that's in addition --
6 25 to 28 years from when you submitted it; correct?

7 A. Correct.

8 Q. And you said that the -- they were estimated
9 installed in 1946?

10 A. Correct.

11 Q. So that would make them 72 years old?

12 A. Yes, Sir.

13 Q. Which would make the estimated life 97 to
14 100 years; correct?

15 A. That report is of the tower. When that tower
16 was installed does not mean that that tower was worked on
17 prior to that.

18 Q. Okay. But one of the assumptions that they make
19 is that that yoke plate had been installed and was an
20 original part that had been installed in 1946 and it had
21 been wearing since then; correct?

22 A. That is in the document, yes, Sir.

23 Q. And so based upon that assumption they estimate
24 that the life of those holes is between 97 and 100 years?

25 A. That's the assumption that was made, yes.

26 Q. Okay. Now, this report was issued in June of

1 2018; correct?

2 A. Correct.

3 Q. Are you aware of any action taken by PG&E after
4 this report based upon this report?

5 A. No, Sir.

6 Q. For instance, at that time as a T-line
7 supervisor were you instructed to identify the
8 90-plus-year-old lines in your district and your area and
9 inspect them?

10 A. No, Sir.

11 Q. To your knowledge, was any T-line region
12 instructed to do so?

13 A. I can't answer that. I don't have the
14 information, the factual information.

15 Q. Okay. But did you yourself take action on
16 the -- after receiving the report?

17 A. There was no need to follow up on it because I
18 had already made the corrective action to fix it.

19 Q. Okay. Did you inspect other towers in the area?

20 A. No, Sir.

21 Q. We're going back to page 2 of 6 in your CAP
22 report. In the entry 8/14/19 didn't you write "Inspected
23 similar towers, plates. No further action required"?

24 A. Correct.

25 Q. All right. So that -- after the report came
26 out, you went back and did some additional inspections?

1 A. Just to make sure I closed everything, that
2 anything hadn't changed before I close this issue out.

3 Sorry about that, Guys.

4 MR. NOEL: That's okay.

5 All right. I believe that's all I have.

6 Jurors have any questions for this witness? I'm
7 not seeing any hands or any notepaper made into paper
8 airplanes flying at me.

9 So, Mr. Hernandez, thank you very much. I
10 believe that's all we have for you today.

11 THE WITNESS: Thank you.

12 MR. NOEL: She will have an admonishment for
13 you.

14 THE WITNESS: Thank you.

15 MR. NOEL: Madam Foreperson.

16 THE WITNESS: Thank you.

17 And for you -- this is me personally. I lost my
18 home in Hurricane Andrew, and I feel -- this is me
19 talking personally. My heart goes out to everybody in
20 Butte County for what they went through so . . .

21 GRAND JUROR NUMBER FIFTEEN: Thank you.

22 GRAND JURY FOREPERSON: Mr. Hernandez, before
23 you leave, I need to read the admonishment to you.

24 You are admonished not to discuss or disclose at
25 any time outside of this jury room the questions that
26 have been asked of you or your answers until authorized

1 by this grand jury or the Court. A violation of these
2 instructions on your part may be the basis for a charge
3 against you of contempt of court. This does not preclude
4 you from discussing your legal rights with your own
5 attorney.

6 Mr. Hernandez, what I have just said is a
7 warning not to discuss this case with anyone except the
8 Court, your lawyer, or the district attorney.

9 Do you understand?

10 THE WITNESS: Yes, Ma'am.

11 GRAND JURY FOREPERSON: Okay. Thank you very
12 much for coming in today.

13 THE WITNESS: Thank you.

14 MR. NOEL: You have to leave those up there.
15 Believe me, we've already had somebody walk off with the
16 exhibits. We had to chase them down.

17 Thank you, Sir.

18 [Mr. Hernandez exits the courtroom and

19 Captain Tom Kluge enters the courtroom.

20 GRAND JURY FOREPERSON: You've been here before.
21 I'm going to swear you in again if you don't mind.

22 It's Kluge?

23 THE WITNESS: Yes, Ma'am.

24 GRAND JURY FOREPERSON: Okay. Captain?

25 THE WITNESS: Yes, Ma'am.

26 GRAND JURY FOREPERSON: Thank you.

1 Captain Kluge, please raise your right hand.

2 You do solemnly swear that the evidence you
3 shall give in this matter pending before the grand jury
4 shall be the truth, the whole truth, and nothing but the
5 truth so help you God?

6 THE WITNESS: It will be.

7 GRAND JURY FOREPERSON: Thank you. Have a seat,
8 please.

9 MR. NOEL: Ready?

10 **EXAMINATION**

11 BY MR. NOEL:

12 Q. Captain, again for the record can you state your
13 full name spelling your last name.

14 A. Thomas Kluge, K-l-u-g-e.

15 Q. Remind us what you do for a living.

16 A. I'm a fire captain specialist for the Butte Unit
17 with Cal Fire as an investigator.

18 Q. You're a peace officer; correct?

19 A. I am a peace officer.

20 Q. When we last heard from you way back in April,
21 we talked about the origin and cause investigation of the
22 Camp Fire.

23 A. Yes.

24 Q. Did your job stop with the origin and cause
25 investigation?

26 A. No, it did not.

1 Q. So after you left and after you turned over the
2 scene to 27/222, what did you do?

3 A. To complete my origin and cause investigation I
4 wanted to find out what events lead up to the failure of
5 the equipment of tower 27/222. As part of my original
6 investigation I requested a bunch of information from
7 PG&E. And they provided information that helped lead me
8 to understand that there may be other issues along that
9 same power line, the Caribou-Palermo line.

10 Q. All right. So let's walk through your
11 investigation starting in mid November.

12 You have in front of you Exhibit Number 383. Do
13 you recognize the exhibit? It's a two-page exhibit. I
14 guess it didn't get stapled together.

15 A. Yeah, I recognize this.

16 Q. What is Exhibit 383?

17 A. This is a submission from PG&E to California
18 Public Utilities Commission regarding the fire that
19 occurred on November 8th, the Camp Fire.

20 Q. Why is the submission from PG&E to the CPUC
21 significant to you?

22 A. This identified that at or around the time the
23 fire started the Caribou-Palermo line sustained an
24 outage.

25 Q. What do you understand an outage to mean?

26 A. That they had an event that occurred on their

1 line that resulted in a loss of power to their line.

2 Q. Let's paperclip these together for right now.

3 A. Okay.

4 Q. Why is this outage significant?

5 A. The outage would have been an expected result of
6 the failure of equipment and the discharge that we
7 believe occurred at the Caribou-Palermo line at the
8 27/222 tower.

9 Q. And what time did PG&E file an indication that
10 that occurred?

11 A. At 6:15 hours on November 8, 2018.

12 Q. At what time is the fire first reported?

13 A. The fire was first reported at 6:28 a.m., 6:29.
14 I'd have to refer to the exact call log to verify.

15 Q. So later did you become aware that PG&E had
16 filed a report on the incident with the California Public
17 Utilities Commission?

18 A. Aside from this report?

19 Q. Yes.

20 A. Yes.

21 Q. And were you able to obtain a copy of that
22 report?

23 A. Yes, I was.

24 Q. And how did you obtain said report?

25 A. It was available on the Internet. I saw it in
26 the news and was able to track it down that way.

1 Q. So directing your attention to Exhibit 384.

2 A. Two pages.

3 Q. Two pages. And let's paperclip them together
4 because somehow they're not stapled.

5 A. Okay. They are paperclipped.

6 Q. What is Exhibit 384?

7 A. This is a December 11th submission from PG&E to
8 the Public Utilities Commission regarding an electric --
9 excuse me, a -- let me look up exactly what that means.
10 Double-check. It's an electrical incident report. Yeah.
11 So this is their report on what they believed happened at
12 the Caribou-Palermo 27/222 tower.

13 Q. Okay. Why is this report significant?

14 A. This report basically says that PG&E was aware
15 that there was an outage. They understood that there was
16 a failure at the 27/222 tower. They were able to find
17 and get specific documentation identifying the specific
18 failure.

19 Q. The report also states that after the failure at
20 6:15 a.m. the line was then de-energized; correct?

21 A. Yes.

22 Q. So that would indicate that the line was
23 energized at the time of 6:15 a.m.?

24 A. Yes.

25 Q. And going back to your first time on the stand
26 when we talked about the origin and cause, it was your

1 opinion based upon everything that you saw that the line
2 was energized when the C-hook broke and the jumper made
3 contact with the steel structure; correct?

4 A. Yes. There's evidence that there was an
5 electrical discharge phase to ground. And that was also
6 reported to me from Jim Nolt who verified that
7 information.

8 Q. And then going on to the second page of the
9 report, the PG&E report also acknowledges a second fire;
10 correct?

11 A. Yes.

12 Q. And what does PG&E say about the second fire?

13 A. Four customers on Flea Mountain were affected by
14 the distribution outage of the Big Bend 110112 kV
15 circuit.

16 Q. What time did that circuit experience a problem
17 according to the PG&E report?

18 A. Approximately 6:45 a.m. on November 8th, 2018.

19 Q. So beginning in -- well, walk us through your
20 investigation once you finished physically up at the site
21 of 27/222.

22 A. Well, there's several things we were trying to
23 determine. One of them was as part of the investigation
24 we try and determine a timeline of how events occurred.
25 So we were able to review these reports, footage, data
26 from the reclosers. We were able to review data from

1 Smart Meters that were affected by the outages.

2 And one thing we tried to determine was, you
3 know, which fire had occurred first and then whether or
4 not they were related to each other and if one was a
5 cause of the other or if they're individual separate
6 starts.

7 Q. Did you also do an investigation into the
8 Caribou-Palermo line itself and specifically 27/222?

9 A. I did.

10 Q. What type of investigation?

11 A. It was -- I was trying to identify and help
12 understand the parts that we observed on the tower, the
13 equipment, what they were, when they got there, what was
14 their purpose, what was their function, how long had they
15 been there, when were they designed? Just trying to
16 figure out as much history back to basically the building
17 of the line and why it was built and what allowed it to
18 be built and what -- what patents were developed in order
19 for this even to be possible.

20 Q. As a fire captain specialist and a peace officer
21 for Cal Fire, prior to November 8, 2018, had you
22 investigated fires potentially caused by PG&E equipment?

23 A. I have.

24 Q. On how many occasions?

25 A. To be specific I would have to look back but
26 more than a dozen at least.

1 Q. During the course of these -- of those previous
2 investigations, have you become familiar with the
3 regulations and requirements on PG&E as a utility?

4 A. Yes.

5 Q. And specifically the CPUC and the Public
6 Resources Codes control PG&E and how they maintain and
7 repair their equipment?

8 A. Yes. Before the fire, it was limited. I was
9 more understanding of the Public Resources Code which are
10 in line with the Public Utility Code.

11 Q. And in your investigation did you become
12 familiar with the CPUC requirements for PG&E for
13 maintaining the transition lines?

14 A. I did.

15 Q. Based upon those understandings, your prior
16 understanding of the Public Resources Code and your
17 learning about the Public Utilities Code and the
18 California Public Utilities Commission, did you request
19 certain types of records from PG&E?

20 A. I did.

21 Q. What types of records?

22 A. I was -- I requested all the maintenance that
23 had occurred on that line initially going back a few
24 years and eventually going back as far as they could
25 find. As more information came in we expanded our
26 request based on the information we received and the

1 first data received.

2 Q. Why did you want that information?

3 A. We were trying to establish the fact pattern
4 that led to the fire.

5 Q. Why is that important?

6 A. My job is to uncover all the truths about an
7 incident and provide a complete report. Any information
8 that is pertinent to a crime whether it can exonerate or
9 help define whether or not somebody is responsible needs
10 to be brought to light. An investigation works both
11 ways. Having all the information available to us at our
12 fingertips to read, analyze, and present is important to
13 a fair investigation.

14 Q. Are you familiar with the Exemplar Tower
15 Project?

16 A. I am.

17 Q. What is the Exemplar Tower Project?

18 A. The Exemplar Tower Project was a series of
19 towers similar in build and design to 27/222. There were
20 several towers that were identified as being potentially
21 built similar with the same schematics, same purpose.
22 And that is they're a transposition tower. And we wanted
23 to identify if this was a one-off incident or if there
24 was potential for another incident to occur similarly.

25 Q. When you say "identified as similar," identified
26 by whom?

1 A. There was a couple of investigators including
2 myself where we were identifying the towers. It was
3 myself and Nick Moore.

4 Q. You identified 27/222 as a transposition tower?

5 A. Yes.

6 Q. Included in the records that you requested from
7 PG&E did you get a listing of other transposition towers
8 on the Caribou-Palermo line?

9 A. I did along with every other tower on the line
10 as well.

11 Q. Okay. And were you, working together with
12 Investigator Moore, able to put together a map showing
13 the transposition towers similar to 27/222 or what
14 appeared to be similar to 27/222?

15 A. Yes, though it doesn't include every tower on
16 the line.

17 Q. Right. You have in front of you what is marked
18 as 385?

19 A. Yes.

20 Q. Do you recognize Exhibit 385?

21 A. I do.

22 Q. And what is Exhibit 385?

23 A. Exhibit 385 is a Google Earth image of the area
24 around the Camp Fire that includes pinpoints with numbers
25 that are representative of transposition towers on the
26 Caribou-Palermo line.

1 Q. So using PG&E's name and convention for the
2 towers?

3 A. Yes, it appears to be.

4 Q. So 20/160, 24/199, 27/222 and so forth?

5 A. Yes.

6 Q. So you put together a list of the similar
7 transposition towers of what you believed to be similar
8 transposition towers; correct?

9 A. Correct.

10 Q. And what action was taken on that list?

11 A. We made an initial flight to try to identify
12 some of these towers and take a look at them. Some of
13 them are pretty inaccessible especially under the
14 conditions -- the weather conditions we experienced this
15 past winter. So we were able to take a flight and
16 identify that there were other transposition lines or
17 transposition towers on the Caribou-Palermo line.

18 Q. Do you remember when that initial flight took
19 place?

20 A. I believe it was December 30th although I'd need
21 to check the flight log.

22 Q. In terms of scheduling flights and examinations
23 of the line, what kind of factors went into when you
24 could do those inspections?

25 A. There was a lot of factors. Availability.
26 Weather was probably our biggest obstacle. There are a

1 lot of ways to prevent a helicopter from flying. Also,
2 washed out roads made access very difficult. That's why
3 there was a bit of a delay getting out there initially.

4 Q. So you flew the line on December 30th?

5 A. Yes.

6 Q. And then subsequently Investigator Moore flew
7 and photographed the transposition towers; correct?

8 A. Correct. I attempted to photograph. However,
9 the camera I was using didn't have a stabilizing lens and
10 those pictures didn't come out with any decent resolution
11 that was helpful.

12 Q. So now I want to go to February 14th. When you
13 were up at 27/222, you testified previously about
14 removing all the hardware off of the tower. Remind us
15 what hardware you took.

16 A. The hardware I took were the -- was the
17 conductor, the conductor support bar, the insulator
18 strings which consisted of several insulator bells, the
19 insulator hooks or what was left of the hook, the support
20 arms, and the -- what we call the dead-end insulator arm
21 and hook or insulator string and hook as well.

22 Q. What was done with those items after they were
23 removed from 27/222?

24 A. They were taken to a storage facility, large
25 evidence storage and documented.

26 Q. And when you say "large evidence storage," I'm

1 guessing you're not talking about a storage facility or
2 public storage facility where anybody can rent?

3 A. No. This is an evidence storage facility. It's
4 under double lock and unavailable to the public.

5 Q. This is a Cal Fire evidence storage facility?

6 A. Yes, it is.

7 Q. On February 14th did you take the evidence out?

8 A. I did.

9 Q. Why?

10 A. We had a forensic photographing team available
11 to us from the F.B.I., and they were going to
12 forensically photograph all our evidence for us.

13 Q. Now, you should have in front of you
14 Exhibit 386.

15 A. I do.

16 Q. What's 386?

17 A. That appears to be a photograph of the -- what I
18 would call the left phase support arm bracket.

19 Q. And all of these photographs in this series are
20 off the 27/222; correct?

21 A. Oh, yes. Well, this one is so far, yes.

22 Q. All right. So the left phase would be the phase
23 upon which the hook failed; correct?

24 A. Yes.

25 Q. And 387?

26 A. I believe this is also the same bracket as

1 mentioned in 386 but a different angle.

2 Q. And 388.

3 A. Again, the same bracket as mentioned in 386 at a
4 different angle.

5 Q. And 389.

6 A. This is a picture of the same bracket, the same
7 wear just without the forensic scale.

8 Q. And 390.

9 A. This would be the same support arm from the left
10 phase of 27/222, but this would be the angle iron itself,
11 I believe. Yes. There is the support arm itself, not
12 the bracket on the support arm.

13 Q. Okay. So 386 through 389 -- or 386 through 388
14 are the -- what we were referring to as the retrofitted
15 bracket off the arm; correct?

