12 indicators -- I'm sorry -- the evidence markers show
13 those aluminum conductor pieces, because on a normal
14 operating conductor line, we should not have those in
15 those locations. So those marked the positions of where
16 those were and in relation to the advancing fire showing
17 the fire pattern at that given location.

18 Q. When you talk about aluminum conductor pieces,
19 describe for us what you mean.

20 A. They resemble the same characteristics as the
21 conductor line that was flowing overhead. And they were
22 approximately 4 to 6 inches in length, and were not a
23 metal, per se, they were aluminum in their type.

24 Q. So in the background up here we can see some
25 more green and some pink. Do you recall what those
26 denote?

A. Yes.

Q. What's that?

A. If I'm looking at it correctly, the green here shows the location of a strike mark on the subject tree, as well as this green mark to the left of the frame, further up, to the left side of the tree, showing another strike mark, that we identified as a strike mark, of a conductor against the tree.

Q. So when we're talking about subject tree, this tree that's laying on the ground that runs from top left corner to middle right all the way across, that's the subject tree you're talking about?

A. Correct.

Q. You said that those are strike marks?

A. Correct.

Q. What do you mean by "strike marks"?

A. Identify the term as a strike mark as an area where the tree itself contacted a, an electrical source and left a remaining charring on the tree.

(Grand Jury's Exhibit 86 introduced.)

Q. So now I'm showing you what's been marked as Exhibit 86 for identification. Do you recognize this photograph?

A. Yes, I do.

1 Q. What does the photograph marked as 86 show?

2 A. This shows the area I determined, as I referred
3 to as strike No. 1. It shows an area where the tree has
4 a remaining burn mark, for lack of a better term, showing
5 the charring on the tree from, we hypothesize, contacting
6 an electrical source, an electrical source that was, had
7 current flowing.

8
9 (Grand Jury's Exhibit 87 introduced.)

10
11 Q. Now, showing you what's been marked as Exhibit
12 87. Do you recognize what's depicted in 87?

13 A. Yes.

14 Q. What is depicted in 87?

15 A. This is what I referred to as strike No. 2.
16 This is a second area a tree contacted, we hypothesize,
17 contacted the electrical conductor line in the 1101 12 kV
18 Big Bend circuit, showing multiple marks of demarcation
19 on the top left. You can see an area where the actual
20 bark of the tree was removed in a circular fashion and a
21 charring, slash, indentation in the area of the tree; as
22 well as on this underside of the tree, another area that
23 we found that was determined to be from an electrical
24 current.

25 Q. Now, you said you found little pieces of the
26 electrical conductor, aluminum electrical conductor?

1 A. Correct.

2 Q. In the general area of origin of the fire?

3 A. Correct.

4 Q. Did you collect the rest of the electrical
5 conductors?

6 A. Yes.

7

8 (Grand Jury's Exhibit 88 introduced.)

9

10 Q. Looking at 88, the photograph marked as 88, can
11 you tell us what we're looking at in this photograph?

12 A. This is a further analysis of the PG&E
13 conductor collected from that site. One's identified as
14 the west-north, so the conductor on the west side of the
15 mountain, north of where the break we identified for the
16 conductor was broken; as well as the east-north, so the
17 conductor on the east side of the mountain on this scene,
18 north of the break where the conductor was broken.

19 Q. Why did you collect those two conductors?

20 A. We collected those conductors as evidence to
21 determine if those conductors, in fact, were a cause of
22 the Camp B Fire, contributed to the cause.

23

24 (Grand Jury's Exhibit 89 introduced.)

25

26 Q. Exhibit No. 89. Do you recognize Exhibit 89?

1 A. Yes.

2 Q. What is Exhibit 89?

3 A. Exhibit 89 shows further analysis of those two
4 conductors, west-north and the east-north. While in that
5 scene of Camp B origin, I measured the distance from the
6 PG&E pole No. 2 to the subject tree, and it was 33 feet.

7 In this photograph, it shows areas of
8 demarcation on those conductors that we determined to be
9 irregular in our analysis of this on that day.

10 Q. What do you mean "areas of demarcation"?

11 A. Areas of conductor that did not seem to have
12 burned, to have been burned by the fire passing through.
13 It was areas of irregular, that seemed irregular, that
14 looked like possible arcing locations. That's why we
15 have -- I located the Post-it note here, the note here as
16 33 feet. That is the measurement from the end of the
17 conductor to this location. So the south end of the
18 conductor.

19 Q. And there's a second note that says 30 feet?

20 A. And the 30 feet is another area we determined
21 there was irregularities.

22

23 (Grand Jury's Exhibit 90 introduced.)

24

25 Q. Exhibit No. 90, do you recognize?

26 A. Yes.

1 Q. What does this show?

2 A. Exhibit No. 90 represents the west-north
3 conductor laid out, showing the particular areas we
4 identified as possible arcing locations to be looked at
5 by a metallurgist.

6 Q. What do you mean by arcing location?

7 A. Possible areas where it was determined -- that
8 we hypothesized the conductor looked like it had been
9 arced, or had arced to something.

10 Q. Okay. What made you think that it had arced,
11 the conductor had arced?

12 A. There were deviations in the steel core
13 conductor that showed indentations and pooling of metal
14 that appeared to be, from our expertise, arcing that
15 needed to be further analyzed -- or analyzed, sorry,
16 by a metallurgist to determine, in fact, if it was
17 arcing.

18 Q. Now, going back, we were looking at the
19 pictures that showed the placards, I think it was 5
20 through 9, which you said were 3- to 4-inch pieces of
21 aluminum conductor that you found; correct?

22 A. Correct.

23 Q. Looking at the west-north conductor here laid
24 out, is there evidence that there's pieces of this
25 conductor missing?

26 A. Yes.

1 Q. Walk us through that.

2 A. There are pieces of conductor missing in this
3 area underneath the conductor writing, as well as further
4 areas along that wood piece that, in normal senses, would
5 have aluminum conductor wrapped around a steel core
6 following the whole length of the conductor. However,
7 there are some missing.

8 Q. I am going to blow this up a little bit. Won't
9 let me blow it up. Looks like down here, if you walk
10 through this, you can see broken ends all over the place;
11 is that correct?

12 A. Correct.

13 Q. And going both ways?

14 A. Correct.

15 Q. How does that play into your hypothesis as to
16 what happened?

17 A. The aluminum conductor pieces are another piece
18 of data that, looking at the overall totality of the
19 investigation, supports something striking the conductor
20 line and the -- possibly arcing, the conductor line
21 arcing to a foreign object and having aluminum conductor
22 pieces fall to the ground.

23

24 (Grand Jury's Exhibit 91 introduced.)

25

26 Q. All right. Number 90 -- or 91, I'm sorry.

1 Exhibit 91, do you recognize?

2 A. Yes.

3 Q. What is Exhibit 91?

4 A. Exhibit 91 is another photograph of the
5 west-north conductor showing the area of demarcation that
6 we identified that needed to be further analyzed by a
7 metallurgy, just particularly this area to the right of
8 the screen.

9 Q. Why is that area significant, in your mind?

10 A. It is a, an area that was not, from our
11 perspective, an area that was due to heat of the fire.
12 The demarcations on the steel core conductor with the
13 aluminum conductor, in my expertise, because it was
14 possible arcing, to be identified later by a
15 metallurgist.

16 In this area, the previous photograph depicting
17 the distance, particularly in pole No. 2, was the same
18 area that if the subject tree fell would have fallen onto
19 the line.

20 Q. Okay. Explain that to us, how you came to that
21 conclusion.

22 A. The end of the conductor south of the break on
23 the west side was at the location of pole No. 2. That's
24 where the conductor was broken. Having that, I measured
25 from that pole No. 2 to the area of the subject tree that
26 was laying on the ground, which was approximately 33

1 feet. Multiple areas, both of those conductors in that
2 33- to 30-foot range showed indications of possible
3 arcing, such as this, meaning the subject tree. There
4 was a possibility the subject tree fell on the conductor
5 lines at those locations.

6
7 (Grand Jury's Exhibit 93 introduced.)
8

9 Q. All right. Exhibit 93.

10 A. Exhibit 93 shows the east-north conductor. So
11 this is the second conductor. The previous photographs
12 were west-north. This would be the east-north conductor
13 from the same 1101 Big Bend 12 kV line that was running
14 parallel with the conductor we just looked at.

15 This is showing the area 33 feet, as well from
16 the end of that separate conductor an area where the
17 subject tree would have fell on the conductor line.
18

19 (Grand Jury's Exhibit 94 introduced.)
20

21 Q. Exhibit 94?

22 A. Exhibit 94 is showing that same east-north
23 conductor that is an area we identified as irregular, the
24 possible arcing that needed to be looked at by a
25 metallurgist for further examination.

26 Q. What suggests possible arcing to you in this

1 photograph?

2 A. The middle of the photograph, this line here,
3 is the steel core that serves as support for the aluminum
4 conductor, which wraps around the steel core. But then
5 there is an indentation in a different coloring, more
6 like a gold coloring, in this photograph that, in my
7 expertise, shows possible arcing on the aluminum
8 conductor, arcing, for an outside foreign object, arcing
9 to the steel core of the conductor.

10 Q. So this line running right down the middle, the
11 straight line, it's not woven, you're saying that's the
12 steel core?

13 A. Correct.

14 Q. And we're looking at quite a bit of deformation
15 and discoloration in this small area?

16 A. Correct.

17 Q. As opposed to the right and to the left of the
18 deformation?

19 A. Correct.

20 Q. What does the deformation of the steel in that
21 location by itself tell you?

22 A. It tells us that there's possible arcing due to
23 the pooling of the metal on this side and the indentation
24 of the metal on the interior.

25 Q. And the aluminum lines themselves, the strands
26 of aluminum conductor, what about those, what do they

1 tell you?

2 A. They can tell us there was some deformation and
3 some pooling on the ends, but I would have to refer to
4 the metallurgist's report and her expertise to determine
5 that.

6 Q. And you're referring to this as "pooling" or
7 "pulling"?

8 A. I was referring to this conductor here as more
9 of a pooling, pool, pooling of liquid.

10 Q. Okay. Like melting?

11 A. Correct.

12 Q. All right. So you've walked all around, you've
13 observed the indicators all around, you've looked at the
14 electrical. What are you doing next?

15 A. We are gathering those facts, gathering all
16 that information and analyzing all the information and
17 putting it all together to determine the actual cause of
18 the fire.

19

20 (Grand Jury's Exhibit 95 introduced.)

21

22 Q. All right. Let's move on to Exhibit 95. What
23 are we looking at in Exhibit 95?

24 A. Exhibit 95 shows a photograph I took looking
25 south with some added graphics that I added showing the
26 location of the strike No. 1 I identified earlier. It's

1 the first area struck by the PG&E conductor line. As
2 well as strike No. 2 on the right side of the screen in
3 green, showing the second strike mark. Again, the PG&E
4 conductor.

5 The illustration shows the fire damage from
6 strike No. 1 to strike No. 2. Showing there was charring
7 in the areas depicted as red on the photograph. Charring
8 of the subject tree, showing an area where fire was
9 burning for a prolonged period of time, compared to the
10 rest of the tree.

11 And based on my training and experience, this
12 is a suspended fuel. The limbs on the subject tree kept
13 it up off the soil. Typically, on a suspended fuel of
14 this type, as the fire passes through, it doesn't burn
15 one side as much as the other. It passes underneath the
16 tree and burns the backside of the fuel.

17 For this, I was attempting to show the charring
18 on this side, and another photograph will show the
19 charring on the other side, are relatively equal to
20 another. Meaning the fire, this charring was not caused
21 by fire passing through. In fact, my hypothesis was it
22 was caused by an ignition of strike No. 1 and ignition of
23 strike No. 2, and that fire burning in between the two as
24 the electrical conductivity ran between the two parts.

25 Q. Now, in the foreground of the picture down in
26 the bottom we have placards 4, 5, 6, and 7. What are

1 those?

2 A. Those are the same placards we identified
3 earlier showing 4- to 6-inch pieces of aluminum
4 conductor.

5
6 (Grand Jury's Exhibit 96 introduced.)
7

8 Q. Let's move to know 96. Explain to us what
9 we're looking at in 96.

10 A. 96 is a photograph looking northwest of the
11 same subject tree as the previous photograph. This is
12 the backside of that same photograph, showing the
13 location of the strike No. 1 on the right side of the
14 screen in green, strike No. 2 left side of the screen in
15 the green, and the illustration I added of red showing
16 the charring on this side compared relatively to no, or
17 little charring on the others away from the strike. And
18 this charring is fairly similar to the same charring I
19 showed in the previous photograph. As stated earlier,
20 typically on suspended fuels you'll have charring only on
21 one side of the fuel, where this has it on both sides.

22 Q. In the foreground, stake with a pink ribbon on
23 it. What does that mean?

24 A. That is an area that our LIDAR crews were using
25 as a reference point.
26

1 (Grand Jury's Exhibit 97 introduced.)

2

3 Q. Okay. All right. On to the diagram marked as
4 97. Explain Exhibit 97 to us.

5 A. Exhibit 97 is a depiction I created showing the
6 overall basic layout of the Camp B origin scene, showing
7 the pole No. 1, the top north side of the scene on top of
8 the geographical bowl, with pole No. 2 being the pole
9 that was fallen near the origin of the scene, and pole
10 No. 3.

11 These two conductors are identified for ease
12 of, for ease of the report and ease for everybody else,
13 as the west-south conductor, conductor A; west-north
14 conductor -- so north of the break, south of the break --
15 conductor B; east-south, conductor C; and east-north,
16 conductor D.

17 Within that area we have Concow Road. And Rim
18 Road is up here, going that way.

19 The subject tree is depicted in this photograph
20 at its location comparatively to pole No. 2. And this is
21 another tree that was down in that area.

22 Q. So the conductor lines that we were looking at
23 earlier that you pulled out and you measured were the
24 west-north and the east-north; correct?

25 A. Correct.

26 Q. And when you say you measured, you were

1 measuring from pole No. 1 to the subject tree?

2 A. No.

3 Q. Okay. Explain that.

4 A. The measurements were from the -- if I can
5 reference my report?

6 Q. Go ahead. I know we talked about, quite a bit
7 about the 33 feet. I want to make sure that we
8 understand how that measurement came about and what it
9 represents. Go ahead.

10 A. The 33 -- 33 feet, I'm sorry, measured from the
11 edge of the conductor, from the south end of the
12 conductor to the north, because the actual line of the
13 break was at pole No. 2.

14 Q. Okay.

15 A. So we hypothesized that this line here was
16 actually connected close to pole No. 2.

17 Q. Okay. So you're talking about the west-north
18 conductor and the west-south conductor, your hypothesis
19 was that that was connected at pole No. 2?

20 A. Correct.

21 Q. And what about the east-south conductor and the
22 east-north conductor?

23 A. That was the same measurement. We measured
24 from the edge of the conductor, from the south edge of
25 the conductor to the north, based on the theory that
26 those, these were severed near the pole No. 2.

1 The illustration does not show a good depiction
2 of the -- when lines are held on a pole, they're tight
3 and taut, so there's going to be -- on the ground,
4 they're going to be a lot more loose than, can be pulled
5 back this way due to the lines being on the ground and
6 not taut in the air.

7
8 (Grand Jury's Exhibit 98 introduced.)
9

10 Q. All right. So let's move on to the diagram
11 marked as Exhibit No. 98. Do you recognize Exhibit 98?

12 A. Yes.

13 Q. Did you come up with Exhibit 98?

14 A. I did.

15 Q. Explain for us Exhibit 98, please.

16 A. Exhibit 98 shows a depiction I created showing
17 the at-scene reference points I created. As part of the
18 fire origin and cause determination, we create reference
19 points, which are points I created, that can be used for
20 reference later at an undetermined date to identify
21 certain locations of items within the scene.

22 So I identify RP-1, reference point 1,
23 reference point 2. And from those points measured with a
24 ruler -- not with a ruler -- with a measuring tape the
25 distance from each reference point to all the numbered
26 locations on here. So this just depicts those numbers

1 and locations.

2 It also shows more of an, in more detail, the
3 overall scene. Showing the subject tree; brown, light
4 brown, line running from bottom right towards the top
5 left. Showing strike No. 1, strike No. 2, and the
6 overall condition of the tree.

7 It's also showing conductors A to B and C to D;
8 as well as Concow Road, with the location of the 1996
9 Dodge pickup, and with that location upon arrival; as
10 well as pole No. 2 in the middle of the screen, with No.
11 1 in the middle being the pole No. 2 stump that was
12 remaining after the pole No. 2 fell to the ground.

13 So it's just an accurate, trying to be an
14 accurate representation of the reference points on the
15 overall scene investigation.

16

17 (Grand Jury's Exhibit 99 introduced.)

18

19 Q. All right. Exhibit 99. Do you recognize 99?

20 A. Yes.

21 Q. What is 99?

22 A. 99 references the GPS coordinates I took of the
23 evidence locations on the origin of the Camp B Fire.
24 Very faintly in the photograph you can see the lines here
25 that appear to be the actual conductor line that was
26 through the area at the time of this satellite image.

1 Q. So let's back up on that. So this is a Google
2 Earth satellite image taken before the fire --

3 A. Correct.

4 Q. -- that you were able to obtain online?

5 A. Correct.

6 Q. Okay. So go ahead.

7 A. So it shows possible, or possible location of
8 the conductor, as well as the subject tree stump, and all
9 the evidence markers I identified at scene. And I took
10 those reference points using my Garmin GPS handheld
11 device.

12 Q. And how did you put those in this photograph?

13 A. From my handheld device that is plugged into a
14 computer via USB, it is download, the reference points or
15 the GPS locations, are downloaded and transferred to a
16 file which can be uploaded to Google Earth and transposed
17 into a satellite image.

18 Q. All right. So let's walk through this from top
19 to bottom.

20 Up here this says E10, G20A tree stump?

21 A. Correct.

22 Q. What does that reference?

23 A. E10 references evidence item No. 10. G20A is
24 how I determined areas of interest before I identified
25 evidence markers to determine areas to be looked at
26 further early on in the investigation. That is the

1 location of the subject tree stump.

2 Q. And what is E11, G19A?

3 A. That is the subject tree itself. The end --
4 I'm sorry, the butt end of the subject tree, eastern end.

5 Q. Okay. So just to make it clear, the two
6 parallel faint lines that start in the upper left side of
7 this photograph and run through all the way to the middle
8 right side, that's what you're referring to as the
9 conductor?

10 A. That's what I hypothesize as the PG&E
11 conductor.

12 Q. Okay. And, let's see, do you know what E34 and
13 E33 are?

14 A. Those are conductors, conductor pieces taken at
15 the northern end of the origin area. I'm sorry, they
16 are, they are a continuation of the two conductors;
17 however, they were identified as separate evidence
18 numbers due to the fact that the, they were disconnected
19 for -- they were severed at certain points, so they
20 became their own numbers in themselves.

21 Q. All right. And E3 and E2, what do those two
22 represent?

23 A. E3 and E2 reference the west-north conductor
24 and the east-north conductor.

25 Q. And E13 and E47?

26 A. I would have to reference my report.

1 Q. Go ahead.

2 A. I actually don't have that in this version of
3 the report. I have it in my supplemental investigation
4 report.

5 Q. Okay. How about the E9, E8, 16, this whole
6 kind of grouping?

7 A. The 4 through 7 is the aluminum conductor we
8 identified earlier in the photograph, as well as 8 and 9.
9 The remaining evidence placards are multiple items from
10 the PG&E power pole No. 2 to, to electrical components at
11 the scene to old type PG&E hardware that we found at the
12 scene.

13 Q. All right. So we know E10 is the tree stump,
14 and E11 -- the subject tree stump, and the E11 is the
15 broken end of the subject tree?

16 A. Correct.

17 Q. Which way is that tree facing in terms --

18 A. The tree is facing in a southwest direction.
19 So on the screen from the left to the right. Horizontal
20 -- or diagonal. Sorry.

21 Q. Basically a diagonal here from approximately
22 E11 to the area of E9, E16, somewhere in there?

23 A. I believe E20 is the end of this.

24 Q. Okay. So in this direction here?

25 A. Correct.

26 Q. What's E24?

1 A. That is the pole, PG&E pole No. 2, stump.

2 Q. And E21?

3 A. I would have to reference my supplemental
4 reports for accuracy.

5

6 (Grand Jury's Exhibit 100 introduced.)

7

8 Q. Okay. All right. Let's see if we can put this
9 all together. Let's go on to No. 100. Do you recognize
10 100?

11 A. Yes.

12 Q. What is 100?

13 A. 100 is a sketch of the Camp B origin scene
14 taken from an overall photograph, with depictions I
15 created on my computer, showing the overall scene.
16 Showing the larger circle as the general origin area I
17 identified earlier, that we came to the location of the
18 fire possibly starting, to the specific origin area, the
19 blue circle, the smaller circle, showing a more advanced
20 area as we worked from the general origin area to more
21 specific area.

22 With the subject tree stump on the right side
23 of this photograph depicted with a narrative and subject
24 tree bottom. Referring to the bottom of the subject
25 tree.

26 The top of the subject tree, with that

1 depiction.

2 The location of PG&E pole No. 2.

3 The crossmember, we identified as a piece of a
4 crossmember that goes perpendicular to the pole of the
5 location here, with the PG&E pole No. 2 stump at this
6 location.

7 This identifies the A conductor, the west-south
8 conductor, the conductor west of the scene and south of
9 the break; as well as the conductor C, the east-north
10 conductor, the conductor east of the scene but north of
11 the break; as well as showing our fire indicators, fire
12 patterns observed at the scene.

13 Showing the red arrows as advancing fire
14 vectors. So a vector, comparative indicator -- a fire
15 indicator shows on a certain fuel what the fire was doing
16 at that particular location. Where a fire vector shows
17 the overall flow of what the fire was doing at that
18 point.

19 So the fire vector advancing fire away from the
20 specific origin area, general origin area going to the
21 southwest; with lateral indicators indicated by the
22 yellow upside down V showing fire direction on the right
23 side of the photograph to the fire moving to the
24 northwest, away from the specific origin area; with the
25 left side of the picture with fire flowing to the
26 southwest and south, away from the specific origin area.

1 The blue U's show the backing fire vector. So
2 areas where the fire is backing at a slower rate, has
3 less intensity away from the specific origin area. So we
4 have that on the right side of the photograph, working
5 with the fire backing to the northeast; as well as on the
6 left side of the photograph the fire backing to the
7 southeast away from the ignition area and specific origin
8 area.

9 The ignition area identified by the red circle
10 with a red X through it was an area determined as the
11 actual ignition area, where the actual fire started, the
12 first sign of any fire due to the subject tree contacting
13 the east-north conductor, conductor C, and creating a
14 strike mark, strike No. 1, at the ignition area.

15 Q. So what do the orange lines running through the
16 middle left to right depict?

17 A. The orange lines on the left side of the screen
18 is the conductor A. So it's the conductor on the west
19 side of the scene, south of this break. And on the right
20 side of the photograph is the east-north conductor,
21 conductor C. Its conductor line on the east side of the
22 scene that was on the north side of the break.

23 The other conductor that was at the scene was
24 not in this photograph. It was further away to the right
25 or left respectively as it coiled back.

26 Q. So let's go back to your five hypotheses.

1 Let's work them backwards.

2 You said the No. 5 hypothesis had to do with
3 the 1996 pickup truck; correct?

4 A. Correct.

5 Q. And is the pickup truck shown in that
6 photograph?

7 A. Correct. The pickup, the 1996 Dodge pickup, is
8 on Concow Road facing north on the left bottom of the
9 screen.

10 Q. So you said as you're working through these
11 investigations, you're constantly testing your
12 hypothesis?

13 A. Correct.

14 Q. And trying to disprove your hypothesis?

15 A. Correct.

16 Q. Were you able to disprove the hypothesis
17 regarding the 1996 Dodge pickup as a potential origin
18 point?

19 A. Yes, I was.

20 Q. How so?

21 A. First off, in our origin and cause
22 investigation with the fire indicators of fire coming
23 from the ignition area and back indicators coming away,
24 working to the east; as well as all the other indicators,
25 advancing, lateral, and backing indicators surrounding
26 the ignition area showing the fire did not originate at

1 the Concow Road or at the 1996 Dodge pickup; as well as
2 the cumulative facts of the images from the lookout
3 camera, the Flea Mountain lookout camera showing the fire
4 started in that area; as well as the times identified
5 through data, PG&E data, showing the, a fault occurring
6 at that site, that area; as well as the reclosure opening
7 at that certain time all helped to rule out the 1996
8 Dodge pickup as a possible cause, as well as interviews
9 with the owner and driver of the 1996 Dodge pickup.

10 Q. So separate from and not including any
11 interviews with the owner of that pickup, you were able
12 to disprove the hypothesis of the pickup started the
13 fire?

14 A. Correct. There's also a video posted of --

15 Q. Okay. Let's not talk about that. Let's talk
16 about what you were able to do with the actual physical
17 evidence on scene.

18 A. Correct. The fire indicators alone allow us to
19 disprove the 1996 Dodge pickup. We just took other
20 precautions, other avenues to further disprove.

21 Q. Okay. Give me a second. I'm trying to find
22 something in the report real quick.

23 All right. Going back to your hypotheses. No.
24 4 was the subject tree fell during the fire when the fire
25 passed through, struck the conductor lines causing
26 ignition, but only after the fire was already at the

1 location.

2 How did you disprove -- or did you disprove
3 that hypothesis?

4 A. Yes, I disproved that hypothesis.

5 Q. How so?

6 A. Multiple factors, including the Flea Mountain
7 Lookout Camera 5 showing a fire occurring at a given time
8 in relation to the reclosure data showing the reclosure
9 opening the circuit on the Big Bend 1101 12 kV line at a
10 given time; as well as the fire indicators, most
11 importantly, at scene showing fire originating from the
12 ignition area identified in this photograph.

13 Q. Okay. Hypothesis No. 3. The subject tree fell
14 prior to the fire, struck de-energized lines, with no
15 ignition, but left broken conductors, and the fire
16 resulted from some other source.

17 Were you able to disprove that hypothesis?

18 A. Yes.

19 Q. How so?

20 A. This was disproved by, again, first and
21 foremost, our fire indicators showing the strike No. 1
22 strike mark on the subject tree, as well as strike No. 2,
23 showing patterns of charring and burning similar to a hot
24 iron on a wood substance, showing that there was
25 electrical conductivity in that line at the time of
26 contact; as well as the irregularities on the PG&E

1 conductor line. Quickly, this proves that the fire was
2 -- that the subject tree struck the energized lines.

3 Q. Hypothesis No. 2. The subject tree fell prior
4 to the fire, struck the lines creating ignition against
5 the tree. Pole No. 2 stayed in place, lines separated
6 and arced to the ground at contact, creating multiple
7 ignition sources for the lines contacting the ground.

8 Were you able to disprove that hypothesis?

9 A. I wasn't able to fully disprove that
10 hypothesis.

11 Q. Were you able to disprove parts of that
12 hypothesis?

13 A. Yes, I was.

14 Q. Which parts?

15 A. The parts I was able to disprove was that there
16 were multiple ignitions created by the conductor falling
17 and arcing to the ground at the point where the conductor
18 severed ends contacted the ground. This was disproved by
19 our origin and cause investigation showing the fire
20 originating from the ignition area, strike No. 1; as well
21 as the fact that the strike No. 1 was the first area
22 contacted by the subject tree, which creates any ignition
23 after that. Not the cause of the fire, the cause of the
24 fire in reference to that as secondary. So the first
25 ignition of the Camp B Fire was the strike No. 1 of the
26 subject tree, so anything after that was secondary.

1 Q. Finally, hypothesis No. 1, subject tree fell
2 prior to the fire, struck the PG&E conductor lines,
3 creating ignition against the subject tree, leaving PG&E
4 pole No. 2 in place. The reclosure opened the circuit
5 with no other ignitions occurring. The conductor lines
6 fell to their resting location.

7 Were you able to disprove any parts of
8 hypothesis No. 1?

9 A. No.

10 Q. Were you able to prove the parts of hypothesis
11 No. 1?

12 A. Our investigations don't work as proving that,
13 proving causes, but we work at disproving. And that was
14 the -- we were not able to disprove any of that
15 possibility and -- but disprove all the other
16 possibilities that we referenced, therefore, that was the
17 cause of the fire.

18 Q. Based upon your investigation, do you have an
19 opinion as to where the Camp B Fire started?

20 A. Yes.

21 Q. What is that opinion?

22 A. My opinion is that the Camp B Fire started in
23 the area near the intersection of Concow Road, cross of
24 Rim Road, more accurately west of Concow Road and south
25 of Rim Road, at the area near, as I labeled, "PG&E pole
26 No. 2," where the Ponderosa pine tree struck the 1101 Big

1 Bend 12 kV electrical circuit causing ignition against
2 the tree at the strike No. 1 mark. That resulted in fire
3 spreading from that location to the remaining area.

4 Q. We're referring to Exhibit 100, the overall
5 diagram?

6 A. Correct.

7 Q. Do you have an opinion as to the cause of the
8 Camp B Fire?

9 A. The cause of the Camp B Fire was a Ponderosa
10 pine tree, shown in this illustration, breaking from its
11 trunk, tree stump depicted on this illustration,
12 contacting the PG&E conductor line; therefore, the cause
13 of the fire was electrical from the PG&E conductor line
14 1101 Big Bend circuit.

15 Q. And upon what do you base that opinion?

16 A. That is based on our origin and cause
17 investigation, all the fire indicators at scene, the PG&E
18 data, referencing the Electrical Incident Report, video
19 from the Flea Mountain Lookout Camera No. 5, and all the
20 data and research compiled during our investigation.

21 Q. So based upon your opinion that the subject
22 tree, a Ponderosa pine, fell onto the live electrical
23 lines, the Big Bend 1101 -- 1101 B? -- or 1101 line --

24 A. Big Bend.

25 Q. -- did you request further assistance in your
26 investigation?

1 A. Yes.

2 Q. What type of assistance?

3 A. We requested assistance from a metallurgist to
4 analyze the conductor line itself, from an arborist to
5 analyze the subject tree and condition of the subject
6 tree itself. That's it.

7 Q. Forgot one. Can't forget Mr. Nolt.

8 A. Our electrical, Mr. Jim Nolt, yes.

9 Q. All right. So why did you summon an arborist?

10 A. Based on the cause of the fire being from the
11 Ponderosa pine tree falling and contacting the conductor,
12 we wanted to determine the condition of that tree to know
13 why that tree fell.

14 Q. Why is the condition of the tree relevant?

15 A. The condition of the tree is relevant to
16 determine -- first and foremost, to prevent this from
17 happening again in the future. To determine better ways
18 of analyzing the tree as in tree stance to prevent any
19 electrical-caused fires, or any fires for that matter.
20 To also identify any potential criminal wrongdoing. And
21 to determine why the actual tree fell.

22 Q. Why is the condition of the tree important to
23 determine a potential criminal liability?

24 A. If the subject tree was identified as dead --
25 as to reason, if the subject tree was identified as dead
26 or should have been identified as dead by someone

1 responsible with surveying the trees and removing those
2 trees, then that would play a factor into, that would
3 play a factor into who could be responsible for ignition
4 of that tree.

5 Q. All right. Let's back up. Is there statutory
6 law, to your knowledge, that requires a utility to
7 inspect and clear trees around power lines?

8 A. Yes.

9 Q. And what is that statute?

10 A. That is the California Public Resource Code
11 4293.

12 Q. Does 4293, in your experience and training,
13 apply to PG&E?

14 A. Yes.

15 Q. And why is the condition of the tree important
16 for 4293?

17 A. It is part of elements that are included in
18 that possible crime.

19 Q. Do you have a copy of 4293 with you?

20 A. I have it in my report.

21 Q. Could you read us the relevant portions of
22 California Public Resource Code section 4293.

23 A. Yes.

24 "Except as otherwise provided in sections 4294
25 through 4296, inclusive of any person that owns,
26 controls, operates, or maintains any electrical

1 transmission or distribution line upon any mountainous
2 land or on forest-covered land, brush-covered land, or
3 grass-covered land shall, during such times and in such
4 areas as are determined to be necessary by director for
5 the agency which has primary responsibility for the fire
6 protection of such areas, maintain a clearance of the
7 respective distances, which are specified in the section,
8 all directions between all vegetation and all conductors
9 which are carrying electrical current.

10 And A --"

11 Want me to keep going?

12 Q. No, let's skip down to the more relevant stuff,
13 which would be the second paragraph of 4293. The end of
14 the second line starts with "dead."

15 A. "Dead trees, old decadent or rotten trees,
16 trees weakened by decay or disease, and trees or portions
17 thereof that are leaning toward the line which may
18 contact the line from the side or may fall on the line,
19 shall be felled, cut, or trimmed to remove such hazard."

20 Q. So 4293 creates a positive duty by a utility
21 such as PG&E to clear dead or dying trees that
22 foreseeably may fall on the line?

23 A. Correct.

24 Q. Based upon all of your measurements, based upon
25 all of your observations out at the origin point of the B
26 Fire, Camp B Fire, not assuming any condition of the tree

1 itself, but was it foreseeable, was it possible for that
2 tree to fall on the lines?

3 A. Based upon the angle of the tree?

4 Q. Based upon everything.

5 A. Well, it happened, so it was possible.

6 Q. Right. Were you able to determine how tall
7 that tree was?

8 A. I believe it was referenced in the
9 supplemental, supplemental portion of my report.

10 Q. Were you able to determine how far that tree
11 stood from the power lines?

12 A. In a relative, relatively within my report,
13 yes.

14 Q. Okay. And the power lines were within the
15 distance within the height of the tree?

16 A. Correct.

17 Q. Okay.

18 I think that's all I got.

19 A. Okay.

20 (Grand Jury Foreperson and Counsel confer.)

21 Q. (By MR. NOEL) All right. We had some
22 questions from the jurors.

23 First, let's go back to Exhibit 81. There we
24 go.

25 First question is do you know who cut the
26 conductor in Exhibit 81, and where in relation to the

1 area of Camp B Fire was this cut?

2 A. No, I do not know who cut these, this conductor
3 in particular. This conductor was the same flow of
4 conductor as the origin of the Camp B Fire. However,
5 this was the conductor that was suspended over Concow
6 Road, north -- sorry -- south of the Camp B Fire scene
7 over Concow Road.

8 Q. Considering the conclusions you have reached,
9 do you believe that both Camp B and the Camp Fire share a
10 single primary failure of PG&E equipment?

11 A. I don't know if I can answer that.

12 Q. Okay. You don't know. You concentrate on Camp
13 B; correct?

14 A. Correct.

15 Q. You weren't one of the investigators working on
16 the Camp Fire itself?

17 A. No, I was not.

18 Q. If the answer to question 2 above is negative,
19 do you believe -- well, let's -- do you believe that the
20 two fires were entirely coincidental on that morning?

21 A. No. Coincidental is a relative term.

22 Q. Right.

23 A. No. My findings on the Camp B stand that the
24 Camp B was caused by that electrical conductor and the
25 tree striking that. That's what I derived.

26 Q. And I think a better term would be separate,

1 that Camp A and Camp B -- or Camp and Camp B were
2 completely separate, just happened to occur on the same
3 morning?

4 A. Correct.

5 Q. Do you believe that Camp, the Camp Fire
6 influenced the ignition of the Camp B Fire?

7 A. No.

8 Q. Do you believe that the Camp B Fire influenced
9 the Camp A -- or the Camp Fire?

10 A. No.

11 Q. Do you -- again, not including any hearsay in
12 which you've heard from anybody else, do you have an
13 opinion as to what caused the subject tree to fall?

14 A. I would have to refer to our experts.

15 Q. Okay. And you said that a arborist came out to
16 examine the tree?

17 A. Correct.

18 Q. Do you recall the name of that person?

19 A. Joe McNeil.

20 Q. So just on your own, you don't have an opinion
21 as to why the tree fell?

22 A. I'd have to refer to the matter, experts on
23 that.

24 Q. You examine the breakage point of the tree?

25 A. Correct.

26 Q. I guess, just to go through a few things

1 possible, did you find bullet holes where the tree broke?

2 A. No. And we examined the ignition, the general
3 origin area and specific origin area for any ammunition
4 casings, any other abnormalities, and used a metal
5 detector, and did not find any of that type.

6 Q. Did you find any evidence of a chain saw on
7 the, at the base of the subject tree where it broke?

8 A. No.

9 Q. Or an ax?

10 A. No.

11 Q. All right.

12 Anything else?

13 I think that's it for this witness.

14 GRAND JURY FOREPERSON: Okay. Captain Lohse,
15 I'd like to read you the admonishment again.

16 Okay. Captain Lohse, you are admonished not to
17 discuss or disclose at any time outside of this jury room
18 the questions that have been asked of you or your answers
19 until authorized by the Grand Jury or the Court. A
20 violation of these instructions on your part may be the
21 basis for a charge against you of contempt of court.
22 This does not preclude you from discussing your legal
23 rights with your own attorney.

24 Captain Lohse, what I have just said is a
25 warning not to discuss this case with anyone except the
26 Court, your lawyer, or the district attorney. Do you

1 understand?

2 THE WITNESS: Yes.

3 GRAND JURY FOREPERSON: Thank you.

4 THE WITNESS: Thank you.

5 GRAND JURY FOREPERSON: Thank you for your
6 time.

7 THE WITNESS: You're welcome. Thank you.

8 [DISCUSSION OMITTED.]

9 GRAND JURY FOREPERSON: (WITNESS #8), before
10 you have a seat, would you raise your right hand to be
11 sworn, please.

12

13 (WITNESS #8)

14 having been called as a witness in
15 the matter now pending, having been first
16 duly sworn, testifies as follows:

17

18 THE WITNESS: Yes, ma'am.

19 GRAND JURY FOREPERSON: Thank you. Have a
20 seat, please.

21

22 EXAMINATION

23

24 BY MR. NOEL

25 Q. (WITNESS #8), for the record, could you state
26 your full name, spelling your last name.

1 A. (WITNESS #8), (SPELLING REDACTED) .
2 Q. By whom are you employed, (WITNESS #8)?
3 A. PG&E.
4 Q. In what capacity?
5 A. Transmission line crew foreman.
6 Q. How long have you been with PG&E?
7 A. Working on 23 years.
8 Q. Can you walk us through your career at PG&E and
9 what led you to your current position as a foreperson --
10 or foreman?
11 A. Well, it started probably in my childhood. I'm
12 third generation lineman. So my grandfather, my dad,
13 uncles, brothers. Moved from Spokane, Washington, down
14 here to California to take this job. I was 21 years old.
15 Started out in Oakland as a, as a grunt, if you will.
16 And then, you know, pretty much bottom of the food chain;
17 work your way up from there.
18 Did that for a while, until I could land an
19 apprenticeship. And then took an apprenticeship for the
20 company which lasted 36 months. Then after that time you
21 become a journeyman lineman.
22 So from there I worked down in the East Bay for
23 ten years, and then around 2006 we sold and moved up to
24 Paradise, and I took a job in Chico as a lineman.
25 Worked as a lineman there for a year and a half
26 maybe, and then started running a crew from there.

1 Q. How long have you been a foreperson?
2 A. I'm sorry?
3 Q. How long have you been a foreperson -- or
4 foreman? I'm used to referring to Madam Foreperson.
5 A. I could be a floor person.
6 See, probably 11 years now, 12 years, roughly,
7 as a floor person.
8 Q. (By MR. NOEL) And you said that you, you lived
9 up in Paradise?
10 A. Yes, sir.
11 Q. Did you lose your home in the Camp Fire?
12 A. Yes, sir.
13 Q. All right. What is your job as a -- describe
14 for us your job as a line foreman.
15 A. Construction line foreman. In that capacity, I
16 guess the easiest way to sum it up is that we in
17 construction do bigger projects versus maintenance
18 projects, which would be maybe daily stuff. Whereas -- I
19 guess the quickest way I could sum it up, maintenance
20 might change out one pole; construction comes through and
21 will change out all the poles on the street.
22 Q. Now, do you work in transmission or
23 distribution?
24 A. Transmission.
25 Q. And is there a difference? Is there a
26 distinction between transmission and distribution?

1 A. Yes.

2 Q. Has that always been the case in your career?

3 A. No.

4 Q. At some point did you work both distribution
5 and transmission?

6 A. Yes.

7 Q. When did that change?

8 A. I hired on in Distribution in Oakland and then
9 ended up taking a job in construction in Antioch. And
10 then I've been in what we call "GC," for PG&E is General
11 Construction. So General Construction is where I reside
12 now.

13 In General Construction, we've always done
14 transmission and distribution, collectively. Meaning
15 today -- or back then meaning, you know, I could be in a
16 splice box doing underground one day, and then the next
17 be in the 500 kV in the towers doing heavy rigging. So
18 we always did, we did both. But, roughly, around 2012,
19 if I remember right, GC was split up into two
20 organizations, which there's Transmission and
21 Distribution. Distribution does typically just
22 distribution. I'm in Transmission, whereas we still do
23 distribution only if it's on, serviced on the poles that
24 we're changing. So if we change out a transmission pole
25 and there's distribution underbuild, then we will handle,
26 you know, transferring that to the new pole.

1 Q. Now, you said, you started to talk about the
2 difference between maintenance and General Construction?
3 You said you do the big, you do the big jobs, they do the
4 small daily jobs. Can you define that a little bit
5 better for us?

6 A. Maintenance -- let's see, does that not define
7 that well enough? I'm not sure how else to answer that.

8 Q. Okay. You started to say, I guess, we change
9 out a whole line, whereas they may just change out one
10 pole.

11 A. Uh-huh.

12 Q. Does that about some up what you said?

13 A. Yes.

14 Q. What do you mean by change out?

15 A. Replace.

16 Q. Replace?

17 A. Replace a pole. Or if there was conductor,
18 like a capacity job, and we had to, needed to reductor
19 a circuit and take out smaller wire and put in bigger
20 wire, then that would atypically be a construction job.

21 Q. Okay. If you were just going up to change
22 insulators on one tower, that would be a maintenance job?

23 A. Could be.

24 Q. Okay. They wouldn't call in your crew just to
25 change out one?

26 A. Not typically, no.

1 Q. Okay. All right. So were you assigned to the
2 Butte County area in the end of 2012, early 2013?

3 A. 2006-ish. Yeah, about 2006 I came up here to
4 Butte County.

5
6 (Grand Jury's Exhibit 241 introduced.)

7
8 Q. All right. You have in front of you an exhibit
9 marked as 241. Do you see the tag in the top right-hand
10 corner?

11 Direct your attention to page 2, which is very,
12 very short. And the third line, it says "Work completed
13 by (WITNESS #8), line is back in service as of 1/31/13."
14 Do you see that part of it?

15 A. I do.

16 Q. All right. And Exhibit 241 is referencing the
17 collapse of the, of towers in 2012. This one
18 specifically is tower 187. Do you recall the tower
19 collapse in the end of 2012?

20 A. I do.

21 Q. Did you assist with the replacement, the
22 temporary replacement of that transmission line?

23 A. I did.

24 Q. Explain to us what your job was.

25 A. For the temporary replacement?

26 Q. Yes.

1 A. Okay. Or as we refer to it as a shoo-fly.
2 Q. Yes, sir. Explain that to us very briefly.
3 A. Briefly, some towers went down. I'm not a
4 hundred percent sure what took them down. Was -- heard
5 that a boulder took out a tower, which can cause a
6 multiple chain effect, which could explain the other
7 towers going down. But I wasn't initially on scene for
8 that, so I don't know. The shoo-fly is nothing more than
9 a temporary way to reroute the line in order to make
10 repairs to the existing line that's damaged.
11 Q. All right. So multiple towers fell down;
12 correct?
13 A. Correct.
14 Q. You helped install a replacement line until the
15 towers could be fixed or replaced?
16 A. Correct.
17
18 (Grand Jury's Exhibit 453 introduced.)
19
20 Q. All right. So you have in front of you I know
21 Exhibit 453. Explain to us what is Exhibit 453.
22 A. It's an estimate drawn up by an estimator on a
23 design that was engineered, if you will, for a temporary
24 solution to construct a shoo-fly.
25 Q. What was your part in the project of the
26 shoo-fly?

1 A. As a crew foreman, giving -- you know -- to
2 build the line, to see that the line was built per, to
3 standard, or per this drawing in this case.

4 Q. Okay. So you actually built the line pursuant
5 to this drawing?

6 A. Correct.

7 Q. Now, can you kind of walk us through this, this
8 drawing, what the different colors and numbers and
9 everything represent.

10 A. The numbers represent location numbers for
11 poles. So each pole in this case is going to have a
12 location number, which you would be able to go to the
13 document that would identify all the building material
14 that would be used on each pole.

15 The coloring, the top right of the screen you
16 can see where it says in the red with the, with the -- I
17 think that's a "TR." I can't read that. But it's
18 depicting the transmission line. And then the red
19 underneath, it's the distribution. And it identifies the
20 size of conductor that would be installed. So --

21 Q. Feel free to get up and use the board.

22 A. That's the new conductor of the transmission,
23 that's the conductor of the distribution, and that's the
24 conductor of the old line that went down.

25 Q. Okay. So the 397 AR, which is depicted in the
26 red, the dashes with the TRs, that's the new conductor

1 that was going up?

2 A. Yes.

3 Q. And the TCU, which is the red dashes with the

4 P's, is distribution line?

5 A. Correct.

6 Q. And 452 AR, which is the dashes and the line,

7 is the old conductor that was being removed?

8 A. Correct.

9 Q. Okay. So this black line that's marked

10 Caribou-Palermo, that was, that's the actual

11 Caribou-Palermo transmission line; correct?

12 A. (Nods head.)

13 Q. And the red lines depict the replacement line

14 that you put in, the shoo-fly?

15 A. Okay.

16 Q. Remember, she can only take down words.

17 A. I'm sorry.

18 Q. I know, I'm looking at you, but you're nodding

19 your head, and she can't take that down.

20 All right. So you actually replaced the line,

21 putting up a new line in a parallel location; is that

22 correct?

23 A. On the road, yes. There's a service road that

24 runs there. And that line, that red line, follows that

25 service road mostly.

26 Q. Along Camp Creek Road?

1 A. Yes, sir.

2 Q. All right. Six towers went down. How many
3 poles did it take to replace those six towers?

4 A. It looks like 15 locations. I don't remember
5 exactly, but I think 15.

6 Q. Okay. And you finished this project in January
7 of 2013?

8 A. I don't recall dates.

9 Q. Right.

10 A. Sounds close.

11 Q. Going back to 241, Exhibit 241, which is the
12 Corrective Work Form, it says that you, the line went
13 back in service, "Work completed by (WITNESS #8), line is
14 back in service 1/31/13?"

15 A. Yep.

16 Q. Is that consistent with your memory?

17 A. Yes.

18 Q. And finally, to put this line back in service,
19 did you use the old conductor or did you install a new
20 conductor?

21 A. No, the new conductor is up on top where it
22 says install 397 AR. That's the new conductor, even in
23 the shoo-fly.

24 Q. Okay. So what happened to the old conductor
25 that was attached to the towers that fell down?

26 A. Rolled up on a machine, I believe, and taken to

1 the scrap yard.

2

3 (Grand Jury's Exhibit 159 introduced.)

4

5 (Grand Jury's Exhibit 454 introduced.)

6

7 Q. Okay. All right. Now we're going to go on to
8 159, should be there in front of you, which is another
9 Corrective Work Form. And, again, your part of this is
10 the very last line on page 2. And then I think, also,
11 you have in front of you 454, which you provided to me
12 earlier today. We don't have a PowerPoint. It's the
13 other one. All right.

14 Tell us what 454 is.

15 A. 454 is a Corrective Work Form for electric
16 transmission line written up by, a tag written up by a
17 maintenance employee --

18 Q. Okay.

19 A. -- doing inspections.

20 Q. So going back to 159 that you have in front of
21 you would be a Corrective Work Form written up by a
22 maintenance employee; correct?

23 A. Correct.

24 Q. And 454 is a little bit different, but explain
25 to us how 454 relates to 159.

26 A. Well, I don't -- I can't speak on the

1 inspection side of it because that's not in my, my job
2 scope of what I do for PG&E, which you've identified as
3 454. So I don't, I don't know about these. But --

4 Q. Okay. Is that something that you're given?

5 A. At some point, yes.

6 Q. Let's go back to you were talking about how you
7 do, your General Construction crew does the big jobs.
8 How do you get your jobs assigned to you?

9 A. I don't pick the work. It usually, you know,
10 picks the local crews in the area, you know, from
11 scheduling. You know, the field engineers that do
12 scheduling set up the work. I don't set up the work.

13 Q. Okay. But the work itself, do you know how
14 that work is identified that it needs to be done?

15 A. No.

16 Q. All right. Back in 2016 did your crew do a big
17 job of replacing parallel groove connectors on the
18 Caribou-Palermo line?

19 A. Yes.

20 Q. Do you know how that job came about being
21 assigned to you?

22 A. Well, yes. Being there was multiple locations
23 to be done, the typical maintenance work group wouldn't
24 be able to handle it, I believe, in a timely manner. And
25 I had a hole in my schedule for work and had other crews
26 helping me at the time from the Camp Creek Road incident,

1 the towers that went down, so I was asked if I could take
2 on that work, looking at my schedule.

3 Q. Do you recall when your crew replaced all the
4 connectors on the Caribou-Palermo line?

5 A. Specifically, no. Dates I don't.

6 Q. Time frame?

7 A. Maybe 2016. Somewhere in there.

8 Q. All right. 454, is any of that document
9 prepared by you?

10 A. Not prepared by me, no. Not, not on 454. But
11 you've got multiple things stapled together here, so. Or
12 there are multiple things stapled together.

13 Q. Right. Is there some part of that document,
14 454, that you signed?

15 A. Yes.

16 Q. And what part is that?

17 A. The Corrective Work Form signing that the work
18 was complete. And then Construction Completion Standard
19 Checklist, or CCSC Form, filled out by me for the work
20 that was complete for changing the connectors.

21 Q. Okay. Did -- when you signed the Corrective
22 Work Form stating that the work was complete, did you
23 date that signature?

24 A. Yes.

25 Q. What date?

26 A. June 18th of '16.

1 Q. Okay. And does that form somewhere on it state
2 what tower number the work was being done on?

3 A. Yes.

4 Q. And what tower number was the work being, that
5 you completed on June 18th?

6 A. 27 over 222.

7 Q. All right. 27/222?

8 A. Correct.

9 Q. All right. So sometime when you finished
10 27/222 in June of 2016, is that a fair conclusion from
11 the paperwork?

12 A. Yes.

13 Q. And you said that you had a hole in your
14 schedule and you had some crews available because of the
15 2012 tower collapse; correct?

16 A. Correct.

17 Q. What was going on in relation to the 2012 tower
18 collapse in June of 2016, or the summer of 2016?

19 A. I believe the final replacement of the towers
20 had gone down.

21 Q. Okay. What part did you play in the final
22 replacement of the towers?

23 A. Building a construction plan to get the job
24 done.

25 Q. All right. Did your crews play any part in the
26 actual construction of the new towers and new

1 transmission lines through there?

2 A. Not the towers, but the line, yes.

3 Q. Explain to us what your crews did?

4 A. Well, PG&E employs a department called Tower
5 Department. I'm in the Line Department.

6 Q. Right.

7 A. So Tower Department builds towers and Line
8 Department restring line.

9 Q. All right. So the Tower Department built the
10 new towers to replace the six towers that fell down in
11 2012?

12 A. Correct.

13 Q. And your crews came in and installed the new
14 conductor on those towers?

15 A. Correct.

16 Q. Just like when you installed the shoo-fly in
17 2013, the temporary replacement poles for the towers, did
18 you simply move the old conductor or did you install all
19 new conductor?

20 A. All new conductor.

21 Q. So while that was going on, you took on the
22 replace connectors project; correct?

23 A. Roughly, correct.

24

25 (Grand Jury's Exhibit 170 introduced.)

26

1 Q. All right. Showing you photograph up in front
2 of you marked as Exhibit No. 170. This has been
3 identified as a photograph of 27/222. Are you familiar
4 with this type of tower?

5 A. Yes.

6 Q. Now, I'm going to give you a, I'm going to let
7 you stand up here. And the Smart Board up here has some
8 really great functions. There's a pen. And basically
9 can you identify for us on the photograph using the red
10 pen, which is your finger, where those connectors that
11 they needed to be replaced are located? Whoops. You
12 changed it to black. There we go back to red. All
13 right. That's okay.

14 A. There's a sixth connector, I'm just not seeing
15 it. It must be right here.

16

17 (Grand Jury's Exhibit 170C marked for identification.)

18

19 Q. We'll label this as, it's 170C is where we're
20 at right now.

21 Just, for the record, you've drawn five red
22 circles around what you identify as the connectors. You
23 say there's a sixth one somewhere probably on the
24 backside of the tower from where the photograph is taken
25 that you can't exactly see?

26 A. Yeah.

1 Q. So there should be six connectors on the tower?
2 A. Yes, there are.
3 Q. Just, briefly, what are the connectors, by the
4 way?
5 A. The way to join two ends of wire together to
6 keep continuity.
7 Q. Do you know why you were replacing those
8 connectors?
9 A. I believe an order came from Asset Strategy
10 Team that, moving forward, all connectors to be used,
11 unless authorized to be able to use a bolted connector,
12 we're to use an Ampact connector.
13 Q. Do you know what the difference is between the
14 two?
15 A. Electrically, no.
16 Q. For instance, when you were installing the
17 shoo-fly, the temporary line, in 2013, January of 2013,
18 did you use parallel groove connectors or did you use the
19 Ampla?
20 A. Ampact.
21 Q. Ampact connectors?
22 A. Ampact on the shoo-fly.
23 Q. Okay. Do you know when the parallel groove
24 connectors were no longer to be used?
25 A. No.
26 Q. Using this, and you can use your fingers, and

1 we'll change colors here, can you describe for us the
2 process of changing those connectors, how your crews went
3 about doing that work?

4 A. We use helicopters for a lot of our work.

5 And you want a different color than black?

6 Q. Oh, yeah. You can change it. There's blue.

7 A. Can I ask which, where the failure was on the
8 tower?

9 Q. The failure was front, right here. We'll put a
10 black mark on it.

11 So now you go back to your blue.

12 A. So the guys would fly in via helicopter and
13 land up here on the bridge, somewhere up here on this
14 bridge right here.

15 Q. Okay. So you're circling the area you describe
16 as a "bridge" with a blue circle?

17 A. Correct.

18 Q. Okay. So you come in on a helicopter and your
19 guys land there --

20 A. Correct.

21 Q. -- on the bridge?

22 Then what do they do?

23 A. Well, with -- typically, when we fly out a
24 couple guys, I'll have a couple, multiple helicopters out
25 of an LZ. And the guys fly in pairs of two. They'll fly
26 out, and the helicopter behind them will be hauling out

1 their cargo. In this case, it would be a dead end
2 ladder.

3 Q. What's a dead end ladder?

4 A. A dead end ladder is -- you can, obviously, see
5 there's no way you can stand on the tower and reach that
6 connector. So a ladder is going to -- it will look just
7 like a ladder, but it's fiberglass and it's going to have
8 a couple rungs on one end. It's going to hang on the
9 tower and come out here to the wire to where it's
10 supported with an A-frame on the wire. And it's got the
11 two rungs there. So that would be like the profile look
12 of the ladder. Is that --

13 Q. Okay. So that's indicated with a blue line
14 going off onto the wire?

15 A. Correct.

16 Q. What do you use the dead end ladder for?

17 A. To get out to the connector.

18 Q. All right. How long does it take to replace a
19 connector?

20 A. Ten minutes.

21 Q. Briefly describe for us the process of
22 replacing a connector.

23 A. Well, the linemen would go up out on the tower.
24 They would ground, they would use a personal ground out
25 on the wire to shunt the wire out so they don't
26 electrically electrocute themselves, if you will. So

1 you've got that connector, they're going to break that
2 connector apart. So you need to have a way to bridge
3 that connection while you temporarily, temporarily bridge
4 it while you change that connector.

5 Q. How do you do that?

6 A. With a personal ground stick.

7 Q. What describe for us what a personal ground
8 stick is and how it will work.

9 A. It's a stick with a ground clamp on one end.
10 And it's going to have -- a fiberglass stick, and it's
11 going to have a cord come off it that will be 15, 20, 25
12 feet long. It's going to have a clamp on that end. So
13 that's one. The guy on this side of the tower would have
14 another. And when they take and hook the clamp up to the
15 steel and they come out here and ground the wire, there
16 and on the other side of the tower, that, that keeps the
17 continuity of that conductor. Therefore, when you break
18 that connector apart, you're not going to get in series
19 with induction.

20 Q. Okay. You used another term earlier, I need to
21 have you define that, "shunt" the wire?

22 A. That is, that's shunt. Same thing.

23 Q. Okay. All right. How long does it take your
24 crews to do a single tower, to replace all the connectors
25 in a single tower?

26 A. It varies. Depends on the flight time from the

1 LZ out to the tower.

2 Q. LZ is what?

3 A. Landing zone.

4 Q. So the question is, the big question is your
5 guys are in the tower, why would they not see what's
6 going on down here in the transposition arms?

7 A. Well, there's quite a bit going on doing, doing
8 this work right here. You've got to understand, these
9 guys are flying into the tower, and the first thing
10 they're looking at is where they're going to land on the
11 tower. So, you know, foot placement. There's days where
12 it's raining, your feet are muddy, which causes, you
13 know, a slippery condition, a safety condition. So
14 coming into the tower, the first thing you got to do is
15 look to see where you land and pick a good spot. So
16 you're looking for something that might be, you know, a
17 bad piece of steel, you know, or a missing piece of
18 steel, or bolts that fall out of the steel that hold the
19 tower together. So you're just being mindful of that
20 stuff, looking for it.

21 So you come in, land on the tower, you belt off
22 to the tower, your line to the helicopter will come slack
23 at that point, then you unclip from the helicopter. You
24 and your pole partner, your buddy, get unhooked from the
25 helicopter. That helicopter leaves and then immediately
26 these guys are transitioning to start looking, they

1 identify where they want to start on the tower. And, you
2 know, meaning this, the outside -- the river faze, the
3 middle faze, or the uphill faze. They pick a side,
4 because it's all got to get done.

5 And then they're now looking at hazards that
6 are associated with their work, which from the tower out,
7 the immediate thing is broken bells. Because you walk
8 out a ladder, you don't have anything to hang on to.
9 You're balancing, you know, to get out there, out to the
10 work. So they wander out on the ladder. And you're
11 looking for broken bells, because sometimes that's where
12 your handle is, is on those insulators. And,
13 unfortunately, people out in the woods love to shoot up
14 insulators with guns. So it's a real deal. And
15 porcelain glass, when it's broke, it's razor sharp. So
16 you're looking for potential safety hazards, you know.
17 That's how you got to get out the ladder.

18 When you get out on the ladder, you get your
19 personal ground installed, now you can get, you know,
20 physical, physically on the wire and starting to touch
21 stuff. But other things you're concerned about is
22 gunshot wire, or wire that's gunshot. I've come on to
23 wire that's got a perfect hole right through the middle
24 of it from a bullet that went through. So you're looking
25 for that stuff. The last thing you want is something to
26 break while you're out on that ladder and it come apart.

1 You know, it could kill you.

2 So you get out there and you're concerned about
3 those things, right here, this is what's going on in your
4 field of view. That's your scope of work is to change
5 this connector out.

6 So after you get out on the ladder by yourself,
7 and your pole partner is out on the other ladder by
8 himself, you guys are yelling across the tower at each
9 other: "My shunt is on," and he's saying, "My shunt is
10 on." Okay, now we know that we can break the connector
11 apart safely without getting in series. In this area
12 right here, there's multiple transmission lines that run
13 with this particular line. So induction is a big thing
14 out there. You get an induced voltage blown onto this
15 current, current-carrying conductor, it might be
16 de-energized, but it's still carrying current from the
17 induction being blown on there.

18 So that's another hazard that they're concerned
19 about flying, flying into the tower, is being able to
20 communicate. The wind's blowing, it's noisy, all of that
21 stuff. There's all these things that are trying to
22 distract you from just getting out here and changing the
23 connector. It seems so simple, but there's so much that
24 goes into it.

25 I mean, as far as that goes, their work is up
26 here. You know, they fly in on top of the tower. They

1 do their work collectively from one side to the other.

2 You can imagine the safety aspect of it, of what they've
3 got to look at.

4 Q. Right. Okay. And thank you. Before we
5 finish, let's make sure we get this marked. I think now
6 we're using green. I just want to make sure we've good
7 and accurate record of what we're doing. This top circle
8 up here is the bridge. We're going to mark that in green
9 as bridge. That's what you were referring to as bridge;
10 correct?

11 A. Yes.

12 Q. This line right here, that's your dead end
13 ladder; correct?

14 A. Correct.

15 Q. And this blue line down here, that's your
16 grounding wire; correct?

17 A. Correct.

18 Q. We're marking that grounding wire in green.

19 Now, this over here on the left side you were
20 drawing on, that is --

21 A. Ground shunt.

22 Q. Ground shunt.

23 A. Or personal ground.

24 Q. Ground shunt, slash, personal ground.

25 All right. And then over here the X is our
26 failure location.

1 All right. And all the red circles are the
2 connectors that need to be changed with the exception of
3 one that couldn't be seen. There's six total; correct?

4 A. Six total.

5 Q. All right. I think we've got everything
6 labeled correctly.

7 I have no further -- let me rephrase that. I
8 have no further questions.

9 Do any jurors have questions for (WITNESS #8)?

10 Seeing none, thank you, (WITNESS #8), for
11 coming in and explaining this. Madam Foreperson is going
12 to have admonition for you.

13 GRAND JURY FOREPERSON: (WITNESS #8), you're
14 admonished not to discuss or disclose at any time outside
15 of this jury room the questions that have been asked of
16 you or your answers until authorized by this Grand Jury
17 or the Court. A violation, a violation of these
18 instructions on your part may be the basis for a charge
19 against you of contempt of court. This does not preclude
20 you from discussing your legal rights with your own
21 attorney.

22 (WITNESS #8), what I have just said is a
23 warning not to discuss this case with anyone except the
24 Court, your lawyer, or the district attorney. Do you
25 understand?

26 THE WITNESS: Yes, ma'am, I understand.

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 70

are certified to be a complete transcription of said stenographic shorthand notes.

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: (WITNESS #18), would
you please stand and raise your right hand to be sworn.

(WITNESS #18)

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do so swear.

GRAND JURY FOREPERSON: Thank you. Have a
seat.

EXAMINATION

BY MR. NOEL

Q. (WITNESS #18), for the record, can you state
your full name, spelling your last?

1 A. Full name, (WITNESS #18), (SPELLING REDACTED) .
2 Q. Are you employed?
3 A. Yes, sir.
4 Q. By whom are you employed?
5 A. Pacific Gas & Electric.
6 Q. In what capacity?
7 A. I am currently a transmission troubleman.
8 Q. How long have you been employed by PG&E?
9 A. Started in '95, so twenty --
10 Q. Twenty-three, 24 years?
11 A. Yeah.
12 Q. Can you walk us through your career with PG&E,
13 jobs that you've held, where you started?
14 A. Right. I started in January of '95 in
15 Sacramento as a meter reader. And then about a year
16 after that I took a job as a customer service rep also in
17 Sacramento, answering the 800 number. About a year to
18 year and a half after that, I took a job as an apprentice
19 lineman in Coalinga, California. Did four years down
20 there. And in 2001 I got a job at Table Mountain as a
21 transmission lineman. About 2005 I took a one-year,
22 six-month to a one-year rotation in the safety program.
23 I came back to my transmission lineman job. Did a couple
24 of shorter rotations, you know, like six months here or
25 there. In between that, that time, in 2014 I believe it
26 was I took a job as a distribution compliance inspector

1 and came back to Table Mountain in 2016, I believe, and
2 have been a transmission troubleman at Table Mountain.

3 Q. Okay. What is the -- you said you did a
4 six-month to one-year rotation in the safety program.
5 What is the safety program?

6 A. That, it's basically you were out there
7 assisting the different departments with their safety
8 records, ensuring that their training was up to date,
9 providing them with additional materials if they needed
10 it. For instance, we had a tower crew that was working
11 up in the canyon. They were working on a heavy slope.
12 They gave me a call, and I directed them where they could
13 get slope information, provided them with what degree
14 slope they could access without being tethered, worked
15 with them to come up with a rescue plan if for some
16 reason an incident were to happen. That's just an
17 example.

18 Q. Okay.

19 A. I also did training for the different crews,
20 provided them with their required mandated training.

21 Q. So you're talking about employee safety,
22 personal safety?

23 A. Yes, sir.

24 Q. One of the things we've talked about, the 100
25 Percent Climbing Program, that kind of stuff?

26 A. That -- this was before that, but yes. That

1 would be an example.

2 Q. Basically ensuring that the employees were
3 doing their jobs in a safe manner, that they weren't
4 going to get hurt, or minimize the chances; correct?

5 A. Yes, sir. And we also did investigations. If
6 something did go wrong, we would be one of the first
7 people that would go out there and do investigations on
8 minor events. The major events, then it would go to a
9 safe, a qualified safety engineer would come out and
10 complete that kind of investigation.

11 Q. All right. So you started as a transmission
12 lineman somewhere around 2000; is that correct?

13 A. 2001, yes.

14 Q. And 2000 -- so when you started as a
15 transmission lineman, that was here at Table Mountain?

16 A. Yes, sir.

17 Q. Okay. What kind of training did you obtain to
18 qualify you as a transmission lineman?

19 A. We go through an apprenticeship. So I started
20 as an apprentice lineman '97 in Coalinga. And that's a
21 three-year apprenticeship. During that apprenticeship,
22 they expose you to both distribution, transmission
23 secondary work. It's supposed to expose you to all
24 aspects of actual line work. So I had a small amount of
25 transmission work during my apprenticeship that I was
26 down in Coalinga, and then when I got to Table Mountain

1 in 2001, basically you get on-the-job training to expand
2 whatever you know.

3 Q. Okay. Who provides the on-the-job training?

4 A. The crew you're working with. It's on-the-job.

5 Q. Why transmission as opposed to distribution for
6 you?

7 A. One of the big factors was the area. So
8 Coalinga, California, is not where I was born, grew up,
9 or a place that I would want to live and raise a family.
10 Not -- hopefully no one's here from Coalinga. If they
11 are, it's a decent place to live, it's just the weather
12 down there is harsh. I was born in Auburn, California.
13 This is obviously a lot closer to Auburn than Coalinga
14 is. And my wife at the time was from Grass Valley. So
15 we were both happy to move up into this area. That was
16 the big factor.

17 It was also more challenging. Distribution
18 work in Coalinga was, it was a little boring I guess.
19 There's not a lot of complicated-type projects in
20 Coalinga. A lot of -- it's just -- I don't know how
21 technical you want me to get, but you got a single phase
22 tap line that's going out to an ag pump for five miles.
23 So you're maintaining a single phase tap line for five
24 miles. You've got crossarm poles. You're doing that
25 every day. There's no variety.

26 Q. I'm just surprised that they have electricity

1 in Coalinga.

2 A. All right. Let's not degrade Coalinga. They
3 were good to me. The people down there were nice.

4 Q. In 2001 you come up here and you become --
5 you're a lineman now, a journeyman lineman assigned to
6 Table Mountain?

7 A. Yes, sir.

8 Q. What types of things were you doing at Table
9 Mountain?

10 A. We did a lot of transmission work. We have a
11 fairly good mix in this area of both wood poles and steel
12 structures; a lot of insulator change-outs, repairing
13 damage, conductor damage, a lot of winter storms, trees
14 come down, damaged structures, conductors. That we'll go
15 out and fix a conductor, replace insulators, replace
16 conductors on occasion.

17 Q. So in 2002 were you asked to do an aerial
18 patrol, the annual aerial patrol of the Caribou-Palermo
19 115 kV line?

20 A. In 2002 the company was going through a
21 bankruptcy process, and that was during the era where we
22 were forced into bankruptcy due to we weren't able to
23 recover the rates that we were paying for electricity
24 from the actual rate payers. That forced us into a
25 bankruptcy situation. And a bankruptcy judge asked us to
26 do a plan of reorganization.

1 Part of that plan of reorganization was to find
2 out what assets we had in our system, whether we had any
3 attachments from third parties on those, which means that
4 we could be collecting money from those third parties,
5 and what -- how many structures we had out there. So
6 they came up with a computer program that they put into a
7 helicopter, and they wanted the employees to go out and
8 log via the helicopter what structure was where, what
9 framing it had, and whether there were any attachments.

10 I was -- I don't want to say that I was a
11 computer expert, but in 2002, which was quite a while
12 ago, at Table Mountain, I was the computer expert. So
13 they actually tasked me to assist with doing that
14 project. I did the Caribou-Palermo and several other
15 lines.

16 Q. Okay.

17 A. Multiple.

18 Q. Who tasked you with that project?

19 A. That would be (EMPLOYEE #9), who was the
20 current supervisor at that time.

21 Q. Okay. And the reasons for why you were tasked,
22 or the reasons for why you were doing the type of patrol
23 at the time, how do you know those?

24 A. I actually created quite a few Excel
25 spreadsheets with GPS data that, the attachment data, the
26 framing data, and those files were the exact same dates

1 or close to in proximity of the dates this particular
2 aerial patrol was done.

3 Q. Okay.

4 A. And I couldn't -- I mean 2002, that was a long
5 time ago. So my -- I don't have perfect clarity of that
6 memory, I just know that, that during that time period I
7 was doing those. And I'm not certain as to whether an
8 additional air patrol was done that year and this was
9 just supplemental, or whether this was the actual air
10 patrol.

11 Q. The information regarding the bankruptcy and
12 the judge's orders, how do you know about that
13 information?

14 A. We were briefed on it.

15 MR. NOEL: And, ladies and gentlemen, just
16 remember your admonition we've given you over and over
17 again. Hearsay. This is not being offered for the truth
18 of the matter, it's simply giving a background as to why
19 and how he came to be doing this. So don't consider it
20 as the truth.

21 We have to give them that to make sure.

22 Q. (By MR. NOEL) Before you did your aerial
23 patrol in 2002, were you given any training in doing
24 aerial patrols of transmission lines?

25 A. I had done some ride-alongs with the
26 transmission troublemen both for aerial patrols and

1 detailed ground inspections, but it was all on-the-job
2 training. There was no official training that I can
3 remember at that point.

4 Q. Do you recall, was there a troubleman for the
5 2002 air patrol or were you by yourself?

6 A. I do not recall.

7
8 (Grand Jury Exhibit 455 was introduced.)
9

10 Q. You have in front of you what's marked as
11 Exhibit 455 for identification.

12 A. Yes.

13 Q. Do you see that exhibit?

14 A. Yes, sir.

15 Q. Do you recognize that exhibit?

16 A. Yes, sir.

17 Q. What is that exhibit?

18 A. That would be related to what we were just
19 discussing, the 2002 air patrol of Caribou-Palermo.

20 Q. That was the aerial patrol that was performed
21 by yourself?

22 A. Yes, sir.

23 Q. This is a little different. It's a long time
24 ago. Can you explain -- we have the front page of 455 up
25 on the big board. Can you explain to us how to read the
26 front page here? And feel free to get up and use the

1 board if you want. You can get up and walk around;
2 you're not chained to the desk.

3 A. Do I have to take the microphone with me?

4 Q. You talk pretty loud.

5 A. So up here in the right-hand corner we've got
6 the date. This is a stamp that's put on after the
7 paperwork is already filed. It's basically a checklist
8 to make sure that all the paperwork related to this
9 patrol is completed. "Supervisor check, final
10 confirmation to DOCC," that's a clerical function to tell
11 them that they can close this work order.

12 So up here you'll see an order number. That's
13 an actual work order number.

14 "Add/Delete Structures," that's a clerical
15 function based on what information is given to them by
16 the transmission troublemen.

17 "Notifications," if there are any notifications
18 that are created for this line.

19 And "Equipment Changes", which oddly enough is
20 not checked. And basically that is our sending the
21 equipment changes to our mapping department for them to
22 correlate and send that information back. That's my
23 understanding of that one.

24 We have "Old Line Sections." So obviously this
25 is an old line. It's basically gone through quite a few
26 different name changes and configurations. The one just

1 prior to this was Caribou-Sycamore Creek -- I don't know
2 if you guys are familiar with Sycamore Creek Substation,
3 but it's up in Chico -- was one section of it. And then
4 the other section of it was Palermo-Big Bend No. 2. Big
5 Bend is a switching station that's on the side of Lake
6 Oroville. So Caribou-Sycamore Creek used to come in from
7 Caribou Powerhouse into Big Bend and then go up to Chico.
8 And the Palermo Big Bend is just that, goes from Palermo
9 Substation up to Big Bend. They combined those two
10 sections of line and turned it into the Caribou-Palermo.

11 The notation here with the little parenthesis,
12 has a semicolon there. So if you look through the larger
13 document, you will see some structures that have a
14 semicolon before the actual structure number and some
15 that do not. That do not are going to be the section of
16 line that went from Palermo to Big Bend. The pieces that
17 do have a semicolon are going to be from Caribou to
18 Sycamore Creek section.

19 Kind of the top part of the form, "Crew
20 Foreman." Obviously, I was not a foreman, but the way
21 these orders got printed out in 2002, if it had a job, it
22 had a foreman. So because I did this aerial patrol, I'm
23 now the foreman. Unfortunately, I didn't get foreman
24 pay, I can guarantee you that.

25 And that's pretty much it for that page, unless
26 -- well, the other thing that kind of leads me to believe

1 that there could have been an additional air patrol is
2 our end date on here is 6/25/2002. And this date
3 obviously is 8/26/2002. So we either filed for an
4 extension or there was an additional air patrol. And to
5 be quite honest with you, I can't remember whether there
6 was an additional air patrol or whether we were just
7 doing this from land.

8 Q. Great. Thank you. Very helpful.

9 All right. Let's move on to page 3 in that
10 document.

11 A. All right.

12 Q. We have page 3 up on the big board. Explain to
13 us what, what we're looking at here on page 3.

14 A. So this is the data sheet. I'm sure if you had
15 some more troublemen here, you've seen these before.
16 This is where we would list all of the findings that we'd
17 have on a patrol. I was brand new. I wasn't real clear
18 on what exactly would be a finding and how to list these,
19 so I kind of like was working just off my own playbook at
20 this point, because I was tasked with adding structures,
21 relating to the POR. So that's what I basically had as
22 findings was these structures were missing from the
23 detailed sheet, which we're going to go into next I'm
24 sure. And so there -- they needed to be added to the
25 patrol.

26 As you can see here, I put structure numbers

1 over here, "add structure" as the comment.

2 "Inspector Name." I'm no longer the foreman,
3 just the inspector. There's my name, the date.

4 "Miles Inspected." I'm 99 percent sure that
5 what I did is I took my miles here and put my miles up
6 there.

7 And the structure count is going to be
8 different. I can't really read it on that. But the
9 structure count was what I was really concerned about.
10 If they want to tell me that it's 62 miles to get from
11 Caribou to Palermo, it doesn't impact anything as far as
12 what I was doing, so I didn't feel like I needed to make
13 a correction. Once again, new, 2002. I guess if you
14 wanted to try and pick it apart, it might not be 62 miles
15 from Caribou to Palermo.

16 This up here, this would be (EMPLOYEE #9)'s
17 signature. He signed it on October 16, 2002.

18 Q. Now, you talked about the object list.

19 A. Yes, sir.

20 Q. Now we have the object list, page 4, up in
21 front.

22 A. Page 4, once again, in the upper right-hand
23 corner, my name, date, inspect date, 2602.

24 You're going to find over here we have the
25 structure numbers listed, as I said before. We have four
26 boxes. You have a choice between four boxes to check on

1 these. Top one being "Completed No Problems," "Completed
2 New Findings," "Preexisting Condition Check," and "Not
3 Inspected this Patrol."

4 This here is going to give you your structure
5 number. And above that is going to be your frame type.
6 The top one, "Suspension, 000 over 001, lattice steel
7 tower."

8 The first correction that I made was on line
9 item 3. I checked the box for "Completed, New Findings."
10 And I was changing the frame from suspension to a DDE,
11 which stands for double dead end.

12 Similar on -- what is that? -- number 5, going
13 down here, the TRP DDE stands for transposition double
14 dead end.

15 And I marked "Completed New Findings" and
16 "Preexisting Condition" checked. And that's based on
17 another part of this patrol, which actually has the
18 conditions that are on the line.

19 So that one there is showing that it has a
20 preexisting condition, meaning that I already have a work
21 order to fix something on that structure. And I marked
22 the "Completed New Findings" because I was changing the
23 frame.

24 Q. Can you explain to us the difference between a
25 suspension tower and a double dead end?

26 A. Yes. Yes. Suspension tower would be where you

1 have the wire is being suspended from a single insulator,
2 or single set of insulators. A double dead end is where
3 the wire is actually, the tension on the wire is being
4 supported by the structure in a lateral sense. So you
5 have the wire coming in being supported by a steel
6 structure, the actual line tension, and then being
7 supported again for the line tension going out the other
8 side. The suspension is just supporting it from a
9 vertical. It's not really supporting a line tension,
10 it's just supporting the vertical tension of whatever
11 weight the wire is.

12 Q. Which uses jumper conductors?

13 A. That would be a double dead end.

14 Q. How do the jumper conductors fit in in the
15 double dead end configuration?

16 A. So the double dead end comes in, is supported
17 via the insulators to the structure. The jumper wire
18 comes off where it attaches to the insulator, is
19 supported or unsupported, depending on what kind of
20 double dead end you have. And then it goes over to the
21 other side of that steel structure. And, generally, a
22 jumper wire, just a dipped loop, or you can have overarm
23 jumpers where it's supported on top of the arm via an
24 insulator. Then it goes to the other side of that double
25 dead end and, once again, it goes out on the main
26 conductor.

1 Q. What's the difference between a double dead end
2 and a transposition tower?

3 A. Double dead ends will generally just come in,
4 go through the jumper wire, go out the same side of the
5 tower. A transposition tower double dead end, it will
6 come in, it will hit a separate set of insulators, move
7 to the other side of the tower, and then go back out the
8 other side of the tower.

9 Q. Okay. Okay. Great. I'm going to move on to
10 page 31 in the packet there. Page 28 of the Transmission
11 Line Object List, but page 31 of the entire packet.

12 A. Okay.

13 Q. Specifically, we have down at the bottom "tower
14 27/222"?

15 A. Yes, sir.

16 Q. And you have some notes on that tower?

17 A. Yes, sir. So we -- it was originally listed as
18 a suspension tower. I lined that out, put "TRP,
19 transposition, double dead end," and marked the
20 "Completed No New Findings" box. The check marks that
21 are by these, on the color copies you can see they're
22 actually in red, and I believe those were put on there by
23 the supervisor.

24 Q. And that's where I was going to. You've been
25 able to view the original color copies of these documents
26 at PG&E; correct?

1 A. I've looked at them via my counsel.

2 Q. Okay. On the copies that you have, that check
3 mark to the right is in red ink?

4 A. Yes, sir.

5 Q. And you said that that indicated to you that
6 that was done by your supervisors?

7 A. It was probably done by my supervisor. I
8 remember my supervisor at that time, he liked to mark
9 everything up in red. And I don't like red pens.

10 Q. That was (EMPLOYEE #9)?

11 A. Yes, sir.

12 Q. Great. Thank you.

13 All right. So that was 2002. So then you go
14 away, do a couple other things, then in 2016 you come
15 back to Table Mountain as a troubleman; correct?

16 A. Yes, sir.

17 Q. What training did you receive to qualify you as
18 a troubleman?

19 A. Mainly on-the-job experience. We have some
20 official trainings for doing switching operations. That
21 -- I'm fairly certain that what you're after is what
22 qualifies me to be inspecting.

23 Q. That's the next question, is back in 2002 you
24 were a lineman who was asked to do this because of your
25 computer skills?

26 A. Yes, sir.

1 Q. Now it's 2016. Now you're a troubleman. What
2 training do you receive in how to do patrols, aerial
3 patrols, of the transmission lines or detailed ground
4 inspections of the transmission lines?

5 A. Basically the on-the-job training.

6 Q. And who do you receive that from?

7 A. The existing troublemen. When I took the
8 position most currently, I was already, I had already
9 done quite a few aerial patrols, detailed ground
10 inspections both with the transmission troublemen and by
11 myself.

12 Q. Do you recall who the troublemen were when you
13 started, the ones who gave you your on-the-job training?

14 A. In 2002, it would have been (EMPLOYEE #7) is
15 what he went by. (EMPLOYEE #7) is his legal name.

16 Q. How about when you returned in 2016?

17 A. When I returned in 2016, I didn't receive
18 additional on-the-job training because I had already been
19 -- prior to leaving for Compliance, I had already been
20 doing transmission troublemen work on occasion.

21

22 (Grand Jury Exhibit 456 was introduced.)

23

24 Q. Okay. So now we're looking at Exhibit 456. Do
25 you see Exhibit 456 in the stack in front of you?

26 A. Yes, sir.

1 Q. Do you recognize Exhibit 456?

2 A. Yes, sir.

3 Q. What is Exhibit 456?

4 A. Exhibit 456 will be the Caribou-Palermo for
5 2016.

6 Q. So between 2002 and 2016, some significant
7 changes to that front page; is that correct?

8 A. Yes, sir.

9 Q. Can you explain to us how to read the front
10 page of Exhibit 456, please.

11 A. Sort of. More of a clerical, but yeah. I can
12 tell you specifically what I'm looking for: Order
13 number, what line you're working on, and your due date.

14 So we have end date of 9/30/2016. However,
15 because this is an air patrol, we've gone to quarterly
16 air patrols. So you get to add -- they should all come
17 up with basically an end date for the quarter. So you're
18 going to have an end date of 3 -- 31 days in March? Yes.
19 3/31, you're going to have 6/30, 9/30, because they're
20 all part of it, the ending of a quarter.

21 Q. Okay. And the middle of the page is a
22 statement?

23 A. Correct. It's stating that per north and south
24 superintendents, all air patrols will be completed
25 quarterly, mass change required, end date to be
26 appropriate quarter.

1 Q. Was this a change in policy from --

2 A. Yes, sir.

3 Q. -- originally? Can you explain to us the
4 change?

5 A. I can't tell you when exactly it took place, as
6 far as the year, but I know that when I first got to
7 Table Mountain we would do air patrols whatever month
8 they were due. Meaning that if you did a ground patrol
9 in February, you were going to be doing air patrol in
10 February. If you did a ground patrol in June, you were
11 going to be doing the air patrol in June. What they were
12 doing was consolidating anything that was in January,
13 February, March into one quarter. And that way you could
14 fly multiple lines on the same day.

15 The theory behind it, it was to cut down in the
16 ferry time and the fact that if you did air patrols for
17 two or three hours, what are you going to do for the
18 other six to eight hours in that day?

19 Q. So prior to this you might spend three days a
20 month doing air patrols, but just doing one line each
21 day?

22 A. No, you would generally only do one day per
23 month --

24 Q. Okay.

25 A. -- prior to this. That would be the one day
26 where you caught all of the air patrols that were due

1 that month. And then after this implementation, you
2 would schedule one or two days, possibly three days, to
3 do three months' worth of patrols.

4 Q. All right. So let's move on to page 3 of
5 Exhibit 456, your Transmission Line Inspection Data
6 Sheet. This doesn't look like it's changed too much in
7 14 years?

8 A. No, sir. There are some differences. If you
9 looked at the last one, you were seeing the supervisor
10 signed it up here. We now have signatures for both
11 inspector and supervisor down at the bottom.

12 Q. So down under "Inspection, Inspector's
13 Signature," that your signature?

14 A. Yes, sir.

15 Q. On August 5th, '16?

16 A. Yes, sir.

17 Q. Who was your supervisor in '16?

18 A. My supervisor would be (WITNESS #12).

19 Q. And you recognize (WITNESS #12's) signature
20 there?

21 A. Yes, sir.

22 Q. And why don't you walk us through this sheet
23 like you've done for previous ones.

24 A. Okay. They, they have been expressing better
25 record keeping. Now, "Inspector Name," rather than
26 having "(WITNESS #18)," my last name, now I have to write

1 my first and last name. And on the detailed inspection
2 sheets you have to write it on every page, which gets
3 kind of annoying, but they wanted better records.

4 We got "Date Inspection Complete," "Miles
5 Inspected." Because this is an air patrol, I'm copying,
6 I'm just going to copy what the line miles are and what
7 the structure order number is.

8 On an air patrol, typically we don't keep a
9 count of structures as we're going over them. We're
10 moving at a pace that's in -- we're in a very tight,
11 confined area of the helicopter. We can't have a lot of
12 paperwork up there. So we're not even making tally
13 marks. We're basically writing down the structures that
14 we have problems with.

15 So on 8/5/2016, structure, this is going to be
16 a semicolon, 6 over 46. Like we went through the last
17 one, the semicolon section and non-semicolon section
18 still exist on this line. So 8/5/16, 6 over 46, I have a
19 priority E, which basically means we have a year to fix
20 it. My comments are "Repair bent tower leg." Then this
21 is going to be the SAP notification that got put into our
22 data working system. SAP.

23 And then it's going to be the same process for
24 these other towers. "Replace damaged insulators, replace
25 disconnected insulator string, replace damaged
26 insulators."

1 And then this last line section, because we no
2 longer were filling out the object list, we were just
3 turning in the data sheet, this last section is basically
4 stating that an air patrol was completed from structure
5 000 over 001 to structure semicolon 37 over 303 with no
6 additional findings. Basically stating that that was,
7 these four findings were the last -- or the only four
8 findings I had on the air patrol.

9 This checklist, which was stamped on the front
10 page of the last one, is now stamped onto the data sheet.

11 "Supervisor Check." Apparently that date
12 didn't get filled out. However, we do have a signature
13 and a date down there.

14 "Confirmed to DOCC." Once again, that is a
15 clerical function saying they can close this order.

16 "Add/ Delete Equipment." We didn't have any
17 equipment to add or delete on this one.

18 "Notification." The date that these
19 notifications were completed was 8/12/2016.

20 And then any equipment changes. There were
21 none on this one.

22 This year here apparently I was not doing
23 notifications on the iPad, so that meant the clerical
24 support would be writing in, basically transferring what
25 I wrote down on paper into our SAP system, and they would
26 actually write the notification.

1 Q. Okay. So the right-hand column says
2 "Notification Number," and then there are nine-digit
3 numbers in each box. That's not your writing?

4 A. No, sir. That would be clerical writing.

5 Q. Okay. Something that was added after you
6 turned the form in?

7 A. Yes, sir. And you can see also this is in
8 black ink. That's in blue ink.

9 Q. "Priority." Who sets the priority for a
10 repair?

11 A. I do.

12 Q. And what are the criteria that you use for
13 determining the priority?

14 A. It's a conjunction of we call it our *ETPM*
15 *Manual, Electric Transmission Preventative Maintenance*
16 *Manual*, and personal experience and judgment call.

17 Q. And what are the different priorities that you
18 have to choose from?

19 A. We have a priority A, which means immediate.
20 It will still have a due date of 30 days that we can have
21 the record in there without having to close it
22 immediately. But an immediate response basically means
23 that we're going to fix that situation right now. We are
24 calling out a crew, I'm going to stand by until it gets
25 fixed.

26 We have a B priority, which is a 90-day,

1 three-month, priority. Still extremely high priority.
2 We schedule our crews out far over three months. So, I
3 mean, even though a 90-day priority doesn't sound like
4 it's very immediate, it really is because we're basically
5 going to rearrange our work to get this done.

6 We have an E priority, which is a one-year.

7 And then we actually even have an F priority,
8 which is a two-year tag. But the only thing that we
9 really use those for is if we're going to create a new
10 road, replace a wood pole that is deteriorated but not in
11 danger of falling down.

12 Q. Okay. Thank you.

13 All right. Moving on to page 4 of Exhibit 456.
14 What is page 4?

15 A. That is going to be the priors. So those are
16 work orders that are currently in the system. There's
17 that nine-digit number that we were talking about for
18 notification number. If an order number is created, that
19 will be listed there. You don't always have an order
20 number, because it might not have been, have been gone
21 through our engineering process for them to create an
22 order number.

23 "Required End Date," what date that is supposed
24 to be fixed by.

25 The date that notification was written up.

26 What kind of notification it is.

1 The planner group, that would be who is
2 responsible for getting that work done.

3 Description of what the work is.

4 "Function Location." This is -- all of our
5 lines not only have a name, but they also have an
6 electrician -- electric transmission line number assigned
7 to them. So ETL3190 is for the Caribou-Palermo.

8 This is coding. So this here is going to give
9 you a way of looking at what is going to be involved with
10 that work. So you have like insulator replacement, you
11 have footings. It's a little bit more of a breakdown on
12 that.

13 And the "Notes," I'm not sure what they use
14 "Notes" for. I've never seen anything in the "Notes."

15 Q. So, for instance, the top "Open Notification"
16 up here says "Caribou-Palermo NERC project." Do you know
17 what that means?

18 A. Yes. The NERC is our governing agency, PG&E's
19 governing agency, on the federal side. And they
20 basically came out with new conductor-to-ground clearance
21 limitations. And when they did that, they found a whole
22 bunch of our lines that weren't in compliance for
23 conductor-to-ground distance. And so when they came back
24 with these numbers, they basically created a project for
25 almost all of our lines that are in mountainous areas.
26 Because when they were originally constructed, it was

1 basically -- well, nobody's going to go out there
2 underneath those conductors, so we don't need to worry
3 about the height. Well, we still need to worry about it.
4 They created this project to try and fix them.

5 Q. Great. One last question before we go on. See
6 "Required End Date, NERC project, 12/31/13," down on the
7 third, "4/16/211, 2011." This is a 2016 inspection, or
8 patrol, to use the correct terminology, is it unusual to
9 see open notifications that are past their required end
10 date?

11 A. It's -- there's probably going to be a reason
12 behind it. The "car tower" is going to be because we're
13 still billing someone and/or it's being held up in legal
14 99 percent of the time.

15 Q. What does that mean, "car tower"?

16 A. That means somebody drove their car through our
17 tower. Actually, off Ridge Bar Road. A SUV left the
18 road, went through the middle of our tower, took out a
19 tower leg, and ended up down in the canyon. Thankfully
20 everybody was okay.

21 But, yeah, they're going to leave that job open
22 until it's gone all the way through.

23 Q. So when somebody like you sets a, does a
24 notification, sets a --

25 A. Due date.

26 Q. Yeah, priority tag. For instance, if it's E

1 priority, within one year, it automatically populates one
2 year out?

3 A. Yes, sir.

4 Q. Okay. Thank you.

5 Now, the one thing that's missing out of this
6 patrol, aerial patrol report, is there is no Transmission
7 Line Object List; correct?

8 A. Yes, sir. This was a transition point where we
9 were moving away from filling out the object list for
10 aerial patrols. And if you have a more recent aerial
11 patrol, you'll see that we have a new form that we were
12 putting in there so that we could break up the dates as
13 to which areas of line we inspected on which dates. But
14 this was basically when we were transitioning from
15 removing object lists on aerial patrols and basically
16 saying that we looked at the line.

17 The reasoning behind that is the object list --
18 once again, you have a very cramped area in the
19 helicopter. Trying to fill out those boxes individually
20 as you're flying along and making sure that your
21 structure count is correct is -- when the structure
22 number is a small yellow strip that's probably about a
23 foot long -- it's not practical to try and make sure
24 you're at that structure as you're checking that box.

25

26 (Grand Jury Exhibit 457 was introduced.)

1
2 Q. All right. So now I want to talk a little bit
3 about the process of setting up and scheduling the aerial
4 patrols of these lines. You have in front of you Exhibit
5 457.

6 A. Yes, sir.

7 Q. Do you recognize that document?

8 A. Yes, sir.

9 Q. What is that document?

10 A. This is a document that gets sent out by our
11 Helicopter Operations. I basically put in a request for
12 a helicopter for doing whatever work I'm doing and then
13 it gets put into a computerized format. I provide them
14 with information, it gets puts into these reports.

15 Q. So walk us through how it is that you schedule
16 and set up the aerial patrols of transmission lines.

17 A. There's a couple different ways. So if I have
18 prior notification, like I know I need to go do my
19 quarterly patrols, then I will sit down at the computer
20 and I will fill in all the information: Where I want to
21 be picked up, what lines I'm going to be looking at, how
22 long I think it's going to take me, who is going to be on
23 the flights with me. And then I submit that to our
24 Helicopter Operations. If it's a non-routine and/or
25 emergency, then it's generally I just make a phone call
26 to our Helicopter Operations and give them that

1 information over the phone rather than having it go all
2 the way back to a computer and trying to do that all on
3 the computer.

4 Q. What's the difference between a routine and
5 non-routine aerial patrol?

6 A. A routine aerial patrol is basically going out
7 there, we're trying to find any problems that are
8 existing or deteriorating. We're trying to find obvious
9 broken, malfunctioning equipment out there.

10 The non-routine is generally in response to an
11 event. It could be a momentary outage, it could be a
12 line that is locked out, meaning that it's relayed and
13 the automatics are not going to bring it back in because
14 it's relayed too many times or they have the relays cut
15 out. So then you're actually going out there to look
16 what caused it to lock out and/or momentary.

17 Q. What's the difference between a non-routine and
18 an emergency patrol?

19 A. There really isn't a whole lot of difference
20 other than the wording. There can be a non-emergency,
21 non-routine patrol, but as far as our accounting goes,
22 our emergency patrols are still considered to be
23 non-routine.

24 Q. Okay. So you said your patrols are broken up,
25 your aerial patrols are broken up by quarter; correct?

26 A. Yes, sir.

1 Q. Is there someone who provides you with that
2 list or are you responsible for keeping your own list of
3 which patrols need to be done in which quarter?

4 A. They will provide -- they, meaning our Asset
5 Management Group, will send us an email saying these
6 lines are due for this month on the detailed ground
7 inspection; and then they also send us our air patrol
8 schedule, which would be these lines are due in the first
9 quarter, these lines are do in the second quarter, third
10 quarter, fourth quarter.

11 Q. Whose responsibility is it to set up and
12 schedule those patrols?

13 A. You mean like who is responsible for calling
14 Helicopter Operations or setting up the --

15 Q. Yep.

16 A. -- helicopter venue?

17 Q. Everything that goes into --

18 A. That would be the transmission troublemen.

19 Q. Everything that goes into actually getting the
20 patrol, doing the patrol.

21 A. Yes, sir. That would be the transmission
22 troublemen.

23 Q. All right. Will -- so what are we looking at
24 here with this Work Period Report, Exhibit 457?

25 A. So I'll make a request to Helicopter
26 Operations.

1 "Start Time" is basically when I tell them to
2 pick me up.
3 "End time" is how long I think I'm going to
4 need the helicopter.
5 "Estimated Hours," six hours.
6 "Vendor" is going to be the helicopter company
7 that's going to be flying me. A&P in this case.
8 "Aircraft Type," whether it's going to be a
9 206, 207, 500.
10 The tail number on that air craft.
11 "Pickup Location," where they're going to pick
12 me up at. In this case, A&P Hangar.
13 "Pickup Time," 7:00 o'clock.
14 "Equipment Weight and Additional Weight."
15 "Patrol Line." This is what I plan on getting
16 done on 8/4/16. That's going to be the date up there.
17 These specific lines. I'll give number of structures.
18 Your order number that's associated with it.
19 "Passengers," who is going to be on there.
20 My LAN ID. Sort of my weight.
21 Then we moved on to the 5th. Very similar.
22 Q. Why is the weight of the passengers important?
23 A. The weight of the passengers is important for
24 flight planning. Basically they need to know how much
25 you weigh as to how much fuel they put on there, as to
26 what equipment they can have on the helicopter, what kind

1 of helicopter they're going to have. You've got altitude
2 restriction -- you know, they all have different lifting
3 capabilities at different altitudes.

4 So, for the most part, they know me, they know
5 how much I weigh, and they probably knew that I might
6 have put a wrong digit in the wrong spot. So, yeah.

7 Q. All right. So on August 4th of '16 you planned
8 to do the Grizzly-Tap, the Cresta-Rio Oso,
9 Caribou-Palermo. I got to ask, this says Butte Valley.
10 Is that the correct name?

11 A. No, it's Butt Valley.

12 Q. Why does it say Butte Valley on here?

13 A. One of the clerks did not want to say butt, and
14 they were very offended that we had a line that had butt
15 in the name, so they changed it to Butte. And somehow or
16 another that got changed into an official name change,
17 only it's not because some documents you're going to see
18 a Butt, the other ones you're going to see a Butte. But
19 it is, it's definitely Butt.

20 Q. So the Butte Valley-Caribou line and the Butt
21 Valley-Caribou line are the same line?

22 A. Yes. If you look, this number here, this is an
23 older line number, they're going to have the same line
24 number. Or the ETL number is going to be the same
25 number. So yes, they are the same line.

26 Q. Also the Plumas-Sierra Tap on this day?

1 A. Yes.

2 Q. You planned to do five lines in total, 1,050
3 structures in six hours?

4 A. That was the plan, yes, sir.

5 Q. All right. Now, going on to August 5th. The
6 next day you were going to do some more patrolling;
7 correct?

8 A. Yes, sir.

9 Q. Explain, walk us through what you planned to do
10 on August 5th.

11 A. August 5th, planned on doing
12 Oroville-Thermalito-Table Mountain number 1, number 3,
13 Oroville-Table Mountain, Palermo-Pease, Table
14 Mountain-Butte number 2. That one is actually Butte.
15 Caribou number 2 and Caribou-Plumas Junction. For total
16 1,673 structures in six hours.

17 Q. I just realized something. We have a little
18 bit of a contradiction. I'm sorry we didn't talk about
19 this before. You have the exhibit down there, 456, which
20 is the report that says that the inspection was done on
21 August 5th. But this would indicate that it was
22 scheduled for August 4th.

23 A. Uh-huh.

24 Q. So is that -- do you remember why or have an
25 explanation for why? I'm sorry, I just noticed that
26 while you were talking about it.

1 A. There was probably an email that got sent out
2 or something else was done as far as likely to explain to
3 Helicopter Operations that these dates were changed.

4 Q. It's not important. It doesn't change it, but
5 I just noticed that there was that issue.

6 A. So there's -- when you're dealing with the
7 canyon lines, there's always a possibility the weather in
8 the canyon is going to preclude you from finishing a
9 patrol or make it to where you can't even start a patrol.
10 So, generally, when I schedule with Helicopter Operation,
11 I will put the canyon lines on whatever first day I'm
12 going to do, and then I have a second day set up for
13 whatever I can do down in the valley. If I get blown out
14 of the canyon, I'll come down and do some valley line.

15 Q. Right.

16 A. And I'll go back up into the canyon the next
17 day to try and complete those canyon lines.

18 Q. Okay. Now we go to a third day?

19 A. Yes, sir.

20 Q. August 12th --

21 A. Yes.

22 Q. -- '16. And it looks like the same, the two
23 lines that are scheduled for August 12th are already
24 mentioned over here scheduled for August 4th and August
25 5th; is that correct?

26 A. Yes, sir. So, I mean, from the way I'm looking

1 at this, this is probably a report that was sent out via
2 Helicopter Operations. This was not the original form
3 that I filled out. It's not my original work order. And
4 so it has it listed on here twice. It wasn't like I was
5 filling out all of this on one day and going, "Oh, well,
6 I'm going to go do these on another day, too." Basically
7 what happened here was I wasn't able to complete the
8 Palermo-Pease and the Cresta-Rio, on their respective
9 days, so I set up another day to actually complete those.

10 Q. Okay. That's what we wanted to bring out.

11 Now, is it common to be doing air patrols for
12 five, six, seven lines per day?

13 A. Yeah.

14 Q. All right.

15 A. On the quarterly air patrols, when we do them
16 quarterly, yes.

17 Q. For instance, on the 4th, total structures,
18 1,050 structures in one day?

19 A. That's what was scheduled.

20 Q. Right.

21 A. Obviously, you see that it didn't get done.

22 Q. That's what I was going to say.

23 A. Right.

24 Q. You scheduled to do 1,050. You obviously
25 didn't get to do the Cresta-Rio Oso. So you actually did
26 about 643 structures on this date. And then again on the

1 5th, the 5th you had scheduled to do seven lines, 1,673
2 structures. You didn't get to the Palermo-Pease, so that
3 would have been minus 120. So 1,500 and change
4 structures that day; is that correct?

5 A. I would have to actually look at the patrol
6 documentation, because obviously this is --

7 Q. Right.

8 A. -- this is not going to be extremely accurate.
9 As you can see, I had to reschedule --

10 Q. Right.

11 A. -- those dates. Helicopter Operations either
12 got an email or I called them on the phone telling them,
13 "Hey, I'm changing these around," and didn't get the
14 change on this piece of paper.

15 Q. Right. But --

16 A. To tell you exactly what, exactly how many
17 structures I looked at per day, I'd have to look at the
18 actual patrol records.

19 Q. Right. The question is, is this unusual to be
20 scheduling to do this much per day?

21 A. It's ambitious, but I wouldn't call it unusual.

22 Q. Perfect. Thank you.

23

24 (Grand Jury Exhibit 459 was introduced.)

25

26 Q. All right. We were talking about your

1 scheduling. You have in front of you Exhibit No. 459.

2 Do you see that exhibit?

3 A. Yes, sir.

4 Q. Do you recognize that exhibit?

5 A. Yes, sir.

6 Q. What is that exhibit?

7 A. So this is from me. I've never seen my email
8 like that. And it's going to Helicopter Operations, more
9 specifically Aja, who works down in Helicopter
10 Operations, generally who I'm dealing with. The CCs are
11 (WITNESS #21), the clerk there; (WITNESS #22), my
12 supervisor. The date that I sent it. And subject was
13 air patrols completed on this request number. So each of
14 our work orders that we process through our Helicopter
15 Operations is going to have a separate request number.

16 Basically saying that I completed the following
17 air patrols on 5/17: Wood Leaf-Palermo, Sly Creek Tap,
18 Forbestown Tap, Kanaka Tap, Caribou-Table Mountain, Bucks
19 Creek-Rock Creek-Cresta; Belden Tap, Oro Fino Tap on
20 5/17.

21 5/18 I completed Palermo-Colgate,
22 Palermo-Oroville number 2, Glenn 1, and the Elk Creek
23 Tap.

24 Stated that the following have not been
25 completed, will be rescheduled: Paradise-Table Mountain,
26 Poe-Rio Oso, Table Mountain Rio Oso.

1 My name, my phone number.

2 Q. Okay. Kind of illustrating the separate
3 incident, what we were talking about before, you schedule
4 so many lines in a day, you do what you can, then
5 sometimes for whatever reason you have to reschedule the
6 other; is that correct?

7 A. Correct.

8 Q. Those would be rescheduled within the same
9 quarter which they're due?

10 A. Yes, sir. Or if they're not going to be, then
11 we have to get superintendent approval. But I'm fairly
12 certain that I would have been able to get those within
13 the quarter.

14

15 (Grand Jury Exhibit 460 was introduced.)

16

17 Q. All right. We also talked about setting up
18 your helicopter schedule. You have in front of you
19 what's marked as Exhibit 460?

20 A. Yes, sir.

21 Q. Do you recognize Exhibit 460?

22 A. Yes, sir.

23 Q. What is Exhibit 460?

24 A. So this is more what gets put into Helicopter
25 Operations. This is a request number, like on the last
26 one that we were looking at where I was referencing a

1 request number. My name, phone number, vendor, what kind
2 of patrol, what kind of work we're doing, in this case
3 patrol. Patrol type is routine. We talked about
4 routine, non-routine. The approving supervisor, he's
5 going to have to approve it for them to get the
6 helicopter out.

7 This particular one was a short request,
8 meaning that I hadn't given them their ten days that they
9 liked to have in order to work with the vendors to get me
10 a helicopter. And then a lot of times I will actually
11 contact a vendor directly to make sure that they have
12 availability. Helps me to know which vendor I'm going to
13 be getting, and it helps heli-ops to know that they can
14 call just the one vendor and they've got a ship waiting
15 for me.

16 So that's basically what this is saying,
17 request less than ten days, reason for request, contacted
18 vendor for available dates.

19 Once again, we've got pickup location, that's
20 A&P headquarters, Richvale Airport.

21 These are lines that I'm going to be looking
22 at. Grizzly-Tap, Grizzly-Tap. Listed twice because a
23 portion of that is owned by Santa Clara, City of Santa
24 Clara. Another portion of it is, I think, owned by us.
25 I'm not positive who owns that piece. But, yeah,
26 basically two or three structures. Caribou-Palermo,

1 Plumas-Sierra Tap, Butt Valley-Caribou.

2 Q. So that's the same line that we heard earlier,
3 Butte Valley?

4 A. Yes, sir.

5 Q. Caribou-Palermo number 2.

6 And listing who is going to be on the flight.
7 Myself and (WITNESS #6). Passenger weight, I was a
8 little more honest this time. Estimated hours of use.
9 Whether we want doors off on the helicopter.

10 This is during the summer months, so sometimes
11 you want to have the doors off in order to get some air
12 in there. Most helicopters don't have air conditioning,
13 and so if you're flying 90-degree weather, it's really
14 hot in there. If you take the doors off, you can get
15 some air through there. The drawback is that if you have
16 any loose items, they can fly out of the aircraft. So
17 you have to make sure that you keep everything secure.
18 Once again, having lots of paperwork or such is not a
19 good idea.

20 Q. So you guys fly all year round; right?

21 A. Yes, sir.

22 Q. You have patrols scheduled throughout the year?

23 A. Yes, sir; first, second, third quarter, fourth
24 quarter.

25 Q. You also have your non-routine --

26 A. Yes, sir.

1 Q. -- basically whenever something comes up?
2 A. Yes, sir.
3 Q. So are you flying during the wintertime?
4 A. Yes, sir.
5 Q. Good weather or bad?
6 A. If they will fly, we will probable be next to
7 them. There's a lot of situations for a flight it's just
8 not advisable.
9 Q. Probably not in the middle of a storm, right,
10 or anything like that?
11 A. No.
12 Q. So if something happens on one of the lines in
13 the middle of a storm, what do you do?
14 A. Go up there at night.
15 Q. Okay. What date were you scheduling patrols
16 for here?
17 A. This is going to be for September 11th, 2018.
18 Q. Okay. So this is the third quarter of 2018,
19 aerial patrols?
20 A. Yes, sir.
21
22 (Grand Jury Exhibit 461 was introduced.)
23
24 Q. We'll move on to Exhibit No. 461, you should
25 have in front of you up on the big board.
26 A. Yes, sir.

1 Q. Do you recognize Exhibit 461?

2 A. Yes, sir.

3 Q. What is Exhibit 461?

4 A. Exhibit 461 is an email from myself. Once
5 again, Helicopter Operations, Aja and (WITNESS #22), CC'd
6 to (WITNESS #21), our clerk, (WITNESS #6), the other
7 transmission troubleman for the area. Sent on the 11th,
8 2018, 5:32 p.m., regarding the prior exhibit we just
9 looked at.

10 And, "Aja, due to weather conditions Feather
11 River Canyon, high winds, we were unable to complete
12 many of the scheduled line patrols for 9-11-18. Grizzly
13 Tap was completed. Caribou-Palermo incomplete; patrolled
14 from Palermo 01 to Belden 8 over 67, approximately 47 to
15 55. Plumas-Sierra Tap not patrolled. Butt
16 Valley-Caribou not patrolled. Caribou number 2 not
17 patrolled.

18 Q. Okay. Let me stop you right here.

19 A. Yes, sir.

20 Q. So all of these -- Grizzly Tap,
21 Caribou-Palermo, Plumas-Sierra, Butt Valley-Caribou,
22 Caribou number 2 -- these are all upcanyon; correct?

23 A. Yes, sir.

24 Q. So weather caused you to stop your patrols
25 going up the canyon?

26 A. Yes, sir.

1 Q. I'm going to assume based on this you started
2 off at Palermo and you were working your way up the
3 Caribou-Palermo when weather made it impossible to
4 continue?

5 A. Yes, sir.

6 Q. So you've scheduled the entire day, now you
7 can't do what you had scheduled because of weather, so
8 what do you do?

9 A. We returned to the valley floor and completed
10 the following lines scheduled for 9/19 on request 18,
11 dash, 01227. Completed the Oroville-Table Mountain
12 number 3; Oroville-Table Mountain; Palermo-Pease; and
13 Oroville-Thermalito-Table Mountain 1.

14 Q. So you couldn't do what you had scheduled
15 because of weather, so you, fair to say, you went to do
16 what you could do?

17 A. Yes, sir, advanced those.

18 Q. So you rescheduled, finishing the
19 Caribou-Palermo and doing the other upcanyon lines that
20 you weren't able to do?

21 A. Yes, sir.

22 Q. At the bottom, "I will be submitting a new
23 request for Cresta-Rio Oso"?

24 A. Yes, sir.

25 Q. Do you remember, did you eventually do
26 Cresta--Rio Oso?

1 A. I'm certain I did, but I couldn't tell you what
2 day.

3
4 (Grand Jury Exhibit 462 was introduced.)

5
6 Q. Exhibit 462. Do you recognize this one?

7 A. Yes, sir. That's going to be a, one of my
8 timecards.

9 Q. Explain to us how to read your timecard.

10 A. My name, date that this timecard applies to, my
11 employee ID number. Comments is generally where I will
12 write what I did that particular day.

13 Go down here, these are going to be how I break
14 up the time, how I'm going to charge. So Caribou-Palermo
15 06:30 to 10:30, four hours, receiving order number. Of
16 course we didn't take off to do an air patrol at 06:30 in
17 the morning, but the ferry time and setup time associated
18 with the job is charged to that job.

19 My first job that morning was to do an air
20 patrol on the Caribou-Palermo. So I met the pilot, I
21 believe the request had 7:00 o'clock. And we do a short
22 briefing, get up in the air. And I'm finished with the
23 Caribou-Palermo 10:30. Move on to Grizzly Tap. Do that
24 from 10:30 to 11:00. There's two separate orders for the
25 Grizzly Tap, because you remember --

26 Q. Right.

1 A. -- one because it belongs to the City of Santa
2 Clara, the other one I believe belongs to PG&E. So we
3 have to have accounting for both of those. We have to
4 charge time to prove that we actually were there.

5 Q. Okay. Which brings us to the next question.
6 We don't need to go through all of this, but why on your
7 timecard are you lining out all the individual tasks that
8 you're doing that day?

9 A. They all have separate quarter numbers. And if
10 you try and close one of those order numbers without
11 having time associated with it, it's basically going to
12 send back an hour, looks like, well, either you're not
13 charging to the right order, doing what you say you're
14 doing, or it hasn't been done.

15 Q. Okay. Go back and define a couple terms you
16 used. You talked about "ferry time"?

17 A. Yes, sir.

18 Q. What is ferry time?

19 A. So that's basically the time it takes to get
20 from where you're going to start from to where you're
21 actually going to actually do the work. So if I'm
22 starting from A&P headquarters, that's not where
23 Caribou-Palermo is. Caribou-Palermo starts -- either
24 start at Caribou or you can start at Palermo, but you
25 have to get there. So the time it takes to get from
26 where you're taking off to where you're going to start,

1 that's ferry time.

2 Q. So based upon the exhibits we looked at
3 previously, we determined that on 9-11-18 you started at
4 the Palermo sub working at 01, and you were working your
5 way up the canyon basically to Belden when you had to
6 change plans because of the weather; correct?

7 A. Yes, sir.

8 Q. So the ferry time was the time it takes you to
9 fly from A&P's airstrip in Richvale to the Palermo sub;
10 is that correct?

11 A. Yes.

12 Q. My understanding?

13 Okay. And then you have your start time on the
14 Caribou-Palermo at 6:30. We know from the previous
15 exhibits that you were meeting a helicopter at 7:00
16 o'clock?

17 A. Yes, sir.

18 Q. So can you explain to us the difference between
19 6:30 and 7:00 o'clock, why that difference?

20 A. It's 30 minutes. No. So the reason that you
21 have that 30-minute difference is because I'm showing up
22 at the yard at 6:30, my helicopter is scheduled to take
23 off at 7:00 o'clock. That's what time he's ready to
24 start rotors, full blades, we get up in the air.

25 So from 6:30 to 7:00 I'm basically driving over
26 to A&P, which is only like a ten-minute drive. So we

1 have a pre-Tell Board briefing. He's going to give me a
2 briefing on the safety features of helicopter -- fire
3 extinguisher location, first aid location, how to shut
4 off the fuel, shutting off fuel prior to pulling all the
5 fuses and/or raking back all your power. And I get this
6 speech every time.

7 Q. That was going to be my next question.

8 A. Which is good, which is good. It definitely
9 keeps safety at the forefront. But, yeah, it takes a
10 little while to get through.

11 Q. All right. By the way, most of these we've
12 seen in here are A&P?

13 A. Uh-huh.

14 Q. Do you get to choose which helicopter vendor
15 you use?

16 A. When we submit a request to Helicopter
17 Operations, if we prior contacted a specific vendor,
18 we'll tell them we've contacted that vendor, they've
19 penciled us in. One of the reasons I like using A&P is
20 they are close, I know the pilots. If I leave it up to
21 Helicopter Operations just to schedule me a ship or get
22 me a pilot, then I could end up with a pilot that I
23 haven't flown before. Especially when I'm going up in
24 the canyon, there are a lot of flight hazards up there
25 that if you have a green pilot, or if you have a green
26 troubleman, can really get you in a jackpot in a bad way.

1 So it's nice to have a pilot who knows those
2 hazards, knows what's, what to expect as he's coming
3 around one of the corners up there. You know, whether --
4 if you have a green pilot up there and he comes around
5 the corner, all of a sudden it's pushing his helicopter
6 down because of the downdraft, you could end up being in
7 a bad situation.

8 Q. So you have some control over what pilots are
9 going to fly your patrols?

10 A. Not specifically. I know transmission
11 troublemen who will request a specific pilot from a
12 specific vendor. I don't do that. I generally like all
13 the pilots that they have over at A&P. They only have --
14 well, I guess they're getting more now. They really only
15 had like four pilots.

16 Q. So you're comfortable flying --

17 A. Yes.

18 Q. -- in the canyon --

19 A. Yes.

20 Q. -- with all of those pilots?

21 A. Yes, sir.

22 Q. They all, to your knowledge, have a great deal
23 of experience up there and know where the hazards are?

24 A. Yes, sir.

25

Q. All right. Okay. Let's get on to your 2018 aerial patrol of the Caribou-Palermo. You have in front of you 463. Do you see that document?

A. Yes, sir.

Q. Do you recognize Exhibit 463?

A. Yes, sir.

Q. What is Exhibit 463?

A. 463 appears to be a Caribou-Palermo air patrol.

Q. We've already walked through the front page, how to read that. Let's go ahead to page 2. And let me know -- you have page 2 in front of you?

A. Yes, sir.

Q. What is page 2?

A. Page 2 is going to be the priors. So those are preexisting conditions.

Q. Okay. The first one up here that's listed is Caribou-Palermo non-routine ground patrol?

A. Yes, sir.

Q. Do you know what that is about?

A. That is going to be in relation to either a momentary or other condition that required us to go out there and do a ground patrol. All ground patrols are supposed to be set up as a priority B, meaning a 30-day -- or a 90-day.

Q. Ninety-day.

1 A. But, generally, a non-routine ground patrol
2 gets completed the same day you're filling out the work
3 order for it. It's put as a priority B so we can have
4 all the accounting or your time charged and everything
5 else. Basically assign that order before we close the
6 order.

7 This one, for some reason or another, was set
8 up with a one-year due date. I can't explain that. I
9 would have to actually look at the notification and/or
10 order number.

11 Q. Okay.

12 A. Figure out what that was for.

13 Q. Just to make sure, we'll clarify for this, that
14 doesn't mean that you're supposed to do a non-routine
15 ground patrol instead of your air patrol?

16 A. No, sir. These are open work orders. These
17 are things that aren't -- you don't need to write -- the
18 non-routine ground patrol is a little bit confusing to
19 have in there.

20 Q. Right. That's why I wanted to explain it.

21 A. Right.

22 Q. So it's clear that that -- all right.

23 So let's move on to page 3. Looking at the
24 Transmission Line Inspection Data Sheet.

25 A. Yes, sir.

26 Q. Now we've added an O-H to the end of that

1 statement. Do you know what the O-H means?

2 A. I believe it stands for overhead. I couldn't
3 tell you 100 percent for certain what their intention
4 was.

5 Q. All right. So walk us through your data sheet
6 for 2018.

7 A. Inspector name, (WITNESS #18). Date inspection
8 completed, 9/19/18. Miles inspected, 62. Number of
9 structures inspected, 457.

10 Q. Let me stop you right there, because this is
11 the third one of these annual patrols, we've had a
12 different number of structures for each patrol?

13 A. Okay.

14 Q. Why would the number of structures vary?

15 A. As I stated before, on an aerial patrol I'm
16 taking this number and putting it there, because I'm not
17 keeping a structure count. The only aerial patrol where
18 I was actually keeping an accurate structure count that
19 we've seen so far would have been that first one in 2002
20 where that was my responsibility, that was my main focus
21 was to get a structure count and framing. These -- I
22 don't have the paperwork in front of me. The only thing
23 that I am taking with me in the helicopter is the last
24 sheet we were looking at, the priors.

25 Q. Okay.

26 A. So I don't even know how many structures

1 they're saying exist on this line. I know where this
2 line starts, I know where this line ends. And that's
3 where I'm going to go is from start to end. When I get
4 back into the office on an aerial patrol, I'm putting
5 this number to there.

6 Q. All right. So looks like you found two
7 problems?

8 A. Yes, sir.

9 Q. What were those problems?

10 A. Structure 2 over 22, facility. The insulator
11 damaged, no good. Action, replace. Priority E. Replace
12 damaged insulator.

13 And this is my writing here because we moved to
14 the iPad, so I had the SAP number, the actual work order
15 number, available for me to put in there.

16 Q. And you're talking about the "Notification
17 Number" column now?

18 A. Yes.

19 Q. Earlier we talked about that that was --

20 A. That was done --

21 Q. -- filled out by the secretary. Now you've
22 gone to an iPad system, and you are the one who is
23 actually filling out that column?

24 A. Yes, sir.

25 Q. Explain to us briefly how the new iPad system
26 works.

1 A. So the way the iPad works is it has a
2 geographical map on it with your lines, your different
3 transmission lines. You can zoom in and get to a
4 structure. You click on that structure, you can report a
5 problem with it. Click on another box, it will say, do
6 you want to report a problem on the structure, or do you
7 want to report a problem on the insulator, or do you want
8 to report a problem on the entire line, or do you want to
9 just report a problem for those GPS coordinates? If you
10 pick, select one of those boxes for an insulator, it
11 would -- they have a separate drop-down for insulator,
12 you select insulator.

13 It will then ask you what kind of damage it has
14 on there. That's another drop-down that you can
15 basically put in there that it's no good -- very generic
16 term. They didn't want to have, you know, 50 different
17 damage codes for each component, because it can be
18 rusted, it can be chipped, it could be flashed, it could
19 be broken, it could be nonexistent. So they just
20 basically go no good, out of standard.

21 What you, what needs to happen at that
22 location, whether you can repair it, or whether you have
23 to replace it, or whether it's missing for some of them,
24 or whether something new needs to be installed.

25 Your priority. We talked about you have a
26 30-day, 90-day, one-year, two-year, based on the

1 lettering.

2 And then on the iPad you actually have another
3 box where you will write in your comments on something
4 like this.

5 Q. Okay.

6 A. You will hit "submit" on there. That will send
7 it off to -- you have to attach some digital photos to
8 it, but you've taken those with the iPad or you've taken
9 them with a separate digital camera and transferred those
10 over to the iPad, and it will submit all that information
11 into our SAP system, and it will give you a notification
12 number.

13 Q. Great. "Inspector Signature," is that your
14 signature at the bottom?

15 A. Sir, yes, sir.

16 Q. Finally, "Supervisor Signature," do you
17 recognize that?

18 A. Not much to recognize, but that is (WITNESS
19 #22's) signature.

20 Q. All right. A new page.

21 A. Yes, sir. That's a new form.

22 Q. Page 5?

23 A. Yes, sir.

24 Q. Please explain it to us.

25 A. On -- if you remember back on the 2002, we had
26 the detailed object list, which listed all the structures

1 on there. The one just prior to this, we have this form
2 on there, I just wrote on the form that I inspected from
3 structure such and such to such and such with no
4 additional findings. This is a breakdown of that little
5 note that I had on there. Basically who inspected, what
6 date was inspected, and what structures they inspected on
7 that date.

8 On this particular one, we started the flight
9 on September 11th and completed the patrol on September
10 19th.

11 Q. That's what we already talked about in terms of
12 your helicopter scheduling, going back to the emails that
13 were --

14 A. Yes, sir. Due to weather conditions, we were
15 unable to complete it.

16
17 (Grand Jury Exhibit 464 was introduced.)
18

19 Q. So moving on, Exhibit 464, do you recognize
20 Exhibit 464?

21 A. That would be a tag that was generated off the
22 iPad that is now being printed on a new format.

23 Q. Okay. What do you mean when you say a tag?

24 A. A work order.

25 Q. All right. Is this work order based upon
26 problems you found during the 2018 inspection of the

1 Caribou-Palermo 115 kV line?

2 A. Yes, sir.

3 Q. And which problem does this work order relate
4 to?

5 A. Well, here you can see that reported by J3S2.
6 That is my LAN ID. The date I found it. If you look up
7 here on the equipment, it's going to be ceramic
8 insulator. It's going to tell you that the insulator is
9 based off of a steel tower. The damage code is no good,
10 out of standard. And the required is repair. Oh.
11 Normally you don't repair an insulator, but this -- if
12 you look down here, this is the -- that last box on the
13 iPad that you can write in there, it says, "Hold-down
14 insulator string has come loose from tower, need to
15 reattach/replace hold-down wire."

16 Q. So basically this form contains all the
17 information that you were telling us that you input into
18 the iPad as you're doing the inspection --

19 A. Yes, sir.

20 Q. -- or the patrol?

21 A. Yes, sir.

22 Q. All right. When you find problems, do you
23 photograph them?

24 A. Yes, sir.

25 Q. And how do you do so?

26 A. I do so with a digital camera.

1 Q. Is that something that the company provides to
2 you or your own?

3 A. This particular instance, the original camera
4 that they had didn't meet my needs, so I decided I was
5 going to purchase one on my own.

6 Q. What about the iPad?

7 A. The iPad is provided by the company.

8 Q. Can you use it to take pictures?

9 A. Yes, but they're very low quality.

10 Q. So you choose, you choose to use your own
11 equipment for better quality; is that correct?

12 A. Yes, sir.

13 Q. This problem with the hold-down on tower 27
14 over 221, did you take photographs?

15 A. Yes, sir.

16

17 (Grand Jury Exhibit 465 was introduced.)

18

19 Q. Next up is Exhibit 465. Do you recognize the
20 photograph marked as Exhibit 465?

21 A. Yes, sir.

22 Q. What is the photograph marked as Exhibit 465?

23 A. That is going to be a picture of the tower in
24 question on the work order. Basically, we -- I try and
25 take a minimum of two pictures, one to show the overall
26 structure and/or the surrounding area so that the work

1 crews can figure out how they're going to access the
2 structure, whether there's anything that's going to cause
3 them problems when they're trying to do the repair.

4 So this is going to be the farther out and/or
5 -- I think the company started turning across the street
6 view. You can see the shadow of the helicopter right
7 there.

8 Q. Yep. See the shadow right here in the center.
9 And we zoomed in on this photograph on the big board.

10 A. Uh-huh.

11 Q. This is tower 27/221?

12 A. Yes, sir.

13 Q. Now let's get a little -- lost the word I
14 wanted -- kind of explain what we're looking at here.

15 A. Can we go to the next picture? Or do you want
16 me to use that one?

17 Q. No, just kind of show us --

18 A. So the wire is coming in. This is going to be
19 a suspension tower. We have some hold-down insulators,
20 because the actual wire weight on this location has got
21 high tower over here, we've got a high tower over here,
22 so the wire doesn't have as much down strain as we
23 normally would have in a suspension configuration. So
24 the wire has a tendency to float. It especially has a
25 tendency to float if you have a bunch of snow and/or ice
26 load. It suddenly unloads. At that point, it could

1 create a large updraft in the wire actually almost
2 smashing to the tower or causing these insulators, which
3 are basically held via gravity, to separate if the cotter
4 keys aren't in exactly the right position.

5 So we have hold-down insulators to prevent that
6 happening. It's not that the wire is floating right
7 there, it's just that it doesn't have as much down strain
8 as we would like to see. So that's why you have these
9 hold-down insulators on the tower.

10 Q. All right. So our line is running from lower
11 right-hand corner of the photograph to the upper
12 left-hand corner; correct?

13 A. Yes.

14 Q. Down here in the lower right, supply side?

15 A. This is going to be towards Caribou, that's
16 going to be towards Palermo, just basing that off of this
17 view right here and my recollection. If I'm wrong, just
18 tell me that I'm wrong.

19 Q. All right. So let's move on to the next one.

20 A. Okay.

21

22 (Grand Jury Exhibit 466 was introduced.)

23

24 Q. 466. Photograph marked as Exhibit 466.

25 A. Yes, sir.

26 Q. Do you see that photograph?

1 A. Yes, sir.

2 Q. Tell us what we're looking at in Exhibit 466.

3 A. So I have a decent zoom on my camera, generally
4 try and zoom it all the way in, take a picture of the
5 actual problem. And in this case the actual problem was
6 this wire right here is supposed to be attached right
7 there. It's no longer attached. These insulators are
8 floating.

9 Q. Why is that a problem?

10 A. As we, as I was just explaining, there's not
11 enough down strain at this particular tower to ensure we
12 don't have additional problems with the insulators
13 slapping into the tower. Or if there's a cotter key
14 that's not precisely lined up, the insulators could
15 separate, and then it would be a free-floating wire.

16 Q. Okay. So why is this a priority E tag as
17 opposed to something more urgent?

18 A. In my judgment, this is a situation where you
19 need to get it fixed, but it doesn't need to be done
20 within the next 90 days. I don't know whether I
21 truncated the actual due date to say that it needed to be
22 fixed before winter, because that is a true situation
23 that I would be looking at. But I know I did talk to the
24 crew foreman about this particular tower, saying, "Hey,
25 we should probably get this before winter." That's where
26 you would have that snow load, ice load create that

1 weight in the wire. That could cause big problems.

2 Q. Okay. I want to go to another view. This is a
3 photograph that's already been identified as Exhibit 195.
4 Should be in the stack right there in front of you. And
5 I have it displayed on the big board.

6 A. Yes, sir.

7 Q. View taken later. Besides the hanger wire
8 being disconnected, do you see other problems with that
9 tower?

10 A. Yes, sir. There's obviously some bent steel in
11 there.

12 Q. Describe for us the problems that you see.

13 A. Well, this is out of whack. The quality of the
14 photo, without being there, I can't tell what caused
15 that. I can't tell what caused this down here. But
16 there's obviously some steel problems with that arm.

17 Q. When you say, talked about "I don't know what
18 caused that, or what caused this down here," you were
19 referring to the bends in the tower arm itself?

20 A. Yes. Yes.

21 Q. Okay. And then on to what's been, already been
22 entered into exhibit as Exhibit 196. It's identified as
23 the opposite tower arm. Do you see any problems with
24 that tower arm?

25 A. Appears to be some bending in that arm as well.

26 Q. Now, when you were doing the patrol in '18, you

1 identified that the wire was disconnected?

2 A. Yes, sir.

3 Q. How come you didn't see the bends and things in
4 the tower arms?

5 A. If you go back to those pictures, that is --
6 the camera that I have is actually same magnification
7 that my binoculars have. So the view that you can see
8 right here is the same view that I'm going to be able to
9 see with my binoculars.

10 If you remember, on this date we actually had
11 to break this flight up because of weather concerns. So
12 on this day it was very windy, there was -- and when you
13 deal with a windy day like that, you can still complete
14 the patrol, but you're going to have to increase your
15 altitude and your distance away from structures. That's
16 because if you do end up having a rogue wind, a down
17 draft or something like that, if you're traveling your
18 typical 30 to 40 foot off the structure, it can actually
19 push you into the structure.

20 So on a day like this where it's bad weather,
21 you're going to increase that distance to, you know, 80,
22 90 feet. So when you zoom in like this picture right
23 here is zoomed in, can't really see that bend in that
24 arm.

25 The other thing is that this arm is not really
26 supporting any weight other than when you run into one of

1 those situations like I, what I was talking about, the
2 snow unloading or different type thing, where it's going
3 to affect where that wire is laying. So structural
4 damage on this arm isn't -- I'm not going to say that
5 it's not critical, but it doesn't need to be addressed
6 before your insulator needs to be reattached to it. In
7 addition to that, when the crew goes out to reattach
8 this, that's when they would notice the structural damage
9 on the arm. But no, I couldn't see that from the air.

10 Q. Who would do the reattachment work?

11 A. The reattachment work would be done by our
12 transmission line crew. The steel work, that would be
13 done later. Probably at the time they wouldn't be able
14 to replace that steel on the spot, it would be done by
15 our Tower Department.

16 Q. So going back to 195 and 196 --

17 A. Yes, sir.

18 Q. -- you talked about these were, that this
19 problem was given an E tag --

20 A. Yes, sir.

21 Q. -- to do within a year, but you said you were
22 concerned that you wanted to get this done before
23 wintertime; correct?

24 A. Yes, sir.

25 Q. But, obviously, this photograph is dated
26 November 11th, 2018, the work still hadn't been done;

1 correct?

2 A. That line is no longer in service, sir.

3 Q. Right. But it was still in service as of
4 November 8th; correct?

5 A. Yes.

6 Q. It was de-energized as a result of the Camp
7 Fire; correct?

8 A. Yes, sir.

9 Q. So at the time the Camp Fire occurred, that
10 problem that you saw in September had not been remedied
11 yet; correct?

12 A. That is correct.

13 Q. Okay. Speaking of November 8th, let's talk
14 about November 8th itself. Were you on duty with PG&E on
15 November 8th?

16 A. Yes, sir.

17 Q. What was your assignment for November 8th?

18 A. My assignment was I believe I was doing a
19 ground, detail ground inspection on the Glenn 4, I
20 believe. I couldn't -- I'd have to look at my timecard.
21 But that's how I was initially starting out my day. Then
22 I received a phone call from my boss saying that there
23 was a relay on the Caribou-Palermo line. He had (WITNESS
24 #6), who normally takes the Feather River Canyon area, he
25 had been up all night at a switch up by Paradise-Table
26 Mountain DUR, public safety power shut off, in case he

1 needed to open up that switch. So he wanted me to go get
2 in a helicopter to go see if I could find out what caused
3 the relay event on the Caribou-Palermo.

4 Q. And he being (WITNESS #22)?

5 A. (WITNESS #22), yes.

6
7 (Grand Jury Exhibit 467 was introduced.)

8
9 Q. Okay. So you have in front of you Exhibit No.
10 467. If you could take a look at that document.

11 A. Yes, sir.

12 Q. Do you recognize that document?

13 A. Yes, sir.

14 Q. What is this document?

15 A. So this is a document that was sent out by our
16 boss (WITNESS #22) to myself, (WITNESS #6), and (WITNESS
17 #19), who is the electric crew foreman, or was the
18 electric crew foreman on the crew. And it's from System
19 Protection, basically trying to tell us where the fault
20 locations were for our relay event.

21 The estimates were, line at the time of outage:
22 Caribou-Palermo 115, 6:15 phase involved. In fault,
23 phase C to ground. Says CG, but that's what it means,
24 phase C to ground. That is a multi-terminal line,
25 meaning that it has a split. Basically comes down the
26 canyon from Caribou Powerhouse and it has a hard tap on

1 to it, meaning that there is a -- there is not any
2 protection in between the tap line and the main line
3 there at Bucks Creek Powerhouse, that's where the Grizzly
4 Tap comes in.

5 And from that point, the way that they're
6 figuring out their relay information is based on
7 conductor size, time resistance. And when you put those
8 two values in, you're going to come up with one location
9 on this tap and another location on the other tap.

10 So they gave us two locations, one being near
11 Grizzly Powerhouse at structure 0 over 3; and the other
12 location being near Big Bend, structure 37 over 303.
13 Their accuracy, based on their equations, were plus or
14 minus two miles.

15 Q. Okay. So this came in to you at 7:56 a.m. and
16 23 seconds from (WITNESS #22)?

17 A. Yes, sir.

18 Q. And this indicates that there was a problem on
19 the Caribou-Palermo at 6:15 a.m?

20 A. Yes, sir.

21 Q. And they want you to go up in a helicopter and
22 go find the problem?

23 A. Yes, sir.

24 Q. After you talked to (WITNESS #22), describe for
25 us what you did.

26 A. So I was headed towards Oroville Airport to get

1 into a helicopter. He called me back later, said that
2 they're -- I can't remember whether he called me or
3 texted me, but there was some problems getting a
4 helicopter, and he wanted me to go up there on the
5 ground. I drove up to Concow, basically saw the smoke
6 plumes from there, contacted him again to try and figure
7 out whether we were going to get a ship. He was still
8 working on it. And so then I drove down to Rock Creek --
9 or Poe Power Dam, which is just before Cresta Powerhouse,
10 and from there you can see across the river and up on the
11 hill slope/, behind a hill, you could see that that's
12 kind of where the fire seemed to have originated from.

13 Q. What made you think that the fire originated in
14 that location?

15 A. It was a very, very windy day. All of the
16 smoke was being blown out of the canyon, so that would be
17 towards the east. So if you go to the far west end of
18 where the smoke begins, that's kind of like where you're
19 figuring it started.

20 Q. Okay.

21 A. It wasn't -- in that kind of wind, it wasn't
22 going to burn upwind.

23 Q. Eventually were you able to secure a
24 helicopter?

25 A. Yes, sir.

26 Q. Do you recall approximately what time?

1 A. I think it was right around 10:00 or 11:00
2 o'clock.

3 Q. And were you able to fly up into the canyon?

4 A. Yes, sir. We contacted Cal Fire to make sure
5 that it was okay with them if we went up to that area.
6 They gave us the okay to do it. We flew up there. It
7 was very, very windy. Once again, you're dealing with a
8 helicopter in high-wind situation, but we were able to
9 get to that location and, couple low passes, and we were
10 able to find it.

11 Q. It being what?

12 A. The -- we were able to find damage on
13 Caribou-Palermo tower 222.

14

15 (Grand Jury Exhibit 468 was introduced.)

16

17 Q. Okay. Should have in front of you Exhibit 468
18 for identification. Do you recognize Exhibit 468?

19 A. Yes, sir.

20 Q. And what is 468?

21 A. 468 is another work order repair ticket related
22 to Caribou-Palermo. It's set up a little bit different
23 because it was a fire-type work order. If you look up
24 there in the word type, it says "Emergency
25 storm-related." They consider fires to be storms as
26 well. And this is the work order for a non-routine,

1 which is what I was doing in the helicopter. It's an
2 emergency, but, once again, we classify emergencies as
3 non-routine.

4 Q. Okay. And then down on the bottom, on the long
5 text, it says, "Line was flown on 11/8/18 when damage
6 found at tower 27/222. Flown again 11/9/18 to assess
7 damage," and so on.

8 A. Uh-huh.

9 Q. Did you fly the line on those days?

10 A. Yes, sir. I flew it 11/8, 11/9, and 12/12.

11 Q. When you flew the line on 11/8, on November,
12 the morning of November 8th, and you located the damage
13 on tower 27/222, did you photograph the damage?

14 A. Yes, sir, I did.

15 Q. And what did you use to photograph the damage?

16 A. My digital camera.

17 Q. The digital camera that we talked about earlier
18 that you had purchased --

19 A. Yes, sir.

20 Q. -- to help you?

21 What happened to those photographs?

22 A. They were on a flash card or SD card and they
23 were given to John Daly with PG&E.

24 Q. Did you retain any copies of those photographs?

25 A. In order to put them -- I, I basically copied
26 them from my camera to my iPad.

1 Q. Okay. And all of those photographs should be
2 in possession of PG&E?

3 A. Yes. And they have them in my iPad as well.
4

5 (Grand Jury Exhibit 469 was introduced.)
6

7 Q. Okay. All right. Let's go on to Exhibit 4,
8 Exhibit 469. Do you recognize Exhibit 469?

9 A. Only vaguely. I've never seen texts the way
10 that you decided to put it in here.

11 Q. Do you recognize the phone number (530)
12 356-0766?

13 A. That is my phone number, my cell phone number.

14 Q. Do you recognize the phone number (530)
15 228-1479?

16 A. I believe that's my supervisor's phone number,
17 (WITNESS #22).

18 Q. All right. This shows it's a text message sent
19 on November 8th. And the body says, "There's damage on
20 Caribou-Palermo tower 222"?

21 A. Yes, sir.

22 Q. Do you recall sending that text to your boss,
23 (WITNESS #22)?

24 A. Yes, I do.

25 Q. When do you recall sending that text?

26 A. When I was in the helicopter. I don't know

1 specifically what time.

2 Q. That's all we need. You were sending it from
3 the helicopter, updating your supervisor?

4 A. Yes, sir.

5

6 (Grand Jury Exhibit 470 was introduced.)

7

8 Q. All right. And next up, 470. Do you recognize
9 470?

10 A. It appears to be another text from me to
11 (WITNESS #22).

12 Q. All right. Continuing the same conversation?

13 A. Yes, sir.

14 Q. And what are you telling (WITNESS #22) in this
15 text?

16 A. Appears I'm telling him wire on tramp tower.

17 Q. What does that mean?

18 A. That means that that is the damage that we have
19 on tower 222, is the wire is basically out of place in
20 the tramp tower.

21 Q. Okay. Describe for us now at this point what
22 damage you saw in 222 when you got there on November 8th.

23 A. So we flew by, I saw that the insulator was not
24 in the right position. At that point, we did, we had to
25 make several passes in order to get in a location where I
26 could see the actual damage. It was very windy. But

1 then, when I was able to eventually figure out what had
2 happened, the insulator appeared to have separated from
3 the tower.

4 There's a hanger arm. Where the transposition
5 jumper comes out, you have insulators that hang down from
6 that hanger arm. And one of the insulators from that
7 hanger arm had separated from the tower, folded upside
8 down, and smashed against the tower leg. You could tell
9 it smashed against the tower leg because the insulators
10 were broken. And although the wire wasn't resting on the
11 tower at that point, it looked, looked to me as if the
12 wire would have actually struck the tower.

13 Q. In your experience, 24 years now with PG&E, 20
14 years as a lineman or troubleman, is it a bad thing for
15 an electrified conductor, a 115 conductor, to make
16 contact with a steel tower structure?

17 A. Yes.

18 Q. Why is that?

19 A. It's going to get a ground. All the steel
20 structures out there, they're all grounded. And they're
21 grounded for safety reasons. If we have wire that comes
22 off a tower or isn't where it's supposed to be and it
23 doesn't go to ground, it doesn't shut itself off, then
24 you have a wire that's out there just waiting to do all
25 sorts of havoc. It could lead to fatalities. It could
26 lead to structure damage. It could be a very bad thing.

1 Q. All right. Now, you said you flew the line
2 again on November 9th?

3 A. Yes, sir.

4 Q. Why did you fly the line on November 9th?

5 A. I was trying to finish up the Caribou-Table
6 Mountain as well. We had several lines that locked out
7 on the 8th. I was unable to fly those. There was a
8 bunch of smoke in the area. We couldn't complete the
9 flight to figure out whether there was damage on those
10 lines as well.

11 The Caribou-Palermo and Caribou-Table Mountain
12 both go to Caribou Powerhouse. Caribou Powerhouse
13 supplies power to the city of Quincy. Without either of
14 those lines, it leads to an unstable situation for
15 electric system up there. And, generally, you'll have to
16 shut off all of Quincy if you don't have one of those two
17 lines energized. Both of those lines were de-energized
18 at that point. They had a specially trained operator
19 that went to Caribou Powerhouse, he was able to keep the
20 system on, but they wanted to get one of those two lines
21 back so they wouldn't have to have somebody sitting in
22 front of that control board 24/7.

23 I was unable to complete that on the 8th, so
24 there was a dual purpose for the 9th. The 9th was to try
25 and complete the patrol on the Caribou-Table Mountain to
26 get that line back energized, and they also wanted to

1 send an additional photographer up to take some
2 additional pictures of tower 222.

3

4 (Grand Jury Exhibit 471 was introduced.)

5

6 (Grand Jury Exhibit 472 was introduced.)

7

8 Q. Okay. So you have in front of you Exhibit 471
9 and 472. These are some more text messages between you
10 and the number you had previously identified as your boss
11 (WITNESS #22).

12 A. Yes.

13 Q. Do you recognize this conversation?

14 A. Yes, I do. And just shows that you should
15 never really be joking around as you're texting on a
16 company phone. Yeah. "Did the special guest show up
17 yet?" I was basically referring to the additional
18 cameraman.

19 Q. And the next one, "I guess I'll wait for them
20 and complete their mission first"?

21 A. Yes.

22 Q. Who is the "them"?

23 A. That would be the camera guy that is -- wanted
24 to take some additional pictures of 222.

25 Q. So why are you taking a camera guy up to look
26 at 222?

1 A. Because there was, there was thoughts at that
2 point that that could have started the Camp Fire.

3 Q. Who was this cameraman?

4 A. I did not get his name.

5 Q. How did you get hooked up with this cameraman?

6 A. (WITNESS #22) told me that I was going to be
7 taking an additional cameraman up there.

8 Q. Okay. All right. So let's go on. Let's
9 change topics up there real quick. We've got about eight
10 minutes before lunch. Let's see if we can finish up and
11 get you out of here by lunch.

12 Showing you what's been marked as Exhibit 193,
13 or what's in evidence I believe as 193, a picture of
14 C-hook and a hanger plate. Why does something like this
15 not get seen in your patrols?

16 A. Are we talking about patrols or inspections?

17 Q. Patrols first. Because you've only done
18 patrols on the Caribou-Palermo; correct?

19 A. Correct. So if you look at the steel that's
20 above the C-hook and the hanger plate, that is going to
21 block any view you would have from above. And if for
22 some reason you looked below, the insulator would be, the
23 skirt of the insulator would be blocking the view from
24 below. You'd have to be almost directly horizontal to
25 get a real good look at what is going on with this C-hook
26 and the hanger plate. And that's generally not something

1 you can do with a helicopter.

2 Q. How would you find wear like this?

3 A. The best way, to be quite honest with you,
4 would be a climbing inspection.

5 Q. To your knowledge, are climbing inspections
6 ever done?

7 A. They're done on triggering events.

8 Q. Okay. You've been a troubleman now since 2016;
9 correct?

10 A. Yes, sir.

11 Q. Have you done a single climbing inspection of a
12 transmission line in Butte County?

13 A. No, sir.

14 Q. What kind of events would trigger you to do
15 climbing inspections on a 115 kV line?

16 A. Failure that appears to not be specific to
17 another event. Meaning if you have a failure that is
18 cause for, that had been caused by degradation or
19 something other than outside force which caused that
20 failure, something that you can't identify as being an
21 outside source.

22 Q. For instance, going back here a ways, here
23 we've got, in Exhibit 195 we've got the hold-down wire
24 that's come unattached. Would that be considered a
25 failure?

26 A. That would be considered a failure.

1 Q. Would that trigger you to go back and look at
2 other towers like this and check their hold-down wires?

3 A. The crew that would go out to repair that, they
4 would be making that assessment at that time. So when
5 they, they have to climb that tower in order to repair
6 that, they would be looking at that, going, "Hey, we've
7 got another issue here with this, besides this piece of
8 steel which is rusted, which caused this steel guide wire
9 to part."

10 Q. Okay. Moving on, Exhibit 183, photograph of
11 C-hook and hanger hole on 20/160. It's been identified
12 as 20/160. Why is this not seen during an aerial patrol?

13 A. Once again, it would have to be just the right
14 angle.

15 Q. 184, same question.

16 A. Same answer.

17 Q. 37, Exhibit No. 37?

18 A. I'm a little, I think I'm lost.

19 Q. Let's see.

20 A. Went from 183 to 184, now we've got 251.

21 (Discussion off the record.)

22 A. I can just look on the screen.

23 Q. Exhibit 37.

24 A. Okay.

25 Q. Do you see a problem in there?

26 A. Yeah, it appears that it's worn in. However,

1 it's also got a different plate on there.

2 Q. Right. Have you ever seen these hanger plates
3 on transmission towers, or transposition towers in the
4 past?

5 A. I haven't really looked for them, but I'm sure
6 that I have seen them. I just wouldn't be able to tell
7 you where or when.

8 Q. So what's the problem that you see with this
9 insulator string hanger hole?

10 A. It's starting to wear through the hanger. The
11 insulator, the C-hook is starting to do some wear.

12 Q. Are you familiar with the term "elongation"?

13 A. Yeah.

14 Q. Do you see elongation in the hole here?

15 A. Yeah. The hole is definitely no longer
16 circular. It's starting to wear through the bottom.

17 Q. Why isn't something like this being picked up
18 in an aerial patrol?

19 A. You need to be at the right angle. So if
20 you're in a helicopter, there's -- to get this angle,
21 you're going to either need to be inside the tower, which
22 is not productive for the helicopter or yourself, or
23 you're going to need to be directly over the wire and
24 only feet or inches above the wire to look at this view
25 from the helicopter.

26 Q. Okay. Let's move on to 257. Do you see a

1 problem in --

2 A. Yes.

3 Q. -- that photograph? What problem do you see?

4 A. It's the same thing. The C-hook is wearing

5 through the hanger plate. And I don't know which one has

6 more wear, the C-hook or the hanger plate.

7 Q. Okay.

8 A. You'd have to take it apart.

9 Q. Why isn't something like this noticed during

10 your aerial patrols?

11 A. Once again, you have a steel member above it.

12 I would almost guarantee that this is going to be the

13 center phase, just based on what I can see there, which

14 means that you're going to have to be, once again, like

15 right above the wire, or you're going to be off to the

16 side, and the steel going to block it.

17 MR. NOEL: It's 12:00 o'clock. Do you guys

18 mind if we go a little bit into lunch to finish?

19 GRAND JUROR #18: Finish.

20 MR. NOEL: I'm seeing nothing but thumbs up and

21 positive signs. So we'll go ahead and go forward, try

22 and go quickly.

23 Q. (By MR. NOEL) 165 -- or 175. Exhibit 175. Do

24 you see a problem in this tower?

25 A. The quality of the photo isn't so great, but it

26 appears to be elongated on that same hole hanger arm.

1 And this is exactly what had failed on 222.

2 Q. Right. And this obviously isn't 222?

3 A. No, it's, it's off Bardees Bar.

4 Q. Probably 35/2811. Does that sound correct?

5 A. Probably real close to it.

6 Q. All right. You can see a lot of daylight

7 through that hanger hole --

8 A. Yes.

9 Q. -- correct?

10 A. Correct.

11 Q. That's not supposed to look like that?

12 A. No, sir.

13 Q. So why isn't that being picked up during the

14 aerial patrols from the helicopter?

15 A. You would have to be at the exact angle that

16 you're talking about right here with the daylight at,

17 exactly that. The position the helicopter would have to

18 be would be a hazardous position for yourself and the

19 helicopter.

20 Q. Okay. But, obviously, this photograph is taken

21 from a helicopter.

22 A. It was?

23 Q. Yep.

24 A. Well, then they've got a very good zoom lens.

25 Q. So it's possible to see these things if you get

26 yourself in the right position and you use the right

1 equipment; correct?

2 A. Did you know that that was what you were going
3 to look for?

4 Q. I can guarantee --

5 A. What about this bolt right here, is this a good
6 bolt?

7 Q. I don't know. I can tell you --

8 A. Does this bolt here look like a good bolt?

9 Q. That photograph was not taken by a PG&E
10 employee. That photograph was taken by a law enforcement
11 officer who has no training, no experience.

12 A. But he, he knew he wanted to take a picture of
13 that.

14 Q. Well, of that tower, yes.

15 A. Not just that tower. He wanted to take a
16 picture of that.

17 Q. So you could see all of that wear and tear, but
18 you don't; is that correct?

19 A. Possibly on that tower. Tower 222 that, I
20 don't know if you have any pictures of the same angle on
21 222.

22 Q. Okay. That's 222. There's Exhibit 37. That's
23 222.

24 A. Would it have been taken from a helicopter?
25 Was that taken from a helicopter?

26 Q. No, this was taken from inside the tower.

1 A. So you're asking me to compare a picture that
2 is taken from the tower --

3 Q. Right.

4 A. -- to a picture that's taken from the
5 helicopter at two different locations? I'm not sure what
6 you're after.

7 Q. No, I'm -- I mean, ultimately, like we've
8 talked about in the past, the question is why weren't
9 these conditions being seen and recorded prior to the
10 Camp Fire?

11 A. Didn't know that they existed. Obviously, if
12 we had, if I had seen a condition that warranted repair,
13 I would write it up. I'm sure that you've looked through
14 a lot of my paperwork. If I find a condition that
15 requires repair, I write it up.

16 Q. All right. Here's Exhibit 188. Do you see a
17 problem there?

18 A. Yeah.

19 Q. What problem do you see?

20 A. It's the same thing, elongation in the hanger
21 plate. And you've got wear in the C-hook.

22 Q. 176?

23 A. Same thing.

24 Q. Same problems.

25 191?

26 A. Yep.

1 Q. 185?
2 A. Uh-huh.
3 Q. Remember, we've got to answer out loud.
4 A. Yes. Sorry.
5 Q. You've done very well on that. We talked about
6 that yesterday. You've done a great job.
7 And 139?
8 A. Little bit more difficult to see, but yes, I
9 can see where there's a, probably going to be a problem.
10 Q. Okay. All right. Well, let's move on real
11 quick.
12 August of 2018, were you assigned to, by PG&E
13 to the Murphy fire?
14 A. I was one of the responding troublemen, yes,
15 sir.
16 Q. What does it mean to be one of the responding
17 troublemen?
18 A. So a page came out that we had a problem with
19 the Caribou-Table Mountain. And so when a page like that
20 comes out, they will send out transmission troublemen to
21 go see if they can find out why there was a momentary
22 and/or lockout event. So I was sent out, (WITNESS #6)
23 was sent out, a couple of distribution troublemen were
24 sent out because there was some fire in the area that was
25 going to be affecting the distribution assets.
26 Q. And what did you find when you arrived at the

1 area?

2 A. Initially, I couldn't find a whole lot because
3 I couldn't see through the smoke and the fire. But
4 eventually was able to see that there was a damaged
5 jumper on a double dead end tower on top of a hill.

6 Q. Like we already talked about, double dead end
7 tower, you've got conductor coming in from the supply
8 side, conductor going out from the customer side, and the
9 jumper is what connects the two of them; correct?

10 A. Yes, sir.

11 Q. Describe the damage you saw to the jumper.

12 A. It appeared to have parted close to, but not
13 at, a connector on the jumper. And I think the connector
14 was more towards the -- you called it the "customer
15 side," we call it the "load side" -- would have been
16 towards the Table Mountain rather than the Caribou side.

17 Q. What happens when a -- well, is the jumper
18 energized?

19 A. Well, it was. As the energized parts, it will
20 -- electricity likes to keep on flowing the way it was
21 flowing. So if you try and break that circuit or you try
22 and open that piece of wire, it's -- there's going to be
23 a very large arc, to the point where it could probably
24 even arc back to the steel tower or a ground source.

25 Q. So, just like we talked about in 222, you saw
26 that the insulator top becomes separated from the tower

1 arm, was hanging upside down, and the jumper made contact
2 with the steel structure?

3 A. Appears that it had, but I don't -- like I
4 said, I couldn't see any scorch marks from the
5 helicopter.

6 Q. And what about in the, in the Murphy Fire?

7 A. Murphy Fire, another individual went up there
8 and took some pictures of it, but I didn't actually go up
9 to the tower and take those pictures.

10

11 (Grand Jury Exhibit 473 was introduced.)

12

13 Q. We have up in front of you Exhibit 473 for
14 identification. Do you recognize 473?

15 A. Yes, sir.

16 Q. What is 473?

17 A. 473 is a form that a fire investigator asked me
18 to fill out. He had asked me if there was any issues
19 that we had with the line. And I told him that there
20 was, that there was an e-page sent out. And then he
21 asked me, "Well, what did the e-page say?" And I started
22 to describe it to him, and he asked me to write it down.

23 Q. Okay.

24 A. I was trying to be very forthcoming and
25 cooperative, so I wrote down what the e-page said. And
26 now it's, it's appearing with me again. Not that it says

1 anything bad.

2 Q. No, it doesn't. And the bottom here, is this
3 your signature?

4 A. Yes, sir. And that is my writing on the body
5 of the text.

6 Q. Okay. Just so that you've got it, we're
7 running out of time, so we're going to withdraw 474, 475,
8 476. We won't go into that.

9 But -- so you get up to the Murphy Fire,
10 eventually you see the tower, you see that a jumper has
11 become disconnected; correct?

12 A. Yes, sir. It appears part, yes.

13 Q. What action did you take as a result of finding
14 that damage?

15 A. I can't remember whether I created a tag or
16 (WITNESS #6) created a tag to repair that jumper.

17 Q. Okay. How about for other towers in the area?

18 A. We did -- the other towers in the area were not
19 damaged.

20 Q. Okay. But we talked earlier about climbing
21 inspections and triggering events and that unusual events
22 that occur on the lines could trigger further
23 inspections, climbing inspections of other similar lines.
24 Did that happen after the Murphy Fire?

25 A. I do not know, because the climbing inspections
26 are not done by the Line Department. They're generally

1 done by the Tower Department. So I really couldn't say
2 whether they did or not.

3 Q. Okay. Did the troublemen do any further
4 inspections or patrols based upon the damage that was
5 found at the Murphy Fire?

6 A. No, sir. We didn't do any additional. We
7 still maintained it regularly.

8 Q. Thank you, (WITNESS #18). I know it's been a
9 long, little longer than we planned. It's been a long
10 morning. I have nothing further.

11 Do any of the jurors have questions? I see
12 one.

13 And the jurors have an opportunity to ask you
14 questions. They do it in writing, myself and the
15 foreperson will take a quick look at it, make sure that
16 it's something that we can actually ask you, and then
17 we'll ask you.

18 THE WITNESS: Do I get to ask them questions?

19 MR. NOEL: Nope. We take the information, we
20 don't give it. That's the unfortunate reality of this.

21 (Counsel and Grand Jury Foreperson confer.)

22 Q. (By MR. NOEL) The question is were you ever
23 trained with specific information regarding the
24 dimensions of the -- looks like it says the dead end of
25 insulator, but the cold end hardware?

26 A. Specifically, I was never trained; however, we

1 do have documentation that shows the dimensions that
2 those are supposed to be kept at.

3 Q. Right.

4 A. So we, as troublemen, do not generally repair
5 the steel. We will send off a work order to the Tower
6 Department for them to repair the steel. But we have
7 knowledge as to what that steel is supposed to look like.

8 Q. Right. So nobody's ever shown you or told you
9 exactly how big that hole, the diameter of that hanger
10 hole, is supposed to be; correct?

11 A. No, sir.

12 Q. And nobody's ever showed you or told you the
13 circumference or diameter of the hook itself?

14 A. No, sir.

15 MR. NOEL: Does that answer it?

16 GRAND JUROR #4: Yes.

17 MR. NOEL: All right. With that, I have
18 nothing further of this witness.

19 And Madam Foreperson's going to read you an
20 admonishment, then you get to leave.

21 THE WITNESS: Okay.

22 MR. NOEL: A lot later than we anticipated, but
23 we understand.

24 GRAND JURY FOREPERSON: (WITNESS #18), you are
25 admonished not to discuss or disclose at any time outside
26 of this jury room the questions that have been asked of

1 you or your answers until authorized by Grand Jury or the
2 Court. A violation of these instructions on your part
3 may be the basis for a charge against you of contempt of
4 court. This does not preclude you from discussing your
5 legal rights with your own attorney.

6 (WITNESS #18), what I have just said is a
7 warning not to discuss the case with anyone except the
8 Court, your lawyer, or the district attorney. Do you
9 understand?

10 THE WITNESS: Yes, I do.

11 GRAND JURY FOREPERSON: Thank you.

12 MR. NOEL: You are done.

13 THE WITNESS: All righty.

14 GRAND JUROR #17: Thanks for your candor.

15 (Lunch break.)

16 [DISCUSSION OMITTED.]

17 [ROLL CALL OMITTED.]

18 [DISCUSSION OMITTED.]

19 GRAND JURY FOREPERSON: Okay. Mr. Magarrell,
20 would you please raise your right-hand.

21

22 ANTHONY MAGARRELL

23 having been called as a witness in
24 the matter now pending, having been first
25 duly sworn, testifies as follows:
26

1 THE WITNESS: I do.

2 GRAND JURY FOREPERSON: Thank you. Have a
3 seat, please.
4

5 EXAMINATION
6

7 BY MR. NOEL

8 Q. Agent, for the record, can you state your full
9 name and spell your last name.

10 A. My name is Anthony Magarrell, spelling of last
11 name is M-A-G-A-R-R-E-L-L.

12 Q. Agent Magarrell, by whom are you employed?

13 A. Employed with the United States Forest Service.

14 Q. In what capacity?

15 A. I am a federal special agent.

16 Q. What does it mean to be a federal special
17 agent?

18 A. We go ahead and I'm responsible for
19 investigating crimes on federal lands, specifically with
20 the forest service, that would include environmental
21 cases such as this, and fire, drugs, timber, those things
22 that affect our public lands.

23 Q. How long have you been a special agent with the
24 forest service?

25 A. Twenty-eight years.

26 Q. Do you have any specific training on

1 investigating fires that occur on US Forest Service land?

2 A. Yes. We have courses specifically for origin
3 and cause, which is our FI210 course. Then we have our
4 advanced course, which is 310, which deals with case
5 investigation, preparation, and how to move forward with
6 those kind of investigations. I'm a graduate of both
7 those courses.

8 Q. How long have you been investigating fires for
9 the forest service?

10 A. Twenty-five plus years.

11 Q. Are you familiar with the Murphy Fire?

12 A. Yes, I am.

13 Q. When did the Murphy Fire occur?

14 A. Yeah, Murphy Fire started in the evening of
15 August 6th, last year, 2018, about -- we had various
16 reports coming in, but I think the report we had with the
17 RP was a little after 11:30.

18 Q. Where did the Murphy Fire occur?

19 A. Near Belden, California, on Highway 70.

20 Q. What was your role in the Murphy Fire
21 investigation?

22 A. I'm the case agent. I'm the lead investigator.
23 So I make determination in terms of work, resources, and
24 how we're going to go ahead and conduct that
25 investigation.

26 Q. As the lead investigator, did you have

1 assistants assigned to you to do this investigation?

2 A. Yes, I did. I had three origin and cause
3 investigators who had graduated from the 210 course.

4 Q. Are you familiar with their training and their
5 experience?

6 A. Yes. I've actually worked with two of those
7 before, which was Courtney Wood and Patrick Callahan.

8 Q. At who was the third?

9 A. The third is Jason Marshall. That was the
10 first time I've worked with him.

11

12 (Grand Jury Exhibit 477 was introduced.)

13

14 Q. We have up on the big board, you have in front
15 of you in the stack there Exhibit 477. Do you recognize
16 the photograph marked as Exhibit 477?

17 A. Yes, I do.

18 Q. What is Exhibit 477?

19 A. 477 is a picture taken from the opposite side
20 of the highway. Highway 70 is a roadway that's on the
21 lower bottom. Feather River is right here. And then
22 it's going to be on the hillside above it heading to the
23 west-southwest with the towers located on power lines.

24 Q. Okay. When we're talking about -- anytime you
25 want, you can stand up and use the big board.

26 A. Okay.

1 Q. Art board here. And we didn't get into this
2 before, you see these arrows on the side? Click on those
3 arrows, they'll bring up various things. The pink bubble
4 in the middle will bring up a pen.

5 A. Oh, you're going to have to walk me through
6 that.

7 Q. Go ahead. When you're explaining what we're
8 looking at, using the photograph and displaying it in
9 words, what are we looking at here?

10 A. Let me try this out. Arrow, pink.

11 Q. Already open. You have the red pen open now.
12 Now it's black.

13 A. Now it's black.

14 Q. Just leave it and go ahead and it's actually,
15 we've learned it's much cleaner if we use the butt end of
16 a pen over your fingers.

17 A. Okay. Gotcha.

18 So over here -- everyone can hear me now
19 without the speaker?

20 This slope right here is pretty much heading
21 towards the west-northwest.

22 Q. You've drawn a black arrow going up to the top
23 right corner with an NW?

24 A. Yeah, heading up the ridge. That's the ridge
25 that drops in. The river predominantly, even though it's
26 slightly off right here, is heading from a north and

1 south. This is the Feather River right here. And this
2 is the road coming across, you can see down here.
3 Apologize, I can't draw stick figures, but I'm drawing on
4 the screen now. But that is Highway 70 right here.

5 Q. All right. So you've indicated with black
6 lines, arrows, the river and Highway 70, and you said
7 this is near Belden town?

8 A. Yeah, actually Belden, California, right here
9 on State Route Highway 70.

10 Q. Which county?

11 A. This would be Butte County.

12

13 (Grand Jury Exhibit 477A was introduced.)

14

15 Q. All right. Save that. We will print that out
16 and save that as 477A for later.

17 A. Better draw a straighter line.

18 Q. All right. X out of this, and we can move on.

19 So give us the chronology of how you became
20 involved in this fire.

21 A. Yeah. Sit back down here.

22 So I received a call in the morning of August
23 7th. I don't recall exactly what time that was. I was
24 doing some other things at the time when this fire
25 happened. At that point in time, it was relayed to me by
26 Investigator Courtney Wood that the fire was unsafe for

1 them to get back into at this time. That was on the
2 morning of the 7th. And it wasn't until -- I had her
3 actually taking statements, witness statements, trying to
4 get everything locked down from the outside until our
5 investigators could actually get onto the site and find
6 out what happened. The investigators were actually able
7 to get out there on the August 9th.

8 Q. And when did you physically get out to the
9 site?

10 A. I did not get on site until the morning of
11 August 11th.

12 Q. And why was that?

13 A. I was on a different mission.

14 Q. Okay. Describe the process of doing an origin
15 and cause investigation like this for the US Forest
16 Service.

17 A. We go ahead and use like a systematic
18 methodology. Basically what it comes down to is
19 excluding. We exclude all the different various types,
20 ways that a fire can actually be caused. Then actually
21 going on the site, we go ahead and use fire indicators,
22 such as angle of char, foliage freezing and stuff.
23 They're actually on the ground that allow us to go ahead
24 and see the direction of which way the fire is going.
25 And then we bring it down to what we call a general
26 origin area.

1 A general origin area could be a large area.
2 Just depends in terms of topography what it is. We try
3 to get down to a specific area of origin -- origin area,
4 excuse me, which sometimes is possible, to where it gets
5 down to a real small spot and say, "This is where the
6 fire started." Or other times, such as this, we kept it
7 and were able to get into a 25-by-50 foot area.

8
9 (Grand Jury Exhibit 478 was introduced.)

10
11 Q. You have in front of you being displayed up on
12 the big board a photograph marked as Exhibit 478?

13 A. Yes.

14 Q. Do you recognize that photograph?

15 A. I sure do.

16 Q. What is the significance of that photograph,
17 478?

18 A. I have my pen.

19 Okay. This one right here, we can see with
20 their jumper cables attached to the main lines.
21 You can see right here, the line actually connects in
22 between. These are called insulators. Jumper cable
23 connects it to, connected to.

24 Now over here -- I need to do my drawing thing.
25 Amazing.

26 Q. It's taking a minute.

1 A. Try it again.

2 So right here --

3 Q. We'll learn this. Do that and start all over
4 again. I do the same thing; my cuffs drag.

5 A. So here's strings of insulators right here. If
6 you notice the jumper cable right here. This is where
7 the connector is. Well, we notice there's nothing
8 attached to that connector. So the jumper line right
9 here, where the connector is on this side, you can see
10 it. I'll kind of draw it right underneath it. That line
11 goes right there depicted in the picture.

12 So what's happened now, we have a failure of a
13 jumper cable for some unknown reason at this time.

14 Looking at -- right here you can tell there was
15 a failure, mechanical failure, and that cable went ahead
16 and is now inoperable.

17 Q. All right. There we go. We saved this.

18 All right. So when you guys were finally able
19 to get up there and access this, you noticed you had
20 jumper cable hanging down?

21 A. Yes. Actually, we noticed that on the day of
22 the fire, information from the original RP, and then also
23 with the investigators on the first date. They were
24 actually able to look from the highway, specifically take
25 this. Investigator Courtney Wood actually took these
26 photos that next morning and was telling me what she was

1 actually seeing. So she could actually see that right
2 from the highway.

3 Q. Now, does the fact that you can see that affect
4 the way that you do your origin and cause investigation?

5 A. It would help us out. In this case, the fire
6 was relatively small, only about 117 acres, memory serves
7 me right, but the methodology is going to be exactly the
8 same no matter what. We're going to go ahead and go
9 through the exclusion matters. We're going to go
10 through, take a look at the burn fire indicators and
11 bring us back to the origin. We're going to do that
12 system every single fire.

13

14 (Grand Jury Exhibit 479 was introduced.)

15

16 Q. Let's move on to Exhibit 479. See exhibit --
17 click out of this.

18 All right. See Exhibit 479?

19 A. Yeah. Just slightly different from 478.

20 Q. All right. Describe to us what we're looking
21 at in 479.

22 A. We have two sets of power lines actually coming
23 through that are kind of parallel. And they are running,
24 I would say, approximately north and south direction, but
25 it's actually more of an eastern aspect. The two lines
26 running parallel, you can see there's going to be three

1 power lines on each tower. They're actually going
2 across. So there's two towers running parallel to the
3 highway, heading mostly north. And each one of those
4 have three of the power cables attached on them.

5

6 (Grand Jury Exhibit 480 was introduced.)

7

8 Q. And Exhibit 480, can you tell us what we're
9 looking at here?

10 A. Yeah, this one really shows us the sets of
11 towers. So looking at this -- I'll draw a quick picture
12 here --

13 Q. Go ahead.

14 A. -- for relation.

15 Q. There it is.

16 A. Excellent.

17 So in this case right here folks, this right
18 here, that's a jumper cable. This line is heading --
19 connects it to here. These two lines are parallel with
20 the slope. The river and the road are down here. These
21 two lines are parallel, goes across. Kind of shows you
22 how it's set up in terms of the pattern.

23 Q. Indicating that the river is down below the
24 right corner of the photograph, the visible horizon of
25 this photograph?

26 A. That is correct.

1

25
26

(Grand Jury Exhibit 481 was introduced.)

Q. And Exhibit 481?

A. That's a closer-up view of the disconnected jumper cable, the failed jumper cable.

(Grand Jury Exhibit 482 was introduced.)

Q. 482?

A. Now we're even getting closer on that. You can see the line right here. That line -- we'll get a closer view, but we'll see where the aluminum strands are actually put together with regard to those jumper cables. We'll see that later.

(Grand Jury Exhibit 483 was introduced.)

Q. 483?

A. That's sets, both sets of the towers are going parallel to the highway and the river, Feather River.

(Grand Jury Exhibit 484 was introduced.)

Q. 484?

A. So went ahead and we had a helicopter go ahead

1 and fly this after the fire started going ahead and
2 mellowing out. I think that was either the 10th or 11th
3 that picture was taken. So H10 is the name of our
4 helicopter here. We took an overall view. I want to get
5 back up and draw some more pictures.

6 Q. There it goes.

7 A. Okay. This right here will show it. I think
8 we have a map or something later. This right here is the
9 slope heading uphill.

10 Q. Drawing a red arrow going off to the --

11 A. This is actually to the northwest, heading
12 towards the northwest.

13 And here is the main line. You can see -- I'm
14 just going to kind of number them as they go across. And
15 start with four with the second set. And you can see
16 here's the tower. I think in the picture we call that
17 tower 1, and this is tower 2.

18 So actually right here, these are the three
19 lines coming up, heading towards north again. There's
20 two lines coming in. Here's the ridge where it comes
21 down. And, once again, you can see now where the river
22 and the highway is.

23 Q. All right. And, just for the record, so we
24 don't have to keep doing this, all of these that he's
25 drawing on, we're putting on the record the printed and
26 marked as the A to whatever their exhibit number is.

25
26

(Grand Jury Exhibit 485 was introduced.)

Q. All right. Exhibit 485?

A. That's still a bird's-eye view of the previous picture, just in a little bit tighter, closer to the ground.

(Grand Jury Exhibit 486 was introduced.)

Q. 486?

A. That picture actually is down a little bit below the lines. It's looking up towards the northwest.

Can we draw the picture on the ridge again? Or covered it already? What do you prefer?

Q. Let's go back. In terms of doing the origin and cause investigation, were you able to determine the direction, the path of the fire, and does this photograph show it?

A. Yeah. So the one of the fire, actually shown in some previous slides, as we go ahead and go through our methodology, we'll go ahead, mark things with flags as we go ahead and go through to see which way it goes.

So red flag, the marking, as we start going through the investigation will be a running, advancing fire. A yellow will be a lateral fire. And then the

1 green will actually be a backing fire.

2 In this case, the red flag indicators, which
3 we'll show I think later, are going to show the fire,
4 it's actually going to show the fire going up the ridge,
5 which I'll depict here in a second, which is heading
6 towards northwest.

7 Q. All right. So an arrow to the northwest,
8 showing the direction of flight of the fire, path of the
9 fire?

10 All right. So once you get into your area of
11 origin, general area of origin, you've read the macro and
12 macro indicators, the things telling you which way the
13 fire is going, tell us what you do now.

14 A. Yeah, at that point in time, of course, we're
15 trying to get it narrowed down. We're looking for
16 indicators where the fire actually started. That's part
17 of that area that we did get set down as a general origin
18 area, which was 25-by-50. We then started seeing
19 physical evidence that was underneath the tower. That's
20 depicted in this one.

21

22 (Grand Jury Exhibit 487 was introduced.)

23

24 Q. Showing you what's marked as Exhibit 487, the
25 photograph, what are we looking at here?

26 A. Yeah, this one, what we go ahead and do, we use

1 white flags for evidence. In this case, we had 15 pieces
2 of evidence we did collect. There was much more than
3 that, but we collected some of the samples of what's
4 going on. And I'm going to show you here what we're
5 looking at on that one.

6 So as part of the fire investigation, too, we
7 actually go through and use magnets. We're looking for
8 anything, of course iron, that kind of stuff, that is
9 going to hook up with a magnet.

10 In this case, this would be a non-ferrous
11 metallic item, which is consistent with aluminum thread
12 on the power lines, which is depicted right there with
13 the circled area. You can see there's strands of the
14 aluminum wire with the jumper cable.

15
16 (Grand Jury Exhibit 488 was introduced.)
17

18 Q. So Exhibit No. -- evidence item number 1 was
19 aluminum strands.

20 Let's move on to Exhibit 488 and evidence item
21 number 2.

22 A. So evidence item number 2 -- I'm going to have
23 to get my glasses. I apologize. I'm realizing finally
24 starting to get old.

25 Okay. So I was looking for it. So, once
26 again, we're looking at some aluminum strands. In this

1 case, they actually were a little charred, so they don't
2 stick out as much. They're going to be located just
3 above the ruler for reference on measurement.

4 Would you like me to circle those?

5 Q. Sure. Please.

6 So what is it that's inside that circle?

7 A. Yeah, so those would be, once again, some more
8 of the aluminum strands or shards from the jumper cable.

9

10 (Grand Jury Exhibit 489 was introduced.)

11

12 Q. All right. Exhibit No. 489. Do you recognize
13 what this photograph is, this exhibit?

14 A. Yes, I do. Also depicts another strand.

15 Do you want me to circle each one of the
16 strands in this photograph?

17 Q. Sure. This one especially.

18 A. Okay. This one is a little bit longer than
19 some of the other ones. And this one.

20 Q. So you can actually see a long strand -- or
21 long is a subjective term, but an actual strand of wire
22 with flag number 3; correct?

23 A. Yeah. That's a longer length. So it does
24 stick out a little bit better.

25

26 (Grand Jury Exhibit 490 was introduced.)

Q. Exhibit No. 490. Do you see that photograph?

A. Yes, I do. I'll go ahead and mark this one, too.

Q. Go ahead.

A. Okay. Going to circle this one. Actually see three strands here. Two of them are kind of fused together; can see it on the end. There's another one on top of it. Three individual strands. Two of them are connected.

Q. Now, off to the left side of the ruler in this photograph there's some other items. Do you know what these are?

A. Take a look here. We did have some fencing that we located on the area. Let me review that and see if it looks like it is consistent with that.

In this case, I do not know.

Q. Okay. But there was other debris on -- up there, the general, in the general area of origin?

A. Yeah, there was a lot of debris that concerned me in that case.

Q. But was that debris related, in your opinion, to the fire?

A. No. As a matter of fact, we actually even had splatter on top of that debris.

Q. What do you mean by splatter?

1 A. We'll go through that here soon.

2 So splatter would be molten slag basically
3 that's come in. When these wires, aluminum wires,
4 actually melt with that heat, you're seeing links of
5 fragments, but you also see where the ends have actually,
6 molten, actually dripped. And we'll actually be able to
7 show that here where we've actually found that on the
8 vegetation in the rocks, which in this case actually
9 caused the fire.

10

11 (Grand Jury Exhibit 491 was introduced.)

12

13 Q. All right. Exhibit 491?

14 A. 491. I'll go ahead and draw this one. It's
15 going to be -- once again, it will be one strand.

16 Q. All right. So inside here that's a strand of
17 aluminum wire?

18 A. Yes, it is.

19 Q. And, again, there's other items kind of
20 scattered around you can see in the picture. Those are
21 not relevant items?

22 A. No, they're not.

23

24 (Grand Jury Exhibit 492 was introduced.)

25

26 Q. All right. Moving on to No. 492.

1 A. Yeah, 492, it's a little bit harder to go ahead
2 and actually view on this one, but we'll go ahead and
3 show it. It's actually a little bit darker and also
4 lighter. Let me go ahead and mark it.

5 Q. This one probably we don't need to mark up.
6 This one's a little --

7 A. Interesting?

8 Q. Yeah. Explain to us what we're looking at.

9 A. So on this one it is another link to wire,
10 which is located underneath the measuring tape,
11 underneath the measuring tool. Little bit harder to see.
12 Has a little bit where looked like some white ash type on
13 the right-hand side. And then in the left-hand side it
14 will be a little bit darker.

15 Q. So we're talking about right in here?

16 A. Going across.

17 Q. Okay. Unfortunately, we can't zoom and write.

18 All right.

19

20 (Grand Jury Exhibit 493 was introduced.)