16 A. Yes.

17 Q. And 389 is the actual original hole, the bracket
18 itself?

19 A. Yes. And the name of that bracket is an ST-20.

20 Q. How did you discover that?

21 A. The name of the bracket?

22 Q. Yes.

23 A. That was part of a schematic drawing we received
24 as one of our requests on the as-builts on how the towers
25 were placed in their original drawings they were
26 designed. It had all of the pieces of equipment

1 identified; the names, lengths, weights, descriptions.

2 Q. Did the as-built as far as the bracket, the
3 ST-20, indicate when that bracket was installed?

4 A. I don't have any indication when the bracket was
5 installed on this tower. There is no record that we
6 received saying that bracket was installed.

7 The original as-built didn't show that bracket
8 being part of the transposition support arm. It was only
9 designed -- as far as I could find in the material given
10 to me from PG&E through our request, that ST-20 was only
11 supposed to be used on the transposition overhead support
12 superstructure that we identified in the previous one.

13 Q. All right. All right. Exhibit 391. What's in
14 Exhibit 391?

15 A. Exhibit 391 is a photograph of the ST-20 bracket
16 from CP 27/222 from the left phase without a scale.

17 Q. And 392.

18 A. Exhibit 392 is the broken phase of the
19 suspension support hook or C-hook from the left phase of
20 CP 27/222 with a scale.

21 Q. So this is our broken hook?

22 A. Yes, it is.

23 Q. Was the other half of this hook ever found?

24 A. Not to my knowledge.

25 Q. What types of efforts were made at 27/222 to
26 find the other half of this hook?

1 A. The investigation team, including myself and the
2 other people identified previously, we used eyes, grid
3 search pattern, metal detectors, magnets over the course
4 of several days. Every time we were up there we were
5 looking for this piece of metal. We were unable to
6 locate it.

7 Q. And on to Exhibit 393. Tell us what Exhibit 393
8 is.

9 A. Exhibit 393 is the hook. And its in the bell
10 that we found it in. This was originally inverted
11 hanging from the conductor of CP 27/222. And this would
12 have been the left phase hook and the first bell.

13 Q. Exhibit 394. Do you have that photograph?

14 A. I do.

15 Q. What is 394?

16 A. Exhibit 394 is the right phase suspension hook
17 or insulator hook from CP 27/222.

18 Q. And what is significant about the hook in the
19 picture or Exhibit Number 394?

20 A. It has a significant wear pattern to it.

21 Q. And what do you mean by that?

22 A. There is a groove worn into the hook at the
23 contact point where it met the support hardware.

24 Q. Now, there's all kinds of -- this is a great
25 photograph. There's all kind of numbers that are visible
26 both on the hook and the bell.

1 A. Yes.

2 Q. Most obviously one RT zero with a slash through
3 it?

4 A. Phi.

5 Q. In black?

6 A. Yes.

7 Q. And do you know who wrote those numbers?

8 A. On this specific bell, yes. That was written --
9 placed on there by a PG&E employee although I'd have to
10 refer to the entry log to get the exact name.

11 Q. A PG&E employee when?

12 A. The moment it was collected before they turned
13 it over to me.

14 Q. All right. So after the fire?

15 A. Yeah. After the fire, yeah.

16 Q. During evidence collection around November 14th
17 or 15th?

18 A. Yeah. And it was under my direction to write it
19 on there.

20 Q. Right. What about the other writings and
21 numbers underneath?

22 A. The casting marks?

23 Q. Yes.

24 A. Yes. Those are -- that is patent information
25 and a category number.

26 Q. Since November have you had an opportunity to do

1 any research?

2 A. I have.

3 Q. What type of research?

4 A. I looked into patents and information from the
5 manufacturer of the equipment.

6 Q. Now, was the manufacturer of the equipment
7 listed on either the bells or the hooks?

8 A. There was stampings that identified -- it didn't
9 have exact names, but it had a company insignia.

10 Q. Were you able to identify the company insignia?

11 A. I was.

12 Q. And what did you determine the manufacturing
13 company to be?

14 A. The Ohio Brass Company.

15 Q. Is that for the hook or bells or both?

16 A. Both.

17 Q. How did you determine that?

18 A. Through an Internet search and then comparing
19 information from catalog -- original catalog information
20 from the Ohio Brass Company.

21 Q. Now, you said earlier that PG&E also provided
22 as-built information on the Caribou-Palermo line?

23 A. They did.

24 Q. And did that information also have reference to
25 equipment suppliers?

26 A. It did.

1 Q. And who did that information list as the
2 supplier of the hooks and the bells?

3 A. After we had already identified the potential
4 company, we received a data presentation from PG&E that
5 identified these specific type C-hooks that have the "B"
6 insignia on it, the raised "B" with no circle, as being
7 an Ohio Brass hook. And that particular schematic was
8 dated 1911.

9 Q. How about the bells? What were you able to find
10 out about the bells?

11 A. The bells I'd have to refer to that specific
12 schematic again. But the bells with the same design --

13 May I stand up?

14 Q. Sure, absolutely.

15 A. Am I loud enough that everybody can hear me?

16 Okay. So the specific shape of the bell end
17 here --

18 Let me stand over here so everybody can see.
19 The specific shape of the bell end helped me identify the
20 year that these bells were created. Also, the shape of
21 the clay casting and the rings and the -- several rings
22 inside the clay casting and their height would help me
23 determine that these particular bells were made sometime
24 between 1911 and 1932.

25 Q. And did the documentation provided by PG&E
26 identify when the Caribou-Palermo line was built?

1 A. It did.

2 Q. When was -- according to the documentation
3 provided by PG&E, when was the Caribou-Palermo line
4 built?

5 A. Sometime between 1920 and 1921.

6 Q. And did the documentation include history of the
7 Caribou-Palermo line?

8 A. It did.

9 Q. And just briefly, from the documentation
10 provided to you by PG&E, can you give us a history of the
11 Caribou-Palermo line.

12 A. A brief history is that the Caribou-Palermo line
13 was originally installed as the -- we have two documents;
14 one says the Caribou-Valona and one says the
15 Caribou-Golden Gate line. Basically it went from the
16 Caribou Power House which was fed off of Lake Almanor out
17 to Golden Gate as power for San Francisco. And that was
18 built by the Great Western Power Company. This was the
19 third transmission line in the state of California by the
20 Great Western Power Company. And then I'd have to refer
21 to the exact date, but essentially PG&E bought the line
22 and made it part of their system.

23 MR. NOEL: And Valona, for the record,
24 V-a-l-o-n-a.

25 THE COURT REPORTER: Thank you.

26 BY MR. NOEL:

1 Q. All right. So let's move on to Exhibit 395.

2 See Exhibit 395?

3 A. I do.

4 Q. What are we looking at on 395?

5 A. I believe this is a close-up of the right phase
6 insulator suspension hook with a scale from Caribou
7 27/222.

8 Q. So not the hook that broke obviously?

9 A. Not the hook that broke.

10 Q. The opposite arm; correct?

11 A. Yes.

12 Q. And what's significant on photograph
13 Exhibit 395?

14 A. I see that there's a 10 millimeter --
15 approximately a 10 millimeter wear pattern in the hook
16 which is consistent with the same -- what I believe to be
17 the same wear pattern as the failed hook on the left
18 phase of the insulator string from the Caribou-Palermo
19 27/222.

20 Q. So you are familiar with the term "channeling"?

21 A. Yes.

22 Q. And would channeling apply to the wear that
23 you're seeing here?

24 A. Yes.

25 Q. So you're saying that there's basically a
26 10 millimeter-wide channel that's been cut into the

1 suspension hook; is that correct?

2 A. Yes, at the point of contact with the support
3 leg bracket, the ST-20.

4 Q. All right. Let's move on to 396. And tell us
5 what we're looking at in 396.

6 A. This is a similar picture as 395 showing the
7 same wear pattern of the same hook.

8 Q. All right. So let's go back to the Exemplar
9 Tower Project. You said that on January 31st
10 Investigator Moore flew the line and photographed the
11 line; correct?

12 A. Yes, that's correct.

13 Q. What did you do with the photographs provided by
14 Investigator Moore?

15 A. I actually drove out to try to identify those
16 and take a look at them and see if there was any
17 significant information we could gather from them when --
18 again when the weather was amicable to do so.

19 Q. At some point did you determine a list of the
20 exemplar towers from which you wanted to collect
21 evidence?

22 A. Nick Moore and I together identified towers that
23 would be.

24 Q. Which towers were those?

25 A. That would be -- initially, if I refer back,
26 quite a few towers here. Make sure I have all my numbers

1 correct.

2 Q. It's 385.

3 A. Okay. 385. So originally we identified 24/199,
4 32/260, and 35/281. There was a fourth tower that we
5 initially believed to be a transposition tower, but upon
6 further review it was determined it was not a
7 transposition tower. And then later we also identified
8 20/160 as a transposition tower that we wanted to take a
9 look at.

10 Q. Why did you identify those specific towers?

11 A. They are in close proximity to the original
12 failure of 27/222. They were also transposition towers
13 of the same type hardware and in the same canyon with
14 similar weather patterns.

15 Q. Did you also review the photographs that were
16 taken by Investigator Moore?

17 A. I did.

18 Q. Did you take those photographs into account in
19 determining which towers you wanted to look at?

20 A. I did.

21 Q. So once you identified the towers 24/199, 32/260
22 and 35/281 of being of interest, what did you do next?

23 A. I wanted to document and preserve those towers
24 in their native position so I had our LiDAR team that
25 came out and did the initial scanning of our towers in
26 our original scene and had them also scan the exemplar

1 towers as well.

2 Q. Remind us what LiDAR is.

3 A. Light and distance range detection. I know it
4 doesn't really fit the acronym, but that's what it is.

5 Q. How do you use LiDAR to document something?

6 A. So LiDar uses basically sonar, photography and
7 puts them together and is able to basically create a
8 digital version of whatever objects. It's used through
9 many industries including PG&E for their vegetation
10 management project.

11 Q. So you asked the LiDAR team to document 24/199,
12 32/260, and 35/281; correct?

13 A. Correct.

14 Q. And did you go with the LiDAR team to do so?

15 A. I did.

16 Q. What happened when you arrived at 35/281?

17 A. I saw that the equipment that was originally
18 photographed by Nick Moore had been replaced or some of
19 it had been replaced.

20 Q. How could you tell?

21 A. The equipment was completely different. I was
22 able to -- I had the photographs with me. I was able to
23 compare and noticed that the insulators were different,
24 the support arms were different, much of the equipment
25 was much newer. Completely different.

26 Q. Was the Caribou-Palermo line energized at that

1 point?

2 A. No, it was not, not to my knowledge.

3 Q. So all the equipment that you wanted off of --
4 well, let's back that up.

5 What equipment did you want off of the exemplar
6 towers?

7 A. I thought the similar equipment that we pulled
8 from 27/222 was important to pull the same equipment from
9 these other towers to have a full comparative analysis
10 done to find out again if this is a one -- you know,
11 one-time incident or if there was any indication or
12 evidence that would explain why this event had occurred.

13 So I wanted the -- again, I wanted the conductor
14 itself, the stabilizing bar, the corona plates, the
15 insulator bells attached to the insulator string, the
16 support C-hooks that were attached to the insulator
17 hooks, the ST-20 brackets if they were in place, and the
18 support arms, the dead-end insulator string, and the hook
19 that was attached to the dead-end insulator string.

20 Q. Which of those parts were gone off 35/281 when
21 you went to do the LiDAR?

22 A. Everything but the insulators. Or everything
23 but the conductor.

24 Q. Were you able to track down the transposition
25 hardware taken off of 35/281?

26 A. Yes. The request was made from PG&E to provide

1 that information, and they complied.

2 Q. On March 8, 2019, did you seize that evidence?

3 A. I did.

4 Q. From where?

5 A. That was voluntarily provided to us from PG&E.
6 It was being stored at a contract company in -- on Pardee
7 Street in Berkley.

8 Q. Do you remember the name of the company?

9 A. I would have to refer to my documents to make
10 sure I had the exact name correct but --

11 Q. Does Fire Cause Analysis sound familiar?

12 A. Yep. That's them.

13 Q. Are you familiar with Fire Cause Analysis?

14 A. I am.

15 Q. What is Fire Cause Analysis?

16 A. Fire Cause Analysis is a -- they do several
17 things. They do private industry fire investigations.
18 They store evidence. They are the private sector version
19 of my job.

20 Q. So you were able to obtain the parts off of
21 32/281 from Fire Cause Analysis?

22 A. Yes.

23 Q. In the next group of photos I'd like to walk you
24 through the evidence that you were able to get back from
25 Fire Cause Analysis.

26 First up is Exhibit 397. Do you have that in

1 front of you?

2 A. I do.

3 Q. What is Exhibit 397?

4 A. This -- these are the -- or this is a package of
5 the insulator strings from 35/281. And this is how it
6 was presented to us.

7 Q. By Fire Cause Analysis?

8 A. Yes. This is their packaging.

9 Q. So palletized and wrapped?

10 A. Palletized, wrapped with the straps around them,
11 and tagged as you see in the photograph in 397.

12 Q. All right. Moving on to 398, what does 398
13 depict?

14 A. Exhibit 398 is a photograph of the C-hooks from
15 the insulator strings. I had to cut open the packaging
16 to expose them. And the markings on the pallet are
17 markings that I had put there.

18 Q. You put the markings or the writing on the
19 pallets?

20 A. I did.

21 Q. And describe for us what the writing says.

22 A. So on the left side of the photograph it says
23 "the west or right phase." And that's referring to the
24 equipment as it was natively on the CP 35/281 line. And
25 on the right side of the photograph is the east or the
26 left phase.

1 And I acquired that information from the
2 evidence tags that were placed at the corona sheets. And
3 as you can see in photograph or Exhibit 397 I transferred
4 the information. And they'll use that to identify which
5 piece is which.

6 Q. You're talking about these tags right here on
7 397?

8 A. Yes. Those are the evidence tags.

9 Q. And that is something that was placed on the
10 parts by PG&E?

11 A. I do not know who put them there specifically,
12 but I know that Fire Cause Analysis said that those were
13 accurate.

14 Q. Okay. All right. So what do you see of
15 significance on 398 with the hooks?

16 A. There is significant wear pattern that's
17 referred to as channeling on the C-hooks of both hooks.
18 And also something significant is that on the east left
19 phase you can see the in photograph there's the raised
20 "B" without a circle on it.

21 Q. That's this right here (indicating)?

22 A. Yes.

23 Q. Why is that significant?

24 A. That tells me that was a similar casting by the
25 Ohio Brass Company made around -- within the same time
26 period as the failed hook on the Caribou-Palermo 27/222

1 hook that failed.

2 Q. Now, you said that you were able to research
3 these parts and the hooks based upon the corporate logos
4 or the stamping; correct?

5 A. Yes.

6 Q. And the company was identified as Ohio Brass?

7 A. Correct.

8 Q. Now, based upon your research was there a point
9 around the time -- around 1911 and 1921 when Ohio Brass
10 changed their corporate stamp?

11 A. Yes, they did.

12 Q. And what was the initial stamp or the stamp as
13 of around 1910, 1911 and the later stamp of 1921?

14 A. The first part of your question is a raised "B"
15 was their original casting logo. And then after that
16 they switched to a circle around -- or an oval around the
17 "B" which represented Ohio Brass.

18 Q. Were you able to determine exactly when that
19 switch occurred?

20 A. There's conflicting information, but I believe
21 it's around 1921.

22 Q. And you were able to find historical photographs
23 or depictions of the hook with the raised "B" back all
24 the way to what?

25 A. 1911.

26 Q. All right. Moving on to 399.

1 A. I have it.

2 Q. What is Exhibit 399?

3 A. This is a close-up picture of the right phase of
4 the 35/281 insulator string and the hook. Or actually
5 just the hook and a portion of the first bell.

6 Q. And what is the significance of photograph 399?

7 A. It shows more clearly and with better detail the
8 channeling and wear pattern in the hook.

9 Q. Moving on to Exhibit Number 400.

10 A. I have it.

11 Q. What does 400 show?

12 A. This is a similar picture with a scale -- a
13 forensic scale in front of it showing the depth of wear.

14 Q. And 401?

15 A. This is a similar photo but at a different angle
16 as 400.

17 Q. And 402?

18 A. This is a similar photograph as before with a
19 different angle.

20 Q. And 403?

21 A. I have it.

22 Q. What is 403?

23 A. This would be the right phase hook.

24 Q. And how can you tell that?

25 A. Oh, I'm sorry. Let me refer to the previous
26 photograph. Let me make sure it's the right phase.

1 Sorry. It would be the left phase. Left phase hook.

2 Q. Okay. How can you tell that?

3 A. The position that it's in and where it was on
4 the pallet.

5 Q. Something else significant?

6 A. Oh, the wear. Sorry. I misunderstood the
7 question. Yeah. It has a significant wear pattern as
8 well.

9 Q. First in terms of which one it is, which hook it
10 is determining whether it's the right or left phase.

11 A. Oh, it's got the "B" visible on it. The raised
12 "B."

13 Q. Right. Got the raised "B" on there. All right.
14 Now, what is significant about the photograph 403?

15 A. The channeling and wear pattern.

16 Q. Why is it significant?

17 A. Probably 25 percent of the hook's structure
18 integrity is gone.

19 Q. And 404. Identify what is 404 for us.

20 A. Exhibit 404 is a similar photograph at a
21 different angle.

22 Q. Again the circle "B."

23 A. The raised "B."

24 Q. The raised "B." I mean circle "B." I'm getting
25 confused.

26 A. Yeah. Raised "B."

1 Q. This is the raised "B."

2 MR. NOEL: It is now six minutes to 12:00. From
3 here we're going to jump into some other stuff. So this
4 would probably be a very good time to break. The next is
5 going to be a significant chunk. We could probably stop
6 here and come back and start up this afternoon and go
7 straight through with the rest.