21

22 Q. 493. What are we looking at in Exhibit 493?

23 A. Now we're starting to get into the point where
24 I was talking about the splatter. And that's molten, in
25 this case, aluminum. And this will be a view up higher.
26 We'll -- the next picture will show it a lot closer.

1 I'll go ahead and mark this one, too.

2 Q. So before you get to that, why is aluminum slag
3 or aluminum splatter important to you as an origin and
4 cause fire investigator?

5 A. Well, it's going to be a source of heat.
6 Imagine what it takes to -- you got an aluminum can, how
7 hot is that to melt? You're looking at a real high heat.
8 So at that point in time, when that's actually put back
9 on the natural vegetation, especially with dry grasses,
10 low humidity -- summertime, it was August -- that's going
11 to be your source that's going to go ahead and cause a
12 fire in this case.

13 Q. Okay. Go ahead and mark it up and show us what
14 you're talking about.

15 A. Let's look at that one. There's some other
16 pieces, small pieces of slag, but this one's the largest
17 one in this picture right here. We'll get a closer look
18 where you can actually see this on that. But here's the
19 slag that's actually on the rock. We'll show quite a few
20 photos with that.

21 Q. You've drawn a red circle around the slag;
22 correct?

23 A. That is correct.

24

25 (Grand Jury Exhibit 494 was introduced.)

26

1 Q. Moving on to 494. What is 494?

2 A. So 494 is a closer version of that same picture
3 on that rock. And you can look on the upper left-hand
4 side, and if you take a closer look at it, you can
5 actually even see where it's raised in terms of aluminum
6 of the ridges. So I'm going to circle it once again.

7 Okay. So that's the molten aluminum that's
8 actually on the rock. And you can see here, too, how it
9 kind of conforms a little bit on the ridges. Actually
10 splattered, kind of laid down, conforming on the rock.
11 And you can see places where it's raised, it's a little
12 bit thicker or thickness, depending on where it actually
13 hit on the actual rock itself.

14

15 (Grand Jury Exhibit 495 was introduced.)

16

17 Q. Moving on to 495. What are we looking at here?

18 A. So 495, we discussed previously about there
19 being other items that were actually located underneath
20 the tower. Mechanical things, looked like there was some
21 previous repairs. Part of this was this unknown wire
22 right here. And this is really key in terms of actual
23 starting the fire if it was there previous or beforehand.
24 So when the splatter actually gets on top of these
25 devices, we know, of course, that was after the fact.

26 So what this actually depicts, I'll show a

1 couple of things here. You can still see -- okay. So
2 there's a whole bunch of this kind of scattered
3 throughout here, but if you look right here in the
4 center, you can see where the slag is actually on top of
5 the fencing right there. Okay? So that fencing was
6 already deposited there beforehand. But still, if you
7 look on the rocks, you've got all these small pieces of
8 splatter, larger pieces, all scattered, then a little bit
9 more even on the fencing.

10 What it does, the investigators, it shows that
11 this wire was already here beforehand, and we were able
12 to exclude that as part of the potential cause on the
13 fire.

14
15 (Grand Jury Exhibit 496 was introduced.)
16

17 Q. All right. 496. What are we looking at here?

18 A. Okay. We're looking at some more of the
19 splatter. This is a little bit further-up version, so
20 it's harder to tell. This actually shows some of the
21 splatter left on some of the unburnt, unburnt -- excuse
22 me -- vegetation, ground debris, dead materials that were
23 on the ground. I think the next picture will show a
24 closeup of this. This one will be a little bit harder to
25 tell, but I'll show you what we have here as soon as this
26 screen allows me.

1 Right here is the item we're looking for.

2

3 (Grand Jury Exhibit 497 was introduced.)

4

5 Q. All right. 497?

6 A. Yeah, 497 is, basically it's a close-in of what

7 I just went ahead and took a photograph of on the

8 previous one, on 496. And just to make sure, wait for

9 our friendly computer to help us out here. Rock, rock,

10 rock, vegetation, vegetation.

11

12 (Grand Jury Exhibit 498 was introduced.)

13

14 Q. All right. 498. What are we looking at at

15 498?

16 A. 498, once again, we're looking at splatter.

17 Remember, there's a lot of molten splatter right here.

18 Looking, going through these photos, this isn't a large

19 area. And all this fire line is, you'll see as it goes

20 ahead, it's more almost like a linear, lateral line that

21 goes through that has this splatter. And that's where

22 we're looking at in that case.

23 Once again --

24

25 (Grand Jury Exhibit 499 was introduced.)

26

1 Q. 499?

2 A. Sorry.

3 Q. Yep.

4 A. Once again, we're looking at more splatter.
5 Sound like a recording on there.

6 Q. But this is how it really is when you do a fire
7 origin and cause investigation; right?

8 A. Yes. In this case, origin and cause
9 investigators were there on the 9th, 10th, we came back
10 to finish things up on the 11th when I was down talking
11 to PG&E, collecting evidence. Two of my investigators
12 wrote they were wrapping up things, going ahead and
13 taking last photographs, heading down the hill. So we're
14 here for three days going through this area. So it's
15 very time-consuming, very meticulous.

16 Q. That's the word I was looking for,
17 "meticulous."

18 A. Oh, yeah. There's only one way to do it, do it
19 right, be thorough.

20 Q. So, again, we have aluminum splatter slag on a
21 rock?

22 A. Yes, that's correct.

23

24 (Grand Jury Exhibit 500 was introduced.)

25

26 Q. Exhibit No. 500?

1 A. Surprise. Once again, very large piece. I
2 think you can see all this little micro stuff all
3 scattered throughout.

4

5 (Grand Jury Exhibit 501 was introduced.)

6

7 Q. I'll give you hope. We have three more. 501.

8 A. I'm hoping to say two after this. At least on
9 these slides.

10 Splatter. This one, once again, you can start
11 taking a look, you can see the splatter. I'll only
12 circle in the one area, but as you can see, there's
13 splatter throughout the whole rock there and the adjacent
14 one next to it.

15

16 (Grand Jury Exhibit 502 was introduced.)

17

18 Q. Two. Exhibit 502.

19 A. All right. Splatter. There we go.

20 Q. More splatter on rocks.

21 A. It will all make sense in the end, folks.

22 Q. This time with number 14 flag in it?

23 A. We are getting close.

24

25 (Grand Jury Exhibit 503 was introduced.)

26

1 Q. And, finally, in this number 15, what are we
2 looking at? At number 503, I mean.

3 A. Yeah, 503. I think we'll actually have two
4 depictions on this one. You'll have a little bit
5 further-up view, but you can see on the edge of that rock
6 looks like a pretty good chunk of splatter located. It
7 is evidence number, item 15.

8
9 (Grand Jury Exhibit 504 was introduced.)

10
11 Q. And the last one, Exhibit 504?

12 A. Yeah. So this is the same picture we just
13 looked at previously; however, this one here you can see
14 a lot better. It's a lot closer in.

15 In this case, we actually do have some more
16 items if you take a look here, but I wanted to emphasize
17 this one here. This is the bigger piece, readily --
18 easily seen.

19 Q. So just give some perspective, when you talk
20 about meticulous, on the bottom of each picture there's a
21 line with the exhibit number and then a DSC number and
22 description. What does that represent, DSC number?

23 A. That's actually going to be a digital, digital
24 photograph that's taken. So each one of those have a
25 number that's identified to it. With that picture is the
26 evidentiary item that's listed with it. And then with

1 that, what that description is we photographed, and then
2 also the direction and GPS location of that photo taken.

3 Q. So you take meticulous photo logs and evidence
4 logs of all those photographs?

5 A. Absolutely.

6 Q. So they understand that as meticulous as I am
7 and as slow as I am, this is picture number 96, we
8 haven't used all 96, have we?

9 A. No, we have not.

10 Q. We were discerning in which pictures we chose.
11 All right. Let's save that.

12 All right. We've gone through the 15 evidence
13 items that you picked up.

14 Now, do you -- as part of your origin and cause
15 investigation, do you also diagram the scene?

16 A. Yes, we do.

17

18 (Grand Jury Exhibit 505 was introduced.)

19

20 Q. All right. So now moving on to Exhibit 505,
21 explain to us what is Exhibit 505.

22 A. 505 is actually the power pole which is on the
23 upper left-hand corner. That one's labeled with the
24 number. Or want me to circle it or read the number?

25 Q. Just leave it. It's marked, I think.

26 A. Yeah. So it's marked 17, dash, 128 with

1 additional numbers. That identifies that power pole
2 right there.

3 So, once again, these are the two parallel
4 lines that you saw on the previous pictures. And those
5 are the pole identifiers on each side.

6 Q. So as we're looking back at some of the earlier
7 photographs, this pole up here, 17, dash, 128, with this
8 connector jumper would be the top, and the top pole line,
9 and the left-hand pole line, and the poles down here on
10 the bottom would be the right-hand pole line; is that
11 correct?

12 A. That is correct.

13 Q. Okay. Just so we understand it.

14

15 (Grand Jury Exhibit 506 was introduced.)

16

17 Q. All right. Moving on to Exhibit 506. Explain
18 to us Exhibit 506, please.

19 A. Okay. So to start using our methodology, we're
20 going through and we're looking for fire and burn
21 indicators. As part of that, I kind of told it
22 previously, I'll show you a couple examples of each on
23 this, if that works?

24 Q. Go ahead.

25 A. What we do is we go ahead and list all the burn
26 indicators we go through. We're trying to find this area

1 and get back to the general origin area. As part of
2 this, these red arrows that I talked about previously is
3 advancing fire. Looking at indicators out there, seeing
4 where it's actually advancing, so we get it back to a
5 general area of, general origin area.

6 The yellow markers right here, remember, these
7 are lateral.

8 And then there's a green one. Those are
9 backing.

10 Depicted as part of this, tower 1, that's going
11 to be the one that we have in question. The circle
12 around it is a general origin area that was determined.
13 And then the tower below it is tower 2.

14 Q. So you determined -- or that it was determined
15 that the general origin area of the fire included tower 1
16 and went down to just below tower 2?

17 A. That is correct. The backing fire went down
18 towards tower 2.

19 Q. Tower 1 was the tower with the disconnected
20 jumper?

21 A. Yes, that is correct.

22 Q. Were you able to determine what transmission
23 line tower 1 belonged to?

24 A. Yeah. Let me make sure I get that one correct.
25 I have that in the original report. Stand by for a
26 second, please. One of those hyphenated names. Want to

1 make sure it's done right.

2 Q. By "report," you're referring to --

3 A. Yes.

4 Q. -- the "Report of Investigation, Official US
5 Forest Service Fire Report"?

6 A. Yes, I'm referring back to my "Report of
7 Investigation" that I'm the author of.

8 So on this line right here is actually the
9 Caribou-Table Mountain line.

10 Q. Okay. So T1 is the Caribou-Table Mountain
11 line?

12 A. Yes.

13 Q. Part of the Caribou-Table Mountain line, as
14 we've learned, that would be tower number 17/128?

15 A. Yes. In the previous photo.

16

17 (Grand Jury Exhibit 507 was introduced.)

18

19 Q. Moving on to the diagram marked as Exhibit No.
20 507, what are we looking at in 507?

21 A. Yeah, 507 is a closer-up of the general origin
22 area. So basically we had a map that was kind of zoomed
23 out that showed all the work we were doing in terms of
24 finding out where the general origin area was. This is
25 now zoomed in specifically to that general origin area.

26 Once again, I'll draw this here.

1 So, in this case, right here, remember, backing
2 fires, green? Lateral ones. Backing fire coming from
3 here. We have a lateral one from here. And we have
4 advancing right here with the red. And in particular,
5 we'll start saying, "Hey, there's white flags." And
6 that's where we're starting to see some of the slag,
7 right there, evidence 14 and 15 that we went over
8 previously.

9 Q. So what does it indicate to you that you have
10 backing fire down at the bottom towards T2, lateral fire
11 going off to the right side, and advancing fire going off
12 toward the top, away from the evidence items 14 and 15?

13 A. We're getting real close to the cause of the
14 fire.

15 Q. You started to establish a specific area of
16 origin here?

17 A. I don't think we actually got to a specific,
18 but we did get to a general area.

19 Q. Okay.

20 A. Once again, we got down to 25-by-50 foot area.

21
22 (Grand Jury Exhibit 508 was introduced.)

23
24 Q. And next, the diagram marked as Exhibit 508.

25 A. Yeah, 508, little bit closer, but it actually
26 comes a little bit further down towards the southeast. I

1 said before in my testimony that we were looking at --
2 the evidence items that we collected was more of a
3 lateral line. That would be something for me, as
4 investigator, consistent with that jumper cable. Once
5 that, whatever the failure was caused that failure of
6 that cable, that cable now swings in a downward movement
7 and makes an arc. These items with the molten slag and
8 the strands -- I'll go ahead and show the picture here --
9 are actually pretty much in a lateral line, consistent
10 with where that cableware dropped.

11 Q. So each of these little boxes that says E3 --
12 leading from left to right -- E3, E1, E2, E4, what are
13 those numbers? Well, first of all, what does the E mean?

14 A. The E is going to be evidence.

15 Q. And what do the numbers related to?

16 A. Those are going to be evidence items we
17 collected. So we had evidence items E1 through E15,
18 which we showed, was the previous slides. Or I guess not
19 slide, pictures. Which are the evidence with the strands
20 and the molten aluminum there, slag, whatever you want to
21 call it, that's actually on top of the rocks there.

22 Do you want me to draw a line on that or are
23 you good?

24 Q. Sure. You've got it pulled up there, go ahead.

25 A. I think it's good right now. Let me double
26 check.

1 Okay. So right here, just past that, where the
2 first picture was with evidence items 14 and 15, this
3 right here is evidence item 13, all the way through 1.

4 Here's a tower. Jumper cable. Went this way.

5 Q. On this tower, was -- the jumper cable that was
6 disconnected, was it on the uphill side of the tower or
7 downhill side of the tower?

8 A. It would be on the southwest -- let me double
9 check here. So it's going to be on the southwest of the
10 -- and that northwest pole is going to be lying on the
11 southwest.

12 Q. So I can have you draw some more in here.
13 We'll change colors. We haven't tried blue yet. So
14 let's try blue.

15 T1, according to the legend, is the tower. So
16 can you show us where that, that disconnected jumper
17 cable would have been?

18 A. Yeah, I'm going to refer to one of my other
19 previous photos we talked about.

20 Q. Go ahead. Just let us know which one.

21 A. Okay. Thank you.

22 Just -- so you've seen my drawing capabilities
23 aren't the greatest.

24 So I'm going to refer back to evidence -- or
25 Exhibit 481, and then I'm going to try to draw again.

26 Bear with me, folks.

1 Q. I think we already got the pen up and ready to
2 go. It's blue this time.

3 A. Excellent.

4 At the tower, remember, we have three lines
5 going across; okay? Jumper cable with the insulators is
6 on this line right here.

7 Q. So blue circle at the bottom of the box marked
8 as T1?

9 A. That is correct.

10 Q. Great. Thank you.

11

12 (Grand Jury Exhibit 509 was introduced.)

13

14 Q. All right. Now, moving on to Exhibit 509. Do
15 you have 509 in front of you there somewhere?

16 A. One moment, please. Yes, I do.

17 Q. And are you familiar with what's depicted in
18 509?

19 A. Yeah. That's a photo I actually took on August
20 11th.

21 Q. What does Exhibit 509 depict?

22 A. That depicts the connecting cable, which is --
23 let me make sure I get the correct -- so it's an Ampact
24 connector, with an A. That connector is actually
25 attaching the line, which I think the next picture would
26 be a better one to maybe show it on.

(Grand Jury Exhibit 510 was introduced.)

Q. Okay. 510?

A. Yeah, please.

Q. Do you have 510 in front of you?

A. Okay. I sure do.

Q. I guess we probably, just for the record, and I'm sure everybody can figure it out, these pieces of paper that are attached to this tag, is that something you attached to the tag, or to the connector?

A. It sure is. With the assistance of PG&E. They actually went up on the line and secured that. Had my investigators on top where the tower was. I was down back at the parking lot where we actually flew the helicopter in, where they disconnected these items where the failure took place. We ended up having both strands of insulators and the jumper cable flown directly from the scene to my location, in which I labeled as evidence.

Q. And describe the process of taking control and cataloging the evidence for us, please.

A. At this time, I ended up having, I believe, four evidentiary items. Let me take a look at my statement here. I had the long strand jumper cable. I had the shortened piece, which is this with a connector. And then I had two strands of the insulators.

1 And, let me see, in terms of -- yeah, so
2 evidentiary items 1511, 1512, 1513, 1514 as part of my
3 report investigation. So we had the string of
4 insulators, another string of insulators with physical
5 damage and scorching, the long end of the jumper cable
6 with the connector, and the short end of the cable with a
7 connector.

8 MR. NOEL: Okay. Now, we're going back and
9 forth, and I want to put something on the record using
10 the language. It's not testimony, but I want to make
11 sure that you guys are familiar with this. I want to
12 make sure you guys are looking at this on the jury. The
13 connectors that we are talking about here, we've heard a
14 lot of talk, a lot of testimony about connectors and
15 parallel groove connectors, remember, in the fire danger?
16 Note, this is not a parallel groove connector. I just
17 want to make sure that that's absolutely clear that
18 everybody understands this isn't the type of connectors
19 that we talked about before that needed to be replaced.
20 We can blame PG&E for lots of things, but this isn't one
21 of the bad connectors.

22
23 (Grand Jury Exhibit 511 was introduced.)
24

25 Q. All right. Go ahead. Oh, we're moving on to
26 Exhibit 511.

1 A. Yeah. It's another picture I took as soon as
2 those items were settled down from the helicopter,
3 detached, when I had to take an overall photograph after
4 we started labeling it.

5 You want me to talk about it and circle as I
6 go?

7 Q. Sure.

8 A. So the previous pictures we discussed right
9 here. The Ampact connector with the shorter part of the
10 cable. Then you can see this right here, kind of blocked
11 a little bit with the insulators, coming all the way
12 around with the other connector. That's the longer piece
13 of the jumper cable that you saw that was hanging. With
14 that now we have two strings of insulators. And we took
15 all those items from that whole line that failed, the two
16 things of insulators and jumper cable between them. And
17 that's the items that we removed where the failure took
18 place, and went from site, specifically there, were then
19 seized as evidence.

20
21 (Grand Jury Exhibit 512 was introduced.)

22
23 Q. Moving on to Exhibit 512. The photograph
24 marked 512, what are we looking at?

25 A. Yeah, this photo was taken by Jim Nolt,
26 Associates, I think actually with Jim. That person is a

1 technical expert that will be bringing advice. He's an
2 electrical expert. And I brought him in in this matter
3 to go ahead and give his expert testimony -- not expert
4 testimony, his expert advice of what was going on here
5 with this case.

6 Q. All right. And what does this photograph
7 depict?

8 A. So this picture we've talked about, and we saw
9 my pictures actually in the field. This is a closer-up
10 version. And there's a couple of things that I really
11 would like to show in this photo right here. Let me go
12 ahead and make some marks here.

13 Q. Go ahead.

14 A. So we take a look, start taking a look at these
15 strands, start taking a look at the ends right here,
16 they've actually been melted here on the ends. That's
17 going to be consistent with the splatter that we actually
18 had on site.

19 And then you can also see where the end's here
20 actually broken off. So not only do we have splatter,
21 but you can see where there's missing parts of the
22 strands. Remember how we had some of the missing strands
23 were actually located on the jumper cable on top of the
24 vegetation?

25

26 (Grand Jury Exhibit 513 was introduced.)

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24
25
26

Q. All right. And Exhibit 513, what are we looking at?

A. Yeah, Exhibit 5 -- 513 is another picture taken by Jim Nolt. And it's just another depiction of what we discussed here in the previous photo.

Q. Now, here -- in the previous photo we just had one. Here we seem to have two strands laid out with the space in between?

A. That is correct. That's actually where the -- I'll mark it here. That's where the failure took place. Original conditions, this right here would have been one piece. That's where the break occurred.

(Grand Jury Exhibit 514 was introduced.)

Q. And Exhibit 514, what are we looking at?

A. Yeah, that just shows a different angle. Kind of gives you a little bit more in terms of coloring of the connector itself, and also of the strands that were connected.

(Grand Jury Exhibit 515 was introduced.)

Q. 515?

A. 515 is important details we need to learn on

1 this. I'm going to start marking on the board.

2 Q. Yep. In this one we may want to use several
3 different colors.

4 A. I think so, too.

5 Q. Start with red, then every time you tap that it
6 will change colors.

7 A. Okay. Red, first one. We'll make it hot;
8 right?

9 So here's the connector. Remember, that's
10 aluminum, also. If you take a look at the end, that
11 whole end of that corner was hot enough it scorched that
12 connect and started molten it -- melting it, excuse me.
13 That's real important.

14 Q. For the record, the agent has circled the
15 corner of the connector with a red circle.

16 So switch colors. Now we're on the black.

17 A. So black. I find it real interesting, also --
18 color probably two of these; okay? We'll go over as we
19 go.

20 Black. Start taking a look right here, you can
21 see whatever the heat source that took place right here,
22 that actually started melting the strands. Actually went
23 into the connector right here. You can see how it
24 actually broke them. Some of them standing up right
25 here, you can actually see the edges right here where
26 it's actually melted and failed.

1 Let's go.

2 Q. Blue?

3 A. So we're going to see the same on the other
4 side, but to a lesser degree.

5 And then --

6 Q. Green?

7 A. Green. Here, one of the things I like about
8 this photo right here, if you actually take a look here
9 at the ends, you can actually see where it's actually
10 kind of mushroomed out a little bit with the molten right
11 here, where it's actually gone ahead with those wire
12 strands. You can see where some of that slag, some of
13 that we called slag and splatter previously is actually
14 still attached to the strands.

15

16 (Grand Jury Exhibit 516 was introduced.)

17

18 Q. And, finally, Exhibit 516.

19 A. Yeah, 516, get my pen out again.

20 So normal conditions, everything is going to be
21 brown right here; right? So if we notice this whole
22 section right here, not only has it been broken off, but
23 you can see where the burn and scorch marks are across
24 there. So we've had a failure where it's jumped through,
25 burned and blew out insulators as well.

26 Q. All right. You circled that with red?

1 A. Yes, I did.

2 Q. Why is that significant, in your mind?

3 A. That shows a failure. Insulator is supposed to
4 be protecting that whole system right there, and it blew
5 up the insulator. So, yeah, whatever that force is that
6 caused that, not only did it break the jumper cable line,
7 but it blew out the insulator.

8 Q. All right. We've gone through all the
9 exhibits. Do you have an opinion as to what caused the
10 Murphy Fire?

11 A. Absolutely. We came to the determination that
12 the cause was the failure of the power line, specifically
13 jumper cable.

14 Q. So going back to where we started, this
15 photograph looking up above the river, can you kind of
16 give us an idea as to what you believe happened on August
17 the, August 6th, 2018?

18 A. Could I refer back to a witness statement on
19 the -- or you want to go through this?

20 Q. Just your own opinion as to the evidence.

21 A. My own opinion as the lead on this
22 investigation right here -- and I will go ahead and
23 circle this here in this picture.

24 Q. Go ahead.

25 A. That's our jumper cable, the tower. There's
26 one. I need to erase that.

1 Q. Go ahead. There's the broom right there.

2 A. Okay. I've got to get my aspects up here.

3 So what happened here is we have, of course,
4 the tower on the line on 1. Below it was tower number 2.
5 That fire with the jumper cable, the one that had failed,
6 we had advancing fire going up ridge line to the
7 northwest. We had a backing fire that went down to the
8 other side of the towers. And then we had a little bit
9 of lateral burning going either direction.

10 So, as part of the fire investigation, going
11 ahead and making those determinations, going through our
12 systematic approach, going through being meticulous on
13 saying -- finding the failure, finding the splatter that
14 went ahead in that arcing view, bringing it back to the
15 general origin area, and then physically looking on the
16 ground, all comes back to the same point of the power
17 line failure.

18 Q. What were the weather conditions like on the
19 evening of August 6th?

20 A. August 6th, there wasn't too much in terms of
21 wind. I think it was minimal, two or three miles per
22 hour, which is kind of normal in the evening. Humidity,
23 I'd have to pull up the weather chart on that if you're
24 looking for actuals.

25 Q. No, just in general.

26 A. General, it's the summertime, folks. I mean,

1 it's beginning of August. This year we've had a little
2 bit of a later summer, so fire conditions are just
3 starting. Last year, as we're aware of, it was a lot
4 worse. So everything was a lot dryer out there. So in
5 terms of fire and threats, everything is dryer out there,
6 everything is more of ready to kindle and go. So
7 conditions were a lot worse for fire activity.

8 Q. But winds were relatively calm?

9 A. At this, at the point of the evening of the
10 fire they were.

11 Q. Were there PG&E personnel present during the
12 investigation?

13 A. Not to the area. We excluded them from the
14 area until we conducted our investigation.

15 Q. Ultimately, when you started collecting
16 evidence -- the lines themselves, the connectors, the
17 jumper line, the insulators -- did you rely on the
18 assistance of PG&E for doing that?

19 A. Yes, I did.

20 Q. Why is that?

21 A. They're the experts in terms of that. I hang
22 from a helicopter and a rope all the time, but not
23 playing with electricity. So that's a technical
24 expertise that really only PG&E has. So we use them as
25 the experts, go ahead and do that. We make sure to
26 secure either side to be able to show that we have that

1 chain of custody in terms of evidence and make sure
2 that's secured throughout the investigation.

3 Q. I think that's all I have.

4 See one. Do we have any other questions from
5 the jurors?

6 A. I wasn't that good, folks.

7 MR. NOEL: I have to go over with her first,
8 then I'll read you the questions.

9 (Counsel and Grand Jury Foreperson confer.)

10 Q. (By MR. NOEL) All right. Now, preface this.
11 We talked a little bit about looking through the
12 photographs, your an origin and cause, you're a fire
13 investigator; correct?

14 A. Yes.

15 Q. You're not an electrical expert?

16 A. No, I'm not.

17 Q. You hired in this case Jim Nolt to come out and
18 assist with this investigation and be the expert;
19 correct?

20 A. Yes. Yes, I did.

21 Q. So I want to limit this question just to your
22 own knowledge, experience, opinion for both of these
23 questions and not getting into Jim Nolt's conclusion.
24 We'll get those from him later.

25 Did the bird-caging, in your opinion, in the
26 jumper exist before or after the failure of the jumper?

1 A. I can't answer that.

2 Q. And, in your opinion, did the bird-caging
3 contribute to the failure of the jumper?

4 A. Once again, I have to result to Jim in terms of
5 his expertise on that.

6 Q. Okay. And we will do that.

7 The one thing is, apparently, the jurors are
8 paying attention because they know all about bird-caging.

9 A. All right. I like it.

10 MR. NOEL: That is all we have. If there's no
11 more questions from the jury, Madam Foreperson, the
12 admonishment.

13 GRAND JURY FOREPERSON: Your name again?

14 THE WITNESS: Anthony Magarrell.

15 GRAND JURY FOREPERSON: Magarrell.

16 THE WITNESS: Magarrell. Want me to spell it?

17 GRAND JURY FOREPERSON: No.

18 MR. NOEL: Don't take the exhibits with you,
19 we've, we already had that.

20 GRAND JURY FOREPERSON: Mr. Magarrell?

21 THE WITNESS: Yes.

22 GRAND JURY FOREPERSON: You are admonished not
23 to discuss or disclose at any time outside of this jury
24 room the questions that have been asked of you or your
25 answers until authorized by this Grand Jury or the Court.
26 A violation of these instructions on your part may be the

1 basis for your, for a charge against you of contempt of
2 court. This does not preclude you from discussing your
3 legal rights with your own attorney.

4 Mr. Magarrell, what I have just said is a
5 warning not to discuss this case with anyone except the
6 Court, your lawyer, or the district attorney. Do you
7 have any questions?

8 THE WITNESS: I do not. Thank you very much.

9 GRAND JURY FOREPERSON: Thank you.

10 MR. NOEL: Just for the record, your attorney
11 in this would include --

12 THE WITNESS: The federal side.

13 MR. NOEL: The AUSA. So you can get out of
14 here, Tony.

15 THE WITNESS: Thank you very much, folks. I
16 appreciate your service here on this.

17 [DISCUSSION OMITTED.]

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 137

are certified to be a complete transcription of said stenographic shorthand notes.

DATED: THIS 6TH day of JUNE 2022

3 (Confidential Grand Jury Hearing Proceedings)

4
5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 MR. NOEL: All right. We ready to get started?

10 Joe McNeil. He should be sitting in the witness
11 room outside.

12 [Witness Joseph McNeil enters the courtroom.]

13 GRAND JURY FOREPERSON: Mr. McNeil, before you
14 have a seat, when you are ready, would you please raise
15 your right hand to be sworn.

16 Mr. McNeil, do you solemnly swear that the
17 evidence you shall give in this matter pending before the
18 grand jury shall be the truth, the whole truth, and
19 nothing but the truth so help you God?

20 THE WITNESS: Yes, I do.

21 GRAND JURY FOREPERSON: Thank you. Have a seat,
22 please.

23 **EXAMINATION**

24 BY MR. NOEL:

25 Q. Mr. McNeil, will you please state your full name
26 spelling your last name for the record.

1 A. Joseph Donald McNeil, M-c-N-e-i-l.

2 Q. What do you do for a living, Mr. McNeil?

3 A. I'm a consulting arborist. So that means I talk
4 with interested individuals, public agencies, attorneys,
5 insurance companies about any matters that concern issues
6 around trees.

7 Q. In front of you you have what is marked as
8 Exhibit 517. Do you see 517?

9 A. Yes.

10 Q. Do you recognize 517?

11 A. I do.

12 Q. What is 517?

13 A. It's a resumé that I've created with a summary
14 of my background and qualifications.

15 Q. Can you walk us through your education, your
16 training, and your experience that qualifies you as a
17 consultant arborist?

18 A. In 1971 I purchased a tree service company from
19 an individual who didn't want to be in business. He
20 wanted to be employed, and he specifically wanted me to
21 employ him. He taught me the heavy rigging and how to
22 manage dismantling heavy structures, aerial structures,
23 and some basics of tree pruning.

24 By 1974 I realized there was a larger
25 arboricultural world. In 1975 I joined the International
26 Society of Arboricultural. It's an international

1 organization now. It has about 24, 25,000 members, I
2 believe. I joined the National Arborist Society which
3 was the Organization of Tree Services, now the Tree Care
4 Industry Association.

5 I joined the California Arborist Association. I
6 attended seminars and conferences that they presented. I
7 attended programs sponsored by the Cooperative Extension,
8 and I asked a lot of questions. Pretty soon I became
9 noticed and have been from that point accepted in the
10 community of arboricultural leaders not only nationally
11 but internationally.

12 I have been very fortunate starting out as a
13 tree guy to be able to associate with, be accepted, and
14 count these professional and industry and academic
15 leaders among friends because it's been a tremendous
16 education over the past 35 years.

17 Q. It says that from 1971 to 1995 you were a
18 working field arborist. Is that true?

19 A. Yes. At that -- during that period is when I
20 ran my tree service.

21 Q. What is a field arborist?

22 A. Field arborists do the physical hard labor.

23 Q. What kind of hard labor?

24 A. Hard, hard labor that's in the hot weather, in
25 the cold weather, in the rain and in the snow climbing
26 the trees, taking parts off of them, pruning, dismantling

1 trees over houses, taking them out, disposing of all of
2 those heavy parts, managing crews which aren't always as
3 cooperative as they could be nor is the equipment as
4 cooperative as it could be.

5 By 1995 I had had it. And I had been consulting
6 for 15 years before that. So it was a natural transition
7 for me to go into consulting full time. And I had an
8 offer to teach at Diablo Valley College at the same time,
9 which I did for a short period of time.

10 Q. What is the difference between a field arborist
11 and, say, a tree trimmer?

12 A. I'd like to think that a field arborist has
13 fundamental knowledge of tree biomechanics. That's how
14 trees react to physical loads, how they grow under
15 different weather and load circumstances, their biology,
16 insects, how they respond to different stress, hot, cold,
17 drought, excess water.

18 And there are training courses that are readily
19 available to all practicing field arborists. And there
20 are certainly different levels of certification that are
21 available to them to certify and pass these courses
22 whereas simply a tree trimmer may be someone who's
23 ignorant of what they are actually doing.

24 Now, a good field arborist is also a tree
25 trimmer, but not all tree trimmers are going to be good
26 arborists.

1 Q. What is the International Society of
2 Arboriculture?

3 A. It's made up of researchers, academics, business
4 owners, field arborists, climbers world wide. I just
5 returned Thursday from Knoxville, Tennessee at our --
6 from our international convention. We had a lot of
7 representation from France, Germany, Italy, quite a few
8 from -- many from New Zealand and Australia, Canada,
9 Brazil all working toward supporting research.

10 Arboriculture is dealing with living organisms.
11 And there is a tremendous amount of research that occurs
12 every month around how trees grow, react, interact with
13 their environment. So there's a lot of publications,
14 peer-reviewed journals and publications and programs all
15 over -- all over the United States and in Europe. And
16 the International Society of Arboriculture sponsors a lot
17 of those.

18 The International Society of Arboriculture also
19 has affiliated sub-associations; Municipal Arborist
20 Association, Utility Arborist Association. And they
21 conduct certification programs at various levels and a
22 qualification program which is somewhat similar to
23 certification in tree risk assessment.

24 Q. Okay. Get to that in just a second.

25 How does one become a member of the
26 International Society of Arboriculture?

1 A. One has to have some association with
2 vegetation, plants, and be willing to join and pay their
3 dues. There isn't a prior education requirement or
4 continuing education requirement.

5 Q. So it says that you're an International Society
6 Arboriculture board certified master arborist. What does
7 that mean?

8 A. That requires that you first be a certified
9 arborist which requires a number of continuing education
10 units or a degree in a related field or both and that you
11 pass a 200-question, four-hour test.

12 Then the board certified master arborist
13 requires additional experience, years, time, and grades
14 essentially, and a test that's the hardest test that I've
15 taken associated with arboriculture. It's a difficult
16 test.

17 Q. And you've been an ISA certified master arborist
18 since 2012?

19 A. Yes.

20 Q. Now, it also says that you are tree risk
21 assessment qualified by the ISA. Can you explain to us
22 what that means.

23 A. Tree risk assessment qualification again
24 requires some basic background in trees. It's based on a
25 two-day course that guides your previous experience into
26 a format for filling out, assessing, quantifying various

1 attributes of trees. Risk is defined as the likelihood
2 of an event and the consequence of that event if it
3 occurs.

4 So if there's a big tree hanging over the house
5 that would be catastrophic if it fell but it's very
6 unlikely to fall, it's low risk. It is a way through
7 matrices of describing risk and communicating it to
8 clients.

9 Q. Now, next it says you're a Pacific Northwest
10 Chapter of ISA certified tree risk assessor.

11 A. That was the TRA Program. It was a precursor to
12 the TRAQ Program. So while I achieved that in 2011 when
13 the TRAQ Program, the Tree Risk Assessment Qualification,
14 became available through the International Society of
15 Arboriculture, I went through that program. So it
16 supercedes the TRA Program.

17 Q. Okay. All right. Let's talk about some of your
18 selected professional society responsibilities. You are
19 a member of many different arborist and tree associated
20 professional societies; correct?

21 A. Yes, current.

22 Q. What is the -- what is WCISA?

23 A. WCISA is a Western Chapter of the International
24 Society of Arboriculture. There are 25 or so chapters in
25 the U.S. of the ISA and then there are some Canadian
26 chapters. There are chapters in various other countries.

1 Q. What is a consulting arborist committee?

2 A. While the International Society of Arboriculture
3 isn't really engaged much in consulting, they do maintain
4 a committee that looks out for the interests of
5 consulting arborists. So that would -- at the time we
6 were dealing with some licensing -- potential licensing
7 issues and conflicts with the state foresters.

8 Q. What is the ASCA?

9 A. American Society of Consulting Arborists is an
10 organization of strictly consulting arborists, people who
11 do what I do. Some of them are full-time consulting
12 arborists, some of them are working, as I did from 1988
13 to 1995, operating tree services and also consulting.
14 It's geared toward training and marketing -- helping
15 consultants train, market, and understand their
16 responsibilities as consultants.

17 Q. And I see you have served as both the co-chair
18 and the chair in the ASCA Standards of Professional
19 Practice Committee. What is a Standards of Professional
20 Practice Committee?

21 A. The active standards of professional practice
22 provide guidance on competence, who can be competent,
23 what defines a competent consulting arborist, due care in
24 carrying out assignments. Independence, impartiality,
25 report writing protocols. That sort of thing. And it's
26 a seven or 8-page document that provides that sort of

1 guidance.

2 At the time I chaired it we also had a component
3 of a disciplinary component which is no longer in place.

4 Q. Now, do any of these societies whether it's the
5 International Society, the American Society Consulting
6 Arborists, the Western Chapter, or any of the other
7 tree-related professional organizations have professional
8 publications for their members?

9 A. Yes. They all do.

10 Q. And have you taken part in or yourself written
11 articles that have been published for other arborists or
12 consulting arborists?

13 A. Yes, I have.

14 Q. Our next list on your resume is publications.
15 Are those articles that you have either
16 contributed to or actually written yourself?

17 A. They are.

18 Q. First up an article entitled -- well, let's go
19 from the bottom so we do it chronologically. "A
20 Photographic Guide to the Assessment of Hazardous Trees
21 in Urban Areas."

22 Do you recall that publication?

23 A. Very well.

24 Q. What is that publication?

25 A. It grew out of some work that another consultant
26 and I did for the East Bay Regional Park District in 1989

1 when we were developing a risk management program for
2 them. And part of that risk management program was to
3 train the regional -- each regional park -- and there's a
4 number of regional parks in the regional park district.
5 Train each local administrator on how to filter and find
6 the trees that they thought we should look at in a more
7 advanced fashion.

8 And Nelda Matheny, the other consultant on
9 this -- one of the other consultants on this said
10 "Wouldn't it be handy if we had photographs of each of
11 these types of defects or tree characteristics that we
12 could illustrate."

13 And she and Jim Clark, who was at University of
14 Washington at the time, co-authored this. I was the
15 technical advisor and the principal photographer for it.
16 And it has been the international go-to book on tree risk
17 management in urban areas for populations of trees for --
18 well, since 1992 up until the TRAQ Program really took --
19 took hold. And now there are other protocols. It's
20 still in use. And it can be -- it can be mixed and used
21 with the TRAQ Program.

22 Q. All right. Next publication is entitled "A Test
23 of Drilling as a Method of Direct Detection of Decay in
24 Trees." What is that article?

25 A. Well, now we have ways we can image the inside
26 of the tree. We have tree radar. We have sonic

1 tomography. We have what are called resistance drills
2 that send a three millimeter wide probe into the tree up
3 to half a meter and by Bluetooth they transmit the
4 results of wood density. The tip is attached back to a
5 computer and it creates a graphic. It looks like a --
6 well, it creates a -- you'll see one of these graphics
7 later.

8 That instrument was just starting to be used
9 when we created this -- this test of drilling. And we
10 were just using an eight-inch by one-foot long drill bit
11 to see if we could feel where decay was and where
12 cavities were. And we presented that at a paper in Salt
13 Lake City that year to the National Society of
14 Arboriculture. And we were able to find decay.

15 Q. Before we move on from that, you used a term
16 "sonic tomography." What is sonic tomography?

17 A. You attach a series of sensors up to a couple of
18 dozen sensors around the trunk of a tree, tab each
19 sensor, and it sends an impulse to each other -- every
20 other sensor. That's all manipulated by a computer
21 program. We go through the entire sequence of sensors
22 and it creates an image of sound speeds inside the tree
23 which correlates to decay or cracks or voids inside the
24 tree. So it gives us a two-dimensional image across that
25 plain. And we can take multiple plains and combine those
26 to 3D images.

1 Q. It looks like in 2012 you were involved in an
2 article or presentation "Forensics and the CSI Effect."

3 A. That was an article for the American Society of
4 Consulting Arborists newsletter. And we see all these
5 magical things happen in CSI where they can zoom in on a
6 license plate from a thousand yards away, clarify it, and
7 they can read the numbers. Well, they can't really.

8 And this whole article dealt with unrealistic
9 expectations that clients might have and how we manage
10 those and what it is we really can do. Because a lot of
11 our work if we're working in litigation at all, is this
12 forensic work trying to determine what happened, why it
13 happened, who should have known it happened? And so that
14 article addressed the difficulty of working around
15 unrealistic client expectations.

16 Q. In 2015 an article entitled "Tree Appraisal:
17 Would it be Missed?" What is that article?

18 A. One of the types of assignments we may take is
19 when trees are damaged by fire or one neighbor wants a
20 better view of the lake and they cut down the neighbor's
21 tree. So how much is that tree worth?

22 This article discussed a number of the factors
23 that go into appraising those trees, coming up with
24 dollar valuations and particularly this one with whether
25 the tree was prominent or not.

26 Q. Finally, an article entitled "Adequate and

1 Appropriate Methodology." What is that article?

2 A. As consulting arborists we may have assignments
3 that involve advising the municipality on one of their
4 big trees in a park. Is it safe? How do you make it --
5 how do you reduce the risk?

6 It may be because the tree has failed and caused
7 damage or injured someone or killed someone. In that
8 case we are looking at why that tree failed and under
9 what circumstance and could somebody reasonably have
10 predicted that and who would that be and what levels of
11 standard of care might different people have to meet.

12 Appraisal that I just mentioned -- I do a lot of
13 work on construction sites. The developer comes in and
14 wants to subdivide. And so we're assigned to protecting
15 the trees they have decided they want to preserve. So
16 there are different methodologies and bodies of practice
17 and instruments that we use for each of these different
18 kinds of assignments.

19 This is a discussion of what those methodologies
20 are, which are adequate. When is enough enough so that
21 you're not charging the client for a lot of stuff that
22 isn't needed, but you are doing everything that is
23 reasonably adequate to fulfill your assignment?

24 Q. Before I forget -- I think I forgot at the
25 beginning of the start of this to ask you what is the
26 name of your company?

1 A. Oh, McNeil Arboriculture Consultant LLC.

2 Q. And finally, under the services that you offer
3 it says "Tree risk assessment." What is tree risk
4 assessment?

5 A. I mentioned earlier that tree risk is the
6 likelihood of an adverse event occurring and the result
7 or the consequence of that event. Different clients of
8 ours have different risk tolerances. Some people -- I've
9 had clients who had trees that were standing upright by
10 one skinny root, and they didn't care if it was going to
11 fall on the house. They wanted that tree.

12 I've had other clients -- and I got a call from
13 one this morning -- that will accept no risk at all.

14 Well, there is always risk around any tall heavy
15 object. Our job is to describe the amount of risk there
16 is, present that to the client, help them decide if it
17 exceeds their risk tolerance, and advise them on
18 alternatives for managing that tree to see if the risk
19 can be reduced to a level that is within their tolerance.

20 Q. How do you do that? How do you assess a tree?

21 A. Start visually, look for body language
22 indicators that might be bulges, indicators of internal
23 cracks, beehives, nesting holes for birds. Look at the
24 bottom of the tree to see if the soil grade has been
25 changed that can foster decay.

26 Start with a sounding mallet, sometimes a

1 hickory mallet and sometimes a rawhide mallet, for the
2 different tones to see if the bark is dead and not
3 detached to the tree or if it's hollow under the bark or
4 under the wood. And at that point, we talk to the client
5 about whether they want to go into something advanced,
6 whether they want to spend the money to excavate and
7 evaluate the soil from the base of the tree or if they
8 want to have us spend quite a few hours using a
9 resistance drill or sonic tomogram. And then we make
10 judgments about what we see with those instruments.

11 First, we have to make interpretations of
12 whether that instrument is telling us that we're looking
13 at sound wood or unsound wood and then we have to decide
14 whether that attribute or defect there really makes a
15 difference and decide how much probability, what
16 likelihood we think there is that a tree may fail in some
17 given period of time. Five years, 10 years.

18 Q. How does a sounding mallet help you assess the
19 health of a tree?

20 A. Well, this (indicating) desk is solid. It's
21 probably not a good -- it's probably not a good
22 demonstration. A hollow tree may sound more like a drum.
23 A small hollow may sound like a drum in a localized area.

24 Q. Why is that important to a tree's health?

25 A. It may not be so important to a tree's health
26 because a tree's health is governed by tissues on the

1 outside that -- where the vascular tissues are, but it
2 may be important to the tree's structure, ability to
3 stand up.

4 Engenders use pipes a lot for structural
5 elements. They're hollow. All the -- all the structure
6 in the pipe is around the outside. Trees can be hollow
7 as long as they're perfectly cylinder and hollow in the
8 center and still have a low likelihood of failure unless
9 that wall gets too thin.

10 If the defect such as a hollow is not centered,
11 then there is a much higher probability that a tree will
12 fail as a result of that defect particularly if there is
13 a crack on the one side.

14 So we need to look using instruments we have or
15 visually and just a mallet to determine what's sufficient
16 to make some decisions to give a client advice on what
17 the likelihood of that tree failure is and what the risks
18 are associated.

19 Q. What kind of things are you looking for when you
20 are doing a visual inspection of a tree as part of a risk
21 assessment?

22 A. Well, I mentioned bird nesting holes and
23 beehives because, you know, there's going to be a cavity
24 of some kind. It may or may not be an indicator that the
25 tree is likely to fail at all. Often it isn't. But
26 we'll be looking particularly for native Oaks whether

1 there's still soil around the base of the tree and we
2 will be listening to the mallet tones.

3 Q. All right. Let's move on. We're not going to
4 go through this one quite as in depth, but you should
5 have 518 in front of you as the next exhibit.

6 A. Yes.

7 Q. What is Exhibit 518?

8 A. That is a longer CV that has a partial list of
9 what I've done over the years, continuing education that
10 I've been involved with over the years. It has the list
11 of licenses and certifications. I think that is
12 duplicated in Exhibit 517.

13 It has a more exhaustive list of professional
14 association responsibilities over the years. It has a
15 list of speaking presentations. It's the long version of
16 the resumé Exhibit 517.

17 Q. What kind of people or businesses hire you to --
18 for your expertise?

19 A. Homeowners, homeowners' associations, attorneys,
20 plaintiffs' attorneys, defense attorneys, insurance
21 companies, counties, municipalities.

22 Q. How about utilities?

23 A. Utilities, yes.

24 Q. Have you ever been hired by PG&E in your
25 capacity as a certified master arborist?

26 A. Yes, several times.

1 Q. Without going into depth as to any cases, what
2 kinds of things did PG&E hire you to do?

3 A. In two cases I was hired specifically to
4 investigate causation of fires. Pandola Fire was one.
5 And I don't recall the year. 2003 through 2006. Tim's
6 Mountain in 2011 outside of Hayfork, Weaverville, Trinity
7 Alps.

8 In both cases trees had failed onto conductors
9 and sparked fires. And the question being asked of me
10 was "Why did this tree fail? How could it have been
11 detected? Should it have been detected?

12 A third --

13 Q. I was going to say has PG&E ever hired you for
14 anything other than post-fire tree risk assessments?

15 A. Yes. In 2013 I participated in a PG&E fire risk
16 reduction pilot study in which they provided a team of a
17 dozen or so senior tree inspectors or line inspectors,
18 the people that do the pre-inspections for PG&E. This
19 was a company called Arbor Matrix. And my portion of
20 this project was to provide the advanced assessment for
21 them if they encountered a tree they thought justified
22 it.

23 Because this was a pilot study, they were trying
24 out whether this kind of protocol might be predictive.
25 My particular portion of it was carried out in Paradise.
26 When they identified the tree that they thought should

1 have a resistance drill or a resistance graph or a
2 tomograph assessment, I would go look at that tree. And
3 we did that in 2013 for a couple of weeks in Paradise.

4 Q. Do you also contract with Cal Fire?

5 A. Yes.

6 Q. How long have you been contracting with Cal
7 Fire?

8 A. About a year and a quarter, I believe. Year and
9 a half.

10 Q. So you started contracting with Cal Fire around
11 2018?

12 A. Yeah. Middle or early 2018.

13 Q. And what do you do for Cal Fire?

14 A. Cal Fire calls me if there's an event, a fire
15 that they think was started by a tree, tree limb, tree
16 trunk, some kind of a failure or contact of the tree with
17 a conductor. They want my opinion on why that tree part
18 contacted the conductor and an opinion of how that might
19 have been detected in advance or whether it could have
20 been detected in advance.

21 Q. In November of 2018 were you asked by Cal Fire
22 to assist with the investigation in the Camp B Fire?

23 A. Yes. They called me within a couple of hours of
24 ignition and asked me to remain on call. And it was
25 several days later, nearly a week -- I think on
26 November 14th they called me to go up. And we went, I

1 think, on November 15th.

2 Q. And what was the purpose or your purpose in the
3 Camp B Fire investigation?

4 A. Initially, it was no different than what I
5 described; to look at specific trees. And as soon as we
6 got there, we saw one tree down on a conductor with Cal
7 Fire investigators working around that tree and a second
8 tree that were later identified as trees 39 and 58.

9 We collected -- that first day we just collected
10 all the data we could on those two trees. And I was
11 later instructed that we should focus our attention on
12 tree 58. We returned a second day three days later. I
13 think it was the 17th. So maybe the first day was the
14 14th. I'll have to check dates here where it's in a
15 report. I don't recall that with specificity.

16 Because I wanted to collect a broader range of
17 data on all the trees that were within or near tree 58.
18 I wanted to have an understanding of tree attributes,
19 tree defects on them, whether they failed or didn't fail.

20 The goal of that was to be able to understand
21 whether this group or suite of characteristics would be
22 predictive in this event of -- of the trees that failed
23 versus the trees that didn't fail. That was the goal of
24 the second day when we collected information on another
25 82 or 83 trees.

26 Q. So did you put together an inventory of the

1 trees in and around the area of origin of the Camp B
2 Fire?

3 A. Yes, I did.

4 Q. Moving on to Exhibit 519 in front of you. Do
5 you have 519?

6 A. I do.

7 Q. You recognize 519?

8 A. Yes, I do.

9 Q. What is Exhibit 519?

10 A. Exhibit 519 contains blue pushpins and numbers
11 that correspond to each of the trees we looked at of
12 which are actually 84.

13 Q. Did you create Exhibit 519?

14 A. Yes. I did that from Google Earth. This was a
15 Google Earth image from December of 2018 after the fire.
16 And we used a Garmin GPS hand-held unit at each base of
17 each tree to locate its -- provide its location,
18 downloaded or uploaded these to a management program, and
19 then over to Google Earth which imported them and
20 inserted these pushpins, and then I modified it to put
21 the numbers on correctly.

22 Q. So what do each of the blue pushpins represent?

23 A. Each one represents one tree.

24 Q. And what do the numbers represent?

25 A. The number next to and actually to the left of
26 and just below each pushpin is the number of that tree.

1 Can I go over to the --

2 Q. Yes, absolutely. Feel free to get up and use
3 the Smart Board.

4 A. Okay. So I'm going to point to some pushpins
5 here at the bottom left.

6 Q. There. That will give you a few more feet.

7 A. Okay. Am I on or did we disconnect?

8 Q. Who knows. Yep, it's on.

9 A. Okay. We're on.

10 MR. NOEL: I thought maybe you guys killed my
11 microphone.

12 GRAND JUROR NUMBER EIGHTEEN: Only on
13 Wednesdays.

14 THE WITNESS: The lower part or the bottom of
15 this image on the left side is a group of numbers that
16 runs from 59 through 66 or something like that. And
17 above that is what looks like a bunch of trees. However,
18 this was taken in the afternoon in December close to
19 winter so the sun is low.

20 So tree 61 is actually pointing largely straight
21 up toward the camera. And what you're seeing above these
22 numbers that look like trees are actually the shadows of
23 the trees. So there aren't trees in this area above the
24 blue pushpins. It's just shadows. That's why it's
25 absent there.

26 Okay. Go ahead. And I will want to come back

1 to that in a minute. Thank you.

2 BY MR. NOEL:

3 Q. Okay. So you created this image with all the
4 blue pushpins and the numbers to represent each one of
5 the trees that you surveyed; correct?

6 A. Yes.

7 Q. And did you catalog each one of those trees?

8 A. I did.

9 Q. Next you're going to move to what's marked next
10 to Exhibit 520. Do you have 520 there in front of you?

11 A. I do.

12 Q. What is Exhibit 520?

13 A. Exhibit 520 is a printout of the spreadsheet
14 that contains the attributes of the 84 trees and some
15 comments on some of them.

16 Q. So walk us through and explain this spreadsheet
17 to us.

18 A. Okay. The first column is pretty explanatory.
19 It's the number of the tree.

20 Q. So that number would match up with the numbers
21 on Exhibit 519 --

22 A. Yes.

23 Q. -- affixed to the blue pushpins?

24 A. Yes, it does.

25 Q. All right. The second is species?

26 A. The second is the species of the tree; Ponderosa

1 Pine, Incense Cedar, Black Oak. And there was a fourth
2 species that I believe was Douglas Fir. Those were the
3 four species we found.

4 The next number is diameter, the distance across
5 the trunk, at four-and-a-half feet above the ground.

6 Q. Why four-and-a-half feet?

7 A. It's a conventional forestry height. It gets
8 argued all over the place whether it ought to be four
9 feet or five feet. And it's different in Canada and it's
10 different in Europe, but here it's four-and-a-half feet.
11 So by convention.

12 Q. Are you familiar with the term "diameter at
13 breast height." Is that a common term for arborists or
14 used by arborists?

15 A. Yes. And there's also diameter at standard
16 height.

17 Q. What is the difference between the two?

18 A. Mostly terminology. In Knoxville there was a --
19 there was a teacher who -- who stood up in one of the
20 sessions and complained about the term "diameter at
21 breast height" because one student kept staring at her
22 chest. And so I guess there's -- there's that political
23 correctness factor.

24 But in Canada "diameter at standard height" has
25 a specific height, and it's not four-and-a-half feet. I
26 think it's -- I don't recall what it is, but diameter at

1 standard height in the U.S. is going to be synonymous
2 with diameter at breast height four-and-a-half feet.

3 Q. All right. So moving on to the next column is
4 "height, comma, feet."

5 A. That's the total height of the tree from the
6 ground to tippy top. We measured that with a laser range
7 finder.

8 Q. Explain to us briefly how you are able to
9 measure that height with a laser range finder?

10 A. There are two of us. For the most part, I stood
11 at the bottom of the tree with the GPS unit. And we
12 located and collected these attributes and notes that you
13 see here. My son works with me. He stood a couple
14 hundred feet away with a laser range finder which is just
15 a small instrument handheld. It has a level in it and it
16 has a compass in it and it has the capability to do a
17 whole lot of trigonometry.

18 So when you point it, you can look through it
19 like a monocular. And when you point it at an object and
20 push a button, it will send a laser out and back and read
21 what the reflection is off the tree. And it does that up
22 to half a mile away on a tree.

23 One of the routines that it has is if you then
24 aim it at a second object, it will tell you the distance
25 between those horizontally. So it would be the
26 horizontal projection. It will tell you what the

1 vertical distance is between them. It'll tell you what
2 the distance along the hypotenuse of that triangle is,
3 the slope distance. It will tell you what the azimuth is
4 between one -- the first point and the second point. How
5 far is it off north? It's calibrated for declinations so
6 it should give you a true north.

7 It gives you more information than we used here.
8 So we simply used it to get the vertical distance between
9 the ground and the very top of the tree. And he had to
10 be standing back far enough so he could see both easily.

11 Q. What is the crown distance in the next column
12 over?

13 A. The crown distance --

14 If I can go back here. Can we go back one.

15 Q. Back to slide five -- or Exhibit 519.

16 A. I'm going to go to -- this is tree 17. I'm
17 going to point out tree 17.

18 Q. Here, let's pull this up a little bit and then
19 you can -- there. Now, you've got the microphone and
20 you're not standing on the edge.

21 A. Okay. Put the microphone back together.

22 I forget. If I zoom this, can I then draw or --

23 Q. Yes.

24 A. Okay. So tree 17 is right here (indicating).

25 Okay. I won't zoom it.

26 Q. Hold on.

1 A. I'll just draw, I think.

2 The base of tree 17 is right here (indicating).
3 There is a line going toward tree 18 that is actually the
4 trunk of tree 17 because the satellite that took this
5 picture wasn't directly above tree 17. They've corrected
6 this so that it looks -- it appears that you're looking
7 vertically down but, in fact, all the vertical elements
8 are tilted over in this (indicating) direction to the
9 southeast.

10 The top of tree 17 is right there (indicating),
11 and tree 18 has fallen into tree 17. But the bottom of
12 the foliage on tree 17, the lowest point of that foliage
13 crown is in that middle section. The distance between
14 the top of the tree and this middle section is the crown
15 distance. That is how many feet there is of this live --
16 of live limbs. And that's called live crown.

17 The reason that is important -- if I can jump to
18 the last column, the last narrow column LCR, live crown
19 ratio, is a ratio between this crown distance, this live
20 crown, and the entire height of the tree.

21 Q. All right. So let's mark this so that in the
22 future we have it.

23 So down here on the left in blue that's the base
24 of your tree; right?

25 A. Yes.

26 Q. Up here is the top?

1 A. Yes.

2 Q. And this middle line is the base of the crown?

3 A. Base of the crown or base of foliage, base of
4 limbs.

5 Q. Let's go "base of foliage."

6 So this (indicating) between the top and the
7 middle line, the top and the base of the foliage, that is
8 what is referred to as your live crown?

9 A. Yes, or crown distance in this table.

10 Q. Okay. So before we move on, anything else that
11 we're missing on this?

12 A. No.

13 Q. Okay. So let's save that. All right. So that
14 is saved. And that will be -- we'll start off today
15 519-A. And we'll deal with that.

16 [Exhibit 519-A marked
17 for identification.]

18 BY MR. NOEL:

19 Q. Okay. So now going back to 520, you started
20 talking to us about the column marked "LCR."

21 A. The reason that is important is the trees that
22 have a bigger live crown ratio tend to be more stable.
23 So if this distance here, if these limbs go --

24 Now, if I hit "X," will it take just this last
25 one off?

26 Q. No. It will take all of them.

1 A. Never mind.

2 Q. But we've got it saved.

3 A. I'll try not to touch it again.

4 Q. It's saved. What you've already done at this
5 point is already --

6 A. If this distance, if these limbs go all the way
7 to the ground, that would be a live crown ratio of
8 100 percent. So 100 percent of the trunk is covered with
9 limbs. If they go halfway up, that would be a 50 percent
10 live crown ratio. And if you look on Exhibit 520 and you
11 look at tree 17, you will see that has a live crown ratio
12 of 59 percent. So it looks about right here.

13 Trees that have a large live crown ratio are
14 relatively fat at the base, skinny at the top, and half
15 as fat halfway up. The wind hits them and they move
16 around and whip back up. They are relatively stable. So
17 that is an important matrix to have.

18 I think it would make sense if I talk about HD
19 ratio at the same time.

20 Q. Okay. Let's go to the next column which is "HD
21 ratio."

22 A. That's height diameter ratio. Trees that have a
23 large live crown ratio -- they're big at the base and
24 relatively short -- tend to have a low height diameter
25 ratio. They're not very tall for as wide as they are. A
26 high diameter ratio is just the height in feet compared

1 to the diameter in feet at four-and-a-half feet.

2 If a tree is more than 50 times as tall as it is
3 wide, there is some literature and some researchers have
4 suggested it's more likely to fail. That really depends.
5 If it's a community of trees growing close together, they
6 are all going to be tall, skinny trees. Generally, there
7 should be an inversion relationship between height
8 diameter ratio and live crown ratio. A large live crown
9 ratio should correlate on most trees with a small height
10 diameter ratio. And in this population of 84 trees
11 generally that is true.

12 A height diameter ratio may be an indicator that
13 a tree is more likely to fail if it's a large number.
14 Live crown ratio may be an indicator that the tree is
15 likely to fail if it's a small number. It just has a
16 little bit of foliage up at the top. And usually, it
17 doesn't have much taper to the trunk. So it has a height
18 diameter ratio. That's why we collect these numbers.

19 We collected -- we also made an observation, if
20 I can go back to significance defects now.

21 Q. Okay. Before we get to that though, so a
22 perfect tree is basically going to be 50/50 on the height
23 diameter ratio and LCR?

24 A. No, depending on how you define a perfect tree.
25 Are you meaning a perfectly most stable tree?

26 Q. Yes, a most stable tree.

1 A. A most stable tree will have a large live crown
2 ratio. Young Redwoods grow with their foliage all the
3 way to the ground. They are really stable in that phase
4 of their life.

5 Q. So if you look on this catalog, tree number 24
6 is a Ponderosa Pine. It has the lowest LCR at 29 percent
7 on this page, but it also has one of the highest HD
8 ratios at 78 on this page.

9 A. Those are both indicators that are in the right
10 direction. Because you expect the high HD ratio to
11 correlate with the low live crown ratio. And you'd
12 expect that tree to fall over, but it didn't. I don't
13 know why.

14 Q. The term I've heard before is a giant toothpick.

15 A. Yeah, that works. But it remained a giant
16 standing toothpick after everything else around it.

17 Q. When you're doing tree risk assessments, how
18 would you rate that tree tree number 24?

19 A. I don't have enough information here to tell you
20 with much confidence how I'd rate that. What I have is I
21 note that it had no significant defects.

22 Can we talk about that in a minute?

23 Q. Yep. We can move on to that.

24 The column next to crown distance is significant
25 defects. What does that mean?

26 A. We talked about decay and bird nesting holes and

1 injuries from road building. A Caterpillar hits the
2 grader that hits the tree. Fires, previous fires that
3 cause injury. Decay gets started, internal decay. Is it
4 central decay? Are there cracks in the tree? Is it
5 sound, but it's fractured?

6 We didn't do an exhaustive examination of each
7 of these trees. We looked at them visually and we used
8 the sounding mallet and we took photographs of them, but
9 we didn't use a resistant drill on most and we didn't use
10 a sonic tomograph and we didn't use ground penetrating
11 radar or any other kinds of tools that there are.

12 So I can't say with certainty that this didn't
13 have some defect, but it didn't have the kind of defect
14 that I would normally detect in a reasonably conducted
15 visual assessment.

16 So did the tree lean? I don't have -- we don't
17 have a note on that one. And if it had extremely, that
18 would -- and it looked like there was a lean prior to the
19 fire, that would be a defect that we'd note. I don't
20 think we saw any of those in this.

21 Q. I'm guessing that when you say you charted
22 significant defects, that these are significant prefire
23 defects?

24 A. Yes, because we're talking about attributes that
25 would have been visible before the fire that would have
26 been predictive of the behavior of the tree during and

1 just before the fire.

2 Q. And did you find trees in the general area of
3 origin that did show significant defects that would have
4 been visible prior to the fire?

5 A. We did. I think the most pronounced of those
6 was tree 30. It did have trunk wounds that we couldn't
7 determine with certainty, but it had an open wound that
8 was open prior to the fire from the ground up to
9 somewhere between six and ten feet because it had burned.
10 We couldn't tell where it had been previously opened, but
11 that open wound covered 40 percent of the circumference,
12 which is almost half the tree was missing on one side and
13 the interior of the tree was decayed.

14 So that tree would have been kind of a
15 no-brainer. And it did follow the rules. It fell over.
16 It was downhill of the conductors, and it fell away from
17 the conductors.

18 Q. The next column is entitled "Fail." What's that
19 column mean?

20 A. Either it fell or it didn't fall. It's biome
21 standing or falling.

22 Q. So if there's an "N" in that column, that tree
23 didn't fall?

24 A. Did not fall.

25 Q. If a "Y," then, yes, the tree did fall?

26 A. That's correct.

1 Q. Finally, the big wide column on the right is
2 "Comments." What can you tell us about that column?

3 A. If there was something notable about that tree,
4 I made notes. A lot of the trees didn't have anything
5 particularly notable about them.

6 Q. All right. Now, you said earlier that your
7 focus was primarily on two trees number 39 and number 58.

8 A. Correct.

9 Q. And those are listed in your tree inventory?

10 A. Yes.

11 Q. Let's walk through 39 real quick. What type of
12 tree was 39?

13 A. Ponderosa Pine.

14 Q. And what was its diameter of breast height?

15 A. Nineteen inches.

16 Q. How tall is the tree?

17 A. One hundred four feet.

18 Q. What was the crown distance?

19 A. Eighty-two feet. Is that 82? This is a
20 little -- 62.

21 Q. Did you see any significant defects on tree
22 number 39?

23 A. Yes, we did.

24 Q. And did tree number 39 fail?

25 A. Yes, it did.

26 Q. What was the HD ratio of tree number 39?

1 A. HD ratio is 66 percent, live crown ratio
2 60 percent.

3 Q. All right. Now, moving down to tree number 58,
4 what type of tree was 58?

5 A. Also a Ponderosa Pine.

6 Q. And what was its diameter at breast height?

7 A. Twenty-two inches.

8 Q. It's height?

9 A. One hundred thirty-four feet. I will give this
10 back to you.

11 Q. The crown distance?

12 A. Crown distance is 77 feet.

13 Q. Did you note any significant defects to that
14 tree?

15 A. Yes, we did.

16 Q. And did that tree fail?

17 A. It did.

18 Q. What was the height to diameter ratio of that
19 tree?

20 A. Seventy-three.

21 Q. And the LCR of that tree?

22 A. Fifty-seven percent.

23 MR. NOEL: All right. It's almost 2:30. We've
24 been in session for almost an hour and a half. This is a
25 good point to take an afternoon recess and come back and
26 finish him up with the actual tree photographs

1 themselves.

2 GRAND JURY FOREPERSON: Okay. All right. We
3 will recess 15 minutes.

4 MR. NOEL: All right.

5 GRAND JURY FOREPERSON: Okay. Before we do,
6 Mr. McNeil, I need to issue an admonishment to you.
7 Sorry.

8 Mr. McNeil, you are admonished not to discuss or
9 disclose at any time outside of this jury room the
10 questions that have been asked of you or your answers
11 until authorized by the grand jury or the Court. A
12 violation of these instructions on your part may be the
13 basis for a charge against you of contempt of court.
14 This does not preclude you from discussing your legal
15 rights with your own attorney.

16 Mr. McNeil, what I have just said is a warning
17 not to discuss this case with anyone except the Court,
18 your lawyer, or the district attorney.

19 Do you have any questions?

20 THE WITNESS: No, I don't.

21 GRAND JURY FOREPERSON: Okay. Thank you.

22 [Recess taken from

23 2:28 until 2:44 p.m.]

24 GRAND JURY FOREPERSON: All members of the grand
25 jury have returned, and we can proceed.

26 **EXAMINATION CONTINUED**

1 BY MR. NOEL:

2 Q. All right. So we talked about earlier you went
3 out to the scene and started an evacuation. You said you
4 focused mainly on tree number 58 and tree number 39;
5 correct?

6 A. Correct. We started with tree 39 because that
7 caught our attention.

8 Q. All right. You have in front of you a
9 photograph marked as Exhibit 521. Did you see 521?

10 A. I do.

11 Q. Do you recognize 521?

12 A. Yes.

13 Q. Did you create 521?

14 A. I did.

15 Q. What is Exhibit 521?

16 A. Exhibit 521 is based on the same aerial as the
17 earlier 519 with the pushpins turned off and a line drawn
18 to show where the conductors were prior to the event.
19 They don't show in the Google Earth December 2018 aerial,
20 but Goggle Earth provides a historical slider that you
21 can slide back to previous versions of the same aerial
22 and you can see the trees in the same places and you can
23 see the conductors.

24 So I drew the conductors in on an older aerial
25 and then brought the slider back up to December 2018, put
26 in trees 39 and 58. You can see that tree 58 is gone and

1 there is an equipment track that goes from Concow Road
2 down to where tree 58's trunk was.

3 Tree 39 is a tapered dark line that runs left
4 west from the white dot by "39." That's not a shadow.
5 That's an actual trunk on the ground.

6 There is a yellow "CF1" dot. Make a note of
7 that. It will be important a couple more exhibits down
8 the road here.

9 Q. Okay. You said that there's equipment tracks.
10 Can you show us what you're talking about.

11 A. Yes. Do you want me to diagram that?

12 Q. No. Just show it.

13 A. Concow Road is labeled and Rim Road is labeled.
14 And this (indicating) track that comes from the
15 intersection of Concow Road and Rim Road down to -- just
16 down slope west of tree 38 is an equipment track. None
17 of that track was present during our site visit.

18 Q. Okay. Do you know why equipment was dragged or
19 driven down to that location next to 58?

20 A. That tree was big. It needed equipment to haul
21 it out. I suppose alternatively they could have used a
22 crane from Concow Road. They didn't.

23 Q. All right. So let's move on to Exhibit 522. Do
24 you have 522 there?

25 A. I do.

26 Q. What is 522?

1 A. Exhibit 522 is tree 39 looking from the east
2 with -- if you go back to Exhibit 521, it would be from
3 the intersection of Rim Road and Concow Road looking
4 toward tree 39, the east side of tree 39. The scale on
5 the right side alternates black and white in one foot
6 increments.

7 Q. Okay.

8 A. This -- the rest of tree 39 is on the left side
9 of the photograph butt end of that log pointing toward
10 the photographer looking down the tree trunk.

11 Q. So tree 39 failed?

12 A. Tree 39 failed. And if you look to the left of
13 that black and white scale, in the center of the tree
14 there is a strip of exposed wood. And it will show up a
15 little better in the next exhibit, I think.

16 Q. Okay. Let's go on to 523.

17 A. Exhibit 523 is a close-up of 522 at about four
18 feet above the ground. And this area here (indicating)
19 was probably free of bark prior to the fire, this area
20 where there were wood-boring insects in here. You can
21 see some holes that came out to the surface on one side.
22 So this is -- this is a feature that was visible to us
23 that probably was visible prior to the fire but only from
24 the intersection of Concow Road and Rim Road.

25 Q. Why is that significant?

26 A. Well, depends on the protocol for examining

1 these trees by the tree inspector for the utility. If
2 their protocol is to walk down the right of way, they are
3 going to be on the downhill side of this tree on the side
4 away from this feature. They're going to be on the west
5 side of the tree, and this feature can only be seen by
6 the east side of the tree.

7 And we don't know what intervening foliage there
8 was, whether there was tall undergrowth that may have
9 been obscured on this end from the east side. We just
10 can't know that.

11 Q. Why did this tree tree number 39 attract your
12 attention?

13 A. Number one, it was laying on top of the
14 conductors. And at that point within the first hour of
15 our being on site no one had told us what to look at. We
16 were looking at what caught our attention. And so this
17 was one of the two accessible trees that were on the
18 conductors. And it had what appeared to be a defect that
19 was likely visible prior to the fire.

20 Q. So when you say "on the conductor," you're
21 talking about this (indicating) top part of the tree that
22 broke off?

23 A. Yes.

24 I'm going to come down to your -- the conductors
25 can't be seen in this photograph, but they cross under
26 the tree just under where you see the lowest limbs. I

1 think that was about where the conductors were laying on
2 the ground.

3 Q. So going back here to 521, your yellow line
4 intersects with tree number 39?

5 A. Yes.

6 Q. And going back to tree number 39 on this picture
7 that was post fire, this Google Earth snapshot, that
8 actually shows the tree laying on the ground; correct?

9 A. That shows the tree laying on the ground and it
10 shows the conductors that -- this is their aerial
11 position prior to the event. When the trees went -- when
12 the conductors came down, the tree may have struck them
13 and pushed them to one side or another. The wires
14 weren't laying in a straight line on the ground. They
15 were snaked back and forth a little bit. So this may not
16 be the exact position of the conductors after the fire,
17 but it's not far.

18 Q. Okay. Now, let's move on to 524. You said when
19 we were talking about 521 earlier, that "CF1" would come
20 into play. So let's talk about 524.

21 A. "CF1" on 521 is the point from where this
22 photograph was taken. And that is actually a whole
23 series of seven or eight photographs that I took looking
24 to the south down Concow Road and finishing looking to
25 the north up Concow Road which is straight.

26 In this photograph it looks like it's bent.

1 That's just because of the stitching program that puts
2 these half dozen photographs together bent it in order to
3 keep the trunks upright and straight.

4 Q. So tell us what we're looking at here.

5 A. So you're looking at -- on the left side you're
6 looking at the trunk of tree 58. You can see the yellow
7 line is approximately where the conductors were on the
8 ground after the fire. You can't see the tall stump of
9 tree 58. It's behind the tree in the foreground on the
10 left side.

11 Tree 39 is off to the far right. It may be --
12 it may be this short stump right here (indicating). It
13 may not be. It's not critical in this photograph, but
14 it's about in that vicinity.

15 Q. And did you create Exhibit 524?

16 A. I did.

17 Q. Can you explain how.

18 A. I used a photographic stitching program,
19 selected these half a dozen or so photographs, and told
20 it to stitch them together horizontally in a panorama.
21 And that's all I know about it. It's magic from that
22 point.

23 Q. And then what about the annotations on the
24 photograph. Did you add those?

25 A. Yeah. That is in Photoshop I added annotations.

26 Q. Why did tree 58 attract your attention?

1 A. Well, it too was laying on the conductors. Two
2 reasons; one it was laying on the conductors and, number
3 two, I was told it should attract my attention. So from
4 that point on we spent -- we spent our time documenting
5 tree 58.

6 Q. All right. So let's move on to Exhibit 525.
7 What is Exhibit 525?

8 A. Exhibit 525 is taken from just uphill from
9 Concow Road actually down the shoulder of a couple of
10 feet on Concow Road to the tall stump of three 58. And
11 the bowl at tree 58, the rest of the trunk is indicated
12 by that red arrow.

13 In the next several slides they're going to
14 be -- we're going to look on the bottom right side here
15 on the north side of the trunk where this is the east
16 side. We're looking downhill to the west. Now, we're
17 going to look at portions on the east/southeast side of
18 the bottom of this trunk. And then we're going to look
19 at a splinter -- a long splinter here and here
20 (indicating) that are attached to the fallen bowl of this
21 tree that ripped off from the west side of the stump.

22 Q. What are we looking at in the Exhibit 526?

23 A. Now we're looking at those two long strips. And
24 when you look at the ones coming straight down, you will
25 see on the right side it's a little bit longer. And if
26 you could briefly go to Exhibit 527, this is looking up

1 from the northwest. On the west side of the tree you can
2 see where that longer piece ripped out. And it's not
3 just bark. It's bark and the outer layers of wood that
4 lifted off that trunk.

5 In this print here (indicating), if you can go
6 back to 526, it matches this shape here (indicating) and
7 then this came off immediately adjacent.

8 Q. All right. So we're going back to 527.

9 A. And I should add these are less important in
10 themselves than they are just to help orient the log and
11 the stump and where we are in the world with those two.

12 Q. In 527 there's a yellow arrow pointing to
13 something on the tree. Did you place that yellow arrow
14 there?

15 A. I did.

16 Q. What is that yellow arrow pointing at?

17 A. It's pointing at wound wood. Wound wood is
18 wounds that -- wood that forms after some kind of injury.
19 It may be when you cut a limb off a tree, it's wood that
20 forms to close that wound around the edge of the wound on
21 the trunk from removing the limb.

22 Any time -- if a car hits the side of a tree
23 trunk and knocks the bark off, the tree will gradually
24 form wood from the sides to close the wound. Its term is
25 wound wood is what covers it.

26 In this case, this margin -- this yellow arrow

1 indicates a margin between wound wood and dead trunk
2 surface where previous fire killed the live tissues on
3 this trunk.

4 And I think in the next exhibit --

5 Q. 528.

6 A. -- 528 these two arrows are taken from at the
7 same point as the single arrow in 527. Exhibit 527 is
8 just to orient you as to where 528 is.

9 There are a couple of fingers of wood -- wound
10 wood, new life. And by "new life" I mean after whatever
11 injury caused these tissues up here to die. This is dead
12 and was dead prior to the fire. It may have been covered
13 by intact bark because it may just have been enough heat
14 to burn the bark and kill the tissue underneath. The
15 inner bark is alive. The outer wood is alive. The layer
16 in between those two can be alive, but the heat may kill
17 those live tissues without burning them completely or
18 causing them to come off.

19 So this may or may not have been covered by
20 burned bark like prior to the Camp Fire. But to the
21 right of this margin above this and to the right and
22 above this feature is dead. And this is live wood that
23 either wasn't killed and continues to grow and add margin
24 or it was protected from lower down by soil and has grown
25 up since.

26 From evidence that you will see in a minute I

1 think that this was left in place after earlier fires,
2 and it's just expanded since then. This is evidence of
3 what the condition of the tree was prior to the fire.

4 Q. So based upon what you're saying, part of this
5 tree was dead before November 8th?

6 A. Part of the surface. And I should -- the live
7 cells are on the outside, not on the inside. Dead
8 doesn't mean decayed. Dead can be sound. Dead may be
9 dried out so dead may be more brittle, but it's also
10 stiffer. So dead doesn't necessarily mean high potential
11 to fail. It certainly is an indicator. If you're aware
12 of it, you ought to look at it more closely.

13 Q. So when you'd be doing a tree risk analysis or
14 assessment, that would be something you would want to
15 look at?

16 A. Yeah. However, in my practice we look at one
17 tree or two or three trees and we have the luxury to stop
18 and poke and hit with a mallet and probe and take bark
19 off if it's dead. There has to be a reason. Each one of
20 those activities is an escalation of the investigation.
21 And at every step there needs to be some indicator that
22 you should escalate your investigation to justify the
23 extra cost of doing that and the extra time to do that.
24 So, yes, in my practice we do that.

25 Q. But the presence of the dead wood doesn't
26 necessarily mean that this tree is in trouble and a high

1 threat to fall over; right?

2 A. It doesn't necessarily mean that. It does mean
3 that if you're aware of the dead wood, it would be a
4 really good idea to check it further. But we don't know
5 if any of this dead wood was visible from within the
6 right of way. It was dead largely on approximately the
7 north, east, and south sides. So around three quarters
8 of this circumference was dead wood.

9 Q. I want to go back real quick. You keep talking
10 about right of way.

11 A. Oh.

12 Q. What is the right of way to your knowledge?

13 A. I'm talking about the utility right of way, not
14 the road right of way. The utility right of way is where
15 the wires were; the conductors.

16 Q. So the yellow line?

17 A. The yellow line.

18 Q. So the utility has a right of way down the line
19 which allows them to get in and work on the line and
20 inspect those things?

21 A. Right. And there may be a road right of way for
22 Concow Road, which is a separate right of way. I don't
23 know the particulars of this forest.

24 Q. So when you're talking about this damage shown
25 in 528, the dead wood, the wound wood, you're saying that
26 that wouldn't necessarily be visible from the right of

1 way. You're talking about someone who is walking the
2 power line?

3 A. Correct.

4 Q. What about somebody who's on the road?

5 A. I can't say with certainty they would have seen
6 it from the road either unlike tree 39 which looked like
7 to me it had a feature that was visible prior to the Camp
8 Fire. I don't know with certainty whether the Concow
9 Road side of this tree would have shown that it was dead;
10 that the bark had fallen off or not. And I don't know
11 how obscured it may have been by undergrowth.

12 Q. All right. Let's move on to photograph 529.

13 A. The 529 is looking from the southeast. Again,
14 you can see the fallen main trunk of the tree with it
15 splintered to the left side of the photograph. And at
16 the bottom center of this photograph is another tall
17 pyramidal fake finger of wound wood protruding upwards
18 that -- and 524 is again a wide view just to orient you.

19 And 530 -- oh, this is a 529. Excuse me. I
20 misspoke. Exhibit 529 is a wide view to orient you.

21 Exhibit 530 is a close-up of that same area with
22 the yellow arrows outlining the wood wound, the live
23 tissues that were present at the time of the fire.
24 Outside that wound was dead. And this is similar to what
25 we saw on the opposite side of the tree.

26 Q. Okay. So inside those yellow arrows in that

1 area you say is live?

2 A. Yes.

3 Q. But the outside is dead?

4 A. Yes, prior to the fire.

5 Q. Prior to the fire.

6 And do you have an opinion as to what caused all
7 of this dead on it? The dead wood on this tree?

8 A. Well, we know that there were a series of prior
9 fires that went through here. And there was one, I
10 think, in 2001 and I think one on 2008. Those show --
11 you'll see those in a few minutes. And it's likely that
12 those previous fires are the cause of these dead tissues
13 that you're seeing on these trees.

14 Q. But either way there seems to be quite a bit of
15 dead wood on the trunk of this tree?

16 A. Yes, the three-quarters of the circumference.

17 Q. And were you able to measure a height level as
18 to how far up or down that damage extended?

19 A. No, because it was so burned -- both on the
20 fallen part of the tree and the stump, it was so burned
21 on the east side that we really couldn't -- we couldn't
22 tell much. There may have been fingers of live wood on
23 the east side, but it was consumed by fire at the time of
24 our inspection. So what was left that we could see was
25 on the northwest and southeast.

26 Q. All right. Exhibit Number 531. What are we

1 looking at in this picture?

2 A. When they collected this tree, they took the
3 limbs off and took sections of the trunk to a storage
4 facility in Magalia. This is the base of the tree
5 looking upward from the ground essentially. They
6 excavated soil down a foot or so so they could cut this
7 first section of the trunk off. And if you notice this
8 (indicating) long straight flat area at the upper
9 right --

10 Q. Well, let's back off for just a second before we
11 get to that.

12 A. Okay.

13 Q. There's a compass on this tree; is that correct?

14 A. Yes.

15 Q. I'm guessing that that isn't a natural feature
16 on these trees?

17 A. Rarely. You're correct.

18 Q. Is there -- is that the east, west, and the
19 north arrow -- the north and south arrow, is that
20 something you superimposed on the tree?

21 A. I superimposed that on the tree. And you'll
22 notice that east and west are reversed relative to north.
23 If you're looking down on an aerial photograph, this is
24 backwards because you're looking up from the ground, and
25 west is the downhill side of the tree, east is the side
26 toward Concow Road.

1 Q. Why are those coordinates significant to you?

2 A. It's just for orientation. For me they were
3 important because we did some testing in several points
4 on this log. And certainly, I wanted to be able to
5 answer the question of what part of the log we were
6 testing.

7 Q. All right. Now that we've got that taken care
8 of, when I interrupted you, you were talking about the
9 flat side, northwest side of the log?

10 A. Yeah. Just for everyone's orientation, the
11 straight flat area -- if you can go back to 527, this
12 straight line here (indicating) is that same flat area.

13 Q. You're referring to the -- to the area below the
14 yellow arrow on the left side of the trunk as we're
15 looking at it in the photograph?

16 A. Yes. For the record, I think it makes it more
17 clear to say that.

18 Q. All right. What is the yellow arrow -- what is
19 the yellow arrow pointing at on this photograph?

20 A. The yellow arrow is -- well, first, I should say
21 that this -- this (indicating) bulge here is where a root
22 came up to meet the trunk.

23 And I'm going to see if I can make this work.
24 Did that zoom?

25 Q. No. You've got to hit the little --

26 A. I've got to do something. Oh, now can I -- can

1 I slide this with my finger?

2 Q. Yep.

3 A. Okay.

4 Q. Pull it down there.

5 A. Okay. So you can see this discolored area up
6 here (indicating) where the bark is detached. If you
7 look at the trunk above this, it was all dead. This is
8 just a discoloration that is associated with that dead
9 issue. I put that in just to call attention to it for my
10 own orientation. And I wanted to have -- well, it's
11 just -- it's really for orientation to be able to point
12 this out as associated with the dead area of above.

13 This -- in the original this is a little more
14 well defined. It's kind of blurry here. And if you
15 look -- if you count rings in here, you'll see that
16 there's a number of years that the tree continued to grow
17 in here and it stopped growing up again here. Again, it
18 doesn't show on this photograph.

19 The other thing that is notable about this is
20 the center of the trunk. What we called the pith,
21 p-i-t-h, is right here (indicating) to the left of the
22 north arrow. And it's relatively the same distance from
23 the edge of the tree in all directions. And that is
24 important because in a pine tree if the tree leans or one
25 side of it is under compression load, it will grow
26 thicker rings on that side.

1 So if the tree leans downhill to the west, we'd
2 have thicker rings out here. The edge of the tree would
3 be out here and this pith would be displaced to the east.

4 So what this indicates is that over the 83 or
5 85 years that this tree was alive, that it was growing
6 straight vertically the whole time. It didn't lean.

7 Q. All right. Moving on to 532, tell us what we're
8 looking at in Exhibit 532.

9 A. This is really just for orientation again.
10 There is the log of tree 58 on the ground with north,
11 south, east, and west superimposed on it. I put these on
12 and Photoshopped just to illustrate that.

13 I don't think there's anything I can say about
14 this that I haven't said already, but it's just another
15 view of this log.

16 Q. Now, we talked extensively earlier on about the
17 advanced testing that is available when you're doing tree
18 assessments or forensics for tree failure.

19 Did you use any of those advanced tests on
20 tree 58?

21 A. Yes. We used the Resistograph, the resistance
22 drill.

23 Q. Explain to us briefly -- or not briefly.
24 Explain to us exactly what is a Resistograph, how it
25 works, and how it assists you in assessing a tree.

26 A. It contains a needle that's 500 millimeters

1 long; half a millimeter. About a -- the meter is a
2 little over a yard. So this is 20 inches and some
3 distance.

4 This needle is flattened at the end into a
5 little spade bit three millimeters wide. It rotates at
6 about 8 to 10,000 rpm. And a second motor drives it
7 forward into the tree. Every time it encounters more
8 resistance -- and that could be from wood that is formed
9 in the year each year or less resistance from wood that
10 is formed in the spring of each year or it encounters a
11 knot or it encounters decay or hollow, a complete hollow,
12 or earlier stage decay, decay that hadn't -- is consuming
13 portions of the wood where there may be fingers of decay
14 but there isn't extensive decay in a particular area.

15 We can interpret what we -- we can infer what we
16 think are those conditions from what this trace looks
17 like. It's sent it back by Bluetooth to a computer and
18 to a Bluetooth-connected printer and creates a graph.

19 Q. So you performed the resistance testing on
20 three 58?

21 A. In four locations.

22 Q. How did you select those four locations?

23 A. If you go back to Exhibit 531, this white --
24 this is a white irrigation flag that is stuck in a hole
25 that they created. This little wire is about the same
26 diameter as the hole it's created. We drilled across

1 from one side to the other just about a foot above
2 because I wanted to get a sense of what we might find
3 going all the way across the tree just above ground
4 level.

5 We took a second profile. And you can see the
6 flag at the top of this root again about a foot up. We
7 took a second profile straight down through this dead
8 area where we knew we could see this degraded material.

9 We took a third one through one of these fingers
10 of live wood, this (indicating) wound wood. And that is
11 in a flat area to the right of the north arrow. This
12 would be on the north/northwest side of the tree. And
13 those were the fingers that were visible in Exhibit 528.
14 Specifically, that's the left finger, the smaller one
15 that you see in 528 on this side.

16 Going back to 531, the flag doesn't show it in
17 this photograph, but the profile was taken straight down
18 in this (indicating) direction to the right of the tip of
19 the non-comparable.

20 A fourth profile -- the reason we chose that
21 third profile in that location was that I wanted to
22 understand what that looked like as it passed through the
23 wound wood into the original tissues. If there were
24 anomalies, that might inform us about the tree.

25 The fourth one we took shows in the far upper
26 left -- and that's about three or four feet up, I

1 think -- and goes straight across the trunk again. And
2 that was just to understand if there was any defect that
3 might show up in that area.

4 If this trunk had been standing upright, we
5 probably would have taken and collected other profiles on
6 it, but it was heavy, it was hard to move, it was
7 delicate.

8 Cal Fire was very careful in moving it. Every
9 flake of bark was still on it. I don't know how they got
10 it in here. And I was afraid to brush up against it.

11 So we collected those four.

12 Q. All right. So you collected data from four
13 sites on the stump of tree 58?

14 A. Right.

15 Q. All right. Moving on to Exhibit 533, it looks
16 like some sort of graph.

17 A. So 533 is the graph from that first profile.
18 And they're labeled from the right -- left to right "358
19 profile one." And then it spells it out over here
20 (indicating). The date of this was December 19th, 2018,
21 east side at one foot. And that was where you saw the
22 flag in the previous exhibit.

23 Each one of these points is an annual ring as
24 early wood in the spring that is softer and late wood in
25 the fall and some of that is harder.

26 And then it gets to the middle of tree. And we

1 may not have gone right through the middle. It's a
2 little hard to distinguish what is going on here. I
3 don't think we hit it in the middle. We may have
4 wandered off a little bit. And then this is where we
5 came out the other side, but this is a profile of sound
6 wood.

7 Q. What do you mean "sound wood"?

8 A. Wood that doesn't have decay, wood that is --
9 although it was burned on the outside, it was not decayed
10 anywhere. What was there was an attached undecayed
11 sound, what you'd like to see on a trunk.

12 Now, there may have been some wood missing on
13 the east side, but we don't know. In fact, even the
14 estimate of our measurement of the trunk diameter of this
15 tree is an estimate because some amount of it has burned
16 on the east side. And we don't know how much.

17 Q. Okay. Exhibit 534.

18 A. Exhibit 534 is taken down through that root.
19 And there is what I interpret as some early stage decay
20 in this orange where suddenly you start to have these
21 wider gaps and you're getting some anomalous drops in
22 this graph. And then I interpret this (indicating) as a
23 more advanced decay in that area right up to 225
24 millimeters.

25 Q. So what does that mean?

26 A. Well, it means there was decay in that one area,

1 and yet we didn't find decay elsewhere. So it may not be
2 a significant decay.

3 Q. Okay.

4 A. And that was -- that was taken at the yellow
5 arrow about a foot -- about a foot above where you can
6 see that white flag up at the far left of the photograph.

7 Q. Exhibit 535.

8 A. Exhibit 535 is just a little short one. And
9 that comes through that finger of wood that we looked at
10 a minute ago on the northwest or north/northwest side of
11 the tree.

12 I'm not a trained dendrochronologist.

13 Dendrochronologists are specialists who can look at tree
14 rings. They can look at cores that are extracted from
15 trees. They can look at cross-sections of trees. They
16 can interpret when rings are -- there's such things as
17 false rings that occur if there are two growth events in
18 one year. They are missing rings sometimes if a tree
19 doesn't grow on one side of the tree for some reason for
20 one year.

21 Dendrochronologists are good at interpreting
22 those kinds of data from those rings. I'm not a trained
23 dendrochronologist, but it appears to me that this
24 event -- this little dip right here and this one here
25 correspond to the 2001 and 2008 fires. Now, the fire
26 burned through this area, but it burned to either side.

1 And the tree responds with extra growth in that area
2 where it is still alive. And so you may get more early
3 wood that is softer and you get these dips.

4 So I suspect these are evidence of those two
5 earlier fires. And that's really a matter of interest
6 rather than anything else. It was something that -- it
7 doesn't help me predict what is going to happen. It
8 doesn't help me be informed about whether this should
9 have been predicted. But what it does do is gives us
10 some more context to evidence about what happened in the
11 past on this tree.

12 Q. And again, this wood is still sound?

13 A. Yes.

14 Q. Even though it's dead and this is taken through
15 wound wood?

16 A. Well, this is live. Wound wood is live wood.
17 We were going through this finger of live wood that you
18 saw in Exhibit 527, this finger here (indicating) or the
19 next exhibit right here. So this was live. And so far
20 as I can tell this was never dead. The stuff on this
21 side was.

22 Now, it's possible that there was some -- that
23 this has grown up over dead tissue, but I don't think so.
24 And in any case, it looks to me like those are likely the
25 earlier fire events.

26 Q. And finally, 536.

1 A. Exhibit 536 went across the entire trunk just
2 as -- this is profile four -- just as profile one did in
3 that was three or four feet up on the trunk. And again,
4 this one looked to me to be sound from one side to the
5 other.

6 Q. Did you also run the Resistograph on tree 39?

7 A. I did.

8 Q. And we're not going to go through those charts
9 but based upon everything that you form in making a
10 conclusion about the condition of tree 39 prior to the
11 Camp B Fire.

12 A. Yes. I was a little surprised. From the
13 outside of tree 39 -- and that was, I believe,
14 Exhibits 522 and 523 -- there was that very narrow
15 external sign of dead tissue. And we drilled across the
16 trunk and found that to be narrow internally, not to go
17 very deep. So this is really a superficial defect. It
18 may not have contributed to the failure of this tree.

19 Q. Based upon everything what was your conclusion
20 as to tree 39?

21 A. You mean -- well, it had this defect that may
22 have been visible from the road in the intersection of
23 Concow and Rim Road. It would not likely have been
24 covered with bark. But the tree inspector may not have
25 had occasion to go up on the road. And it wouldn't have
26 been invisible from the -- from inside the utility right

1 away.

2 The failure may not have been associated with
3 this defect at all because I don't think it was as --
4 when we drilled through it, it wasn't as serious as it
5 looked like it might be from the outside. Often when
6 there's a small defect like that on the outside, we see
7 that it expands on the interior to create a significant
8 area of unsound compromised wood.

9 Q. What was your conclusion with regard to tree 58?

10 A. Tree 58 was clearly dead on the south, east, and
11 north sides, but I can't say that would have been
12 visible -- I can't say with any certainty that would have
13 been visible from the utility right of way. It's likely
14 there would have been some missing bark. Three quarters
15 of the tree was dead. But I don't know where that
16 missing bark -- I can't say that with certainty. Most
17 likely if there was missing bark, it would have been on
18 the east side visible from Concow Road again depending on
19 intervening foliage undergrowth.

20 Had a tree inspector had occasion to look at
21 that tree more closely tree 58, had they had a mallet
22 with them, had they tapped it with a mallet, that
23 certainly would have revealed the wood on three sides was
24 dead and the bark was detached. And that's in the event
25 that the bark was still there. But they would have to
26 have reason to walk up to that tree from the center of

1 the right of way and look at it as opposed to the other
2 trees they're looking at that day.

3 Having done that, then they could call ideally
4 for an advanced inspection. I don't think that is in the
5 protocol for continuing now, but ideally an advanced
6 inspection could have been called for. I don't know that
7 an advanced inspection would have revealed more than
8 mostly sound dead wood. Still that's a tree that is dead
9 on three sides near a conductor. And I can't say more
10 than that about it, I don't think.

11 Q. Do you have an opinion as to why tree 58 failed
12 on the morning of November 8th?

13 A. One of the disappointments in what we did
14 because we put a lot of time in collecting all of that
15 information that's in the charts and the height diameter
16 ratio and live crown ratio and whether there were defects
17 that could quickly be detected, that might reasonably be
18 expected as contributors under normally expected serious
19 storm conditions. And that's one of the things we look
20 at. Is this defect likely to contribute to a failure
21 under the kind of conditions we can expect one storm
22 every five or eight years? Pretty extreme storm.

23 There was one indicator -- I think it was height
24 diameter -- on trees that failed that actually did
25 coincide. Nothing else coincided. None of the other
26 things that should have been predictors predicted.

1 And that is either because this was such a small
2 sample -- this is only 83 trees. If we looked at a
3 thousand, maybe we'd see a pattern. Or it may be that
4 the wind was -- the wind event was just so extreme that
5 it overwhelmed these indicators. I don't know. But we
6 weren't able to draw any conclusions about what we
7 normally would consider predictors or indicators having
8 potential to fail.

9 So I can't really say why that tree failed
10 because -- now, it did have a high height diameter ratio.
11 It did have a low -- relatively low live crown ratio.
12 Well, those are indicators. And it was dead on three
13 sides, but we don't know if that dead condition on three
14 sides was highly visible, a little bit visible, or not
15 visible at all.

16 It is likely that the height diameter ratio and
17 the live crown ratio contributed to it, but some of the
18 other trees -- there is another one in there that has
19 even worse ratios and it didn't fail. So these trees
20 weren't playing by the rules. And that may be because of
21 exception ally high winds or it may be because of our
22 small sample size.

23 MR. NOEL: I have no further questions.

24 Is there any questions from the jurors?

25 [Conferring off the record.]

26 BY MR. NOEL:

1 Q. Okay. There are some questions from the jurors
2 themselves that I will -- some of them I will ask you.

3 The first one is "Did you examine and consult on
4 the Camp A Fire?"

5 And I can answer that. No. He doesn't even
6 know about Camp A Fire. So we're not going to go into
7 that.

8 The second one though is "Would you say that
9 these two events --"

10 Are you talking about Camp A and Camp B? All
11 right. So we'll skip that.

12 "Do you know when tree 58 was removed from the
13 area?"

14 A. No, I don't. It was between our last site visit
15 on, I think, November 17th and in December.

16 Q. 19th?

17 A. Yeah. It was between November 17th and
18 December 19th, but I don't know the date. I think it had
19 been at least a couple of weeks after the 19th. So it
20 was probably late November, but I don't have knowledge of
21 that.

22 Q. Let's see. It says "To what would you assign
23 the failure of tree 39?"

24 I'm guessing the question is what do you think
25 caused the failure of 39?

26 A. Well, I'm going to use the same answer I did

1 for 58 and that is I can't know because there was so many
2 trees that showed indicators, that showed they should
3 fail and didn't and so many that did fail that maybe
4 should have stood, that --

5 Sometimes there are clear indicators of why a
6 tree failed. You can find decayed roots. You can find a
7 decayed section of the trunk. You can find what is
8 called bark inclusion or codominant stems and so half the
9 tree peels off.

10 But under extreme events any tree can fail even
11 if it's not got any predisposing factors. And these
12 trees did have some predisposing factors. But other
13 trees that didn't seem to have predisposing factors
14 failed. So I don't have an answer with any precision why
15 either of these trees failed. A lot of wind and extreme
16 conditions.

17 Q. Then we'll skip one question that ties right
18 into the next question which is "Does heavy winds of 30
19 to 50 miles per hour have any significant causes on these
20 wounded areas potentially creating these failures?"

21 A. It can. In a modest wind a 30 mile-an-hour wind
22 is fairly modest. A 50 mile-an-hour wind is pretty
23 common. I would -- I don't know what the winds were. I
24 have not seen the wind data for that day, but I would
25 expect it was above 50 miles an hour. The -- up to 30 or
26 40, even 50 you'd expect trees to behave more in line

1 with their -- their failure predictors, their defects.

2 I don't know. Can you read that back again just
3 to see --

4 Q. Do heavy winds 30 to 50 miles an hour have any
5 significance?

6 A. They do. One other thing that can happen with
7 heavy winds is they can fracture a tree, but it may not
8 fail and it may fail six months later in a ten
9 mile-an-hour wind. I don't think that is relevant in
10 this case.

11 But, yes, lighter winds can certainly have an
12 affect. And if there is a really significant defect,
13 they might topple a tree. Tree 30 I noted was heavily
14 decayed and fell down hill. I would expect tree 30 to
15 fall down in a relatively light wind.

16 Q. Did you discover any evidence of possible
17 lightening strikes on tree 39 or tree 58 in your
18 investigation?

19 A. No, we didn't. And the lightening strike might
20 be where there's a whole strip of necrotic tissue from
21 the top down. It's where the current follows the trunk
22 from top to bottom. But we didn't see any evidence of
23 that on the live portions of the crown on either tree.

24 MR. NOEL: Anything further from any of the
25 jurors?

26 That's all we have for you, Mr. McNeil. We

1 appreciate you coming down.

2 THE WITNESS: All right.

3 MR. NOEL: Now, the foreperson is going to have
4 an admonishment for you.

5 THE WITNESS: I will keep my mouth shut.

6 MR. NOEL: And hopefully, I have all the
7 exhibits.

8 THE WITNESS: Yeah. I didn't take any.

9 MR. NOEL: We have had someone try and escape
10 with the exhibits. So we had to chase him down.

11 THE WITNESS: Well, because I was inadvertently
12 reshuffling those at the end, I think that's a good idea.

13 GRAND JURY FOREPERSON: Mr. McNeil, I'd like to
14 remind you that you are admonished not to discuss or
15 disclose at any time outside of this jury room the
16 questions that have been asked of you or your answers
17 until authorized by this grand jury or the Court. A
18 violation of these instructions on your part may be the
19 basis for a charge against you of contempt of court.
20 This does not preclude you from discussing your legal
21 rights your own attorney.

22 Mr. McNeil, what I have just said is a warning
23 not to discuss this case with anyone except the Court,
24 your lawyer, or the district attorney.

25 Do you have any questions?

26 THE WITNESS: No, I don't. I saw the picture of

1 all those deputies with shotguns at the district
2 attorney's office. They looked worse than Bonnie and
3 Clyde so . . .

4 GRAND JURY FOREPERSON: Okay. Thank you for
5 your time today. We appreciate it.

6 THE WITNESS: Thank you.

COURT REPORTER'S CERTIFICATE

This is to certify that I, Lisa McDermid Welch, a Certified Shorthand Reporter of the State of California was present at the time and place the foregoing grand jury proceedings were had and taken in the within matter; and that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings; and afterwards caused my said shorthand writing to be transcribed into typewriting; and the foregoing pages, beginning at the top of Page 1 to and including Page 74 hereof, constitute a full, true, accurate, and complete record of the proceedings.

DATED: This 6th day of June, 2022.

Lisa McDermid Welch

12 [DISCUSSION OMITTED.]

13
14 MR. NOEL: Are we ready to go with witnesses?
15 Peter Martin.

16 [Witness enters the courtroom.]

17 GRAND JURY FOREPERSON: Mr. Martin, before you
18 are seated, would you please raise your right hand to be
19 sworn.

20 Mr. Martin, do you solemnly swear that the
21 evidence you shall give in this matter pending before the
22 grand jury shall be the truth, the whole truth, and
23 nothing but the truth so help you God?

24 THE WITNESS: Yes.

25 GRAND JURY FOREPERSON: Thank you. Have a seat,
26 please.

1 MR. NOEL: Before we start, the earlier one.

2 GRAND JURY FOREPERSON: There were two of them.

3 MR. NOEL: Yep.

4 Just for the record, the court clerk certified
5 some documents for us earlier. I've lodged those with
6 the foreperson. And the Sergeant at Arms just brought us
7 back in the -- I'm guessing the court clerk Ms. Dionne
8 realized that there was a wrong date on the
9 certification. It was dated September 9th instead of
10 September 10th. So she brought us corrected copies.

11 You swear the witness?

12 GRAND JURY FOREPERSON: Yes, I did.

13 **EXAMINATION**

14 BY MR. NOEL:

15 Q. Mr. Martin, can you state for the record your
16 full name spelling your last name.

17 A. Lewis Peter Martin, M-a-r-t-i-n.

18 Q. By whom are you employed, Mr. Martin?

19 A. PG&E.

20 Q. In what capacity?

21 A. Senior materials -- senior advising materials
22 engineer.

23 Q. What is a senior advising materials engineer?

24 A. My background is in materials engineering and my
25 title is senior advising, a level between senior and
26 principal engineer.

1 Q. What's the difference between the two?

2 A. Seniority.

3 Q. Okay. What training or education or experience
4 do you have that qualifies you as a materials engineer?

5 A. I have a bachelor's and a master's and a Ph.D.
6 in material science and engineering.

7 Q. Walk us through that.

8 A. So four years of undergrad, approximately four
9 years of graduate school working on the master's, and
10 then another three years to complete the Ph.D. It
11 involved a lot of course work. The master's and the
12 Ph.D. both involved writing dissertations.

13 Q. What exactly is -- does it mean to be a
14 materials engineer?

15 A. So it means that you have experience and
16 background studying and correlating how materials behave
17 based on what they're made from and how they're made, all
18 classes of materials including metals.

19 Q. That was going to be my next question is what
20 kind of materials are we talking about here?

21 A. My background is pretty general. I have quite a
22 bit of experience in ceramics and in polymers and in
23 metals. Metals are typically studied quite extensively
24 in the curriculum because they're somewhat of a model
25 system. But I've worked in -- across a bunch of
26 different fields.

1 Q. When did you get your Ph.D. in materials
2 engineering?

3 A. 1996.

4 Q. How long have you been with PG&E?

5 A. I've been with PG&E since June of 2016.

6 Q. What did you do before you came to work for
7 PG&E?

8 A. I was a product developer engineer at a company
9 called Pentair in Menlo Park where we developed heating
10 cables to prevent pipes from freezing.

11 Q. How long did you do that?

12 A. I did that for eight years.

13 Q. How about before that?

14 A. Before that I was an engineer at Lawrence
15 Livermore National Lab.

16 Q. What is Lawrence Livermore?

17 A. Lawrence Livermore is a national laboratory that
18 is -- that is owned by the Department of Energy that is
19 largely dedicated to nuclear weapons work, but I worked
20 predominantly on automotive gas emissions sensors.

21 Q. How long were you at Lawrence Livermore?

22 A. Nine years.

23 Q. Does that cover your period from your Ph.D.
24 until you get to PG&E?

25 A. No. There was one other little step. For three
26 years I worked for a small business in Washington D.C.

1 Or excuse me. Just outside Washington D.C.

2 Q. Doing engineering work?

3 A. Doing materials engineer work, yes.

4 Q. So what exactly do you do for PG&E as a senior
5 advising materials engineer?

6 A. I spend a significant fraction of my time
7 performing failure analyses and condition assessments on
8 assets that have been returned from the field. So if
9 things break, they send them to us. And somebody like me
10 or me will look at them and inspect it and do an analysis
11 and figure out how it broke and why.

12 Sometimes it's not things that broke. Sometimes
13 it's things that have been -- we call it
14 opportunistically taken out of the field. For instance,
15 if they've gone up on a pole to change something, they
16 might grab everything that is on the pole and send it to
17 us. And we will inspect it all and document the
18 condition that it's in.

19 Q. Do you have an office at PG&E?

20 A. I have a cubicle.

21 Q. A cubicle. Where is that cubicle?

22 A. It's in San Ramon, 3400 Crow Canyon Road.

23 Q. Do you have a special building that you're part
24 of or a special division that you're part of?

25 A. Division. The organization that I'm part of is
26 called Applied Technology Services.

1 Q. ATS?

2 A. ATS. So that's about 120 people or so. Within
3 ATS there's a group called materials and bathymetry that
4 is currently eight people or so. Eight or nine people.
5 And I'm in that group.

6 Q. All right. The group was called materials and
7 what?

8 A. Bathymetry. It's a weird mixture of functional
9 areas. And I'm not sure exactly how that came about.
10 But the bathymetric guys are the guys that go out and
11 drive boats around on the lakes and rivers and do
12 underwater sonar surveys to make sure that where our
13 assets cross a body of water they haven't been exposed by
14 the currents and things like that.

15 Q. I'm sure that madam court reporter has
16 bathymetry in her glossary, but can you spell it for me
17 for my notes.

18 A. Sure. B-a-t-h-y-m-e-t-r-y.

19 Q. So tell us about your job at ATS and what you do
20 daily.

21 A. I serve to a certain extent as a point of
22 contact for some of these assets that are being returned
23 in from the field. So I do a bit of logistical work to
24 track inventory of what we have on site. That's not very
25 technical, but it's important. It's something like but
26 less rigid than maintaining a chain of custody. Right?

1 But most of the technical work that I do is failure
2 analysis like I've already described.

3 Q. What is failure analysis?

4 A. So failure analysis is when you take a component
5 that has failed and you basically do something that is a
6 little bit like forensics -- it's part of forensics;
7 right? -- to try to determine what happened. Why did it
8 break? Was there something wrong with it? Was it just
9 old? Did somebody crash into it or did a tree fall on
10 it? What happened?

11 Q. Do you have to have failure before you do a
12 failure analysis?

13 A. Well, by definition you have to have a failure,
14 but we can also do and do condition assessment.

15 Q. Okay. What is the difference between condition
16 assessment and failure analysis?

17 A. So in a failure analysis you are trying to
18 determine why it broke and in a condition assessment you
19 are trying to figure out what condition it's in now. It
20 hasn't failed. They have taken it out of the field
21 either because it didn't look right or something else
22 broke and they were just grabbing everything that was on
23 the tower for a variety of reasons.

24 Sometimes it's a construction project and maybe
25 they're replacing one thing and they just grab the other
26 things. And, for example, you want to get the handle on

1 "Hey, this thing is somewhat old or very old" depending.
2 And we want to know how strong it still is and is it
3 still functioning properly.

4 Q. In the spring of 2018 were you asked to examine,
5 evaluate, and test some hanger plates that came off of a
6 transmission line?

7 A. Yes.

8 Q. All right. You should have in front of you
9 Exhibit 382. Do you see Exhibit 382 sitting there?

10 A. Yes.

11 Q. Do you recognize Exhibit 382?

12 A. Yes. This is a report that I wrote.

13 Q. Tell us about 382.

14 A. This is a report on six hanger plates that were
15 delivered to me by David Hernandez on April 13th of 2018.
16 And the request was to evaluate the quality of the
17 material and whether it was -- they were the right
18 material and if anything unusual happened to them or if
19 the observed wear was normal.

20 Q. All right. You were talking earlier about
21 basically work flow and how things come in. You talked
22 about that the field sends things in to you.

23 Is this an example of that?

24 A. Yes.

25 Q. When things like these hanger plates come in to
26 you, are you familiar with those items before you get

1 them?

2 A. Not always.

3 Q. In this case the hanger plates -- were you
4 familiar with those types of hanger plates before
5 Mr. Hernandez brought you these six for testing?

6 A. I was not.

7 Q. What do you do when you're not familiar with the
8 parts that you're asked to analyze or test?

9 A. So my first step is generally to contact one of
10 the subject matter experts, one of the field experts.
11 Actually, that would be my second step. The first thing
12 is when the person is delivering it to me, I basically
13 acquire as much information from them as I can. What is
14 this thing? How does it work? Where did it come from?

15 And then I'll contact one of the subject matter
16 experts and say "Explain it to me again." The same
17 things. What are these? How do they work? Where do
18 they come from? Do they break a lot? You know. "Tell
19 me anything you can about it."

20 Then I'll typically go to the internal
21 documentation if I can find any that is relevant. And
22 usually that pretty much is good enough. I can't think
23 of a scenario where it wasn't.

24 Q. What type of internal documentation would you go
25 to?

26 A. Work procedures, construction manual,

1 construction standards. We have -- we have documents --
2 I'm not exactly sure how to categorize them, but they say
3 what are approved components for a certain application.
4 They might not be -- you know, they would be current
5 typically, but sometimes I can find older versions that
6 will sort of backdate a little bit. It gives me a
7 general feel for what the part is and how it's used.

8 Q. Okay. So basically you get to know the parts?

9 A. Yeah.

10 Q. Going to the front page of 382 there's some
11 information on there; event date, CAP number, nearest
12 city, line and voltage, structure number.

13 A. Uh-huh.

14 Q. Is that information that you were given by David
15 Hernandez?

16 A. Yes. And it's documented in Appendix A.

17 Q. Okay. All right. And then we see
18 Mr. Hernandez's name on there. There's also the name
19 Jeff Lockwood, Reliability Specialist.

20 A. Uh-huh.

21 Q. Who is Jeff Lockwood?

22 A. Well, Jeff Lockwood is the reliability
23 specialist. And what that means is that he's -- he's a
24 person who goes to sites where something fails or where
25 there are questions and provides guidance to the field
26 crews when they need it as to whether a particular thing

1 is unusual and warrants further analysis.

2 Q. And then your signature is on the front page?

3 A. Correct.

4 Q. And who is Sireesha Mopati?

5 A. Sireesha Mopati is a peer of mine, and she
6 provided the review for this document.

7 Q. And that's her signature on there?

8 A. Uh-huh.

9 Q. All right. Let's start walking through the
10 report itself. It starts off with an executive summary?

11 A. Correct.

12 Q. Why an executive summary?

13 A. The reason that we perform or provide these
14 services to our internal clients is to get them the
15 information that they need. There's a lot of information
16 in here that is very technical and really honestly is
17 mostly meant for me in case of a situation like this.
18 But what's really important to the client is the stuff
19 that we put in the executive summary; a brief
20 encapsulation of what we did, what we found, and what are
21 our recommendations.

22 Q. So a concise summary of the findings?

23 A. Right. And bearing in mind that the field
24 crews, you know, they don't want to read all of this
25 stuff.

26 Q. And they're not engineers; right?

1 A. They just need the answer. They just need the
2 answer.

3 Q. All right. So as to recommendations, what is
4 the recommendation section underneath there? Explain
5 that to us.

6 A. So one of the reasons that we perform an
7 assessment like this is to identify whether there are any
8 reasonable follow-up actions that should be taken. And
9 if we perceive that there is within reason some follow-up
10 action, then we recommend it. And that's what the
11 recommendations are.

12 Q. Okay. Secondary findings. Can you explain to
13 us what those are.

14 A. So as you walk through an assessment, it's very
15 technical and you're doing a lot of -- a lot of
16 inspection and gathering data. And sometimes you find
17 out things that are interesting and relevant. They're
18 not directly relevant to the condition of interest
19 potentially and they're not necessarily directly relevant
20 to the recommendation, but there are things that you feel
21 are worth documenting. And so we consider those to be
22 secondary findings.

23 Q. Okay. What is ASTM?

24 A. ASTM is the American Society for Testing
25 Materials. They generate standards for various types of
26 tests and for various materials. So a thing like steel

1 might have a standard associated to it. Excuse me. Let
2 me rephrase that. A type of steel might have a certain
3 strength and a certain composition. And if they want to
4 market that steel as conforming to a certain standard,
5 then it has to meet the strength and composition
6 requirements that are laid out in that standard.

7 And the reason that that's done is to make it
8 easier for customers to understand what they're getting.
9 Rather than saying "Hey, here's a piece of steel," you
10 can market it as "Hey, here's a piece of A36." And they
11 know that that refers to standard 36 and they know what
12 you're selling them.

13 Q. All right. And then we have a list of
14 appendices and attachments?

15 A. Yes.

16 Q. We'll get to that.

17 The introductions. Specifically the first
18 paragraph of section 3.0, the introduction, where did you
19 get the information in that paragraph?

20 A. So David told me when he delivered the parts
21 that they were from the Parkway-Moraga Line and the
22 structure number and that he was delivering them to me
23 because substantial wear was observed.

24 I believe that the removal dates were either
25 reported to me at the time of delivery by David or were
26 identified later when I was asking -- when I was asking

1 him.

2 So each of these lines has three plates
3 associated with it on that structure; the Bahia-Moraga
4 and the Parkway-Moraga. He handed the six plates to me.
5 And my recollection was that he told me they were from
6 Parkway-Moraga.

7 So when I got farther into the process of trying
8 to figure out why I had six plates, I thought maybe there
9 were two plates on each phase. And so I had to do a
10 little digging. And I found, oh, I got three from
11 Parkway and three from Bahia. And somewhere in that
12 process I identified the removal dates.

13 Q. Okay.

14 A. And the CAP number was on the CTIS.

15 Q. And what is the CAP number?

16 A. CAP stands for Corrective Action Program. And
17 that would -- a number -- a CAP item is initiated for
18 every type of repair and incident that we have and each
19 of those items gets a number associated with it. And so
20 you can think of this as a tracking number for
21 documentation that somebody went out to that structure
22 and did something.

23 Q. And then there's a Footnote 1 down on the
24 bottom.

25 A. So as part of the investigation probably
26 occurring when I was trying to figure out what the span

1 lengths were on either side of this structure because the
2 span length affects how heavy the conductor is and so
3 that affects the load on the suspension plate.

4 I identified that, you know, this line had
5 changed its name and the structure number at some point
6 in the past.

7 Q. Okay. And where did you get the information
8 identifying this as 48/260 of the Vaca-Dixon-Moraga Line?

9 A. Drawing 22857, Rev. 20.

10 Q. Okay. And what does that refer to?

11 A. That is a PG&E technical drawing that shows the
12 line. And it's probably -- probably includes a table of
13 the different span lengths. So whenever I document that
14 a line has changed names, I like to include that
15 documentation in the report just for completeness.

16 Q. Now, going through the rest of the report, walk
17 us through -- and then we'll go back and go through some
18 of this stuff more in-depth. Walk us through how you
19 tested and analyzed these six plates and why.

20 A. So this is a fairly standard failure analysis
21 procedure. It can be used also for condition assessment,
22 which is what this really is. And the steps are laid out
23 in Section 4.0, visual inspection, metallography, optical
24 and scanning electron microscopy, mechanical testing, and
25 chemistry. So those are the steps.

26 Q. So what is metallography?

1 A. The metallography is where we cut out a little
2 piece of the metal and we mount it in something that
3 looks like a small hockey puck. And we polish the
4 surface until it's so smooth that it shines like a
5 mirror. And then we'll etch it with a little bit of
6 acid. And that reveals the structure at sort of a
7 microscopic level of the metal. And the structure is
8 very characteristic of the type of metal and how it was
9 manufactured to a lesser condition of the metal.

10 Q. Okay.

11 A. The most important thing that we do is visual
12 inspection. I mean, for all the technical training that
13 we have, you know, our main tools are often a camera and
14 a ruler. So we start with a visual inspection and just
15 start out with the simplest thing; identifying what these
16 parts are. How wide are they? How thick are they? How
17 many holes do they have? How big are the holes?

18 And then we document that the one hole that was
19 elongated where the hooks were actually -- where the
20 insulators were actually hung from, document how bad is
21 that elongated piece and how much material was left
22 below. So all of that was part of the visual inspection.

23 Q. Okay.

24 A. Then we moved on to the metallography which
25 showed that the structure of the material at the
26 microscopic level was proper for the type of material

1 that we thought that these plates should be made from
2 which would be something like an A7 steel or A36 steel.
3 A7 is the -- it refers to the ASTM standard that was in
4 place for this type of steel at the time we think these
5 plates were manufactured and installed. And A36 is --
6 which is in the '40s. And A36 is the current equivalent
7 standard.

8 Q. Has there been any changes?

9 A. The standard was tightened up a little bit.
10 There have been changes in all the standards over this
11 period, some small little things that clarify
12 inconsistencies, maybe how a manufacturer has to test the
13 materials to establish that he meets the requirements.

14 For what's relevant here there was some really
15 subtle changes, very minor in the strength of the
16 material. Or less minor but still not too significant in
17 the composition of the material. I would have to look at
18 the --

19 Q. All right. So after you do the metallography,
20 then you're doing --

21 A. So then we really got into the -- it's another
22 aspect of the metallography. But we took those same sort
23 of cross-sections that were polished and we did this
24 cross-section right at the area where the part was worn.

25 So that would be -- if you see where it says
26 "plates five and six" in that lower left-hand corner, you

1 can see that hole that used to be round kind of looks
2 like a keyhole now. That part where it looks like a
3 keyhole below that or kind of toward the corner, we
4 sectioned that out and looked at what was going on right
5 at the area where it was wearing at a microscopic level.

6 Q. And for the record, up on the big board we have
7 section one which we'll be getting to in a minute from
8 the report displayed.

9 All right. Then it says you did mechanical
10 testing, Rockwell B and Tensile Testing.

11 A. Correct.

12 Q. Tell us about those.

13 A. So for the mechanical testing we contracted an
14 external lab in Hayward called Anamet to cut pieces out
15 from the area between the holes from some of these plates
16 and basically put them in a machine and pull on them
17 until they break to see how strong the material is.
18 That's what tensile testing is.

19 Q. What about Rockwell B?

20 A. Rockwell B is a hardness test. There really
21 isn't a standard value for that. But if you do enough
22 work around steel, you start to get a feel for the range
23 where steel would be. So it just was -- in a sense I
24 more did it for completeness just to have it. I don't
25 rely particularly on it for any of the conclusions in the
26 report.

1 Q. Okay. And finally, chemistry, OES, and LECO.

2 A. Right.

3 Q. What are those tests?

4 A. So optical emission spectrometry is a technique
5 where essentially they -- it's a little bit simplified,
6 but they essentially -- they drive an electric spark to
7 the surface of the material. It creates a little plasma
8 of the material itself. And they basically take a light
9 from that plasma and separate it into its component
10 colors for want of a better word. And those colors will
11 give a characteristic composition so you can tell what
12 all the relevant chemicals are in the part and how much
13 there are by doing that except for carbon and sulfur. It
14 doesn't work for carbon and sulfur. So we need this
15 other technique that is called LECO.

16 Q. And what is LECO?

17 A. LECO is a combustion technique where they
18 actually -- it's a different technique, and they do it in
19 a different way to get comparable numbers for carbon and
20 sulfate. So that's where all these numbers came from.
21 These are weight percents.

22 So, you know, they were telling you that plate
23 two had 22 weight percent of carbon, which is typical for
24 plain carbon steel.

25 Q. Let's skip ahead to some of the pictures that we
26 have up on the board in front of us from page 9 of your

1 report, Figure 1. Tell us what we're looking at here.

2 A. Those are the six plates that I received from
3 David Hernandez just laid out to display that's their
4 as-received condition.

5 Q. And feel free -- you can get up and use the
6 board -- this is all touch screen -- as much as you want.

7 So in each one of these there's three rows of
8 plates. Each one is two separate plates. Correct?

9 A. Correct.

10 Q. Is there some reason they're stacked the way
11 they are or paired up the way they are?

12 A. Not really. Again, when David handed them to
13 me, I either misspoke or I misunderstood. I assumed they
14 were all from the same line. They were commingled. So I
15 just -- again, this is really just as-received condition
16 documentation just to show that this is what I received
17 at the lab. We haven't even started doing anything yet
18 with this.

19 Q. All right. And is this keyholing, this wear
20 pattern on the bottom of each hole, is that what was
21 concerning?

22 A. Yes.

23 Q. All right. On to Figure 2. Explain to us what
24 we're looking at here.

25 A. Again, I like to be complete with the report.
26 So I find that it's often valuable to document where the

1 components came from. So I've shown what we received.
2 Now we're documenting where they came from.

3 So the top is a map that shows the location of
4 the tower where the components were taken, which I
5 believe is 20/115. And then the tower on the other side
6 of the highway, which was a relatively long span. I
7 think a little over 2,000 feet. And it's showing the
8 location as it's crossing Highway 24 kind of near the
9 Caldecott Tunnel.

10 The bottom image is not showing very well, but
11 it actually shows the structure itself. This is taken
12 from a flyover, a high definition video that was taken
13 from a flyover that was available in the Geographic
14 Information System that we have. We call it GIS.

15 Q. Okay. So there's a database that has high
16 resolution video of transmission towers?

17 A. There is. It's a little bit hit and miss, but
18 you can often find pictures of the structure and/or
19 flyover video.

20 Q. Okay. And high resolution pictures of the
21 structure?

22 A. They say they're high resolution. I don't know
23 how high res they actually are.

24 Q. All right. Now, you mentioned it earlier and
25 you kind of -- you were talking about both the map and
26 the picture of the span. And the length of that span is

1 germane to your analysis?

2 A. That's correct.

3 Q. How so?

4 A. The rate of wear is dependent upon the load
5 that's on the contact point. And the load basically
6 is -- it's related to how much stuff the part is holding
7 up. So if you have a very long span and it's 2,000 feet
8 on one side and about a thousand feet on the other,
9 that's more stuff that it's holding up than if its spans
10 were very short.

11 So the weight is heavier. So the force at the
12 contact point where the wear is occurring is higher so
13 you get more wear. That's why it's relevant.

14 Q. All right.

15 GRAND JURY FOREPERSON: Mr. Noel, we have a
16 juror that needs to have five minutes.

17 MR. NOEL: Absolutely. Let's take a quick
18 break.

19 GRAND JURY FOREPERSON: Thank you.

20 MR. NOEL: Give him the separation admonition
21 real quick.

22 GRAND JURY FOREPERSON: Yes.

23 Mr. Martin, you are admonished not to discuss or
24 disclose at any time outside of this jury room the
25 questions that have been asked of you or your answers
26 until authorized by the grand jury or the Court. A

1 violation of these instructions on your part may be the
2 basis for a charge against you of contempt of court.
3 This does not preclude you from discussing your legal
4 rights with your own attorney.

5 Mr. Martin, what I have just said is a warning
6 not to discuss this case with anyone except the Court,
7 your lawyer, or the district attorney.

8 Do you have any questions?

9 THE WITNESS: No.

10 GRAND JURY FOREPERSON: Okay. Thank you.

11 THE WITNESS: Thank you.

12 MR. NOEL: Let's take a quick break with the
13 judge.

14
15 [Recess taken at 10:05 a.m.]

16
17 [PROCEEDINGS OMITTED.]

18
19 [Recess taken from
20 10:07 until 10:10 a.m.]

21
22 GRAND JURY FOREPERSON: All members of the grand
23 jury have returned and we are ready to proceed.

24 **EXAMINATION CONTINUED**

25 BY MR. NOEL:

26 Q. All right. One final thing real quick here. We

1 are looking at Table 1, which is page 11 of your report,
2 background data harvested from ET-GIS. What is ET-GIS?

3 A. So I referenced earlier that we have a
4 Geographical Information System. ET is indicating the
5 electrical transmission portion of that system. It's
6 kind of like a web-based, map-based system where you can
7 go in and find a location or a transmission line or a
8 structure, whatever you're looking for, and try to pull
9 as much information on that location or structure as you
10 can.

11 And just for completeness, I tried to tabulate
12 all the information that I can find just so if it ever
13 came to something in the future, somebody would know sort
14 of what I was talking about in terms of the location, the
15 assets.

16 Potentially -- although I don't think any of
17 this was super relevant to what we're talking about but
18 potentially what information I was working with when I
19 discussed environmental affects or, you know, stuff like
20 that.

21 Q. Okay. Down towards the bottom there is a
22 category section entitled "Insulator."

23 A. Yes.

24 Q. Do you see that?

25 A. Yes.

26 Q. Where did you get the information on the

1 insulators?

2 A. From ET-GIS.

3 Q. Okay. It says the insulator year installed
4 1946.

5 A. That's correct.

6 Q. That's what the GIS states?

7 A. Yeah.

8 Q. All right. So next up Figure 3, photographs.
9 This is page 12 in the report. Photographs of the holes.

10 A. Yes.

11 Q. Tell us how you analyzed the holes and what
12 results you got?

13 A. So just to be clear, Figure 3 is showing front
14 and back surfaces of plates that were somewhat
15 arbitrarily labeled 1, 2, and 3. As I said before, the
16 plates were commingled so I didn't really know which one
17 came from which phase of which line. But these three are
18 the more corroded ones, the more rusty-looking ones.

19 So from the visual inspection I'm documenting
20 that these things look like they have kind of keyholes
21 instead of a round hole where the insulator string should
22 hook from.

23 Can I ask a question to you?

24 Q. Sure.

25 A. Is it clear to everybody what this plate is?
26 This plate is at the tip of an arm on a tower, and a

1 string of insulators hang from these holes, one insulator
2 string from each plate. And at the bottom of that
3 insulator string is the conductor that's carrying all the
4 electricity. So this is the piece that holds the
5 conductor essentially in the air. So that's why we care
6 when they're worn.

7 Q. Yep.

8 A. So the first thing really with this was to
9 basically do what we would call a dimensional analysis.
10 So measuring the size of the hole maybe across the
11 direction, perpendicular to the direction where the wear
12 is. And that tells you kind of the original size of the
13 hole. And then you measure it in a direction where it
14 was worn and it tells you how far it wore.

15 So if it used to be three-quarters of an inch in
16 diameter and now it's .9 inches in diameter or at least
17 along that axis, you know you've gone fifty-thousandths
18 of an inch. One hundred fifty-thousandths of an inch.
19 Excuse me.

20 And I measured how thick those little ligaments
21 of material were. We call this area here [indicating] a
22 ligament. And now that's the amount of metal that is
23 holding up the insulator. So that was the first step.
24 And that's basically the information we got from -- I
25 don't know. That would be associated with this picture.

26 Q. Okay.

1 A. Do you want to move on?

2 Q. Yep. Go ahead.

3 A. So the next picture four is the same information
4 for the other three plates. You can see they're not as
5 rusty. I speculate in the report -- I think it's
6 reasonable speculation -- that the way that these plates
7 were probably grouped together like this, that the three
8 more rusty ones were probably on the downwind side. The
9 wind tends to come from the west. And the line was
10 running north/south with the Bahia-Moraga Line on the one
11 side and the Parkway-Moraga Line on the other side. So
12 one side and the other side would be east and west.

13 And you could imagine that when it gets wet from
14 rain or whatever, the upwind side dries off first. So
15 maybe, maybe the downwind side was more rusty, but that
16 was all a little bit of speculation. But this figure is
17 basically showing the same thing for the other plates.

18 So if we move on, this is showing -- Figure 4 is
19 mislabeled. It should be Figure 5 probably. Yeah, it
20 should be Figure 5.

21 So the figure on page 14 is just showing a
22 close-up view of one of the wear surfaces. Actually,
23 three of the wear surface plates 2, 4, and 6. And what
24 you're seeing is that the material -- the way that it's
25 worn it almost looks like the metal has squeezed out.
26 Does that make sense?

1 The hook would ride on this surface here
2 (indicating.) The hook was holding up the insulators.
3 And you can see this metal almost looks like it's
4 squeezed out; right? Which is characteristic of a
5 certain type of wear which is called adhesive wear which
6 is where the metal kind of has an upload on it and it
7 sort of sticks together a little bit. And then when the
8 part moves, it kind of drags a little bit of material
9 with it. And then if it moves back, it drags some
10 material in the other direction.

11 It's not really very important to anything, but
12 for completeness we like to identify what was the wear in
13 it. So it's adhesive wear.

14 Q. So is adhesive wear common in these types of
15 setups?

16 A. It would be common because the materials are
17 similar. If you had one material that was very much
18 harder or very much softer than the other, you might
19 get -- you might get a different type of wear. Or if
20 there were grit in there like sand or coercive products,
21 you might get an abrasive wear which is kind of what it
22 sounds like. It's basically just abrading the material.
23 So that's what that figure is showing.

24 Figure 6 shows basically we cut off those wear
25 surfaces from plates 2, 4, and 6 and now we're just
26 looking down on the wear surfaces just to show that

1 there's coercion there meaning that they're old. It took
2 a long time to wear this far.

3 They're corroding. They are wearing slowly
4 enough that corrosion forms on the surface. And you can
5 see the deformation, for example, in the bottom image
6 number four. You can see that it's bulged out right in
7 the middle. That's showing that squeezing out of metal
8 that I was showing you again supporting what we have.

9 Q. Are you talking about right here (indicating)?

10 A. Right here (indicating). For example, see how
11 it's bulged out. This is cut from a plate so it should
12 be flat. So right here (indicating). So that's again
13 just showing that we have adhesive wear.

14 Q. And these are the ligaments --

15 A. Yeah.

16 Q. -- we talked about earlier?

17 A. Yeah.

18 Q. From two, four, and six?

19 A. Yes.

20 So if you go back just real quick -- I don't
21 want to spend too much time. But if you go back to
22 Figure 4, the first Figure 4, what you're looking at is
23 basically we cut here and here (indicating), took a
24 piece, stood it up, and we're looking like that just down
25 on the wear surface.

26 Q. Okay.

1 A. So if you go back to Figure 6, that's what we're
2 looking at there. You can see the cut surfaces. Cut,
3 cut, cut.

4 Q. Yep.

5 A. And then in Figure 7 it's just showing where we
6 did the cuts to make the metallography.

7 Q. Okay. So here -- come on. Show us what you're
8 doing here (indicating).

9 A. So we looked at it in different ways. So first
10 of all, we cut some pieces up here to look at the base
11 material away from where the wear was. Just what was
12 this plate of steel like the way it was fabricated?
13 There's no issue there. There's no wear. There's no
14 nothing. Right?

15 Q. Okay.

16 A. Then we wanted to look at the wear surface, but
17 you have the wear surface like this; right? So how do
18 you look at that? Do you look at it this way or this way
19 or this way (indicating)? So these are the ways that we
20 looked at it.

21 In this piece we sectioned it this way in the
22 middle. And that is what this is trying to show. And we
23 looked in that [indicating] direction. So you consider
24 this. We spliced it this way and we looked at it this
25 way.

26 Q. Okay. So let me see if we can summarize that

1 for our court reporter who needs to take everything down.
2 We're talking about the two photographs on the top of
3 page 16, the photo on the left marked plate six, the
4 photo on the right marked plate two.

5 We're initially talking about plate two;
6 correct?

7 A. Right.

8 Q. And the red boxes that are drawn into plate two
9 to show where you took metal or where you performed
10 metallurgy tests --

11 A. On the base metal.

12 Q. -- on the base metal plate two; is that correct?

13 A. Yes.

14 Q. Okay. Now, we moved -- then you moved on to
15 plate six which shows with red dotted lines where you cut
16 plate six. And then there's an insert that goes back to
17 the previous page page 15 showing the cross-section of
18 plate six after you had cut it.

19 A. Yes.

20 Q. Okay.

21 A. And these two little yellow "V"s and the red
22 here, that's a little shorthand or symbol that we use to
23 show how we're viewing or what's the viewing surface.

24 Q. Okay.

25 A. So in the trans mount we're viewing this way
26 which means we cut it here (indicating) which means what

1 would the range that we'd be looking at. We'd be looking
2 across the part. So that's why we call it transverse.

3 Similarly, up here it's going this way which is
4 the long direction of the part. So that's why we called
5 it long mount.

6 Q. And again, you're pointing at the plate in the
7 picture?

8 A. Yes. I'm sorry.

9 Q. Thanks for explaining the yellow "V"s.

10 A. Yeah.

11 Q. Most of us would have thought those were
12 backfires; right?

13 A. It's a lot of words, but basically what it means
14 is we want to look at the inside of the metal in this way
15 so we're looking like that (indicating). And we wanted
16 to look at the inside of the metal this way so we're
17 looking like that. So just parallel to the ligament and
18 perpendicular to the ligament are the two directions that
19 we are looking at.

20 Q. Beautiful.

21 A. It's a little simpler like that.

22 The next figure just shows the microstructure,
23 which is a fancy word for saying what did the metal look
24 like after we polished it and etched it with a little bit
25 of acid. And it's a microstructure that is typical of a
26 plain carbon steel.

1 And the reason that we say that is it's
2 compromised of basically two phrases. The white phase is
3 something called ferrite which is just almost completely
4 iron. And the dark phase is something called pearlite
5 which is a very fine structured mixture of ferrite and a
6 higher carbon content material called cementite.

7 And this is -- this is telling us -- because the
8 transverse and the longitudinal view look the same, this
9 is telling us that the material is -- has the same
10 microstructure in both directions. So it hasn't been
11 deformed. It hasn't been cooled too fast from the
12 processing temperature that would form things that look
13 very different which would make it really hard and
14 potentially brittle.

15 And it's just telling us that the material
16 looked to be the right type of material as much as you
17 can tell from looking at the microstructure. And there's
18 no -- there's nothing wrong with it. It was probably
19 manufactured by a process that's called annealed which is
20 a heat treatment.

21 So Figure 9 we're just looking again at some of
22 the cross-sections from the wear surface. So these areas
23 at the -- the boundary between the dark and the light
24 area in each of these pictures is where all of that wear
25 occurs. And what we're seeing is that there is some
26 corrosion. These pits are corrosion in 9c. We're seeing

1 some corrosion products in 9d and in 9c which is the
2 lighter-colored stuff which is telling us that the
3 surface is rusting which again is telling us that it's
4 not abrading very fast.

5 And we're seeing a lot of plastic deformation.
6 For example, in 9b these little pieces that look like
7 they've almost been pulled like that, stretched, that's
8 plastic deformation which again is a characteristic of
9 adhesive wear.

10 Q. Okay.

11 A. So it's just telling us that again everything
12 looks like it should based on what we thought was going
13 on.

14 Figure 10 is sideways, but that's okay. It's
15 the other view of the failure surface. And the most
16 important takeaway from this is just that if you remember
17 the picture that we saw before of the microstructure
18 where I said everything looked good and it looked like
19 the material is supposed to look, if you look close to
20 this surface, this is indicating that the red box at the
21 top of the page came from where it's indicated and the
22 red box at the bottom came from here [indicating].

23 If you look at these blown-up pictures in these
24 red boxes, you can see that the material is really
25 smeared. It's not those nice colonies of pearlite in
26 this nice clean white matrix. It's actually smeared.

1 And if you look here (indicating), this is five
2 thousandths of an inch. So you talk about this is, you
3 know, fifteen or twenty thousandths of an inch deep. The
4 metal is still distorted. And that's telling us that the
5 wear process deforms the metal below the surface which is
6 characteristic of a specific type of contact, sort of
7 rolling contact and wear.

8 Q. All right. On to Figure 11.

9 A. It's not interesting but . . .

10 Figure 11 is not super relevant, but it just
11 shows a really nice pretty picture of the material in 11b
12 where it squeezed out from the side. So what we're
13 looking at is if my hand were the plate, then you'd be
14 stretching out the hole here this way and looking this
15 way (indicating) so the material looks like it squeezed
16 out and went perpendicular to my hand like that.

17 You see this nice curving thing like this, it's
18 all the material that squeezed out. If this were
19 perfect, it would just come up and turn left. But it
20 squeezed out like that. So it really deforms the
21 material showing the metal itself is not brittle. It's
22 ductile meaning that it can form plastically. It can
23 bend, deform, smear.

24 Figure 12 is very similar to the -- it's very
25 similar to Figure 8 which was the nice microstructure
26 pictures that I showed you when I said the material looks

1 like it's supposed to look. Well, this is what it looks
2 like under the -- under the wear surface. So very close
3 to the surface in (a).

4 Those nice colonies of pearlite all broken up
5 and smeared this way, it's just showing that there's a
6 lot of local stress there and that the material has been
7 deformed plastically.

8 And (b) is a little bit deeper and (c) is even a
9 little deeper. And (d) -- by the time you get to
10 (d) you're sixty-five thousandths of an inch below the
11 surface and the material starts to look normal.

12 So this is telling you a couple of things. It's
13 telling that you once you get about sixty-five
14 thousandths of an inch, less than a tenth of an inch --
15 and this ligament is almost three-tenths of an inch thick
16 or this particular one was more than three-tenths of an
17 inch. Once you get about less than a tenth of an inch
18 below the surface, the material looks just like it does
19 far away from the hole.

20 And the other thing it's telling you is that
21 it's not just degrading -- obviously just degrading at
22 the surface, but the stresses are not just acting on it
23 at the surface. They're acting below the surface which
24 just helps us identify a little bit more of the physics
25 and the mechanics behind the wear mechanism. But from a
26 practical perspective or a lay perspective it's not super

1 important.

2 Q. All right.

3 A. To a scientific guy it's really cool and really
4 interesting.

5 The same thing actually applies to Figure 13.
6 Now, these are the same type of --

7 So if you could go back for a second. I had a
8 hard time figuring out -- you see how these white grains
9 are very clean. They just look white. This should be
10 the same stuff, but it looks very -- kind of like
11 somebody sprinkled pepper on it. And I wanted to
12 understand why does it look like that? What's going on
13 here? Is this a problem? Should it be like that or
14 what's going on?

15 And so what I discovered was that this sheering
16 where things are getting smeared out like that here is
17 actually breaking up these colonies. And those colonies
18 are showing up like debris here. And in order to prove
19 that I looked at it as -- so these are at 500 x
20 magnification. I looked at it at a higher magnification.
21 And in order to do that I used an electronic microscope.

22 So if you go to the next page, page 21, these
23 are scanning electron micrographs or microscope images at
24 a thousand x for these, I guess.

25 So these are 500 and a thousand. So 500 -- one
26 of the things that it does it has a deeper depth. So you

1 can actually see on the topography and you can see that
2 the peppery stuff is sticking up a little bit. And then
3 at a thousand x you start to be able to see that what
4 we're actually looking at is a pearlite colony getting
5 smeared and broken up. And so that's why it looks like
6 it's full of debris. It is full of debris.

7 And then this is what the pearlite looks like at
8 high magnification. So this is what the material looks
9 like, you know, at, you know, a little bit less than a
10 tenth of an inch below the surface. This is what it
11 looks like in the surface. Very different.

12 Q. All right. So a and b are at the surface, c and
13 d are below the surface?

14 A. I apologize. a and c are at the surface.

15 Q. a and c are at the surface?

16 A. b and d are below the surface.

17 Again, I apologize. Not super interesting for
18 you guys probably but to a technical guy it's super cool.

19 Moving on to page 22 we contracted an external
20 lab to test the material strength. So we cut out parts
21 away from the cracked surfaces from the body of the
22 plate, pulled on them, and determined the yield strength
23 and the tensile strength and the elongated failure.

24 So what those mean are if you cut a piece of
25 this material and, in order to get results that can be
26 compared to other test results, like if two different

1 labs did it, you do them -- you make these parts a
2 certain shape and size so it's part of the standard. You
3 pull on it in this machine with, you know, thousands of
4 pounds of force and eventually as you pull on it, it
5 stretches a little bit. And if you would let go, it
6 would go back to the same shape. Right? And that's
7 called elastic deformation.

8 If you pull on it -- and everybody has done
9 that. Let's say with this thing; my eye glasses. If I
10 bend it a little bit, that's elastic. It went back to
11 the same shape. But I could bend it harder and it
12 wouldn't go back. And that's called plastic deformation.

13 And the yield strength is where plastic
14 deformation starts. That's kind of like how hard can you
15 pull on the part before it deforms to the point where it
16 doesn't go back? That's the yield strength.

17 The tensile strength is how hard you pull on the
18 part before it actually just breaks. So you could think
19 of that as the ultimate strength or the strength at
20 failure. And these are given in units of pounds per
21 square inch. They're scale to the size of the part.

22 And then the elongation for failure is basically
23 how much percentage longer does it get before it actually
24 breaks? So it gets 36 percent. That's a lot of
25 elongation. And that is telling you that you have a good
26 part that is ductile. It's not brittle.

1 And these strengths are consistent with the ASTM
2 standards that I talked about before; A7 and A36. And
3 those values are given in the last two columns. So
4 essentially the yield strength measures 43, 36, and 40
5 approximately. And this is telling us that the minimum
6 yield strength of A7 was 33. So it meets A7. And the
7 minimum yield strength by A36 was 36. That's where the 36
8 comes from in the more modern standard. And it meets it.
9 And similarly with these numbers here, we're in the
10 proper ranges and similarly with the elongation we're in
11 the proper ranges.

12 So it's telling us -- all these casings are
13 telling us that the material appears to be good material
14 properly manufactured with the proper properties to be
15 the alloy that we think that you would make a plate like
16 this out of and that we would make a plate like this out
17 of today for sure.

18 Q. Okay. So go on to Table III on the bottom half
19 of page 22.

20 A. Same everything except instead of strength we
21 are talking about the chemical composition. These
22 numbers are weight percents. So, for example, weight
23 percent of carbon, weight percent of Manganese,
24 Phosphorous, Sulfur, Silicon, and Copper. But so
25 otherwise it's all the same.

26 When we're comparing those, what we found to the

1 limits that are set out in the two standards is the
2 material was consistent with both of those standards.

3 Q. Okay. On to page 23.

4 A. So there was some discussion. So now if you can
5 imagine we have these parts and they have a little bit of
6 metal that is below where the hook would be. So you look
7 at them and you go "Wow, that's a lot of wear. I wonder
8 how strong this part is?" And we have actually gone and
9 figured out how strong the metal is.

10 So the next thing that you can do logically in
11 your head is you can say "Well, if I know how big the
12 metal piece there that is holding the load is and I know
13 how strong the metal is, I can probably predict how
14 strong that little piece that is holding up the load is."

15 And so I actually had one of the mechanical
16 engineers at the facility where I work model this up for
17 me. And he did what is called a shear tearout mechanism
18 as, you know, being the appropriate mechanism for how to
19 model the strength of that. And he generated this plot
20 of how much load in thousands of pounds.

21 This should say -- these are -- this got
22 distorted on this. But these are thousand pounds of
23 load. And this is how thick the ligament would have to
24 be -- let me say that backwards and say this is how thin
25 the ligament would have to be to fail at that load.

26 So what this is telling you if you have 4,000

1 pounds, this is telling you that you would have to be
2 about total .08 or .07 inches of ligament to hold it up
3 or else it fails. At 12,000, you know, maybe that's
4 closer to .23 inches. Otherwise, it fails.

5 And there's a reason there are two lines. If we
6 use the minimum -- so we used for the calculation the
7 strength we measured. But usually you don't design
8 things based on the strength that you actually have in
9 your part. You design things based on the minimum
10 strength called out by the standard because a different
11 part might barely make that minimum strength whereas the
12 part you measure might be over strength. So you usually
13 design by the minimum strength called out by the
14 standard. And so that's the other line.

15 The strength we measure, the minimum strength,
16 and the A7 standard; two lines. They don't make much
17 difference but a tiny bit. So that --

18 Q. Go ahead.

19 A. No, please.

20 Q. So I was going to ask you were you done on the
21 top chart?

22 A. Yeah.

23 Q. Okay. I was going to ask you about the bottom
24 chart now Table 5.

25 A. So we know that when you measure out those
26 plates and you figure out that big hole that the

1 insulator is hanging from, if there was no wear, there
2 would be approximately .9 inches of material. Is that
3 right? I think it was .9.

4 Excuse me for a second. No. I'm sorry. It's
5 .75. I think it was .75.

6 Regardless, we know about how much metal would
7 be below the hole and now we know how much metal is left.
8 So we know how much metal is lost. And it was about -- I
9 think about a half an inch roughly.

10 So if we know the part has been in service for
11 72 years, we can divide those two numbers and estimate
12 the wear rate. And there's a lot of assumptions that go
13 into that approximation, but that's what we call a linear
14 approximation because we don't have any data in the
15 middle to tell us if it wore really fast in the beginning
16 and then slowed down and now it's wearing really slowly.

17 We don't know any of that, but we can make
18 what's called a first order estimate and just do this
19 linear approximation. We take where we started, where we
20 are now, that gives you a thickness of metal that you
21 have lost. And you divide it by the number of years and
22 that gives you an amount of metal per year that you've
23 lost on average over the last 72 years. And that
24 number -- the worst number for that was about .007 inches
25 per year.

26 So if you estimate -- if you estimate the load

1 on the plate to be between 4,000 and 5,000 pounds, which
2 we estimated based on the weight of the insulator and the
3 weight per foot of the conductor and the length of those
4 two spans, then you can predict how long had this seven
5 thousandths of an inch per year wear rate before you get
6 to the critical ligament thickness where you're going to
7 actually fail the part.

8 I made some assumptions that I'll get into in a
9 second, but this is important. Rather than predicting
10 the load itself, we actually just plotted it as a
11 functioning load.

12 So if you're going to lose seven thousandths of
13 an inch per year, which is a linear approximation, but
14 that's the average that you've seen over the last
15 72 years. If you put no load on it, well, that obviously
16 doesn't make sense. It will last for 40 years. That
17 doesn't make sense. In 40 years you're going to lose all
18 the rest of the ligament. If you put 12,000 pounds of
19 load on it, you're only going to last between five and
20 ten years before it fails.

21 And then that's where we get to the point where:
22 Well, how much load is actually on it? And we estimated
23 based on the things that I said already -- the insulator
24 and the conductor -- that there was actually between
25 probably 4 and 5,000 pounds on the plate in terms of the
26 load from the conductor and the insulator.

1 So that would tell you ballpark 25 years before
2 you get to the point where it -- the ligament gets so
3 thin that it fails.

4 Now, we made some assumptions in that. I've
5 already pointed out one assumption which is that we're
6 assuming that this wear rate was linear. In my opinion,
7 that is conservative because I believe that it would wear
8 faster at the beginning just based on the geometry of the
9 two parts.

10 The other really critical assumption made in
11 that is that as that ligament gets thinner, the stresses
12 get higher. And as the stresses get higher, you can
13 introduce another way of the thing failing and cause it
14 to crack. So it's quite possible that it could crack
15 before it gets to the point where it fails by this
16 mechanical loading. And that's why we -- that's why we
17 point out those assumptions that we made in page 7, on
18 page 7.

19 There are a couple other things we don't know.
20 In 1999 they put those big -- have you ever seen those
21 orange balls they put on the power lines. Those are
22 called aviation markers. Those things are bigger than
23 they look. They're three feet in diameter. And they put
24 those on in 1999. And I don't know what, if any, impact
25 that has on the conductor motion.

26 The other thing is if anything was ever done to

1 this line that changed the wear -- the loading on it, if
2 they re-conducted with a different conductor, I don't
3 know. So I don't really know the loading. Maybe it
4 wasn't always there.

5 So we pointed out -- we made a lifetime
6 prediction. We pointed out the assumptions that we made.
7 We feel that it's appropriate to make this prediction
8 because after all these parts are not in service. So
9 we're not actually making a repair, replace, or leave in
10 service decision based on this rudimentary linearization,
11 you know, prediction that is based on the linearization
12 of the wear rate.

13 And then we made based on this recommendation
14 that, you know, for sure this wear rate and this
15 calculation for remaining lifetime is telling us that
16 this thing is not in danger of falling down in the next
17 year or two or five, but it's definitely worth inspecting
18 the other towers around to see if they have a similar
19 condition. Because while 25 years is not disastrous,
20 it's also not great. And this is an estimate. So that's
21 where the recommendation came from.

22 Q. Right.

23 A. So I think that --

24 Q. And one of the other assumptions is that these
25 hanger plates had been in use for 72 years prior; right?

26 A. That's true.

1 Q. You don't know that. It's just that's what the
2 records say is that it was installed in 1946.

3 A. And that is not even actually correct. The
4 records say that the insulators and the towers were
5 installed in 1946. I couldn't find any documentation to
6 say when the suspension plates were installed. I
7 couldn't find any documentation to say that they have
8 never been replaced. But I couldn't find anybody that
9 would say that they thought that they had been replaced
10 either.

11 And I asked the transmission line construction
12 and maintenance guys and I asked the civil engineers, and
13 everybody seems to be of the thinking that they were
14 probably original, but I don't have any more information.

15 Q. But you do know that these towers were built in
16 1946?

17 A. That's the information that is in the ET-GTS and
18 it was confirmed by the civil guys.

19 Q. Right. So the oldest that these -- assuming
20 that the hanger plates were original, the oldest they
21 could be is 72 years?

22 A. That's correct.

23 Q. Now, how would it affect your conclusions in
24 that the seven one-thousandths of an inch per year wear
25 if actually those hanger plates were installed much
26 later? Say 10, 20, even 30 years?

1 A. The wear rate would be high. If you
2 recalculated it based on the shorter lifetime, you've
3 lost a certain amount -- the amount of material you lost
4 is fixed. And we got to the wear rate by dividing that
5 by the age. If you make the age smaller, the wear rate
6 gets higher. And then if you cascade that down, your
7 predicted lifetime gets lower.

8 Q. So a lot rides on whether or not that hanger
9 plate was from 1942 or 1946 or not?

10 A. So I'm going to consider that -- I would
11 disagree with that statement because they've already been
12 removed from service. And the goal or the purpose of the
13 assessment was not to, you know, say how much longer can
14 we leave these things in service. The goal of the
15 assessment was to say "They look really bad. When we
16 found them, were they actually really bad or were they,
17 you know, better than they look?" And I think even if
18 you -- however you slice it, it's better than it looks.

19 Q. Right. Ultimately, your finding is that no
20 matter how bad some of these hangers look -- and we're
21 looking at page 12, Figure 3 -- these still have quite a
22 bit of life in them and they're not ready to go away
23 right away. Is that about it?

24 A. Yeah. And to -- yes, that's it. For example, I
25 believe that lower -- that lower one Figure c, by the
26 calculation that was done by the mechanical engineer --

1 he is also, I believe, a Ph.D. mechanical engineer and
2 does these types of calculations for a living. His
3 calculation indicated that that ligament there had a
4 breaking strength around 13,000 pounds. And our best
5 estimate is the load on it was actually about 4 to 5,000
6 pounds.

7 Q. Now, you wrote all of this up in your report?

8 A. Yes.

9 Q. Correct?

10 A. Yes.

11 Q. And your report has published within PG&E?

12 A. Please explain what you mean by "published
13 within PG&E."

14 Q. Well, a copy of it goes to Mr. Hernandez?

15 A. Correct.

16 Q. A copy of this would go to the reliability
17 specialist Jeff Lockwood.

18 A. Yes.

19 Q. A copy of it stays in the -- in the lab?

20 A. In the archive, yes.

21 Q. You keep a copy. Your own copy; correct?

22 A. In the archive. It's within our ATS, which is
23 the 120 personnel organization that I work within, has an
24 archive of reports. So we log all these reports for, you
25 know, archival purposes. But widely dissimilated? To
26 the best of my knowledge, I don't know.

1 Usually, when I deliver a report like this to a
2 person like Jeff -- excuse me -- Dave, I give him a
3 little bit of a -- some sort of a statement to the effect
4 of, you know, "Please distribute this as you see
5 necessary because I might have missed someone."

6 Q. Okay. But this wouldn't go out, say, to the
7 Transmission Asset Management Division of PG&E, at least
8 not from you?

9 A. Not from me, no.

10 Q. Okay. But you don't know if it eventually got
11 to them through some other manner?

12 A. That's correct.

13 Q. But ultimately, your finding is that based upon
14 these hanger plates that you were provided, this is how
15 quickly those hanger plates are wearing out. And this is
16 approximately the age that you would expect that these
17 hanger plates would be no good anymore.

18 Does that about sum it up?

19 A. Under this environmental and application
20 condition. So, you know, the wind factors into it, the
21 proximity to the coast factors into it, the actual load
22 which relates back to the span length and all of that
23 other stuff factors into it. But with all of that great
24 big, you know, "yeah but" attached to it --

25 Q. Right.

26 A. Yes, sort of.

1 Q. So --

2 A. I mean, those are a lot. The environment plays
3 a big part in it and also the orientation with respect to
4 the prevailing wind. But similar hanger plates with a
5 similar amount of stuff hanging from them in a similar
6 environment should be expected to behave similarly.

7 Q. Yep. And you said that based upon everything --
8 all the experimentation, all the calculations, the tests
9 that you did that are all detailed in your report -- that
10 these hanger plates that are shown in Figures 3 and 4
11 that Mr. Hernandez brought you have approximately 25 to
12 28 years of life left in them before that ligament can no
13 longer hold the -- the weight of the string; is that
14 correct?

15 A. Would have had that much life if they had been
16 left in place. And based on -- based on the -- you know,
17 the assumption that I list out in the report, these
18 assumptions can be considered somewhat disclaimers.
19 Right?

20 Q. Right.

21 A. It's quite likely that before it actually tears
22 out, it may develop a cracking mechanism which would
23 decrease the age a little bit. And again, that -- that
24 25 years is not intended to say that you're rock solid
25 for 25 years. It's intended to say that these look
26 really bad, but you're not talking about two years or

1 five.

2 Q. So based upon the assumption that these hanger
3 plates were 72 years old when they were taken out of the
4 tower; correct?

5 A. Yes.

6 Q. Which would put their life -- their usable life
7 based upon your calculations at anywhere from 97 to
8 100 years?

9 A. Potentially.

10 Q. Right?

11 A. As long as they didn't start cracking.

12 Q. I'm not real good at math.

13 A. I wouldn't push it that close but --

14 Q. Exactly.

15 A. Right.

16 Q. So the ultimate question on that is do you know
17 if this was -- this was -- this report was dissimilated
18 or this information was pushed out to people who are
19 dealing with transmission lines with similar hooks,
20 similar poles that were over 90 years old?

21 A. Can I go back to your prior question for a
22 second?

23 Q. Go ahead.

24 A. Just very briefly. When I ceded your point
25 about the 90 years, I was just strictly thinking about
26 the numbers.

1 Q. Right.

2 A. There are these issues of GO-95 and required
3 safety factors and whatnot that would preclude you from
4 pushing that far. Right?

5 Q. Yeah. We're not even getting into --

6 A. This is all just sort of a paper experiment;
7 right?

8 Q. Exactly.

9 A. When you say 25 years based on this, again it's
10 just to say, you know, this means it's not getting ready
11 to fall down. That's really it.

12 Q. Right.

13 A. So then your question was do I know about the
14 semination of the report?

15 Q. Right.

16 A. Is that what it was?

17 Q. To your knowledge, did this go out to any of the
18 people that would have been dealing with transmission
19 lines over 90 years old?

20 A. Not to my knowledge. But if it did, I probably
21 wouldn't know.

22 Q. Okay. And you said yourself earlier that when
23 you would have talked to Mr. Hernandez about this, you
24 would have recommended "Hey, you need to go back and look
25 at similar hanger plates and make sure they're okay too;
26 right?

1 A. I limited my recommendations because of the --
2 and we see this a lot; right? Really location-dependent
3 behavior; right? Similar conduct. For example, wind
4 behaves very differently in the mountains than it does by
5 the coast. That's just an obvious example.

6 So I limited my recommendation essentially to
7 what it says. "Perform targeted, additional inspections
8 at selected locations where environmental and loading
9 conditions can be considered to be equivalent."

10 And then I list out a few things of what that
11 means. So the reason that I do it that way rather than
12 say "Go pick these areas to inspect" is because I don't
13 know the system like that.

14 Q. Yeah.

15 A. So . . .

16 Q. Now, when you were --

17 A. And one last thing. I'm not sure -- I suspect I
18 never delivered that recommendation verbally, by the way.

19 Q. Okay.

20 A. It's in the report.

21 Q. Okay. Yep. We just want to make sure we get
22 everything right.

23 A. I don't recollect -- it's possible that I did.
24 I don't recollect discussing this report verbally with
25 David.

26 Q. Okay.

1 A. Just to be very clear.

2 Q. Yep. And we -- more than anything else we want
3 to make sure we've got it right. So if anything let us
4 know.

5 All right. Do you know if anybody else has done
6 previously any similar type of analysis at PG&E?

7 A. I'm not aware of any.

8 Q. How about outside PG&E on a national or
9 international scale? Do you know if anyone has done any
10 analysis of wear patterns on hanger plates?

11 A. I'm not aware of it.

12 Q. How about on the hooks themselves?

13 A. I haven't done -- I'm not aware of it. Oh, I'm
14 aware of some strength testing that was done. I'm not
15 sure when. Maybe the '80s or the '90s at ATS on hooks.
16 And then that's all that I'm aware of regarding hooks.

17 Q. Okay. Now, when you got these six hanger
18 plates, you didn't get hooks to go with them; correct?

19 A. That is correct.

20 Q. Would the hooks have been significant in making
21 a determination of the wear?

22 A. I believe the hooks would have been interesting
23 to me but really having the hooks wouldn't have changed
24 anything with respect to the -- the assessment of the
25 hanger plate itself. I probably would have evaluated the
26 hooks for completeness, but all the evidence you need is

1 in the hanger plate itself.

2 Q. Okay. All right. Anything else from the report
3 that you think is important for us to cover?

4 A. I don't think so.

5 Q. All right. Now, I want to move on to a few
6 other things.

7 A. Can I take just a two-minute break real quick
8 before we --

9 GRAND JURY FOREPERSON: Yes.

10 THE WITNESS: Thank you.

11 MR. NOEL: Sure.

12 GRAND JURY FOREPERSON: Two minutes?

13 THE WITNESS: Yeah. I just need to pop out
14 there.

15 GRAND JURY FOREPERSON: Sure.

16 MR. NOEL: Same admonition as normal; don't talk
17 to anybody on the way to or from.

18 THE WITNESS: Okay.

19 [Break taken from

20 11:00 until 11:05 a.m.]

21 MR. NOEL: Everybody ready? Everybody still in
22 place?

23 BY MR. NOEL:

24 Q. Okay. You indicated there was something you
25 wanted to clarify from your report.

26 A. Yeah, regarding the distribution. It slipped my

1 mind, but we -- specifically, it looks like my supervisor
2 attached a copy of the report to the CAP item in our
3 Corrective Action Program. So if you remember that, we
4 talked about it in the beginning about how this has a CAP
5 item associated with it in the table.

6 Q. Right.

7 A. So a copy of that report was -- was attached to
8 the CAP item meaning that everyone in PG&E has access to
9 it and anyone who was specifically coming to look at this
10 issue of the -- these plates and what was done would have
11 found the report if they had been looking at the
12 attachments.

13 Q. Okay. Thank you.

14 A. So that is just clarifying the distribution.

15 Q. All right. Occasionally, does PG&E let you out
16 of the lab?

17 A. They let me out today.

18 Q. They had no choice today.

19 A. Yes, occasionally.

20 Q. And specifically, back in March did they send
21 you up here to the beautiful Feather River Canyon --

22 A. They did.

23 Q. -- for a couple of days?

24 A. The 28th and 29th. Something like that.

25 Q. And why were you here?

26 A. Some equipment was being removed from the

1 Caribou-Palermo Line, three structures specifically that
2 resembled in their configuration the structure where the
3 Camp Fire is thought to have potentially started. And
4 those materials that were removed from those structures
5 were going away forever, I believe, to the FBI lab. And
6 they wanted me to document what was taken and, you know,
7 put some eyes on the condition of that before it went
8 away forever.

9 Q. Right. So we let you into the evidence handling
10 area and let you document, measure, and everything else
11 with these?

12 A. Correct.

13 Q. Okay. I put up on the board Exhibit 424. It's
14 already been entered into evidence.

15 Do you remember this hook specifically and
16 insulator string?

17 A. I do.

18 Q. And did something catch your attention when this
19 hook and insulator string came off the tower?

20 A. The condition of the hook.

21 Q. Why so?

22 A. The wear is severe. But even more than -- even
23 more than the depth of the wear, how sharp it is and how
24 sharply defined and localized it is. It's like you went
25 in there and sliced it out with a scalpel or something.
26 It really surprised me.

1 Q. All right. Move on to 425, a little different
2 view. Does that show the -- what you're talking about?

3 A. Yes.

4 Q. Now, you have not been able to do any testing on
5 any of the equipment that was removed from the exemplar
6 towers; correct?

7 A. That's correct.

8 Q. But I think we talked about this previously when
9 you and I met and we were talking about the wear patterns
10 in these hooks.

11 A. Yes.

12 Q. And you were kind of explaining your theory on
13 how those hooks would wear and how that would -- I guess
14 age is the word that I was looking for. Do you recall
15 that?

16 A. Yes.

17 Q. What do you see -- what determinations or what
18 can you opine as to the -- how these hooks are going to
19 age or how this wear pattern is going to affect these
20 hooks long term based on what you're seeing?

21 A. Let me think. Well, clearly the strength has
22 been degraded. You're talking about two-thirds of loss
23 of material. Something like that.

24 The shape of the wear is very different than
25 what I've seen in more common applications. And, of
26 course, I've never seen anything worn like this. But the

1 thing that really caught my eye, like I was saying
2 before, is how sharp that notch is.

3 Usually when you get a hook off a tower, the
4 area where it's worn in, all the ones I've seen except
5 for these were very superficial. But some of the ones we
6 pulled that day were fairly superficial too. And the
7 wear area is usually smeared out kind of football-shaped
8 on the inside of the hook which indicates that the hook
9 is moving around in various different ways. You know,
10 it's rocking and it's yawning and rotating a little bit.

11 So the contact is really moving around and it's
12 sort of distributing the wear over a big area. And this
13 looks like the hook was only allowed to do one thing and
14 that is rock this -- you know, rock in one plane. And
15 that's why --

16 And this is total speculation. I'm not a civil
17 engineer. I'm not a mechanical engineer, and I haven't
18 seen a lot of these hooks. And I've never seen one like
19 this before that day. But it sure looks like it only was
20 allowed to rock in one plane.

21 Q. Almost like it was on top of a saw; right?

22 A. Kind of like that instead of being like on top
23 of a bowling ball where it would be going like this
24 (indicating) sitting right on top of one thing doing that
25 (indicating).

26 Q. Now --

1 A. That's what it looks like.

2 Q. We're looking at Exhibit 426 now. And one of
3 the things that struck my eye after talking to you and
4 going through the pictures from the -- from the
5 Parkway-Moraga Line is right here, this (indicating) kind
6 of defamation at the top of the hook.

7 A. Yeah.

8 Q. Do you see that?

9 A. I do.

10 Q. It kind of looked to me to be similar to what
11 you had previously been describing to us and pointing out
12 to us on those pictures.

13 What -- how would you describe this, for lack of
14 a better term, ooze?

15 A. I would describe it as what we call probably
16 material transfer. And that is where you've got these
17 two things rubbing against each other and then material
18 kind of sticks together. And then as the part moves it
19 drags the material over somewhere else. And then
20 eventually you end up taking this dragged material and
21 squeezing it out the sides. That's what it looks like
22 from this one picture, but I also notice that it's not in
23 the other pictures.

24 Q. Right. That's why I threw in this extra
25 picture. Because in that one picture the light just --
26 it picks it up and you can really see it in there.

1 A. It could be that. It might not be indicative of
2 an overall mechanism if it's not present in the other
3 location though. But, you know, it could be that. And
4 there is no question it's wear. And so at this point I'm
5 not sure if it matters what the wear mechanism was.

6 Q. And finally, we have 427, hanger holes.

7 A. Yep. I remember this one, too.

8 Q. Why do you remember this one?

9 A. So it looks like one hole wore out and they
10 bolted on a modification to have a new hole to hang from.

11 Q. Have you ever been able to find anything out
12 about when this modification was added?

13 A. I never looked.

14 Q. Okay.

15 A. But the insulators were dated -- my recollection
16 is that the insulators on that string were dated 1949,
17 which is definitely more recent than the other
18 insulators.

19 Q. 1949. And where did you get that from?

20 A. It's my recollection that they were marked with
21 that date.

22 Q. Okay.

23 A. The insulators themselves.

24 Q. The insulators themselves. Okay.

25 A. It should be in the photos.

26 Q. I didn't bring any photos.

1 Another picture of the wear. Oh, I did want to
2 go back to one more thing. We talked about the -- let me
3 start that sentence over again.

4 With the Parkway-Moraga Line we were talking
5 about corrosion. And you talked a lot about the
6 difference between, say, coastal and valley and mountain;
7 correct?

8 A. Yeah.

9 Q. And a lot of that has to do with the corrosion
10 because of the amount of salt that is in the air?

11 A. That's correct.

12 Q. Thank you.

13 There seems to be a similar amount of corrosion,
14 at least to my untrained eye, on the hanger holes that
15 are coming off of the Caribou-Palermo in this case 24189.

16 A. I would tend to disagree.

17 Q. Okay.

18 A. To me this corrosion is not as deep. It's more
19 what I would call superficial.

20 Q. But we're looking at 427 again. What I'm
21 referring to is the corrosion, this discoloration in the
22 ligament and the edges of the -- of the hanger plates.

23 A. Yeah. I can't really comment on that. I just
24 don't know.

25 Q. Okay. You haven't had the opportunity to put
26 any of these under the microscope?

1 A. No, certainly not.

2 Q. All right. And 429. And then we go to 430,
3 another one showing -- just from what you were seeing and
4 what you saw out there, are we seeing similar wear
5 patterns to what you saw with the Parkway-Moraga hanger
6 plates?

7 A. Some aspects of it look similar. Some of it
8 look -- I see some differences. And I'm not sure if it's
9 significant.

10 Q. Okay. And for the record, you're looking at
11 Exhibit 430.

12 A. Four thirty.

13 Q. And finally, 431. Oops. Sorry.

14 Do you see anything in 431 that you think just
15 from your trained eye would be significant?

16 A. This one looks very similar to the
17 Parkway-Moraga for sure; the pattern and material and the
18 pattern of wear.

19 Q. And we're seeing a lot of corrosion around here?

20 A. Yep.

21 Q. Included in the -- in the keyholing itself?

22 A. Uh-huh.

23 Q. And what about the material here on the edges?

24 A. It looks like that abrasive -- excuse me. I
25 take that back. Adhesive wear type squeezed out
26 material. It looks like it. It could be something else.

1 Q. All right.

2 A. It could be delamination of the -- I think it
3 is.

4 Q. Delamination or --

5 A. It could be the galvanization coming out, but I
6 don't think that's what it is.

7 MR. NOEL: Okay. I have nothing further for
8 Dr. Martin.

9 And I forgot to tell you this previously. The
10 jurors have the opportunity to present written questions
11 for you.

12 THE WITNESS: Okay. I was aware.

13 [Conferring off the record
14 with the grand jurors.]

15 BY MR. NOEL:

16 Q. All right. Do you know what dead-end suspension
17 hooks or hanging brackets are?

18 A. Yeah.

19 Q. Have you ever received dead-end suspension hooks
20 or hanging brackets from the 115 transmission line
21 Caribou-Palermo?

22 A. No.

23 Q. Are you personally familiar with the
24 Caribou-Palermo transmission line?

25 A. Only to the extent that I'm aware that it's been
26 implicated in the Camp Fire and to the extent that I went

1 up there for those two days to assist with the equipment
2 removal from those three structures.

3 Q. Do you have any knowledge of the general age of
4 the components of the line?

5 A. Of the Caribou-Palermo Line?

6 Q. Yes.

7 A. Only what's been reported, you know, external to
8 PG&E.

9 Q. Okay.

10 A. The general age.

11 Q. According to your report, are you aware that all
12 those insulating hanging hardware parts have no record of
13 replacement and are currently at -- okay. I'm not
14 reading this very well.

15 Are you aware that there are insulating hanging
16 hardware parts that don't have any records indicating
17 that they were replaced during the lifetime of those
18 towers that are at or past a reasonable wear lifetime?

19 A. Is the question asking if I'm aware of
20 components that are on that line that are past their
21 lifetime?

22 Q. Okay. Yeah, that's a good --

23 A. I'm not aware of the condition of that line.

24 Q. So, for instance, we're talking about -- we have
25 up here in front of us 431.

26 A. Wait a minute. Was the question about the

1 Bahia-Moroga and Parkway-Moraga? Because they're
2 referenced in the report.

3 Q. You're right. Maybe it is, yeah. I'm putting
4 everything in the Caribou-Palermo Line.

5 GRAND JUROR NUMBER FOUR: Actually, that's what
6 it's aimed at. The Caribou-Palermo, not the other one.

7 BY MR. NOEL:

8 Q. Okay. So the question is -- I guess I'm having
9 difficulty. But basically are you aware that on the
10 Caribou-Palermo there are hooks and holes that are
11 currently at or past their reasonable useful life?

12 A. I'm not aware of the conditions of anything on
13 that line, only of the components that we pulled out on
14 those two days.

15 Q. Okay. So the follow-up question to that is
16 based upon your observations of those two days, what
17 would your recommendation to PG&E be regarding that line
18 or others of similar age and type?

19 A. So in order to answer that question, I think
20 that you have to point out that this is a very specific
21 type of tower in that the wear that we observed was in a
22 specific location on that tower. So I think that -- and
23 again, I'm not a transmission line engineer and I'm not a
24 civil engineer. But I mean, the logical recommendation
25 to make having seen this is to inspect especially that
26 location on similar transposition towers of similar

1 design and vintage.

2 Q. Right. So you'd be talking about -- you know,
3 let me see if I can summarize it. That probably they
4 need to be out looking at the wear patterns and the hooks
5 and the holes, the cold-end attachment hardware holding
6 the jumper line on pre-1930 transposition towers?

7 A. I think that that would be a reasonable
8 recommendation to make based on what we have learned and
9 what we've seen. I think -- and I'm just trying to run
10 this through my head; right?

11 So would I be comfortable to make that
12 recommendation? To be really honest, that is a little
13 bit more broad than a recommendation that I would make.
14 If I received a component from a line, I probably would
15 make a similar recommendation but limit it to that
16 transmission line and then rely on the powers that be in
17 the, you know, transition line maintenance or asset
18 management team to expand the scope of the investigation
19 as appropriate.

20 Is that fair? I think it would be more
21 comfortable to say that.

22 Q. Yep. Okay.

23 All right. Have you ever written a similar
24 report on similar materials or components prior to June
25 of '18?

26 A. No. Actually, this was my first wear report.

1 Q. Okay. Who within PG&E would be responsible for
2 distribution of this or similar reports to both field and
3 supervisory management?

4 A. I'm sorry. I have no idea. There's a
5 decision-making process. I really don't know.

6 Q. All right. Plates show corrosion on them when
7 viewing the photos?

8 A. Right.

9 Q. The report, according to the question, indicates
10 "Corrosion? No."

11 Is this an oversight or does it refer to a
12 specific type of corrosion?

13 A. Oh, yeah. I'm sorry. I know exactly what the
14 question is in reference to. It's in reference to
15 Table 1 of page 11, I think. Yeah, yeah.

16 So this is in reference to the location and
17 whether it's in what is considered to be a high-corrosion
18 zone which is really just everything that's within some
19 distance of the coast. So it's far enough away from the
20 coast that it's not considered to be in a high-corrosion
21 zone.

22 Q. Okay.

23 A. Or even a moderate corrosion zone. But I have
24 to say that the corrosion zone may be somewhat
25 inaccurate. But this is not in reference to what
26 corrosion is on the part. This is in reference to what

1 is logged in the ET-GTS in terms of categorizing a
2 location itself.

3 Q. So does that answer that question?

4 A. Yes.

5 MR. NOEL: Great. Anything else?

6 Dr. Martin, thank you. Madam Foreperson is
7 going to have an admonishment for you and then you can
8 get out of here and head back to the lab.

9 GRAND JURY FOREPERSON: Same admonishment just a
10 reminder. You are admonished not to discuss or disclose
11 at any time outside of this jury room the questions that
12 had been asked of you or your answers until authorized by
13 the grand jury or the Court.

14 A violation of these instructions on your part
15 may be the basis for a charge against you of contempt of
16 court. This does not preclude you from discussing your
17 legal rights with your own attorney.

18 Mr. Martin, what I have just said is a warning
19 not to discuss this case with anyone except the Court,
20 your lawyer, or the district attorney.

21 Any questions?

22 THE WITNESS: No. I understand.

23 GRAND JURY FOREPERSON: Thank you for your time
24 today.

25 THE WITNESS: Thank you.

26 [Witness exits the courtroom.]

1 MR. NOEL: The next witness will be (WITNESS
2 #23). He's in the furthest back attorney room.

3 While you're doing that, I will pass these out.

4 [Witness enters the courtroom.]

5 GRAND JURY FOREPERSON: (WITNESS #23), just
6 before you are seated, I need to swear you in. (WITNESS
7 #23), please raise your right hand.

8 (WITNESS #23), do you solemnly swear that the
9 evidence you shall give in this matter pending before the
10 grand jury shall be the truth, the whole truth, and
11 nothing but the truth so help you God?

12 THE WITNESS: I do.

13 GRAND JURY FOREPERSON: Thank you. Have a seat,
14 please.

15 **EXAMINATION**

16 BY MR. NOEL:

17 Q. (WITNESS #23), could you please state your full
18 name spelling your last name for the record.

19 A. (WITNESS #23). Last name is (Redacted
20 spelling.)

21 Q. By whom are you employed, (WITNESS #23)?

22 A. Pacific Gas & Electric.

23 Q. In what capacity?

24 A. Currently I'm a safety specialist.

25 Q. What is a safety specialist?

26 A. A safety specialist -- our technical title is

1 senior electrical field safety specialist for the
2 contractors. So I go out and I observe the work that is
3 being completed by our contractors and insure that they
4 are following all our standards, procedures, and that
5 they are doing the work properly, safely.