8 GRAND JURY FOREPERSON: Okay. So, Captain
9 Kluge, I need to admonish you before we go to --

10 THE WITNESS: Yes, Ma'am.

11 GRAND JURY FOREPERSON: Before we take the
12 break.

13 So, Captain Kluge, you are admonished not to
14 discuss or disclose at any time outside of this jury room
15 the questions that have been asked of you or your answers
16 until authorized by this grand jury or the Court. A
17 violation of these instructions on your part may be the
18 basis for a charge against you of contempt of court.
19 This does not preclude you from discussing your legal
20 rights with your own attorney.

21 Captain Kluge, what I have just said is a
22 warning not to discuss this case with anyone except the
23 Court, your lawyer, or the district attorney.

24 Understand?

25 THE WITNESS: I do understand.

26 GRAND JURY FOREPERSON: Okay. Thank you.

1 THE WITNESS: Thank you.

2 MR. NOEL: Recess for lunch?

3 GRAND JURY FOREPERSON: Recess for lunch.

4 MR. NOEL: Be back at 1:30?

5 GRAND JURY FOREPERSON: Okay.

6 [Whereupon the luncheon recess is
7 taken from 11:55 a.m. until 1:30 p.m.]

8 --oOo--

1 JULY 30, 2019

2 AFTERNOON SESSION

3 (Confidential Grand Jury Hearing Proceedings)

4
5 (ROLLCALL OMITTED.)

6
7 MR. NOEL: Anything we need to deal with before
8 we bring Captain Kluge back in?

9 GRAND JURY FOREPERSON: No.

10 MR. NOEL: Sergeant-at-arms, thank you.

11 [Captain Kluge enters the courtroom.]

12 GRAND JURY FOREPERSON: He can just have a seat,
13 can't he?

14 MR. NOEL: Yep.

15 THE WITNESS: Thank you.

16 MR. NOEL: Still under oath.

17 THE WITNESS: Yes. Thank you.

18 **EXAMINATION CONTINUED**

19 BY MR. NOEL:

20 Q. Now, when we broke, we were talking about the
21 collection of the transposition hardware from 35/281 from
22 Fire Cause Analysis.

23 A. Yes.

24 Q. Going back to 385 -- Exhibit 385, the map
25 showing the five -- well, the 27/222 and the four
26 exemplar towers.

1 A. Yes.

2 Q. Now, you collected the transposition hardware
3 off 27/222 back in November?

4 A. Correct.

5 Q. And now you've collected 35/281 from PG&E's
6 representative Fire Cause Analysis in March?

7 A. Correct.

8 Q. Were you able to collect the hardware off of
9 20/160, 24/199, and 32/260?

10 A. Yes.

11 Q. How did that occur?

12 A. It was coordinated over a long period of time
13 due to weather constraints, but we were able to, with the
14 help of PG&E because they're the only people available to
15 remove equipment, have that equipment removed with the
16 assistance of a contract helicopter, Cal Fire Nike Moore
17 as well, and the FBI was also there to help document
18 everything.

19 Q. Describe the process that went into the
20 collection of the evidence from the exemplar towers
21 20/160, 24/199, and 32/260.

22 A. Once we'd already had an opportunity to sit down
23 with day collection --

24 Q. Day collection.

25 A. Well, basically we started with identification
26 of what was to be done that day. I made it clear with

1 the PG&E legal representation that -- and confirmed with
2 them that this is still voluntary release of equipment to
3 Cal Fire. Therefore, there was no warrant required.
4 They complied with our request.

5 Once it was identified and a safety briefing was
6 done, the plan was to have PG&E crew members remove the
7 equipment, load it onto a helicopter sling, and have that
8 transported by helicopter to a landing zone location.

9 There's two landing zones that we used out of
10 that way of traffic, places identified for safety
11 reasons. We had -- I was at the landing zones to receive
12 the equipment from PG&E. Nick Moore was at the sites to
13 observe the removal, to make sure that the equipment was
14 not damaged, mistreated, and was removed under specific
15 direction.

16 Nick Moore and I coordinated together on what we
17 wanted to see done as it was removed. Things were
18 photographed as they were being removed again by PG&E
19 employees who are on the tower who could take close-up
20 photographs.

21 As the equipment came in, it was identified,
22 documented, and immediately tagged as evidence by myself
23 and it was documented photographically by the F.B.I. And
24 they cataloged everything for us. That equipment was
25 then loaded --

26 And just to be clear, on the equipment that we

1 removed on each of the other three towers from 20/160,
2 24/199, and 32/260, we removed the conductor, the
3 conductor stiffener rod, the corona plates, the insulator
4 strings both right phase and left phase, and the dead-end
5 insulators, the supporting C-hook hardware, the ST-20
6 brackets if so equipped, and the support arms for those
7 insulator strings.

8 All that equipment was loaded into the back of
9 the Cal Fire state side and secured by me. I had custody
10 of it until it was placed into our large evidence storage
11 locker and then everything was cataloged and booked.

12 Q. All right. So let's start on March 28, 2019,
13 with tower number 20/160. Were the parts that you
14 requested removed from the tower by PG&E?

15 A. Yes, they were.

16 Q. And you were there to supervise and take custody
17 of those parts?

18 A. I was. And if I may add, this particular tower
19 we did not need a landing zone. We were able to drive
20 right to it, collect the evidence, and put it directly
21 into a vehicle.

22 Q. And you supervised the collection and
23 documentation of that evidence?

24 A. I did.

25 Q. All right. So let's go to Exhibit Number 405.

26 A. Excuse me. I have it.

1 Q. And what is Exhibit Number 405?

2 A. This is an insulator string. I'd to refer to
3 the photo log, but I do believe -- yeah, this is from
4 20/160. And it appears to be the right phase by the
5 markings on the bells.

6 Q. What is the photograph log?

7 A. A photo log is a document that catalogs and
8 identifies what photos represent. It's a table of
9 contents for the photographs.

10 Q. Okay. Do you have the photo log with you today?

11 A. I do not. I do not. I don't think it's in this
12 stack of exhibits. But if I may stand up, I could
13 probably take a look at it from the example.

14 Q. Go ahead.

15 A. Okay. It doesn't say specifically on those, but
16 I know the layout and I know the location and I remember
17 standing next to it. And the only one that we could
18 possibly be standing next to when it came to the ground
19 was 20/160. So I do know this is from the right phase of
20 20/160.

21 Q. How do you know it's the right phase?

22 A. It's marked on the bells that you can clearly
23 see in the photograph.

24 Q. You're talking about the "R" with the -- what is
25 the name of the --

26 A. Phi or phi depending on your pronunciation.

1 Q. The "R" phi symbol on each of the bells?
2 A. Correct.
3 Q. Moving on to 406, I think.
4 A. Yes. I have it.
5 Q. The computer doesn't want to cooperate. There
6 we go. Exhibit 406.
7 A. Okay.
8 Q. Do you have Exhibit 406?
9 A. I do.
10 Q. What does Exhibit 406 depict?
11 A. This is the left phase insulator string from
12 tower 20/160. I should clarify. It's 20 over 160.
13 Q. And Exhibit 407?
14 A. Yes. This is the dead-end hook from the
15 insulator string from tower 20/160.
16 Q. And 408?
17 A. Similarly the right phase hook.
18 Q. And anything significant on that photograph?
19 A. A couple things. This has a channeling wear
20 pattern at the point of contact with the ST-20 --
21 correction, with the hanging point on the tower. And it
22 also has a raised "B" as well.
23 Q. Exhibit 409.
24 A. I have it.
25 Q. What is Exhibit 409?
26 A. Similarly the right phase hook from 20/160.

1 Q. And the significance?

2 A. It has a channeling wear pattern at the point of
3 contact and a raised "B."

4 Q. Exhibit 410?

5 A. I have 410.

6 Q. What does 410 depict?

7 A. Exhibit 410 is the right phase hook again with a
8 different angle being supported by one of the FBI staff
9 who was photographing.

10 Q. Exhibit 411?

11 A. Exhibit 411 is another photograph of the left
12 phase hook with a scale.

13 Q. And the significance?

14 A. Again, it shows the wear pattern. I might add
15 that there's -- I haven't mentioned this before in the
16 other photographs but, as I'm looking at this, it stands
17 out to me again that the point where it's being worn and
18 channelled is not oxidized. It tells me it's a fresh
19 wear pattern.

20 Q. Anything else significant about this hook?

21 A. If I haven't mentioned it before, it does have
22 the raised "B."

23 Q. Exhibit 412?

24 A. This is another photograph of the left phase. I
25 believe it's similar but flips so you can see the other
26 side of it.

1 Q. Four thirteen.

2 A. Again, this is a left phase hook from 20/160.

3 Different angle being supported by an FBI agent.

4 Q. Four fourteen?

5 A. Similarly the same hook from left phase slightly
6 different angle.

7 Q. Now, you talked earlier about the lack of
8 oxidation.

9 A. Yes.

10 Q. This is a good photograph to explain what you
11 mean.

12 A. Comparatively the bulk of the C-hook is covered
13 with an oxidation and it's also -- knowing from the
14 as-built, it's also zinc-coded or hot zinc dipped to
15 galvanize it. At the point of contacting you can see
16 that there is no oxidation. It's not dull in color.
17 It's not missing -- or it's not covered with the zinc
18 coding. It's been all removed through the wear process.

19 Q. So oxidation -- are you talking about this
20 (indicating) discoloration on these other parts of the
21 hook?

22 A. Yes. That would have to be confirmed through
23 metallurgy, but that is what I believe it to be, yes.

24 Q. And the point of contact you're talking about
25 this channel right here (indicating)?

26 A. Yes.

1 Q. And the lack of oxidation is shown by what in
2 the channel?

3 A. The reflection of the light. Its reflective
4 surface has been polished over wear through time.

5 Q. So it's not discolored like everything else?
6 It's shiny and metallic?

7 A. Correct.

8 GRAND JUROR NUMBER SEVENTEEN: I want to
9 interject for a second. We don't have Exhibit 413 and
10 beyond. It stopped printing.

11 GRAND JUROR NUMBER FIFTEEN: It says "Error.
12 Image stop."

13 GRAND JUROR NUMBER SEVENTEEN: So we do not have
14 that. Just letting you know.

15 MR. NOEL: I'm sorry.

16 GRAND JUROR NUMBER SEVENTEEN: No worries.

17 MR. NOEL: Okay. Well, we'll just keep going
18 then.

19 GRAND JUROR NUMBER EIGHTEEN: Fix it later.

20 BY MR. NOEL:

21 Q. All right. Let's go on to 415.

22 A. I have 415.

23 Q. And what does 415 depict?

24 A. This is a support arm from tower 20/161.
25 Correction. 160. And this is the right phase with a
26 scale.

1 Q. What is significant about this?

2 A. This picture depicts the wear pattern on the
3 support arm that is consistent with the hook being sat in
4 that hole and rubbed away over a period of time.

5 Q. And what is the disfiguration or . . .

6 A. So we know from -- I'm sorry. I didn't mean to
7 interrupt.

8 Q. No. I just lost track of what word I was going
9 to use for the -- we've been it calling the keyholing.

10 A. Yes. So keyhole was used in several as-builts.
11 So the keyhole, we know, should have been an inch and
12 1/8th from the as-builts and the schematic specifications
13 we had. It's supposed to be machine round. And this one
14 has been worn to a -- I hate to use the term pear shape,
15 but it doesn't really fit this entirely perfectly. But
16 it has been worn to one side clearly.

17 Q. So what you're talking about is this hole right
18 here (indicating) according to your review of the PG&E
19 documents should be round and 1 1/8th inch in diameter?

20 A. Yeah, that is correct.

21 Q. So across at any point should be 1 1/8th inch?

22 A. Correct.

23 Q. And the wear that you're referring to, is this
24 stuff that's at the top of the picture as it sits?

25 A. Yes, as depicted. Yes, it's at the top of the
26 picture.

1 Q. And we should probably point out --

2 A. This photograph is upside down in what should
3 have been its native position.

4 Q. Right. So that wear point would actually be on
5 the bottom as it would hang in the tower?

6 A. Correct.

7 Q. All right. Let's move on to 416.

8 A. I have 416.

9 Q. What is 416?

10 A. Four sixteen similarly is the left phase of
11 tower 20/160.

12 Q. And what do you see of significance in this
13 photograph?

14 A. Similar wear. Also I could point out that this
15 particular arm did not have an ST bracket -- ST-20
16 bracket attached nor were there holes drilled for it.
17 That's part of the manufacturing. It wasn't originally
18 intended on this particular tower to be there.

19 Q. So based upon your review of the historical
20 documents from PG&E, this would have been the
21 configuration of the original tower arm?

22 A. Minus the wear that is existing in the keyhole,
23 yes.

24 Q. Right. And this hole, according to the PG&E
25 documents, was supposed to be 1 1/8th inch in diameter?

26 A. Similarly, yes. This should be 1 1/8th

1 hand-machined with a drill bit.

2 Q. All right. So let's move on to March 29th.

3 A. Okay.

4 Q. And what did you do on March 29th?

5 A. On March 29th is where we met at the first LZ,
6 landing zone -- excuse me -- where we met with PG&E to
7 remove the exemplar equipment from 24/199 tower of the
8 Caribou-Palermo line.

9 Q. Explain for us the process of collecting the
10 evidence at 24/199.

11 A. It was a pretty big undertaking to make happen.
12 Very difficult to access. We had to make several trips
13 out there beforehand to examine the equipment that we
14 wanted to pull. Again, delays with weather but we were
15 able to finally come up with a day and time that worked.

16 Initially, we had our agents that were helping
17 us from the FBI went up and photographed the tower as it
18 stood in its original configuration as built. And then
19 we had them -- once they came back, we were able to bring
20 Nick Moore up to the tower where he could observe any
21 removal process that occurred. Then PG&E took the
22 helicopter up and started removing equipment using their
23 linemen and tower men.

24 Q. Now, when you say the FBI personnel
25 photographers were taken up to the tower and then Nick
26 Moore was taken up to the tower, describe how they were

1 taken up to the tower.

2 A. They were taken up through the Butte County
3 Sheriff helicopter, not the PG&E contracted helicopter.

4 Q. Now, prior to March 29th had you visited 24/199
5 physically?

6 A. Yes.

7 Q. On how many occasions?

8 A. At minimum two, possibly three. I'd have to
9 check my records but definitely at least twice.

10 Q. Why was 24/199 picked for the Exemplar Tower
11 Project?

12 A. Number one, it was a transposition line,
13 transposition tower within the vicinity of our original
14 failure or the original tower failure I should say. And
15 it had similar equipment. It was in a similar type
16 terrain in a similar position on a hill with similar
17 canyons around it. A lot was similar with it. Probably
18 out of all the towers this was probably the most similar
19 in its location with environmental factors in
20 consideration.

21 Q. When you visited the tower, were you able to
22 look at the tower?

23 A. Very easily.

24 Q. Even more easily than other towers?

25 A. I wouldn't say more easily due to the access. I
26 can say that tower 20/160 had an easier access to get to

1 and was similarly close to a road. However, 24/199 was
2 probably one of the shorter towers where you could see
3 the equipment most easily from ground level.

4 Q. Did you notice anything about the equipment on
5 24/199 that caught your attention?

6 A. Several things caught my attention.

7 Q. Please explain.

8 A. First, I -- when we first arrived at the landing
9 where the tower meets the road, it literally comes right
10 up to the tower. It's real easy access aside from
11 weather and the road being washed out. You can see that
12 the left phase insulator string is different from all the
13 other insulator strings on all the other towers.

14 Before lunch I spoke of how I could tell the
15 manufacturing date of the insulator strings by the shape
16 of the bells. I noticed the bells had a different shape
17 to them. I had not seen them on the Caribou-Palermo line
18 or in all the towers I had looked at previously.

19 I also observed that there was a splice in the
20 conductor -- the transposition conductor line that we
21 talked about before that -- the one that goes from one
22 side to the other. So that would be the transposition
23 line going from the left to the right phase. There's a
24 splice there like a three-bolt or four-bolt connection
25 that tied those two pieces of wire conductor together.