6 Q. How long have you been with PG&E?

7 A. This past July would be 15 years.

8 Q. You have in front of you what is marked as
9 Exhibit 537. Do you recognize 537?

10 A. Yes, Sir.

11 Q. What is 537?

12 A. 537 is my job résumé for the position that I am
13 currently in.

14 Q. I want to walk through your résumé a little bit
15 with you. It says you are "seeking a specialist position
16 in safety that will allow me to utilize my personal
17 experience and safety skills."

18 What personal experience do you have with
19 safety?

20 A. Personal experience with safety. Well, starting
21 my career, I mean, at PG&E's apprenticeship you are
22 taught how to properly do things the safe way. I went
23 through with the apprenticeship, became a journeyman in
24 2008. And when I got to the Table Mountain crew, I
25 became -- I was appointed the team safety lead for our
26 crew. And in that role I was in charge of insuring that

1 the crew had all of the proper protective equipment on
2 hand at all times, that our ADD, our first-aid kit, fire
3 extinguishers were all current and operable. And I
4 was -- in that aspect I was also a member of our safety
5 grassroots team for our department.

6 So all of the safety leads from each crew came
7 together once a month to meet, talk about safety issues,
8 safety concerns with the crew that our fellow workers are
9 bringing up and talk about those things, find ways to
10 mitigate the hazards, things that we can do to get around
11 the hazards and make work safer and bring those issues to
12 the leadership and also take those -- whatever we've
13 talked about and whatever we've come up with back to our
14 teams to work.

15 Q. How did you get into safety in the first place?

16 A. Well, it was that role there with -- when I got
17 to Table Mountain crew working for (WITNESS #12), he
18 appointed me as safety lead. And went that route,
19 enjoyed it. And then when I had my accident in 2015 with
20 the assistance of my wife pushing me toward getting off
21 the crew and looking into safety and helping guys in the
22 field being more safe, I was able to convince leadership
23 that we needed a full-time safety chair. And I was
24 elected by my peers to be that person.

25 I served as the safety chair for two years and
26 as a safety chair just insured that all of my safety

1 leads or all the crews were communicating what we talked
2 about, that any of the projects -- safety projects that
3 we were putting together and in putting in the work were
4 completed and a lot of coordination with leadership.

5 And with my role as safety chair I was offered a
6 position that I'm currently at by my old superintendent
7 who is now not with the company any longer.

8 Q. And who would that be?

9 A. Trevor Emmons.

10 Q. You mentioned in passing your accident in 2015.
11 Is that an on-the-job accident?

12 A. Yes, Sir.

13 Q. What happened to you?

14 A. Our crew was -- our crew was tasked for the day
15 to do a bare-hand project working on our 500 kV circuit
16 up on Round Mountain. And that was a three-hour drive
17 for us. It was an early day. We headed up there. I was
18 in a truck on my own.

19 Got to the job site shortly after the crew, and
20 we did our tailboards. Our super was on site, our
21 foreman was on site, all our crew was on site that was
22 doing the work -- that were doing the work.

23 We met together, talked about the hazards of the
24 job, went out and did the job. But when we got to the
25 tower, there was an additional hazard that wasn't
26 identified before we got to it. And the crew, myself,

1 and the three other linemen on the tower -- we talked
2 about it. We paused and talked about what we saw there
3 and how to mitigate it.

4 It was something that we had worked on before in
5 a different aspect, but this one was completely
6 different. Instead of just running through our job site,
7 it ran through our job site, down the tower to a splice,
8 and then back up and out. It's something that we had
9 never seen before. And so we mitigated that hazard the
10 best that we knew how.

11 And unfortunately, it wasn't good enough. I got
12 electrocuted about 8,000 volts. And I bled off that
13 induction five times before I was able to pull myself off
14 and land in the tower.

15 Q. So you were actually climbed up inside the tower
16 when that happened?

17 A. Yes, Sir.

18 Q. Now, it says you were a journeyman lineman 2009
19 through 2015. Before that, you were a United States
20 Marine?

21 A. Yes, Sir.

22 Q. And how long were you a Marine?

23 A. Seven years.

24 Q. What did you do at the Marine Corps?

25 A. I was -- my watch was 6531 Aviation Ordnance.

26 Q. What does that mean?

1 A. BB stacker; loading bombs and guns on airplanes.

2 Q. Okay. So how did you get to PG&E from doing
3 that?

4 A. One can only work so long for \$10 an hour in the
5 airport after getting out of the Marine Corps. You spend
6 all day. I have two uncles and a cousin who were linemen
7 who were pushing me in this direction. And I protested
8 as long as I could. And then coming to PG&E I realized
9 how much I enjoyed it. And I ended up just biting the
10 bullet and coming here.

11 Q. So walk us through your PG&E career.

12 A. In order to get into PG&E, I had to take a job
13 as a gas utility worker in San Francisco. I worked there
14 for two years, became a fieldman before I got my
15 apprentice bid to Chico. I'm from Marysville/Browns
16 Valley area. I grew up here. So I wanted to come back
17 home, be close to my grandmother.

18 And once I took that bid, I got up here to
19 Chico. I was an apprentice linemen, did a three year
20 apprenticeship, journeyed out. And at one point during
21 my apprenticeship I had the option to do work with a
22 transmission crew out of Table Mountain. And I knew that
23 that is exactly when where I wanted to be working on the
24 towers, the big wire, the helicopters, all the fun stuff
25 that PG&E linemen do.

26 And so it took seven years, but I finally got

1 the opportunity to be part of that crew. And by the time
2 I got there all those old guys that I worked with a long
3 time ago were already gone. But I came in to a good
4 crew. Most of the guys on my crew I had come up in the
5 apprenticeship with. So we knew each other and we knew
6 how to work with each other. And, yeah.

7 Does that answer your question?

8 Q. What year did you come to Table Mountain?

9 A. If I were to guess, it would be around 2012.

10 Q. Other than being the safety lead in -- at Table
11 Mountain, what was your job assignment at Table Mountain?

12 A. Lineman on a crew.

13 Q. Okay. At some point were you made a temporary
14 troubleman?

15 A. Yes, I was.

16 Q. How was it that you became a temporary
17 troubleman?

18 A. I can't recall exactly how I was appointed the
19 temporary job. There are two thoughts in my mind, and
20 these are just guessing. I had had an injury -- a slight
21 injury that put me on modified duty where I rolled into
22 this. Either that or I was backfilling for a retired
23 position that hadn't been filled, a retiree that left,
24 and that position hadn't been filled.

25 Q. Do you remember when you became a temporary
26 T-man?

1 A. I don't.

2 Q. Were you given any training to be a T-man?

3 A. I remember going to a class on switching, but I
4 believe that that is a class that all transmission
5 linemen take. And until looking at my -- my class
6 records on my -- on our intranet, I was -- I don't
7 remember taking the course. But it says that I took a
8 course in transmission troublemen line inspections.

9 Q. Do you know when that test was?

10 A. I don't.

11 Q. Class, not test. I'm sorry.

12 A. No, Sir.

13 Q. Who compiles your records?

14 A. I don't know.

15 Q. You don't?

16 A. No.

17 Q. Okay. What was the class that you don't recall
18 taking?

19 A. I can't recall the name.

20 Q. Do you recall the subject matter?

21 A. Not exactly, no.

22 Q. All right. In 2014 were you assigned to assist
23 (WITNESS #1) with doing the detailed ground inspection of
24 the Caribou-Palermo 115 line?

25 A. Yes, Sir.

26 Q. Do you know why you were assigned to assist

1 (WITNESS #1)?

2 A. I don't know the exact. But if I were to -- if
3 I were to guess on the reasoning, it would be because --

4 Q. Okay. Let's not speculate or guess. Nobody
5 told you why?

6 A. Nobody told me why.

7 Q. Okay. You were just assigned to do the
8 inspection with (WITNESS #1)?

9 A. Yes, Sir.

10 Q. In front of you you should have -- and actually,
11 you don't because I left it up on the bench. Thank you.

12 Exhibit 167. Do you see Exhibit 167?

13 A. Yes, Sir.

14 Q. Do you recognize Exhibit 167?

15 A. Yes, I do.

16 Q. Now, we're looking at the cover page of 167. I
17 want to move to the second page of 167.

18 Okay. Do you recognize the second page?

19 A. Yes.

20 Q. What is the second page?

21 A. It's the line -- transmission line inspection
22 data sheet.

23 Q. How is it that you recognize page 2 from the
24 line inspection data sheet in 167?

25 A. This sheet is where I would place any issues
26 that were found on the line, the structure number, and

1 what the issue was on it as well as -- this sheet is
2 signed by myself and whoever else assisted me with -- I
3 assisted or they assisted me with the inspection and then
4 signed off by the supervisor, myself, and --

5 Q. Okay. Up on the top under "Inspection" -- under
6 "Inspector name," it says "(WITNESS #23)." Do you see
7 that?

8 A. Yes, Sir.

9 Q. Is that you?

10 A. Yep.

11 Q. Is that your writing?

12 A. That is my writing.

13 Q. Okay. And then "Date inspection completed."
14 Part of the date is cut off but something 28/14. Do you
15 see that?

16 A. Yes, Sir.

17 Q. Is that your writing?

18 A. Yes, Sir.

19 Q. Miles inspected 62 miles. Is that your writing?

20 A. Yes, Sir.

21 Q. And number of structures inspected 446. Your
22 writing?

23 A. Yes, Sir.

24 Q. Now, next to where it says "Inspection findings
25 data" it's written "completed on 8/18/14 with something
26 and (WITNESS #1) 8/28/14."

1 Do you see that?

2 A. Yes, Sir.

3 Q. Is that your writing?

4 A. "Completed by --" or "completed on 8/28/14" and
5 then my signature was the 3rd. That's my writing.

6 Q. Okay. All right. And then obviously you didn't
7 write (WITNESS #1)'s.

8 A. No.

9 Q. How about the notifications that are listed in
10 there?

11 A. That is my writing all except for the
12 notification numbers at the end.

13 Q. Okay. And there's -- on the first line to the
14 right of 26215 it looks like a different writing in
15 parentheses. It says "Investigate." Do you see that?

16 A. Yes, Sir.

17 Q. Is that your writing?

18 A. That is not my writing?

19 Q. Do you know what that means?

20 A. I don't.

21 Q. All right. So let's talk about the inspection
22 itself. What was your job in terms of the inspection?

23 A. To go to each structure and inspect it.

24 Q. Each and every structure on the Caribou-Palermo
25 115?

26 A. Well, in this inspection (WITNESS #1) and myself

1 split the inspection in half.

2 Q. Okay. Why did you split it in half?

3 A. Four hundred forty-six structures to inspect is
4 a lot. And half of that -- half of that line is in very
5 rough terrain. And so that would be the section that I
6 took. And given (WITNESS #1)'s less ability to move he
7 took the structures in the lower half.

8 Q. Are you trying to very nicely say that (WITNESS
9 #1) was getting old and couldn't get to a lot of the
10 structures?

11 A. In a nice way, yes.

12 Q. Okay. So that -- your assignment was to do the
13 structures that he couldn't get to; correct?

14 A. Yes, Sir.

15 Q. Okay. All right. And you took the difficult
16 portion of the line?

17 A. Yes, Sir.

18 Q. And which portion of the line is the more
19 difficult?

20 A. I am not sure on the number, but it would be the
21 portion pretty much where the line comes up out of the
22 hole where Poe Powerhouse is and comes over Highway 70
23 and starts heading toward Pulga and up toward Caribou.

24 Q. Okay. All right. Tell us how you did a
25 detailed ground inspection of a transmission line or your
26 understanding of what you were to do?

1 A. Okay. So depending on the terrain and the
2 accessibility, I would come up to the structure. And I
3 started with the footings, look at the tower as a whole,
4 and I'm looking for anything out of place; bent steel,
5 anything not where it's supposed to be.

6 Head up to the -- the tower portion where the
7 lines are actually connected to the tower, looking at
8 insulators on one phase, looking at insulators on one
9 phase, connections, and insuring that everything is there
10 and everything is intact and moving to the next phase
11 doing the same things across the tower.

12 Q. How much attention were you paying to the
13 cold-end attachment hardware?

14 A. Can you repeat the question.

15 Q. How much attention would you pay to cold-end
16 attachment hardware?

17 A. I would look at it to make sure that it was
18 there and see it.

19 Q. Okay. Were you ever told by anyone to look at
20 cold-end attachment hardware specifically during
21 inspections or patrols?

22 A. I don't recall.

23 Q. Were you ever given any training in cold-end
24 attachment hardware for inspections and patrols?

25 A. I don't recall.

26 Q. Now, when you were a lineman, did you change

1 insulator strings?

2 A. Yes, Sir.

3 Q. Did you change insulator strings on the
4 Caribou-Palermo Line?

5 A. Yes, Sir.

6 Q. So you knew how an insulator string was supposed
7 to -- how the cold-end attachment hardware was supposed
8 to look when it was initially installed; correct?

9 A. Yes, Sir.

10 Q. All right. I'm going to walk through -- we have
11 up on the board -- this is page 17 of the transmission
12 line object list of your 2014 report. And up at the top
13 right is your name and a date. Is that correct?

14 A. Yes, Sir.

15 Q. Now, some of the pages have your name, some of
16 the pages have (WITNESS #1)'s name; correct?

17 A. Yes, Sir.

18 Q. What does that tell us?

19 A. That (WITNESS #1) inspected the structures on
20 that page.

21 Q. Okay. So if your name is on the page, you
22 inspected those structures and if (WITNESS #1)'s name is
23 on the page, he inspected them; is that correct?

24 A. Yes, Sir.

25 Q. So that is how we can tell your work apart?

26 A. Yes, Sir.

1 Q. All right. So go through us briefly the
2 mechanics -- go through for us briefly the mechanics of
3 doing a detailed ground inspection for you.

4 A. Other than my method for looking at a structure
5 that I'm looking at?

6 Q. Yep. And how you --

7 A. Okay. So for me obviously that area is very
8 remote and the terrain is pretty rough. Most of this was
9 completed either by hiking in or riding in on a Razor or
10 a Ranger off-road vehicle.

11 So this form, this (indicating) booklet did not
12 come with me on this. All of my findings would go into
13 my notebook that I carry with me.

14 When I looked at a structure if there was
15 nothing wrong with it, it didn't get wrote down on my
16 notebook. If I did find issues in the field, it got
17 wrote in my notebook. So the only thing that I came off
18 the hill with in my notebook were issues that I found on
19 the structures; structure name or number and the issue.

20 MR. NOEL: Obviously, we're not going to finish.
21 We got a little late start with (WITNESS #23). We're not
22 going to finish him reasonably in the next 10 or
23 15 minutes. So it's just about 12 o'clock noon and time
24 for lunch.

25 GRAND JURY FOREPERSON: Okay.

26 MR. NOEL: If you'd like to take a break at this

1 point.

2 GRAND JURY FOREPERSON: Ready for a break?

3 Okay. Yes.

4 Okay. (WITNESS #23), I need to read you an
5 admonishment before we do go to lunch.

6 You are admonished not to discuss or disclose at
7 any time outside of this jury room the questions that
8 have been asked of you or your answers until authorized
9 by the grand jury or the Court. A violation of these
10 instructions on your part may be the basis for a charge
11 against you of contempt of court. This does not preclude
12 you from discussing your legal rights with your own
13 attorney.

14 Mr. (WITNESS #23), what I have just said is a
15 warning not to discuss this case with anyone except the
16 Court, your lawyer, or the district attorney.

17 Do you have any questions?

18 THE WITNESS: No, Ma'am.

19 GRAND JURY FOREPERSON: Okay. Thank you.

20 MR. NOEL: All right. Be back 1:30?

21 GRAND JURY FOREPERSON: Yes.

22 MR. NOEL: All right. Thank you.

23 [Whereupon the luncheon recess is taken
24 from 11:56 a.m. until 1:30 p.m.]

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: (WITNESS #23), if you'd
raise your right hand, please. I need to swear you in
again.

(WITNESS #23)
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: Morning. I do.

GRAND JURY FOREPERSON: Thank you. Have a seat
please.

EXAMINATION

BY MR. NOEL

Q. Welcome back. I think when we left off we were
just starting to talk about the 2014 detailed inspection
of the Caribou-Palermo. In the interim, we've talked and

1 you said, you've told me, indicated to me, that you
2 realize that there was something that you said the last
3 time you wanted to correct?

4 A. Yes, sir.

5 Q. What is that?

6 A. So in looking at our map app. that shows our
7 circuits on the map, I remembered the location area where
8 (WITNESS #1) and I separated the inspections.

9 Q. Okay.

10 A. I recall inspecting towers around Big Bend
11 Substation. And so being in that area, I remember being
12 in that area with (WITNESS #1) and looking at towers. So
13 it's -- that would be the area where he and I did
14 separate our inspections.

15 Q. Okay.

16 A. He went south and I went north from there.

17 Q. All right. Now, you have the packet in front
18 of you, the exhibit, probably flip through the top of
19 that to the big packet which is 167, where we left off.
20 And we left off, we were on page 17 of the Transmission
21 Line Object List.

22 A. Okay.

23 Q. All right. You found that?

24 A. Yes, sir.

25 Q. All right. Remind us again how to read the
26 Transmission Line Object List.

1 A. Okay. So top to bottom?

2 Q. Yes, please.

3 A. Inspector name would be who inspected that, the
4 structures on that sheet. The date that they were
5 inspected.

6 Look down the column, or actually at the top
7 here, I can't remember what, what the 3, 3190 -- I
8 believe that that's a number for the circuit. The
9 circuit name. The job number, which the inspection job
10 number, the 41980167.

11 And then off that column, on the left-hand
12 side, would be separating each structure. Its SAP ID
13 number, which is the number that structure has in the
14 PG&E system, and then its coordinates. Separated, each
15 one separated horizontally by whatever your findings
16 would be, whether it would be you completed the
17 inspection of that tower, found no problems, found
18 problems, new findings, inspected preconditions. And
19 then you would put in your notes whatever it was that you
20 found.

21 Q. Okay. Going back to the top.

22 A. Yes, sir.

23 Q. The order number that you identified up there,
24 the order 41980167?

25 A. Uh-huh.

26 Q. What is that number?

1 A. I believe that that's the job number. So let's
2 say I get, I get a job with the crew to go out and fix
3 the, replace a pole. We're given an order number to
4 charge to, our time to. That's the order number. This
5 would be the order number for that inspection itself.

6 Q. Okay. And that's the same number that you see
7 on the data sheet up at the top left column?

8 A. Uh-huh.

9 Q. Right here?

10 A. Yes, sir.

11 Q. And also on the front page, this number right
12 here?

13 A. Yep.

14 Q. Why is that number, why at the time as a
15 temporary troubleman is that number relevant to you?

16 A. It would be the time that I charged my hours to
17 when completing inspections.

18 Q. Okay. Explain, please.

19 A. So when I would go out and do any kind of work
20 on that inspection, whether it be go out and actually
21 doing the inspection, staying in the yard and actually
22 doing paperwork, I would charge that time, my time, to
23 that, whether it would be a couple hours or the whole
24 day.

25 Q. So that's a unique code that goes to the
26 inspection of the Caribou-Palermo?

1 A. Yes.

2 Q. And does that code stay, always stay the same
3 for the Caribou-Palermo or does it change year to year?

4 A. I don't know.

5 Q. All right. So going back to page 17, your
6 name's on the top; correct?

7 A. Yes, sir.

8 Q. So that what does that indicate?

9 A. That I completed the inspection.

10 Q. Or at least the inspection on this page?

11 A. On this page.

12 Q. And then in the left-hand column you said that
13 the numbers denote the GPS location of each tower; is
14 that correct?

15 A. Yes, sir.

16 Q. So you did the, you inspected the towers listed
17 on page 17?

18 A. Yes, sir.

19 Q. Go on to page 18. And did you inspect the
20 towers listed on page 18?

21 A. Yes, sir.

22 Q. Now, on the right-hand column there are some
23 numbers. And looked like they're handwritten in. Can
24 you explain those numbers to us?

25 A. Okay. So these numbers are height measurements
26 for the conductor from our closest object within that

1 mile.

2 The footage is 48, so we'll go with, what is
3 it, 000 over 06. That structure, believed to be within
4 that mile marker of that circuit, the closest point was
5 48 feet from the ground, ground to the belly of the
6 conductor.

7 And then the 72 degrees is the temperature of
8 that, that that was taken. And that matters because when
9 it gets warmer, that wire sags more; when it gets cooler,
10 that wire tightens up and your distance between the
11 ground and the conductor is greater.

12 Q. Why in 2014 were you taking these measurements?

13 A. Was told to.

14 Q. By whom?

15 A. I don't recall. I don't recall who told me to.
16 I just know that when I did the inspection and thought I
17 was complete, I was told to go back out because I needed
18 to take measurements.

19 Q. So the measurements weren't taken at the same
20 time that the inspection was done?

21 A. No, they were not.

22 Q. Explain to us how that happened, please.

23 A. The process of doing them or me being told?

24 Q. You being told.

25 A. Me being told. To the best of my recollection
26 is that I completed the paperwork, went to go turn it in,

1 and I was told to go back and that I needed to have these
2 measurements done for NERC.

3 Q. Had you received any training in measuring line
4 clearances?

5 A. I believe one of the troublemen helped me out,
6 figure out how to use the gun, which is vary easy to use.

7 Q. Do you recall which one?

8 A. I don't.

9 Q. You mentioned a gun. Can you explain to us
10 what this gun is?

11 A. So this gun uses a laser, I believe laser, to
12 -- that you shoot to the conductor and then you shoot to
13 the ground below the conductor, and it gives you a
14 measurement between the two objects.

15 Q. So you use that to measure the line clearance
16 on the conductor?

17 A. Yes, sir.

18 Q. How about the other, the temperature? Well,
19 the temperature. We'll get to the other.

20 A. Temperature is given on the gun at the time
21 that you do it. So you would measure, measure, take your
22 reading, and then note the temperature that it was giving
23 you.

24 Q. Okay. How much instruction were you given in
25 what you needed to do in terms of the line measurements?

26 A. I don't recall. All I recall is that I was

1 told to go back out there and get measurements. I was
2 given a gun. And I can't recall who it was that trained
3 me. It could have been (WITNESS #1). It could have been
4 one of the other troublemen.

5 Q. Okay. So after you finished your inspection is
6 when you found out you needed to do the line
7 measurements, then you went out and did the line
8 measurements all at one time --

9 A. Yes.

10 Q. -- is that correct?

11 That first time you went out and did, did you
12 do the line measurements correctly -- or did you record
13 the line measurements correctly?

14 A. Apparently I did not, because I was told that I
15 needed to have the time as well.

16 Q. So before you went out, you weren't told to
17 record the time?

18 A. I don't recall.

19 Q. But you didn't record the time?

20 A. I didn't record the time.

21 Q. So how did you get the time into the report?

22 A. So I played around with the Internet, found
23 historical weather for the day on weatherunderground dot
24 com. And I went through each location, their general
25 area, and whatever the time it was -- or whatever
26 temperature it was at that time I marked down that time.

1 So it's kind of an approximate time, time to that
2 temperature for that location.

3 Q. Okay. I want to make sure that we got this
4 right. So you go out first and you do the inspection and
5 you fill out the paperwork for the inspection; for
6 instance, the completed, no new problems, or preexisting
7 conditions checked?

8 A. Uh-huh.

9 Q. All of that stuff was done first; correct?

10 A. Yes.

11 Q. Then later you came back and added the line
12 clearance measurements and temperature; is that correct?

13 A. Yes.

14 Q. And then still later you came back and added
15 the times?

16 A. Yes.

17 Q. And the times are just an approximation?

18 A. Yes.

19 Q. All right.

20 Okay. Let's move on. Page 19.

21 Did you inspect the towers listed on page 19?

22 A. Yes.

23 Q. Page 20?

24 A. Yes.

25 Q. Did you inspect the towers marked on page 20?

26 A. Yes, sir.

1 Q. All right. Page 21. Did you inspect the
2 towers on page 21?

3 A. Yes, sir.

4 Q. Now, there's -- what's the difference between
5 page 20 and page 21 -- or all the pages that we've talked
6 to up to now and page 21?

7 A. I -- different miles?

8 Q. Nope.

9 A. I don't know. I can't tell what date that is.

10 Q. Can't tell what?

11 A. Whether it's the 13th or 14th that I wrote
12 there.

13 Q. On page 20?

14 A. Uh-huh.

15 Q. You're talking about up here in the right-hand
16 corner?

17 A. Yes, sir.

18 Q. Looks like either a 14 and then a 3 written
19 over the top, or a 13 and a 4 written over the top;
20 right?

21 A. Yes.

22 Q. That's what we want to talk about. So very
23 clearly on page 21 that date changes to 8/13; right?

24 A. Or 8/14.

25 Q. No, on page 21.

26 A. On page 21, yes. Yes.

1 Q. What's the significance of the date that's
2 handwritten in the top right corner?

3 A. Well, if you were to read this, it would mean
4 that that was the date it was inspected. But it could be
5 the date that I wrote my inspection down from my log book
6 to this.

7 Q. Okay. So if I were someone that was reviewing
8 this report, would it be safe for me to assume, based
9 upon all this information, that you inspected these
10 towers on 8/13 and that as part of that on 8/13 you took
11 the line measurements, the temperature, and recorded the
12 time?

13 A. To assume, yes.

14 Q. Let's move on quickly, page 22. Are those
15 towers that you inspected?

16 A. Yes, sir.

17 Q. Those are your line measurements?

18 A. Yes, sir.

19 Q. And these again are dated 8/13?

20 A. Yes, sir.

21 Q. Page 23?

22 A. Yes, sir.

23 Q. You inspected those towers?

24 A. Yes, sir.

25 Q. 24, inspect those towers?

26 A. Yes.

1 Q. 25?
2 A. Yes.
3 Q. 26?
4 A. Yes.
5 Q. 27?
6 A. Yes.
7 Q. Did you inspect those towers?
8 28?
9 A. Yes.
10 Q. Okay. You inspected those towers?
11 A. Yes.
12 Q. 29, you inspected those towers?
13 A. Yes, sir.
14 Q. Page 30, did you inspect those towers?
15 A. Yes, sir.
16 Q. Page 31, did you inspect those towers?
17 A. Yes.
18 Q. Page 32?
19 A. Yes.
20 Q. Inspected those towers?
21 A. Yep.
22 Q. All right. Page 33. Did you inspect those
23 towers?
24 A. Yes, sir.
25 Q. But now the date has changed once again. On
26 what date did you inspect the towers listed on page 33?

1 A. It says it's 8/7/14.

2 Q. Okay. So the date inspected listed says 8/7?

3 A. Yes, sir.

4 Q. But that doesn't necessarily mean that they

5 were actually inspected on 8/7?

6 A. No, sir.

7 Q. All right. Page 34, did you inspect those

8 towers?

9 A. Yes, sir.

10 Q. 35, did you inspect those towers?

11 A. Yes, sir.

12 Q. And these are all on 8, listed as 8/7 as the

13 date inspected?

14 A. Uh-huh. Yes.

15 Q. Page 36, did you inspect those towers?

16 A. Yes, sir.

17 Q. 37, did you inspect those towers?

18 A. Yes, sir.

19 Q. Now, you notice there's no page 38. Do you

20 have any idea what happened to page 38?

21 A. I do not.

22 Q. What do you do with the reports when you

23 actually finish them, they're completely all done,

24 they're signed off on?

25 A. I turn them in.

26 Q. Do you keep copies of them?

1 A. No.

2 Q. All right. Do you know where the copies are

3 kept -- or where the original is kept?

4 A. I have no idea, no.

5 Q. All right. Moving on, page 39. Did you

6 inspect those towers?

7 A. Yes, sir.

8 Q. And we're still on the date inspected of August

9 7th?

10 A. Yes.

11 Q. Page 40, did you inspect those towers?

12 A. Yes, sir.

13 Q. Page 41?

14 A. Yes.

15 Q. Page 42, did you inspect those towers?

16 A. Yes, sir.

17 Q. Page 43?

18 A. Yes.

19 Q. Page 44, did you inspect those towers?

20 A. Yes, sir.

21 Q. Page 45, did you inspect those towers?

22 A. Yes, sir.

23 Q. Page 46, did you inspect those towers?

24 A. Yes, sir.

25 Q. Page 47, did you inspect those towers?

26 A. Yes, sir.

1 Q. All right. Page 48, did you inspect those
2 towers?
3 A. Yes, sir.
4 Q. Now, page 55, did you inspect the towers listed
5 on page 55?
6 A. I did not.
7 Q. You did not?
8 A. (Shakes head.)
9 Q. Okay. Who inspected those towers?
10 A. (WITNESS #1).
11 Q. Why is your name at the top of the page?
12 A. Page 49?
13 Q. No, 55.
14 A. Oh, 55. I'm sorry.
15 Q. Right. Okay.
16 A. I was going --
17 Q. I'm sorry, I forgot, you have every page.
18 A. I have every page.
19 Q. We're just skipping ahead to the pages with
20 your name on it. So, so 49 it goes to (WITNESS #1), then
21 you appeared again in 55?
22 A. Yes.
23 Q. All right. And what date is indicated on that
24 page?
25 A. 8/6/14.
26 Q. All right. So we talked about and you talked a

1 little bit earlier, for each one of the towers there's a
2 GPS location that's listed on the sheet; correct:

3 A. Uh-huh.

4 Q. Remember, you have to answer so she can --

5 A. Yes, sir. Sorry.

6 Q. So every one of the towers can be plotted on a
7 map using their GPS; is that correct?

8 A. Yes.

9 Q. And then we have the dates that are assigned.
10 And you said after your testimony, prior testimony, you
11 went back and looked at it and you were able to determine
12 where you and (WITNESS #1) kind of separate?

13 A. Yes, sir.

14

15 (Grand Jury Exhibit 538 was marked for identification.)

16

17 Q. Up in front of you is a map marked as 538. Go
18 ahead and look at it. And give you a little bit of time
19 on that.

20 Do you recognize the area depicted in the map?

21 A. Yes, sir.

22 Q. What is depicted in the map?

23 A. This is the Feather River Canyon with the
24 circuit marked certain GPS locations and certain dates.

25 Q. Okay. And you can go ahead back with 167. And
26 do the dates that are, that are marked on here and the

1 towers numbers coincide with the dates in the, in 167,
2 the detailed inspection report?

3 A. 167, I'm confused what you're asking.

4 Q. Right.

5 A. Structure 167?

6 Q. No, no, no. The Exhibit No. 167. I'm just
7 referring to the exhibits.

8 A. Okay. Copy that.

9 Q. For instance, you can look in there and see, on
10 8/14 did you inspect 000 over 001? Make sure that the
11 rest of these dates are correct.

12 A. Okay. So they seem to match what's in here
13 except for colon 30 over 246 doesn't have a date on it.

14 Q. So let's move on to 539, which is a little bit
15 more of a close-up.

16 Let me first back up. Where is Big Bend on
17 538?

18 A. Down in this area here.

19 Q. Okay. So right below what's marked as 128,
20 130, right in there?

21 A. I would have to look at a circuit map and look
22 at the substation to know exactly --

23 Q. Okay.

24 A. -- where it is.

25 Q. Just the general area?

26 A. Down below the lake.

1 Q. You said earlier that you and (WITNESS #1)
2 separated around Big Bend, and then you worked the upper
3 half of the line --
4 A. Yes.
5 Q. -- is that correct?
6 A. Yes, sir.
7 Q. So it looks plotted out that, for the most
8 part, you started at the bottom and worked your way
9 upstream to Caribou; is that correct?
10 A. Yes, sir.
11 Q. Okay. So let's move on to 539.
12 A. Can I take a break real quick?
13 Q. You need a break? Sure.
14 A. Thank you. I will be right back.
15 (Break taken.)
16 GRAND JURY FOREPERSON: (WITNESS #23) is back.
17 We need to proceed, please.
18 Q. (By MR. NOEL) Everyone's back in their seats
19 after a short break.
20 All right. Moving on to 539. Trying to chart
21 this progress according to your report day by day. This,
22 we refer to page 55; is that correct?
23 A. Yes, part of -- yes. Yes.
24 Q. Okay. So on August 6th, 2014, where did you
25 start? Where did you start your inspection?
26 A. I don't recall.

1 Q. Okay. According to the report, where did you,
2 did your inspection start?

3 A. It's hard to say because, I mean, I start work
4 at 6:30 in the morning.

5 Q. Okay.

6 A. 8:30 the report says I was there. But the
7 times come off the Internet.

8 Q. Okay. That's one of the next things I was
9 going to get to.

10 So the report says that you were at structure
11 number 037 over 299 at 8:30 a.m. on August 6th, but
12 that's not necessarily correct; right?

13 A. No, sir.

14 Q. All right. But we know from page 55 that on
15 August 6th you inspected between 036/292 and 037/299; is
16 that right?

17 A. If you're following the record, yes.

18 Q. Okay. But you look at me and kind of don't
19 sound convinced that the record's correct?

20 A. Well, only because I didn't -- the measurements
21 and the times are different.

22 Q. Okay. But what about the dates?

23 A. I don't recall when I put the dates on here,
24 whether it be the day that I did the inspection or
25 whether it was the day I actually sat down for a day's
26 worth of work on paperwork.

1 Q. Is there a way to actually chart what days you
2 actually were out in the field doing the inspections?
3 Are there records?

4 A. Timecards.

5 Q. How would timecards show where you were?

6 A. My timecards have all of the job numbers on
7 them, what I charge my time to.

8 Q. Okay. You're talking about that number we
9 talked about earlier, the 04980 -- 419, I'm sorry, 80167
10 number; correct?

11 A. Yes, sir.

12 Q. All right. So the time that you spent on this
13 inspection would have all gone onto your timecard for
14 those days; is that correct?

15 A. Can you repeat that? I'm sorry.

16 Q. The time that you spent doing this inspection
17 would have reflected on your timecard for that day?

18 A. If my memory serves me right, yes.

19

20 (Grand Jury Exhibit 540 was marked for identification.)

21

22 Q. Okay. All right. Let's move on now to 540.

23 Now, 540 we're talking about towers inspected
24 on August 7th, according to the report; correct?

25 A. Yes, sir.

26 Q. And, again, the times are not correct; right?

1 A. The times were taken off the Internet.

2 Q. Okay. But is it safe to assume, based upon the
3 paperwork, that on August 7th, 2014, you started at tower
4 number 030 over 246 and ended your day at tower number
5 015 over 123?

6 A. That was five years ago; I don't recall what I
7 did on the 7th.

8 Q. Okay. But I'm talking about according to your
9 report that that's what you did; correct?

10 A. Somebody looking from the outside at this
11 report would assume that that's what happened, yes.

12

13 (Grand Jury Exhibit 541 was marked for identification.)

14

15 Q. And now 541, now we're looking at August 13th.
16 And this is, according to the report, it would appear
17 that you started at 015/122, which is one tower up from
18 where you ended the previous session, and took it all the
19 way up to 0003 over 022? Is that a correct reading of
20 your report, or what the report states?

21 A. Yes, sir.

22

23 (Grand Jury Exhibit 542 was marked for identification.)

24

25 Q. And then finally, on August 14th. And slide --
26 or Exhibit No. 542 depicts the towers, or the areas that

1 were inspected, according to the report, on August 14th?

2 A. Yes.

3 Q. Besides the times and the dates not actually
4 being indicative of when something was done, are there
5 other issues with your report that you're aware of?

6 A. Not that I recall, no.

7 Q. Okay. On the, each page -- at the top of each
8 page of the Transmission Line Object is the inspector
9 name; correct?

10 A. Yes, sir.

11 Q. And we talked about it, that that indicates
12 that that's the inspector who inspected the towers listed
13 on that page; is that correct?

14 A. Yes, sir.

15 Q. And back on the Transmission Line Data Sheet,
16 where it's signed off, it's signed by you and (WITNESS
17 #1). And that would indicate that the two of you did the
18 inspection and found the problems; correct?

19 A. Yes, sir.

20 Q. Were there other personnel involved in the 2014
21 detailed inspection?

22 A. Yes.

23 Q. And who was that?

24 A. (WITNESS #14).

25 Q. Who is (WITNESS #14)?

26 A. (WITNESS #14) is a fellow lineman who I asked

1 to assist me in a big part of the inspection.

2 Q. Why did you ask (WITNESS #14) to assist you?

3 A. We had a good amount of towers that are
4 inaccessible by foot, and we were going to utilize a
5 helicopter to inspect those towers. But for one person
6 to do it, it would be a big task, so I asked for his
7 help.

8 Q. Was it normal to use a helicopter to do a
9 detailed inspection of a transmission line?

10 A. Not that I recall, sir.

11 Q. Did you have to seek permission to do so?

12 A. I don't recall asking for permission, but I
13 would assume so, being that a helicopter is expensive.

14 Q. Right. Who was your boss at the time?

15 A. (WITNESS #12) was my boss and, my best
16 recollection, (EMPLOYEE #16) was filling in for him.

17 Q. So if you were going to get a helicopter under
18 those unusual circumstances, would it have been necessary
19 for you to get the approval of (EMPLOYEE #16)?

20 A. Yes, sir.

21

22 (Grand Jury Exhibit 543 was marked for identification.)

23

24 Q. Okay. On, go on to 543. And direct your
25 attention to 543. Pull that up in there.

26 A. It's after 42; right?

1 Q. I put it together, so that is not something you
2 can assume.

3 All right. Do you see number 543?

4 A. Yes, sir.

5 Q. Do you recognize number 543?

6 A. I do not.

7 Q. Okay. Can you please read 543 for me?

8 A. "From --"

9 Q. No, not out loud. You can just read it to
10 yourself.

11 A. Okay.

12 Q. Just I want to ask you some questions about it.

13 A. Okay.

14 Q. Who is (WITNESS #21)?

15 A. (WITNESS #21) is the clerk at Table Mountain
16 Substation, line clerk.

17 Q. And who is (EMPLOYEE #16)?

18 A. (EMPLOYEE #16) is a troubleman out of Table
19 Mountain who was temping for (WITNESS #12).

20 Q. So (EMPLOYEE #16) was your temporary boss at
21 the time of the Caribou-Palermo inspection; is that
22 correct?

23 A. Yes, sir.

24 Q. So who is (WITNESS #1)?

25 A. (WITNESS #1), otherwise known as "(WITNESS
26 #1)."

1 Q. That's what I wanted to get; we're talking
2 about the same guy.
3 (WITNESS #23), that's you?
4 A. That's me.
5 Q. (WITNESS #19)?
6 A. A lineman on the crew.
7 Q. So this looks like an email from (WITNESS #21)
8 to (EMPLOYEE #16) that's CC'd to you; is that correct?
9 A. That's what it looks like, yes.
10 Q. About using the helicopter for the
11 Caribou-Palermo; is that correct?
12 A. Yes, sir.
13 Q. And then up above it is another email to
14 (WITNESS #12). You say (WITNESS #12) is the big boss.
15 He was the guy in charge; right?
16 A. Yes, sir.
17 Q. Okay. So it's talking about -- well -- well,
18 can you read us and explain to us the email starting
19 with, "Hi, (EMPLOYEE #16)."
20 A. "Hi, (EMPLOYEE #16). (WITNESS #1) and --
21 (WITNESS #1) will fly one southern air patrol due in
22 August when we have scheduled maintenance using
23 helicopters on August 26th and 27th, 2014. This will be
24 more cost effective than having (WITNESS #10) and
25 (WITNESS #11)," two other troublemen, "doing it since we
26 will be working in the general vicinity and can knock

1 this out in a very short time, along with segments of the
2 Caribou-Palermo line that are inaccessible by foot."

3 Q. So is it safe to assume that you would have
4 been flying the Caribou-Palermo on the 26th or 27th?

5 A. Yes, sir.

6
7 (Grand Jury Exhibit 544 was marked for identification.)
8

9 Q. All right. Now I want to move on to 544. Do
10 you see Exhibit 544?

11 A. Yes.

12 Q. Do you recognize Exhibit 544?

13 A. I do.

14 Q. What is Exhibit 544?

15 A. 544 is a helicopter tailboard that we're
16 required to complete when we're doing helicopter work.

17 Q. What is this a tailboard for?

18 A. This tailboard is for crew work that was
19 completed on --

20 Q. You can go ahead and stand up.

21 A. -- looks like 8/27 to me.

22 Q. You can stand up and use the board to stretch
23 out, believe me.

24 So why don't you walk us through this form,
25 tell us what it is.

26 A. Okay. So the tailboard form basically walks us

1 through a brief. The work location. This would be -- I
2 can't read that.

3 Q. Always a little difficult. Can you read it on
4 the printed copy, on the actual exhibit?

5 A. I can't read the road name. The helicopter
6 vendor is A&P Helicopters. And circuit number is
7 Caribou-Palermo 115 kV. LZ coordinator is (EMPLOYEE
8 #15), who is our foreman. Person in charge, on the right
9 side here, is the foreman (EMPLOYEE #15). First line
10 supervisor, (EMPLOYEE #16). The job number, so the work
11 that we were completed -- completing that day on the
12 Caribou-Palermo, the order number 31074797. Tailboard at
13 8:00 o'clock in the morning on the 27th.

14 Q. Okay. This section down below, crew members
15 and assignments, can you explain that for us?

16 A. Crew members, this is where we sign saying that
17 we were at the tailboard. (EMPLOYEE #15), foreman.
18 Person in charge, myself. (EMPLOYEE #13), fellow
19 lineman. (REDACTED), an apprentice on loan to us.
20 (EMPLOYEE #16), a fellow lineman. Looks like Jordan, who
21 was an apprentice on loan to us. I cannot read the last.
22 I know the bottom one looks, I believe that's (WITNESS
23 #1) right here. Nope. Yeah.

24 Q. (WITNESS #1) or (WITNESS #14)?

25 A. (WITNESS #14).

26 Q. (WITNESS #14)?

1 A. And I can't read that last one. This is the
2 pilot and the field guys.

3 Q. Okay. So inside this little box on the right,
4 the pilot?

5 A. Clayton was the pilot. And I can't remember
6 who, so many field guys. Looks like (WITNESS #12),
7 (WITNESS #12). I can't tell.

8 Q. Okay. Okay. So do you know what you were
9 doing on the Caribou-Palermo on that day?

10 A. That was a long time ago, and I've done so much
11 helicopter work that I can't recall what exactly we were
12 doing on that line.

13 Q. Okay. Is this when you were finishing the
14 inspection?

15 A. This tailboard has nothing to do with our
16 inspection portion of it.

17 Q. Okay. How can you tell that?

18 A. The order number, all the crew members. To the
19 best of my recollection, (WITNESS #14) and I and the
20 pilot were the only ones involved in the inspection with
21 a helicopter.

22 Q. If this tailboard conference had to do with the
23 inspection of the Caribou-Palermo, what would be written
24 in for the job number?

25 A. We would write in the order number at the top
26 of the inspection.

1 Q. That's the 8941980167 number we keep talking
2 about?

3 A. Yes, sir.

4 Q. All right. Move on, now I want to switch gears
5 again and go back to --

6 A. Okay. While we're switching gears, can I take
7 a break?

8 Q. Sure.

9 THE WITNESS: Thank you.

10 MR. NOEL: Madam Foreperson, I guess it's up to
11 you.

12 THE WITNESS: Can I?

13 GRAND JURY FOREPERSON: Yes.

14 THE WITNESS: Thank you.

15 (Break taken.)

16 MR. NOEL: All right. Ready?

17 THE WITNESS: Yes, sir.

18 I would like to make a correction to something
19 I said earlier.

20 GRAND JURY FOREPERSON: Okay. All jurors are
21 present. (WITNESS #23) is back.

22 Q. (By MR. NOEL) All right. As you were coming
23 in you said you'd like to correct something you stated
24 earlier?

25 A. So in stating that on these sheets I'm the one
26 that completed the inspections on that page, (WITNESS

1 #14) assisted me with some of this inspection and handed
2 me over whatever issues he may have had. So I'm not sure
3 what structures those are. I don't recall which
4 structures those are that he inspected, but I did the
5 logging of those inspections. So --

6 Q. Right. But you said (WITNESS #14) helped you
7 with this?

8 A. With the flying portion.

9 Q. And nobody else?

10 A. To the best of my recollection, no.

11 Q. Do you recall (EMPLOYEE #13) assisting with the
12 inspection of the Caribou-Palermo?

13 A. I do not.

14 Q. Do you recall (EMPLOYEE #16) assisting with the
15 inspection of the Caribou-Palermo?

16 A. No, sir.

17 Q. Do you remember (EMPLOYEE #15) assisting you
18 with the inspection of the Caribou-Palermo?

19 A. I do not.

20 Q. All right.

21 All right. So let's move on. Now we've
22 brought up another page of the report. Do you recognize
23 this page? This would be in 167.

24 A. Yes, sir.

25 Q. What is this page?

26 A. This is a list of pre, I guess they call them

1 -- what do they call them? Preconditions. Preexisting
2 conditions.

3 Q. Okay. Is there a nickname for it?

4 A. Not that I recall.

5 Q. Have you heard the term "priors"?

6 A. Yes, sir.

7 Q. Is this sometimes noted they are called the
8 "priors list" or "priors page"?

9 A. Yes, sir.

10 Q. What, in your experience, in your knowledge as
11 a lineman and a temporary troubleman, what does this page
12 indicate?

13 A. This page indicates what structure has what
14 issue on it currently.

15 Q. Currently to when?

16 A. I don't know. Yeah, I don't know.

17 Q. Is this page something that you produce?

18 A. It is not.

19 Q. Where does this page come from?

20 A. I don't know who puts this page together, but
21 these tags can either be -- we call them "tags,"
22 "notifications," whatever you want to call them -- they
23 come from either crew on site notice something and they
24 wrote it up, troublemen wrote something up, it goes in.

25 Q. Let's talk about the page itself first.

26 A. Okay.

1 Q. The information on the page, is that something
2 that you generate or something that you're given as part
3 of your inspection?

4 A. Something that I'm given. It comes in a
5 package like this.

6 Q. That's where I was going. So the notifications
7 page is something that you were provided with the packet
8 to perform the inspection?

9 A. Yes, sir.

10 Q. And do you know why you're given the
11 notification page listing all the tags?

12 A. So that we can look at these conditions and
13 ensure that they're safe and that we can still, or that
14 we still have work to do or if they've been completed.

15 Q. Okay. So going back with your inspection. And
16 now I want to go to pages 41 and 42 of your inspection.
17 Do you see those pages?

18 A. Yes, sir.

19 Q. Both pages have your name at the top?

20 A. Yes.

21 Q. That would indicate that you did the
22 inspection; correct?

23 A. Yes.

24 Q. But we don't know for sure if you did or not?

25 A. This section I did.

26 Q. You know for sure that you did?

1 A. We did not fly this section. This is
2 accessible by vehicle.

3 Q. All right. And this starts, page 41, in the
4 first tower, is what -- God, I can't read it up there.

5 A. 41?

6 Q. Yep.

7 A. Colon 022 over 184.

8 Q. So goes from 22/184 to 24/199; is that correct?

9 A. Yes, sir.

10 Q. And based upon the report, it would appear that
11 you inspected these on August 7th, '14; correct?

12 A. Yes, sir.

13 Q. And on 22/188, I believe that's the right
14 tower, can you explain the check mark that's on there?

15 A. Says "preexisting condition" checked.

16 Q. What does that mean?

17 A. That would mean that whatever issue was out
18 there was, was looked at.

19 Q. Okay. So let's go back to the notifications
20 page. Do you see that preexisting condition on the
21 notifications page?

22 A. I do.

23 Q. What does it say?

24 A. It says "Caribou-Palermo 22/188, replace
25 connectors."

26 Q. Do you understand what replace connectors

1 means?

2 A. Means that there's connectors on that we were
3 supposed to be replacing or written up to be replaced.

4 Q. All right. Do you know anything about the
5 history of that tag?

6 A. I don't.

7

8 (Grand Jury Exhibit 545 was marked for identification.)

9

10 Q. All right. I want to go forward to 545, the
11 map marked as 545. Again, do you recognize the area
12 depicted on the map?

13 A. Yes, sir.

14 Q. What is the area depicted on the map?

15 A. Storrie Road, a big section of the line that is
16 pretty much only accessible by -- well, you can get back
17 there by a truck, but it's kind of tight.

18 Q. Okay. And this map shows a close-up of the
19 area from 23 over 193 to 22 over 186; is that correct?

20 A. Yes, sir.

21 Q. And that's an area that, again, according to
22 the report, you inspected on August 7th; correct?

23 A. Yes, sir, according to the report.

24 Q. Now, superimposed we've got the portion from
25 the notifications page and from the inspection for
26 22/188. Do you see that?

1 A. Yes.

2 Q. So indicates "preexisting condition checked,
3 tower number 22/188" right here?

4 A. Uh-huh.

5 Q. That preexisting condition was replace
6 connectors?

7 A. Yes, sir.

8 Q. Correct?

9 And this is information that you were provided
10 by the company prior to your inspection?

11 A. Yes, sir.

12 Q. So when did you start at Table Mountain?

13 A. Get my fingers out. Actually, you know what,
14 get my resume out. 2010-ish.

15 Q. You started there as a lineman?

16 A. Yes, sir.

17 Q. Do you remember a major event occurring on the
18 Caribou-Palermo line in 2012?

19 A. I don't.

20 Q. Okay. Do you remember replacing any conductor
21 line on the Caribou-Palermo in January of '13?

22 A. Hold on. Wait. There was a section -- I only
23 recall because we've talked about this before, but a
24 section of the line that a couple towers went down and
25 were replaced.

26 Q. Yep. It's more than a couple towers; right?

1 Five towers?

2 A. (Nods head.)

3 Q. Remember, you've got to answer out loud.

4 A. Yes.

5 Q. So in 2012 five towers fell down, also one
6 additional tower was damaged beyond repair; correct?

7 A. I don't recall the specifics.

8 Q. But you recall having to restring line?

9 A. I didn't do it personally. I recall our
10 Transmission General Construction crew going in and doing
11 it.

12 Q. Okay. Do you know what a shoo-fly is?

13 A. Yes, I do.

14 Q. What is a shoo-fly?

15 A. Shoo-fly is a section of line -- I guess the
16 best way to explain it, it's a section of line that goes
17 around an existing section of line.

18 Q. So I'm showing you, or you have in front of
19 you, should have in front of you there what's already in
20 evidence as 453.

21 A. 453. I'll find it.

22 Q. I thought it was in that packet.

23 A. All I have is 5's, but I can see it right here.

24 Q. Well, we have it displayed up on the big board.
25 It's a digital copy with the Grand Jury sticker signed by
26 the foreperson. Signed, dated by the foreperson. Do you

1 recognize this map? Do you recognize what that map
2 depicts?

3 A. I don't recognize this map, but I can see what
4 it depicts, yes.

5 Q. Is that based on your experience with PG&E?

6 A. Yes.

7 Q. Okay. Explain to us what we're looking at.

8 A. So basically looks like we're taking out a
9 section of line and putting in a new, some new structures
10 and section of line.

11 Q. So this line is the Caribou-Palermo, correct,
12 according to the line?

13 A. Yes, sir.

14 Q. And according to the map, it goes from 22 over
15 186 to 23 over 193; correct?

16 A. Yes, sir.

17 Q. So the question is how did you inspect 22/188
18 if it wasn't there?

19 A. I recall inspecting that entire line from the
20 section (WITNESS #1) and I went from to Caribou
21 Powerhouse minus whatever structures (WITNESS #14)
22 inspected.

23 Q. Okay.

24 A. In my process of writing issues down, I
25 wouldn't have seen any issues on these, so I didn't write
26 anything down on these brand new poles that may have been

1 out there. So coming back to my paperwork and looking
2 from my notebook of issues and cross-referencing by what
3 issues were given to me in the beginning, that's how that
4 may have been marked.

5 Q. Okay. That's what I wanted to go back over
6 with you. This is where we started the last time right
7 before we ended. Walk us through your process when you
8 were a temporary troubleman for conducting and recording
9 an inspection.

10 A. So coming into an inspection on a structure,
11 I'll come and start at the base of the tower, work my way
12 up, looking for anything that stands out. Any -- I look
13 at the footings, look at the steel, making sure that the
14 steel is sound, nothing's out of the ordinary.

15 Work my way up to the conductor area, looking
16 at the insulators, looking at the connections, looking
17 for any arcings, burns, broken glass, any leakage, making
18 sure that the shoes are tight, that they haven't moved.

19 And then if I've noticed that there's something
20 wrong on that structure, I'll write down on my note pad
21 because I don't take this out to the field because of
22 hiking and driving in a Razor, don't want to get this
23 document messed up. So the structure number and the
24 issue go on my note pad.

25 If I look at that tower and there were no
26 issues, I don't write anything down, so that when I get

1 back to the yard all that I have in my notebook are
2 structures that had issues. And that gets
3 cross-referenced with the priors list. And whatever I've
4 written down on my list, if it is on the priors list, I
5 cross it off so I don't reduplicate whatever has already
6 been written up, and then transpose all of this to the
7 actual object list.

8 Q. So the priors list is something that is
9 provided to you by the company prior to the inspection;
10 correct?

11 A. Yes, sir.

12 Q. That's not something you generate?

13 A. No.

14 MR. NOEL: I think that's all I have for
15 (WITNESS #23). Do any of the jurors have questions?

16 I see at least one hand going up.

17 All right. The jurors themselves get the
18 opportunity to ask you questions. So they're writing
19 them down, they will hand them to me, we'll review them
20 and then read them to you.

21 (Counsel and Grand Jury Foreperson confer).

22 MR. NOEL: All right. I think I've got six
23 questions here from the jurors.

24 Q. (By MR. NOEL) All right. Start off with if
25 you're using a laser to make a measurement to gauge
26 distance between the conductor to the ground, how, how do

1 you gauge the low point of the conductor?

2 A. By sight.

3 Q. Do you have any tools to do so or --

4 A. No, sir.

5 Q. Just guessing as you're looking at it?

6 A. Best estimation.

7 Q. Did you receive any training in determining the
8 low point of the belly of the conductor? So following up
9 on that, first, are you given any training to teach you
10 how to identify the low point.

11 A. Basic linemanship. When we sag wire, we're,
12 we're sagging wire to the equal, so all three phases are
13 the same length.

14 Q. If the inspection lists only reflect the date
15 you wrote down the information, how can we know with
16 certainty the date you actually inspected the equipment?

17 A. Without my notebook, there's no way to know.

18 Q. Does your timecard reflect the GPS coordinates
19 of the equipment you inspected on that date?

20 A. I don't recall.

21 Q. If these reports cannot be relied upon in one
22 aspect, how can we rely on them in any other aspect?

23 A. I don't know.

24 Q. If a priors list contains an issue, an issue,
25 would that have been -- okay. If a priors list contains
26 an issue, would the priors list be modified if the issue

1 was corrected?

2 A. By me?

3 Q. Yes.

4 A. I don't recall.

5 Q. And following up on the earlier question about
6 your notebook, what happens with the notes you take
7 during your inspection?

8 A. I don't recall what I did with them. I'm not
9 told to keep them.

10 Q. Okay. Are there, to your knowledge, are there
11 any policies within PG&E for keeping those records?

12 A. Not to my knowledge.

13 Q. Is your method, or what your procedure was, for
14 doing your inspections, was that common?

15 A. That's what I did. I wasn't taught that.

16 Q. Okay. How were you taught to do it?

17 A. I, I don't recall.

18 Q. If you don't take your priors list, slash,
19 inspection packet with you when completing the
20 inspection, how do you know what to look for on a tower
21 with a preexisting condition?

22 A. I look at the tower entirely, so I would see
23 preexisting conditions. Those preexisting conditions or
24 whatever condition it may be, good or bad, would be
25 written down. So if I found an issue, it would be
26 written down, I would come back and cross-reference it to

1 my priors list.

2 Q. Okay. So when you're doing the inspection with
3 your notebook, you're actually writing down every
4 condition that you see?

5 A. Yes, sir.

6 Q. And then you come back and you check that
7 against the priors list to see if any of those are on
8 there?

9 A. Yes, sir.

10 Q. How do you check -- I mean, for instance, this,
11 on 22/188 replace connectors, do you remember what it is
12 you're looking for or why that would be an issue?

13 A. Well, I knew at the time that we had these type
14 of connectors that they wanted to get rid of. So if I
15 saw them out there, I would write them up.

16 Q. Okay. You're talking about parallel groove
17 connectors?

18 A. I don't know the exact name. We called them
19 the -- I can't remember what we called them. Been five
20 years.

21 Q. And so -- but you have no idea as to how long,
22 how old that tag was; correct?

23 A. No.

24 Q. And so when you're checking this box,
25 "preexisting condition checked," what does that mean?

26 A. That means that whatever the issue was out

1 there was inspected.

2 Q. Okay. But going back to the way you said you
3 were doing your inspections, you're taking a notebook
4 out, you're looking at everything, you're recording
5 anything that you see, and then you're coming back and
6 comparing it to the priors list. So, correct me if I'm
7 wrong, but it sounds like for this, you would have
8 written down in 22/188 -- or you wouldn't have written
9 down -- it would have been, "I saw connectors." But how
10 is that checking the preexisting condition other than
11 just identifying that there were connectors in that line?

12 A. I don't know.

13 Q. Is there others like that? So let's go to page
14 45 of your Transmission Line Object List.

15 A. All right.

16 Q. We're looking at tower number 27/222. This
17 says, "Preexisting condition checked." If you can flip
18 back to your object list and tell me what the preexisting
19 condition was.

20 A. Replace connectors.

21 Q. Okay. So the same, same issue.

22 So when you checked off the 27/222 preexisting
23 condition checked, what does that actually mean?

24 A. That I saw the issue out there and wrote it in
25 my book.

26 Q. Okay. It doesn't mean that you actually looked

1 at the issue to determine if there had been any changes
2 or anything like that?

3 A. In my opinion, there wouldn't -- I would have
4 no way to gauge a change if I didn't write it up
5 initially and see it and have pictures of what it looked
6 like in the initial write-up.

7 Q. Okay. We talked about you said earlier you
8 knew that those connectors were no longer in use;
9 correct? Do you know why those connectors --

10 A. I don't recall.

11 MR. NOEL: Anything further? Any more
12 questions?

13 All right. I think that's all we have of this
14 witness.

15 GRAND JURY FOREPERSON: (WITNESS #23), I need
16 to remind you of the admonishment I gave last week or the
17 week before.

18 THE WITNESS: Three weeks ago.

19 GRAND JURY FOREPERSON: You are admonished not
20 to discuss or disclose at any time outside of this jury
21 room the questions that have been asked of you or your
22 answers until authorized by the Grand Jury or the Court.
23 A violation of these instructions on your part may be the
24 basis for a charge against you of contempt of court.
25 This does not preclude you from discussing your legal
26 rights with your own attorney.

1 (WITNESS #23), what I have just said is a
2 warning not to discuss this case with anyone except the
3 Court, your lawyer, or the district attorney. Do you
4 have any questions?

5 THE WITNESS: No, ma'am.

6 GRAND JURY FOREPERSON: Okay. Thank you for
7 your time.

8 [DISCUSSION OMITTED.]

9 (Lunch break taken.)

10 [PROCEEDINGS OMITTED.]

11 [ROLL CALL OMITTED.]

12 [DISCUSSION OMITTED.]

13 GRAND JURY FOREPERSON: Before you have a seat,
14 Mr. Renfro, I need to swear you in. If you would raise
15 your right hand, please.

16
17 JOHN RENFRO
18 having been called as a witness in
19 the matter now pending, having been first
20 duly sworn, testifies as follows:

21
22 THE WITNESS: Yes, I do.

23 GRAND JURY FOREPERSON: Thank you. Have a
24 seat, please.

BY MR. NOEL

Q. For the record, can you please state your full name, spelling your last name.

A. John Bradley Renfro, R-E-N-F-R-O.

Q. Mr. Renfro, by whom are you employed?

A. PG&E.

Q. Let's turn that microphone a little bit.

What do you do for PG&E?

A. I am a transmission system operator.

Q. What is a transmission system operator?

A. My job is to monitor the electric grid, take equipment in and out of service, keep it within operating limits, and keep power to cities on, dispatch personnel and --

GRAND JUROR #15: Can't hear him.

MR. NOEL: We're still having trouble hearing you. Pull that microphone up, maybe speak a little bit more into it.

GRAND JUROR #15: Thank you.

MR. NOEL: With these high ceilings, these acoustics aren't real good.

THE WITNESS: I understand. Would you like me to start again?

Q. (By MR. NOEL) Go ahead.

A. My job is to monitor the electric system,

1 respond to outages, main -- keep the equipment in service
2 and within operating limits, dispatch personnel in the
3 field, and try to keep the electric grid running in a
4 stable condition.

5 (Discussion off the record.)

6 Q. (By MR. NOEL) All right. So physically where
7 do you work?

8 A. Out of the Grid Control Center in Vacaville.

9 Q. What is the Grid Control Center?

10 A. It is the consolidated hub for all transmission
11 operations for PG&E.

12 Q. Give us a quick description of what it looks
13 like in the Grid Control Center.

14 A. We have large map wall that displays all of our
15 extra high voltage lines, 115, 230, 500 kV. The state's
16 split into six jurisdictions, and each of those
17 jurisdictions has their own pod where they have all their
18 computer controls, maps SCADA, and personal computers.

19 Q. Explain to us how you keep the transmission
20 system up and running.

21 A. We monitor the SCADA, which is a Supervisor
22 Control and Data Acquisition program. It's essentially
23 remote monitoring. We have control of the equipment in
24 the field. We dispatch personnel if we do not have
25 control of equipment. We monitor control points,
26 equipment limitations, voltage limitations, loading on

1 lines, et cetera.

2 Q. Were you on duty in the Grid Control Center on
3 the morning of November 8th, 2018?

4 A. Yes, I was.

5 Q. What was your job that morning?

6 A. I was on the real-time operations desk.

7 Q. What is the real-time operations desk?

8 A. Real-time operations desk is the operator on
9 shift for daily routine work, trouble. We are constantly
10 monitoring what's happening throughout the day on our
11 assigned jurisdiction.

12 Q. What was your assigned jurisdiction?

13 A. My area was the north state jurisdiction, which
14 consists of Humboldt, Round Mountain, and Table Mountain
15 Control Centers.

16 Q. From your position in the Grid Control Center,
17 from your desk in there when you are monitoring, are you
18 able to do real-time monitoring of all of the
19 transmission lines in Humboldt, Round Mountain, and Table
20 Mountain?

21 A. Yes.

22 Q. All simultaneously, or do you pick which one
23 you're going to look at?

24 A. There's a computer constantly pulling data,
25 monitoring all lines in the system. As an operator, I
26 tend to focus on the equipment I'm working on at the

1 time, or equipment being switched out of service, or
2 equipment that has experienced a trouble event.

3 Q. What happens if there's a problem on one of the
4 lines you're monitoring?

5 A. When a trouble event occurs, SCADA and our EMS,
6 our mapping program, pulling pages of audible and visual
7 alarms that will alert us to trouble on the line.

8 Q. Is that information presented to you or --

9 A. Yes.

10 Q. How do you find out that there's a problem on
11 the line?

12 A. Yes. There are alarm pages I have up on my
13 SCADA computer which alert me to that, like I said, using
14 visual and audible alarms. I see those directly.

15 Q. Okay. Is it some kind of an alert that goes
16 off telling you there's a problem, or do you just --
17 watching the page and seeing that that looks out of
18 place?

19 A. It's an audible. It's a distinct audible tone
20 when the trouble event occurs on a piece of equipment.

21 Q. At approximately 6:15 a.m. on November 8th, did
22 you get a trouble alert?

23 A. Yes.

24 Q. And were you able to determine what line?

25 A. Yes.

26 Q. What line did that come from?

1 A. That would be the Caribou-Palermo 115 kV line.

2 Q. Now, at the time or prior to the alert, was the
3 Caribou-Palermo 115 kV line energized and performing?

4 A. Yes, sir. It was normal and in service.

5 Q. What was the alert that you received?

6 A. Breaker open at both the Caribou and Palermo
7 terminals of the line.

8 Q. What does that tell you?

9 A. That tells me that the line relayed and
10 protective system took the line out of service.

11 Q. Okay. What does it mean for a line to relay?

12 A. A line to relay indicates that protective
13 relays data that are tied to circuit breakers at both
14 terminals of the line experienced a fault condition
15 telling the breaker to open and take the line out of
16 service, de-energizing it.

17 Q. And you said protective measures that were in
18 place set in?

19 A. Correct.

20 Q. What kind of protective measures?

21 A. All lines in our system are protected by
22 relays. They monitor current on the line, and any
23 abnormal current that would be caused by faults exceed a
24 threshold or a time threshold and trips the breaker,
25 which takes the lines out of service.

26 Q. When you receive this alert, what do you do?

1 A. At that time, my first job is to verify what
2 line it was. So I would pull up a map, see, okay, yes,
3 my breakers are open.

4 Had the line tested? Yes or no.

5 What customers are out at that time?

6 What are concerns I may have if another line is
7 perhaps overloaded because of this?

8 And then I have 5-, 10-, and 15-minute reports
9 to make.

10

11 (Grand Jury Exhibit 566 was marked for identification.)

12

13 Q. Okay. You have in front of you a stack of
14 exhibits. I'm going to start going through them.

15 Starting with the one marked Exhibit 566 in
16 front of you, do you see that item?

17 A. I do.

18 Q. Do you recognize 566?

19 A. Yes, sir. It's details of the interruption
20 report.

21 Q. Okay. Explain to us what we're looking at.

22 A. Interruption report is how we document outages
23 on lines or equipment. We use it to log our time that
24 the line relayed or equipment relayed, what time our
25 notifications are made.

26 Q. Okay. And you can get up and move around and

1 use the Smartboard here. Kind of walk us through how to
2 read this report and what it is that it's telling us.

3 A. First, assigned jurisdiction for me that day.
4 I was assigned to the north state area, specifically
5 Table Mountain jurisdiction. That's the jurisdiction the
6 line is.

7 Resource type. Of course, the Caribou-Palermo.
8 Voltage level.

9 The time the event initially started. 0615.
10 Same time we became aware when I received the initial
11 alarms.

12 When you come to this, the cause, we have no
13 visual on the trouble at that time, so we put "unknown"
14 until we have visuals in the field. We can update this
15 at a later date.

16 Q. System protection details?

17 A. So system protection is a separate group
18 message of our protection engineers. They have the
19 ability to remotely dial into the protective relays at
20 both terminals, and they can interrogate the relays,
21 which means pull data remotely and get a rough idea of
22 where the fault may have occurred on the line. They then
23 fill in their section on this and send us an email saying
24 we believe the fault may be within this area, plus or
25 minus a mile mark usually.

26 Q. So is that the information down here, fault

1 location 1, fault location 2?

2 A. That is correct.

3 Q. Explain to us what all of that means.

4 A. So accuracy of location, it could be plus or
5 minus two miles of their initial fault. So appeared this
6 one, 22.2 miles from Caribou Powerhouse. That is
7 probably the terminal they pulled from at Caribou. I can
8 only speculate. I am not sure. They would send us this
9 information, plus or minus two miles, we would take that
10 into accord. And then this is the second time they
11 interrogate the relays, which means they may have pulled
12 from a second set. There are two at each terminal. So
13 the second set could have been more or less accurate.
14 They have to pull both data and give this to us. We have
15 to then send it to field personnel to try to get someone
16 on site to investigate.

17 Q. So is this telling us that the trouble is
18 somewhere between these two points, or these are two
19 separate things that may be at one of those points?

20 A. It could be at either one of those points
21 within plus or minus the two-mile mark.

22

23 (Grand Jury Exhibit 566A was marked for identification.)

24

25 Q. Okay. Let's move on next to the second page of
26 that document, which I believe is marked as 566A -- is

1 that correct?

2 A. That is correct.

3 Q. Okay. What is 566A?

4 A. So 566A is where it is actually showing my
5 recorded times for all the actions I performed. I
6 clicked the tabular and opened the interruption report
7 0615.

8 My first report was to my system dispatch at
9 0616. I notified him of the time the Caribou 115 kV line
10 relayed.

11 Distribution was not affected. So that's an
12 irrelevant box for that.

13 And then E-page, which is our 15-minute
14 notification, was sent out. And that goes to the
15 supervisor of the field personnel, field personnel,
16 whoever is -- I'm sorry, I'm trying to think of the word
17 -- subscribed to the E-page notification system.

18 Q. What is the E-page notification system?

19 A. It's essentially an email notification, or it
20 can go out as a text. Recording usually be made on
21 pagers. It is nothing more than what this line here
22 says. "11082018 0615 Caribou-Palermo 115 line opened
23 relayed. Did not test for wild fire mitigation." That
24 is all -- anyone subscribed to that will get an alert on
25 their phone; text message, email. And that is as basic
26 as it will read. Just a notification that that line is

1 now out of service.

2 Q. So the last part of that message, "Did not test
3 wildfire mitigation," what does that mean?

4 A. Did not test due to wildfire mitigation implies
5 that we had cut all reclosing out on that line.

6 Q. You're going to have to explain that to us,
7 what that means.

8 A. So reclosing during normal conditions and not
9 fire season, a line would attempt to test, re-energize
10 itself to put the line back into service.

11 Q. Okay. Let me put it into layman's terms. We
12 have some light switches over there behind you. When the
13 light is on, is the circuit open or closed?

14 A. The circuit is closed.

15 Q. So when we turn the light off, the circuit is
16 open; right?

17 A. Correct.

18 Q. So these reclosures would be, the lights are
19 on, the circuit is closed, something happens to knock the
20 lights off, and then the switch would automatically go
21 back on again and test; right?

22 A. Correct.

23 Q. Okay. So you don't know who the E-page was
24 sent to that morning?

25 A. I do not have a list of who is subscribed to
26 the E-page.

1 Q. Is that something you physically have to do
2 something to do, or the computer does automatically?

3 A. So we have on our interruption report, we
4 choose to send a notification, we select send E-page, we
5 choose Table Mountain outage, and it sends it to all
6 personnel subscribed to Table Mountain outage.

7 Q. Okay. Then the next event on there, 1108 at
8 6:18. Go ahead and explain for us.

9 A. That was actually a accidental time put in by
10 me. I should not have done that. I put the time in the
11 wrong box. That was supposed to be my time for E-page
12 notification. I accidentally closed the interruption
13 report, which implied that the line had been returned to
14 service, which it had not.

15 Q. Okay. And then going back up the page.

16 A. Up there is where I corrected my time and put
17 it 0618 I notified via E-page, that my E-page had been
18 sent, corrected my time.

19 Q. Okay.

20 A. And at the top, this is our last notification I
21 initially made for the Caribou-Palermo 115 kV line relay.
22 It caused a sustained interruption to Grizzly Powerhouse.
23 Rock Creek jurisdiction, Rock Creek Hydraulic Opps, I was
24 in charge of that powerhouse, so I made a call to
25 (WITNESS #7) who was on shift for the Rock Creek
26 operation at the time.

22
23
24
25
26

(Grand Jury Exhibit 567 was marked for identification.)

Q. Great. Let's move on to 567. Do you recognize 567?

A. It just -- that is my correcting my time for the interruption report to the lines still being out of service.

Q. Okay. So let's back up. Just in general, what is 567?

A. 567 is what we call a "total log." Transmission operations and Transmission operations total logging. This is how we create logs of daily events. Any significant events, we would create a log item such as this, and then continue to type any important details, personnel phone numbers, information in. And in this case, with the INT, dash, 11514 in the right corner, it is saying that this log is associated with that interruption report for the Caribou-Palermo 115 kV line.

Q. I was just going to ask you about that, because we saw that number on 566 also repeated several times, the INT11514. What is the significance of that number?

A. That number itself is actually the interruption report for the Caribou-Palermo line. So if we go back to item 566, you'll see in the top left corner the interruption report has its own number stamp.

1 Q. Okay. Right there at the top, "detail for
2 interruption"?

3 A. Correct.

4 Q. All right. Is that a unique number --

5 A. Yes.

6 Q. -- for this event?

7 A. Yes.

8 Q. So anything we see referencing INT11514 would
9 be -- sorry -- referencing the interruption recorded at
10 6:15 a.m. on November 8th, 2018, on the Caribou-Palermo
11 115 kV line?

12 A. That is correct.

13 Q. All right. And this says, under the "Log
14 Text," what does that mean?

15 A. Under "Log Text," it, again, was me correcting
16 my time that I became aware of the interruption. It was
17 nothing more than a time change correcting my E-page
18 error.

19

20 (Grand Jury Exhibit 568 was marked for identification.)

21

22 Q. Okay. Let's move on to 568. What is 568?

23 A. This is the time stamp for me actually starting
24 the interruption report for the Caribou-Palermo 115 kV
25 line.

26 Q. What time did you do that?

1 A. Date created, 0617, log text 0615 started an
2 interruption report 11514 for Caribou-Palermo. So at
3 115. Or 0615, excuse me.

4 Q. So 0615 is when you first got it. This created
5 date, 061742?

6 A. That would be when I saved the log digitally
7 logging it.

8 Q. Okay. I was going to ask if that referenced
9 the accidentally ended it then restarted it or --

10

11 (Grand Jury Exhibit 569 was marked for identification.)

12

13 Q. Next, 569. What is 569?

14 A. Again, time stamp notification of when I put in
15 my E-page. So save log at 0618, about E-page sent at 06
16 -- or in regards to the same interruption report.

17

18 (Grand Jury Exhibit 570 was marked for identification.)

19

20 Q. Okay. 570?

21 A. Time stamp of me marking that Distribution
22 Operations was NA. We did not notify the outage of the
23 Caribou-Palermo line.

24 Q. So D-O stands for Distribution Operations?

25 A. That is correct.

26 Q. And what does NA stand for?

1 A. NA is not applicable. They had no customers'
2 outages.

3 Q. NTFB?

4 A. Abbreviation for notified.

5 Q. This didn't affect any distribution customers?

6 A. That is correct.

7

8 (Grand Jury Exhibit 571 was marked for identification.)

9

10 Q. 571?

11 A. Another time stamp of the time I saved the log
12 in reference to my notification to (WITNESS #7) at Rock
13 Creek Operations.

14

15 (Grand Jury Exhibit 572 was marked for identification.)

16

17 Q. 572?

18 A. This is the time stamp for my dispatcher in his
19 log when I made my report to him. So contact would be
20 myself, John Renfro, and notified my assistant dispatch,
21 Ralph Natividad. Log was created by him. This is him
22 indicating what reports I made to him.

23 Q. Okay. So what -- when you say "my dispatcher"
24 or "my assistant dispatcher," explain to us what that
25 means.

26 A. So whenever we have a line or equipment remove

1 itself from service or significant events, our first
2 notification to make, once we have an understanding of
3 what's going on, is to our system dispatch. We have to
4 state what time the equipment took itself out of service,
5 what equipment it was, who was affected, and weather
6 conditions at that time. It also appears that he put
7 that he notified CAL/ISO Rueles at the same time. So
8 following my report to him.

9 Q. Okay. So you immediately make a report to
10 Mr. -- how do you pronounce that?

11 A. Natividad.

12 Q. -- Natividad at 6:15. In between 6:15 and 6:24
13 Mr. Natividad --

14 A. 0624 would be the time he saved this.

15 Q. Okay.

16 A. That is when it time stamped.

17 Q. All right. Do you have any idea where the
18 mention of the weather being windy comes from?

19 A. Again, we are required to make that in a
20 report. And we knew of high winds in the area. So when
21 I initially report the outage, I reported high winds in
22 the area.

23
24 (Grand Jury Exhibit 573 was marked for identification.)
25

26 Q. Next, on to 573. Explain 573 to us.

1 A. This is a log item I created at -- looks like
2 he made the report at 0642, as indicated at the top of
3 that DTS time.

4 I created the log myself stated at 0645.

5 0638 I received a call from Rock Creek Control
6 that there had been a report of a fire from their roving
7 operator in the canyon across from Poe Dam.

8 Q. Okay. What is Rock Creek Control?

9 A. Rock Creek Control is a hydro-operation center
10 in the canyon based out of our Rock Creek Powerhouse.

11 Q. Do you know where that is in reference to the
12 Caribou-Palermo line?

13 A. It would be along the Highway 70 corridor,
14 somewhat parallel to it.

15 Q. So somebody named (EMPLOYEE #2) from Rock Creek
16 calls you and reports that there's been a fire?

17 A. That's correct.

18 Q. And that the fire is being reported to him, and
19 that he's getting that information from somebody at Poe
20 Dam?

21 A. Correct.

22 Q. And it goes on. You go ahead and read the rest
23 of it and explain it to us.

24 A. The next notification, 0640, was when I
25 notified my dispatch of the fire.

26 And then 0641 I notified our T-line supervisor

1 of the fire in the canyon, requested personnel dispatch.

2

3 (Grand Jury Exhibit 574 was marked for identification.)

4

5 (Grand Jury Exhibit 574A was marked for identification.)

6

7 Q. So let's go on to 574. I'm going to play you a
8 recording.

9

(Recording plays.)

10 Q. You heard the recording, you've got the
11 transcript. The recording, 574; the transcript, 574A.
12 Is that the phone call that's listed in 573?

13 A. That's correct.

14 Q. So that's you calling --

15 A. (WITNESS #22), our T-line supervisor.

16 Q. For Table Mountain?

17 A. Correct.

18

19 (Grand Jury Exhibit 575 was marked for identification.)

20

21 Q. All right. 575. Explain to us what this log
22 entry says.

23 A. So for every piece of equipment that comes out
24 of service, we start a log number. That would be, in
25 this case, the T18016158 number.

26 Q. So that's in addition to the interruption

1 report?

2 A. Correct. The interruption report would then
3 become associated with the outage log. This is to
4 actually track the equipment out of service.

5 Q. So what equipment was taken out of service?

6 A. This is the, in reference to the
7 Caribou-Palermo 115 kV line. And this log specifically
8 is when I entered the equipment out of service, slash,
9 path interrupted.

10 Q. Okay. So equipment out of service, we're
11 talking about the entirety of the Caribou-Palermo line?

12 A. That is correct.

13

14 (Grand Jury Exhibit 576 was marked for identification.)

15

16 Q. And 576, do you recognize this document?

17 A. Yes.

18 Q. What is 576?

19 A. This is the actual work card document for the
20 clearance T18 number there. It's a little hazy, but this
21 is where we would track all the outage information.

22 Q. Okay.

23 A. So the card -- again, same reference as the
24 interruption report.

25 Work type. At this point we were assuming we
26 have to clear the Caribou-Palermo line.

1 Q. What does it mean to clear it?

2 A. We have to establish a clearance to safely work
3 on the line. We have to create visual open points, lock
4 them, hang on line tags so there is no possibility for
5 the line to be energized into personnel working on the
6 line.

7 Q. Okay. Go ahead.

8 A. Again, so line, Caribou-Palermo.

9 ISOID. CAL/ISO monitors PG&E and regulates our
10 equipment, what equipment we have in and out of service.
11 They have their own log numbers associated to all of
12 ours.

13 Primary cause. Line equipment trouble.

14 The line relayed itself out of service. We
15 don't have any more specifics.

16 Secondary cause. Under investigation.

17 Unfortunately, I cannot read that.

18 Q. This is getting really fuzzy up there, isn't
19 it?

20 A. Scheduled start time. That would be at --
21 probably the time the card was made.

22 And then the log. 575 is the actual start time
23 entered here.

24 Line or apparatus. Our tool automatically
25 posts what was in the interruption report which was
26 created. So that's where you get the Caribou-Palermo

1 line relayed and did not test due to wildfire mitigation.
2 That should simply say Caribou-Palermo 115 kV line.

3 Q. Okay.

4 A. And we began writing switching to clear the
5 line for safety and repairs. So initial clearance was
6 supposed to be from Caribou switch 113, 137, Bucks Creek
7 switch 135, and Big Bend switch 185.

8 Q. Great. So -- because I want to make sure that
9 we understand this, where it says "scheduled start," that
10 doesn't mean that this was something that was scheduled;
11 right?

12 A. Correct.

13 Q. We don't want any misunderstanding.

14 "Scheduled end," you didn't know when it was
15 going to end?

16 A. We just put a generic time in.

17
18 (Grand Jury Exhibit 576A was marked for identification.)
19

20 Q. Okay. Then go over to the back of that page,
21 which I believe is 576A. Can you explain what we're
22 looking at here?

23 A. This is all the time stamps for, time stamps
24 for filling out the work flow. On every outage card we
25 have on our total tool there is a series of steps that
26 are required to follow.

1 In the case of trouble, we tend to skip all of
2 the permissions due to the line already being out of
3 service. So that's why you would see, "skipped work
4 step, TSO confirms all pre-clearance requirements,
5 takeout switching started, skipped equipment out of
6 service, skipped acknowledge."

7 Unfortunately, the tracking tool does not carry
8 over times from interruption reports well.

9 Q. Okay. Is this something that's automatically
10 populated, or something that you have to hand type into
11 the computer?

12 A. Every time we turn a, perform an operation on
13 this tool in regards to work flow, it is time stamped.
14 It can be undone, but the time stamp remains.

15 MR. NOEL: That is all I have.

16 Do the jurors have any questions of this
17 witness?

18 Seeing no hands, apparently the jurors do not
19 have any questions for you. Thank you very much,
20 Mr. Renfro.

21 Madam Foreperson has an admonition to read you.

22 GRAND JURY FOREPERSON: Mr. Renfro, you are
23 admonished not to discuss or disclose at any time outside
24 of this jury room the questions that have been asked of
25 you or your answers until authorized by the Grand Jury or
26 the Court. A violation, a violation of these

1 instructions on your part may be the basis for a charge
2 against you of contempt of court. This does not preclude
3 you from discussing your legal rights with your own
4 attorney.

5 Mr. Renfro, what I have just said is a warning
6 not to discuss this case with anyone except the Court,
7 your lawyer, or the district attorney. Do you have any
8 questions?

9 THE WITNESS: I do not.

10 GRAND JURY FOREPERSON: Okay. Thank you so
11 much for your time.

12 THE WITNESS: Thank you.

13 MR. NOEL: Thank you, sir.

14 We've been in session now for just under an
15 hour. Do you want to take a break now and start fresh
16 with a new witness and power through her, or do you want
17 to start with her, go for a little while, and take a
18 break?

19 GRAND JUROR #4: Go for a little while and take
20 a break.

21 GRAND JURY FOREPERSON: Okay.

22 MR. NOEL: Okay. Whatever you guys would like.

23 (WITNESS #21).

24 (Discussion off the record.)

25 GRAND JURY FOREPERSON: Everybody's back in
26 their place. We're ready to begin.

1 (WITNESS #21), would you please rise and raise
2 your right hand so I can swear you in.

3
4 (WITNESS #21)
5 having been called as a witness in
6 the matter now pending, having been first
7 duly sworn, testifies as follows:

8
9 THE WITNESS: I do.

10 GRAND JURY FOREPERSON: Thank you. Have a
11 seat, please.

12
13 EXAMINATION

14
15 BY MR. NOEL

16 Q. For the record, (WITNESS #21), could you please
17 state your full name, spell your last name.

18 A. My full name is (WITNESS #21). My last name is
19 (SPELLING REDACTED).

20 Q. By whom are you employed, (WITNESS #21)?

21 A. Pardon?

22 Q. By whom are you employed?

23 A. Pacific Gas & Electric.

24 Q. In what capacity?

25 A. I'm currently an operating clerk for
26 Transmission.

1 Q. How long have you been employed by PG&E?

2 A. Twenty-eight years.

3 Q. Could you walk us through your PG&E career, the
4 jobs that you've held since you started.

5 A. Sure. So I started in 1991, and I was hired as
6 a meter reader/utility clerk. So I was a dual -- I did
7 physical work and I did clerical work. And then I had
8 the option of working on rotation for Construction, which
9 I did. I worked as a joint pole clerk. That's a clerk
10 that goes out in the field and measures the connection
11 point on poles. But the bulk of my career was either
12 meter reading or customer service prior to working for
13 Transmission, which I've been with Transmission about
14 seven years.

15 Q. All right. What's your current -- what station
16 are you currently assigned to?

17 A. I am currently at Table Mountain Transmission,
18 out of Table Mountain in Oroville.

19 Q. How long have you been at Table Mountain?

20 A. Seven years.

21 Q. And you're an operating clerk at Table
22 Mountain?

23 A. I am.

24 Q. Have you been an operating clerk the entirety
25 of your seven years at Table Mountain?

26 A. Yes.

1 Q. What is an operating clerk?

2 A. An operating clerk is someone who just works
3 supporting the operations for different groups. Most of
4 the functions that we do are clerical assistance,
5 although, you know, we order materials for jobs, payroll,
6 various things.

7 Q. When you say "support," describe for us how it
8 is that you support the operations at Table Mountain?

9 A. Once again, I do payroll for all the guys, I
10 order supplies, I sometimes coordinate delivery of things
11 out in the field, ordering general supplies, getting the
12 mail; just clerical functions pretty much.

13 Q. Basically everything that keeps the place
14 running; right?

15 A. Yeah.

16 Q. So you work with the troublemen?

17 A. I work with the crew and the troublemen and the
18 supervisor.

19 Q. In front of you, you have what's marked as
20 Exhibit 251. Do you recognize Exhibit 251?

21 A. It's a paper template called a "Corrective Work
22 Form."

23 Q. What do you mean by a paper template?

24 A. Well, this is a paper version of what was
25 handed to me back in, several years ago when we would
26 fill these paper templates out, or the troublemen would.

1 And then the next one is an electronic version. So
2 there's a difference.

3 Q. Okay. And let's go on to 252. What is 252?

4 A. 252 is the electronic version versus the paper
5 version that we just saw.

6 Q. So walk us through your role in this process.

7 A. Okay. So when there was a problem out in the
8 field, our troublemen primarily would fill out the paper
9 template, give it to me, and then I would take that same
10 information and I would enter it in a system called SAP,
11 and it would generate the electronic version that prints
12 out.

13 Q. Okay. So you take the handwritten notes of the
14 troublemen and input them into the computer?

15 A. They weren't always handwritten. They had the
16 option of either handwriting them or they would type the
17 template out on a computer and send it to me via email.

18 Q. Then you would enter that into the SAP system?

19 A. That's correct.

20 Q. What's the SAP system?

21 A. It's the system that we use to capture this
22 information, or to create what we called -- these are
23 called "notifications" notifications of work. We also
24 use SAP to do timekeeping.

25 Q. What do you mean timekeeping?

26 A. So when we do -- when I do payroll, it's

1 through SAP as well.

2 Q. Okay. So do you know what SAP stands for, or
3 did you already say that and I missed it?

4 A. I don't know specifically what SAP stands for.

5 Q. But it's a computer system that you use?

6 A. Yes.

7 Q. Let's go on to what's Exhibit 159. Do you have
8 159 there?

9 A. I do.

10 Q. Okay.

11 A. It's another electronic copy of a notification.

12 Q. Now, what I wanted to ask you about on this
13 one, on 159, is the long text at the bottom.

14 A. Okay.

15 Q. And specifically your name pops up in there.
16 And if you can, explain to us what these notes mean, how
17 they're made, why they're made.

18 A. Anytime you go into SAP, it captures your name
19 and it also captures the date and the time that you put
20 the note in there.

21 So in this exhibit, it shows that I made a
22 note, and the note is stating, "Per (WITNESS #12)," who
23 was then my supervisor for Transmission. So it says,
24 "Per (WITNESS #12), T-line Supervisor, work code should
25 be 534 for voltage connectors." And it was updated.

26 So we have work type codes that we use to

1 identify the work. And 534 is synonymous with bolt
2 connectors, which is what this work is.

3 Q. Okay. Then the next note -- that note is in
4 2012; right?

5 A. No, that note that I read, I was reading my
6 note.

7 Q. Okay. Your note's, your first note's in 2014?

8 A. Correct.

9 Q. Then there's a second note from you, same day
10 but different note?

11 A. Okay. So it's a planner group note. So the
12 note states, "Planner group updated from TLT to TLN."

13 And so we used planner groups to identify who
14 was going to do the work. And TLT is for Tower
15 Department, and TLN was specific to our group. So we
16 have a tower group that works tower, certain kinds of
17 work, and then there was certain work that we would do on
18 the towers. So this way you could differentiate who was
19 going to be doing the work.

20 Q. So updated from TLT to TLN. Does that mean
21 that it was changed from you guys to somebody else, or
22 from somebody else to you guys?

23 A. Somebody else to us. So instead of the Tower
24 Department group working the tag, we at Table Mountain
25 were going to be doing the work.

26 Q. And then finally, there's a third note in there

1 from you in 2016. Do you see that?

2 A. I don't see that on here.

3 Q. Should be on the second page.

4 A. Oh, okay. So that note says that the work was
5 completed by (WITNESS #8) on 6/18/16. And so that's
6 generally whoever completed the work, we note that.

7 Q. Okay. How do you get that information?

8 A. So generally when work is completed in the
9 field, or back then we would get a notification and the
10 information would be written on the notification and then
11 I would enter that same information into the SAP system
12 to close out that notification.

13 Q. Okay. Now, I want to talk to you about patrols
14 and inspections. What is your role in patrols and
15 inspections?

16 A. So my role is every year we have a maintenance
17 plan, annual maintenance plan, and it's all the detailed
18 inspections and the air patrols that we're going to
19 complete for the year. And so we'll get a master list
20 from what we call our "asset strategist." She'll tell us
21 what's going to be done that particular year. And my
22 role is to print all of those patrols out and give them
23 to the troubleshooters that are going to complete the work.

24 Q. Who is the asset strategist?

25 A. The asset strategist is assigned
26 geographically. And our asset strategist, her name is

1 (WITNESS #9).

2 Q. When you say you're supposed to pull the
3 patrols, print the patrols out, what does that mean?

4 A. That means that I enter the job number and then
5 there's a function where you just simply print them out
6 and then you hand them to whoever is going to be doing
7 the work.

8 Q. What is it they're printing out?

9 A. I'm printing out either the detailed
10 inspections, which is on the ground, or the air patrols,
11 which is the one that we do in the air.

12 Q. Okay. Now, the yearly inspection, the yearly
13 calendar or schedule, that's something you get from
14 asset, from asset -- the asset strategist, I'm sorry, at
15 asset management?

16 A. Yes. That's -- they put that together.

17

18 (Grand Jury Exhibit 577 was marked for identification.)

19

20 Q. You should have an Exhibit 577. It's actually
21 going to be underneath that in the -- should be, should
22 be in this pile right here. There you go.

23 You have in front of you 577; correct?

24 A. Correct.

25 Q. What is 577?

26 A. It's just a master list of the maintenance work

1 that we were going to do for the year of 2014.

2 Q. Now, there's different colors on there.
3 There's yellow, there's red, there's blue. Do those
4 colors have any significance?

5 A. I'm not aware of the significance of those
6 colors.

7 Q. Is the Caribou-Palermo detailed inspection on
8 577?

9 A. It is.

10 Q. Where is it at? And, by the way, feel free,
11 you can always get up here and play with the Smartboard
12 if you want to.

13 A. It's highlighted in yellow on here. And it's
14 the fourth line down from the top.

15 Q. Okay. So walk me through how to read this.
16 First column says function location, or "function loc.,
17 ETL3190." What does that mean?

18 A. So every line that we have out there has its
19 own name that it also has its own number that identifies
20 the line. So that line, ETL, is 3190. That's the number
21 of the line. And then we have the name of the line.

22 Q. Okay. "Proposed basic finish date." Do you
23 know what that, what that means?

24 A. That's the month in which we want to conclude
25 that particular patrol -- or inspection, excuse me.

26 Q. Okay. And then, "Description, "10391

1 Caribou-Palermo tower"?

2 A. I don't know the significance of the 10391, but
3 the Caribou-Palermo is the line that it's referring to.

4 Q. Any idea what this "MAT" column means?

5 A. It's just identifying -- the BFZ is for a
6 detailed inspection. But if you saw BFX, that's for an
7 air patrol that we do with helicopters.

8 Q. Okay. "Main work center, Table Mountain."
9 That's your place; right?

10 A. That's right.

11 Q. Does that say "short text"?

12 A. It's just letting you know that it's a detailed
13 inspection versus an air patrol.

14 Q. And then this column that says "work," what is
15 that?

16 A. That's a number that the asset strategist would
17 put in there. I don't know the significance of those
18 numbers except that they were hours allotted to that
19 particular inspection and/or patrol.

20 Q. In your previous experience at Table Mountain,
21 was it common for asset management to allot hours for
22 inspections or patrols?

23 A. The first couple years that I was there, it was
24 always on those master lists. And then I believe it was
25 like 2016 was the last year they did it. And then moving
26 forward, we don't do that anymore.

1 Q. So what does that allotted work hours, that 89
2 hours represent?

3 A. I don't know how they derive or come up with
4 those numbers. It was believed to be a number that they
5 expected the patrol or anticipated that particular patrol
6 or inspection to be done.

7
8 (Grand Jury Exhibit 578 was marked for identification.)
9

10 Q. All right. Another copy just blown up so you
11 can actually read it.

12 Now, on to 578. Do you recognize 578?

13 A. It appears to just be a master list, a
14 maintenance plan, master sheet, for 2014.

15 Q. Okay. Now, you said every year at the
16 beginning of the year, asset management, your asset
17 strategist, sends you out a schedule; correct?

18 A. That's correct.

19 Q. Does that schedule get changed and amended
20 during the year?

21 A. Sometimes it does based on access or safety
22 issues, weather. Things like that are given
23 consideration.

24 Q. So is it unusual to get several different
25 schedules for the same transmission lines during the
26 year?

1 A. You might have a schedule that gets revised
2 based on a meeting generally with -- so every year the
3 troublemen would get together and they would review the
4 last maintenance plan. And if changes were needed, then
5 we would try to do that at that time. So there would be
6 revisions.

7 Q. Okay. This one, 578, starts with patrols to be
8 completed by the end of the month, January 2014; is that
9 correct?

10 A. It starts that way, yes.

11 Q. Then goes through April?

12 A. Right.

13

14 (Grand Jury Exhibit 578B was marked
15 for identification.)

16

17 Q. And the second page, which I believe is 578B --
18 or, yeah, should be 578A or B. I'm sorry, I lost track.

19 A. B.

20 Q. B. That would be May through June?

21 A. Correct.

22

23 (Grand Jury Exhibit 578C was marked
24 for identification.)

25

26 Q. And 578C would be July and August?

1 A. That's correct.

2 Q. Now, again, is the Caribou-Palermo line
3 reflected on this schedule?

4 A. It's reflected in the month of August. And
5 it's the fourth line down.

6 Q. So line number 91, Caribou-Palermo. And then
7 we've blown it up up here.

8 One thing, the hours column has changed. Do
9 you have any idea why that would happen?

10 A. Maybe initially we were looking at an unrevised
11 copy. I'm not really certain.

12 Q. Is it common for that number to change every so
13 often?

14 A. Well, again, I don't really understand why the
15 hours were put on there in the first place. So a change
16 like that, I don't know why they would add or take away
17 hours.

18 Q. Okay. In your experience as the operating
19 clerk, the person who is inputting all of this data in,
20 were the numbers, the allotted hours reasonable for the
21 job that they wanted done?

22 A. I have no idea, because I've never done field
23 work, and I have no idea what it would take to do some of
24 these patrols.

25 Q. Well, was it common for patrols or inspections
26 to go longer than the allotted time?

1 A. Sure.

2

3 (Grand Jury Exhibit 587 was marked for identification.)

4

5 Q. Now I'm going to ask you to take a look at 587,
6 which appears to be an email.

7 A. 587?

8 Q. Yep.

9 A. Okay.

10 Q. Do you recognize the emails there, 587?

11 A. I have read this since this date, but it's only
12 been brought to my attention during this time period.

13 Q. Can you explain what this, what this email --
14 well, let's start, there's two emails, first off.

15 Initially there's an email from somebody named (WITNESS
16 #9) to (WITNESS #12) and you; correct?

17 A. Correct.

18 Q. (WITNESS #9), that's the person you identified
19 as your asset strategist?

20 A. That's correct.

21 Q. (WITNESS #12) was your boss?

22 A. Yes.

23 Q. And it says, "Updated P&I calendar effective
24 May 1st." What is a P&I calendar?

25 A. I don't know what she's referring to by P&I.
26 Patrol and inspection?

1 Q. Okay. Who is Warren Ma?

2 A. Warren Ma was a finance guy. I don't think

3 he's around anymore, but he was in charge of finances.

4 Q. Okay. It says, "All hours on each HQ calendar

5 have been updated to reflect proper targets as indicated

6 in the table below." Then there's the table below. Do

7 you see Table Mountain on there?

8 A. I do.

9 Q. Okay. What does BFU mean?

10 A. BFU. They've changed those MAT codes, so --

11 Q. Okay.

12 A. It's now BFZ.

13 Q. Okay. Because down below it says BFZ.

14 A. I don't know what those are.

15 Q. "Annual ground patrols, Table Mountain," and

16 2016 Units is zero?

17 A. I have no idea. That's a question for a

18 finance guy.

19 Q. All right. And then down below, "BFZ, detailed

20 ground inspections, Table Mountain, 9,919," with a money

21 target of 30.5, an hours target of .30.

22 Do you understand what any of that stuff means?

23 A. I wasn't familiar with the formulas that they

24 were using to get these so-called unit costs. That's

25 what they're referring to on this piece of paper.

26 Q. This is referring to the cost of actually doing

1 the inspections and patrols; right?

2 A. I believe it's referring to the unit cost for
3 doing the work.

4 Q. Okay. And that unit cost would be the proper
5 targets; am I reading that right?

6 A. Again, this is something that the finance
7 people are putting together. So they're indicating on
8 there that they're allowing so-called 1.2 minutes per
9 structure on like air patrols, so there's probably some
10 kind of formula they have to come up with these numbers.
11 But I was not involved in that.

12 Q. Okay. Why would they send this to you?

13 A. They probably sent it to everyone. It was
14 probably how they ended up coming up with these hours
15 allotted for the patrols, these different formulas.

16 Q. Okay. Now I want to go through some more
17 emails with you.

18 How are we doing with time? Everybody good?
19 Been going about an hour and a half. Anybody need a
20 break?

21

22 (Grand Jury Exhibit 579 was marked for identification.)

23

24 Q. All right. First up is going to be 579. Do
25 you have that in front of you?

26 A. I do.

1 Q. Do you recognize this email?

2 A. I have seen this email.

3 Q. Who is (WITNESS #11)?

4 A. (WITNESS #11) was one of our troublemen that
5 worked for Table Mountain. He's no longer with us there.

6 Q. Who is (WITNESS #10)?

7 A. He was another troubleman who worked at Table
8 Mountain, but he's no longer there.

9 Q. Okay. If you could read the emails out to us
10 and explain to us what they mean.

11 A. Okay. So it's, so this is a snippet of a
12 conversation. It's not a conversation in entirety. But
13 what I'm reading, it says, "(WITNESS #11)," it's based on
14 an email from me, "go ahead and charge yesterday to the
15 Volta if you want, and then you'll still have about 8
16 plus hours left to use today between the two of you."

17 Q. Okay. What is the Volta?

18 A. We have different lines named Volta. So this
19 email was probably based on a phone call that I received.
20 Oftentimes, the troublemen would call me and they'd want
21 to know if there were certain hours left on patrol. So
22 this could be the Volta Deschutes, it could be Clark
23 Volta. I would have to know the beginning of the
24 conversation to be able to determine that.

25 Q. Now, the subject of the email is CTNWD. Would
26 that be Cottonwood? And BENTON, number 2, do you know

1 which line that is?

2 A. That's just another one of our lines, but it
3 doesn't seem like it's even related to this response.

4 Q. Okay. But the Volta would be another
5 transmission line; right?

6 A. Most likely, yes. If it's referring to hours,
7 correct.

8 Q. And did you say that the 8 plus hours that
9 would relate to that allotment time?

10 A. So what would happen is the troublemen would go
11 out and they would physically do an inspection or an air
12 patrol. And then once they completed those patrols in
13 the field, they would have the paperwork part of it. So
14 it's two separate things, the field work and the
15 paperwork.

16 So when they came back in the office and they
17 completed all their work, they wanted to charge time to
18 complete the paperwork. And at that time they had kind
19 of this performance metric that they tried to meet. It
20 was really something that specifically (WITNESS #11) and
21 (WITNESS #10) and those troublemen back then, they felt
22 like they had to kind of adhere to these hours, so they
23 would ask me how many hours were left on these particular
24 patrols quite frequently.

25 Q. So -- but why would they be asking you -- if
26 they were doing an inspection on the Volta, why would

1 they be asking you about charging that inspection to the
2 Volta?

3 A. Because maybe they had already finished the
4 Volta in the field and they're wondering if there's hours
5 left on it to charge time spent doing paperwork.
6 Sometimes they could spend all day writing up these
7 notifications that we looked at earlier. Sometimes, you
8 know, it only took them like a few, few minutes,
9 depending on what they found.

10

11 (Grand Jury Exhibit 580 was marked for identification.)

12

13 Q. Okay. Let's go on to 581 [sic], another email.
14 Let's start with email on the bottom, an email from you
15 to (WITNESS #10) and (WITNESS #11), Tuesday, October 27,
16 2015. Do you recognize this email?

17 A. Where do you want me to start?

18 Q. Starting at the bottom and read up.

19 A. Okay. So that starts off with (WITNESS #22) --
20 is that what -- am I looking at the wrong thing?
21 Different piece of paper.

22 Q. Yeah, that's a different piece of paper. We're
23 going to have to look at that and see.

24 A. It looks like it's 580.

25 Q. Okay. Made a note of that, if you missed it,
26 it's 580.

1 All right. So 580. We've got the right one.

2 Do you recognize 580?

3 A. I do.

4 Q. All right. Starting with the first in sequence
5 emails on 580, can you read it to us and explain it.

6 A. So that would be starting on the bottom here.
7 So it says, "Hi, (WITNESS #10), (WITNESS #11), we've
8 reached our maximum hours on the Bridgeville Cottonwood,
9 we may be slightly over the allotted time, 95 hours total
10 versus 91.5 hours allotted. Time upload can't be
11 confirmed yet at this point. Please charge to something
12 else. Thank you."

13 Q. Okay. What is the Bridgeville Cottonwood?

14 A. It's another one of our lines.

15 Q. And 91.8 is the allotment for that line; is
16 that right?

17 A. It appears that way, yes.

18 Q. And at this point, 95 hours had been charged
19 against that inspection?

20 A. That's what it states.

21 Q. And then it says, "At this point, please charge
22 to something else." Explain to us what that means and
23 why?

24 A. So, again, I would get frequent phone calls
25 that generally started the conversation as to how many
26 hours were left on an inspection or air patrol, because,

1 again, they would go out and they would do the physical
2 work, and then they would have time needed or wanted to
3 write up all these notifications. So it looks like that
4 they were asking me how much time was left on this to
5 write up notifications.

6 And oftentimes, too, they would work these
7 detailed inspections or air patrols simultaneous, you
8 know, if the lines were next to each other. So they
9 might be working on two or three at once.

10 Q. All right. And then the second email up top,
11 can you read that to us and explain it.

12 A. So it says, "Update, based on the time upload,
13 we are at 85 hours. So that should be perfect. Not over
14 after all. Nonetheless, let's call it good so I can
15 close the patrol on Thursday."

16 Q. Okay. So, first of all, what's the time
17 upload?

18 A. So SAP uploads every night, and that's when it
19 captures the hours that may have been charged through
20 payroll. It uploads every night. And so you don't see
21 the true hours until the upload is complete.

22 Q. Okay. When you say, "Nonetheless, let's call
23 it good so I can close this patrol on Thursday," explain
24 that to us, please.

25 A. So I can't complete my work until they complete
26 their work. In other words, if I still have time to

1 enter for them, I can't close out a patrol. And, once
2 again, we have to differentiate the difference between
3 physically doing a patrol and writing up notifications.

4 So, again, there was like this performance
5 metric that they, these troublemen, were trying to meet.
6 They didn't want to, from a personal standpoint, go over
7 the hours. So this is just a conversation saying that if
8 you're done writing up notifications, let's do it,
9 because I need to close the patrol.

10

11 (Grand Jury Exhibit 581 was marked for identification.)

12

13 Q. Now let's go to 581. The real 581. Do you
14 recognize 581, the email chain?

15 A. Yes.

16 Q. All right. Who is (WITNESS #22)?

17 A. So (WITNESS #22) is my current supervisor.

18 Q. Who is Stacie Doyle?

19 A. Stacie Doyle was my clerical supervisor. She's
20 also been leading the Compliance group.

21 Q. And who is (WITNESS #6)?

22 A. (WITNESS #6) is one of our current troublemen.

23 Q. All right. So let's start again at the bottom,
24 because as we've discussed before, the --
25 chronologically, it goes bottom to top.

26 A. Okay. So this is dated September 25th, 2017,

1 and it's from (WITNESS #22) to me. It says, "Can we
2 ensure the helicopter cost was, in fact, split three ways
3 between the Tower Department using it on the
4 Caribou-Palermo structure, as well as sending it down to
5 Sac. for the Palermo Pease 19 over 40 insulator
6 emergency?" question.

7 And then my response to (WITNESS #22) was, "Hi,
8 (WITNESS #22). The helicopter costs --" I'm sorry, this
9 is not -- it's a little faint.

10 Q. Yep.

11 A. Oh, "The helicopter costs have not hit the PM
12 yet. Maybe we'll get lucky and they'll be split between
13 the other two jobs. I will follow up and let you know."

14 So, in other words, they hadn't billed it yet.

15 The Helicopter Operations Department is a
16 separate operation and they do all the billing for us for
17 these types of things.

18 So concluding this email, it looks like from me
19 to Stacie Doyle, I say, "Hi, Stacie. As we know, the
20 Helicopter Ops Department is not timely with the billing.
21 This is what sent to (WITNESS #22). regarding his
22 comments."

23 Q. So how are you involved with the helicopters
24 for the helicopter patrols?

25 A. So the air patrols are all done by helicopters.
26 And at the time, like back several years ago, we would

1 have to work with the local vendors to set up the
2 helicopters for the guys. Now we have our own department
3 and they do all the coordinating of the flights. And so
4 my involvement is that before I close out a patrol, say a
5 patrol is done, an air patrol, I got to make sure that
6 the charges have been billed on there. Sometimes there's
7 a delay in getting those charges billed because it's
8 controlled by a different department.

9 Q. Okay. What's a PM?

10 A. A PM is like an order number.

11 Q. So is that the unique order or job number for
12 each one of the inspections or patrols?

13 A. When we -- looking at a master maintenance
14 plan, each air patrol, each line, each ground inspection
15 has its own PM or order, yes.

16

17 (Grand Jury Exhibit 582 was marked for identification.)

18

19 Q. Let's move on to 582.

20 A. Okay.

21 Q. And, again, emails, (WITNESS #22), (WITNESS
22 #6), Stacie Doyle, and yourself.

23 So let's start at the bottom, and read them to
24 us and explain to us what's going on.

25 A. Okay. So this, the subject is the Caribou 2
26 line, which is a whole different line. It says, "Hi,

1 Stacie, per our earlier discussion regarding the
2 excessive and accumulative cost of the Caribou 2 ground
3 inspection, here are some of the plausible reasons the
4 costs are so high:

5 Helicopter was used to access poles that are
6 inaccessible. Can't walk on railroad tracks, and the
7 river blocks access, scope only from a long distance,
8 which is one sided;

9 Crew was used for one day to long-line into the
10 inaccessible poles."

11 In other words, we're using a helicopter, we're
12 dropping the guys down on a rope when we're referring to
13 long-line.

14 Another reason is the rugged terrain.

15 The fourth reason, we have a new troubleman for
16 the area.

17 And the fifth reason, "History of 'minimal
18 problems found' by previous T-men," which is the
19 troublemen, "which needs field confirmation for
20 inaccessible areas -- or location.

21 The inspection is assigned to (WITNESS #6), so
22 please reach out to him for additional questions."

23 Q. So let's stop right here. It sounds like
24 Stacie Doyle isn't real happy with how much, how long
25 this inspection is taking, is that --

26 A. Stacie Doyle was looking at the costs on this

1 particular inspection, obviously, and she's asking me
2 about it. And in looking at this email before, I'm
3 wondering where I had come up with all these reasons.
4 While I had evidently talked to our foreman who was
5 basically conveying the information to me, that's what I
6 recollect about it. But, yes, she was questioning the
7 excessive cost.

8 Q. Even more basic, why is Stacie Doyle asking you
9 why it's costing so much to do a, an inspection?

10 A. Because she was my clerical supervisor, and she
11 was in charge of compliance and things like that. If
12 you're going to use a helicopter, okay, if you're going
13 to long-line guys into rugged terrain, you're going to
14 incur some pretty hefty costs.

15 Q. Right. But I guess still goes back to the
16 question of wouldn't that be a question of (WITNESS #22)
17 and not a question for you as to why those costs are so
18 high?

19 A. I would love that. But maybe (WITNESS #22)
20 wasn't available, so they were hoping that I could get
21 the information probably from someone else, which looks
22 like I conveyed, but --

23 Q. All right. So let's read the continuation, the
24 later email, please.

25 A. Okay. It says, "Hi, Stacie." This is coming
26 from me to Stacie Doyle. "One more thing regarding this

1 detailed inspection. Historically, we were allotted 210
2 hours, and to date with a very thorough inspection we are
3 at 235 hours and near completion."

4 Q. 210 is what the company is telling you it
5 should be --

6 A. That's --

7 Q. -- correct?

8 A. Obviously, what was probably stated on the
9 maintenance plan.

10 Q. Right. 235 isn't enough, your guys are still
11 out there doing this inspection; right?

12 A. We're going over. But that's not untypical
13 either.

14 Q. Okay. And that's why, is that why the company
15 is, why you're writing the earlier email saying, "Hey,
16 this is why we're going so far --"

17 A. So you're talking about a specific patrol in a
18 specific year. We do a lot of patrols a year, so it's
19 just a generalization based on information that was
20 conveyed to me as to the plausible reasons why it was
21 expensive. Again, it was one of those lines where if you
22 can't come in on foot, then you're going to have to use a
23 helicopter and long-line.

24 Q. Right. But some of those things don't change
25 year to year; right?

26 A. Again, I'm not the geographic expert, and I've

1 not been out there, for example, to the Caribou 2 or any
2 of these lines, so --

3 Q. Right.

4 A. They can change, I'm sure.

5 Q. Right. But, for instance, the railroad tracks
6 don't go anywhere from year to year.

7 A. Correct.

8 Q. The river doesn't go anywhere from year to
9 year.

10 A. I agree.

11 Q. The mountains don't go anywhere from year to
12 year. So the accessability problems that are being
13 addressed here would be the same probably every year;
14 right?

15 A. Unless there was maybe a road that I'm not
16 privy to that washed out or something like that. But I
17 would say that that would be consistent.

18 Q. But if that were the case -- you said you got
19 this information from your, probably from your foreman;
20 right?

21 A. I believe I got it from (WITNESS #19), who was
22 then foreman, yes.

23 Q. Okay. If that were the case, wouldn't you have
24 expected that if you went to (WITNESS #19) and said,
25 "Hey, you know, these guys are on me because this
26 patrol's taking too long, this inspection is taking too

1 long. Why is it taking us so long to do it?" It would
2 be reasonable to expect that (WITNESS #19) said, we have
3 to do all this stuff because the road washed out?

4 A. (WITNESS #19) wasn't always our foreman. Our
5 foremans have changed a lot.

6 Q. Okay. But you said you think that you got this
7 information probably from (WITNESS #19) or somebody?

8 A. I had to have gotten it from someone like
9 (WITNESS #19), because I didn't know this about this
10 particular location. And I believe it was a conversation
11 with (WITNESS #19).

12 Q. Right. Like I said, the point is there's
13 nothing in there about a road washing out or some other
14 problem, it's basically the accessability problems here?

15 A. There are accessability problems based on this
16 email. But, again, it's a snippet of a conversation, so
17 I don't know if there's another conversation that gives
18 any other reasons.

19

20 (Grand Jury Exhibit 583 was marked for identification.)

21

22 Q. All right. So let's move on to 583. Do you
23 recognize 583?

24 A. I do.

25 Q. And please read to us and explain 583.

26 A. So it looks like (WITNESS #11), who was one of

1 our historical troublemen, he was one who frequently
2 called me like most every day. He was one who
3 specifically called me and was very concerned about the
4 hours on a patrol. And so was (WITNESS #10).

5 So this is an email from (WITNESS #11) dated
6 April 23rd, 2013. It says, "Hello, (WITNESS #21). How
7 about the Volta Deschutes? I was thinking we had way too
8 much time left on it."

9 And then I am sending back to (WITNESS #11),
10 "Hi, (WITNESS #11). Perhaps some hours did not get
11 uploaded prior to the payroll period closing today,
12 because as of now there are 105.5 hours on it, dot, dot,
13 dot, over. So let's just call it good with these, okay?"

14 And then he says, "Sounds great. Thanks for
15 the heads up. Appreciate the extra help."

16 And I respond, "No problem. Anytime."

17 So, again, it's a conversation in part. And
18 when I say "in part," we don't know what preceded this.
19 And he's asking me about the hours that are left on the
20 inspection. So most likely he wants to charge against it
21 to write up some notifications.

22 Q. But you're telling him you're at 105.5, so
23 you're over your allotment; correct?

24 A. They were, again, doing sometimes two, three
25 different patrols or inspections, and they would try to
26 utilize the time just to kind of comply with the hours

1 allotted. They didn't want to go over when they were
2 writing up notifications. So, again, there's a
3 difference between the physical patrols and the writing
4 up of notifications.

5
6 (Grand Jury Exhibit 584 was marked for identification.)
7

8 Q. All right. Let's move on to 584. Can you read
9 us this email and explain it.

10 A. Okay. So this is another one of our
11 troublemen, and his name is (EMPLOYEE #16). He's still a
12 troubleman with us today. It's from me to him. It says,
13 "Hi, (EMPLOYEE #16). Please do not charge anything else
14 to the Malin-Round Mountain number 2 quarterly air patrol
15 for 8/29/17. We can absorb further costs in the annual
16 air PM." Then I'm stating the number of that annual.
17 "For yesterday can I suggest?" And then I'm listing out
18 lines with hours.

19 And then there's a note that says, "On the
20 Malin-Round Mountain number 2 quarterly, previously you
21 posted 1 hour on 8/11/2017 for paperwork. Advise no more
22 charges."

23 Then says, "Add your switching and travel to
24 San Ramon. Let me know. Thanks."

25 So I'd like to explain something here. On our
26 500 kV lines, we do quarterly inspections, we do

1 quarterly air patrols. And so then we also have our
2 annuals, our annual patrols. And so this one, if we're
3 going to go out there and we're going to go on the Malin
4 and we're going to do an annual, we're not going to have
5 two different PM's to charge to, we're only going to
6 charge to one. So when I'm talking about absorbing the
7 costs, I'm saying that the annual PM is going to absorb
8 the cost for the quarterly. There's no sense in having
9 another PM to charge to because you're doing the same
10 work. You're reviewing the same line.

11 Q. Okay. But you said, "Please do not charge
12 anything else to the Malin-Round Mountain number 2. We
13 can absorb further costs in the annual air," and then the
14 PM. And that has its own order number; right?

15 A. I'm telling them that they should charge to the
16 annual because we don't need to be charging to two
17 different jobs when we're inspecting the same line.
18 That's a formality that we do.

19 Q. Okay. And then, "For yesterday can I suggest,"
20 and then what does that mean?

21 A. A lot of times these guys would turn to me if
22 they didn't do a paper timecard. It may have been a
23 conversation over the phone, because it looked like this
24 guy was going to be going to San Ramon. So he may have
25 called me, I don't know, because I don't have the
26 preceding conversation in front of me. But he may have

1 been wondering how to break down his time, considering
2 the conversation about the quarterly and the annual.

3 Q. All right. Going to switch gears here. So
4 this is probably a perfect time to take a break. It's
5 about five after 3:00, we've been going for over an hour
6 and a half.

7 GRAND JURY FOREPERSON: Okay. Let's take
8 break. Ten minutes?

9 MR. NOEL: Whatever you'd like.

10 GRAND JURY FOREPERSON: Fifteen? Fifteen.

11 I didn't admonish her.

12 MR. NOEL: Let's go ahead and do that.

13 GRAND JURY FOREPERSON: Okay. (WITNESS #21),
14 you are admonished not to discuss or disclose at any time
15 outside of this jury room the questions that have been
16 asked of you or your answers until authorized by this
17 Grand Jury or the Court. A violation of these
18 instructions on your part may be the basis for a charge
19 against you of contempt of court. This does not preclude
20 from you discussing your legal rights with your own
21 attorney.

22 (WITNESS #21), what I have just said is a
23 warning not to discuss this case with anyone except the
24 Court, your lawyer, or the district attorney. Do you
25 have any questions?

26 THE WITNESS: No.

GRAND JURY FOREPERSON: Okay.

THE WITNESS: I understand.

THE COURT: Thank you.

(Break taken.)

GRAND JURY FOREPERSON: All members of the Grand Jury have returned from their break, and our witness is present as well.

(Grand Jury Exhibit 585 was marked for identification.)

Q. (By MR. NOEL) All right. Moving on to 585. Do you have that one in front of you?

A. I do.

Q. Okay. Who is (EMPLOYEE #1)?

A. (EMPLOYEE #1) is our steel engineer.

Q. Okay. Explain the email chain to us here, please.

A. Okay. I'm going to preface the conversation and say not only is she a steel engineer, she's in charge of the budget for road work. So this email refers to John Lynott who was in charge of the road work itself, but (EMPLOYEE #1) would manage the budget.

So the email starts off as an email from me to (EMPLOYEE #1), and says, "I don't coordinate the work for Table Mountain, I just process it or do things based on a specific directive from management. Oftentimes, I have

1 no idea regarding the particular details of the job, nor
2 would (WITNESS #9).

3 As far as this job, John Lynott or (WITNESS
4 #12) may be able to shed some light on the two road
5 contracts that got moved from TM31282658, work type code
6 374, Caribou Table Mountain, to 31295301, work type code
7 505, for the Caribou-Palermo." And it was for White
8 Construction.

9 "It looks like John Lynott asked," and I'm
10 getting a LAN ID of this Daniel Barstad. The four digit
11 LAN ID is specific to PG&E. And, again, it says, "It
12 looks like John Lynott asked DCEC Daniel Barstad to move
13 the 2017 charges totaling \$45,060.36 from one job to
14 another, but they're not for the same line," question
15 mark. "(WITNESS #12) has been on an extended vacation,
16 but will be back in the office next Monday. Your odds of
17 getting information from John Lynott would probably be
18 the best option right now. I'm sharing this accounting
19 problem with (WITNESS #22), who is our acting supervisor,
20 because we can't just move these charges back to a
21 completed 2016 job without affecting that calendar year
22 budget."

23 Q. So sounds to me like the problem is charging
24 work on one PM to a different one?

25 A. So, I don't know why everybody seems to think
26 that I'm the accounting expert. I didn't go to

1 accounting school. So I have a steel engineer asking me
2 about this particular job, and it appears that White
3 Construction, which was an outside vendor, did some road
4 work and that those charges, they were trying to move the
5 monies from one job to another job and in a different
6 calendar year. So I was questioning that, like what are
7 we doing? Because generally when we move monies, it has
8 to be for the same line. It's not for two different
9 lines. So I was really confused with what they were
10 doing here.

11 Q. So this \$45,060.38 was originally charged to
12 Caribou Table Mountain with a PM number, then it was
13 moved to Caribou-Palermo with a different PM number; is
14 that it?

15 A. That's what it states, but it was my
16 understanding from further conversation that those two
17 lines kind of intersect so that the road was kind of like
18 an intersecting road. But, nonetheless, I haven't seen
19 it where you start with one job and then you move it into
20 another unrelated line.

21 Q. And then let's go up to your last response to
22 (EMPLOYEE #1).

23 A. All right. So you don't want me to read what
24 she wrote to me?

25 Q. It's not important.

26 A. Okay. Then I said to her, to (EMPLOYEE #1),

1 "Just curious how we justify moving money from a 230 kV
2 line to a 115 kV line that's not in the same proximity or
3 intersect via a right-of-way. Never seen this before."

4 Q. Okay.

5 A. And, again, I just said that I heard that they
6 did somehow intersect. So I don't, I don't know. But
7 this was, this was a questionable, hadn't seen this done
8 before where we moved, you know, monies from one to
9 another.

10

11 (Grand Jury Exhibit 586 was marked for identification.)

12

13 Q. Let's move on to 586.

14 A. All right.

15 Q. Do you recognize 586?

16 A. I do.

17 Q. Now, what does 586 pertain to?

18 A. Let me refresh my memory real quick.

19 Q. Okay.

20 A. Okay. So I'm sending an email to (EMPLOYEE
21 #16), who is one of our troublemen. He was also the
22 fill-in supervisor for (WITNESS #12) frequently, as he
23 would be upgraded from a troubleman to a supervision
24 position.

25 Okay. So I'm putting, "Hi, (EMPLOYEE #16),
26 (WITNESS #1) will fly the one southern air patrol due in

1 August when we schedule maintenance using helicopters on
2 August 26 or 27, 2014. This will be more cost effective
3 than having (WITNESS #10) or (WITNESS #11) doing it,
4 since we will be working in the general vicinity and can
5 knock this out in a very short time, along with segments
6 of the Caribou-Palermo line that are inaccessible by
7 foot. Hope this is agreeable with you."

8 So this line is, Plumas Sierra Tap, is like a
9 very, very short line, like minimal structures on it.

10 And then I sent an email to (WITNESS #12),
11 "FYI, just keeping you in the informational loop."

12 Q. So it sounds like this is pertaining to the
13 2014 detailed inspection of the Caribou-Palermo?

14 A. It doesn't say the detailed inspection. I can
15 assume that. We have had other work out there during
16 that time period.

17 Q. Okay. All right. And it's talking about the
18 Caribou-Palermo that are inaccessible by foot and setting
19 up helicopters for that; correct?

20 A. Correct. But, again, I don't know if it's
21 regular work or if it's, you know, like an inspection or
22 an air patrol that's annual.

23 Q. All right. Let's jump ahead to November 8th,
24 2018. Were you working that day?

25 A. I was.

26 Q. When did you become aware of the Camp Fire?

1 A. When I stepped out the door and I saw the
2 plumes of smoke.

3 Q. When did you become aware that the Camp Fire
4 may have been started by PG&E equipment?

5 A. When a public statement was made really. There
6 was always speculation, so I don't know the exact
7 confirmed date that it was public that we may have had
8 involvement.

9 Q. When did you become aware that the
10 Caribou-Palermo line may have caused it?

11 A. Okay, so the Caribou-Palermo I had heard that
12 it had started there. And I became aware of it when my
13 supervisor asked me to pull inspections and air patrols,
14 historical inspections.

15
16 (Grand Jury Exhibit 588 was marked for identification.)
17

18 Q. Okay. 588 is an undated email that appears to
19 be from you to someone named (WITNESS #22). Do you
20 recognize this email?

21 A. Well, as it's in front of me, it must be to
22 (WITNESS #22), who was my supervisor.

23 Q. Would he have been the person you just said
24 asked you to look into the patrols?

25 A. (WITNESS #22) did ask me when the fire started
26 to get the historical air patrols and inspections. He

1 asked for specific ones. I don't recall exactly which
2 ones I pulled. As well as Stacie Doyle, who was my
3 clerical supervisor. And she's also the compliance
4 person. So she asked for the same information.

5 Q. Do you know how Stacie Doyle knew?

6 A. Because she's in Compliance, so as soon as
7 there's something of that magnitude, she gets a phone
8 call.

9 Q. So read us your email here and explain it to
10 us.

11 A. All right. So the email reads, (WITNESS #22),
12 the last annual air patrol was split between two dates,
13 9-11-18 and 9/19/18, with two findings." And then I list
14 what those findings were.

15 "I've researched the detailed inspection and
16 suspect it was done in 2014, but there's no file for that
17 line."

18 At one time, we had people come in here and
19 rearrange all our files; it was a mess.

20 "I'm looking to see if the detailed inspection
21 was misfiled. We've done air patrols up to that year.
22 Sorry for the delay of information. I'll get back to you
23 on the ground inspection."

24 So I'd like to add to that, when I'm
25 referencing this file not being found, we did have some
26 contract people come in to PG&E. We were trying to

1 standardize our filing system, and so we contracted these
2 people out. And they did end up misfiling a lot of our
3 stuff. So we had to go through everything again to try
4 to get it back in line. And so, obviously, this was
5 temporarily missing. We did find it.

6 Q. Okay. So you did eventually find the detailed
7 inspection for the Caribou-Palermo?

8 A. Yes.

9
10 (Grand Jury Exhibit 589 was marked for identification.)

11
12 Q. Next up is the email chain 589.

13 A. Oh, it's the continuance. So along that line,
14 the email is from me to (WITNESS #22), my supervisor.
15 "Good news, the Caribou-Palermo 2014 patrol was misfiled.
16 We completed the last detailed inspection in 2014. There
17 were a lot of priors, namely connector tags. There were
18 four new findings, which all, which were all insulators
19 in the colon section of the line."

20 So, so to explain that, we have, where the line
21 takes a different turn, we identify it with like little
22 colon marks when it takes a turn. We also identify it
23 with like a semicolon when it goes a different direction.
24 So we've got a straight line, and then when I refer to a
25 colon, just so you know what that is.

26 Then the email continues on to say, "Let me

1 know if I can further assist. Will be getting a
2 materials delivery tonight. Do you want me to stay for
3 the delivery? Please confirm."

4 Q. All right. So you have in front of you Exhibit
5 No. 167. Should be underneath the stuff on your left, I
6 believe. It's a big packet.

7 A. It's a part of this detailed? Oh, yes. Okay.
8 Got it, I believe.

9 Q. Do you recognize Exhibit 167?

10 A. So this is the Caribou-Palermo, and it's the
11 2014 detailed inspection.

12 Q. The entire report? Is it the entire report?

13 A. Well, based on something that I saw earlier,
14 it's missing a page, but I didn't know that until earlier
15 today. It's missing page 38.

16 Q. That's the entirety of the report that you
17 found somewhere misfiled on November 8th?

18 A. Yes.

19 Q. Where did you eventually find it?

20 A. It was filed. So the filing system has kind of
21 morphed into different formats. There was a time where
22 we actually had folders like, you know, five-page kind of
23 folders where we would file the patrol. Then we'd file
24 like non-routine patrols in one section. We'd file
25 completed tags.

26 So this I don't recall specifically. It was

1 probably in one next to it. Just kind of -- I don't
2 remember specifically where I pulled it, but it was right
3 in the close proximity.

4 Q. So this front page that refers to Operation
5 Control Ticket, who generates this page?

6 A. I print this page out from the maintenance
7 plan, from the annual maintenance plan. It's part of the
8 whole patrol.

9 Q. Okay. Explain to us how to read this.

10 A. What do you mean? Like --

11 Q. How do you read this page? What does all this
12 information mean?

13 A. Okay. On the top, every detailed inspection
14 and/or air patrol has its own PM number. So we start off
15 with an order number that's specific to this particular
16 detailed inspection. It names the line we're talking
17 about, the Caribou-Palermo. We have a start date of
18 August 30th, 2014, and an end date of August 31. So this
19 was expected to be completed by the end of August.

20 I wrote in here, "Detailed Inspection," so it
21 stood out. That's what I normally do. It's also listed
22 down in the bottom here. That's about the summary of the
23 page. It does have Stacie Doyle's name on there since
24 she was kind of the lead of this work. And it has her
25 telephone contact.

26 Q. Okay. Who is SRF5 partner?

1 A. That is Stacie Doyle.

2 Q. So how is Stacie Doyle a partner? Is she
3 actually out there doing the inspections?

4 A. No. She's assigned the clerical work. She's
5 the one in Compliance that's in charge of -- all the
6 asset strategists would work under Stacie Doyle. She was
7 like the lead.

8 Q. All right. So let's go over to I think next
9 page. The Transmission Line Inspection Data Sheet. Do
10 you recognize that document?

11 A. Yes.

12 Q. Is your writing anywhere on that document?

13 A. Yes, in several spots.

14 Q. Okay. Where?

15 A. So at that time when, as I explained earlier,
16 we get the paper template, we'd have to enter that
17 information into SAP, and that would generate a
18 notification number. So my handwriting is listed on the
19 notification number on the far right-hand side. That's
20 my handwriting.

21 And then down where there's a stamp near the
22 bottom, my handwriting is also, "Confirmed to DOCC."
23 That's the date that the patrol was supposedly finished.

24 "Add/delete equipment," that is my writing
25 there.

26 And then on the stamp where it says

1 "Notification," that's when all this was closed.

2 "9/2/14," that's my handwriting.

3 "Equipment changes," it says that I sent an
4 email to (WITNESS #9). And that's also my handwriting.

5 Q. What about this up here where it says the
6 "Existing"?

7 A. Oh, that is mine, yes.

8 Q. What does that mean?

9 A. So when the guys go out in the field, the whole
10 objective of doing a detailed inspection or an air patrol
11 is that they find new problems out there. And so in this
12 particular scenario, it looks like we already had an
13 existing tag on the structure that's referencing colon 26
14 over 215. And so instead of that being a new finding,
15 there was already an existing tag. So that notification,
16 notification number was existing, and then the others
17 underneath it were new findings.

18 Q. All right. Let's go on to the next page. What
19 is this page?

20 A. So every time a troubleman goes out to do a
21 detailed inspection or an air patrol, I run a report on
22 the existing notifications. We call it "priors." And
23 those priors go into the patrol, and they reference them
24 to see if there's tags already existing for a particular
25 problem. So this is a prior list.

26 Q. This is something that you generate?

1 A. It's something that's generated through SAP.
2 It's a report that you can generate through SAP to
3 capture any existing tags.

4 Q. So going back to where we started with the tags
5 that are generated by the troublemen in the field, they
6 bring those back, they enter them, and then you enter
7 them into the SAP system; correct?

8 A. Repeat that.

9 Q. The troublemen generate the tags, they either
10 write out or go into the computer and print out
11 notifications, the corrective work forms, that then come
12 to you to get entered into SAP; correct?

13 A. One way or another, yes. Either handwritten or
14 the typed-up template is given to me.

15 Q. Then this list is based upon what you've
16 entered in SAP; correct?

17 A. What I entered in SAP or -- we have different
18 departments. So we are, once again, identified as TLN.
19 That's our planner group. So you're going to get a
20 combination of notifications on the priors. You're going
21 to get stuff from our vegetation department. You'll get
22 road tags. You'll get tower tags. We get a lot of
23 different kind of tags.

24 Q. Okay. So going back to the previous page, the
25 Transmission Line Inspection Data Sheet, you said you had
26 written on colon 26 over 215 "existing," which would

1 indicate that that was a preexisting tag; is that
2 correct?

3 A. That's what it says.

4 Q. Okay. And do you find that tag on this list
5 someplace?

6 A. And, now, you have to be specific about when
7 that tag was worked. That tag could literally be worked
8 overnight, it could be worked in a two-, three-day time
9 period. So it depends on when I run these priors as to
10 when they actually worked the tag.

11 Q. Okay. So how far in advance of the patrol or
12 inspection do you run the priors?

13 A. We try not to run them until they're, you know,
14 ready to go out and do them, because it's at their
15 discretion that they go out and work these patrols. So
16 if we run these three weeks in advance, it may change,
17 you know. So now we've tried to do it about a week
18 before.

19 Q. But the existing tag for 26/215 wasn't on the
20 list when this was printed; correct?

21 A. Well, let's look at the priors. I don't know
22 unless I researched it. That's the way it appears. But
23 maybe it got worked from the time I ran it.

24 Q. So it wasn't on the priors list when you ran
25 the priors, so then would that have been something that
26 would have been added to the list, notification, that

1 would have gone out after the list was compiled or
2 printed and then --

3 A. You're asking me about something that occurred
4 in 2014. What I would have to do to properly give you an
5 answer is look up the notification number and look at the
6 date in which it was created and look at the date in
7 which it was worked. I don't know why it's not appearing
8 on that list.

9 Q. Okay. So when the troublemen go out and do
10 these inspections or patrols, sometimes does it occur
11 that assets are moved or missing or out of service?

12 A. It's their responsibility when they're doing
13 the patrol to let us know. As you go through, and we'll
14 get to that in a minute, there's an object list which
15 lists all the equipment numbers, and it's part of their
16 job when they're out there that they look at those
17 particular structures. And if there's something that's
18 changed in the field, they should let us know, yes.

19 Q. Okay. What's the process for that to occur?

20 A. So via the detailed inspections, because we're
21 not going to do that by air, because you're going to be
22 getting out and assessing it. I mean, you assess things
23 differently by air. You're not like -- you're looking at
24 it from an aerial standpoint, but you're not looking
25 right at the structure. You look at things differently
26 when you're on the ground. But via a patrol, if a

1 troubleman goes out, when he's done with a patrol, he'll
2 come back and he'll let me know that there's certain
3 things that need to be -- like equipment needs to be
4 changed or equipment is missing.

5 And so then what we do is we generate what's
6 called an "RW notification." And that's to our asset
7 strategist group so that they update the maintenance plan
8 so that next year when our guys go out, that those things
9 are corrected.

10 But mind you, not all the time -- it's not just
11 the troublemen's responsibility, it's also a
12 responsibility with engineering and/or supervision to get
13 these things conveyed.

14 Q. What about the Tower Department?

15 A. The Tower Department has its -- you know -- I
16 don't work the Tower Department, but they should have the
17 same protocol where that information is conveyed.

18 Q. So if the Tower Department goes out and drags
19 the tower away and it's no longer there, they should be
20 putting in the information to update this; correct?

21 A. You would think that engineering would be on
22 top of that and have that taken care of. Because if the
23 whole tower goes away, I'm sure the steel engineer's
24 involved.

25 Q. All right.

26 A. But let me explain something else.

1 Q. Go ahead.

2 A. I think it's important to note that steel has a
3 different cycle than wood. So when we're talking
4 specifically about a maintenance plan, that maintenance
5 plan, like steel, it may come out then five years, you
6 know. So if something happens in the interim and it's
7 not identified via a detailed inspection, and it's
8 identified in a different manner, then that asset would
9 not have been changed via our troublemen and an RW
10 notification. I don't know if I'm making sense.

11 Q. That's a very good point. So you're familiar
12 with the *ETPM*, correct, and the inspection cycles that
13 are set forth therein; right?

14 A. I am. The *ETMP* manual is changing constantly.

15 Q. Right. But the *ETMP* manual, isn't it true,
16 mandates that wood transmission poles, so wood poles
17 being used to support transmission lines, of 115 or
18 greater, have to have a detailed inspection of every two
19 years; correct?

20 A. Not steel.

21 Q. No, wood.

22 A. Wood is every other year.

23 Q. Yes.

24 A. We either do a ground or we do an air.

25 Q. So six big steel poles, steel towers,
26 disappeared in 2012 and were replaced by wooden, by 15

1 wooden poles, they probably should have been getting
2 detailed inspections; right?

3 A. I would have to look specifically at the line
4 that you're talking about. That's something that would
5 involve engineering, such as Henry Ho, Kichi Maximura
6 (phonetic), those big projects. I think you're leading
7 up to like a horseshoe.

8 Q. We're talking about -- we can go back to here.
9 When did you start with Table Mountain?

10 A. 2012.

11 Q. When in 2012?

12 A. I started ironically on April Fools' Day.

13 Q. So you were there on December 21st, 2012?

14 A. Yes, I believe I was.

15 Q. Do you recall on December 21st, 2012, a large
16 section of the Caribou-Palermo line collapsing?

17 A. Take that back. Maybe I wasn't there. My
18 father was very ill that year, and he died January 7th,
19 so maybe I wasn't around.

20 Q. Okay. All right. I'm very sorry.

21 Were you aware that a portion of the
22 Caribou-Palermo line collapsed in December of 2012?

23 A. By you telling me that. But specifically, we
24 work on so many different lines and have so many
25 different things going on, I know that's a monumental
26 thing, but only by you stating it does it bring back any'

1 type of memory.

2 Q. Okay. But that's the kind of thing that should
3 be reflected in here; right?

4 A. What's that?

5 Q. You know, when you've got, for instance, tags
6 22/188?

7 A. Those are all connector tags. Those are all
8 voltage connector tags.

9 Q. Exactly. But 22/188 fell down on December
10 21st, 2012.

11 A. See, you know that, but I don't know that.

12 Q. Exactly. And you're the one that's supposed to
13 know that; right?

14 A. I am not --

15 Q. Because you're the one who is putting this
16 information in SAP?

17 A. No, I'm not supposed to know that, because I am
18 just running that --

19 Q. Right.

20 A. -- for every detailed and air inspection. And
21 mind you, we've got about 118 of them. I'm only --

22 Q. Right. But if your troublemen are out there
23 doing their jobs, they should be recognizing that these
24 towers are all missing and that they're listed -- we'll
25 go on to the Transmission Line Object List.

26 A. And let's base that on when did they go out

1 there? Because steel has a different cycle. When did
2 this happen, and when did they go out there?

3 Q. Well, I'm telling you that this happened on
4 December 21st, 2012 --

5 A. Okay.

6 Q. -- on the Caribou-Palermo. Somehow in 2014
7 those towers were inspected. In 2014, those towers show
8 up in your priors list.

9 A. What's showing up on the priors list?

10 Q. Towers that no longer exist.

11 A. You mean the connector tags?

12 Q. Yeah. There's a tag in there -- or there's a
13 notification in there that says --

14 A. Those tags are going to show up as priors until
15 they're actually worked. So logic tells me --

16 Q. But the tower is gone. The entire section of
17 line is gone. It's no longer there to be worked.

18 A. Okay. Well, then if nobody's worked the tag,
19 they're going to exist. That's not something that I'm
20 going to monitor.

21 Q. Okay.

22 A. It would come from engineering. And then
23 engineering should have followed up with the removal of
24 those existing tags.

25 Q. Or the guys who did the inspection in 2013 --

26 A. Okay.

1 Q. -- could have noted that you were missing those
2 on their report; correct?

3 A. If they were missing in the field, then the
4 troubleman's responsibility is to identify them.

5
6 (Grand Jury Exhibit 596 was marked for identification.)

7
8 (Grand Jury Exhibit 597 was marked for identification.)

9
10 Q. All right. Let's go back to time stuff. And
11 direct your attention to 596. We'll go through this.
12 597.

13 We've already talked a little bit about
14 timecards. You said you're the one who processes the
15 timecards; correct?

16 A. Yes.

17 Q. I want you to take a look at 596 and 597 and
18 kind of walk us through them. Are you finding them in
19 there?

20 A. There we go. 596, yep.

21 Q. And walk us through the timecards -- I just
22 pulled a couple of timecards -- how to read them and the
23 information and how you use it.

24 A. Okay. So I'm the timekeeper for Table Mountain
25 Transmission. I'm the timekeeper, well, historically for
26 approximately 10 to 12 guys, for the crew, and for the

1 troublemen. So everybody submits a timecard. They
2 submit them either handwritten or via email. These
3 particular timecards are for a gentleman named (WITNESS
4 #1), or (WITNESS #1), as he's referred to. And then it's
5 my job to enter this timecard via SAP. And that's the
6 summary of it.

7 Q. Okay. So when we go down, on notes and
8 comments, this timecard -- well, first of all, what date
9 was this timecard for?

10 A. It states July 24th, 2014.

11 Q. And there's a number written in here, comments,
12 CDLALO9 something something?

13 A. So every guy has their own little twist of
14 telling me or trying to help me differentiate whether
15 they're doing crew work, whether they're doing air or
16 ground inspection or patrol. And namely I need to try to
17 figure out if the guys are switching. So that log number
18 is my cue with this particular gentleman that there was
19 some switching going on. And you can see that on the
20 bottom line where it says SWTCHO, that's also synonymous
21 with switching. Whereas the other first line is actual
22 work, which is different.

23 Q. Okay. So explain the notes/comments section
24 down here for us.

25 A. So most of the guys -- well, all of the guys
26 historically have been working ten-hour days. Some of

1 them have Fridays off, some of them have Mondays off. So
2 they work four tens. So what we're seeing here is ten
3 hours. The first five hours it just says that he was at
4 the Caribou-Palermo. To me, I don't know if that's a
5 regular job, I don't know if that's a detailed inspection
6 based on what I'm looking at, but it references an order
7 number, which, as we know now, is the inspection for that
8 particular year.

9 Q. That 41980167, that's the PM number, the order
10 number, for the 2014 detailed inspection?

11 A. Correct.

12 Q. Okay.

13 A. So then underneath it it says Colgate Palermo
14 switching. So after he worked on the patrol for seven
15 hours, he's telling me that he went out and he did some
16 switching, and he did it on a different line, and he
17 charged it to a different order.

18 Q. Okay. So according to this, on July 24th, '14,
19 (WITNESS #1) charged 7 hours from 1630 to 1130 and then
20 1200 to 1400 to the Caribou-Palermo detailed ground
21 inspection 41980167?

22 A. That's what he's stating.

23 Q. Okay. And then the next one, 597, do you see
24 that?

25 A. Yes.

26 Q. You have that?

1 A. He's charging 10 hours to the Caribou-Palermo
2 same detailed inspection on July 29th.

3 Q. Okay. So we started to talk about this
4 earlier. The information with the, from the timecards --
5 you're the timekeeper; right?

6 A. Yes.

7 Q. And the information from the timecards not only
8 goes into the payroll system, it goes somewhere else;
9 right?

10 A. Well, it gets charged to whatever order.

11 Q. Okay. That's what I'm going to. Is that in
12 the SAP system?

13 A. We enter the order in the SAP system where we
14 enter payroll, yes.

15 Q. And why does the payroll, why is there pay
16 records or timecards stuff go into SAP, go into the
17 orders?

18 A. So that guys can get paid and so that we can
19 allocate the charges to the appropriate orders. Now,
20 mind you, I want to say something. There's certain
21 people, like myself, I'm a non-billable employee. I
22 don't charge to a job every day. I go to work and I have
23 a code that I put in, and it just defaults to what we
24 call a PCC, which is just a generalized charge.

25 These troublemen and these linemen, they go out
26 and if they work specific jobs, then their jobs are

1 allocated based on the job numbers that they put in
2 there.

3 Q. Okay. Are there ways for you to go in and
4 check who has been working on different projects and how
5 many hours they've spent on that project or they've
6 billed to that project?

7 A. Yeah. If you go into SAP and if you go into
8 the cost of the job, you look at the labor, and it will
9 give you a list of who charged to the job on what
10 particular day.

11

12 (Grand Jury Exhibit 590 was marked for identification.)

13

14 Q. I'm going to back up here to 590. Should be
15 there somewhere in front of you.

16 A. Which I can't read.

17 Q. It's difficult to read. And we can blow it up
18 here.

19 A. I can see it better there than here.

20 Q. That didn't help, did it? Okay. Let's get out
21 of there.

22 A. I can see that.

23 Q. And you're more than welcome to get up here and
24 walk around and use this.

25 Have you seen 590 before?

26 A. I haven't read it because it's too small.

1 Q. Okay.

2 A. So --

3 Q. Do you want to take a minute here where it's

4 blown up on the big screen?

5 A. Okay.

6 Q. What is 590?

7 A. So when we do payroll, we can go into -- it

8 looks like the display of all the time that was entered.

9 It gives us -- if I put display and I put a date range in

10 there, it should show all the jobs and the accounting,

11 what everybody got charged.

12 Q. So is this 590 a list for a certain person?

13 A. Yes. It looks like it's for (WITNESS #1).

14 Q. Okay. Who is EEEP4?

15 A. That would be me.

16 Q. You were talking earlier, I think you referred

17 to a LAN ID?

18 A. Yes.

19 Q. That's your LAN ID?

20 A. Everybody at PG&E has a specific LAN ID,

21 four-digit, and that's mine.

22 Q. And then in this column here it says "General

23 receiver." That seems to be PM numbers; correct?

24 A. Yes.

25 Q. Does this chart show all of (WITNESS #1')

26 billed hours by PM number for August, or at least some of

1 them?

2 A. I'm looking at the date range.

3 Q. Starts down here at the very bottom, on line
4 54, August 1st, 2014. And it ends on line 2 with August
5 29th.

6 A. I can assume that. I mean, there's 31 days in
7 August, but if that's what it states, I'm sure it's
8 capturing it all.

9 Q. Okay. Do you see the PM, the order number, for
10 the Caribou-Palermo detailed inspection on here?

11 A. It ends in 0167. Can you point it out to me?
12 Because I don't --

13 Q. It's right there.

14 A. Okay.

15 Q. On line 52. I'm still looking. If you see it
16 -- there's another one. On line 45, 46. Feel free, if
17 you find any, tell me. I'm still looking for them.

18 A. Well, this is August. And based on the
19 information that you presented to me with these
20 timecards, some of it would have been in July.

21 Q. Okay. The only two that show up on here, looks
22 like from what I can see, are August 6th and August 7th.
23 And that's a grand total of -- am I reading this right?
24 -- 5 hours and 8 hours? Or 5 hours and 3 hours, so that
25 would be 8 hours?

26 A. The way it appears, yes.

(Grand Jury Exhibit 591 was marked for identification.)

Q. Okay. All right. So let's move on. Same thing, 591. Like I said, feel free to get up and move around and look at this thing. If you want to play with this thing, pen's right here; circle things.

What is 591?

A. Okay. So now it's for (WITNESS #23), or (WITNESS #23). He's the other troubleman. And it looks like it's a summary of his time charged for the month of August.

Q. Again, do you see the order number for the Caribou-Palermo on there?

A. Well, you've got it in yellow. I see it there.

Q. So right here in yellow?

A. Here. Here. There's one here. All right.
So --

Q. All right. So, looks -- looking, we've found four all together; right? So am I reading this right? So that's 5 hours on line 60 on August 6th; 10 hours each on August 13th and August 14th, and that's lines 39 and 38; and then 3 hours on August 18 and line 34. Does that appear correct?

A. That's what you're showing me, but --

Q. And that's what I'm asking, are those the only

1 ones we could find?

2 A. No, there's one here.

3 Q. Okay. So you found one on August 7th and line
4 56. Anything else?

5 A. No. That looked like it.

6 Q. Okay. So all together, 38 hours; is that --

7 A. That's the way it appears, yes.

8 Q. So we got 3 plus 10 plus 10 -- 23 -- plus 10 --
9 33 -- plus 5 -- 38; right?

10

11 (Grand Jury Exhibit 592 was marked for identification.)

12

13 Q. Okay. Next up, number 592. Do you recognize
14 that one?

15 A. Now we're jumping into a different calendar
16 year, which I don't understand, because the year on this
17 is 2015 in July.

18 Q. Right.

19 A. So that wouldn't even be applicable to this.

20

21 (Grand Jury Exhibit 593 was marked for identification.)

22

23 Q. Yep. And 593?

24 A. (EMPLOYEE #16) was a crew member. And this is
25 for (EMPLOYEE #16). And he is charging 5 hours to this
26 particular inspection.

25
26

(Grand Jury Exhibit 594 was marked for identification.)

Q. 594?

A. (EMPLOYEE #15). (EMPLOYEE #15) was also our, one of our foremans at one time. He's charging 5 hours to this detailed inspection, as well as -- mind you, now these guys are charging to other orders, also. And it's come to my attention that the order on the bottom, and I'm not sure about the other order, but the one that begins with 3 is also work on the Caribou-Palermo. It's like regular work, not the annual inspection.

Q. Right. But he's specifically charging to 41980167, which is the Caribou-Palermo detailed --

A. Correct.

Q. -- ground inspection?

A. Yep.

Q. As is, the same is true with (EMPLOYEE #16)?

A. Correct.

Q. As a matter of fact, (EMPLOYEE #16)'s and (EMPLOYEE #15)'s match; right?

A. Yes.

Q. (EMPLOYEE #16) is also charging that 3107 number?

A. That's correct.

Q. But specifically charging 5 hours to 41980167?

1 A. That's correct.

2 Q. That is specifically the Caribou-Palermo
3 detailed inspection?

4 A. For 2014.

5 Q. For the 2014, thank you.

6

7 (Grand Jury Exhibit 595 was marked for identification.)

8

9 Q. Next up.

10 A. (EMPLOYEE #13). He was also a crew member.

11 Q. I'm sorry, this is 595.

12 A. Pardon?

13 Q. This is number 595. I forgot to identify it
14 for you.

15 A. I see.

16 Q. We have to keep a record for her as to what
17 we're talking about.

18 A. So this is a summary for (EMPLOYEE #13)
19 pertaining to the detailed inspection. He charged 5
20 hours as well as the same hours to the other two jobs
21 that the other crew members did.

22 Q. All right.

23 A. Now, mind you, we were missing (WITNESS #14).
24 (WITNESS #14) was also out there, but this was
25 referencing the incorrect summary for 2015, so we would
26 need to add his hours in as well.

1 Q. Yep.

2

3 (Grand Jury Exhibit 598 was marked for identification.)

4

5 (Grand Jury Exhibit 599 was marked for identification.)

6

7 (Grand Jury Exhibit 600 was marked for identification.)

8

9 (Grand Jury Exhibit 601 was marked for identification.)

10

11 (Grand Jury Exhibit 602 was marked for identification.)

12

13 (Grand Jury Exhibit 603 was marked for identification.)

14

15 Q. Okay. So now I want to move on to these

16 handwritten notes that start off with 598 and go all the

17 way to 604. I'm sorry, 603. You should have them right

18 there in front of you.

19 A. 598 to 604?

20 Q. 603. 603.

21 A. Okay.

22 Q. Do you recognize those handwritten notes?

23 A. So these are my handwritten notes.

24 Q. What do these notes -- well, let's start off

25 with 598, the first page. Walk us through what these

26 notes mean.

1 A. So I think it would be easier, and I don't mean
2 to change it up, but I think it would be easier if we
3 started on 600 --

4 Q. Okay. Go ahead.

5 A. -- to better, to better explain to these folks
6 the significance.

7 Let me first start by saying that when the Camp
8 Fire started, I was asked to pull detailed inspections
9 and air patrols for (WITNESS #22) and Stacie Doyle. And
10 when I did that, I looked at this particular inspection,
11 and I could obviously see that there were discrepancies
12 like with the dates. So I took it upon myself to try to
13 figure out what had actually happened on this patrol.
14 And so that's what these notes are referring to.

15 And so if we start with Exhibit 600, what I did
16 is I first looked at the detailed inspection itself, the
17 order number, and I went into the costs, and I wanted to
18 know who charged to this particular job and what dates.
19 And so if you look at Exhibit 600, we'd start off with
20 (WITNESS #1). And so all the dates there were the dates
21 that he charged the job. And then we've got the crew,
22 which was a four-man crew. And then we've got (WITNESS
23 #23), who was the other one assisting on this particular
24 inspection.

25 So what you're looking at is -- that's pretty
26 fuzzy, but the hours charged, and then there's some

1 negated hours as well, specifically on (WITNESS #1).

2 Do you want me to continue?

3 Q. Yes, go right ahead. You can explain it.

4 A. So that's really the summary of that first
5 sheet is that I was just trying to identify who charged
6 to the job and on what dates by looking at the order.

7 Q. So how did you find, for instance, who charged
8 to the job? How did you get that information?

9 A. So if you go into the order itself, which is an
10 SAP, there's a place where you can look at the actual
11 costs. And then you would click on the labor that's
12 related to that job, and it will list everybody who's
13 charged from timekeeping. It drops in there, so you can
14 see that.

15 Q. Okay. Go ahead. Where do you want me to go to
16 next?

17 A. Okay. So Exhibit 599 is just, it was like a
18 partial. I had to keep all notes. So this was just a
19 partial of 600, of Exhibit 600. It's kind of
20 repetitious.

21 So then we can move to 598. And so what we
22 have had historically at Table Mountain is we've got a
23 calendar for the work that the crew is planning to do,
24 and then we've got a calendar for all of the switching
25 that the troublemen were scheduled to complete. And so
26 this particular list, what I was looking at were those

1 two historical calendars to try to figure out what was
2 going on on a particular day.

3 And the very top entry, 8/25 -- when I say
4 "CARPAL," that's Caribou-Palermo. So the crew was to
5 call working out there that day, as well as 8/26. They
6 were working on that line. But it's a different number
7 up there than the detailed inspection, so they probably
8 had work simultaneous with this inspection on that same
9 line.

10 And then it shows that the crew was out there
11 on 8/27.

12 So I was looking for any kind of specific
13 information that I could glean from those calendars. We
14 were doing work on 8/29 on the Table Mountain Butte line.
15 Then it showed on 8/1 there were fires, and they were the
16 Bald and Eiler fires, and they were up in the Burney
17 area. They started on 8/1.

18 And if you proceed down the list, you'll see
19 that on 8/5 specifically all of the crew went to Burney
20 because of the fire. At that time we only had one
21 troubleman, and that would be (WITNESS #1). So
22 presumably he was up there as well.

23 8/6, we had what's called a "road show" in
24 Chico, where management came. We had like a half day of
25 listening to what they had to present, and then there was
26 5 hours that people had left in the day to work.

1 And then the SW that you see next to 8/7 and
2 8/8 refers to there were switch locks on the calendar.
3 So one of our troublemen, whoever it was assigned to, had
4 to be switching on those particular dates.

5 We were also doing not only the
6 Caribou-Palermo, but it looks like we were doing the
7 Palermo Pease, which is a whole different inspection. We
8 were doing that simultaneous with this. And that's shown
9 on 8/8.

10 8/9 there was switching on the Wood Leaf
11 Palermo, which is kind of in close proximity.

12 And then it just jumps on down to 8/19. And it
13 looks like we had some kind of an expense job that we
14 were working on the Caribou. And the WW stands for
15 Westwood. That's a whole different line.

16 8/21, we were still on the Caribou-Westwood.
17 We did some work on another line called the Head Gate
18 Tap. There was switching on the Glenn line.

19 So this is just really capturing, or trying to
20 figure out what everybody should be doing, you know, like
21 the troublemen and the crew. And then I was trying to
22 relate this to this specific patrol and see where
23 everybody was supposed to be. And that leads me to
24 Exhibit 602. Now, mind you, I did this just kind of like
25 a cursory review. This is why there is all this
26 scribbling. But what I tried to do here was to look at

1 the dates on the patrol and see what dates coincided with
2 timecards.

3 So you'll see on the top, on (WITNESS #1), 7/29
4 his timecard says that he was out there on this patrol.
5 And I was trying to match it here, and I could not.

6 7/31, same thing. There's nothing in here that
7 says that date on here, and so forth.

8 So we went through this whole list and the two
9 marks in yellow -- or two marks in orange, those were the
10 only dates, based on my research, that appeared that he
11 was out there, on the 6th and the 7th on here.

12 And then same with (WITNESS #23) and the crew.
13 I was just trying to figure out how these dates lined up.

14 So (WITNESS #23), all the dates that are in
15 here did match his timecards. So everything in orange, I
16 could account for those 38 hours in here.

17 Then the crew, on this particular patrol, they
18 did not put that the crew was out there, but they were
19 out there simultaneous with the other job. And that was
20 on 8/27, 2014. And they each worked 5 hours on this
21 particular patrol.

22 So that's what my research showed.

23 Q. So based -- you started to say something
24 earlier on about backing out time?

25 A. So, again, I am an operating clerk, but I also
26 do payroll. And a lot of people look to me for

1 accounting. I try to be as conscientious as possible.
2 If I know somebody may have transversed a number, or
3 let's say they said they were on the Caribou-Palermo
4 working crew work, well, that's different than if you
5 charged to a detailed inspection. So in referencing
6 backing out time, there was an instance on this
7 particular patrol where I did back out time.

8 Q. Why?

9 A. Because based on the summary that I gave you --
10 and I'm speculating because we're talking about the year
11 2014, but based on Exhibit 598, we had other things going
12 on and there was reason to believe that I needed a
13 confirmation on some of the charges belonging to (WITNESS
14 #1).

15 Q. If you add up all of the time that was charged
16 to the Caribou-Palermo inspection in 2014 before you
17 backed things out, how much time was it?

18 A. I have no idea.

19 Q. Well, when you backed out (WITNESS #1's) time,
20 you backed out 27 1/2 hours; right?

21 A. I'll agree with that.

22 Q. And total time for this inspection was 93
23 hours?

24 A. Okay.

25 Q. So before you bucked it out -- before you
26 backed out (WITNESS #1), that would have put it at 130

1 1/2 hours; is that correct?

2 A. If you say so.

3 Q. Well, 93 plus 27 1/2. Or is it 120?

4 GRAND JURY CLERK: One-twenty.

5 Q. (By MR. NOEL) One-twenty and a half, point
6 five, hours. So well over the allotted time, whether it
7 was 89 or 100 or 90.5; correct?

8 A. It would have been based on what you're telling
9 me. Mind you, we have a lot of inspections and/or air
10 patrols that are either over or under.

11 Q. Right. But this inspection was well over?

12 A. And, again, if we talked about the formulas in
13 which they're coming up with for this hour allotment that
14 we used to have, to me now it makes no sense because I
15 would say that there wasn't really enough time allotted
16 for that.

17 Q. Right. And the allotted time was either 90.5
18 or 89?

19 A. If they say so.

20 Q. Correct?

21 A. Based on their formula.

22 Q. And after you backed out (WITNESS #1's) hours,
23 it dropped it down to 93.5 or -- yeah, 93?

24 A. But I think we should bring up Exhibit 598 once
25 again. I don't just arbitrarily back out time. I'm
26 privy to switch logs, I am privy to conversations with

1 foremean. At that time, I was working with management.
2 There had to have been a reason, a plausible reason, and
3 I think that on this Exhibit 598 we can better see. One
4 of the dates that was backed out was 8/5. If all of our
5 people are in Burney on a fire, I highly doubt that
6 (WITNESS #1) was the only one working a detailed
7 inspection, because he was the only troubleman around at
8 the time.

9 8/7 was another day. We had a switch log. He
10 was the only troubleman, I believe, in the area. And so
11 the accounting, instead of being charged to the
12 Caribou-Palermo should have been charged to switching on
13 to Sly Creek Tap.

14 And then there was another date somewhere down
15 in here that did not match up with the patrol, because,
16 as we looked at earlier, there were only two days that he
17 so-called was in the field. So the time was backed out,
18 waiting for a confirmation, and I obviously never got
19 back to that. So anyway, I just wanted to further
20 explain it --

21 Q. Okay.

22 A. -- that there had to be a plausible reason.

23 Q. Let's go back to 590. This is the (WITNESS #1)
24 time sheet stuff; right? This shows (WITNESS #1's)
25 billed hours from 8/1 through 8/29. This shows that on
26 8/5 that (WITNESS #1), 10 hours yard maintenance. So is

1 that what you changed it to?

2 A. On 8/5?

3 Q. Yeah, 8/5. Shows him 10 hours August 5th,
4 2014. Follow it all the way across, 10 hours, 1033,
5 blah, blah, blah. It goes all the way over here, it says
6 yard maintenance.

7 A. That's 10/6; right? I can't see that far.

8 Q. It's okay to get up and walk. It's right here.
9 Here's 8/5.

10 A. Okay.

11 Q. That's the day you said it was the fire?

12 A. Right.

13 Q. And that goes all the way across, it says 10
14 hours, and he was doing yard maintenance. All the way at
15 the other side.

16 So I'm asking is that what you changed his
17 entry to?

18 A. No. That was taken out.

19 Q. What do you mean it was taken out?

20 A. I would have to look at that. I would have to
21 look at his timecard.

22 Q. Okay.

23 A. I know that there were date discrepancies.

24 Q. So you also determined, based upon their
25 timecards, that on August 27 that (EMPLOYEE #15),
26 (EMPLOYEE #13), (EMPLOYEE #16), (WITNESS #14) all worked

1 5 hours on the Caribou-Palermo?

2 A. That's what they put on their timecard. That
3 was the day that they long-lined out there.

4 Q. Okay. That was on the --

5 A. Should have been on the 27th, although they
6 dated this patrol incorrectly by putting it 8/28 at the
7 conclusive date.

8 Q. Right. Their timecards showed that they were
9 working on order number 41980167 on --

10 A. They did that, but they also were working
11 another job that was simultaneous on the same line.

12 Q. Right. Let me show you what's in evidence,
13 544.

14 A. Okay. This is the first I've seen this.

15 Q. No, I realize that.

16 A. Uh-huh.

17 Q. Shows they were doing the helicopter actually
18 on the --

19 A. On another job simultaneous. They used that
20 helicopter to do both the detailed inspection, it's my
21 understanding, and this other job.

22 Q. All right. I think that's -- did pretty good
23 today.

24 Questions?

25 Now the jurors themselves are allowed to ask
26 you questions. They've written them down, and they give

1 them to me and we review them, then I will read them to
2 you.

3 (Mr. Noel and Grand Jury Foreperson confer).

4 Q. (By MR. NOEL) All right. These are questions
5 that have been written down by some of the jurors and to
6 be asked of you.

7 If a troubleman was over the allotted hours and
8 still had to, and still had work to complete, how was the
9 work completed?

10 A. Okay. So we're talking about two different
11 parts of the work. The physical field work should
12 always, on a detailed inspection, be the last date that
13 they were physically in the field.

14 As far as the creation of notifications, again,
15 the mindset for these troublemen is that they were -- it
16 was like a personal performance measurement that they did
17 not go past these hours. That's why they would call me.
18 So when it came time to do the notification creation,
19 they'd say, "How many hours do I have left on that
20 patrol?"

21 And if I said like 8, they'd say, "Great, I've
22 got a day's worth of work." You know, "I'm going to
23 charge the day to that, to create notification."

24 But they didn't want to exceed the patrol for
25 the notification creation. But that's how they would do
26 it.

1 Q. So what if for some reason they're still out
2 doing the detailed inspection?

3 A. They're going to go over. And you'll see
4 historically there's times when we've gone well over. So
5 this fixation on hours, hour allotment, is really kind of
6 a silly measurement, because we would quite often go over
7 or quite often we would go under, depending on what we
8 were doing.

9 Q. We have seen a number of forms detailing
10 planned inspection hours for each month. Is there a
11 similar form that details the actual hours spent on these
12 inspections?

13 A. Actual hours are what we were just looking at
14 earlier on the screen where we would look into the hours
15 on the actual order applicable to align. And if you look
16 at the labor charges there, then you can see what was
17 actually charged.

18 GRAND JUROR #4: I'm not sure you answered the
19 question. I asked if there was a form that printed out
20 like that form showing actual hours worked for that
21 month?

22 THE WITNESS: A form? Oh, well, you could, you
23 could see that captured through SAP on timekeeping. So
24 you could narrow it down to a certain employee and a date
25 range, and you could print that out and you could see
26 where if time had to be corrected. And when I say that,

1 I want to be very specific about the accounting portion.
2 Because there was never a time when we actually changed
3 the hours that they said that they were working. It was
4 an accounting issue. So in answer to your question, sir,
5 in timekeeping, yes, you can see that.

6 Q. (By MR. NOEL) If there was so much shifting of
7 hours from one line or department or another, how does
8 management know how to arrive at the number of hours to
9 plan for inspections?

10 A. That's a really good question. Because, again,
11 when it came to these hours, I was not the one that came
12 up with a formula. I was not the one that assigned the
13 hours. I have no idea how, how much time it took to do
14 this.

15 So repeat to me the whole question.

16 Q. If there was so much shifting of hours from one
17 line or department or another, how does management know
18 how to arrive at the number of hours to plan for
19 inspections?

20 A. So there wasn't always a lot of shifting. Not
21 to say that there wasn't. If you shift monies for any
22 reason, it has to be on the same line. You can't go, as
23 we explained earlier, you can't take money from one job
24 and then just move it to another, another line. It
25 should be line for line. And from a, from a financial
26 standpoint, that's not my job. That's something that's

1 done by people like Warren Ma, that we mentioned his
2 name, the financial people. I would never actually move
3 monies. I'm not profiled to do that.

4 Q. Was the schedule of planned maintenance based
5 on the previous year's planned or on the previous year's
6 actual maintenance?

7 A. I really don't know how the hour allotments --
8 I mean, I haven't really done a comparison. But
9 essentially, like if there were certain patrols scheduled
10 for January of one year, then the following year we would
11 do those same patrols. But, for example, we would
12 alternate based on cycles. One time it would be air,
13 then it would be ground. But we wouldn't -- I don't know
14 how they came up with those numbers, I really don't. I
15 don't know how that would change.

16 Q. In planning maintenance, how much weight is
17 giving -- given to the prior trouble list items carried
18 over from year to year?

19 So that probably, that's probably not a good
20 question for you. You're not making the schedules;
21 right?

22 A. I'm not making the schedules, no. And I don't
23 -- like I said, those hours, I don't even know the
24 formulas except for what I read on there how they come up
25 with those.

26 Q. Were you personally aware prior to November

1 8th, '18, of the general age of the Caribou-Palermo line?

2 A. Pardon?

3 Q. Were you personally aware prior to November

4 8th, 2018, of the general age of the Caribou-Palermo

5 line?

6 A. No, I was not. Truly, I was not.

7 Q. Have you subsequently been made aware of that?

8 A. Yes, I have.

9 Q. Is it fair to say that a detailed inspection

10 was carried out on the Caribou-Palermo line in August of

11 2014, but none since then?

12 A. I would have to check my records, but with the

13 cycle of steel, we are due for that I know this month.

14 It has not been done yet. But I believe that was the

15 last detailed inspection, yes, in answer.

16 Q. If a troubleman does not take a priors list

17 with him, can he be certain if an item on any particular

18 structure has been cleared if he cannot see a problem?

19 A. No, he wouldn't be certain. So taking a list

20 out -- repeat that again.

21 Q. If a troubleman does not take a priors list

22 with him --

23 A. Yes.

24 Q. -- can he be certain of any, of an item on a,

25 any particular structure has been cleared if he cannot

26 see a problem?

1 A. No, because if you're referencing priors, if
2 you don't have it in front of you, then you don't, you
3 don't know. I mean, they mark a box, it's either
4 completed, or if it has a prior it has a check mark as
5 well. So they're supposed to go from structure to
6 structure and review each location. And that's captured
7 here in a detailed inspection.

8 Q. How often is a steel structure supposed to have
9 a detailed inspection?

10 A. I believe it's every five years. But we are
11 reviewing a lot of processes, and this *ETMP* manual we
12 have has had some changes. So I don't know if that cycle
13 will be sooner than later.

14 Q. Do other lines have similar issues with regard
15 to their inspections and their record keeping?

16 A. I'm sure there is instances in which I'm not
17 privy to, maybe you are, but this is not a clean
18 inspection, per se, so I should hope not.

19 Q. Anything else?

20 I see no hands.

21 Madam Foreperson, would you like to admonish
22 the witness?

23 GRAND JURY FOREPERSON: Yes.

24 (WITNESS #21), you're admonished not to discuss
25 or disclose at any time outside of this jury room the
26 questions that have been asked of you or your answers

1 until authorized by this Grand Jury or the Court. A
2 violation of these instructions on your part may be the
3 basis for a charge against you of contempt of court.
4 This does not preclude you from discussing your legal
5 rights with your own attorney.

6 (WITNESS #21), what I have just said is a
7 warning not to discuss this case with anyone except the
8 Court, your lawyer, or the district attorney. Do you
9 have any questions?

10 THE WITNESS: No. Thank you.

11 GRAND JURY FOREPERSON: Okay. Well, thank you.

12 MR. NOEL: All right. You are done.

13 THE WITNESS: Thank you folks for listening.

14 MR. NOEL: Go home and relax.

15 THE WITNESS: Dismissed?

16 MR. NOEL: We would not dismiss you. You're
17 free to leave.

18 [DISCUSSION OMITTED.]

2 OCTOBER 8, 2019; 8:45 a.m.

3 (Confidential Special Grand Jury Hearing Proceedings)

4
5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 MR. NOEL: We're ready to go?

10 THE FOREPERSON: Yes.

11 MR. NOEL: Chief Fowler.

12 [Captain Fowler enters the courtroom.]

13 GRAND JURY FOREPERSON: Chief, before you sit
14 down, please raise your right hand to be sworn.

15 Okay. Chief Fowler, do you solemnly swear that
16 the evidence you shall give in this matter pending before
17 the grand jury shall be the truth, the whole truth, and
18 nothing but the truth so help you God?

19 THE WITNESS: Yes.

20 GRAND JURY FOREPERSON: Thank you. Have a seat,
21 please.

22 **EXAMINATION**

23 BY MR. NOEL:

24 Q. For the record please state your full name
25 spelling your last name.

26 A. Arthur Orin Fowler, F-o-w-l-e-r.

1 Q. And do you have a nickname by which you go?

2 A. Yes.

3 Q. What is it?

4 A. Chip.

5 Q. By whom are you employed?

6 A. Cal Fire.

7 Q. In what capacity?

8 A. Battalion chief in the intel shop in the North
9 Region Office in Redding.

10 Q. What's the intel shop?

11 A. One of our primary jobs is to monitor fire
12 activity throughout the north region of California which
13 is roughly half of the area that Cal Fire is responsible
14 for and report to the region chiefs about new fires, how
15 big they are, how fast they're moving, the threats there
16 that are out in front of them. That's the primary one.

17 Q. How long have you been with Cal Fire?

18 A. Approximately 25 years.

19 Q. What training and experience do you have that
20 qualifies you for your job at the intel shop?

21 A. To become a battalion chief you are required to
22 be a fire captain for, I believe, three years. And then
23 there's an interview process to get on the eligibility
24 list -- it's a state-wide list -- so that you can apply
25 for battalion chief jobs open. And then there's
26 additional interviews for each job usually as you apply.

1 Q. How long have you been in your present position
2 with the intel shop?

3 A. Approximately two months.

4 Q. Have you received any specialized training to
5 prepare you for your new position?

6 A. No. I would think that the experience I had in
7 my previous position helped play a role in being hired as
8 one of the intel battalion chiefs.

9 Q. And prior to your current position, what was
10 your assignment within Cal Fire?

11 A. I was a fire captain in Butte County in the
12 pre-fire engineering position.

13 Q. What is pre-fire engineering?

14 A. Pre-fire engineering is a role in our department
15 where we use GIS and local knowledge to help identify
16 where we should put pre-fire projects like shaded fuel
17 breaks to help protect our community and also use GIS to
18 map projects as well as other map projects.

19 Q. What is GIS?

20 A. It's Geographic Information System.

21 Q. How do you use Geographic Information Systems to
22 plan for fire?

23 A. We can use data that has been collected over the
24 years. A lot of the data is collected by Sacramento.
25 And we can display that on a map, and we can see where
26 our different values at risk are at. We can see the

1 types of vegetation that's out there, slope, weather
2 patterns such as humidity, like average humidity or
3 average wind, average heat.

4 And once those are displayed on a map, you can
5 see where our values of risk are at and you can also see
6 where the previous shaded fuel breaks or other vegetation
7 management projects that we can use to help slow down or
8 stop a fire are. We can put that on a map and see where
9 holes are at and where we need to focus on additional
10 fuel reduction projects.

11 Q. How do you use vegetation management to plan for
12 fires?

13 A. Vegetation management is primarily where we go
14 in and say -- like the Loafer Creek area. The Loafer
15 Creek Campground is a large vegetation management
16 program. And it's -- we go in and burn it. Primarily
17 what we use the VMP program for is to burn the grass and
18 the undergrowth so that we get rid of the ladder fuels
19 and the large amounts of fuels that build up over the
20 years.

21 And when that happens, it gives us an
22 opportunity to slow down or stop a fire easier because
23 the fire will stay on the ground instead of getting up
24 into the crowns of trees and into the brush.

25 Q. You used the term "ladder fuels." What are
26 ladder fuels?

1 A. Ladder fuels are fuels that help a fire get from
2 the ground into the crowns of trees. So those fuels can
3 be low-hanging branches. It can be overgrown brush. It
4 can be pine needles that just drape in the branches that
5 burn much easier than branches do and the fire will more
6 easily spread.

7 Q. Does Cal Fire keep historical records of fires?

8 A. Yes.

9 Q. Why?

10 A. There's multiple reasons. One reason is to
11 determine the types of vegetation that burned.
12 There's -- even if I'm not from an area and I see the
13 fire history map and see that there's been a fire stopped
14 in that certain location, I may not know why that fire
15 was stopped there, but I knew it was stopped there at one
16 point. It could be a road, it could be a natural
17 barrier, or it could be a dozer line. And that gives us
18 an opportunity to plan to stop that fire there again.

19 Q. Is there a requirement that Cal Fire as a state
20 agency keep historical fire maps?

21 A. Yes.

22 Q. How long has Cal Fire been keeping historical
23 fire maps?

24 A. In the data that I have seen we have some fire
25 perimeters dating back to the 1800s.

26 Q. How are the historical fire maps kept?

1 A. There are 21 Cal Fire units in California and
2 each of them are required to collect these fire
3 perimeters and send them to Sacramento annually around
4 February.

5 Q. So the next question is where are these
6 historical fire maps kept?

7 A. There's an environmental scientist in Sacramento
8 that maintains the database that has -- he'll take my
9 fire perimeters from Butte County, for example, and, for
10 lack of a better term, stitch them together throughout
11 the state so that the following year we all have access
12 to the fire history throughout the state.

13 Q. How are the individual fire maps made?

14 A. Individual fire maps --

15 Are we talking new fire maps?

16 Q. Let's talk presently and as much as we can
17 historically.

18 A. So when there's a new fire, somebody with a GPS
19 unit or -- well, there's multiple ways we can get the
20 data. Sometimes it's a picture and the person doing GIS
21 is just looking at the picture and drawing them --
22 drawing them -- drawing the fire in the GIS program to
23 the best of their ability. Sometimes it's a firefighter
24 with a GPS unit that brings that GPS unit back and
25 downloads it after they've walked the fire and gives the
26 data off of it.

1 Sometimes it's -- there's infrared flights that
2 take place at night by aircraft. And they can send me a
3 perimeter that they see at least of the heat. It may not
4 be the exact perimeter, but it's used to create a new
5 fire map with operations.

6 Q. Prior to this age of computers and electronics,
7 how were fire maps created?

8 A. I suspect they were just hand drawn.

9 Q. Have you seen hand-drawn fire maps?

10 A. I have.

11 Q. And all of those fire maps are gathered in
12 Sacramento?

13 A. The -- I don't know about the maps themselves,
14 but the fire perimeters are electronically gathered in
15 Sacramento or for Sacramento, yes.

16 Q. All right. Next to you you have what's marked
17 as Exhibit 606, and I also have it up on the big board.

18 Can you explain to us what 606 is.

19 A. This is a fire history map primarily for Butte
20 County and the surrounding area. And it has fire history
21 on it dated back to the 1800s. And I color-coded that
22 map to more easily identify the most recent fires. So
23 red being the most recent and that bluish color being the
24 oldest.