26 I also observed the fact that it appeared that

1 the conductor was actually supporting the insulator
2 string. In other words, if you can imagine -- and I wish
3 we had a good picture here. But the way the conductor
4 was shortened due to splice, it was actually supporting
5 the base of the insulator string.

6 That was evident in the curve of the insulator
7 string. Where every other insulator string is taut,
8 pulled straight, this had a curve to it. And so, of
9 course, that got me curious and I started looking around.
10 And I was able to find a similar-type insulator string
11 with all three -- all ten bells -- eleven bells -- excuse
12 me. Eleven bells attached on the ground close but had
13 everything intact minus a few broken pieces of ceramic,
14 but it was missing the C-hook.

15 From the ground I was also able to notice that
16 the C-hooks that were in place were severely worn. That
17 was evidenced by the amount of sunlight I could see in
18 that keyhole. Just from the ground looking up you could
19 clearly see that there was a significant amount of wear.

20 At that point, I already knew that the apex of
21 the C-hooks specifically with the raised "B" casting is
22 supposed to be 15/16th in height.

23 Q. How do you know that?

24 A. That's from the as-builds. Again, the
25 specification page that we received from PG&E.

26 Q. Go ahead.

1 A. We know that to be 15/16th of an inch. Dually I
2 know that the keyhole is supposed to be 1 1/8 of an inch.
3 Estimated from the ground I believe that I saw somewhere
4 in the neighborhood of three quarters of an inch or 7/8th
5 of an inch of exposed keyhole that wasn't filled with a
6 hook where with those numbers we should have
7 approximately 3/16th of an inch only of sunlight exposed.
8 So that told me there was some significant wear there.

9 Q. How so?

10 A. Can you repeat the question.

11 Q. How so? Why does the amount of sunlight you
12 could see through those holes tell you that there was
13 significant wear?

14 A. There should have only been 3/16th of space
15 between the top apex of that hook and the top apex of the
16 keyhole. And there was almost three-quarters of an inch.
17 Again, that was estimated from the ground. I wasn't able
18 to take a scale to it.

19 Q. All right. So let's get into the evidence
20 recovered from 24/199.

21 A. Okay.

22 Q. Exhibit 417.

23 A. I have that in front of me.

24 Q. What does 417 depict?

25 A. This is an insulator string being delivered to
26 the landing zone off of Highway 70. And it's an

1 insulator string that is hanging from a helicopter
2 grapple.

3 Q. So somewhere up above outside the frame of this
4 picture there is a helicopter; is that correct?

5 A. Yes, there is.

6 Q. And somebody waiting to accept that --

7 A. Yes.

8 Q. -- insulator string?

9 A. Yes. Those are PG&E employees.

10 Q. So explain to us a little bit about how it
11 worked on the landing zone for taking custody of and
12 documenting this evidence.

13 A. PG&E received all the information -- or all the
14 equipment at the landing zone. These employees had been
15 working with the contract helicopter. They understood
16 how to speak to each other using hand signals. For
17 safety reasons we had them be the ones to receive the
18 equipment from the helicopter.

19 Yes, I am trained to speak the same language
20 with ground hand signals, but that's within the
21 government sector. Private sector is different. And for
22 safety reasons we -- just to make sure everybody went
23 home at the end of the day we kept them on the ground.

24 Once they received the equipment, they merely
25 turned it over to me. And at that point, I maintained
26 custody of it.

1 Q. So were you able to supervise the equipment from
2 the point that it reached the ground?

3 A. Yes. And we also had radio communication with
4 the -- with Nick Moore at the tower and also PG&E
5 employees had communication with each other as well the
6 whole time. So we were able to maintain not only custody
7 by radio but by visual contact.

8 As equipment was removed, Nick Moore told me
9 what was coming off and he told me that it was on its
10 way. And he was able to maintain visual contact with the
11 item until I saw it. And then I told him over the radio
12 that I can now see it. And that way we maintained visual
13 custody the whole time between the two of us.

14 Q. All right. Moving on to 418, do you have 418?

15 A. I do.

16 Q. And what is 418?

17 A. This is an insulator string from 24/199.

18 Q. Can you tell from this photograph which
19 insulator string it is?

20 A. From this photograph, no, I cannot. I don't
21 believe this has been marked yet.

22 Q. So once the insulator strings were disconnected
23 from the helicopter line and turned over to you, what
24 happened to them?

25 A. They are carried over to a shady gazebo area.
26 At the -- this is a day-use area right along the Feather

1 River usually used by travelers to kind of take a rest
2 stop, but we were able to use it for the day. We
3 reserved it and placed everything underneath the shade.

4 It's better for picture quality to be able to
5 control the light. Everything was set on cardboard and
6 measured, cataloged, and photographed under the gazebo.

7 Q. All right. Moving on to 419, what does
8 Exhibit 419 show?

9 A. I have 419. This is the -- this is the top
10 portion of the dead-end insulator string which includes
11 the hook. The C-hook.

12 Q. And how can you tell that?

13 A. Excuse me. It's marked.

14 Q. And explain to us what those markings mean.

15 A. These markings -- so the 26/199 depicts which
16 tower it was taken from. The "DE" referred to the
17 dead-end. That's referred to as the third insulator
18 string off to the -- usually the left side of the tower.
19 And then if you look at the bells, they are each marked
20 one, two, three, four and so on individually.

21 Q. I think you said 26/199.

22 A. Oh, excuse me. It should have been 24/199.

23 Q. Okay. All right. Let's move on to 420.

24 A. I have it.

25 Q. Do you recognize 420?

26 A. I do.

1 Q. And what is 420?

2 A. Exhibit 420 is one of the insulator strings from
3 24/199 with a hook.

4 Q. And 421?

5 A. Yeah, 421 is a -- this is the right phase
6 insulator string from 24/199.

7 Q. How can you tell it's the right phase?

8 A. There are markings on the cardboard identifying
9 what it is. That was the first marking we did before we
10 actual marked -- we marked the cardboard before we marked
11 the insulator string. That way we could photograph it in
12 its native condition.

13 Q. And on to 422.

14 A. I have 422.

15 Q. What is depicted in 422?

16 A. This is the right phase top of the insulator
17 string. This is the hook that shows significant
18 channeling and deformation of the hook.

19 Q. What makes you think that is significant
20 channeling?

21 A. I believe this hook is already in failure based
22 on all the other C-hooks I was able to observe throughout
23 this entire investigation including looking at the
24 as-builds and the specification drawings. The apex of
25 this particular hook has actually been distorted by the
26 weight of the hook.

1 If I may stand up.

2 Q. Yes, please.

3 A. Having looked at a lot of these hooks, I know
4 right here (indicating) there's a flat spot where it's
5 actually started to open up under the weight. And I have
6 not seen that flat portion at the apex on any other hook.
7 Plus, it's --

8 I know it's kind of hard to see here in this
9 photograph. I'm sorry you don't have a photograph in
10 front of you. But this is almost completely worn
11 through. There is less than a quarter inch of material
12 left here.

13 Q. Now, going back to 27/222, we saw the
14 photographs earlier and what we referred to back in April
15 to the -- the cuticle or the nail, the little portion
16 that was left, the nub sticking out. Remind us
17 approximately how wide that was.

18 A. Well, if I may refer to the exhibit.

19 Q. Go ahead.

20 A. Bear with me a moment. I have a few exhibits
21 today.

22 So I'm referring to Exhibit 392 and Exhibit 393.
23 So using the scale provided in the photograph there is
24 what appears to be just over one millimeter of material
25 left. The side profile that is visible in Exhibit 393
26 you can see where the -- similarly, I believe that the

1 hook that failed in 27/222 also began to open up and
2 cause there to be a curvature of the phase as visible
3 in 392.

4 As it began to open up, the wear pattern
5 changed. It went from being a perfect straight channel--
6 let me rephrase it. Not a perfectly straight channel but
7 from being a mostly straight channel to actually tapering
8 and changing its geometry a little bit as it opened up.

9 So I think the hook depicted in Exhibit 422
10 shows that process beginning. And I believe that hook in
11 Exhibit 422 is in the similar type of failure as 27/222.

12 Q. All right. Let's move on to 423.

13 Do you have that photograph there in front of
14 you?

15 A. Let me straighten this out real quick. Four
16 twenty-three. Yes, I have it in front of me.

17 Q. What is 423?

18 A. I'm sorry. What was that?

19 Q. What is 423?

20 A. Oh, 423 is a photograph of the first dead-end
21 bell and the hook that is attached to it that was used as
22 a support for the dead-end string with scale.

23 Q. And 424?

24 A. Exhibit 424. This is the failing hook from the
25 right phase and the first bell insulation -- or first
26 bell from the insulator string with a scale.

1 Q. Now, I want to direct your attention to the
2 first bell.

3 A. Okay.

4 Q. And you talked earlier about some of the
5 insulator strings appearing different.

6 A. Yes.

7 Q. And is this one of those?

8 A. Yes. This is the first bell of the insulator
9 string that I mentioned was significantly different in
10 shape and design from all the others that I had seen on
11 the Caribou-Palermo line. The markers are different as
12 well.

13 Q. Right. Fifteen thousand lb.

14 A. Yes.

15 Q. Do you know what that refers to?

16 A. I didn't find any specific documentation that
17 identified it, but to me it tells me this would be rated
18 at 15,000 pounds. So we did find documentation that
19 talked about what a bell is supposed to be rated at.
20 This one is made after some of the other documentation we
21 had. This one actually has a higher rating than some of
22 the insulator bells we'd seen on the rest of the
23 Caribou-Palermo line. The other bells that we saw were
24 only rated at 12,000 pounds. So I assume that this is
25 the newer version at the higher rating.

26 Q. Now, right here in the middle can you tell us

1 what that is.

2 A. Yeah. That is the circle "B" marking from the
3 Ohio Brass Company. That was circa 1932ish.

4 Q. All right. Moving on to 425, do you have that
5 one in front of you?

6 A. I do.

7 Q. And what does 425 depict?

8 A. Similarly to 424 this is the other side of it,
9 the backside we did not see in the other photograph with
10 a scale.

11 Q. All right. Now, on the hook itself were you
12 able to find any markings?

13 A. Let me refer back to the other photograph. This
14 one in particular I don't see them here and I do not
15 recall seeing any on it the day that we collected it.

16 Q. All right. Four twenty-six.

17 A. I have that.

18 Q. What does 426 depict?

19 A. Four twenty-is six similar to 425. The same
20 view of it but a different angle with a scale.

21 Q. Four twenty-seven.

22 A. I have 427.

23 Q. What is 427?

24 A. This is the right phase support arm. This would
25 be the arm that was supporting that severely damaged hook
26 for the right phase insulator string.

1 Q. How can you tell this is the right phase?

2 A. It's marked. And I put those marks myself.

3 Q. Describe for us what you mean by marked.

4 A. I put -- I started marking in paint the right
5 phase or R phi and also marked it with a black Sharpie R
6 phi and 24/199. It's upside down in this particular
7 picture.

8 Q. And what does -- in your view is there anything
9 in this photograph?

10 A. A couple things. The -- the wear pattern is
11 similar to other wear patterns we have seen. Again, the
12 keyhole is bigger than it's supposed to be. It's worn
13 differently. This particular arm does have the ST-20
14 bracket attached.

15 And there's actually metal transfer evidence on
16 this particular bracket. The ST bracket has the severe
17 black discoloration. I believe it to be metal transfer
18 having talked to a metallurgist.

19 MR. NOEL: Remember, hearsay doesn't go for the
20 matter. Don't consider it.

21 THE WITNESS: Oh, yeah.

22 BY MR. NOEL:

23 Q. All right. Let's move on to 428.

24 A. So this is the same right phase support arm.
25 This is the opposite side from Exhibit 427. And this is
26 the -- this is the actual angle iron from the arm itself,

1 not the ST-20 bracket.

2 Q. Four twenty-nine.

3 A. Similar photograph with a paper behind it to add
4 contrast.

5 Q. Four thirty.

6 A. Four thirty. This would be the -- this is the
7 left phase. I know it's not marked, but I know where
8 this is from. Because of the grass and everything behind
9 it I know this is from 24/199. And the position of the
10 ST bracket in relationship to the geometry of the angle
11 iron from the support arm tells me this is the left phase
12 support arm.

13 Q. And what do you believe is significant in this
14 photograph?

15 A. This is probably the most worn support arm that
16 we had in our entire exemplar project. And it shows the
17 most amount of wear.

18 I don't know if we have a scale with this
19 particular photograph or another photograph with a scale,
20 but this is almost clear worn through on the actual -- on
21 the original hole.

22 Q. You're talking about this (indicating) hole up
23 here on the arm itself?

24 A. Yes.

25 Q. And the amount of wear on that hole?

26 A. Yes. It's almost completely through in respect

1 to its original design.

2 Q. Let's move on to 431.

3 A. I have that.

4 Q. What is 431?

5 A. Exhibit 431 is the -- again the left phase
6 support arm from 24/199 with a scale to it. With a scale
7 I'm able to estimate from this photograph that it's
8 somewhere between three to four millimeters of material
9 left at the apex of the wear.

10 Q. So again, this isn't the hole that the hook was
11 attached to at the time of the removal; correct?

12 A. No, it's not. And I can tell that by the
13 oxidation on the deformed metal.

14 Q. Right. This is one of the brackets as you can
15 see from the previous photograph 430 that was equipped
16 with the ST-20 bracket?

17 A. Correct.

18 Q. Just so we're clear, the insulator at the time
19 of the removal was hanging from the ST bracket?

20 A. Yes.

21 Q. Got it. So let's go on to 432.

22 A. This is a similar photograph, this one with a
23 piece of paper behind it to show contrast.

24 Q. Four thirty-three.

25 A. I have 433. And this is a very similar
26 photograph, a different zoom.

1 Q. All right. Four thirty-four?
2 A. I have 434.
3 Q. And what does 434 depict?
4 A. Four thirty-four is the dead-end hook from --
5 that supported the dead-end insulator string from 24/199.
6 Q. Anything significant?
7 A. Comparatively speaking, this one has less wear
8 though there is a significant amount of wear compared to
9 the other dead-end hooks that we saw.
10 Q. Four thirty-five. What is 435?
11 A. Four thirty-five. I have that. It's a 24/199
12 left phase hook.
13 Q. And what, if anything, do you believe is
14 significant about this photograph?
15 A. This hook is different from many of the hooks
16 we've seen so far. The shape of it is different. The
17 geometry doesn't match the other hooks that we've
18 collected. I believe this to be a newer hook than a
19 raised "B" or even a circle "B" hook.
20 Q. Were you able to locate any markings on it?
21 A. There are markings on it. There was not a -- I
22 would have to -- I'd have to look at the piece of
23 evidence itself, but I do not recall there being a
24 casting stamp on this one.
25 Q. For instance, the raised "B" or --
26 A. Raised "B," circle "B," star "B." Any of those.

1 Q. Right. And this hook was, you said, physically
2 different from the others?

3 A. It's geometry was different, yes.

4 Q. And 436?

5 A. I have that.

6 Q. What does 436 depict?

7 A. Again, this is the left phase hook. Similarly,
8 I think a different zoom. Yeah, a little bit different
9 zoom.

10 Q. And do you see any wear patterns on this hook?

11 A. I do.

12 Q. Where?

13 A. This is at the point of contact. I see
14 channeling, a wear pattern at the point of contact.

15 Q. We're talking right here (indicating)?

16 A. Yes.

17 Q. The apex of the hook?

18 A. At the apex of the hook, yes.

19 Q. Four thirty-seven.

20 A. Yeah, this is the right phase hook from 24/199
21 by itself.

22 Q. And 438.

23 A. Again, this is the 24/199 right phase hook with
24 a different angle on the light source.

25 Q. You can really see the channeling on this one.

26 A. Yes.

1 Q. All right. So that's it for 24/199. That
2 leaves us with 32/260.

3 A. Yes.

4 Q. But before I get to that, when you physically
5 went up to inspect these poles, these towers prior to the
6 removal of the evidence from the towers, did you also
7 look at towers around them?

8 A. I did.

9 Q. And specifically, I want to talk about 221.
10 Remember 221?

11 A. Yes.

12 Q. And --

13 A. Just confirming, the Caribou-Palermo 27/221?

14 Q. Two twenty-one, yes. When you first saw 221,
15 did you notice anything unusual about it?

16 A. Yes.

17 Q. What was that?

18 A. The -- a couple things. The build was different
19 from 27/222. This was a type of tower that was used to
20 support the wire mid span. In other words, there wasn't
21 any cut in the wire. They just drilled it, clamped it in
22 the middle of the conductor and held aloft. It was held
23 aloft with an insulator string and bolted equipment and
24 it was also stabilized -- supposed to be stabilized
25 underneath with another insulator string.

26 I noticed right away that on the lower insulator

1 string on the left phase of 27/221 the guidewire had
2 disconnected -- like a stabilizing cable had disconnected
3 at the turnbuckle.

4 Q. During one of your return trips to look at
5 27/222, did you notice anything different about 221?

6 A. We made many return trips. And there was times
7 where there's evidence in place and there's times we took
8 exemplar evidence off. So some stuff had changed
9 throughout the course of our investigation. So, yes.

10 Q. At some point when you returned, did you notice
11 that the insulator strings had been changed on 221?

12 A. Yes, they had.

13 Q. And the guidewire for the insulator string had
14 been broken off and been replaced and fixed?

15 A. Yes, it had.

16 Q. Now, were you able to look at those insulator
17 strings from the ground?

18 A. I was able to, yes.

19 Q. And specifically, were you able to look at the
20 hooks from the ground?

21 A. The new insulator strings did not have hooks.

22 Q. On 221?

23 A. On 221. It is a different type of mounting
24 hardware.

25 Q. Okay.

26 A. It is more of a -- we call it clevis. Again,

1 I'd have to -- I've looked at a lot of equipment. I'd
2 have to double check that, but I'm pretty certain it was
3 a clevis, not a hook.

4 Q. Okay. So let's move on to 32/260.

5 A. Okay.

6 Q. Again, March 29th, 2019?

7 A. Yep.

8 Q. And explain to us the setup for the removal of
9 the 32/260?

10 A. This is a similar setup as we did for 24/199.
11 This is at a different landing zone there. This is the
12 landing zone directly behind the Cal Fire Jarbo Gap
13 Station number 36 in Butte County. That landing zone is
14 typically used for firefighting aircraft or for emergency
15 medical ambulances, air ambulances. We reserved it that
16 day on the 29th to use it for a LZ similarly as we did on
17 Highway 70 for 24/199.

18 We had the same briefing, had the same
19 discussion with PG&E lead representatives to make sure
20 this was still voluntary and they were complying with our
21 requests.

22 Q. And describe the process of removal, recovery,
23 and documentation.

24 A. This was a little bit different in that we had
25 the ability to drive small pick-up trucks to the tower
26 location as opposed to flying everybody there. But due

1 to the amount of time and daylight we had left and
2 weather conditions anticipated coming later that day, we
3 weren't able to get our forensic team from the FBI to
4 forensically photograph the tower before it was removed,
5 but we had the LiDAR scans. We were confident that that
6 would give us the information we needed to show us the
7 native position everything was in as it was removed or
8 before it was removed.

9 So the helicopter again kind of the same thing.
10 We had Nick Moore at the tower. He had -- the distance
11 between the LZ and the tower was horizontally probably
12 less than a mile. And so it was a really quick
13 turnaround. So Nick was able to easily say "Okay. This
14 particular piece of equipment is now in the helicopter.
15 It's on its way to you." And within a moment I had
16 visual custody of that piece of equipment.

17 Excuse me.

18 Again, we had the PG&E employees working with
19 the helicopter to remove the equipment from the sling.
20 Once it is safely removed and the helicopter is away, it
21 was handed over to me. And I maintained custody of it
22 from that point forward.

23 Q. All right. Looking at photograph or Exhibit
24 Number 439, what are we looking at here?

25 A. This is the first piece of equipment from, yeah,
26 32/260.

1 Q. So a piece of your equipment being flown into
2 the LZ?

3 A. Correct. This is -- what you can see in the
4 photograph is an insulator string.

5 Q. All right. And Exhibit 440?

6 A. This is -- this is, I believe, the same
7 insulator string coming in, the first piece of equipment
8 and being received by PG&E employees.

9 Q. And 441?

10 A. This is the equipment being removed from the
11 sling by PG&E employees.

12 Q. And 442?

13 A. I have that. That is similarly being removed
14 from the sling by PG&E employees.

15 Q. Now, you described earlier -- you talked about a
16 grappling hook.

17 A. Yes.

18 Q. And in this photograph can you see the grappling
19 hook?

20 A. I can. It's red.

21 Q. Okay. Why don't you show us what the grappling
22 hook is.

23 A. It's this (indicating) portion of the -- sorry.
24 It's this (indicating) portion of the sling right here in
25 red.

26 Q. All right. So let's move on to 443. See that

1 photograph in front of you?

2 A. I do have 443.

3 Q. And what does 443 depict?

4 A. This is the dead-end insulator string with the
5 C-hook attached.

6 Q. How can you tell it's a dead end?

7 A. It's marked on the cardboard that we used for
8 identification.

9 Q. Four forty-four?

10 A. I have it.

11 Q. What is 444?

12 A. This is the left phase insulator string.

13 Q. How can you tell?

14 A. It's marked on the cardboard it's resting on.

15 Q. Four forty-five?

16 A. This is the dead-end first insulator bell from
17 the string and the dead-end first hook or the dead-end
18 hook.

19 Q. And how can you tell that?

20 A. It's marked on the first bell.

21 Q. And you see anything significant in this
22 photograph that you believe to be significant?

23 A. Yes. What's significant is you don't see
24 anything abnormal that we saw on many of the other hooks.
25 This doesn't have a wear pattern.

26 Q. Four forty-six?

1 A. I have 446.

2 Q. And what does 446 depict?

3 A. This is the left phase C-hook and first bell

4 from the insulator string from the left phase of 32/260.

5 Q. How can you tell that?

6 A. It's marked on the first bell.

7 Q. And you see anything that you believe to be

8 significant in this photograph?

9 A. Yes. If this is original equipment, it is -- it

10 does have a wear pattern. It is significant. It's not

11 as significant as some of the other hooks.

12 Q. Anything else that you see that is significant?

13 A. Yes. This has -- I can't see it very well in

14 this photograph, but from my memory I believe this has a

15 circle "B" on it.

16 Q. Let's see if we can blow it up.

17 A. I'm sorry. It's just a raised "B."

18 Q. All right. So it's the same as the 27/222 hook?

19 A. Yes.

20 Q. Four forty-seven.

21 A. I have that.

22 Q. What does 447 depict?

23 A. This is the right phase insulator hook and first

24 bell.

25 Q. How can you tell that?

26 A. It's written on the first bell.

1 Q. Four forty-eight?

2 A. I have that.

3 Q. What does 448 depict?

4 A. This is the -- based on the geometry of the
5 angle iron, this is the left phase support arm with
6 scale.

7 Q. Anything you believe is significant about this
8 photograph?

9 A. Yes. It does have a little bit of wear though
10 not nearly as much as some of the others we have seen and
11 it does not have a ST-20 bracket.

12 Q. Okay. When you're talking about a little bit of
13 wear, you're talking about on the hole right here
14 (indicating); correct?

15 A. Yes. Specifically, again this is upside down
16 from its original as-built position. But this would be
17 the lowest -- in this picture is the top apex, but its
18 native position is the lowest apex position. So where
19 the red discoloration is or brown.

20 Q. So we're looking here at almost 20 millimeters
21 of metal between the edge of the hole and the edge of the
22 steel or iron or whatever that it is; correct?

23 A. Correct based on that scale, yes.

24 Q. As opposed to some of them where we're talking
25 about four to five millimeters?

26 A. Correct.

1 Q. All right. Four forty-nine.

2 A. I have that.

3 Q. And what does 449 depict?

4 A. I believe this is the opposite side of the same
5 left phase support arm.

6 Q. It's a little bit easier to see this one. It
7 looks like the wear pattern is approximately 13 or 14
8 millimeters?

9 A. I would say that is a good approximation.

10 Q. Move on to 450.

11 A. I have 450.

12 Q. What does 450 depict?

13 A. This is the dead-end hook from 32/260 by itself.

14 Q. Anything that you believe is significant about
15 this photograph?

16 A. Yes. It's -- I think it's a good representation
17 of what the original hook shape should be. It has
18 minimal wear comparatively speaking.

19 Q. Four fifty-one.

20 A. I have 451.

21 Q. What does 451 depict?

22 A. This is the left phase hook of 32/260 by itself.

23 Q. And what do you believe is significant about
24 this photograph?

25 A. It has the raised "B" and again the wear pattern
26 that was talked about before.

1 Q. And finally, four fifty-two.

2 A. Yes. This is the right phase hook from 32/260
3 by itself.

4 Q. And anything significant about this photograph?

5 A. Again, the amount of wear is not consistent with
6 the other hooks we've seen in other exemplar towers.

7 Q. Okay. And is there a manufacturer's mark on
8 this (indicating) one?

9 A. There appears to be, yes. They're covered in a
10 lot of paint. It's much easier to see on the screen but,
11 yeah.

12 Q. Let's see. That's not going to focus. We're
13 talking about right here (indicating); correct?

14 A. Yes. I believe that to be a raised "B."

15 Q. All right. Why was 32/260 chosen as part of the
16 exemplar tower project?

17 A. Well, it was a transposition tower with a
18 similar-type build with similar equipment on it. There
19 was something that was different though about it. This
20 was deep in a canyon, much lower elevation from the
21 canyon bottom than all of our other towers.

22 The worst towers were near a hilltop or ridge
23 top with dissecting canyons nearby. This particular
24 canyon or the location of this tower in the canyon was
25 maybe 100 feet above the water; not very high. And at
26 that time the water was flowing pretty well at that

1 point. We went by to look at it.

2 I believe a lot of it has to do with the wind.
3 I'm not a metrologist. I'm not going to pretend to be
4 nor am I, you know, an expert on how the wind affects
5 specifically a transposition tower, but that is a
6 difference in that location is the wind patterns are
7 different.

8 I do know about wind and how it affects my job
9 as a firefighter. I think that that is a factor.

10 Q. So going back and borrowing from some phrases we
11 used back the first time you were here, one of them we
12 learned is protected area. And that's an area that's the
13 backside of something that is protected from the fire.

14 A. Yes.

15 Q. Based upon your experience up there, multiple
16 trips to the different towers, would you say that 32/260
17 was in a protected area from the wind?

18 A. Yes.

19 Q. As opposed to 20/160?

20 A. Yes. So 20/160 was very exposed to the down
21 canyon diagonal winds or the diagonal wind pattern --
22 excuse me -- down in the valley -- I'm sorry. The bottom
23 of the canyon -- excuse me -- was well protected.

24 Other locations we had difficulty standing on
25 windy dates. The day that we collected this evidence was
26 a windy day as evident by the clouds. Those types of

1 clouds are usually associated with wind as you can see in
2 the pictures. And down there at the bottom of the canyon
3 we didn't have any significant wind by Nick Moore. Well,
4 I can't speak for him. But even at the LZ we had quite a
5 bit of wind which was only, you know, maybe a thousand
6 feet of elevation above the tower.

7 Q. We talked back in April about 27/222 being not
8 only at the peak up on top of a ridge line but also being
9 a convergence of the Feather River Canyon and Flea
10 Canyon; correct?

11 A. Correct.

12 Q. Were any of these other towers, the exemplar
13 towers, at similar convergence points?

14 A. Yes. In fact, if I can refer to Exhibit 385.

15 Q. Absolutely. Let me pull it up on the board real
16 quick.

17 A. It's got a great kind of perspective. So up
18 where the numbers 20/160 are, you can see where that's
19 right at a convergence of the canyon.

20 Q. Right here (indicating)?

21 A. Yeah. At the top of the photograph, correct.

22 Q. So the Feather River Canyon coming through here
23 (indicating) down below?

24 A. Yes.

25 Q. And then you're talking about this canyon up
26 above; correct?

1 A. Correct. So that was a canyon convergence. On
2 24/199 if you look opposite of where that tower is at
3 specifically where the crest is, there's a -- on the
4 other side of the canyon there's another spur canyon
5 coming off of there. That's also a convergence. At
6 27/222 obviously you have the giant Flea Valley that's
7 pretty evident right there.

8 Q. Where it comes out and empties at Pulga?

9 A. Correct. At tower 32/260 we do have a bend in
10 the river, but there's no convergence of canyons. But on
11 35/281 what we have there is a spur ridge with a canyon
12 on either side of it. So you're going to have a
13 convergence there as well.

14 Q. So the exemplar towers were not only picked
15 because they were the same type of towers as 27/222 but
16 also because they're similar or opposite conditions?

17 A. Correct.

18 Q. Compare and contrast?

19 A. And I do believe this -- between 20/160 and
20 35/281 I believe that we collected evidence from every
21 transposition tower that was between those two points.

22 MR. NOEL: Okay. I think that's all I have.

23 Do the jurors have any questions? All right.
24 We have a couple of questions from the jurors.

25 BY MR. NOEL:

26 Q. To your knowledge, has any investigation into

1 the fire that started up near Flea Mountain the same
2 morning as the Camp Fire been investigated?

3 A. Could you repeat the question one more time.

4 Q. To your knowledge, has there -- I will rephrase.

5 To your knowledge, has there been any
6 investigation into a fire that started up near Flea
7 Mountain on November 8, 2018?

8 A. We didn't have a report of a fire specifically
9 near Flea Mountain. We did have another report of a fire
10 at the intersection of Rim Road and Concow Road. And
11 that one was investigated by Cal Fire.

12 Q. And Flea Mountain is actually where the fire
13 camps are, isn't it?

14 A. Correct.

15 Q. In your opinion and your examination of the
16 failed equipment as well as the items that served as
17 exemplars, is there significant enough damage to these
18 exemplars to cause concern about these items still in
19 service being subject to failure?

20 And this simply is your opinion.

21 A. So it would be conjecture because of my opinion
22 but --

23 Q. So that means it's not evidence?

24 A. Yeah. So this is -- just from my observations I
25 will tell you what I understand is that we took equipment
26 from five towers. Four out of five had equipment that

1 was failing. There's a lot of equipment out there. I
2 don't know the status of the other lines. I don't know
3 the status of the towers having not inspected them
4 myself. But just based off the numbers and probability
5 alone, I would say there's probably more equipment out
6 there that is in the process of failing, yes.

7 Q. Do you at any time feel PG&E was withholding any
8 evidence from you?

9 A. I feel that PG&E has been cooperative very
10 specifically to what we're asking them to do. They're
11 not providing anything above and beyond what we've asked
12 for. But they have made it so that we haven't had to go
13 through extraneous court processes to get equipment and
14 material and information from them. So they have been
15 being forthright but not always timely with their
16 responses.

17 Q. Well, as part of your investigation did you keep
18 track of PG&E's public pronouncements with regard to the
19 Camp Fire and the Caribou-Palermo line?

20 A. Yes.

21 Q. Now, back in December did PG&E make an
22 announcement about the status of the Caribou-Palermo
23 line?

24 A. They did.

25 Q. What was that?

26 A. That the -- there was a --

1 I assume you're referring to the Study 9.

2 Q. Well, we're not going to talk about that.

3 A. Okay.

4 Q. But just to put it frankly, did PG&E announce
5 that they were -- the line was de-energized and they were
6 trying to figure out what to do with the line?

7 A. Yes. They told us that they had identified that
8 there were issues -- publicly identified there was issues
9 and they had not made a determination whether or not it
10 would ever be re-energized again.

11 Q. Subsequently PG&E has announced that the
12 Caribou-Palermo is being decommissioned?

13 A. I've heard that on the news and read it in the
14 news, yes.

15 Q. So on January 31 35/281 still had its original
16 transposition hardware on it; correct?

17 A. I'm sorry. What date?

18 Q. January 31st.

19 A. Yes.

20 Q. What was the weather like in late January and
21 early February?

22 A. Very wet, stormy. Everything was soggy. The
23 ground was unstable. We had difficult accessing even --
24 you know, roads that were normally accessible were
25 inaccessible.

26 Q. Now, you said you went up to do the LiDAR prior

1 to the removal of evidence --

2 A. Correct.

3 Q. -- in early February; correct?

4 A. Correct.

5 Q. How did weather play a factor into when you
6 actually were able to do that?

7 A. It prevented us from doing anything. What few
8 windows we may have had were either unexpected windows in
9 the weather or equipment and personnel were not
10 available. So it really pushed us back a number of
11 months that we wanted to get more work done sooner than
12 later.

13 Q. But yet when you arrived at 35/281, all of the
14 transposition hardware had been replaced?

15 A. It had been, yes.

16 Q. On a de-energized line?

17 A. On a de-energized line to my knowledge, yeah.

18 Q. Exhibits 410 and 411 show a raised letter "B" on
19 the C-hook.

20 A. Let me refer to those real fast for you before
21 you ask the question.

22 Q. Yep.

23 A. Referring to 410 and 411?

24 Q. Yes, 410 and 411.

25 A. I have 410 and 411 in front of me.

26 Q. Okay. And the question says "Since these were

1 made between 1911 and 1930."

2 Now, you've researched historically those hooks
3 and the numbers on them and the symbology on them;
4 correct?

5 A. Correct. But it's from -- some of that original
6 information was from an unverified website. Other
7 information that we got from Hubbell who now owns Ohio
8 Brass confirmed that it is very likely that was the time.

9 Q. Okay. So we don't know for sure that they were
10 made during that time? Just based upon the available
11 data right now, the historical data, that is your
12 conclusion?

13 A. Yes. And I can say that we do know that these
14 were for sure made before 1967 because that would bring
15 an entirely different shape and design to their
16 stampings. And that was absolutely verified by Hubbell.