25 Q. Can you explain to us how you put this map
26 together.

1 A. Essentially used the geodatabase that's provided
2 from Sacramento with additional fire perimeters that I
3 have received here locally and used the GIS program
4 called Arc Desktop and used that program to create the
5 map.

6 Q. So this was made from the official records of
7 Cal Fire?

8 A. Yes.

9 Q. And feel free to stand up, and I'll show you
10 real quick. We use this (indicating) arrow. You can
11 draw, you can zoom, or whatever.

12 And explain to us how to read this map.

13 A. For this particular map the only thing I put in
14 the legend was the fire history because that was the
15 primary goal of this map was to display fire history for
16 Butte County. So the only thing in the legends are those
17 fires grouped by date.

18 And so like all the red is our fires in Butte
19 County from 2016 through 2018. So it's a little hard to
20 read on this. But, for example, this fire here
21 (indicating) was the Cherokee Fire in 2017.

22 Q. We can -- oops. We can blow it up.

23 A. We can blow it up, but you can't see the labels.
24 But each fire or most fires that had a fire name or age
25 range assigned to it in the database are labeled. And
26 anything over a certain size -- and I don't recall what I

1 used. I believe it was 10,000 acres -- have kind of a
2 bolder title to it. So those larger fires pop out.
3 Otherwise, they kind of get lost in the map.

4 And so this fire was the Cherokee Fire in 2017
5 that took place the same time as the fire in Bangor and
6 in LaPorte. And the majority of this (indicating) red,
7 if not all the majority of it, is the Camp Fire.

8 Q. Now, it looks like there are some yellow and
9 blue and orange lines and patterns within the perimeter
10 of Cal Fire. Is that true?

11 A. Yes.

12 Q. What do those depict?

13 A. Those -- the fire history kind of stacks on top
14 of each other. Oldest is on the bottom and the newest is
15 on top. And so what we try to do with this map so that
16 people had an idea of when those fires burned was add an
17 outline so that you could see all these other fires.
18 These are all -- with the exception of some of the rare
19 highways but most of these different colors in here are
20 other fire perimeters outside of the roads, the rest of
21 the lines.

22 Q. And the fire is marked. And we can't really
23 read the names blown up. But using the big board over
24 there, the printed-out copy are the individual fires
25 marked with their information?

26 A. Most of them. There were some that didn't

1 populate.

2 Q. And what is the information that is provided for
3 those fires?

4 A. So it should be the fire name, the year of the
5 fire, and any fire -- maybe it's a thousand acres. Any
6 fire over a thousand acres has the acreage associated
7 with it. If we did acreage for every fire, it would just
8 be -- it would be difficult to read the map.

9 Q. All right. So before we go on -- oh, we've got
10 to get to the "X" out of that and just focus. I've got a
11 blowup here of the Camp Fire.

12 A. Okay.

13 Q. And, you know, kind of use that bigger view to
14 explain a little bit further the Camp Fire and the
15 history of fire in that area.

16 A. So the only areas that we don't have a fire in
17 in this section of the county are these areas that are
18 off white or gray color. Everywhere else there's been
19 fire in the county. And so some of them are small and
20 very old. And they don't even necessarily have names
21 attached to them.

22 We have some that burned. Like the Lightning
23 Complex of 2008 is roughly this yellow line. It gets a
24 little jumbled in here (indicating) because of other
25 fires but this yellow line here. So a large portion of
26 that Concow area burned in 2018. And then there's

1 smaller fires like the 2012 Concow, 2016 Saddle Fire.

2 MR. NOEL: All right. Thank you. I have
3 nothing further.

4 Do any of the jurors have questions for this
5 witness? I don't see any questions from the jurors.

6 So Madam Foreperson is going to read you an
7 admonishment and then you're done.

8 THE WITNESS: All right.

9 GRAND JURY FOREPERSON: Okay. Chief Fowler, you
10 are admonished not to discuss or disclose at any time
11 outside of this jury room the questions that have been
12 asked of you or your answers until authorized by the
13 Grand Jury or the Court. A violation of these
14 instructions on your part may be the basis for a charge
15 against you of contempt of court. This does not preclude
16 you from discussing your legal rights with your own
17 attorney.

18 Chief Fowler, what I have just said is a warning
19 not to discuss the case with anyone except the Court,
20 your lawyer, or the district attorney.

21 Do you have any questions?

22 THE WITNESS: I do not.

23 GRAND JURY FOREPERSON: Okay. Thank you for
24 your time today.

25 THE WITNESS: Thank you.

26 MR. NOEL: Thanks.

The next witness will be Captain Baker.

[Mr. Fowler exits as Mr. Baker enters the courtroom.]

GRAND JURY FOREPERSON: Captain Baker, before
you have a seat, I need to swear you in.

THE WITNESS: Okay.

GRAND JURY FOREPERSON: Thank you.

Captain Baker, do you solely swear that the evidence you shall give in the matter pending before the grand jury shall be the truth, the whole truth, and nothing but the truth so help you God?

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a seat, please.

EXAMINATION

BY MR. NOEL:

Q. For the record, would you please state your full name spelling your last name.

A. Joshua James Baker, B-a-k-e-r.

Q. Captain Baker, are you employed?

A. Yes, Sir.

Q. By whom?

A. State of California Cal Fire.

Q. In what capacity?

A. As of three months ago I'm the unit's pre-fire engineer.

0. Which unit?

1 A. Cal Fire Butte Unit.

2 Q. Okay. And let's back up. How long have you
3 been employed by Cal Fire?

4 A. Since 2005.

5 Q. Describe for us your career with Cal Fire, the
6 positions you've held, the training and experience you
7 have.

8 A. Well, I started out as a volunteer firefighter
9 in 2000, was a volunteer until 2005, was picked up
10 seasonally with the department, was seasonally working
11 nine months a year until 2012. I promoted to limited
12 term engineer working basically nine months a year, four
13 or five months a year as a company officer engineer, and
14 then three or four months a year as a firefighter one.

15 Promoted in 2014 to permanent engineer. That
16 was my first permanent classification with the
17 department. Worked for about four and a half years as a
18 permanent engineer, promoted to limited term captain in
19 the Shasta Unit for four months, then was offered a
20 permanent captain's position here in the Butte Unit in
21 the Emergency Command Center. Worked for three years in
22 the Emergency Command Center until I promoted into
23 this -- or transferred into this new position about three
24 months ago.

25 Q. And that position is again?

26 A. Pre-fire engineering.

1 Q. Were you provided any specialized training as
2 part of your new position?

3 A. So I did a 24-hour course on my own in Arc GIS
4 through Chico State and I did some ride-alongs with the
5 former pre-fire engineer, and I've had a three-day course
6 in mapping and GIS taught through the department in
7 Redding.

8 Q. So explain to us your job as a pre-fire
9 engineer.

10 A. So as the pre-fire engineer I'm in charge of
11 tracking new fuels projects that we do, fuels reduction,
12 hazard fuel reduction projects, making incident maps,
13 mapping projects for the department, ground-level
14 planning, looking at ways that we can hopefully prevent
15 fires from happening in the future through hazard
16 mitigation and education of the community.

17 Q. So today we want to talk about the 2008
18 Lightning Complex Fires.

19 A. Okay.

20 Q. Beside you and also up on the electrical board
21 or the electronic board is a map marked Exhibit
22 Number 607. Do you recognize Exhibit 607?

23 A. Just as a data request yesterday to print this
24 map out. That was actually, to be honest with you, the
25 first time I had seen this map. But I hold all of the
26 data for the unit and so I was asked to provide this map.

1 Q. What do you mean you hold all the data for the
2 unit?

3 A. So when I transitioned into this new position, I
4 received basically what we refer to as a break. And it's
5 a hard drive that consists of state data and then all the
6 previous data from all -- dating back to -- to be honest,
7 I don't know when -- how long we have kept this data.
8 But previous pre-fire engineers -- basically we just pass
9 this data from one person to the next so that we have all
10 of that information archived for historical records.

11 Q. So you're the current keeper of the historical
12 data for the Butte Unit?

13 A. As far as the mapping and GIS data, correct.

14 Q. All right. What is Exhibit 607?

15 A. Exhibit 607 --

16 Q. And feel free to get up and walk around.

17 A. Okay. So Exhibit 607 is the final map product
18 produced from the Lightning Complex from 2008. We had
19 two separate incident command teams working. Command
20 Team Nine was deployed June 23rd through July 23rd of
21 2008. At that point they transferred command to Incident
22 Management Team Five from July 22 through August 1st.

23 This was the final map product that, I'm
24 assuming, with a culmination of the two different teams
25 and GIS functions within their teams that tracked the
26 final footprints of the fires within the Lightning

1 Complex.

2 Q. And from where did you obtain this map?

3 A. This was on my computer within the hard drive.

4 Q. So this is an official record of Cal Fire of the
5 fire?

6 A. Correct. When we have an incident management
7 team deployment inside our unit, the team takes over the
8 GIS portion and the mapping portion of that and then they
9 provide all of that data over to myself as the GIS person
10 in one fashion or another, either a thumb drive or
11 something like that. And then we save it and archive it
12 into whatever fashion or however we're going to save that
13 data.

14 Q. And these records are kept in the regular course
15 of business by Cal Fire?

16 A. Correct.

17 Q. And they are actually required to be kept by Cal
18 Fire; is that correct?

19 A. Yes.

20 Q. And these maps are made at or close to the time
21 in which the fire is occurring?

22 A. So we to the best of our ability map all
23 incidents in live time for folks to provide them the
24 newest and most up-to-date information that we have in
25 regards to where a fire is burning. So we -- we're --
26 either ourselves or a team are putting together an

1 incident action plan every day. And that will have the
2 latest footprint of the fire perimeter in it.

3 Q. Why is it important for Cal Fire to make and
4 keep present maps of fires?

5 A. Well, for multiple reasons. So we would provide
6 a map for people being deployed right now for operations
7 and planning purposes, and we will also provide the
8 incident management team historical data in regards to
9 fire history so that -- for planning purposes also.
10 Because if you have fire history in that area, we might
11 be able to determine where fire has burned previously.

12 Because it's going to do a couple things. One,
13 it's going to possibly change the way in which a fire is
14 burning because the fuel model might change but also
15 provide us some intel into the way -- not necessarily the
16 way the fire was stopped but where it was stopped in
17 previous history. So our history is really important to
18 us to be able to determine operations and planning.

19 Q. So these maps and the fact that these maps are
20 correct and accurate are very important for firefighting?

21 A. Absolutely.

22 Q. And these maps are created for reasons other
23 than just to display?

24 A. Oh, yeah, absolutely. Operations and planning
25 is a huge portion of what we do. We need to know where
26 that fire is burning, the direction it's headed, how it's

1 spreading as well as where our resources are working for
2 accountability.

3 As you can see in the map, it's separated out by
4 these division breaks. And so you're able to tell --
5 we'll have certain resources assigned into these
6 divisions. And based upon that, that way we know where
7 our folks are working for accountability and what the
8 operations are for each one of those divisions because it
9 might change for each one what our tactics and strategies
10 are.

11 Q. All right. Can you explain to us how to read
12 Exhibit 607.

13 A. So down here (indicating) you have your -- your
14 compass dictating which way is north, west, south, and
15 east. You have a legend which tells you everything that
16 is happening in the map, who created the map, and then
17 the teams that were assigned to the map. And then inside
18 the legend you have your highways.

19 This one is hard to read. Highways, roads,
20 rivers, lakes. You have different areas of DPA meaning
21 who's expected to provide protection inside those areas
22 when there's not a fire burning. So whether it's the
23 Forest Service, Cal Fire, local government, et cetera,
24 that has to provide fire protection or suppression within
25 that area.

26 We also notate on here safety zones, staging

1 areas, drop points, helispots, if there's any spot fires
2 outside the main fire footprint. Remote area weather
3 stations are notated on here, whether or not there's any
4 water sources, mobile repeaters for communications. And
5 in this one they have a bridge that is not passable. So
6 they wanted to make sure that was put on there. And then
7 we have a completed fire line and then how that line was
8 constructed either hand line or dozer line.

9 It's broken up into different divisions: Bravo
10 Division, Charlie; the different drop points. And then
11 in here are some dozer lines that look like they might
12 have been different operations that they tried to
13 potentially stop that fire spread. And it either jumped
14 the line or it was a contingency line. But this right
15 here (indicating) is the final footprint where we were
16 able to stop that fire.

17 Q. So this pink area in here (indicating) is the
18 actual footprint of the fire?

19 A. Correct, fire perimeter.

20 Q. And what about this darker kind of greenish
21 yellow at the top?

22 A. Which part are you referring to? Up here?

23 Q. Yeah. Inside the black lines, but it's not
24 pink.

25 A. Yeah. So they -- apparently, they stopped the
26 fire right inside this perimeter. I believe that this

1 was created -- and I wasn't on this incident in this
2 capacity, but I believe this is where they were creating
3 some contingency lines in the event they weren't able to
4 stop the fire where they were able to stop it.

5 It's a different color because again of the
6 direct protection area who is supposed to provide fire
7 suppression in this area. But all the different dozer
8 lines and division breaks that you see they were planning
9 for that fire to potentially continue to grow but
10 thinking that they could stop it out here in that area.

11 Q. So geographically can you point out cities,
12 towns, monuments, any landmarks that are identifiable on
13 the map.

14 A. Yeah. So the easiest way -- so this right here
15 (indicating) is running along the west branch of the
16 Feather River and right along Highway 70. Up towards the
17 top it looks like it stopped in the area of Campbell.

18 And I don't know how familiar you guys are with
19 the area but north of Concow, Jarbo Gap. There's Rag
20 Dump, Flea Mountain, Big Hill. And for us those are
21 areas that we've worked in in the past so those do mean a
22 lot to us.

23 Q. How about Pulga?

24 A. I believe Pulga is -- so this area is all right
25 where Camelot staging is in the Pulga area, but I don't
26 believe they have notated it on this spot. I don't see

1 it on here.

2 Q. Is it safe to say that the fire started
3 northeast of Pulga in the Feather River Canyon or above
4 the Feather River Canyon and burned down the Feather
5 River Canyon?

6 A. To be honest with you, I don't know which
7 direction this fire burned in.

8 Q. All right. But that is the area that is burned
9 out?

10 A. Correct.

11 Q. Okay. That is the pink area.

12 And this (indicating) area down here where the
13 containment line is on the far left -- on the far west,
14 can you tell us what area of the county that is.

15 A. It's -- well, you can see that down here to the
16 left is the Town of Paradise. So that's going to be down
17 in the canyon below Paradise in the drainage.

18 Q. The west branch?

19 A. The west branch, correct.

20 MR. NOEL: Okay. Thank you. I believe that's
21 all I have of the witness.

22 Do any of the jurors have any questions?

23 [Pause in proceedings.]

24 BY MR. NOEL:

25 Q. Okay. We have some questions from the jurors.
26 We've gone over them. I have a couple questions I don't

1 think would be appropriate for you.

2 A. Okay.

3 Q. But Question Number One: Are these maps, for
4 instance, 607 shared with PG&E? And if so, how?

5 A. Unknown.

6 Q. Question Number Two: Does Cal Fire meet with
7 PG&E regularly in prevention and hazard mitigation
8 planning?

9 A. Being new to my position I have yet to meet with
10 any PG&E representatives. I'm not sure if that's in the
11 course of my job description at this point.

12 MR. NOEL: Anything else? All right. Thank
13 you.

14 Madam Clerk -- or Madam Foreperson is going to
15 have an admonishment for you and then you're done.

16 THE WITNESS: Okay.

17 GRAND JURY FOREPERSON: Captain Baker, you are
18 admonished not to discuss or disclose at any time outside
19 of this jury room the questions that have been asked of
20 you or your answers until authorized by this grand jury
21 or the Court. A violation of these instructions on your
22 part may be the basis for a charge against you of
23 contempt of court. This does not preclude you from
24 discussing your legal rights with your own attorney.

25 Captain Baker, what I have just said is a
26 warning not to discuss this case with anyone except the

1 Court, your lawyer, or the district attorney.

2 Do you have any questions?

3 THE WITNESS: No, Ma'am. Understood.

4 GRAND JURY FOREPERSON: Thank you for your time
5 today.

6 THE WITNESS: Thank you.

7
8 [DISCUSSION OMITTED.]

9
10 [Recess taken from
11 9:33 until 10:15 a.m.]

12
13 GRAND JURY FOREPERSON: All members of the grand
14 jury have returned, and we're ready to proceed.

15 MR. NOEL: All right. Call Rich Mortensen.

16 GRAND JUROR NUMBER EIGHTEEN: So this is the guy
17 from Arizona?

18 MR. NOEL: Yep.

19 GRAND JUROR NUMBER FOUR: You need to apologize
20 to him several times.

21 MR. NOEL: I have.

22 [Mr. Mortensen enters the courtroom.]

23 GRAND JURY FOREPERSON: Mr. Mortensen, before
24 you take a seat, would you please raise your right hand
25 to be sworn.

26 Okay. Mr. Mortensen, do you solemnly swear that

1 the evidence you shall give in this matter pending before
2 the grand jury shall be the truth, the whole truth, and
3 nothing but the truth so help you God?

4 THE WITNESS: I do.

5 GRAND JURY FOREPERSON: Thank you. Have a seat,
6 please.

7 **EXAMINATION**

8 BY MR. NOEL:

9 Q. Agent, for the record please state your full
10 name spelling your last name.

11 A. Sure. Richard Mortensen, M-o-r-t-e-n-s-e-n.
12 And Richard is common spelling.

13 Q. By whom are you employed?

14 A. The Department of Homeland Security, Homeland
15 Security Investigations.

16 Q. In what capacity?

17 A. I'm a special agent criminal investigator.

18 Q. How long have you been a special agent with
19 Homeland?

20 A. Since October 2009.

21 Q. Prior to October 2009 by whom were you employed?

22 A. The U.S. Forest Service and the U.S. Border
23 Patrol.

24 Q. In what capacity?

25 A. I was employed from October 2007 to October 2009
26 by the U.S. Forest Service. I was a special agent

1 criminal investigator for the Forest Service. I did
2 resource investigations which also included origin and
3 cause investigations for fires. And for the Boarder
4 Patrol I was a patrol agent.

5 Q. What training did you receive in origin and
6 cause investigations for fires?

7 A. I received a 40-hour training for basic wildlife
8 fire. I think it's called FI-210. I have received the
9 basic wildland fire investigation and advance wildland
10 fire investigation training.

11 Q. And as a Forest Service special agent, what
12 geographic area were you assigned?

13 A. The region I was responsible for was basically
14 Northern California. At the time I was assigned to an
15 office in the Plumas National Forest.

16 Q. Now, in September of 2008 were you assigned to
17 investigate a fire in the Plumas National Forest?

18 A. Yes.

19 Q. And was that fire given a name?

20 A. Yes.

21 Q. What was the name of the fire?

22 A. The Rock Fire.

23 Q. Where did the Rock Fire occur?

24 A. It's been a few years so I'm going to review the
25 report, but it was in the eastern district of California
26 in the Plumas National Forest down in the canyon.

1 Q. What canyon?

2 A. I can't remember the exact name of the canyon
3 without referring to the report.

4 Q. And you wrote an investigation report?

5 A. Yes, I did.

6 Q. And you have a copy of that report with you
7 today?

8 A. I do.

9 Q. And referring to the report refreshes your
10 recollection as to details of the fire?

11 A. Exactly, yes.

12 Q. So whenever you refer to the report, if you'd
13 please just let us know on the record that you're
14 referring to the report. And if there's a place in the
15 report in particular to which you're referring, also let
16 us know that.

17 A. Okay. The fire that we're referring to is in
18 the report under the Rock Fire cause and determination
19 and it identifies the fire as occurring near the Rock
20 Creek Dam located off of a ranger district of the Plumas
21 National Forest.

22 Q. Okay. Describe for us how you investigated the
23 Rock Fire.

24 A. After being notified that a fire occurred, it's
25 my responsibility to go out and determine the origin and
26 cause. So I go to the area where the fire was

1 identified. Going to the area that was identified
2 geographically, I drive to the location, physically see
3 where it is, study the terrain, the access to it.

4 Is that what you're referring to?

5 Q. Yeah. Now, did you work alone or were you
6 assigned a team?

7 A. I had a fire prevention technician Jenny Manly
8 with me when I initially responded to the area.

9 Q. Okay. But what was your role in the
10 investigation?

11 A. My role is to determine the origin and cause of
12 the fire.

13 Q. I guess what I'm asking is are you the lead
14 or --

15 A. Yes, I was the lead investigator assigned there
16 to review the fire and determine the origin and cause.

17 Q. All right. And were you assigned supporting
18 personnel to assist you with that task?

19 A. Yes.

20 Q. And did you write the report?

21 A. Yes, I wrote the report.

22 Q. All right. When did the Rock Fire start?

23 A. It was on September 30th, 2008, at approximately
24 2:30 p.m.

25 Q. How large was the Rock Fire?

26 A. It ended up being approximately five acres.

1 Q. And what did the Rock Fire burn?

2 A. Natural vegetation.

3 Q. Describe the process for us by which you
4 determined the origin and cause of the fire.

5 A. When we arrive to a fire -- in this particular
6 incident it was in a canyon and it's steep. So when we
7 arrived to the fire, one of the areas that we look for is
8 possible influences that could ignite a fire and then we
9 also look at the direction that the fire is burning using
10 macro indicators that we have studied during origin and
11 cause investigations.

12 Q. Are you familiar with the term "negative
13 corpus"?

14 A. Yes.

15 Q. What does negative corpus mean or what did it
16 mean to you at the time?

17 A. Negative corpus means looking at all the
18 available known origins or causes of fire and eliminating
19 them from the cause of fire.

20 Q. You talked about micro and macro indicators.
21 Can you describe and define what you mean by those.

22 A. Sure. A macro indicator to me is maybe a large
23 view of a fire to help you determine where the origin and
24 cause is. A traditional type macro indicator might be
25 the "V" burn pattern. Obviously if you follow the "V"
26 back to the bottom of the fire, that's more likely where

1 the origin and cause was.

2 And a micro indicator is where you're within the
3 burn and you can look at how the fire affected the plants
4 or the obstacles or anything inside the fire to track
5 those back to the origin.

6 Q. So using macro and micro indicators were you
7 able to determine the general area of origin of the Rock
8 Fire?

9 A. Yes.

10 Q. Describe for us how you did so.

11 A. I'm going to refer to the report here. But
12 basically, when you get into the area of the fire, you
13 look at what causes a fire to burn a specific direction
14 or a specific area. And this way the fire burned uphill
15 away from a tower.

16 When I arrived at the scene, it was -- the area
17 was behind a locked gated area where it was unlikely for
18 people to be there. So you could eliminate camping or
19 some of those -- campfires and those types of other
20 issues.

21 Once you get to the fire, you're able to look at
22 how the vegetation burns and use macro indicators like
23 cupping, freezing, backing to indicate a smaller portion
24 where the origin was.

25 Q. Even though you somewhat eliminated that based
26 upon the fact that the general area of origin was within

1 a locked, gated, fenced-in area, do you still look for
2 any signs of possible campfires or any human activity
3 while you're doing your origin and cause investigation?

4 A. Yes.

5 Q. And on this day did you see any?

6 A. No.

7 Q. So go on and explain to us how you used the
8 macro and micro indicators to take this back to the area
9 of origin.

10 A. Okay. Hold on a second. I'm going to refer to
11 this report here a little bit. I have pictures in the
12 report which would help more easily explain.

13 Q. We'll get to those in just a second. It's just
14 kind of a general overview right now.

15 A. General overview. When you get to the area of
16 the fire, like I said, you evaluate the terrain and the
17 things that could cause a fire.

18 In this specific incident the fire was burning
19 uphill and away. So when you get into that, you can
20 focus on the power lines. There was a power line
21 existing there.

22 Q. That was going to be my next question.
23 During -- when you were looking for potential sources for
24 ignition of the fire, what did you look at?

25 A. Due to the remoteness of the area and the
26 restricted access, to me lightening would have been a

1 logical cause or any man-made item in the area. And the
2 only man-made item in that area was a power line.

3 Q. Were you able to eliminate lightening as a
4 possible cause?

5 A. Yes.

6 Q. How so?

7 A. The BLM -- Bureau of Land Management -- tracks
8 lightening strikes in the area. And I believe in the
9 report -- there's a report from the BLM indicating that
10 there were no lightening strikes in the area of the fire
11 given the time that it started.

12 Q. So when you arrived at the general area of
13 origin, were you able to narrow the potential sources of
14 ignition for the fire?

15 A. Yes.

16 Q. And to what were you able to narrow the sources?

17 A. The power line.

18 Q. How were you able to do so?

19 A. Well, when I arrived to the scene, I could see
20 there was a defect in the power line. And given
21 everything else that was evaluated, that was really the
22 only cause that could have ignited the fire.

23 Q. All right. Let's go on. And in front of you
24 you should have Exhibit 546, Photograph 546.

25 Do you see that photograph?

26 A. I do.

1 Q. And we also have it up on the big board.

2 Now, do you recognize that photograph?

3 A. I do.

4 Q. Explain to us what we're looking at in this
5 photograph.

6 A. There's the tower that is in the origin of the
7 Rock Fire. It's the tower that supports the power line.
8 And where you see the yellow arrow pointing to the
9 dangling wire, that is what was identified as a jumper
10 and it was a defect in the power line.

11 Q. Okay. Go back then. On the photograph itself
12 there are written or typed "broken power line jumper" in
13 yellow with a yellow arrow pointing to the line.

14 A. Yes.

15 Q. Is this something that you annotated onto your
16 photograph?

17 A. It is.

18 Q. That is part of your report?

19 A. Yes, it is.

20 Q. Why was this significant to you?

21 A. Due to all the other causations that are out
22 there for fire, everything was able to be eliminated
23 except for this mechanical defect.

24 Q. Now, were you able to identify the specific
25 transmission line in which this tower was part of?

26 A. The name of the transmission line?

1 Q. Yes.

2 A. Yes.

3 Q. What transmission line?

4 A. I'm going to have to refer to the report on that
5 one. I know it's in here because I just saw it. I've
6 been out of the fire industry for a little while so . . .

7 I know it's in here. I just have to find it.

8 Q. If you look back in your report to Exhibit I way
9 back towards the back, I think that's what you're looking
10 for.

11 A. Yeah. The Caribou-Palmero line.

12 Q. Palmero or Palermo?

13 A. It says "Palmero." It could be a typo.

14 Q. Okay. Okay. All right. Were you able to
15 determine what type of transmission line this was?

16 A. It is a 115 kV line attached to the top of the
17 power line tower located within the general origin of the
18 fire.

19 Q. Okay. All right. So I want to walk through the
20 individual possible causes and talk about how you
21 eliminated those.

22 A. Great.

23 Q. First off, lightening.

24 A. Lightening. As we discussed earlier, the BLM
25 lightening strike map tracks lightening strikes. I
26 received a copy of that lightening strike map for that

1 date, time, area and there was no indication that there
2 was lightening.

3 Q. How about debris burning?

4 A. Yes. There's no evidence of debris burning
5 found. It was behind a locked gate. I remember there
6 was a gate that restricted access. It was across the
7 canyon and up on a hill. There was no evidence of any
8 debris burning in that area.

9 Q. How about equipment use?

10 A. Equipment use. Other than a -- other than the
11 power line there's no heavy equipment that could get in
12 the area. It's -- you know, it's restricted, it's steep,
13 it's remote. And there was no signs of any equipment use
14 in the area.

15 Q. How about railroads?

16 A. From my recollection there is no railroad in
17 that area at all on that side of the road.

18 Q. Children playing with fire?

19 A. Again, back to the children. Due to the
20 remoteness and the location of the fire, there was no
21 indications that children would be there nor would it be
22 common or likely that kids would ever be in that area.

23 Q. Did you find any evidence of campfires in the
24 area?

25 A. I did not.

26 Q. Now, the next category is the term incendiary.

1 Can you describe for us what incendiary means.

2 A. I'll get to that. I'm going to read from the
3 report. It's been a while since I've done one of these.

4 Under the section called "Incendiary" and it
5 says "Incendiaries or arson fires are deliberately,
6 maliciously, or recklessly set." And I did not find
7 anything that would indicate that.

8 Q. And finally smoking. Did you locate any
9 evidence of smoking in the area of origin?

10 A. I did not.

11 Q. Did you observe any evidence of any other type
12 of possible ignition source for the fire?

13 A. Just the power line.

14 Q. Okay. Now, did you contact PG&E about the
15 Caribou-Palermo 115 line?

16 A. I did.

17 Q. And obtain records as to the status of the
18 Caribou-Palermo 115 line on September 30th?

19 A. I did.

20 Q. And what did you learn from PG&E with regard to
21 the Caribou-Palermo line?

22 A. I think the term they used was "open-ended." It
23 means that there was a defect in the line identified
24 during the approximate time the fire started in that
25 area.

26 Q. Okay. Now, let's get back to the photographs.

1 Let's go on to Exhibit 547.

2 A. Okay.

3 Q. Do you recognize Exhibit 547?

4 A. Yes.

5 Q. What is Exhibit 547?

6 A. Exhibit 547 is a picture of the broken power
7 line and the jumper. And there are words I put on there
8 indicating where that is in the picture.

9 Q. And Exhibit 548. Do you recognize Exhibit 548?

10 A. I do. It's a photograph of the broken power
11 line jumper in relationship to the origin of the fire.

12 Q. And again, so we don't have to do this every
13 time. But on most of these photographs there's yellow
14 typewritten information. Is that information that you
15 annotated onto the photographs?

16 A. Yes.

17 Q. Is that part of your report documenting the
18 scene?

19 A. Yes.

20 Q. All right. So describe to us what we have on
21 548.

22 A. Exhibit 548 is a picture from up above the tower
23 looking back toward the origin specifically showing the
24 tower and the broken equipment that was associated with
25 the tower.

26 Q. With the origin being where?

1 A. At the base of the tower.

2 Q. And 549. Do you recognize 549?

3 A. I do.

4 Q. What is 549?

5 A. Exhibit 549 is a picture going uphill towards
6 the tower showing the relationship of the broken jumper
7 and the power line in relation to the origin of the fire.

8 Q. Do you recognize 550?

9 A. Yes.

10 Q. And what is 550?

11 A. Exhibit 550 is showing the origin of the fire in
12 relation to the tower.

13 Q. Do you recognize 551?

14 A. I do.

15 Q. What is 551?

16 A. Once again, it's another photograph of the
17 broken power line jumper and the tower in relation to the
18 origin of the fire.

19 Q. Now, in this case you have additional
20 information annotated on the photograph. It says
21 "Supposed to connect here" with an arrow.

22 A. Correct.

23 Q. Can you explain that to us.

24 A. Yes. This picture identifies -- you can see
25 that jumper is just hanging down from one side of the
26 power line. And what it identifies is where that jumper

1 is supposed to be connected on the power line.

2 I think you can actually see it in other
3 photographs or the other ones that are still connected.

4 Q. And moving on to 552, do you recognize 552?

5 A. Five fifty-two, yes.

6 Q. What is 552?

7 A. In 552 the word on it "Run" with the arrow
8 indicates they are going uphill. It indicates the
9 direction that the fire traveled away from the tower
10 uphill.

11 Q. Can you acclimate us on where 552 was taken?

12 A. From this picture it looks like 552 was taken on
13 the uphill side of the tower facing down the power line.

14 Q. Where in relationship to the area of origin?

15 A. Just uphill from the origin of the fire.

16 Q. Then 553.

17 A. Five fifty-three is a photograph indicating the
18 origin being downhill and then freezing which would be a
19 micro indicator showing the vegetation bending to the
20 right in this photograph indicating that the fire is
21 traveling in the direction of the freezing vegetation.

22 Q. Describe for us what you mean by freezing and
23 how that's used as a micro indicator.

24 A. So in this picture you can see where the
25 freezing -- there's an arrow that is bending from left to
26 right and you can see on the vegetation where that

1 vegetation is bending left to right. The freezing in
2 this picture indicates the fire was moving from the left
3 to the right. And it's indicative by the vegetation
4 freezing.

5 Q. Now 554.

6 A. Yes.

7 Q. Explain to us what we're looking at.

8 A. The upper left corner of this picture you can
9 see freezing. It's just a closer shot of the actual
10 micro indicator of freezing. And below freezing you can
11 see on the vegetation that the vegetation is bent to the
12 right, from left to right. And the bending of that
13 vegetation is a micro indicator indicating the fire is
14 moving from the left to the right.

15 Q. And feel free to stand up and use the board if
16 you want to at any time to illustrate points or explain
17 things.

18 A. This right here (indicating) that I'm pointing
19 at is the upper left portion of the photo. Underneath
20 the words "freezing" the top of the vegetation that is
21 still somewhat green. And it indicates the yellow line
22 starting here (indicating) and then has vegetation bent
23 from left to right in the direction of the arrow. That
24 shows it's freezing in that manner.

25 Q. Moving on to Exhibit Number 555, do you
26 recognize that?

1 A. I do.

2 Q. Can you tell us what we're looking at.

3 A. Yes. This photograph is of consumed fuel in the
4 middle of the picture, which is all that dark burned-out
5 area. There's a word that says "Origin" in the middle
6 with an arrow pointing to the left showing that the
7 origin of fire was to the left and it burned through the
8 consumed fuel up to the right.

9 And then the lateral movement shows unconsumed
10 fuel or protected fuel on the left side which would be
11 the left side of the fire as it burned from left to right
12 uphill.

13 Q. And 556. Please explain to us what we're
14 looking at.

15 A. Five fifty-six is a picture of consumed fuel and
16 unconsumed fuel. It's one of the indicators. Obviously,
17 an area that has consumed fuel is where the fire existed
18 and the area of unconsumed fuel or protected fuel -- in
19 this situation protected leafs shows that the fire did
20 not burn as heavily in that area. So it's able to
21 indicate edges of the fire.

22 Q. All right. Exhibit 557. Do you recognize this
23 photograph?

24 A. I do.

25 Q. What does this photograph show?

26 A. This photo shows a closer view of what was

1 originally determined to be the origin or was determined
2 to be the origin of the fire and this (indicating) is a
3 smaller area where we'd actually get down and take a
4 closer examination.

5 Q. How did you determine this area inside the
6 yellow circle was the origin of the fire?

7 A. As previously discussed, those indicators with
8 freezing and protected fueling and protected leaves you
9 can follow those in a reverse pattern and it will help
10 indicate those macro indicators and it will help indicate
11 where that origin came from, where it burned from.

12 And then if you go on the other side of that,
13 there's different indicators that show the fire behavior
14 that was going downhill was different than the fire
15 behavior that was going uphill, and that point between
16 where those two meet becomes the origin of the fire.

17 Q. Please acclimate us on the area that we're
18 looking at here.

19 A. The area is the -- I'm going to stand up here.
20 The area is circled in the yellow circle.

21 Q. Right but in terms of a geographical area and
22 specifically in relation to the broken jumper line.

23 A. In this photo you can see that the tower legs
24 are on the left -- in the upper left corner. And so this
25 would be the base of the tower underneath the broken
26 jumper or the broken jumper would be unattached to the

1 power lines above this general area.

2 Q. All right. Moving on to 558 and looking at this
3 photograph.

4 A. Yes.

5 Q. Explain to us what we're looking at in 558.

6 A. So this would be the origin. This would be --
7 this would be the macro and micro indicators where you
8 start looking for the portion of the fire that is backing
9 downhill versus burning uphill. And like I said earlier,
10 where those two points meet is where the origin is going
11 to be.

12 So in the upper left picture of this -- of this
13 photograph you can see where it says "protected fuel
14 backing" which the backing is the micro indicators
15 showing that -- showing the difference in behavior --
16 fire behavior burning up and away versus slowly burning
17 down.

18 And then we have a picture in the middle showing
19 the consumed fuel which means the fire was there burning
20 fuel longer than the protected fuel and the backing and
21 the arrow pointing to the origin.

22 Q. Do you recognize 559? The photograph marked as
23 559?

24 A. Uh-huh.

25 Q. And please explain to us what we're looking at
26 in the photograph marked as Exhibit 559.

1 A. As we were discussing fire behavior, in this
2 picture there's the advancing with the arrow pointing
3 uphill. So this is showing that the fire in this
4 photograph was burning uphill or advancing uphill. And
5 that was indicated by the staining on the rocks and the
6 cupping and protection of the vegetation and then the
7 origin pointing in the direction of the arrows.

8 What the staining is is when a fire is burning
9 something, we all know it turns black. And so if you
10 have a rock and the fire is burning on one side heavier
11 than the other side, then that rock or whatever is
12 burning is either going to be consumed or it's going to
13 be stained with smoke or whatever coming off the fire.

14 Q. Okay. So our area of origin would be below the
15 area shown in the fire here?

16 A. Be in the direction of the arrows, yes. And in
17 this photograph you can kind of -- you can kind of see
18 it. You don't have the color version, but there's black
19 on this side and white on this side which would be the
20 fire pressing more on one side of the rock than the other
21 side just like if you were in a campfire. The inside is
22 black and the outside is not.

23 Q. All right. Exhibit 560 do you recognize?

24 A. I do.

25 Q. Could you explain Exhibit 560 to us.

26 A. It's just a wider view of what appears to be the

1 earlier photograph. We're showing the protected fuels
2 which are areas of unburned fuel which means the fire was
3 not in that area. You're showing consumed fuel which is
4 where the fire had burned and the staining on the rocks
5 which is an indication of which direction the fire came
6 from and then an arrow pointing toward the origin of the
7 fire.

8 Q. And 561. Do you recognize 561?

9 A. Yeah.

10 Q. Can you explain 561 to us.

11 A. Five sixty-one is the base of the tower in
12 relation to the broken jumper, the broken jumper which
13 would be part of the tower above this. And this is a
14 perfect example of the consumed fuels versus unconsumed
15 fuels. So in this area we have the protected fuels in
16 green, which is the area the fire didn't consume heavily.
17 It consumed fuel where the fire stayed longer and had
18 direct impact on those fuels and burned. And then the
19 origin of the fire is pointing off just to the upper
20 right portion of this picture.

21 Q. All right. Moving on to 562.

22 A. Yes.

23 Q. Describe for us 562.

24 A. Five sixty-two is similar to the earlier exhibit
25 where it shows the origin, the base of the tower, the
26 broken jumper, and where it was supposed to connect.

1 Q. Okay. All right. Exhibit 563. Do you
2 recognize 563?

3 A. I do.

4 Q. What is 563?

5 A. Five sixty-three is a map of the power line and
6 the broken jumper and the specific origin area of the
7 fire.

8 And it's okay if I stand up?

9 Q. Absolutely.

10 A. This (indicating) is the tower. These are the
11 power lines. And this is the jumper, and where the
12 jumper is supposed to be connected is here. And then
13 this is identifying the specific origin area of the fire
14 directly underneath where the jumper was supposed to be
15 connected.

16 Q. And again, how did you determine that the
17 specific area of origin was directly below the
18 disconnected jumper?

19 A. Using the macro and micro indicators displayed
20 by the fire.

21 Q. And 564. What are we looking at?

22 A. It's just a closer-up sketch. Power lines,
23 tower, showing the properly -- this one actually is good
24 because it has properly connected jumpers and conductors.
25 And this one shows the broken jumper line and conductors
26 and where the specific origin of the fire was underneath

1 that area of the broken jumper.

2 Q. Now, I want to spend sometime with you in the
3 specific area of origin. Explain what the notations
4 mean. There's triangles and horseshoes and arrows.

5 A. Okay. This obviously is not to scale. The
6 arrows on this are going to show where the fire was
7 burning. This is going to show the lateral movement, and
8 these views are showing the backing.

9 Q. Okay. Remember, we need to have it so that the
10 court reporter can take it down what you're talking
11 about. And when you're saying "this" and pointing at
12 stuff --

13 A. Sure.

14 Q. First off, let's do a little foundational on
15 this. When you say a sketch, this is actually a
16 hand-drawn sketch; correct?

17 A. Correct.

18 Q. It's not to scale?

19 A. Correct.

20 Q. All right. So walk us through each of the
21 symbols identifying the symbol and what it means.

22 A. In this sketch the three arrows facing to the
23 right side of the photo are indicating the direction that
24 the fire burned which in this photo would be uphill. And
25 you can't see that.

26 The triangles -- there's four triangles opposite

1 of each other, the circle and an "X" in the middle. The
2 triangles are going to be indicating lateral movement of
3 the fire.

4 The "U"s -- there's two rows of "U"s that each
5 have three and a row of "U"s with two. They're going to
6 indicate backing. And then the circle and the "X" is
7 going to indicate the specific origin.

8 Q. All right. You said that you contacted PG&E to
9 obtain records regarding the Caribou-Palermo line on
10 September 30th, 2008.

11 A. Uh-huh, yes.

12 Q. And do you recognize Exhibit 565?

13 A. I do.

14 Q. What is Exhibit 565?

15 A. This is the report that we received when
16 requesting the interruptions on the line from PG&E.

17 Q. And what does the report you received from PG&E
18 indicate?

19 A. It says "Text" in this portion here
20 (indicating). "Palermo 152 open, which open ended the
21 Caribou-Palermo 115 line," which is an indication to me
22 or my understanding that there was a failure in the line
23 somewhere at that time on that date.

24 Q. And is there a time as to when that occurred?

25 A. Here it says "Start 9/30/2008 1402, ended
26 9/30/2008 1415."

1 Q. What time approximately did the Rock Fire start?

2 A. In this report, I think the first initial report
3 from the Rock Fire was 2:05. Let me confirm. It was
4 approximately 2:30 when it was first reported, which in
5 this situation would be 14:30 which would be 15 minutes
6 after showing that it ended.

7 Q. Based upon your investigation, the photographs
8 we've gone through, and everything you looked at, did you
9 form an opinion as to what caused the Rock Fire?

10 A. The broken jumper.

11 Q. And upon what did you base that opinion?

12 A. I based that off my training and experience.
13 And going through the fire examination that is the only
14 thing, only evidence the fire could occur was based on
15 the power line.

16 MR. NOEL: Okay. I believe that's all I have.

17 Do we have any questions from the jury or from
18 the jurors? All right. We have some questions from the
19 jurors themselves to follow up.

20 THE WITNESS: Okay.

21 BY MR. NOEL:

22 Q. In your fire experience how often would you
23 estimate the fires are the result of broken or defective
24 power line equipment?

25 A. That's a good question. I was in the Plumas for
26 two years. And half of that time it is under snow. So

1 to be honest, I can't recall how many power lines, but I
2 know that from speaking with other investigators that are
3 fire investigators in the same general area that it's not
4 an uncommon occurrence.

5 MR. NOEL: And remember, Ladies and Gentlemen,
6 that limited instruction you've been given with regard to
7 hearsay.

8 BY MR. NOEL:

9 Q. When investigating a fire caused by broken or
10 defective power line equipment, do you research and
11 record the age of the equipment involved?

12 A. In this particular investigation we did not.

13 Q. Why not?

14 A. For me as the fire investigator the age of it
15 may have caused it, but what I'm there for is to find out
16 what caused it, not why it was caused. So it could be
17 300 years old. I don't care. That's what caused it.

18 Q. And going back what was the total area of this
19 fire?

20 A. Five acres.

21 Q. So was that a relative small fire?

22 A. Yes. And not only was it a relatively small
23 fire, it was extremely remote. It didn't burn any
24 structures and no one was hurt. It was really low.

25 Q. So would it be safe to say that your
26 investigation was limited solely to the origin and cause?

1 A. Yes.

2 MR. NOEL: Anything else? Does anybody else
3 have any questions? Any follow-up? I see nothing.

4 I'm going to give this back to the clerk.

5 Madam Foreperson will have an admonishment for
6 you.

7 GRAND JURY FOREPERSON: Agent Mortensen, you are
8 admonished not to discuss or disclose at any time outside
9 of this jury room the questions that have been asked of
10 you or your answers until authorized by this grand jury
11 or the Court. A violation of these instructions on your
12 part may be the basis for a charge against you of
13 contempt of court. This does not preclude you from
14 discussing your legal rights with your own attorney.

15 Agent Mortensen, what I have just said is a
16 warning not to discuss this case with anyone except the
17 Court, your lawyer, or the district attorney.

18 Do you have any questions?

19 THE WITNESS: I do not.

20 GRAND JURY FOREPERSON: Okay. Thank you for
21 your time today.

22 THE WITNESS: Thank you.

23 MR. NOEL: Just don't take the exhibits with
24 you.

25 THE WITNESS: Okay.

26 MR. NOEL: We have had that happen.

1 THE WITNESS: I'll give them to you right now.

2 MR. NOEL: Thank you.

3 THE WITNESS: Thank you.

4 MR. NOEL: I'll hand the exhibits to Madam

5 Clerk.

COURT REPORTER'S CERTIFICATE

This is to certify that I, Lisa McDermid Welch, a Certified Shorthand Reporter of the State of California was present at the time and place the foregoing grand jury proceedings were had and taken in the within matter; and that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings; and afterwards caused my said shorthand writing to be transcribed into typewriting; and the foregoing pages, beginning at the top of Page 1 to and including Page 57 hereof, constitute a full, true, accurate, and complete record of the proceedings.

DATED: This 6th day of June, 2022.

Lisa McDermid Welch

11
12 [DISCUSSION OMITTED.]

13
14 [Witness enters the courtroom.]

15 GRAND JURY FOREPERSON: Mr. Maslowski, before
16 you have a seat, please raise your right hand to be
17 sworn.

18 Mr. Maslowski, do you solely swear that the
19 evidence you shall give in this matter pending before the
20 grand jury shall be the truth, the whole truth, and
21 nothing but the truth so help you God?

22 THE WITNESS: I do.

23 GRAND JURY FOREPERSON: Thank you. Have a seat,
24 please.

25 **EXAMINATION**

26 BY MR. NOEL:

1 Q. Mr. Maslowski, for the record could you state
2 your full name spelling your last name.

3 A. Yes. My name is Rodney Joseph Maslowski,
4 M-a-s-l-o-w-s-k-i.

5 Q. Mr. Maslowski, are you currently employed?

6 A. Yes, I am.

7 Q. And by whom?

8 A. I am employed by Flynn Resource Consultants,
9 Inc. often called Flynn RCI. I'm a part-time consultant.

10 Q. Consulting in what?

11 A. Matters associated with power systems.

12 Q. What types of matters with power systems?

13 A. Well, maybe describing some of my recent work
14 would cover that.

15 Q. Go ahead.

16 A. Our client -- current client -- one of the
17 current clients that I'm involved with is the City of San
18 Francisco. You may be aware that they made an offer to
19 purchase the PG&E facilities in San Francisco. So behind
20 the scenes there's been a lot of financial and legal and
21 technical consultants advising how that could take place.
22 I'm one of those technical consultants.

23 So I'm not trying to decide whether it's a good
24 idea or not. I'm trying to decide what it's going to
25 cost. But if you were going to purchase a system, what
26 would be the facilities that would make sense? That's

1 one of them.

2 Also again the town or city of San Francisco.
3 It's a different arrangement in San Francisco. San
4 Francisco has customers. They have several thousand
5 customers metered. They have power sources such as the
6 Hetch Hetchy Reservoir. So these customers are getting
7 their power from San Francisco, but the delivery system
8 is PG&E and their wires. So there's a relationship
9 there. San Francisco pays for the use of the wires.

10 After 2015 there was a new contractual
11 arrangement between the two parties as to how that power
12 would be delivered and who would pay for what. And that
13 has changed substantially, caused a lot of problems from
14 San Francisco's appoint of view. And so I have been
15 advising about what are the right ways to connect things?
16 Are there things within that? It's a wholesale
17 distribution tariff; WDT. Are there issues with the WDT
18 that should have been addressed?

19 And there were hearings to present San
20 Francisco's point of view and to try to resolve some of
21 those issues.

22 To my knowledge, the Federal Energy Regulatory
23 Corporation, I think it is, has not ruled on those things
24 yet after several years. So it's on hold. But that was
25 one of my roles too. I testified there.

26 Q. During your time with Flynn, have you previously

1 been asked to testify in proceedings involving PG&E?

2 A. I did testify before the FERC. And that
3 involved PG&E. That was with respect to the wholesale
4 distribution tariff.

5 We currently have filed my testimony in a
6 specific connection situation where they were going to
7 take power to a new muni-transit station. It goes by the
8 acronym of Six Berry. And we are contesting how that
9 connection was made and how certain facilities were
10 charged. That is in the -- I don't know all the legal
11 terms, but I provided testimony. Somebody has come back
12 and then we've gone back cross-answering, I think.

13 And then we've also received testimony from a
14 FERC technical witness -- FERC Federal Energy Regulatory
15 Corporation technical witness -- on the engineering
16 aspects of that case.

17 Q. What is your educational background that
18 qualifies you to advise on these types of matters?

19 A. I have a degree in electrical engineering from
20 University California Berkley, graduated in 1970. I also
21 have an MBA from Saint Mary's College in Moraga. I think
22 that was 1992 or 1993. So that's my educational
23 background.

24 I'm a registered licensed engineer in
25 California, an electrical engineer. And I have 35 years
26 of working experience at PG&E.

1 Q. That would be the next question.

2 A. Well, you're talking about credentials.

3 Q. You took my surprise away.

4 A. To be frank, I think my experience qualifies me
5 as much as anything with respect to doing this testimony
6 as school.

7 Q. Bingo. How long have you been with Flynn?

8 A. I would say I've been with Flynn for probably
9 approaching ten years.

10 Q. By whom were you employed prior to Flynn?

11 A. I have also had consulting arrangements with a
12 company called Nexant, N-e-x-a-n-t. I believe that was a
13 spinoff of Bechtel. And I also did work for somebody
14 called Energy Experts International. So those were
15 shorter. And then Flynn is the only place I've been.

16 Q. More consulting within the technical energy
17 sphere?

18 A. Pretty much, yeah.

19 Q. And prior to that by whom were you employed?

20 A. Oh, prior to that I was employed by Pacific
21 Gas & Electric Company from 1970 through 2005.

22 Q. Walk us through your PG&E career, what you did
23 for PG&E, jobs you held.

24 A. Sure. I actually had three summers with PG&E
25 prior to going to work for them in 1970. That was in
26 Fresno. And that was part of an intern program. So I

1 read meters one summer. And I actually was out on a line
2 crew in Fresno one summer and then I was in the
3 engineering office in Fresno. That was really an entre
4 to getting employment after I got out of school.

5 From there I started in San Francisco in the
6 local office as a planning engineer. Planning engineers
7 are the people that look at the capacity of the lines
8 relative to the load they're serving and decide if they
9 need a new substation, if they need a new line.

10 Also if there were reliability issues, too many
11 outages, or other problems, the planning engineers would
12 look at that. So I did that for several years. I was an
13 individual contributor. Nobody worked for me.

14 I moved from there across the East Bay to
15 Concord after several years and I became a planning
16 engineering supervisor. So now I had people doing the
17 studies and I was in charge of them.

18 I kind of bounced back and forth between San
19 Francisco and the East Bay. I came back to San
20 Francisco, and now I had engineers and service planners.

21 Service planners are the people when you call up
22 and say "I've got a new building and I want to get power
23 from PG&E. You know, what will it take? How will that
24 be designed?" There's various rules about who pays for
25 what and stuff like that. So I had service planners.

26 Eventually in San Francisco I had construction

1 work force under my management as well as the engineering
2 and technical staff. So these were the local linemen,
3 and this was in San Francisco. So it was a lot of
4 underground workers to build and take care of and
5 maintain the system. All of these jobs were completely
6 focused on distribution facilities. There was no
7 transmission or substation responsibilities as I recall.

8 I did come in to the general office. So there's
9 the corporate headquarters, so-called general office or
10 GO, and there's local offices. So all this time I had
11 been in the local office. I came into the general office
12 in department. And I was in a transmission and
13 distribution department. I was sort of the T&D's
14 representative with respect to planning and expansion of
15 the power system.

16 There was a separate department for planning and
17 transmission systems and making recommendations. And you
18 had an operating department that had a point of view on
19 what would be a good way or bad way to do that. So that
20 was my job is to represent an operating point of view as
21 to how this expansion was going to take place.

22 I'm not remembering the exact dates, Marc,
23 but --

24 Q. That's okay.

25 A. I believe that -- I believe I'm correct in 1986
26 I was made a department manager in the general office in

1 the headquarters. And that was for distribution
2 engineer. So at the corporate level we were doing
3 planning. We had the system databases. We had other
4 stuff that was used by the various regional offices.

5 And one year later I believe roughly I became
6 the manager. I was called a manager of electric T&D. So
7 that basically took the responsibilities I had for this
8 distribution engineering group and folded in some
9 additional responsibilities.

10 I believe it coincided with the retirement of
11 the gentleman that had been doing the T&D department
12 before. I don't remember exactly. I presume -- I
13 believe it was sort of a complete transfer of his
14 responsibilities, but there's a possibility that some
15 other things may have gone someplace else. I just
16 honestly don't remember.

17 I'm going to close up here pretty quick. In
18 '91 -- so all my jobs previously had been what I would
19 call technical jobs. I was responsible for some part of
20 the system. I was designing, I was, you know,
21 supervising people who designed, who took care of things.

22 I became something called a division manager.
23 There are 13 divisions in PG&E. And those are the local
24 offices that are running PG&E for that local office. And
25 that would include customer service reps, that would
26 include marketing reps, that would include the

1 construction work force and linemen, the emergency
2 responders, the gas department, the building department.
3 It was like a small little business there. And so I was
4 in central and eastern Contra Costa County as the Diablo
5 Division manager.

6 I believe it was 1995 where I changed jobs again
7 and I came back into the headquarters. And I was the
8 manager of system operations. System operations was the
9 transmission level dispatchers and engineers that are
10 monitoring and running the grid 24 hours a day. How much
11 generation? Which lines are in and out for work?

12 I guess that's enough of a description.

13 There were a few adjustments in those
14 responsibilities over time. I believe at one time the
15 transmission planning department I mentioned earlier and
16 how there's people out there identifying plans for the
17 future, growth, they were brought in under my
18 organization too. It's called the Electric Transmission
19 Planning and Operations.

20 So it's an interesting mix if you're familiar
21 with those kinds of responsibilities. The planners are
22 looking out five years and the operators are looking out
23 five minutes. So that was, you know, an interesting mix.

24 I believe the planners got peeled off again.
25 And at the end I was pretty much running system
26 operations until I retired.

1 Q. As part of your job as system operations, did
2 that include communicating with or reporting to the ISO?

3 A. It certainly did. In the course of my job there
4 was a substantial change in the way the power system is
5 operated in California. And that was the creation of the
6 California Independent System Operator. In addition to
7 that there was a California Energy Market Place that came
8 in as well.

9 So I was in charge of PG&E's operation at the
10 time the -- I'll just use the term ISO, California
11 Independent System Operator, when the ISO came in. So
12 behind the scenes there were many of us that were working
13 to figure out how to make that happen. It's not a
14 trivial task. But in the course of things people were
15 hired, systems were installed, and the operational
16 control of the utilities grid in California was turned
17 over to California ISO. And I believe that was roughly
18 in April of 1998.

19 Q. From your perspective as a PG&E management
20 person dealing with the ISO, what were the
21 responsibilities or what did PG&E have to do with the
22 ISO?

23 A. Well, the ISO was an overlay over PG&E's
24 operations. They were still a control center at PG&E.
25 They managed day-to-day activity. There was a control
26 center in Southern California Edison. Same thing.

1 Control center San Diego Gas and Electric. So it was
2 over the top of those.

3 And by that I mean that they had the ultimate
4 control and decision making on -- let's say next week I
5 want to take a line out of service from "A" to "B"
6 because it needed to have some maintenance on it. They
7 had to approve that change. Conversely, if they issued
8 some sort of an operating order, whatever that might be,
9 it was the utility's duty to enact that order.

10 For example, if they said de-energize a line for
11 some reason, whatever that might be, we did that.

12 I could remember a situation where my dispatcher
13 received an order to do something called backing Diablo
14 Canyon. Backing means turning down the energy from
15 Diabale Canyon. And my dispatcher declined to turn down
16 the energy. And the next day we had a discussion that
17 "You follow the orders. We'll sort it out after the
18 facts." So they really had the ultimate authority.

19 Q. And just to put on the record, what kind of a
20 facility is Diablo Canyon?

21 A. Diablo Canyon is 2,200 megawatt nuclear power
22 plant. And essentially -- it probably still is the case
23 now, but it's called base load. You turn it on and let
24 it run. That is the best way for that kind of plant to
25 run. It's not used to being adjusted one way or the
26 other unlike load-following units that are built to

1 adjust and change. Not use.

2 Q. Can you give us an example of what would be the
3 load-following unit in generation?

4 A. Well, there are various kinds, but probably
5 typically those that are gas-fired units. They tend to
6 be smaller so they're a little bit more flexible. You
7 know, a reasonable size gas unit might be 3 or 400
8 megawatts.

9 The power units at Diablo Canyon are 100,100
10 megawatts each. And there's two of them. So they are
11 big. They're just not made to be, you know, moving up
12 and down very much.

13 Q. Would hydroelectric be considered to be --

14 A. Yeah, load-following.

15 Q. -- load-following?

16 A. Yeah, I think hydro could. The hydro plants are
17 complicated with respect to there's water, dispatching
18 requirements in addition to generation. And most water
19 arrangements are water first, generation second. So a
20 little less able to count on that.

21 Now, if you have to dispatch the water, you
22 dispatch the water. And you're going to make electricity
23 if you do that.

24 Q. All right. What were you doing in 1987?

25 A. Well, I -- through reading various documents
26 that refreshed my memory, in 1987 I was the manager of

1 Electric Transmission and Distribution in PG&E corporate
2 headquarters.

3 Q. Let's go into depth a little bit more about your
4 job as manager in the Electric Transmission and
5 Distribution and exactly what that entailed.

6 A. I don't have a great recollection on exactly
7 what the job was, but I had various groups under my
8 manager. In the typical structure there's a manager,
9 there's some sort of second-level supervisor over a team
10 of individuals that are doing certain work.

11 Now, that work could have been what kind of
12 vehicles to purchase for the line workers? What kind of
13 tools? What kind of work procedures would be utilized?
14 There could be also not for transmission but for
15 distribution some engineering standards or specifications
16 for material. So it was -- that's a general description
17 of things.

18 Q. And did you say earlier you were in that
19 position from 1987 or thereabouts to 1991?

20 A. I believe that is correct, yes.

21 Q. Do you recall while you were the manager of the
22 Electric Transmission and Distribution a program by which
23 PG&E created a new classification entitled transmission
24 troubleshooters?

25 A. I remember the classification. I remember the
26 creation of that. I would be unable to say exactly when

1 that happened.

2 Q. Okay.

3 A. You know, if there was information that it was
4 in '87, I wouldn't be in a position to disagree with
5 that.

6 Q. When -- well, let me ask you this: Did you know
7 (WITNESS #17)?

8 A. I do know (WITNESS #17).

9 Q. Do you remember (WITNESS #17)?

10 A. I remember him well. He's an extremely calm
11 person.

12 Q. Was he one of the persons that reported to you
13 in your capacity as the Electric Transmission and
14 Distribution manager?

15 A. You know, I don't remember exactly. My sense is
16 to say no. One of the things about the way the
17 organization works is you have a corporate headquarters
18 organization that's providing policy, directives, and
19 information that is implemented by the regional
20 organizations where the actual transmission troubleshooters
21 and other line workers and people like that work. So
22 they work for -- so I work for a vice president of
23 electric operations. They work for a regional vice
24 president.

25 So (WITNESS #17) may have been implementing
26 things that came out of my department, but I don't

1 believe he worked for me. If you tell me he did, I will
2 just have to trust you on that.

3 Q. You were talking earlier and most of your
4 experience up to that point was in the distribution side;
5 correct?

6 A. Yes. I will say specifically my experience was
7 in distribution. And it was in the -- the, you know,
8 management, development, and expansion of the system.
9 There are engineers at PG&E that are writing engineering
10 standards about, you know, how thick the insulation on a
11 cable has to be, what size transformers should be
12 installed, et cetera. I did not do that kind of work.

13 Q. When you moved into the Electric Transmission
14 and Distribution management, did you receive any training
15 in transmission? The transmission system itself?

16 A. I did not.

17 Q. So in front of you you have a document marked as
18 Exhibit 608. There should be a white exhibit tag in the
19 top right corner. Do you see that?

20 A. I have that, yes. Thank you.

21 Q. And do you recognize that document?

22 A. I do from the fact that I have seen it. I would
23 have been hard pressed to exactly describe it just out of
24 the cold.

25 Q. All right. We have 608 up here on the big
26 board. So 608 appears to be a memo signed by yourself.

1 Is that correct?

2 A. I think what you have here is the cover letter
3 that --

4 Q. Cover letter; right?

5 A. -- was actually distributed it. You know, the
6 document underneath is actually the bulletin or the
7 standard which I signed. This was signed for me by the
8 secretary.

9 Q. Okay. How can you tell that?

10 A. Well, I can tell because that's not my
11 handwriting, A, and, you know -- well, this is "Rod J."
12 and this is "RJ" and then her initials are here best I
13 can tell.

14 Q. Okay.

15 A. But it was not unusual once, you know, the real
16 document was made for a secretary to take and distribute
17 it. That was more efficient to get it done that way.

18 Q. Let's walk through this starting at the top. We
19 have the term "Information Bulletin" and then "Division
20 Department Transmission and Distribution Electric
21 Operations." Is that correct?

22 A. That's correct.

23 Q. That is the division that you were managing at
24 this time?

25 A. I was managing the T&D department. Electric
26 operations was the -- a bigger umbrella. So there would

1 have been other departments besides the transmission and
2 distribution. There probably was a substation department
3 and there was a -- there would be other departments.

4 Q. Then we have -- some of this is cut off in the
5 way it's been preserved. I'm guessing that in 1987 this
6 was probably manually typed out and copied on a Xerox.

7 Would that be about right?

8 A. Probably. If you make a change, you use
9 Whiteout so . . .

10 Q. So this is dated November 25, 1987; is that
11 correct?

12 A. That's correct.

13 Q. And it says "The Transmission and Distribution
14 Bulletin Manual Change Notice Number 85." Is that right?

15 A. That's correct.

16 Q. Can you explain what is a Transmission and
17 Distribution Bulletin Manual Change Notice.

18 A. Well --

19 Q. What number 85 means?

20 A. Yeah. Well, first of all, it's not a manual
21 change. It's a change to a manual. So there was a
22 binder of T&D bulletins that addressed various issues,
23 aspects, things that would not necessarily be an
24 engineering standard but maybe there was a work
25 procedure. Maybe there was something about utilization
26 of certain equipment or . . .

1 You know, I'm sorry. I'm not remembering
2 exactly, but there would have been multiple bulletins.
3 And apparently these bulletins had been changed 84 times.
4 There was not 84 changes of this bulletin, but it was the
5 84th change -- or excuse me, the 85th change of all the
6 bulletins in that manual.

7 Q. So somewhere out there there should have been a
8 policy manual or policy binder for persons in the
9 Electric and Distribution -- in Transmission and
10 Distribution Electric Ops Department?

11 A. Well, not only would there be manuals in the
12 department that created them, there would be manuals in
13 the user community out on the other end of this thing
14 that were implementing these things. You know, if you
15 went into an office, you'd find engineering standards,
16 you'd find other corporate policies and procedures, and
17 you'd probably find a binder of T&D bulletins.

18 Q. Okay. And it goes on. And this is addressed to
19 "Holders of transmission and distribution bulletin
20 manuals."

21 Would that be the people you're talking about?

22 A. That is the community I'm talking about.

23 Q. All right. "The attached revised bulletin
24 should be inserted into your manual." And then we have
25 this "Section 1: Insert and remove."

26 Can you kind of explain to us how to read that

1 real quick.

2 A. Sure. So I presume if you would have opened up
3 a manual at that time, there was a preexisting bulletin
4 on patrolling and inspecting. And that would have been
5 noted as Revision 5 suggesting there'd also be a four,
6 three, two, one and the original. So this thing has
7 evolved or developed over time. And so the idea was to
8 remove number five and put in number six.

9 Q. So this is to take the place of number five?

10 A. Sure.

11 Q. Now, number five says it was effective
12 December 1, 1984. This bulletin -- this revision number
13 six is to be effective November 1, 1987.

14 So three years approximately; right?

15 A. That's right.

16 Q. And when we get to later on in the bulletin
17 going through the meat of the bulletin itself, one of the
18 things that it says is "This should be revisited in 1990
19 and either reissued or changed."

20 So do you remember was there a three-year cycle
21 or three-year rule for revisiting the manuals or the
22 policies and procedures?

23 A. I would not have been able to specify three
24 years if I had not read it. I don't remember three
25 years, but I would say just on a general basis it was
26 always the expectation that documents had a review

1 period. They either were only effective for a period of
2 time or they were effective until the next review. This
3 wasn't going to go away but only be updated.

4 So yeah, things change in three years. I don't
5 think you had to wait for three years if there was a
6 substantial change. But on the other hand, you know, if
7 there were small things to be changed, they might be
8 accumulated and updated on that three-year cycle.

9 Q. So this is revision six. We know they're
10 supposed to remove revision five. So based upon that
11 should we assume that there are probably five previous
12 editions of this bulletin out there somewhere?

13 A. I would agree with that, yes.

14 Q. And using the three-year rule, that would
15 basically take us back to about, what, 1972?

16 A. That's right if the three-year rule was
17 retroactive.

18 Q. All right. So this is for -- this is a bulletin
19 for routine patrolling and inspection of transmission
20 lines; is that correct?

21 A. That is correct.

22 Q. Can you go through the -- read for us the body
23 and explain any -- explain just what that means.

24 A. Well, as with other changes and procedures the
25 supervisor is always responsible for assuring that
26 subordinate employees who use the above information but

1 are not assigned a manual are made aware of changes.

2 So I can imagine -- I don't know who the exact
3 recipients of the manual were. But if you had a team of
4 linemen who implemented these things or other workers for
5 that matter, they would be made aware of it. It would --
6 you know, these people don't necessarily have offices
7 where we would put a binder and that kind of stuff. So
8 that might be a reason why we didn't have the manual.

9 "When the change notice is inserted, please show
10 date inserted, enter bulletins attached, and initial the
11 appropriate change notice number on the change log notice
12 in front of the manual."

13 I think this was a procedure to verify that
14 people actually put the thing in there and that they were
15 using the latest version. There is always, you know,
16 version control issues when you have a lot of documents.
17 So somebody could open up the thing and see, oh, version
18 six, you know, roughly in that timeframe.

19 "In order to assure the use of the latest
20 transmission and distribution bulletins, new and revised
21 bulletins should be inserted when issued and the old
22 bulletins removed."

23 So I think the idea there was you didn't have a
24 mess of one through four or five sitting underneath
25 there. Basically you operated from the most recent
26 version.

1 Q. All right. So then we already talked about your
2 signature line. And down here it looks like there's a
3 "cc" on here. Do you see that?

4 A. No. It's "CSBille." I believe that is
5 B-i-l-l-e. That's a person named Connie Bille. So
6 that's her initials.

7 Q. Do you remember who Connie Bille was?

8 A. Part of the administrative team for the
9 organization. She would not be a technical person to my
10 recollection.

11 Q. All right. And then reference to "JP" on here.
12 Do you remember who that person is?

13 A. I don't.

14 Q. Okay. And finally on this page down way in the
15 bottom "T&D mailing list." Do you recall what is the T&D
16 mailing list or who's on it?

17 A. I don't. I don't recall it. I don't know who's
18 on it.

19 Q. All right. Let's flip over now to page 2 and
20 the actual meat of this document. So I know this was a
21 long time ago. But before we get into the meat, can you
22 kind of explain to us your role in the creation of this
23 document.

24 A. Okay. I was a department manager. As I
25 described earlier, there were second level supervisors
26 between me and frontline people doing the work. So as a

1 manager I was responsible for, you know, running the
2 organization. I was responsible for setting goals,
3 objectives, priorities, et cetera. I'm not saying there
4 aren't managers who also tried to do some of the specific
5 work. That was not me. It wasn't my job to do my
6 employees' job.

7 And frankly, particularly when it comes to
8 transmission lines, I am not a transmission line hardware
9 expert. So it was my job to inquire, ask questions,
10 understand who I could trust and move forward with that.

11 Q. All right. First off, in all caps the very
12 first line of the body says "REGIONAL VICE PRESIDENTS."
13 Is that to whom this is addressed or --

14 A. I believe that is correct, yes.

15 Q. So this is something that you were submitting to
16 those above you for what reason?

17 A. We were submitting it to the regional vice
18 presidents to be implemented. It was -- you know, later
19 on it was developed in the course of people that were
20 under these regional vice presidents. It was a bit of a
21 collaborative effort. And it's curious that I, as a
22 manager, was telling the vice presidents what to do, but
23 I think that is kind of what was going on here.

24 Q. And so the memo itself is addressed to the
25 regional vice presidents but the cover page, the cover
26 letter that we have on there is addressed to the

1 Transmission and Distribution Department itself. So from
2 that should we assume that this was approved by the
3 regional vice presidents and now it's being distributed?

4 A. I would not have that expectation. It was
5 actually going to the holders of the manuals under these
6 guys.

7 Q. Right.

8 A. And women.

9 Q. But now that -- you know, the fact that you were
10 distributing this to the people who'd actually be
11 implementing it, would that indicate that this -- the
12 changes in this provision had been approved by the
13 regional vice presidents?

14 A. I can't explain it, but I don't think that they
15 were in the approval process.

16 Q. Okay. All right. So walk us through this.
17 Let's start off with the very first section; the policy.
18 Can you read us the policy and explain to us what you
19 recall about the policy.

20 A. Sure. "It is PG&E policy to patrol all
21 transmission lines and inspect supporting structures,
22 associated hardware, and right-of-way with the frequency
23 and detail given in Section II below. The Regions
24 perform patrols to ensure that the transmission
25 facilities are in good repair in order to maintain a high
26 standard of service reliability and safety. This policy

1 is consistent with Section III of G.O. --" which stands
2 for General Order 95 parenthetically which is the state
3 power system code.

4 Q. CPUC?

5 A. CPUC. Excuse me. "-- which outlines the
6 requirements for all lines.

7 Information concerning patrols and repairs shall
8 be maintained in a database and retained for a minimum of
9 five years. This will allow easy retrieval of data
10 necessary to evaluate trends, identify areas for
11 improvement, and prepare reports to regulatory agencies."

12 Q. So the first thing -- we're talking about
13 database. Now, this is a 1987; pre-Internet. Did you
14 guys have computers and a computerized database for the
15 storing and managing of this type of reports?

16 A. I don't specifically remember. In the document
17 itself we refer to something called the CONDOR database.
18 So I presume that's some sort of way to accumulate
19 information. I have no recollection of CONDOR. I
20 couldn't tell what you it was like, but certainly there
21 were computers.

22 Q. Now, the -- going back up here to the section.
23 "This policy is consistent with Section III of G.O. 95."

24 And you started talking G.O. 95 is General Order
25 95. And that's CPUC; correct?

26 A. (Nods head.)

1 Q. How much experience or knowledge did you have
2 with regard to the CPUC and the regulations of PG&E?

3 A. Well, at the time I was working, I was -- I
4 would say I was probably pretty familiar with G.O. 95.
5 G.O. 95 sets forward things like clearances from lines to
6 trees, clearances from lines to houses, clearances from
7 lines to the ground, and other requirements like that. I
8 would be unable to quote you any of those requirements at
9 this time.

10 Q. What is the relationship between PG&E and CPUC
11 or what was it when you were managing for PG&E?

12 A. They were a regulatory authority that had
13 jurisdiction over PG&E. I don't think there was any
14 dispute that General Order 95 was something to be
15 complied with.

16 Q. All right. Let's move on to Section II:
17 Implementation. And starting off with paragraph number
18 one requirements, if you could read that for us. And we
19 have some questions about it.

20 A. Sure. "Requirements: It is the responsibility
21 of each Region to ensure proper training of personnel
22 conducting line patrols. This is to be accomplished
23 through use of periodic training classes for all
24 transmission troublemen and any other personnel who may
25 be called upon to patrol. The training should include a
26 review of this bulletin, other T&D bulletins as

1 appropriate, patrol safety, Engineering Drawing 022168,
2 and G.O. 95 requirements. The use of available
3 videotapes (spacer damage, infrared patrolling, et
4 cetera) is encouraged. Particular attention should be
5 given to the specific items listed on the code sheet that
6 is provided with this bulletin. The Transmission and
7 Distribution Department will assist the Regions in
8 setting up and conducting the training classes."

9 Q. Now, we'll get into some specifics there later
10 in the document. But what do you remember about the
11 troubleman program when you were managing this
12 department?

13 A. I'm kind of -- thinking back, of course, there
14 was not this transmission troubleman classification but
15 there was a troubleman classification. So these were
16 the -- these were people that were on shift pretty much
17 24 hours a day and they were emergency responders. And
18 if there wasn't an emergency, there was other work for
19 them to be able to do.

20 The transmission troublemen was a new
21 classification. It may have even taken some of the other
22 previous troublemen into there. I don't know who staffed
23 it, but I think it was -- provided more focus on the
24 transmission system.

25 Q. Do you recall a specific type of training
26 program or, you know, in-service training or continuing

1 training program for the transmission troublemen?

2 A. I'm sorry. I don't. There was a lot of
3 training at PG&E. There were a lot of turning into, you
4 know, regular -- don't take this the wrong way but people
5 into linemen, line workers. There was a training yard
6 in -- off of Highway 5 where they were trained. And then
7 ultimately that training center was moved into Livermore.

8 So PG&E grew many of their own line workers.
9 And so there could have been a session with respect to
10 transmissions there. I believe there were some
11 transmission towers in the training facilities. But what
12 exactly was done for transmission troublemen, I'm sorry.
13 I can't say.

14 Q. Okay. Next up, number two. If you can read
15 that for us real quick.

16 A. Sure. "Each region shall establish a patrol
17 schedule for all of its lines in accordance with this
18 bulletin."

19 Q. What is a region?

20 A. The region was an organizational construct that
21 was put in. It was kind of like another layer, if you
22 will. And these divisions were subsets of the regions.

23 My recollection is there were six regions. And
24 those regions had a vice president. They had several
25 other staff members. There was sort of an overall -- so
26 the vice president had a manager underneath him and some

1 of the departments nested there. The regional vice
2 president would have had responsibilities for marketing,
3 would have had responsibilities for customer service, and
4 those kinds of things. So there were six of them.

5 Q. Okay. Let's move on to the next page. And
6 paragraph three, please.

7 A. Sure. "Regions shall patrol all transmission
8 lines for which they have been assigned maintenance
9 responsibility, both inside and outside Region
10 boundaries. Where necessary inter-region agreements
11 should be made to avoid duplicating patrols. The results
12 of these patrols are to be documented in sufficient
13 detail to ensure that patrols and noted repairs are
14 scheduled and completed."

15 Q. All right. So inside the regions there are
16 transmission lines; correct?

17 A. That's correct.

18 Q. And if I'm understanding this correctly, the
19 regions themselves are responsible for patrolling the
20 transmission lines within their region?

21 A. Yes. And I think what this was attempting to
22 get to is transmission lines don't necessarily observe
23 organizational boundaries. So you should have -- you
24 could have a line that runs from "A" to "B" and, you
25 know, a portion of that line was in one region and a
26 portion was in another region.

1 So those two might get together and say, you
2 know, "Region 1, you patrol this line between the
3 substation even though that comes into my territory."
4 And then you have another line down in the other area
5 where a portion of it was patrolled by them backing the
6 other guys. Or they could make a determination that "We
7 will stop at the boundaries." It sounds to me like this
8 was suggesting that they work that out.

9 Q. Let's move on to paragraph four. Could you read
10 that for us, please.

11 A. "Regions shall take prudent steps to identify
12 and evaluate any discrepancies noted on patrols.
13 Corrective action should be scheduled and prioritized so
14 that problems affecting safety or which may result in
15 near term line failures are handled without delay.
16 Correction of items affecting the longer term liability
17 of the line should be scheduled in accordance with
18 available budgets and manpower."

19 Oh, sorry.

20 "Repairs to wood pole transmission facilities
21 should be referred to the appropriate Region Transmission
22 Department. Plans regarding major repairs on steel tower
23 lines should be directed to the Electrical Engineering
24 Department with a copy of the request sent to the
25 Transmission and Distribution Department. It is
26 important that the Transmission and Distribution

1 Department also be notified of any maintenance,
2 operating, or hardware problems that may have systemwide
3 impact."

4 Q. All right. How would you define corrective
5 action?

6 A. Corrective action would be to fix the problem.

7 Q. So repair it; right?

8 A. It could be repair or replacement. Let's say,
9 you know, you go out there and a hunter shot at the
10 insulators and several of them are broken. You would
11 take that string down and replace it.

12 Q. Can you please explain to us when it talks about
13 "correction of items affecting the longer term
14 reliability of the line" what is meant by the reliability
15 of the line?

16 A. The reliability of the line, I believe, is the
17 ability to stay in service and deliver electricity.

18 Q. Now, I want to skip down to paragraph "B" or
19 Section B. Right?

20 A. Yes. Okay.

21 Q. Which is entitled "Types of Patrols." It says
22 "Patrols that are referred to in this bulletin are
23 segregated into four categories."

24 And then we move on to page 3 and the first
25 category is ground patrol. Can you read for us what it
26 says about ground patrol.

1 A. Yes. "Ground patrol: This is to be done by
2 vehicle or by foot patrol depending on the terrain.
3 Every structure is to be viewed from all angles needed to
4 accomplish and complete inspection. Where possible the
5 conductor between the towers should also be inspected."

6 Q. Okay. Number two is aerial patrol.

7 A. "Aerial patrol: Aerial patrols are to be done
8 by helicopter."

9 Q. That's all it says about aerial patrols; is that
10 right?

11 A. That's what I see, yeah.

12 Q. And then number three is infrared. I'm not
13 going to ask you to read that entire thing, but if you
14 could briefly describe for us your understanding of what
15 infrared patrol is.

16 A. Sure. Infrared is you use newer technology to
17 scan the line. If there was a hot spot developing on the
18 line, that portion of the line would appear brighter.
19 There would be sort of like a effervescent or something,
20 if you will, about that portion. And the kind of things
21 that could become a hot spot most typically was where
22 connections were made.

23 The wire that you see on those lines that goes
24 forward is not a continuous wire. You run out of wire at
25 the end of the reel and you splice them together. So
26 that splicing point is always -- you know, that's a point

1 of potential problems on the line. So you would scan
2 that.

3 There are other connectors that are connected at
4 the base of the insulator string where it's clamped in.
5 So when there's power flowing on the line, it creates
6 heat. Transmission lines, even when they're operated
7 that way and everything is absolutely fine, they get
8 warm.

9 Matter of fact, the design understands that a
10 power line will sag as it warms up. And part of the
11 limitation on how much you can carry on the line is:
12 Would it sag?

13 So in any case, you want to add -- make sure
14 that the line has some load on it. I'm seeing here it
15 says you should have at least 50 percent of its capacity.
16 Let's say the line had a rating of 400 amperes. So it
17 sounds like you should have 200 on it at least to make
18 sure you see enough warming in the areas where there
19 might be a hot spot.

20 Q. You mentioned in there talking about splicers
21 and connectors. Do you understand and can you briefly
22 explain what the difference is between a splice and a
23 connector?

24 A. Sure. A splice is the point at which, you know,
25 the old reel ends and the new reel comes in. So
26 basically you're taking either end of the connector

1 and -- either end of the conductor and you put it into a
2 sleeve.

3 I think there's different kinds of connectors,
4 but the one I'm most familiar with is like a tube. And
5 you slide either end of the wire in until it's fully
6 inserted. And then they have hydraulic presses that
7 compress that sleeve to make almost like a solid bar out
8 of it.

9 Inside there there's also dielectric grease. I
10 think it goes by the eloquent name of goop. So you wire
11 brush the line, you goop the line, you put the line -- it
12 could be preloaded inside the sleeve and then you press
13 it.

14 I would distinguish that from -- so that is
15 obviously a current-carrying element of that line. That
16 sleeve should be -- you know, the mantra is always make
17 the sleeve better than the line itself.

18 The lines are also connected at the insulators.
19 So you see, you know, the string hanging down or you see
20 the ones out like that. At this point it's not sliding
21 loose there. It is clamped at that location.

22 So that clamp is not a current-carrying element,
23 but I think it's possible if there was wear at that
24 point, it might show on an infrared inspection.

25 Q. Have you ever seen -- or let me back up on it.
26 Are you familiar with the term "parallel groove

1 connectors"?

2 A. I am.

3 Q. What is a parallel groove connector?

4 A. They were called PG, "P" and "G" standing for
5 parallel groove. And as best I recall, a parallel groove
6 connector was a connector that had like two slots. So
7 one connector would go into the top slot and another
8 conductor would go in the bottom slot. And then you
9 would clamp those two together and that became a
10 connection point, a parallel groove. I thought there
11 were parallel groove clamps, but any clamp connecting PG
12 clamps is what was used for a connection.

13 Q. Okay. Are those parallel groove connectors
14 still commonly used in utilities?

15 A. I really can't speak to other utilities. I know
16 at PG&E there came a time where these PG clamps were
17 failing and as a result wire was being dropped on the
18 ground.

19 In my recollection that was a distribution
20 situation, but that's my recollection. And so PG&E went
21 to a program to utilize new clamps for those connections.
22 And I think they went back and proactively replaced some
23 of the PG clamps.

24 Now, the PG clamps in my recollection is not
25 something that would be used to hook two wires together.
26 It's more common if you have a mainline system going

1 through and you tap off -- you go down the street. So a
2 small wire here (indicating). You connect the small wire
3 to the big wire with a PG clamp.

4 There are other clamps too. And I think they
5 went to something called a fire wedge clamp. So that
6 somehow put the conductors in. And you had a wedge and
7 it used a small explosive charge like maybe a shotgun
8 shell or something like that. You activated that and it
9 drove that wedge in to clamp that down. So it was a very
10 much more forceful kind of clamping. It's not something
11 you can take apart by the way but --

12 Q. Yeah. Now, going back, to your knowledge, to
13 your memory, PG&E at some point prohibited the use of the
14 parallel groove connectors; right. Or clamps?

15 A. That's correct.

16 Q. And ordered that all that are in use be replaced
17 by something new?

18 A. Well, I don't remember the part about all of
19 them, but I do remember there was a replacement program.
20 And certainly the new installations did not use the PG
21 clamps.

22 Q. All right. Have you ever seen or were you aware
23 of parallel groove connectors being used in place of
24 splices to fix broken wire?

25 A. I'm not aware of that.

26 Q. Okay. In your experience and your knowledge,

1 your training as an electrical engineering, would that be
2 appropriate?

3 A. Well, it would cause me concern. I think one of
4 the issues if it's in a -- a span of conductors, there's
5 a fair amount of stress on the span. And so the idea of
6 crimping that splice is to make it a strong connection.
7 That -- in my mind a PG clamp would not fit that kind of
8 description.

9 Q. How about if it was a short span?

10 A. No. I don't even know -- you know, long or
11 short it would not be the preferred insulation from my point
12 of view.

13 Q. Are you familiar with the transposition towers
14 on a transmission line?

15 A. Generally speaking, yes. Actually,
16 transposition takes place in a lot of transmission lines
17 even on the wood pole lines.

18 Q. Yep. And we're talking about a jumper cable,
19 say, going from a left phase to a right phase on a
20 transposition tower.

21 Have you ever seen a parallel groove connector
22 being used as a splice on that type of line?

23 A. I haven't. But I will also say that when we're
24 talking about a span of wire, I'm talking about hundreds
25 of feet or longer where there was a great deal of stress.
26 There is almost no physical pulling or stress in general

1 on jumpers other than the weight of the wire itself. So
2 I would be, you know, at least neutral on the ability to
3 use the PG clamp on that kind of jumper cable.

4 When I was describing it earlier about using the
5 PG clamp for a little line going down the street, that is
6 almost an electrical jumper cable there although what I
7 was describing was distribution.

8 Q. Correct. All right. So let's skip over here to
9 number four climbing patrol.

10 A. Oh, read it?

11 Q. Yep, please.

12 A. "Climbing Patrols: These patrols are usually
13 made for a specific purpose such as to check for loose
14 bolts, deteriorated hardware, et cetera. Since climbing
15 patrols will normally only involve a sampling of the line
16 structures, they should be combined with a ground patrol
17 so that an entire line section (all structures and spans)
18 is patrolled. If this is done, the patrol shall be
19 designated a climbing patrol and it will take the place
20 of a routine ground patrol for this line section.

21 NOTE: Towers five years old or newer need not
22 be climbed unless hardware problems unless hardware
23 problems have been detected --"

24 We didn't have spell check back then.

25 "-- have been detected or specific concerns have
26 been raised."

1 Q. All right. So let's work backwards on this. Do
2 you recall why towers five years old and newer would not
3 be need to be climbed?

4 A. I don't think I had any involvement with the
5 determination of five years. I would just say, you know,
6 from general expectations that's pretty much a brand new
7 line, not much in the way of wire tearing or anything
8 else going on there.

9 Q. I think the rest is pretty self-explanatory.

10 Drop down to Subsection C. Can you read for us
11 and explain to us the different classes of lines.

12 A. Sure. "For purposes of determining the annual
13 patrol requirements, overhead and underground
14 transmission lines shall be classified as follows:

15 Class A - all 500 kV and all bundled 230 kV
16 overhead circuits.

17 Class B - all other 230 kV circuits and any 115
18 kV or lower voltage circuit where the failure of that
19 circuit would result in severe overloads or where a large
20 load curtailment would result. Circuits which act as
21 outlets for important generation or act as major area
22 ties should be considered Class B.

23 Class C - all remaining overhead circuits.

24 And Underground - all underground transmission
25 facilities."

26 Q. What does it mean by all bundled 230 kV?

1 A. So the typical transmission line has three
2 phases. So you see three wires that make up the circuit
3 called A, B, and C. The 500 kV and these bundled 230 kV
4 lines use two conductors per phase. So you have twice
5 the capacity as if you had a single conductor.

6 So these were put in because these are major
7 bulk transport lines. They are very high capacity lines,
8 and they use two wires. You can use more than two. You
9 can do three, you could do four per phase. And it goes
10 by the term "bundled."

11 The 500 is already bundled by the way and some
12 of the 230s are bundled.

13 Q. Now, dropping down to Class B, "Any 115 kV or
14 lower voltage circuit where the failure of that circuit
15 would result in severe overloads or where a large load
16 curtailment would result."

17 Can you explain to us what that means.

18 A. Well, in the transmission world there are lines
19 that are network lines meaning that if that line were to
20 go out of service, there is no customer hooked directly
21 to it and the power that flows there would redistribute
22 itself automatically over existing lines.

23 So that means that if they were at some level
24 and the line went out, they would go up. Now, normal
25 planning would suggest that you should be able to take
26 one line out of service and not create these overloads.

1 So I realize what it says here. I can also say unless
2 there was unusual circumstances, there shouldn't have
3 been a severe overload.

4 And then large load curtailment. You know,
5 there's a load that because it's connected to a
6 substation serving a load on the line, if that goes out,
7 it goes out. That could be called a curtailment.

8 Curtailment to me also means that because you're worried
9 about an overload, you curtail the load. You turn some
10 power off.

11 Q. Okay. And then --

12 A. In a generation, well, that -- you know, you
13 need the resources on the system so you don't want to
14 lose the resource.

15 Q. What would be considered important generation?

16 A. Probably in the magnitude of the generation. So
17 I think, you know, if you had a 20 megawatt generator
18 somewhere, it probably wouldn't count as important. But
19 if you're getting into double digit numbers, it might be
20 more important.