17 Q. Do you know if any of these C-hooks had been
18 replaced before?

19 A. I would love to know the answer to that. I
20 don't know. And I'm sure there's some of them that have
21 been. I could only assume. This isn't the first time
22 they've had an issue with them. But to my knowledge, I
23 don't know if any one had ever been replaced.

24 Q. In your review of the historical documents, the
25 maintenance documents, the repair documents from PG&E,
26 have you found any documents indicating that this -- that

1 the C-hooks on 27/222 had ever been replaced?

2 A. No.

3 Q. Or on 24/199?

4 A. Nope.

5 Q. Or 35/281?

6 A. No.

7 Q. Or 260?

8 A. No.

9 MR. NOEL: All right. Any further questions?

10 Madam Foreperson, the admonishment, please.

11 GRAND JURY FOREPERSON: Okay. Captain Kluge,
12 you are admonished not to discuss or disclose at any time
13 outside of this jury room the questions that have been
14 asked of you or your answers until authorized by this
15 grand jury or the Court. A violation of these
16 instructions on your part may be the basis for a charge
17 against you of contempt of court. This does not preclude
18 you from discussing your legal rights with your own
19 attorney.

20 Captain Kluge, what I have just said is a
21 warning not to discuss this case with anyone except the
22 Court, your lawyer, or the district attorney.

23 THE WITNESS: Okay.

24 GRAND JURY FOREPERSON: Okay. Thank you for
25 your time today.

26 THE WITNESS: Thank you.

1 MR. NOEL: It is now seven minutes to 3:00, our
2 normal break time. Take a 15-minute break and start up
3 fresh with Captain Lohse at ten after?

4 GRAND JURY FOREPERSON: Okay.

5 [Recess taken from

6 2:53 until 3:22 p.m.]

7 GRAND JURY FOREPERSON: Okay. We're ready. The
8 grand jurors have all returned, the members have all
9 returned from their break. And we will get started.

10 MR. NOEL: Captain Lohse, please.

11 GRAND JURY FOREPERSON: Captain Lohse, before
12 you have a seat, I need to swear you in. Would you
13 please raise your -- thank you.

14 Captain Lohse, do you solemnly swear that the
15 evidence you shall give in this matter pending before the
16 grand jury shall be the truth, the whole truth, and
17 nothing but the truth so help you God?

18 THE WITNESS: I do.

19 GRAND JURY FOREPERSON: Thank you. Have a seat,
20 please.

21 THE WITNESS: Thank you.

22 **EXAMINATION**

23 BY MR. NOEL:

24 Q. Captain, could you please state your full name
25 spelling your last name for the record.

26 A. Scott Lohse, L-o-h-s-e last name.

1 Q. Captain, by whom are you employed?

2 A. Cal Fire Department of Forest Fire and
3 Protection. Also known as Cal Fire.

4 Q. And in what capacity?

5 A. As a fire captain specialist with the Tehama
6 Glenn Unit.

7 Q. What is your specialist? What is your
8 specialty?

9 A. Fire investigator.

10 Q. How long have you been with Cal Fire?

11 A. Since 2006.

12 Q. Describe for us your career, the path in Cal
13 Fire -- within Cal Fire that has brought you to your
14 current position as a fire captain specialist.

15 A. Started with education. In 2006 I obtained an
16 associates degrees in fire technology from Butte College
17 and then I began my career in the same year with Cal Fire
18 as a firefighter. Obtained a bachelor's degree in public
19 administration from Chico State and also just
20 incorporated education towards my goal of being a Cal
21 Fire firefighter.

22 In 2011 I became a fire apparatus engineer and
23 went to a company officer academy where I was trained in
24 fire investigation; basic fire investigation. In 2016 I
25 went to POST, the California Peace Officers Standard
26 Training. Went to regular basic course. From there I

1 became a fire captain in March of 2016 and in my current
2 position that same year.

3 GRAND JURY FOREPERSON: Captain Lohse, excuse
4 me. Would you mind moving your microphone up a little
5 bit, please. We're having a hard time hearing you.

6 THE WITNESS: Okay.

7 MR. NOEL: Pull it towards you a little bit,
8 too.

9 THE WITNESS: Okay. Better?

10 GRAND JURY FOREPERSON: Yes. Thank you.

11 BY MR. NOEL:

12 Q. Sir, you're a peace officer?

13 A. Yes.

14 Q. What training do you have in wildland fire
15 origin and cause investigation?

16 A. I'm a certified National Wildfire Coordinating
17 Group fire investigator INVF. I'm also a state fire
18 marshall certified investigator one.

19 Q. Describe the training that qualifies you for
20 those certifications.

21 A. With the certified NWCG training you have to
22 have FI-210 as well as a basic task book that shows you
23 can accomplish a task as a fire investigator on multiple
24 incidents. And on top of that I completed the fire
25 investigation 310 which is an additional course based on
26 serial arson investigation.

1 Q. So you have completed 210 and 310. Is there a
2 110?

3 A. There is a 110 but having the 210 supercedes
4 that 110 basic course for general firefighting for fire
5 fighters.

6 Q. Okay. So 210 is specifically to origin and
7 cause investigation?

8 A. Correct. So 210 is the standard that Cal Fire
9 uses for our systematic investigations.

10 Q. And how long have you been a fire captain
11 specialist?

12 A. Since March of 2016.

13 Q. Did you have experience doing origin and cause
14 investigations prior to promoting to a fire captain
15 specialist?

16 A. Yes. Starting as a fire fighter in 2006 I
17 served as an assistant to company officers in origin,
18 cause, and determination. And when I became a company
19 officer in 2011, I was tasked with origin and cause and
20 as a fire apparatus engineer and have been so throughout
21 my career.

22 Q. To which unit were you assigned in November of
23 2018?

24 A. Tehama Glenn Unit.

25 Q. On November 8, 2018, were you ordered to assist
26 Butte County Fire with the Camp Fire?

1 A. I was not ordered to assist until November 12th.

2 Q. Okay. So on November 12 --

3 I don't know why I'm doing this. Give me a
4 second. Why do it from memory when you have it right
5 here.

6 All right. So what was your assignment on
7 November 12th?

8 A. My assignment was to assist in the origin and
9 cause investigation of the Camp Fire initially to conduct
10 the interviews.

11 Q. Okay. So physically did you have to respond to
12 Butte County?

13 A. Yes.

14 Q. And what kind of interviews were you supposed to
15 conduct?

16 A. Interviews related to residents in the area
17 regarding what they saw in regards to the Camp Fire.

18 Q. At some point on November 12th was your
19 attention or your assignment diverted?

20 A. Yes.

21 Q. To what?

22 A. I was assigned to go to Concow and Rim Road in
23 the community of Concow to assist in the investigation of
24 a possible second origin of the Camp Fire.

25 Q. Were you briefed prior to responding to Concow?

26 A. Yes.

1 Q. And why was it your belief the second fire was
2 in the area of Concow Road and Rim Road?

3 A. Photographs obtained from the Flea Mountain
4 lookout camera five showed a fire in that area separate
5 from the original Camp Fire.

6 Q. Now, I am showing you what has been marked as
7 Exhibits 56 and 57 for identification. Do you recognize
8 those photographs?

9 A. Yes, I do.

10 Q. What are Exhibits 56 and 57?

11 A. Exhibit 56 is from Flea Mountain camera lookout
12 five. This is an area of smoke coming from the
13 intersection of Concow Road crossing Rim Road taken at
14 6:48 a.m. on November 8th.

15 Q. How can you tell it's taken at 6:48 a.m.?

16 A. There is a caption at the top left that reads
17 so.

18 Q. Are you talking about this (indicating) right
19 here?

20 A. Yes.

21 Q. And that caption -- is that something that is
22 automatically supplied by the fire watch camera
23 equipment?

24 A. I would have to refer to someone else to answer
25 that.

26 Q. Okay. All right. So we're looking at 56 on the

1 board right here in front of us; correct?

2 A. Correct.

3 Q. Tell us what we're looking at.

4 A. We are looking south in the Flea Mountain
5 lookout camera five and we're showing smoke in the area
6 of Concow Road cross of Rim Road. And while at scene
7 standing at that location there's demarcations as far as
8 a saddle left of the smoke in a grassy area and to the
9 right of the smoke that helped us determine we were in
10 the right location for the original -- correction, for
11 the second Camp Fire.

12 Q. From this photograph how were you able to
13 determine a possible location in the intersection of
14 Concow Road and Rim Road?

15 A. Some of that determination was acquired before I
16 got there. But while looking at and observing this
17 photograph with the location -- seeing the location of
18 Flea Mountain lookout five as well as the certain
19 topographic features I just mentioned, we were able to
20 identify that this was the area of the second Camp Fire.

21 Q. And what does this photograph show to you as a
22 fire investigator?

23 A. That there's smoke and there'd been a fire.

24 Q. Moving on to 57 describe what we're looking at
25 on Exhibit 57.

26 A. Exhibit 57 was taken at 6:55. So seven minutes

1 after 56. And this is showing fire breaching the area of
2 approximately Rim Road in that same intersection.

3 Q. And feel free to get up and use the big board or
4 the Smart Board any time you want.

5 A. Okay. Thank you.

6 Q. So are you saying we could actually see fire on
7 this photograph?

8 A. Yes.

9 Q. Describe it.

10 A. There is fire here (indicating) at the base of
11 the road at this location here (indicating). This is Rim
12 Road and Concow Road goes this way and heads south.
13 Beneath this area there is a geographic bowl where the
14 Camp B Fire started.

15 Q. So we have to describe all of this for the
16 record. So we can see a flat light area going across the
17 top of this ridge and continuing past the fire. Are you
18 saying that that's Rim Road or Concow Road?

19 A. Correct.

20 Q. Okay. And then we can see what looks like
21 another road branching off going to the - if you're
22 looking at it from the bottom, up towards the top left
23 corner.

24 A. You actually can't see that road from here
25 because it's on this side here (indicating).

26 Q. Okay. Do you know what this is right here

1 (indicating)?

2 A. Yes. That is the little knob in that area.
3 It's just a little knob, a little deviation in the
4 topography.

5 Q. Okay. And the gold represents the fire?

6 A. Yes. The fire location at the given time.

7 Q. Now, originally you were shown photographs.
8 Eventually, were you shown -- were you able to obtain the
9 videos?

10 A. Yes.

11 Q. I have Exhibits 58 and 59. Do you recognize
12 those exhibits?

13 A. Yes.

14 Q. What are those exhibits?

15 A. Exhibit 58 is the Flea Mountain lookout camera
16 five showing the footage from the camera that you just
17 saw and then the second one 59-A is the Bloomer 9 East
18 camera which would be looking north towards the Camp Fire
19 fire origin.

20 Q. I'm sorry. We skipped that part. We didn't
21 even ask.

22 Did you become aware at some point that there
23 was possibly second camera footage of the Camp B Fire?

24 A. Yes.

25 Q. And what was that?

26 A. It was the Bloomer 9 East camera.

1 Q. Okay. So first off we have up on the big board
2 58, the video. I'm going to play the video. And can you
3 narrate to us what we're seeing.

4 A. This is Bloomer 9 East Fire Camp. It's not the
5 direction it's pointing. It's actually pointing to the
6 north.

7 Q. Actually, this is saying it's Bloomer. For some
8 reason we've got this mixed up.

9 A. Yeah. This is the Bloomer 9.

10 Q. Okay. This is Bloomer.

11 A. So this smoke here (indicating) is the original
12 Camp Fire.

13 Q. So describe what -- remember, we have to make a
14 record. So when you say "This smoke here --"

15 A. This smoke here in the top right-hand corner
16 represents the smoke from the large Camp Fire going on at
17 the time of this incident, at the time of this camera
18 footage showing it going from right to left and across
19 the screen.

20 Q. Oops. And, of course, this sucker.

21 GRAND JUROR NUMBER TWO: All of our exhibits are
22 off too, Mark. We don't have 56. What you were
23 referring to as 56 is 57 for us. Everything is a number
24 off.

25 GRAND JURY SECRETARY: Just a side note, when
26 Hartshorn was talking about them, they were labeled

1 incorrectly. So in your packet where it's Exhibit 57,
2 it's actually 56. So they're off by one number in the
3 packet if that helps.

4 MR. NOEL: And we somehow skipped a slide here.
5 So now we're back to 57; right? The Flea Mountain
6 camera?

7 GRAND JURY SECRETARY: Flea Mountain camera is
8 Exhibit 58.

9 MR. NOEL: Exhibit 58.

10 GRAND JURY SECRETARY: And in your packet it's
11 labeled 59, but it's really 58.

12 BY MR. NOEL:

13 Q. All right. So now we're at the Flea Mountain
14 camera. What are we seeing?

15 A. So this camera is looking south and it's showing
16 nothing as of now. And it'll get to a point where you'll
17 see a light smoke right here (indicating) in this area.
18 And that's the area of the still footage we looked at
19 earlier of the area of Concow Road and cross of Rim Road.

20 And later on this smoke, which I believe is from
21 the Camp B Fire -- or sorry, the original Camp Fire,
22 coming across the screen, you see all this smoke here
23 (indicating). This is the second origin, the Camp B Fire
24 that's at Rim Road across Concow Road.

25 Q. So basically, you start seeing smoke coming from
26 the area of Concow Road and Rim Road at about 7:00 --

1 A. Should be 6:48.

2 Q. Right. But in terms of the timeline on the
3 video, it's about 7.97, I think, seconds into the video.
4 And then the fire starts to appear here at 8:48.

5 Is that what it says? What does that say down
6 there? 7:66. Is that correct?

7 A. Correct.

8 Q. And now we restart it from here very quickly.
9 All that smoke is from the Camp A Fire?

10 A. Correct.

11 Q. The Camp Fire?

12 Okay. So now let's go to the Bloomer East.

13 A. As I mentioned earlier, Bloomer East is actually
14 facing the north. So fairly soon you should be able to
15 see the top. It's very quick. But in this area if you
16 can focus your attention on this area, you will see a
17 small area of smoke. And that is the Camp B Fire. This
18 large smoke coming across your screen is the original
19 Camp Fire. If we can freeze it -- oh.

20 Q. I'm trying to control it.

21 A. Oh.

22 GRAND JUROR NUMBER FOUR: We see it.

23 THE WITNESS: You see it. That is the area of
24 the Camp B Fire. And the Flea Mountain lookout camera
25 should be further north past that location. So we're
26 getting two different aspects.

1 BY MR. NOEL:

2 Q. All right. So once the possible origin that
3 Concow and Rim was identified, what happened?

4 A. We identified that location as a possible second
5 fire. So we proceeded to look at the whole area in
6 totality and determine if that was a second origin.

7 Q. Describe the process by which you did so.

8 A. As stated earlier, we used a 210 process. It's
9 a systematic investigation using the scientific process.
10 So first, we have to gather all this data to determine
11 where we go from there.

12 So we initially started walking from north to
13 south through that area that you saw earlier. And later
14 I refer to it in the report as a geographical bowl. And
15 we examine all the macro and micro fire indicators, macro
16 being the large scale, something you would see with a
17 naked eye, and micro later being the smaller versions
18 where you have to get down and really look at it in
19 detail.

20 We began observing all those indicators and
21 looking at all different impacted topography as the fire
22 affected the area.

23 Q. All right. You have in front of you the
24 exhibits. And I want to direct your attention to Exhibit
25 Number 60. Is that the correct number? The first photo
26 should be 60. Cool.

1 What are we looking at in Exhibit 60?

2 A. So if you can recall how you saw the image from
3 Flea Mountain lookout five, this is Concow Road right
4 here (indicating). And this comes around this way, if
5 you can imagine in your minds, and turns into Rim Road.
6 So we are actually looking south. This is the
7 geographical bowl I was referring to.

8 Within that geographical bowl we have a PG&E
9 12 kV conductor line running south to north through this
10 whole area. And so we are taking -- this is a picture --
11 an overall picture of that whole area, that whole
12 geographical bowl.

13 Q. So describe for us how using your 210 training
14 and requirements you began your investigation.

15 A. So the initial phase we're just looking at it.
16 Does this match the area and do these indicators that we
17 see in this area match the video of that?

18 So with our investigations we usually start from
19 the area of most damage to the area with the least
20 damage. But like I stated, we first examine this whole
21 area looking from north to south examining all the fire
22 indicators and things that came up. As I said, we're
23 looking at macro indicators. We are seeing on this
24 portion where I am located now the fire coming up at us.

25 And also as we walked down through this bowl,
26 the ground of this area -- if you can think about pottery

1 and stuff like that -- is hot. Something that is burned
2 like hot soil is a crunchy, crunchy, brittle soil.

3 As you walk down through this bowl, we began
4 noticing there's a little more vegetation, a little more
5 soil that was soft, pliable as it sustained less heat.

6 So with wildland fires near the origins there
7 should be less fire intensity. And that's why we go from
8 the area of more intensity, more damage to the area of
9 least damage.

10 So think of a match in a field. When that match
11 hits the ground, it's a very low intensity. It starts to
12 build, starts to build, and as it gains momentum is when
13 you see your most damage. So we try to go from the most
14 damage to the least damage.

15 Q. Okay. Let's move on to Exhibit 61.

16 A. Now, as I stated earlier, this is just us
17 examining the whole area, seeing what was in the area.
18 So this shows the conductor line. There are two
19 different conductors running south to north through this
20 whole area. And on the northern section of this
21 geographical bowl is a pine tree that is down on the
22 lines.

23 Q. And what are the lines? You say --

24 A. It's a PG&E conductor 12 kV conductor.

25 Q. And are the lines visible -- the electrical
26 conductor visible in the photograph?

1 A. Yes.

2 Q. All right. You're talking about the gray lines.
3 Two of them are joined together coming off the bottom
4 right side of the photograph going to the middle of the
5 photograph?

6 A. Correct.

7 Q. Once you've gotten your overall view, what are
8 you doing next?

9 A. Once I got -- once we had our overall view, we
10 start really looking at the indicators and going from the
11 area of most damage. We start down here because of all
12 the -- if you can look at all these -- the treeline up
13 here, you can see there's more foliage over here on this
14 side in the middle of the picture at the top as compared
15 to the right side top. So we determine that this area
16 was the area of most damage. And we're going to start
17 looking at indicators from back this way back to where a
18 possible origin could be detected.

19 Q. When you're talking about indicators, describe
20 for us what you're talking about.

21 A. Indicators represent an object or an area on the
22 ground that represents how the fire traveled through. So
23 if you can think about this paper right here, the fire
24 came from this (indicating) way this. This would be
25 damaged and this would be protected. So a lot of the
26 indicators we looked at is protection.

1 So if we see that the fire -- this paper is
2 damaged on this side and protected on this side, we can
3 gather that the fire came from this direction. And that
4 is an example of a fire indicator. But with all those
5 fire indicators we can get the fire vector, which is the
6 overall fire pattern and movement of the fire.

7 Q. Okay. Let's move on to Exhibit 62. What are we
8 looking at in Exhibit 62?

9 A. This is an example of an advancing fire
10 indicator. With our investigations there are three paths
11 a fire will take. There's advancing fire going forward,
12 the main heat of the fire, there's a lateral fire that
13 will go from side to side, and there is backing fire
14 which is basically the opposite of advancing. It's a
15 slow -- more slow burning away from the fire.

16 This photograph here represents an advancing
17 indicator as shown by the red placard on the bottom. You
18 can look at these grass stems. The tops -- it's called
19 cupping.

20 So we determined this indicator shows the fire
21 coming from your location this way in the photograph.
22 This is because of the cupping. The cupping is at an
23 angle like this per say where if the fire came from this
24 way, it's going to burn at an angle and burn this side
25 first and create basically a cup at the top of that stem
26 of how it burned.

1 Also you see in the reverse photograph that --

2 Q. Which is 63.

3 A. -- when we use the reverse photograph, that side
4 was more damaged than these stems on this side. And that
5 is that protection I was talking about and referring to.
6 As the fire comes from forward to back in the photograph,
7 it protects -- this side is protected. So this red arrow
8 represents the fire travel in this photograph.

9 Q. So now we're talking about 63, which is another
10 view of 62 from the other side?

11 A. Correct.

12 Q. So more damage to lesser damage?

13 A. Correct.

14 Q. Okay.

15 A. These photographs were taken at the north end of
16 the geographical bowl that I explained earlier closer to
17 the Rim Road side.

18 Q. All right. Move on to 64.

19 A. This is the same area as the previous two
20 photographs but showing more protection and more of the
21 overall picture of all these -- each of these are
22 indicators. Those represent the whole fire vector. The
23 fire is basically coming up this way from right to left
24 in the photograph. And later the origin of the fire was
25 closer to the right top corner of this photograph.

26 Q. So when we're looking at these, we're looking at

1 all these stems that are sticking out. They are all
2 consistently burned from the right side and going up into
3 the left side; correct?

4 A. Correct.

5 Q. And they are all over. Let's use our pen here
6 when it comes on. All right. It's a red pen.

7 So we're talking about these areas right here.
8 Some of the best ones that you can see are on here?

9 A. Correct.

10 Q. And you're saying it's not an accident that the
11 burning is all going that way or that the stems have all
12 burned very similar pattern?

13 A. Correct.

14 Q. That's an indication of fire direction?

15 A. Correct.

16 Q. That means this fire was moving from the right
17 to the left as the arrow shows?

18 A. Correct.

19 Q. All right. We will save that and print it out
20 later.

21 All right. Let's move on to Exhibit 65. See
22 that photograph?

23 A. Yes.

24 Q. What does -- now we're looking at something
25 yellow. Tell us about 65.

26 A. The yellow placard represents lateral fire

1 spread. So we have advancing going forward, lateral to
2 the sides. It will exhibit a lot of the same
3 characteristics as an advancing fire. It's just
4 basically the direction of the travel which makes it
5 specific.

6 So here we are looking at these -- this tree and
7 all the -- the trunks of the tree. And you can see
8 looking at this photograph there is relatively little
9 damage on the bark itself. So in this photograph it's
10 going from top to bottom fire travel.

11 Q. How do you tell lateral as opposed to forward?

12 A. Forward or advancing fire is -- basically it's
13 your direction of travel, but lateral fire indicators
14 should not be as pronounced as severe as advancing fire
15 because the fire is flanking to the right. It doesn't
16 have the momentum going forward.

17 Q. Let's go on to 66. Explain what we are looking
18 at on 66.

19 A. This is a reverse of the previous photograph,
20 and it represents the area the fire came from. So it's
21 another lateral indicator showing that this arrow is the
22 way the fire travelled. The fire traveled this way
23 leaving the backside of this little tree protected as
24 you saw in the previous photograph.

25 Q. So this we're looking at the tree from the
26 direction the fire is coming from; correct?

1 A. Correct.

2 Q. So you're actually seeing burning and charring
3 on the side of the tree facing us?

4 A. Correct.

5 Q. Whereas on the previous photograph 64, 65, there
6 doesn't appear to be any charring?

7 A. Correct.

8 Q. All right. Let's move on to 67. What are we
9 looking at in Exhibit 67?

10 A. Exhibit 67 is an area we determined there was
11 backing indicators with the blue upside down "U." You
12 can see at the bottom of the photograph here depicting
13 backing indicators as far as the amount of vegetation
14 left on the brush in this photograph and it's drooping
15 toward the fire toward where the fire came from to where
16 this is near Concow Road to where there's advancing fire
17 from Concow Road. And we determined that that was due to
18 the original Camp Fire meeting -- with the heat flux of
19 that fire meaning the backing indicators of the Camp B
20 Fire.

21 Q. Okay. So let's back up a little bit. In this
22 picture we have two different color flags. We have blue
23 flags and we have red flags. Is that correct?

24 A. There's a yellow over here also.

25 Q. Awe, okay. There's a yellow flag over there.
26 Is the color of the flag significance?

1 A. Yes. The color of the flag is a fire indicator
2 shown at that particular location. So red meaning
3 advancing, blue meaning backing, yellow meaning lateral
4 indicators.

5 Q. And then you said we have the upside down "U"?

6 A. Correct.

7 Q. Which means what?

8 A. The top of this placard here represents the fire
9 going this (indicating) way. So the -- I don't know how
10 to explain that. It's basically a point to where the
11 fire is going to.

12 Q. So the fire at that point where the blue upside
13 down "U" is you determine at that point the fire is going
14 up the photograph?

15 A. Correct.

16 Q. And then above that are a series of red flags
17 and a red arrow pointing directly at the or almost
18 directly at the blue "U"?

19 A. Correct.

20 Q. So we have fire coming the opposite direction
21 also?

22 A. That's correct.

23 Q. And explain to us how you determine that the red
24 arrows, the advancing fire coming away from Concow Road
25 were part of the original Camp Fire as opposed to the
26 Camp B?

1 A. So if there was no other influence on this top
2 portion of this soil here, we would continue to see the
3 backing indicators coming from the Camp Fire origin all
4 the way up to the top of the photograph. But as you see
5 in the photograph the degree of severe damage we have
6 here as well as these rocks exhibited protection and just
7 the devastation of that represented the fire traveling
8 downward in the photograph. So it did maintain the
9 consistent backing indicator all the way up to the road.

10 Q. So in that one area we have fire moving in
11 totally opposite directions?

12 A. Correct.

13 Q. All right. Exhibit 68. What are we looking at?

14 A. We are looking at a Ponderosa pine that had
15 fallen towards the southwest. I identified this as the
16 subject tree.

17 Q. What do you mean by the "subject tree"?

18 A. I determined to reference this tree for
19 references within my report, but it's the subject tree
20 being that it's the tree that caused the Camp B Fire.

21 Q. Okay. We'll get to the cause in a minute.

22 How were you able to determine the origin area
23 of this fire?

24 A. From all the -- like I said, the 210 course I
25 described earlier, we kick off where the origin of the
26 fire is. So with the subject tree we had to look at the

1 subject tree in detail to determine --

2 If I can backtrack. First off, this is an
3 earlier photograph when we first walked through the scene
4 as I talked about earlier to get an overall overlay of
5 the scene.

6 While the indicators you previously saw and in
7 all the photographs we came to a general origin area that
8 is basically an area where we determined generally where
9 the fire started. And we take that area and we work in
10 even more intensely to determine the exact origin of the
11 fire.

12 So this subject tree was in that general origin
13 area. And we needed to look at this subject tree further
14 to identify how it got there.

15 Q. All right. And Exhibit 69 -- what does this
16 show?

17 A. This shows the stump of the -- that same subject
18 tree. It also shows how the remaining subject tree
19 bottom exists as well as the condition of the stump with
20 burning and charring on the left side of the photograph
21 and more unburned on the right side.

22 Q. All right. Exhibit 70. What are we looking at?

23 A. Exhibit 70 shows the subject tree looking
24 southwest. The subject tree is in the middle of the
25 photograph pointed toward the southwest. Also present
26 are evidence placards placed at where evidence locations

1 were with the left side of the photograph showing the
2 subject tree stump.

3 Q. What is the significance of the evidence
4 placards?

5 A. The evidence placards show where evidence is
6 located. Those are also logged with GPS, but these
7 evidence placards represented seconds of illuminated
8 conductor. This here was the subject tree itself and
9 this one near the stump on the left side of the picture
10 was for the stump itself.

11 Q. And Exhibit 71. Can you plan this photograph.

12 A. Yes.

13 Q. Go ahead.

14 A. Exhibit 71 shows the bottom end of the subject
15 tree and the fibers and everything remaining on the
16 subject tree. Also we have the subject tree laying on an
17 existing log that was laying on the ground.

18 Q. Why is that significant?

19 A. It becomes significant to determine if the tree
20 fell before or after the fire.

21 Q. How would that log laying underneath the tree
22 help determine if the tree fell before or after?

23 A. If the tree fell before the fire, there should
24 be protected vegetation or protected wood underneath the
25 subject tree in between the log laying on the ground. If
26 it fell after the fire, there should be no protection

1 because that area would have already burned. It would be
2 black already on that log.

3 Q. All right. Exhibit 72. What are we looking at?

4 A. This is the subject tree stump. This shows the
5 condition of the subject tree stump. And as you -- if
6 you could zoom in, you could see the top. And at the
7 scene we saw the top of this subject tree stump was not
8 fresh. It did not look as if it had splinters, fresh
9 splinters from a just fallen tree. In fact, it looked as
10 if it had been subjected to smoke and fire. Another
11 indicator suggesting that this tree could have fallen
12 before the fire.

13 Q. So you're saying that down here at the break
14 there appears to be fire damage?

15 A. Correct.

16 Q. And that would indicate what?

17 A. That the tree fell before the fire.

18 Q. How so?

19 A. If the tree fell before the fire, the stump
20 would be remaining standing still. When the fire would
21 come through, the fire would burn the remaining portion
22 of what is left of the subject -- or correction, of the
23 stump.

24 Q. Well, these portions -- the interior portions of
25 the stump would only be exposed to the fire if the tree
26 fell before the fire came through; is that correct?

1 A. Yes.

2 Q. All right. Exhibit 73 is a photograph.

3 The missing pages from earlier. We can take them later.

4 All right. The photograph marked as Exhibit 73,
5 what are we looking at?

6 A. Exhibit 73 shows the area -- the top of the
7 geographical bowl and the north side of the geographical
8 bowl. If you look further into the picture on the left
9 side in the middle going from left to ride is the subject
10 tree. This is a tree at the top of that bowl that fell
11 as we determined fell after the fire due to the
12 splintering in the fresh -- the fresh wood remaining on
13 the stump.

14 Q. Right. I want to contradict this with what we
15 saw before. You're talking about this stump right here
16 on the right side of the photograph; correct?

17 A. Correct.

18 Q. And he let's activate our pen. And we can draw
19 on this now.

20 So you're talking about this (indicating) damage
21 right there on the -- the right side of the circle in
22 red; correct?

23 A. Correct.

24 Q. And explain to us why that is different from
25 what was over on the subject tree?

26 A. The splinters and wood remaining in this area is

1 unburned where a fire term we called protected because we
2 determined this fell after the fire came through with the
3 outer bark being burned and this remaining clean and
4 unburned. The fire fell -- or the tree fell after the
5 fire that's -- opening up the stump which was protected
6 earlier.

7 Q. All right. So is the subject tree shown on this
8 photograph?

9 A. Correct, yes.

10 Q. Let's go with a different colored pen. Let's go
11 with a blue pen.

12 Can you show us by circling the subject tree for
13 us.

14 A. (Witness complies.)

15 Q. All right. So circled in blue going from upper
16 left-hand side to the middle of the photograph to a tree
17 laying on its side, that's what you referred to as the
18 subject tree?

19 A. Correct.

20 Q. Okay. What else is significant in this
21 photograph?

22 A. The PG&E 12 kV conductor line running south
23 north or top to bottom left to right in the photograph.

24 Q. All right. Using the -- let's use a highlighter
25 to do this. Using the yellow highlighter can you trace
26 for us the electrical line with the conductor you're

1 talking about.

2 A. Yes. (Witness complies)

3 Q. All right. So you've highlighted a thin gray or
4 silver kind of squiggly line that's moving from the
5 bottom of the photograph up towards the center of the
6 photograph?

7 A. Correct.

8 Q. All right. And let's save that. And this will
9 be 73-A?

10 [Exhibit 73-A marked
11 for identification.]

12 BY MR. NOEL:

13 Q. Okay. Let's move on to 74. What are we looking
14 at in 74?

15 A. Exhibit 74 is the subject tree stump.

16 Q. And what is the significance of this photograph?

17 A. The significance of the photograph is showing
18 the stump in relation to its topography as well as the
19 burn charring on the right side of the stump compared to
20 last time.

21 Q. How do we see the burn patterns you're
22 describing in this photograph?

23 A. The burn patterns are charring on the right side
24 and more protected on the left side. And more to this
25 photograph was just getting the overall remaining ends of
26 the stump to see how it fell, how it broke.

1 Q. Okay. Let's move on to 75. What are we looking
2 at in Exhibit 75?

3 A. This is the top end of the subject tree stump
4 looking down.

5 Q. And what does this photograph show or supposed
6 to depict?

7 A. This shows that the top of the subject tree
8 stump is not -- it does not have clean, protected wood.
9 The wood, in fact, has been charred and been subjected to
10 heat.

11 Q. Why is that significant?

12 A. Because it helps us determine if the tree fell
13 before or after the fire.

14 Q. Exhibit 76. Explain to us what we're looking
15 at.

16 A. Exhibit 76 shows the PG&E conductor running from
17 the top left to the bottom right showing the conductor
18 ending near the middle of the screen and also showing the
19 overall totality of the area.

20 Q. Why is that conductor of significance?

21 A. The conductor is significant because in this
22 photograph it shows that the conductor was broken on the
23 left side -- in this photograph the left side of each
24 conductor.

25 Q. How does the -- how can we see that?

26 A. The conductor did not continue all the way to

1 the south.

2 Q. Let's continue on to Exhibit 77. What are we
3 looking at here?

4 A. This shows a photograph looking at the overall
5 scene as well as a tree we determined by the same way we
6 determined the previous two stumps that you had shown to
7 fall after the fire with the conductor running through
8 the area as well as melted -- melted aluminum going
9 through from left to right in the photograph.

10 Q. So what is the significance of melted aluminum?

11 A. Melted aluminum based on our hypothesis
12 determine that the conductor was in fact in the air as
13 the fire passed through at this location.

14 Q. How so?

15 A. If the conductor is in the air, this is what we
16 call "aluminum drip." So it's basically aluminum was
17 melting off the steel core of the conductor and dropping
18 to the ground. And this is actually the conductor to the
19 right -- top right of the aluminum drip is a PG&E
20 conductor that is still intact.

21 So by determining that this tree -- by -- these
22 helped us determine as well as the stump that this tree
23 fell after the fire or the aluminum was suspended during
24 the fire. The tree fell after a fire passed through and
25 pushed the remaining aluminum conductor down the hill.

26 Q. Okay. Let's use our pen again as soon as this

1 opens up. And we'll call this 77-A.

2 So let's start off with our yellow highlighter
3 first. Can you highlight the in tact conductor you're
4 describing.

5 A. Yes. (Witness complies)

6 Q. All right. Now, let's use the blue highlighter.
7 Can you highlight for us what you indicated as the
8 aluminum drip or the aluminum pieces on the ground.

9 A. Yes. (Witness complies)

10 Q. All right. So now you've highlighted those
11 areas or surrounded or circled those area with the green
12 highlighter?

13 A. Correct.

14 Q. And let's use the blue highlighter itself. If
15 you can highlight -- pick out one or two pieces of the
16 aluminum drip or melted aluminum on the ground just to
17 highlight it.

18 A. (Witness complies).

19 Q. All right. So we'll -- like I said, we'll mark
20 that as 77-A.

21 [Exhibit 77-A marked
22 for identification.]

23 BY MR. NOEL:

24 Q. Going on to 78, what are we looking at in the
25 photograph marked Exhibit 78?

26 A. This is a severed end of one of the conductors

1 within the general origin area of the Camp B.

2 Q. What do you mean a severed end?

3 A. An end that we determined was severed from the
4 remaining portion of conductor. It did not continue
5 through the whole thing.

6 Q. Okay. And why is the severed conductor of
7 significance to you?

8 A. It's of significance because we -- there had to
9 be a reason for the conductor to break. And with the
10 factors of the subject tree being crossed, the area where
11 the PG&E conductor would have been is a significant piece
12 to the puzzle.

13 Q. Okay. What do you mean the subject tree being
14 across the area where the conductor would have been?

15 A. The PG&E conductor line ran south to north and
16 the subject tree fell to the southwest across the area
17 where the PG&E conductor would have been if it is
18 suspended.

19 Q. How can you tell that the conductor ran south to
20 north?

21 A. Due to the location of the poles. The power
22 poles.

23 Q. All right. So the power -- you were able to see
24 the locations of the relative power poles?

25 A. Correct.

26 Q. And where was the subject tree laying on the

1 ground in relation to the power poles?

2 A. It was in between poles -- it was in between the
3 pole on the northern section of the geographical pole we
4 saw earlier and -- sorry. Let me backtrack that. It
5 was -- I have a diagram that shows the scene which may
6 help.

7 Q. All right. We'll get to that in a second.

8 All right. Let's move on to 79. What are we
9 looking at in Exhibit 79?

10 A. This is another PG&E conductor that is severed
11 from the remaining intact conductor.

12 Q. Exhibit 80?

13 A. Another section of the severed end of the
14 aluminum PG&E conductor.

15 Q. Exhibit 81?

16 A. This is the severed end of the conductor that
17 was across Concow Road basically south of the
18 geographical bowl I depicted earlier. And this
19 photograph shows that the pins were not only cut with
20 some type of cutting device.

21 Q. How can you tell that?

22 A. Based on the serrations of the metal itself
23 where if we looked at the previous photograph, they were
24 more jagged edges. This photograph shows that they were
25 almost pressed.

26 Q. It looks like there's a good photograph in 78.

1 Can you highlight the difference between what we
2 were looking at in 78 on the ends and 81?

3 A. Yes. So these ends are jagged.

4 Q. Do you want the pen?

5 A. Yes.

6 Q. Hit your little arrows. Hit the arrow. There
7 you go. And then the center pink. And that will bring
8 you up your pen. It will take a second. There you go.
9 Now, you've got a red pen.

10 A. These ends are jagged, and they do not exhibit a
11 shiny fresh cut as compared to the other photograph.
12 This steel section of the one conductor is also different
13 from the severed conductor by tool.

14 MR. NOEL: All right. So let's save those. And
15 we'll mark that as 78-A. And we'll print that out and
16 get it marked and brought back to you.

17 [Exhibit 78-A marked
18 for identification.]

19 BY MR. NOEL:

20 Q. All right. Let's move on to 82. Explain
21 Exhibit 82 to us.

22 A. Exhibit 82 is another severed PG&E conductor.
23 This was south of the subject tree's location where the
24 previous --

25 Sorry. I'll stop there.

26 Q. And Exhibit 83.

1 A. Exhibit 83 shows the subject tree from right to
2 left in the right top of the photograph as well as a PG&E
3 power pole in the center of the photograph from bottom to
4 top as well as a PG&E conductor from the left side of the
5 photograph ending at the location of a power pole which I
6 later identified as PG&E pole number two.

7 Q. Okay. So this is a PG&E pole right here dead
8 center going up the photograph?

9 A. Correct.

10 Q. And where is the subject tree in relation to
11 this?

12 A. The subject tree is to the right on the right
13 side of this photograph.

14 Q. Did you examine the PG&E pole?

15 A. Yes.

16 Q. And obviously, just for the record, this pole is
17 laying on the ground. It's not standing up.

18 A. Correct.

19 Q. And do you see other parts to this pole in the
20 photograph?

21 A. Correct. At the bottom of the photograph is the
22 remaining stump of the PG&E pole number two.

23 Q. Anything else that should have been attached to
24 this pole?

25 A. The cross member which they call that would be
26 at the top is from the left side of this photograph as

1 well as an insulator bolt that would hold the PG&E
2 conductor.

3 Q. So we've got a lot going on in this photograph.
4 Let's mark this. So right here in red that's the pole;
5 correct?

6 A. Correct.

7 Q. And where is our subject tree?

8 A. (Indicating.)

9 Q. Okay. So go ahead and mark that subject tree.

10 A. Same color?

11 Q. Same color with your finger.

12 And let's write "subject tree."

13 A. (Witness complies.)

14 Q. And somehow I dragged something across there,
15 and there's squiggles between the two.

16 All right. Now, can you mark the stump.

17 A. Yes.

18 Q. Let's mark that as "stump."

19 A. (Witness complies.)

20 Q. And how do you determine that that stump belongs
21 to that pole?

22 A. We examined the severed ends of the pole itself
23 as well as the stump and determined the ends matched each
24 other.

25 Q. All right. So next we have crossarm. So why
26 don't you identify the crossarm.

A. (Witness complies.)

Q. And just right "X arm," I think.

And you said there's an insulator bolt?

A. Correct.

Q. And circle that and mark that "INSBLT."

A. (Witness complies.)

Q. And finally -- sorry. Finally, you said there's a conductor running through here?

A. Correct.

Q. So let's do that with our highlighter and highlight in yellow the conductors that you see.

A. And this was determined to be not a current conductor. That was an old piece of --

Q. And you're talking about the -- what appears to be a wire that's running through --

A. Correct.

Q. -- from the insulator bolt, across the top, and down past the stump?

A. Correct.

Q. Let's save this as 83-A.

[Exhibit 83-A marked

for identification.]

MR. NOEL: This is probably a real good time to break before we start moving into other areas of this.

GRAND JURY FOREPERSON: Okay.

MR. NOEL: So it's about 4:26 it looks like or

1 4:24. Normally, we stop at 4:30. So we could come back
2 next week and finish him up and do whatever other
3 witnesses we have for next week.

4 GRAND JURY FOREPERSON: Okay.

5 MR. NOEL: Plan on a short day next week.

6 GRAND JURY FOREPERSON: Okay.

7 Captain Lohse, you are admonished not to discuss
8 or disclose at any time outside of this jury room the
9 questions that have been asked of you or your answers
10 until authorized by this grand jury or the Court. A
11 violation of these instructions on your part may be the
12 basis for a charge against you in contempt of court.
13 This does not preclude you from discussing your legal
14 rights with your own attorney.

15 Mr. Lohse, what I have just said is a warning
16 not to discuss this case with anyone except the Court,
17 your lawyer, or the district attorney.

18 Do you understand?

19 THE WITNESS: I understand, yes.

20 GRAND JURY FOREPERSON: Okay. Thank you for
21 your time today.

22 THE WITNESS: Thank you.

23 MR. NOEL: All right. You may step down for
24 right now.

25 Are we in recess for the night, Madam
26 Foreperson?

1 GRAND JURY FOREPERSON: Yes, we are.

2 MR. NOEL: Okay. Be back next Tuesday at 8:30?

3 GRAND JURY FOREPERSON: Yes.

4 [Matter adjourned at 4:25 p.m.]

5 ---oOo---

COURT REPORTER'S CERTIFICATE

This is to certify that I, Lisa McDermid Welch, a Certified Shorthand Reporter of the State of California was present at the time and place the foregoing grand jury proceedings were had and taken in the within matter; and that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings; and afterwards caused my said shorthand writing to be transcribed into typewriting; and the foregoing pages, beginning at the top of Page 1 to and including Page 200 hereof, constitute a full, true, accurate, and complete record of the proceedings.

DATED: This 6th day of June, 2022.

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: Captain Lohse, raise
your right hand, please.

CAPTAIN SCOTT LOHSE
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: Yes.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. Captain Lohse, when we left off last week we
were looking at Exhibit No. 83 and talking about the
fallen power pole. I want to go back at this point and
refresh a little bit on your methodology for conducting a

1 wildland origin of cause investigation.

2 You talked about how you go around and you look
3 at all the, look at all of the micro indicators, macro
4 indicators. Explain to us your mental process as you are
5 doing so.

6 A. As I'm doing so, I'm making sure to keep the
7 scientific process in mind for collecting data. All the
8 macro and micro indicators you just mentioned are part of
9 collecting that data in order for us to determine a
10 hypothesis on what started the fire, called an "origin
11 and cause" investigation. So we always go find the
12 origin of the fire first, where the fire was located,
13 where it was started. Then from that area determine what
14 actually caused the fire.

15 Q. What are these hypotheses, hypotheses?

16 A. Are you talking for this fire?

17 Q. Just in general.

18 A. Hypothesis is a, based on all the data given,
19 it's a working, a working idea, working theory to
20 disprove. So we always work to disprove a hypothesis.
21 From all that data and everything we have, we're trying
22 to disprove the theory that we have come up with in what
23 started the fire. That's based on, like I said, all the
24 data that's available.

25 Q. Do you only have one hypothesis?

26 A. No. We, based on the data that we have, we

1 were able to form multiple hypotheses and try to disprove
2 each to better identify the most probable cause of any
3 fire.

4 Q. As you were walking through, doing the origin
5 investigation at the Camp B fire, did you formulate
6 hypothesis, hypotheses regarding what caused the fire?

7 A. Yes. And this is determined after we have
8 looked at the fire indicators and came to a general
9 origin area, basically an area that we say this is
10 generally the area the fire started, and we can work
11 further in from here. I developed from this fire five
12 different hypotheses.

13 Q. Do you recall your five different hypotheses?

14 A. If I can look in my report?

15 Q. If that would refresh your recollection.

16 For the record, Captain Lohse has a copy of his
17 Origin and Cause Report with him.

18 A. And I refer to these hypotheses as
19 possibilities, but the general working hypothesis, I had
20 five different possibilities.

21 Possibility No. 1 was the subject tree that we
22 identified earlier fell prior to the fire, struck PG&E
23 conductors lines, creating ignition against subject tree,
24 leaving power pole in this photo in place. The recloser,
25 PG&E recloser opened the circuit with no other ignitions
26 occurring. The conductor lines fell to the resting

1 location. Basically the fire was started by the subject
2 tree falling to the PG&E conductor lines, creating a fire
3 against the tree.

4 Possibility No. 2 is the subject tree fell
5 prior to the fire, struck the lines, creating ignition
6 into the tree. Pole number 2 stayed in place. Lines
7 separated, arced to the ground, making contact with
8 either one or both lines, creating multiple ignition
9 sources for the lines contacting the ground. This
10 hypothesis was based on the possibility of multiple fires
11 occurring from the hot ends, or electrically charged ends
12 of the conductor lines falling.

13 Possibility No. 3 suggested, was the subject
14 tree fell prior to the fire, struck de-energized lines
15 with no ignition, but left broken conductors, that the
16 fire resulted from another source.

17 Possibility No. 4 was a subject tree fell
18 during the fire when the fire passed through, struck the
19 conductor lines, creating ignition against the tree, but
20 after the fire was already in its location.

21 Q. So let me stop you on No. 4. When you say
22 "subject tree fell during the fire," what do you mean?

23 A. That the fire was already in place prior to the
24 subject tree falling.

25 Q. Okay. And what fire would that be?

26 A. The Camp Fire.

1 Q. Okay. So you're talking about the larger Camp
2 Fire coming in and roaring through as opposed to B fire
3 starting --

4 A. Or any fire. I was -- just based on the data I
5 have, I just wanted to rule out that the strike, or the
6 tree fell prior to the fire. So by looking at this,
7 basically saying the subject tree fell during the fire
8 when the fire passed through. So we had to rule that out
9 basically.

10 Q. Okay. Go ahead.

11 A. Possibility No. 5 was that the fire started
12 from a 1996 Dodge pickup that was located on Concow Road
13 south of Rim Road.

14 Those are my five possibilities I referred to
15 in there.

16 Q. Now, most of those possibilities involved in
17 some way this electrical line that was running through
18 the area?

19 A. Correct, except for possibility No. 5.

20 Q. Do you have any specialized training in
21 investigating electrical-line-caused wildland fires?

22 A. Yes.

23 Q. Please explain that to us.

24 A. I've taken online courses on the basic elements
25 of electricity, as well as been involved in the 2017
26 Sonoma County fires as well as the Creek Fire in southern

1 California in 2017. Those are both large wildland fires
2 originating from electrical equipment.

3
4 (Grand Jury's Exhibit 84 introduced.)

5
6 Q. Let's start going forward to Exhibit 84. Now
7 that you've made these hypotheses, that this is possibly
8 a, electrical-line-caused fires, what steps do you take
9 next?

10 A. Once that's been determined, we basically try
11 to, due to the scientific process, try to rule out or
12 disprove all hypotheses. And we're still collecting data
13 as the fire -- as our investigation continues.

14 The photograph here is of a PG&E recloser that
15 was approximately 1.1 miles south of the Camp B origin
16 area. This recloser shows that it was open at the time
17 of this photograph. This recloser was, as I said, 1.1
18 miles south of the fire, Camp B Fire. It was located on
19 a pole that was disconnected from its original pole, had
20 broken off, was on the side of the road.

21 Q. Do you know what a recloser is?

22 A. Yes.

23 Q. What is a recloser?

24 A. A recloser works as a, originally for fire
25 control or fire safety method for PG&E, in this case.
26 Basically when there's a fault against the line, a

1 recloser is intended to attempt to correct any fault that
2 was created by reclosing. So when a fault occurs, the
3 circuit was open, the recloser basically recloses the
4 circuit to attempt to fix whatever issue is going on.

5 This recloser was a one-time recloser, meaning
6 it had locked. It had been changed to incorporate -- due
7 to the fact that this is in a high fire hazard area, it
8 would just -- if a fault happened, it would not reclose
9 the circuit, it would just open and stay open.

10 Q. So what does it mean for the circuit to be
11 open?

12 A. For the circuit to be open -- as electricity
13 flows, it needs a closed circuit, so it needs full
14 contact. If you can imagine any electrical circuit,
15 lights in this room, they're all on one closed,
16 self-continuous circle or circuit. As soon as that
17 circuit is opened, a line is cut to where there's a
18 separation in electrical connectivity, it stops the flow
19 of electricity.

20 Q. So what does it mean to you that this recloser
21 was open?

22 A. This means to me that a fault occurred on the
23 line. And being the fact that the power flowed from
24 south to north, that something north of this recloser
25 faulted on the 1101 Big Bend 12 kV circuit.

26 Q. Why is that significant?

1 A. It is significant because that area
2 incorporates the area of the Camp B Fire.

3 Q. Now, you said that the power at that area flows
4 from south to north?

5 A. Correct.

6 Q. How were you able to determine that?

7 A. That was determined through conversations with
8 PG&E personnel, above my level.

9 Q. All right. Was the recloser depicted in item
10 No. 84, or Exhibit No. 84, collected and seized as
11 evidence?

12 A. Yes.

13

14 (Grand Jury's Exhibit 85 introduced.)

15

16 Q. All right. Okay. So now on to No. 85.
17 Showing you photograph marked as Exhibit No. 85, can you
18 explain to us what we're looking at?

19 A. This is the photograph I took looking south,
20 showing my evidence markers 4 through 9, which are
21 generally 4 to 6 inches each of aluminum conductor
22 breach, evidence markers. As well as the subject tree in
23 the photograph as well.

24 Q. What is the red marker there in the middle?

25 A. The red indicates an advancing indicator.

26 Q. So as a fire investigator, what are you

1 learning, or how are placards 4 through 9 and the red
2 flag helping you to determine where and why this fire
3 started?

4 A. The red flag was determined based on our origin
5 and cause investigation finding indicators coming through
6 a general origin area and a specific origin area.
7 Showing where the fire came from helps us determine where
8 the fire came from.

9 The, within that area we're looking for any
10 abnormalities, be it wire, ammunition, shell casings,
11 anything that should not be in that location. So the