21 Q. All right.

22 A. I would also say that, you know, there could be
23 specific locations where that generation is needed to
24 keep the system running at that location. And that would
25 become important.

26 Q. So now we're at D: Frequency of Patrols. Can

1 you read that for us.

2 A. Sure. "Most of these patrols can be
3 accomplished by one transmission troubleman. However,
4 certain aerial inspections, remote locations, and safety
5 considerations may require the use of a second
6 troubleman. Where possible minor repairs should be made
7 during ground and climbing patrols to avoid the need to
8 return to the site."

9 Q. All right. Now we're talking about the
10 different patrol frequencies. And I want to skip down to
11 the Class B circuit.

12 A. Sure.

13 Q. And what were the requirements for patrolling a
14 Class B circuit in 1987.

15 A. Okay. "Class B circuits. A, one annual ground
16 patrol; B, two aerial patrols spaced approximately six
17 months apart; C, one infrared patrol every five years.
18 This may be counted as one of the two annual aerial
19 patrols; D, one annual climbing patrol. Climb five
20 percent of steel structures each year unless a problem is
21 found whereupon the adjacent structure shall also be
22 climbed and expected. Where possible this patrol should
23 be combined with an annual ground patrol to cover the
24 entire line section."

25 Q. So in 1987 on a Class B circuit the PG&E
26 troubleshooters were doing at least one ground patrol and two

1 aerial patrols per year?

2 A. That's correct. They were also doing a portion
3 of climbing.

4 Q. And that is what we're going to get to.

5 A. Sorry.

6 Q. Yep. And then as part of the ground patrol they
7 were also climbing -- were supposed to climb five percent
8 of the steel structures on each line each year? Is
9 that --

10 A. That's correct.

11 Q. So pretty vigorous inspection and patrol
12 schedule at that point?

13 A. I think so, yes.

14 Q. So, for instance, if a line has 446 structures
15 on it, you would expect the troublemen inspecting that
16 line every year to do five percent of that or
17 approximately -- what is that? All of a sudden I lost
18 the math in my head. Five percent of 446 would be --

19 A. It's about 20 towers, I think. Or 25 towers.
20 Somebody got a calculator out there?

21 GRAND JUROR NUMBER SEVENTEEN: You're close.

22 THE WITNESS: I'm an engineer. I guess I'm
23 supposed to figure that out.

24 BY MR. NOEL:

25 Q. So in 1987 that's the standards that were set
26 for the troublemen to inspect and patrol a Class B

1 circuit?

2 A. Right. And I'm also expecting they don't climb
3 the same five percent every year. Hopefully, there's a
4 rotating cycle.

5 Q. And now if we dropped down to a Class C circuit,
6 what was the inspection and patrol requirements for
7 Class C?

8 A. Sure. "Class C, a, one annual ground patrol; b,
9 one annual aerial patrol."

10 Q. So even in Class C, which is the lowest of the
11 transmission, you were doing one ground patrol and one
12 aerial patrol?

13 A. That's correct.

14 Q. Every year?

15 A. That's correct.

16 Q. All right. So let's skip down to F: Patrol
17 Reporting.

18 A. Okay.

19 Q. If you could read that for us.

20 A. "Patrol Reporting: Transmission lines form the
21 backbone of our system and are a critical factor in our
22 ability to efficiently serve the energy requirements of
23 our customers. Many of these lines are located in remote
24 locations and are not easily noticed. Therefore, it is
25 important that the troubleshooters be alert to details and
26 little things that may cause larger problems later on.

1 The troubleman should be made aware of and look for both
2 natural and man-made conditions such as overgrowing trees
3 and vegetation, right-of-way encroachments, structure and
4 equipment problems, and construction activity. Typical
5 items that should be reported during a line patrol are
6 listed in Appendix A. The code sheet in Appendix B can
7 be used as a quick reference."

8 Q. All right. Pretty self-explanatory. We're
9 going to skip over G and go a little bit to H, the
10 recordkeeping. And we talked a little bit about this
11 earlier. And if you could read us Subsection H-1 on the
12 record keeping.

13 A. Sure. I -- just editorially I thought G was
14 kind of nice in that it was a respectable patrol.

15 Q. Exactly.

16 A. You know. That was the way you should conduct
17 your business.

18 Q. Yep.

19 A. Sorry. Record keeping. Which one did you want?

20 Q. Let's start with number one.

21 A. "Number one: Record Keeping. A record of line
22 patrol reports shall be retained for a period of five
23 years. The storage should be made by transcribing the
24 actual field report into a database management program.
25 The Transmission and Distribution Department will
26 coordinate changes to the existing CONDOR Program and

1 will distribute them to the Regions as required. The
2 Regions may use other software they feel will better suit
3 their needs as long as the reporting requirements are
4 met.

5 A follow-up system shall be used to ensure that
6 all necessary repairs are completed and documented. This
7 includes any corrective work that is planned or underway
8 but not complete.

9 The patrol/maintenance database program shall
10 contain all the necessary items to create reports,
11 schedule patrols and maintenance, generate follow-ups,
12 and provide an electronic library record of all patrols
13 and maintenance performed. This program will aid the
14 Regions in administering the transmission patrolling
15 program in an efficient and cost effective manner."

16 Q. Now, we talked earlier about the CONDOR Program
17 and you don't really remember what the CONDOR Program is.
18 But is it safe to say here in 1987 PG&E has a
19 recordkeeping program by which the inspectors, the
20 troubleshooters who were doing the patrols are recording their
21 patrols or inspections on paper forms that are then being
22 transcribed into a computer data management system?

23 A. I would interpret these words to say that. I
24 don't -- at that time there was no such thing as, you
25 know, hand-held computers or iPods or stuff like that.
26 So that's what would have happened. Paperwork

1 transcribed. They may have had staff to do the
2 transcription. I don't know that they had the time do
3 that, but somebody did.

4 Q. And in 1987 PG&E was already looking forward and
5 planning for an electronic library to have a record of
6 all of the patrols and inspections. Is that correct? Am
7 I reading that correct?

8 A. You're reading that correct.

9 Q. Would it surprise you that until 2017 PG&E was
10 still using paper which was then transcribed into a
11 system?

12 A. You know, to tell you the truth, it would.
13 There was a big effort to put computers in gas
14 servicemen's vehicles and certainly distribution
15 troubleshooters. So I am surprised.

16 Q. All right. So let's move on to number two
17 there, Subsection 2 of Subsection H which talks about the
18 forms. Can you read that to us.

19 A. Okay. "Two: There are two report forms that
20 can be used in conjunction with this bulletin. One is
21 form 62-4768 and the other can be generated by use of a
22 database management program. The Region may use
23 whichever form is more conducive to their patrol effort.
24 A sample of form 62-4768 is attached. Completed patrol
25 sheets are returned for reentry into the program system
26 for maintenance scheduling.

1 The patrol report should be entered using the
2 appropriate code found be in the attached code sheet.
3 Multiple codes may be used if required with the codes
4 separated by a comma. When completing the patrol report
5 form, the following conventions should be used: A,
6 usually only the three digit code is required to specify
7 the condition of the tower or structure; B, if the report
8 concerns an insulator string with a broken or damaged
9 bells, specify how many bells are damaged out of the
10 total number of bells in the string."

11 Q. Let me interrupt you right there. This is a
12 long one. So I will kind of annotate this.

13 What is bells? What are we talking about bells?

14 A. I think that's vernacular for individual
15 insulators. The string of insulators is a connection of
16 five, 10, or 15 of these individual insulators,
17 individual bells that connect together and make a string
18 of insulators. One end is connected to the energized
19 portion of the line and the other end is connected to the
20 tower or to the pole.

21 Q. All right. Go ahead.

22 A. Okay. "If the report concerns an insulator
23 string with broken or damaged bells, specify how many
24 bells are damaged out of the total number of bells in the
25 string and which bells are broken. Reference is the line
26 end."

1 That would be the so-called hot end.

2 "This information should be entered in the
3 'Patrol Comments' section of the patrol sheet. Examples:
4 3:10 1, 2, 3. This means that 3 out of the 10 bells are
5 broken and that they are in the 1st, 2nd, and 3rd bells
6 in the string."

7 Keep going?

8 Q. Keep going.

9 A. Okay. "If the report concerns a specific phase
10 such as a damaged conductor, specify which phase by
11 indicating top, middle, bottom, left, center or right.
12 Reference is determined by facing the line in the
13 direction of ascending structure numbers.

14 If damage to bundled conductor or hardwire is
15 being reported, specify the appropriate subconductor.
16 Use the same reference as in c.

17 If word descriptions are required, legibly print
18 it in ink or soft lead in the 'Patrol Comments' section
19 of the patrol sheet. For example, list the type of sign
20 missing under Code 305.

21 Each structure on the patrol must have an entry
22 in the 'Problems Found' section of the patrol sheet. If
23 there are no problems, enter 900. If the structure is
24 climbed during a climbing patrol, enter 910.

25 If a problem is between towers such as spacers
26 or conductors, it should be reported relative to the

1 lower numbered tower. All directions and positions
2 should be reported as if looking from the lower numbered
3 to the higher numbered tower or structure."

4 Q. So it looks like in this section to me that you
5 are giving the troublemen specific instructions that if
6 you find a problem whether it's insulators or something
7 else, you're going to -- you're to give a description
8 that is detailed enough that somebody is going to be able
9 to find the problem and fix it. Is that correct?

10 A. I would agree with that.

11 Q. All right. I'm not going to spend any time on
12 the next section. We will skip ahead to the last page.
13 And this Subsection B talks about compliance review.

14 A. Okay.

15 Q. If you could read that for us.

16 A. Sure. "The Transmission and Distribution
17 Department will conduct periodic reviews to ensure that
18 patrols are being correctly carried out, all required
19 repairs are completed, and the patrols are properly
20 documented. The intent of these reviews will be to
21 address problems each Region may be encountering. The
22 Transmission and Distribution Department will also assist
23 the Region in identifying and implementing the necessary
24 actions to ensure the success of the line patrol
25 program."

26 Q. So what does this paragraph mean?

1 A. Well, it says that the Transmission and
2 Distribution Department is going to look. Somebody needs
3 to go back out and see whether the patrols were conducted
4 or the repairs made.

5 I believe it has been written with, my term,
6 softer language to suggest a collaborative effort between
7 the Regions and the corporate headquarters. You know,
8 the Regions were their own organizations. And so it was
9 a bit of a teamwork approach to make sure the two parties
10 worked together as opposed to writing something that said
11 "We'll be there to audit you. And if we find out about a
12 problem, you're going to be in big trouble." That was
13 not the style of the approach that we had.

14 Q. But basically telling them "Hey, we're going to
15 be checking your work and so be aware of that"?

16 A. Absolutely.

17 Q. All right. "C: Procedure Development Process."
18 If you can read that for us and explain it.

19 A. Yes. "This bulletin has been revised in
20 collaboration with the Regional Transmission/Substation
21 Superintendent and Transmission Lines Supervisors. It
22 has also been reviewed and modified to reflect practices
23 employed by other west coast utilities subject to special
24 circumstances that may exist on our system."

25 Q. What I wanted to talk about is when you're
26 talking about other west coast utilities, what do you

1 mean by that?

2 A. Well, the other west coast utilities in
3 California includes San Diego Gas & Electric, Los Angeles
4 Department of Water and Power, Southern California
5 Edison, which is the southern area. As you go north --
6 gosh, I don't know what some of these are all now. But
7 there was PacifiCorp. There was other entities in Oregon
8 and Washington including Bonneville Power Administration.

9 So all of these were west coast, if you will,
10 utilities who maintained and operated transmission lines
11 and distribution lines too for that matter.

12 Q. So your knowledge back in the '80s at least at
13 this time was PG&E kept in contact and communication with
14 these other utilities to talk about policies, procedures,
15 problems?

16 A. In general, yes. There were utility groups that
17 got together finding out what was -- you know, was there
18 new information, new material. One of the examples that
19 I've used is we talked about the insulator bells. Those
20 are these heavy porcelain things that once you get a
21 string of about five of them, most of us couldn't pick it
22 up. Very heavy.

23 And the innovation was to utilize polymer
24 insulators. So it's made out of kind of a fancy plastic.
25 Not really plastic but mobile plastic thing that slid
26 over a fiberglass rod and probably could carry an entire

1 equivalent of insulator strings.

2 So people were beginning to try polymers. And
3 I'm sure there was a great deal of discussion between
4 "Are you guys trying them?"

5 In the early days they didn't always work out
6 great. You know, it's the implementation of new stuff.

7 So "Are you guys seeing this with these kind?"
8 or "Are you buying from Vendor A or Vendor B?"

9 I don't know that it was a formalized process as
10 much as it was just people got together and they talked
11 about things.

12 Q. Okay. Now, the final paragraph is "Policy
13 Implementation Issues." And we discussed this a little
14 bit earlier. So will you read it.

15 A. Yes. "This procedure will be updated as changes
16 occur which would affect its content, but not later than
17 November 1st of 1990." And that is my signature.

18 Q. So that's November 1st, 1990. Now we're back to
19 that three years. You can, you know, edit this before,
20 but it has to be revisited at least by within three
21 years?

22 A. That is right.

23 Q. All right. And then that is your signature down
24 there Rod J. Maslowski?

25 A. That is me.

26 Q. And then on here you cced somebody. It looks

1 like Damianakes.

2 A. Well, it's -- actually, his name is Chris
3 Damianakes. So the "C" must be his first and middle
4 initials. And so he would have been the overall author
5 of the document.

6 Q. Okay. Who was Chris Damianakes?

7 A. Chris Damianakes was an engineer that worked for
8 me. I think it would be incorrect to suggest that he
9 wrote this by himself. Matter of fact, the suggestion is
10 that there was collaboration with other -- the regional
11 people. There would have been collaboration with other
12 more line worker-type people within my organization.

13 Christopher was an engineer like me. He came
14 from school. Probably didn't construct transmission
15 lines or construct wires. Unfortunately, Mr. Damianakes
16 passed away.

17 Q. Do you know when Mr. Damianakes passed away?

18 A. I don't know the date. I believe it was a
19 skiing accident. And that's an unfortunate situation.

20 Q. Yep. So let's move on to some of the
21 attachments here. "Appendix A: Conditions To Be Noted
22 When Patrolling Lines." And this talks about specific
23 things for the troubleshooters to be looking for; right?

24 A. That's correct.

25 Q. And I want to go down -- talk to me about this
26 Section B which talks about line hardware and insulators.

1 A. Okay. Shall I read it?

2 Q. Go ahead.

3 A. Oh, sure. "Line Hardware: One: Insulators
4 broken, chipped, or otherwise damaged. Patrolmen shall
5 report the number of insulators in the string and the
6 number damaged. In addition, the location within the
7 string should be specified as broken or chipped insulator
8 near the line end are critical.

9 Insulators that are out of plumb."

10 That is number two.

11 "Number Three: Insulators dirty.

12 Number Four: Worn hardware and connectors.

13 Number Five: Shed deterioration or other damage
14 to non-ceramic insulators."

15 And those are the new ones I was talking about.

16 Q. Okay. So this section is specifically dealing
17 with insulator and insulator hardware; correct?

18 Subsection B?

19 A. Yes.

20 Q. Okay. What does it mean to say an insulator is
21 out of plumb?

22 A. The insulators hang generally vertically unless
23 you're turning a corner where they may have an angle to
24 them. So I guess if I was looking at it, if all the
25 insulator strings from the three phases were hanging
26 perpendicular to the ground, that's right. If one of

1 them for some reason was out of line with the others, I
2 would consider that unusual. I don't know what might
3 cause that, but that would be a suggestion there's
4 something wrong.

5 So out of -- plumb means it was hanging in a
6 direction it should be. Out of plumb is, for some
7 reason, it's not looking like the other insulators.

8 Q. So then we go on to number four. And it says
9 "Worn hardware and connectors."

10 A. Okay.

11 Q. Now, the way I would read this is this is
12 talking about hardware and connectors associated with the
13 insulators. Is that correct?

14 A. Yes, unless there was that jumper situation
15 which are unique conditions for towers. But for the most
16 part, I would say it's the hardware connected with that
17 insulator.

18 Q. And what kind of hardware and connectors are
19 associated with insulators?

20 A. Well, I'm not a hardware expert, but there's
21 something that connects the insulator string to the
22 tower.

23 Q. Right.

24 A. That's the cold un-voltaged grounded end. And
25 at the other end of it there's a connector that clamps
26 the wire or somewhere secures the wire to the hot end of

1 the insulator string. So I think it's probably
2 suggesting those.

3 Q. Okay. So are you familiar with the term
4 cold-end attachments?

5 A. I think so, yes.

6 Q. Okay.

7 A. It's not about the temperature. It's about the
8 voltage.

9 Q. Right. So is it reasonable to believe that
10 the -- that this worn hardware and connectors in number
11 four would apply to the cold-end attachment hardware as
12 well as the hot-end attachment hardware?

13 A. I would think that it would be.

14 Q. All right. Let's move down to C. And we're
15 going to need to take a break here in a minute. Let's
16 get you finished up here real quick.

17 A. Sure.

18 Q. Under "Structures."

19 A. Okay.

20 Q. I want to go over the top couple of these.

21 A. All right. "Structures: One, bent, broken, or
22 missing members. Two, out of plumb or twisted. Three,
23 footings needing repair or covered by dirt or water.

24 Q. So let's stop it right there.

25 A. All right.

26 Q. Why would bent, broken, or missing members be a

1 problem on a tower structure?

2 A. I believe that that would potentially weaken the
3 structure.

4 Q. And how about out of plumb or twisted?

5 A. That would suggest something is going on with
6 that tower whether it's earth movement or there's
7 something else that is putting undue stress on it and the
8 tower is beginning to move.

9 Q. And why footings needing repair or covered by
10 dirt or water? Specifically I want to talk about
11 footings needing repair. It doesn't need any
12 explanation. But why would it be important that the
13 footings of the tower be covered by dirt or water?

14 A. Well, the footing is the -- generally speaking
15 the concrete footing that is holding this thing in the
16 ground. From there it's steel going up to the top. And
17 if it's under dirt or water, then you have the
18 possibility of corrosion at that connection point.

19 If it's steel, galvanized steel, to the best of
20 my knowledge, is not intended to rust unless you had a
21 condition where it was possibly under dirt or under
22 water.

23 Q. All right. Skip through this real quick. I
24 don't think there's anything we really need to talk
25 about.

26 We get back now where there's a line patrol

1 report. So this is what we're talking about in the
2 reporting section for what the towermen should fill out.

3 So this is the form --

4 A. Oh, I'm sorry. Excuse me.

5 Q. Was this the form that was talked about earlier,
6 the document about whether troublemen should fill out the
7 document if there's any findings?

8 A. Yes, it is.

9 Q. All right. Now, get to the last thing here
10 which is "Transmission Line Patrol Report Damage Codes."
11 You see this?

12 A. Yes.

13 Q. And what is this form that we're looking at?

14 A. I believe this is a way to identify problems
15 that are found with a code probably allowing for, you
16 know, sorting or accumulation of information by code. If
17 there was multiple problems of the same code, that would
18 suggest, you know, a systemic problem of some sort.

19 Q. So back there when we were talking about the
20 requirements or the reporting requirements for the
21 troublemen that talked about three digit codes to
22 indicate the problem, this defines all three digit codes;
23 is that correct?

24 A. That's correct.

25 Q. I guess I'm just looking for anything that may
26 need to be defined. Kind of -- we already talked about

1 what the bells are.

2 Do you know what this OHGW term that is repeated
3 throughout here stands for?

4 A. I think OHGW stands for overhead ground wire.
5 And I believe that also would be like a lightening shield
6 wire. Towers that have exposure to lightening and
7 lightening storms will have a wire that is on it above
8 the conductors, a separate location. And usually there's
9 two. If there's two circuits, there's two shield wires
10 or overhead ground wires.

11 The idea is that the lightening strikes the
12 shield wire and not hit the conductors. That wire is
13 grounded so the energy from the lightening will dissipate
14 into the ground.

15 Q. All right. Other than that I think we've got
16 all of it. And the next thing we've got -- I'll just ask
17 you about a couple of exhibits that we have. We have 158
18 up here on the big board for you and we also have the
19 damage code section.

20 And I was going to ask if you could indicate or
21 point out some of the damage codes on the tower itself.

22 A. Well, maybe I can just kind of talk about what I
23 see here.

24 Q. Yep, absolutely.

25 A. So this is the steel structure. The footings
26 would be down here somewhere in the part that you could

1 see. These individual crosspieces would be the members
2 that they were talking about if that was bent or twisted.

3 Then you see overhead wires coming in. It's a
4 little hard to see where all of them are. But it looks
5 to me like the line comes in these three or goes out. I
6 can't tell which direction is which.

7 If some of these phases are being shifted over
8 to the other side of the tower, they're being transposed
9 or rolled.

10 These are insulator strings. This is where the
11 wire is connected to the hot end. And this is where the
12 insulator string is connected to the cold end of the
13 tower end.

14 This does not look to me like it has the
15 overhead ground wire, the lightening shield wire. Those
16 would have been up on top above all of this stuff.

17 You know, it's really hard to tell. I see some
18 little black dots here. I don't know if those would have
19 been some of the connectors you were asking about earlier
20 or not.

21 MR. NOEL: Okay. I think we've been going now
22 for almost two hours; an hour and 45 minutes. It's time
23 for a break. I think we've done enough. We have to go
24 through the final slide which is another transposition
25 tower.

26 Before we finish though, do any of

1 you members --

2 MR. FOGG: Mark, I have questions.

3 MR. NOEL: Go ahead.

4 **EXAMINATION**

5 BY MR. FOGG:

6 Q. Mr. Maslowski, I don't mean to walk through the
7 whole memorandum again, but I want to jump back to a few
8 points.

9 Will you return to the first page of the
10 bulletin, please. Not the letter but the bulletin
11 itself.

12 There's a paragraph that mentions something
13 about training courses. Who would have determined the
14 content of those courses?

15 A. I don't remember the training specifically. So
16 I would believe that it was probably the local
17 transmission people and the transmission people from my
18 portion got together. It's possible -- it would be
19 efficient -- if there was a training program that could
20 be utilized by all of them. So it's even possible that
21 the regions got together and identified training. But
22 I'm sorry. I don't remember the details.

23 Q. Okay. I want to jump forward now to page 4 of
24 the bulletin, letter C, the classes of lines.

25 A. Yes.

26 Q. Was the risk that a line could start a fire

1 considered in classifying lines in this bulletin?

2 A. It was not. In my recollection, the lines
3 starting a fire was not an occurrence that was happening
4 back in 1987.

5 Q. Do you know if PG&E tracked the number of fires
6 its lines started back in the '80s?

7 A. They tracked almost every outage situation that
8 occurred. My recollection is that there were few, if
9 any, fires started by lines.

10 Q. Okay. And then down on letter D still on
11 page 4, the frequency of patrols that you discussed with
12 Mr. Noel. Who decided who set the frequency of those
13 patrols? Who decided, let's say, that there be a ground
14 patrol every year, for example?

15 A. I don't know for sure. You know, we don't know
16 what this document changed. So it could be that we
17 changed a reporting requirement. The frequency never did
18 change. That could have been set by predecessors or
19 perhaps it was set by this team of people. I don't
20 recall.

21 If anything, it would have been in corroboration
22 between the line experts in my group and probably with
23 input from the local regions as well.

24 Q. And now quick question on budgets. Did you have
25 a role in setting budgets in your work with PG&E?

26 A. I have had a lot of involvement about budges

1 over my time with PG&E.

2 Q. Can you tell us how the budgets for transmission
3 troublemen would have been set.

4 A. Generally speaking the transmission troublemen
5 would have been a small compound of an overall
6 transmission expense budget. These -- there's sort of
7 two pots of money. There's capital money. Capital money
8 means when you're building lines. And that's money, if
9 I'm not mistaken, that's borrowed. And it's high level
10 expenses; hundreds of thousands or millions.

11 You also have a work force that is employed on a
12 day-to-day basis to patrol, maintain, and operate the
13 line. That is expensive. So there would have been a
14 transmission line expense item in a regional budget. And
15 the transmission troublemen would have been included in
16 that.

17 Q. Who would have been setting those budgets within
18 PG&E?

19 A. I would believe that the regional vice
20 presidents would set a proposed budget. There has to be
21 some sort of overview corporately as to what those
22 budgets were. I may have been asked for input on it, but
23 I don't think I had any authority over a budget.

24 MR. FOGG: Okay. Thank you, Mr. Maslowski.
25 Those are my questions.

26 MR. NOEL: Just as a follow-up to that.

1 **CONTINUED EXAMINATION**

2 BY MR. NOEL:

3 Q. In your long term with PG&E did you at least
4 budget-wise see any major shifts in philosophy within the
5 company?

6 A. It would be disingenuous to say there wasn't
7 budget pressure at PG&E. There always was. If I know
8 the process, the -- there were rate cases that funded the
9 utilities. The rate cases then set the standard for a
10 budget, but you couldn't budge more than the rate case
11 allowed you to collect.

12 My general recollection is that budgets for the
13 distribution -- or excuse me. The rate cases for
14 distribution systems were filed with the Public Utilities
15 Commission. That was -- I might be incorrect, but I'll
16 say I don't think the utilities ever got what they
17 requested from the CPUC. That was always a challenge
18 back and forth What was the right level of funding.

19 The transmission budgets were set by federal
20 rate cases or FERC. And that would again be a
21 combination of expense money and capital money. And I
22 believe the FERC was much more likely to agree with what
23 the utilities proposed than the CPUC.

24 Q. In terms of financial policy itself, would there
25 be -- the philosophy of the company, did you see or
26 recognize any major shifts during your long career?

1 A. You know, the one thing that struck me was PG&E
2 was always a company that they were careful about capital
3 investments on lines. And it could be both T&D. I'm
4 thinking of transmission now. Because there was always
5 the opportunity to adjust generation if there was a
6 transmission line issue, not always but that would be a
7 potential solution. You could either ramp up or ramp
8 down generation. The alternative was to build a new
9 line.

10 So PG&E had a lot of operational procedures to
11 utilize this generation to keep the system reliable.

12 There are -- this became a conflict when the
13 California ISO took over the system. And they were much
14 less interested in operating solutions and they wanted
15 what they called wire solutions. So there was a big
16 shift there where PG&E was expected to spend more money
17 building new lines.

18 The reason behind that is when PG&E ramped the
19 generation, they were usually ramping their generation.
20 And there was no obvious immediate cost. When the ISO
21 ramped generation, somebody had to pay for it. And so it
22 was pushing back.

23 I think they found that the other utilities were
24 relying less on operating generation solutions than they
25 were on wire solutions.

26 Q. I guess I'm just going to a more general

1 philosophy of the company. And kind of to pinpoint it
2 one of the things that we have heard is that at one time
3 PG&E was a utility that was run by engineers and then at
4 some point it became a utility that was run by
5 accountants and that the philosophy shifted from being a
6 utility to being a profit.

7 You were with them for a long time in a
8 management role. Did you see that type of shift?

9 A. Well, I certainly saw the shift in the
10 leadership. It was a technical company run by technical
11 engineers. And the transmission occurred more to this
12 type of people or possibly even attorneys. So there was
13 that approach.

14 There was a whole -- there was -- I think we
15 went through a time where we didn't make money on the
16 facility. So could you run cable systems or come up with
17 another idea? So things like that came about.

18 MR. NOEL: Okay. Any further questions? Let's
19 see. We have a couple of questions from the jurors.

20 [Conferring off the record.]

21 MR. NOEL: Got one right here.

22 BY MR. NOEL:

23 Q. Okay. Mr. Maslowski, the grand jurors have some
24 questions for you they have written down. I have them.
25 We've gone over them. And so I am going to read those
26 questions to you now.

1 A. Okay.

2 Q. "During your time during -- during your career
3 with PG&E, do you believe that the linemen and troublemen
4 had plenty of training on the towers and transmission
5 lines?"

6 A. I believe that they did.

7 Q. "Did you personally train or hold training
8 seminars for linemen or troublemen?"

9 A. I did not.

10 Q. "When your 1987 policy changed bulletin number
11 85 uses the phrase on page 2 of "Routine patrolling and
12 inspection should be scheduled in accordance with
13 available budgets and manpower," what does this mean
14 practically?"

15 A. Can you give me the location reference again,
16 please.

17 Q. Yep. It says on page 2 "Routine patrolling."
18 I'm trying to find it. Oh, it says subparagraph number
19 four in the last sentence. So it's right here
20 (indicating).

21 "Correction of items affecting the longer term
22 liability of the line should be scheduled in accordance
23 with available budgets and manpower."

24 A. Okay. Well, I believe this is suggesting that
25 there's something at that location that isn't of
26 immediate concern. It's not going to have the line fall

1 down or break or something like that immediately.

2 For example, let's say five insulators out of a
3 ten bell string were shot and broken. I think that's
4 something that would need to be looked at immediately.

5 Let's say there was one. That's not going to
6 fail the line right away. And so that could be put into
7 the workload of the team and with what money they had to
8 take care of the lines.

9 There would be other examples. You know.

10 Q. "In the creation of these policies and
11 procedures was there ever any consideration of the actual
12 operational age of the overall equipment being
13 inspected?"

14 A. Not that I'm aware of.

15 Q. "Was there, in your experience, ever any effort
16 by the PG&E scientific or metallurgy departments to
17 determine a feasible affective age of fundamental
18 structural elements in the transmission line and their
19 substructure?"

20 A. Not that I'm aware of. That doesn't mean it
21 couldn't have been done. There was a scientific team
22 called the Department of Engineering Research. I believe
23 DER headquartered first in Emeryville and then in
24 San Ramon.

25 So often if there were -- I'm trying to think of
26 the kinds of things that might have failed and were

1 typically given to DER to make an analysis of.

2 Q. "And did you ever have to deal with or review
3 any of those reports?"

4 A. I may have been aware of the reports. That's
5 the kind of thing that the electrical engineering
6 department had. You know. The physical design experts
7 there, I presume that would have been probably with them
8 and the DER.

9 Q. "Was there any consideration given to establish
10 a more frequent patrol regimen for line structures
11 exceeding certain ages? For instance, 25 years?
12 100 years?"

13 A. No, not that I'm aware of.

14 Q. "Was there ever any effort of which you were
15 aware to scientifically or technically establish a useful
16 line span of metal towers and equipment?"

17 A. No.

18 MR. NOEL: Anything else? Seeing no hands and a
19 lot of blank stares. We have been going for a little
20 over two hours now. That is all that we have of this
21 witness.

22 Would you please admonish Mr. Maslowski.

23 GRAND JURY FOREPERSON: Mr. Maslowski, you are
24 admonished not to discuss or disclose at any time outside
25 of this jury room questions that have been asked of you
26 or your answers until authorized by this grand jury or

1 the Court. A violation of these instructions on your
2 part may be the basis for a charge against you of
3 contempt of court. This does not preclude you from
4 discussing your legal rights with your own attorney.

5 Mr. Maslowski, what I have just said is a
6 warning not to discuss this case with anyone except the
7 Court, your lawyer, or the district attorney.

8 Do you have any questions?

9 THE WITNESS: I don't.

10 GRAND JURY FOREPERSON: Okay. Thank you so much
11 for your time today.

12 THE WITNESS: Thank you.

13
14 [DISCUSSION OMITTED.]

15
16 [Recess taken from
17 10:40 until 11:02 a.m.]

18
19 [DISCUSSION OMITTED.]

20
21 [Recess taken from
22 11:03 until 11:20 a.m.]

23 GRAND JURY FOREPERSON: All members of the grand
24 jury are present.

25 MR. NOEL: Mr. Sergeant-at-Arms, would you like
26 to -- (WITNESS #7) should be in the second attorney

1 client room out there. And Mr. Fogg hasn't come back in.
2 You may want to see if he's sitting out there still and
3 tell him to come back in.

4 [Witness enters the courtroom.]

5 GRAND JURY FOREPERSON: (WITNESS #7), before you
6 have a seat, you need to be sworn in. Please raise your
7 right hand.

8 (WITNESS #7), do you solemnly swear that the
9 evidence you shall give in this matter pending before the
10 grand jury shall be the truth, the whole truth, and
11 nothing but the truth so help you God?

12 THE WITNESS: I do.

13 GRAND JURY FOREPERSON: Thank you. Have a seat,
14 please.

15 **EXAMINATION**

16 BY MR. NOEL:

17 Q. (WITNESS #7), for the record could you please
18 state your full name spelling your last name.

19 A. (WITNESS #7), [Redacted spelling.]

20 Q. (WITNESS #7), are you employed?

21 A. Yes.

22 Q. By whom?

23 A. PG&E.

24 Q. In what capacity?

25 A. Hydro operator at Rock Creek.

26 Q. How long have you been with PG&E?

1 A. About two and a half years.

2 Q. What is a hydro operator?

3 A. We generate electricity with hydroelectric
4 generators, manage the water in the Feather River Canyon.

5 Q. What is Rock Creek?

6 A. It's Rock Creek Switching Center.

7 Q. What is -- describe for us what that is.

8 A. It's like the hub of the lower Feather River.
9 We control Rock Creek units, Poe units, Cresta units.

10 Q. And when you say "units," what are you talking
11 about?

12 A. Generators, hydro generators.

13 Q. Generators?

14 A. Yeah.

15 Q. So the powerhouses where they're creating the
16 hydroelectric power?

17 A. Correct.

18 Q. All right. And what do you do there at the
19 center?

20 A. I'm an operator. I deal with alarms, stop and
21 start units.

22 Q. Were you on duty at the Rock Creek Power -- or
23 the Rock Creek Switching Center I guess it is; right?

24 A. Correct.

25 Q. -- on the morning of November 8, 2015, at
26 approximately 6:25 a.m.?

1 A. Yes, I was.

2 Q. Why were you on duty so early?

3 A. I just was -- I had just done the night shift.
4 I'd been there since 6:00 p.m. the night before. We work
5 12-hour shifts.

6 Q. Okay. So you were right at the end of your
7 shift?

8 A. Correct.

9 Q. Now, at some point around 6:20 in the morning
10 did something unusual happen?

11 A. Yes. I received a call on the radio to report a
12 fire.

13 Q. Do you remember who called you to report the
14 fire?

15 A. Yes. It was my generation supervisor at that
16 time (WITNESS #16).

17 Q. Do you know how to spell (WITNESS #16)?

18 A. (WITNESS #16). That's the best I can do.

19 Q. You said that Mr. (WITNESS #16) called you on
20 the radio?

21 A. Correct.

22 Q. What radio?

23 A. We have radios to keep in communication with
24 each other throughout the canyon.

25 Q. So what action did you take based on that?

26 A. I immediately dialed 9-1-1. I was transferred

1 to Cal Fire and reported the fire location.

2 Q. All right. Now, you have in front of you a
3 document marked as Exhibit 132-A.

4 A. Yes.

5 Q. And I'm spooling up to play a recording that's
6 marked as 132. And I will play this for you and then
7 we'll go back and talk about it. But first listen to it
8 and tell me -- well, I'll ask you some questions about it
9 at the end.

10 [Exhibit 132 played in open court.]

11 BY MR. NOEL:

12 Q. All right. We have listened to 132 now. Do you
13 recognize the voice of the 9-1-1 caller on the recording?

14 A. Yeah. I mean, it was a year ago.

15 Q. Okay.

16 A. That is me on the phone.

17 Q. So that's you talking to the dispatcher?

18 A. That is correct.

19 Q. All right. And did you review the recording
20 against the transcript?

21 A. Yes.

22 Q. And does the transcript fairly and accurately
23 depict what's on the recording?

24 A. Yes, except there's one error here. It says on
25 page -- what is this? Page 2. It says "All I see is
26 like right around one of the tours." That should be a

1 tower. So it says 20 feet from the base of the tower
2 something.

3 Q. Okay.

4 A. A typo.

5 Q. All right. So let's walk through the
6 transcript. They said you initially called 9-1-1 and you
7 were put through to Cal Fire; correct?

8 A. Correct.

9 Q. Any estimation of how long it was between when
10 you received information of the fire and when you called
11 9-1-1?

12 A. A couple minutes maybe.

13 Q. All right. So you start going through the
14 information. And then we start hearing somebody in the
15 background. And I think at some point you referred to
16 him as (EMPLOYEE #2)?

17 A. (EMPLOYEE #2), yes. Because I was right in the
18 middle of shift change.

19 Q. Who is (EMPLOYEE #2)?

20 A. He's another operator at Rock Creek.

21 Q. Is he your relief?

22 A. Correct.

23 Q. And we also heard you refer to somebody named
24 (WITNESS #16). And then we hear Mr. (EMPLOYEE #2)
25 talking to somebody on the radio in the background and
26 provide information.

1 A. Right. Because as you heard, like, they wanted
2 to know the size of the fire. (WITNESS #16) had relayed
3 that initially. So (EMPLOYEE #2) was standing by the
4 radio and said "Hey, (EMPLOYEE #2), you know, call and
5 see if you can estimate the size of the fire." So he
6 contacted (WITNESS #16) on the radio and then you heard
7 (WITNESS #16) estimate the size 100 by 100.

8 Q. So that voice that we're hearing on the radio in
9 the background is (WITNESS #16)?

10 A. That is correct.

11 MR. NOEL: I don't think I have any more
12 questions.

13 Do the jurors have any questions?

14 Mr. Fogg, anything?

15 MR. NOEL: All right. I think that's all we
16 have for you today.

17 THE WITNESS: Okay.

18 MR. NOEL: And Madam Foreperson is going to read
19 you an admonishment before we let you go.

20 GRAND JURY FOREPERSON: (WITNESS #7), you are
21 admonished not to discuss or disclose at any time outside
22 of this jury room the questions that have been asked of
23 you or your answers until authorized by the grand jury or
24 the Court. A violation of these instructions on your
25 part may be the basis for a charge against you of
26 contempt of court. This does not preclude you from

1 discussing your legal rights with your own attorney.

2 (WITNESS #7), what I have just said is a warning
3 not to discuss this case with anyone except the Court,
4 your lawyer, or the district attorney.

5 Do you have any questions?

6 THE WITNESS: No.

7 GRAND JURY FOREPERSON: Okay. Thank you for
8 your time.

9 THE WITNESS: Thanks.

10

5 [ROLLCALL OMITTED.]

6
7 MR. NOEL: Are we ready to proceed with the next
8 witness?

9 GRAND JURY FOREPERSON: We are ready.

10 MR. NOEL: (WITNESS #9). She's in the third
11 room.

12 [Witness enters the courtroom.]

13 GRAND JURY FOREPERSON: Before you have a seat,
14 I need to swear you in. Please raise your right hand.

15 Do you solely swear that the evidence you shall
16 give in this matter pending before the grand jury shall
17 be the truth, the whole truth, and nothing but the truth
18 so help you God?

19 THE WITNESS: Yes.

20 GRAND JURY FOREPERSON: Thank you. Have a seat,
21 please.

22 **EXAMINATION**

23 BY MR. NOEL:

24 Q. For the record, can you state your full name
25 spelling your last.

26 A. (WITNESS #9), [Redacted spelling].

1 Q. (WITNESS #9), by whom are you employed?
2 A. Pacific Gas & Electric Company.
3 Q. In what capacity?
4 A. What do you mean? Which --
5 Q. What's your job?
6 A. I'm a compliance supervisor.
7 Q. How long have you been with PG&E?
8 A. Over 35 years.
9 Q. What is a compliance supervisor?
10 A. As a compliance supervisor I manage all the
11 compliance work for maintenance patrols and inspections.
12 And I have a team of seven people.
13 Q. What do you mean by compliance?
14 A. Compliance of maintenance tags, maintenance
15 visual tags for regular inspections and corrective work.
16 Q. And how long have you been a compliance
17 supervisor?
18 A. I've only been a compliance supervisor since
19 September of this year. Prior to that I was asset
20 strategist, slash, asset maintenance planner.
21 Q. What is an asset strategist?
22 A. An asset strategist works for the headquarters
23 throughout the transmission line system on all their
24 maintenance, their yearly, quarterly, monthly, whatever
25 schedule it is from chosen sections for the circuits and
26 transmission line.

1 Q. When you use the term "headquarters," can you
2 explain to us what that means.

3 A. So the headquarters and transmission line -- we
4 have 11. It's system-wide from -- you break it down to
5 Bakersfield and all in between. So there's 11
6 maintenance headquarters.

7 Q. So have you heard the term Table Mountain
8 Center?

9 A. Table Mountain Headquarters, yes.

10 Q. Okay. That's what I was going to ask you. Is
11 Table Mountain Headquarters and Table Mountain Center the
12 same thing?

13 A. Yes. I've never heard it called center but,
14 yes.

15 Q. And you said that you also -- the other term for
16 your job is asset maintenance strategist?

17 A. Planner. So up until 2013 our classification
18 was asset strategist. HR made a change calling us now
19 asset maintenance planners. Same job, different name.

20 Q. All right. How long were you an asset
21 strategist or asset maintenance planner?

22 A. For transmission line I came in about March of
23 2012.

24 Q. And I'm sorry. Where physically is your office
25 located?

26 A. In Rocklin, California.

1 Q. So as an asset strategist or an asset
2 maintenance planner, did you deal with all of the 11
3 headquarters or a subset thereof?

4 A. No. My headquarters that were assigned to me
5 were Eureka, Table Mountain, and Sacramento. And I
6 assisted in other areas as needed.

7 Q. All right. So you did the maintenance planning
8 for those three headquarters?

9 A. Yes.

10 Q. All right. Describe what goes into the
11 maintenance planning for the headquarters?

12 A. Well, the headquarters themselves plan their
13 schedules. What I do is I call out the orders for their
14 yearly patrols and inspections.

15 Q. What do you mean you call out the orders?

16 A. Through SAP. Our program in SAP. They're
17 called PM orders. It's what the guys charge to and it's
18 based on each inspection. Patrol or inspection.

19 Q. All right. Where do you get the information to
20 build those?

21 A. From SAP.

22 Q. Okay. Now, in front of you you have a stack of
23 documents. And we're going to go through them one at a
24 time. The first one should be Exhibit Number 614.

25 A. Yes.

26 Q. Do you see Exhibit 614?

1 A. I do.

2 Q. Do you recognize what is 614?

3 A. It's a calendar that the asset planners/asset
4 strategists put together to give to headquarters. And
5 this is a proposed one which means the orders are
6 probably called and we sent it to headquarters for them
7 to verify the schedule looks good to them.

8 Q. Okay. So we're looking on the big board at the
9 first page of 614. At the top it says "2013 Proposed
10 Patrol Insperions."

11 A. That's a typo.

12 Q. "For Table Mountain." And Table Mountain would
13 indicate the headquarters? Table Mountain headquarters?

14 A. Yes.

15 Q. And this is a four-page document?

16 A. Yes.

17 Q. And then we're going to focus in on page 3 which
18 would appear to show July and August?

19 A. Yep.

20 Q. Is that correct?

21 Okay. Now, explain to us how to read this
22 calendar.

23 A. On page 3?

24 Q. Yeah, or just in general this 2013 calendar.

25 A. Well, in July it shows there's air patrols and
26 detailed inspections that are due in the month of July.

1 Q. Okay.

2 A. It says the headquarters, the circuit name.

3 Q. All right. Let's go through this one column at
4 a time.

5 The first column I see here says "F-u-n-c-t,
6 L-o-c."

7 A. It's functional location meaning the circuit.

8 Q. Okay. And then for each one there's an ETL
9 number; is that correct?

10 A. Yes.

11 Q. And what does that number represent?

12 A. That circuit, that line name.

13 Q. And then the next column "Proposed basic finish
14 date."

15 A. Uh-huh. So that's due. And it needs -- well,
16 it needs to be completed at the headquarter level by the
17 end of 7/31/2013.

18 Q. Okay. So that's the -- what is the term I'm
19 looking for? Basically the drop-dead date that these
20 things have to be done by that date?

21 A. Negative. So this is the -- the calendar the
22 headquarters puts together. They schedule and plan their
23 work. The work is not -- by CPUC standard it's not due
24 until 12/31/2013. So these are calendars that are
25 completed by our headquarters when they're due, but the
26 work itself is not due or late until 12/31.

1 Q. Okay. So the work is due -- during the calendar
2 year it's due, but the company breaks it down by month or
3 at least in 2013 broke it down by month?

4 A. They break it down by month so they can schedule
5 their patrols and their personnel throughout the year.

6 Q. And the next column the description.

7 A. That's the name of the line.

8 Q. Okay.

9 A. Or the circuit or the functional location.
10 They're all kind of the same.

11 Q. The next column "MAT."

12 A. That's a material activity code that's on an
13 order. BFX meaning it's an air control. It's all on
14 accounting, which is not showing on here. And BFZ is the
15 detailed inspection.

16 Q. Okay. "Main work center."

17 A. Yep.

18 Q. Table Mountain.

19 A. Table Mountain. So all of our 11 headquarters
20 will have that column.

21 Q. And "Short text."

22 A. Short text is just saying what that MAT code is.
23 Short text is air patrol or BFX. Overhead detailed
24 inspection is BFZ.

25 Q. And the next column "STD text key"?

26 A. Yeah. So standard text key is something we use

1 in our maintenance plan to identify what type of. And
2 they're all ETL02 in transmission line. It's a SAP
3 field. It means nothing for the headquarters.

4 Q. Okay. And then the next column is "Work."

5 A. So it looks like in here it's the hours that
6 they get or plan to do the work; the patrols or
7 inspections.

8 Q. Got it. And the next is "Unit For Work,"
9 which --

10 HRS. Does that mean hours?

11 A. Yes.

12 Q. And finally --

13 A. Group counter. That is something we use in our
14 maintenance plan. We have different codes for different
15 types of patrols and inspections that we do.

16 Q. Okay. And can you explain briefly to us the
17 difference between them.

18 A. One AA is always air patrol. I'm not sure what
19 AO is. I haven't looked at that in a long time. AB
20 could be -- it could be a steel line. Let me think what
21 AB is.

22 It's something we use internally. It has no
23 bearing on the calendar.

24 Q. Okay. All right. So in 2003 -- 2013 -- I'm
25 sorry -- the calendar was done by months. Is that
26 correct?

1 A. That's what it looks like.

2 Q. So on page 1 has January, February, March,
3 April; page 2 May, June; page 3 July, August; and page 4,
4 which we don't have up, September, October, November,
5 December.

6 A. Yes.

7 Q. Okay. And by month are listed the dates for
8 doing various inspections?

9 A. Yes.

10 Q. So, for instance, on page 3 of 4 the first entry
11 under August says "Caribou-Palermo plus."

12 A. Plus means nothing. It's just on the circuit.
13 I don't think they're there anymore because a lot of them
14 have that.

15 Q. Okay. Now, when we get over here to the -- to
16 the side at the "Work" and "Unit For Work" columns," what
17 did you say that that represents?

18 A. How much time they have to do the patrol.

19 Q. Okay. So 2013 14.8 hours to do the air patrol
20 over the Caribou-Palermo?

21 A. That is what it says.

22 Q. Where do you come up with that number?

23 A. That number is based on the structures that are
24 on the Caribou-Palermo line and an equation that we get
25 from Business Finance. And I don't know where they get
26 that equation from.

1 Q. Okay. So let's back up. When you're talking
2 about putting out the calendar, this proposed calendar,
3 is this your work product?

4 A. This one wasn't. But, yeah, it would be the
5 asset strategists who put these together.

6 Q. Okay. And this is for 2013?

7 A. Yes.

8 Q. You started in -- you said March of 2012?

9 A. Yes.

10 Q. So walk us through the timeline for putting
11 together these maintenance calendars or these inspection
12 and patrol calendars?

13 A. So we generally -- and when I say "we," I never
14 called them out. It was a peer that was at a higher
15 level. But around November -- it could be earlier -- we
16 called SAP work management to call out these orders.

17 So we have them do it because there's so many.
18 There's a lot of PR notifications meaning -- a PR
19 notification is a structure on line.

20 They called -- we sent an e-mail. We ask them
21 to call up the next year's patrols. It takes them about
22 a week or two. And then we receive the patrols back, the
23 order numbers by line, and then we create this calendar.
24 And we just create it by, you know, the last year's
25 calendar or new calendar. It's not a compliance
26 document. It's something that we just download from SAP.

1 Q. Okay. So when you download this calendar, is
2 the "Work" and "Unit For Work" hours columns completed or
3 is that something that you need to add in?

4 A. That's -- we add that column in.

5 Q. All right. Can you explain to us how you come
6 to that figure.

7 A. Like I said earlier, we take the -- like the
8 Caribou-Palermo line, divide it by the structures, and
9 Business Finance provides us the equation of how much
10 time they have to do air patrols or detailed. And I do
11 not recall -- I don't know who comes up with that.

12 Q. Okay. What is Business Finance?

13 A. It's the people that give us the money, the
14 business finance function. There is a -- well, every
15 year we do our calendars. They go to Business Finance
16 and say "We've got this many patrol inspections." They
17 do the budget. It's essentially the budget for our
18 patrols and inspections.

19 Q. So they take the budget for every year and
20 determine under that budget how much time each?

21 A. Yeah, I guess. I've never sat with them.

22 Q. Okay. And then you said they send you an
23 equation that you used to determine that ultimate number
24 that goes into this?

25 A. Yes. At some point they did. Obviously, this
26 one they must have.

1 Q. All right. Okay. And what is that equation?

2 A. I can't be for sure. It's -- for an air patrol
3 it's how many -- it could be how many minutes per
4 structure. I don't know what equations that they used.
5 And then you divide it by how many structures or times it
6 by however many structures and that comes up with the
7 hours of work.

8 Q. Okay. When we previously talked to you, you
9 used the term "multiple" to describe what you got from
10 Business Finance?

11 A. Yes.

12 Q. Is that the correct term?

13 A. Yes.

14 Q. Okay. And is that number, that equation the
15 same every year or does it change?

16 A. I do not recall. I don't know what Business
17 Finance -- it could be -- I don't remember whether they
18 changed it or didn't or if it was the same every year. I
19 don't know.

20 Q. Now, when we left off, we were talking about the
21 calendar and schedule for setting these calendars. And
22 you said that you try to get out the proposed calendar
23 sometime -- I think you said in November; is that
24 correct?

25 A. Yeah. We try to strive to get it out usually by
26 the second week of November so that -- to all the 11

1 headquarters so they can look at it. And if there's any
2 changes that need to be made, they'll come back at us.
3 And we try to finalize it by the end of December so they
4 can start planning and scheduling their work for January.

5 Q. Is it common to have multiple drafts of this
6 calendar before the final?

7 A. Yes.

8 Q. Okay.

9 A. Several.

10 Q. Is it common to actually have additional drafts
11 after the final?

12 A. So after we get the final out, we don't usually
13 have additional drafts. There are many changes during
14 the year, in the course of 12 months where if there's,
15 like, high snow and they can't get in when they're
16 scheduled to be in -- this year we had a lot of that. Or
17 last year -- then we can move it out because it's not due
18 to 12/31/2000 -- at the end of the year.

19 Q. So once it's on final, it's final. And then if
20 there are any changes to it, those are just considered
21 changes as opposed to a final/final?

22 A. Yes.

23 Q. All right. Oh, and other than the fact that
24 this calendar we're looking at Exhibit 614 says
25 "Proposed" in its title, is there another way to
26 determine if that would show from the contents itself

1 that this would be a proposed and not a final?

2 A. It would say final in the wording. We try to
3 always put -- instead of proposal, we have the final. We
4 would put "2013 Final Patrol" or it could be "2013 Table
5 Mountain Final." There's no -- it's just our own
6 document. It's not a legal document, a compliance
7 document. It's for our headquarters.

8 Q. But at the top of the caption, at the top of the
9 title in terms of the information captured in the
10 schedule, is there some information that's not on this
11 proposed draft that would be on the final?

12 A. Yes. There's no order number. It's usually a
13 column number. That's what -- the patrol is an order
14 number for them to go out and do the work.

15 Q. All right. So let's move on to number 615.
16 That should be the next document in your stack.

17 A. Oh, that's little.

18 Q. Yep. And we can only work with what we work
19 with here.

20 A. Right. That's fine.

21 Q. So you recognize 615?

22 A. Yes.

23 Q. And what is 615?

24 A. It's just another calendar. I can't -- there's
25 no header on it. But looking at it, I would say it's a
26 proposed because I don't see any order numbers on here so

1 I know it's not a final draft.

2 Q. And proposed for what year?

3 A. Oh, 2014.

4 These aren't my regular glasses so they're --
5 sorry.

6 Q. And again, like the 2013 proposed schedule, the
7 schedule is broken down by month?

8 A. Yes. Everything looks the same.

9 Q. I will move on to -- this one doesn't actually
10 have pages because it's all one document.

11 A. Okay.

12 Q. But I want to move down to August and take a
13 closer look at August.

14 A. Okay.

15 Q. All right. So again, we have the same thing.
16 We have the functional location, which is the -- the ETL
17 number for the line, the date.

18 Now it's saying this is the 14th. So it's due
19 August 31, '14?

20 A. Yes.

21 Q. That's just internal; right? Caribou-Palermo
22 Plus Towers?

23 A. Yeah. That just came on the maintenance plans.
24 It means nothing. A lot of them have "tower" or
25 "insulator" or "wood pole." That's nothing.

26 Q. Okay. BFZ?

1 A. That's the MAT code that's on the border for the
2 work meaning that BFZ needs a detailed inspection. BFX
3 is air and BFZ is ground patrol.

4 Q. Okay. Table Mountain which is the work center?

5 A. Yes.

6 Q. "Transmission OH detailed inspection."

7 A. Yes.

8 Q. Correct?

9 And then again we have the columns for the work
10 and unit work hours?

11 A. Uh-huh, yes.

12 Q. And this time it says 89 hours.

13 A. Yes.

14 Q. And again, explain to us how that number was --
15 works.

16 A. That's Business Finance. They give us an
17 equation to times by the structures.

18 Q. All right. Let's move on to 578.

19 A. Wait. Which one?

20 Q. 578. It should be right there. Oh, duh. I
21 forgot to pull it out.

22 A. Well, I can look at the board.

23 GRAND JURY SECRETARY: We have it pulled out.

24 MR. NOEL: Thank you.

25 BY MR. NOEL:

26 Q. Now, 578. You have it on the board. You have

1 the original copy of it there; the evidence copy.

2 A. Okay.

3 Q. Now, this appears similar to 615 but a little
4 bit different.

5 A. Okay.

6 Q. And --

7 A. It's the same information, just a different
8 format.

9 Q. Okay.

10 A. That's what it looks like to me.

11 Q. So we talked about sometimes you'd send out
12 multiples of these, but they're different drafts and
13 everything that are sent out through the process;
14 correct?

15 A. Correct.

16 Q. Now, what year is this for?

17 A. 2014. It's cut off on here. Oh, it's not cut
18 off on here. Yeah, 2014.

19 Q. Okay. And again, we've got the Caribou-Palermo
20 on line number 91.

21 A. Okay.

22 Q. And as we go across this, we have this number
23 now in here. That's a 41980167 number.

24 A. That's the order number to go out and complete
25 the work.

26 Q. Okay. And then "Detailed Inspection." And now

1 in the hours column we have 90.5.

2 A. Okay.

3 Q. So this is the same information, but we've got a
4 change here. A minute -- or an hour and a half.

5 A. Okay. So -- okay.

6 Q. So is that common for that to change?

7 A. Yeah. It could be because now it's going to
8 become -- this is like the final draft. And perhaps
9 Business Finance came up with a different figure though
10 we had the proposed.

11 Q. Okay.

12 A. So that's -- and that happens.

13 Q. Right. And actually, I think if you go back and
14 look through it, it's difficult because of the format on
15 the 214 -- or 615.

16 A. Right. It was 89. It went up by one hour.

17 Q. Right. But it looks like several of the others
18 have also gone up?

19 A. The details?

20 Q. Right.

21 A. It looks like they have all gone up.

22 Q. The details?

23 A. Yes.

24 Q. Okay. And then here we have a blue column that
25 says 8/1/14 and a red column that says 8/31/14. What do
26 those mean?

1 A. That means when you do a patrol, it's due at
2 the -- it starts 8/1 to 8/31, 7/1 to 7/31. So they're
3 all like that. I don't know who put this calendar
4 together, but it's -- the orders are one month tags, one
5 month orders. It's due in that month.

6 Q. Okay. All right. So let's move on to number
7 616. Do you have 616 there in front of you?

8 A. I do.

9 Q. And you recognize 616?

10 A. Well, it looks like an e-mail from me saying
11 "Here's your 2015 proposed patrol" that I e-mailed out in
12 August.

13 Q. All right. Now, we talked about earlier
14 generally these things start going out in November, but
15 you said sometimes earlier?

16 A. Right. We can call them out earlier. It does
17 not hurt it to call them out earlier.

18 Q. All right. So who is (WITNESS #12)?

19 A. (WITNESS #12) was -- at that time was the
20 supervisor at Table Mountain.

21 Q. And how about (EMPLOYEE #16)?

22 A. A troubleman at Table Mountain.

23 Q. (WITNESS #21)?

24 A. Field clerk at Table Mountain.

25 Q. And who is Mary Hvis --

26 A. Hvistendahl.

1 Q. Hvistendahl?

2 A. Hvistendahl. She was a superintendent at that
3 time for transmission line.

4 Q. What is a superintendent?

5 A. Superintendent is the boss of -- she probably
6 had the whole northern division. She's got -- like the
7 supervisors fall underneath her.

8 Q. Okay.

9 A. I think at that time we had north and south.
10 And I think she was the north superintendent.

11 Q. All right. So reading the body of this, what's
12 going on here? What are you e-mailing them about?

13 A. Well, I'm sending them the patrols that we
14 looked at earlier saying "Here is your proposed 2015 air
15 patrols or inspections having the T-man update it to the
16 best guest you can. In case there's a change, it needs
17 to be filled out and sent to me."

18 Q. Okay. Now, let's move on to 617.

19 A. Okay.

20 Q. Recognize 617?

21 A. Yeah. It's just an e-mail indicating that I
22 went over the patrols again. I found one that -- it
23 looks like there was an air patrol and detailed for the
24 same year. When there's a detailed in the same year as
25 an air patrol, you cancel the air and do the detailed.

26 Yeah, that's it. So, yeah. I don't know if I

1 wrote it in here, but I definitely write e-mails like
2 this.

3 Q. How would you have both the detailed and air in
4 the schedule in the same year?

5 A. It's -- SAP schedules sometimes a lot of work
6 the same air and detailed. I can't tell you why they do
7 it, but it comes out. And when we call the patrol
8 inspections, we review this. If there's a detailed and
9 air, we cancel the air. We're not going to spend extra
10 money doing the air when the detailed boots are on the
11 ground.

12 Q. Okay. And do you have an inspection and patrol
13 cycle for each of the --

14 A. Yes. Every cycle is different depending if it's
15 steel structure, wood, all towers. Yeah, there's many
16 different schedules that is in our ETPM manual.

17 Q. Okay. So here's an example where, okay, we've
18 sent out the proposed schedule, found a mistake in it.
19 Here's basically another draft of the patrol schedule.
20 Is that --

21 A. So what's a mistake? I don't understand that.
22 There's not really a mistake.

23 Q. Okay.

24 A. Are we still talking about this e-mail?

25 Q. Yeah.

26 A. So no. They don't see that because I've already

1 identify that there's two patrols. It's not like
2 something in SAP came out like that. They won't see
3 that.

4 Q. Okay.

5 A. I would have deleted the air patrol.

6 Q. Okay. So let's move on to 618. Do you have
7 that there in front of you? Another
8 very-difficult-to-read one.

9 A. It's better though.

10 Q. A little better.

11 Do you recognize 618?

12 A. Yeah. Another patrol for, it looks like, 2015.

13 Q. All right. So it looks like a very similar
14 format to the exhibits we looked at before 614 and 615.

15 A. Yes.

16 Q. But there's one major difference that I can --
17 that looks to me. And do you recognize what that
18 difference is?

19 A. Yeah. It looks like this patrol probably had
20 two tabs on the original list. One's for air patrol,
21 one's for detailed is what I see.

22 Q. Okay.

23 A. So air patrols we would do quarterly. Whether
24 it had a January, February, March, they were all due in
25 March. And keep in mind they're not due until 12/31
26 ultimately.

1 Q. Okay.

2 A. So there's -- and then when it's -- on the
3 second page, it looks like it's all detailed. It's
4 detailed inspections. And they're done when they're due.
5 If it's got a January date, it's due in January. If it's
6 got a March date, it's due in March and on down the line.

7 Q. Okay.

8 A. So this looks like it was probably one document
9 with two tabs.

10 Q. Right.

11 A. And this is how we usually -- we do them now.
12 And maybe that changed in 2015. I do not know.

13 Q. Okay. So was there a change in the way that the
14 air patrols were scheduled between 2014 and 2015?

15 A. Well, I don't recall. Maybe they did them the
16 month they were due. I can't be for sure.

17 Q. Okay. This here. Like I brought back up 578,
18 which is the 2014. And it divides it by month. And we
19 have both air patrol and detailed inspections by month.

20 A. Right.

21 Q. Same thing on the -- on 615 for 2014 and then on
22 614 which is the 2013 same thing. We've got it broken
23 down by month and it's air patrol?

24 A. Yeah. It looks like they did them by the month
25 for every kind of patrol. And then it looks like in 2015
26 based on this we separated it in two different tabs; one

1 by air, which is quarterly here, and one by detailed
2 which is monthly.

3 Q. Okay. Now, 618. Can you tell if that's a draft
4 or if this would be a final?

5 A. Well, it's got the order numbers on it. It
6 potentially could be the final, but there's usually a
7 header at the top that will say "Final." And I don't see
8 that here. So I can't tell you for sure this is a final.

9 Q. Okay.

10 A. But it does have more data on it including that
11 first column which is the number for the patrols to be
12 done on and charged to.

13 Q. And third quarter we have here. And there's no
14 line numbers on this but --

15 A. I see it.

16 Q. Caribou-Palermo?

17 A. Uh-huh, yes.

18 Q. With an order number 42292776?

19 A. Yes.

20 Q. And that would be the number that would -- the
21 order number that would go on all the paperwork related
22 to that inspection or patrol?

23 A. Yes, yes.

24 Q. Okay. And again, over here we have the hours
25 column again and we have 14.8 hours.

26 A. Yes.

1 Q. So that didn't change between 2013 and 2015?
2 A. It shouldn't have.
3 Q. All right. Let's move on to 619. Do you have
4 that there in front of you?
5 A. I do.
6 Q. Do you recognize 619?
7 A. Well, it looks like an e-mail from me back in
8 2016.
9 Q. Go ahead and read it.
10 A. It looks like it's the projected patrol
11 inspections for 2017. So it's sending it to (WITNESS
12 #21) and to the T-man and the supervisor with their 2017
13 proposed inspection -- patrols and inspections calendar.
14 Q. Okay. And like we -- you know, one of the
15 things that we deal with with e-mails and e-mail chains
16 is they actually go from reverse chronological order.
17 A. Right.
18 Q. So the first e-mail would be the bottom e-mail
19 on here; correct?
20 A. Yes.
21 Q. And that's an e-mail from you?
22 A. Uh-huh, yes.
23 Q. And what is the date on that?
24 A. October 31, 2016.
25 Q. And we already identified (WITNESS #12) and
26 (WITNESS #21)?

1 A. Yes.

2 Q. You're (WITNESS #9)?

3 A. Yes.

4 Q. And who is Stacie Doyle?

5 A. Stacie Doyle. At that time I think she was my
6 supervisor. Yes, she was my supervisor.

7 Q. Okay. And go ahead and read the e-mail really
8 quick.

9 A. "Please see the attached spreadsheet with your
10 projected 2017 patrols/inspections for Table Mountain.
11 If you'd like to review the calendar with the T-men, let
12 me know if anything seems to be missing or needs to be
13 realigned. Your air patrols will be bulked quarterly
14 again as they were this year."

15 And it's two tabs that they had in 2015 as well.

16 "The actual call of the PMS will happen sometime
17 before Thanksgiving."

18 So it looks like what I did here is I pulled out
19 the proposed patrols and inspections through 2017 early.
20 I hadn't actually called the orders out yet. Or Stacie
21 hadn't called the orders out yet. Same information. We
22 just wouldn't get the orders.

23 Q. Okay.

24 A. So just going into SAP, pulling a document of
25 what are the proposed patrols and inspections without
26 calling them.

1 Q. Okay. So we talked about this earlier, you
2 know, that someone calls the orders out?

3 A. Yes.

4 Q. And you said that that person would have been
5 Stacie Doyle?

6 A. No. Stacie at the time called out -- when I say
7 called out, they called the work management gurus or the
8 work management team Mary Laufenberg. And they called
9 the orders out. So she sends an e-mail -- there's
10 actually a document in PG&E like a program that's -- we
11 track it. It goes from "Please call out our ETL lines
12 for the year 2017." It goes through e-mail. It goes to
13 a SAP management team somewhere. And Mary Laufenberg is
14 the person that usually provides all the orders for us.

15 Q. Okay. So I'll make sure I've got this straight.
16 So when you're ready to start putting together the
17 schedule for the next year, you would tell Stacie Doyle
18 to request the call-out?

19 A. Yeah. I didn't tell Stacie. She knew. She
20 called out the orders all the time. So, yes, I would
21 say -- she would say "We're ready." She calls them out.
22 We work together as a team to go through them.

23 Q. And those would go to somebody in what division?

24 A. They don't go to anybody. They come to Stacie
25 Doyle at the time. Stacie would then -- we, her team,
26 which is the asset strategist/asset maintenance planner,

1 would look at the calendar. We review them and send them
2 out to the headquarters whatever headquarters were
3 assigned to us.

4 Q. Okay. You mentioned a division and somebody
5 named Mary Laufenberg.

6 A. There's no -- I don't know what -- if I said
7 division, I don't know why. We don't have divisions.
8 But Mary Laufenberg works for PG&E. She works in the --
9 I call them the SAP work management gurus because somehow
10 we call them, they can make a mass change that we don't
11 have the capability of doing. I don't know how they do
12 it. But she provides us with all the order numbers for
13 them to do the next year's patrols.

14 Q. Okay. That's where I was getting confused. And
15 I want to make sure we got that straight.

16 A. Sorry.

17 Q. That's okay.

18 All right. So when you're setting this out, you
19 are setting out a preliminary schedule before that
20 process has been --

21 A. Yeah. It looks like I did that here, which we
22 can do. We probably called orders two weeks later
23 because it was the end of October.

24 Q. All right. Let's move on to 620. Do you
25 recognize 620?

26 A. Yeah. It looks like an e-mail to me -- I mean,

1 from me.

2 "Please find attached the updated Patrols for
3 the Calendar for 2017. There are still two patrols.
4 We'll work on next Tuesday for the following two
5 circuits. You have requested both the ground inspections
6 and not an air patrol. Please look over the calendar and
7 let me know by the end of business."

8 So these two lines are in the heart of Chico in
9 town. They can't have air patrols. We're not allowed to
10 have helicopters. So this was telling me I was going to
11 update these to all ground patrols moving forward which
12 was done.

13 Q. Okay.

14 A. So that's all this one is.

15 Q. And so now we're -- what's the date of this?

16 A. December 23, 2016. So they've got the calendars
17 by now. They've got their final calendars for 2017.

18 Q. Okay. Yeah. And that's the subject of it here.
19 2017. What is "P&I"?

20 A. Patrols and inspections.

21 Q. Okay. Table Mountain HQ?

22 A. Final.

23 Q. Final?

24 A. Yep.

25 Q. So if we were looking for this document, would
26 that be the name that this document would be saved under?

1 A. Yes.

2 Q. Okay. So there should be a 2017 schedule?

3 A. Yes.

4 Q. There should be a 2018 schedule?

5 A. Yes.

6 Q. And there should be a 2019 schedule?

7 A. Yes, there is.

8 Q. Okay. So before we move on, talk about those --
9 the work hours that we were talking about, the estimates
10 for how long it should take them or that they're budgeted
11 to perform those.

12 You took over as asset strategist in 2012;
13 right? March of 2012?

14 A. Yes.

15 Q. When you took over, was that -- was that what we
16 kind of came to term the allotments, the budgeted work
17 hours part of the yearly patrol and inspections
18 schedules?

19 A. Yes.

20 Q. At some point did that change?

21 A. I think that in 2016 it changed to where we
22 didn't put those hours for the upcoming patrols in 2017.

23 Q. So was that -- was the hours replaced or were
24 they put someplace else?

25 A. They didn't add that column. It was a column
26 that we added. It wasn't anything from SAP. We added an

1 extra column with the work hours.

2 Q. Okay. Were you still budgeting work hours for
3 each inspection?

4 A. I don't do budgets. So Business Finance may
5 have. We did not.

6 Q. Okay. I guess the way I should ask it is were
7 you still doing the calculations based upon the equation
8 that Business Finance provided to you?

9 A. No.

10 Q. All right. So there wouldn't be that work hours
11 column in at least the '17, '18, and '19 schedule?

12 A. That is correct.

13 Q. All right. So let's move on to 621. Sorry. Do
14 you see the document marked 621?

15 A. I do.

16 Q. And do you recognize 621?

17 A. I've seen it.

18 Q. All right. What is 621?

19 A. Exhibit 621. Evan Geisert came into PG&E in
20 2014. It was creating a work management team. He needed
21 someone to be a clerical support person to all the
22 clerical personnel. And I was named the temporary one.
23 I believe I started in September of 2014.

24 Q. Okay.

25 A. Maybe the end of September.

26 Q. So in terms of his position with the company or

1 in the transmission division, what was Evan Geisert's?

2 A. Superintendent for transmission line.

3 Q. For all of the transmission lines or --

4 A. No. He did work management. He was with the
5 work management team under transmission line. There's
6 different things.

7 Q. And then this is addressed to himself?

8 A. Yes.

9 Q. And someone named Lawrence Kazmierski?

10 A. He was a director at the time of the
11 transmission line.

12 MR. NOEL: Can you see the spelling up there,
13 Madam Reporter, or do you need me to --

14 THE COURT REPORTER: Oh, wait. Hang on a
15 second. Okay. I got it.

16 BY MR. NOEL:

17 Q. I'm sorry. Who was Mr. Kazmierski?

18 A. At that time he was a director under
19 transmission line.

20 Q. And what is a director?

21 A. One of the big bosses that all the
22 superintendents report up to him.

23 Q. Okay. And, of course, we know who (WITNESS #9)
24 is.

25 A. Yes.

26 Q. Who is John Parks?

1 A. He was a senior director in charge of all of
2 transmission line.

3 Q. And who is Nick Daleo?

4 A. Nick Daleo is someone who was a supervisor that
5 worked under Evan Giesert.

6 Q. So Mr. Giesert comes in as the new supervisor of
7 the T-line work management group. Is that what I -- do I
8 understand that correctly?

9 A. Yes.

10 Q. And then made some changes as to how things were
11 done?

12 A. Yes.

13 Q. Is that true?

14 And one of those changes was that you got
15 promoted?

16 A. Yes, on a temporary basis.

17 Q. So can you read us this e-mail and kind of
18 explain it as we go.

19 A. Read the whole thing?

20 Q. Yeah.

21 A. Okay. "I am sure you have all read the
22 organizational announcement from yesterday. We will be
23 setting up a brief call tomorrow to discuss and address
24 questions. Additionally, (WITNESS #9) will be setting up
25 time with you and your respective supervisors to talk
26 through the next steps."

1 Q. Okay. So let's stop right there. The (WITNESS
2 #9) that is being referred to, is that you?

3 A. Yes.

4 Q. And who are you going to be contacting and what
5 are you going to be talking them through?

6 A. So it looks like -- because I'm the clerical
7 supervisor now temporarily, I'm going to be talking to
8 all the supervisors that the clerks actually report to on
9 a daily basis.

10 Q. Okay.

11 A. The clerical staff at each headquarter.

12 Q. Okay. All right. So now go on.

13 A. "There are a few things I want to clarify.
14 There is no question that the clerical team is a critical
15 component of the organization. Your consistent and
16 substantial efforts enable operational execution and
17 compliance. Our overreaching goals with this
18 re-organization are to ensure supervisors receive
19 consistent and optimal clerical services, clerical team
20 receives improved support and governance --" I can never
21 say that -- "clerical services are affordable and
22 leverage scale and technology.

23 Short term the organization will change very
24 little. You will continue to support your local
25 headquarter as you do today. We will be inventorying
26 processes and surveying the team on what is working well

1 and opportunities that require action."

2 More?

3 Q. Yep. Go ahead.

4 A. "Long term the organization and support services
5 will change. We will be looking to improve support to
6 the supervisors, eliminate process waste, and leverage
7 our scale and technology. This will be an inclusive and
8 transparent process based on partnering with you and the
9 supervisors to find and implement solutions.

10 Look forward to speaking with you over the next
11 few days and throughout the process. Please give me a
12 call if you have any questions. Evan Geisert."

13 Q. Any idea what any of that means?

14 A. He liked to do a lot of fluff. So yes. In
15 layman's terms I became his clerical supervisor. The
16 clerks reported directly to a supervisor at the
17 headquarters. My -- what Evan's vision is is to have a
18 supervisor manage them. It could be for vacation relief.
19 It could be if they needed help at one headquarters or
20 the other. That's what my role was to make sure all the
21 work is being done throughout all the headquarters in
22 transmission line.

23 Q. All right. So he mentioned in here an
24 organizational announcement from yesterday.

25 So now let's move on to 622. And the same
26 question. Ask you --

1 A. I don't think I can read this. I can't.
2 Q. It's a little bit better on the big board.
3 A. Oh, yeah.
4 Q. And we can actually --
5 A. Do I have to read that whole thing?
6 Q. No. I just want to kind of ask you about it.
7 A. I'll have to stand up.
8 Q. It's not real great. The quality of the copy of
9 a copy of a copy of a copy is not the best.
10 But do you recognize this document marked as
11 622?
12 A. Yes.
13 Q. Is this the work announcement referenced in 620?
14 A. That's what it looks like.
15 Q. And can you just -- you don't have to read it.
16 Can you kind of explain to us what's going on here, what
17 the changes are, and how this affects the --
18 A. Well, it just -- he's developing his work
19 management. He wanted a clerical piece, program manager
20 which manages the budgets, works on capital. And what's
21 that? Resources and -- that's planning and scheduling,
22 corrective work, contract work, patrols and inspections.
23 That's really hard to see. Resources and work
24 would have patrols and inspections.
25 Q. Okay.
26 A. They would have all end corrective work.

1 Q. And then down here at the bottom it says
2 "(WITNESS #9) will serve on a rotational basis as a
3 supervisor over clerical support."

4 A. Yes.

5 Q. All right.

6 A. So I had different people that were doing
7 functions.

8 Q. Right. And one of those is Sean Clesen it looks
9 like?

10 A. Yes.

11 Q. And who is Sean Clesen?

12 A. Sean was a new person that came over and worked
13 with Evan. I don't know what he did. I can't read that.

14 Q. It says "Transition to a new role focused on the
15 internal reporting, governance, process improvement, and
16 initiatives."

17 A. I don't really know what he did.

18 Q. And then there's (EMPLOYEE #8).

19 A. Yes.

20 Q. Do you know who she is?

21 A. Yeah. She was asset strategist/asset
22 maintenance planner. She was my equal.

23 Q. So she will serve on a rotational basis as the
24 operational analyst lead.

25 A. Yes. So maybe she -- I'm not really sure what
26 she did. Maybe running reports.

1 Q. How about Jefferson Heidelberger?

2 A. He was transferred from Business Finance. So it
3 looks like he was program manager, supporting
4 maintenance. So he was a new guy under Evan too. And I
5 really don't know what he did.

6 Q. Okay. So he's somebody that came in from
7 Business Finance; right?

8 A. Yes.

9 Q. Those are the people that control the budget?

10 A. Yes. I don't think he had anything to do with
11 the budget here. He just came under the work for
12 transmission line.

13 Q. Okay. And then going down to the next page we
14 have Donna Thorne. Do you know who Donna Thorne is?

15 A. Yeah. Donna has been retired. She was an asset
16 strategist/asset maintenance planner and she was also a
17 clerical supervisor after I left. I only did it for
18 three months. And then Stacie Doyle was the office
19 strategist. She was a supervisor in 2002.

20 Q. You said Donna Thorne is retired?

21 A. Yes. She's been retired a little while.

22 Q. And you started in 2012; right?

23 A. Yeah.

24 Q. Was Donna Thorne already there as an asset
25 strategist when you started?

26 A. Yes. Her and Stacie were both there.

1 MR. NOEL: Do you need any other names spelled?

2 THE COURT REPORTER: I can't see it either. So
3 I'll have to -- I'll get it later. I can't see it.

4 BY MR. NOEL:

5 Q. All right. Let's move on to 623 which is a
6 little bit easier to read but not much.

7 Do you recognize 623?

8 A. Yeah, I sure do.

9 Q. And again --

10 A. It's an e-mail I wrote a year ago. A little
11 over.

12 Q. Okay. And again walk us through what this is.

13 A. Okay. So every year PG&E gets audited by the
14 California ISO, which is the CAISO. We get audited every
15 year on the lines, probably 15 to 20 lines that they're
16 going to do an audit on us.

17 So what I did is I sent an e-mail to all the
18 clerks who are up there. So I sent an e-mail to them
19 asking them to provide me all the order numbers that they
20 did on insulator washes which somebody still wants to
21 know. So I sent it to all the clerks. I didn't know.

22 So the next one up Tina is a clerk in Victor and
23 a man by Justin -- you probably can't see it, but his --
24 it's like right here (indicating).

25 Q. Okay.

26 A. Okay. So he does all the washes whether it's

1 helicopter washes or ground washes and then in the body
2 he writes how many structures. And then this doesn't
3 have all the information, but it will tell me what line
4 it's on. So I provided all my information to Justin
5 Young. I didn't know who to get it from, but she told me
6 that.

7 Q. Okay. And the information that you got from
8 Justin Young is what is in here?

9 A. Yeah.

10 Q. And so --

11 A. And this is just a couple. It will say 20
12 structures. I can't tell. Does it have a line name on
13 there? I can't tell.

14 Q. Yeah, it's hard to read what we've got in there.

15 A. Oh, it looks like I was looking for the two
16 lines; the Cottonwood Number One and Cottonwood Number
17 Two, where it says "20 structures." And she verifies it
18 with Justin in a long text from notification.

19 Q. And then one of the questions on here you're
20 asking for all the insulator washes in 2017. And then
21 there's a follow-up e-mail on here. It looks like it's
22 from (WITNESS #21) responding to your e-mail and it says
23 "Can you verify that the 2017 work was completed in 2017
24 instead of 2016."

25 A. I don't know what that means.

26 Q. And then in this stuff on Justin Young it shows

1 it as a 2017. But when you read down here, it says 20
2 structures washed 6/1/16 per those?

3 A. They might have sent the wrong information. I
4 don't know.

5 Q. And this is the information from the SAP?

6 A. It looks like it's on a notification in a long
7 text, but there's not that much information there.

8 Q. Okay. All right. Let's move on to 624. Do you
9 recognize what that is?

10 A. It looks like an e-mail that was sent from
11 (WITNESS #21) to me with a few e-mails.

12 Q. Okay. Yeah, it's an e-mail chain between you
13 and (WITNESS #21)?

14 A. Yeah.

15 Q. And that took place when?

16 A. She sent the e-mail February 9, 2018. It's at
17 the very bottom.

18 Q. And the subject is listed as "Paradise Table
19 Mountain Missing Equipment."

20 A. Yes.

21 Q. Is that correct?

22 A. That's what it looks like.

23 Q. So it starts off with (WITNESS #21) e-mailing
24 you about some problems and then you responding back.

25 A. Yeah, yes.

26 Q. All right. Can you explain to us the problem

1 that (WITNESS #21) is expressing in her initial e-mail?

2 A. Yeah. So she writes --

3 (Court reporter interrupts the witness.)

4 THE WITNESS: So what she's looking for is they
5 went out on a patrol it looks like. They have Structure
6 :11/99A which has created notification, a notification.
7 She tried to create a job.

8 "It indicates that this is no longer a valid
9 structure. When I pulled the 2017 detailed inspections,
10 I noticed that this structure has now been removed from
11 the master equipment list.

12 Can you please research this and let me know
13 what's going on. Why did all these 'snakebite' locations
14 fall off the master equipment list? Are they recoverable
15 and need to be added back? Was there a renumbering
16 issue?"

17 And then my response --

18 Q. Well, hold on. Let's break this down first and
19 explain things. So what does it mean to create a
20 notification?

21 A. So without looking at the notification, it looks
22 like somebody went out and did a patrol. And they had a
23 finding on this Structure :11/99A which created a
24 notification. It looks like she tried to create a job,
25 but it says that that equipment number. So there's an
26 equipment number tied to this, a SAP equipment number

1 tied to the :11/99A. It sounds like she's saying it's no
2 longer there, it's no longer a valid structure, it's not
3 in existence. That's how I'm reading this.

4 Q. Okay. So that's what I want to make sure.

5 A. Okay.

6 Q. And then it goes down here and it says "Why do
7 all of these snakebite locations fall off the master
8 equipment list?"

9 A. See, I don't know what that means. What
10 snakebite means I don't know.

11 Q. Is it common for the master equipment list in
12 SAP to not be entirely correct?

13 A. Yeah. It could have been mapping removed it and
14 we weren't contacted or a contractor might have removed
15 it. I don't know. Without looking into it I have no
16 idea.

17 Q. But it looks like the structure was there when
18 the inspection was done and now it's no longer in the
19 system?

20 A. That's what it looks like.

21 Q. Okay. And then your response to her. Can you
22 read that.

23 A. "I will look into this later this afternoon. I
24 am currently not in the office."

25 And then I said "Mapping does all the equipment
26 record entries and it's making me mental." Sorry. "Did

1 you check GIS to see what the equipment record is
2 showing?"

3 So GIS is, you know, our system that has all the
4 reliance.

5 Q. Okay. And who is mapping?

6 A. The Mapping Department is in charge of all
7 equipment records and SAP to create, delete, or make
8 changes. They started -- they took that over around the
9 end of 2015.

10 Q. And why is mapping making you mental?

11 A. I was joking. Okay. It's (WITNESS #21).
12 I'm -- you know.

13 Q. No. I know.

14 A. And mapping has some issues. In my opinion,
15 they have -- it was new for them to -- well, not really
16 2018, but it's their responsibility. They took over all
17 the equipment. It is not ours.

18 Q. Okay. And then up here now we're talking
19 (WITNESS #21) responds back to you.

20 A. "I don't extend myself to GIS because I have
21 seen such a conflict with the iPad information, and
22 that's jumping into a whole different arena."

23 Q. Okay. What is the conflict between the GIS and
24 the iPad information?

25 A. I don't know. The iPad -- all information in
26 GIS downloads into the iPad. If the equipment records

1 aren't correct in GIS, it's not going to be correct in
2 the iPad.

3 Q. Okay.

4 A. That's a mapping concern. I don't know.

5 Q. And is there conflicts between the information
6 in GIS and the information in SAP?

7 A. There could be, yes.

8 Q. Okay. And the iPads -- what are we talking
9 about the iPads?

10 A. The iPad is what they do their patrols and --
11 their patrols on. When they go out and do a walk and do
12 a detail, it's on an iPad. So they go structure to
13 structure. It has the equipment numbers and the forms
14 they fill out.

15 Q. So is the iPad based upon GIS or is it based
16 upon the SAP?

17 A. Well, in -- this was 2018. It would have been
18 based out of GIS.

19 Q. All right. So let's move on to 625. And this
20 is another in the same -- just another part of the same
21 e-mail chain; right?

22 A. Yeah. It should have all been together but,
23 okay.

24 Q. But actually --

25 A. It's kind of snippets or something.

26 Q. One of the interesting things about the way we

1 get this stuff is if you look down at the bottom of the
2 document number --

3 A. Yes.

4 Q. See, they're not consecutive. So they're kind
5 of off.

6 A. Okay.

7 Q. So I can't really staple them together and
8 respond and put them as one thing if they're --

9 A. Okay. So this is that same e-mail that we just
10 went over in that last document. And then it looks --

11 So do you want me to read it again?

12 Q. No, no.

13 A. And then my response was "I will be in the
14 office at 9:30 today and I will take care of this
15 request. I've been having some medical issues. It
16 sucks." Sorry. "Getting blood taken in 20 minutes,
17 Hopefully, I'm still alive. LOL."

18 Q. Obviously, you survived?

19 A. I survived. I don't like needles so . . .

20 Q. All right. So this is just another portion of
21 the same?

22 A. Yes.

23 Q. All right. Let's move on to 626.

24 A. Okay.

25 Q. And this starts off with a -- with an e-mail
26 from (WITNESS #21) to you in October of 2017.

1 A. Okay.

2 Q. And explain to us what's going on here.

3 A. Well, it sounds like she sent me an e-mail
4 indicating she had an issue with the object list. It
5 wouldn't print. She said it was 23 pages and they want
6 to do patrols as soon as possible.

7 My response to the T-man and to (WITNESS #21) is
8 "This patrol is ready to print now with all the
9 structures on it. I believe there are 44 pages. This
10 was a strange one and I am still looking at the whole
11 maintenance plan."

12 Q. What is a maintenance plan?

13 A. The maintenance plan is what creates all the
14 orders for them to go out and do their patrols and
15 inspections.

16 Q. Kind of explain to us what goes into the
17 maintenance plan.

18 A. It's the schedule. It's a cycle of the years.
19 You know, every year it depends on the cycle that line is
20 on.

21 Q. So it's not like an individual plan for each
22 individual line?

23 A. It is an individual plan for an individual line,
24 yes.

25 Q. Okay.

26 A. Every circuit has their own maintenance plan.

1 Q. Okay. And what goes into that maintenance plan?

2 A. Well, what we do -- there's a maintenance plan
3 and then all the structures -- they're called
4 maintenance. We call maintenance items that we attach to
5 the plan, but it's a PR notification that we attach to
6 the plan.

7 Q. Okay.

8 A. And then they go out and do their work. It
9 creates an order which is on our calendars.

10 Q. Okay. And what is the object list, if you know,
11 that's referenced in (WITNESS #21)'s initial interview?
12 Or I mean, e-mail?

13 A. Yeah. So the object list is what -- it's like a
14 document that has each structure, what it is, and if
15 there's -- when the guys go out to do their patrols, they
16 write on it if there's anything wrong. It's structure by
17 structure.

18 Q. So that's the same as the transmission object
19 list that is attached to every inspection?

20 A. Yeah. It's -- yeah, that's what the object list
21 is. And it sounds like she was having difficulties. Or
22 SAP, our system, has difficulties at times. And maybe it
23 wasn't printing. I looked at patrols. I don't know why
24 I wrote 44 pages when it was 23. Without looking into
25 it, I can't -- I don't know.

26 Q. Okay.

1 A. But this isn't abnormal.

2 Q. And let's move on to 627. Okay. Do you
3 recognize 627?

4 A. Yeah.

5 Q. Can you explain to us what we're looking at
6 here.

7 A. So it looks like at the bottom that's called an
8 RW Request Work Notification. Without seeing what's in
9 that -- where it's got the highlighted area, it says that
10 (WITNESS #18) went out and looked at the line. It looks
11 like it was removed on a capital order which starts with
12 a three series number. All the ports were topped at 12
13 kV level, removed all tags and notifications from the
14 structures.

15 So there's a corrective order instruction. It
16 no longer belongs to transmission line. This is a
17 mapping issue at this point.

18 Q. Okay. So earlier we were looking at a case
19 where we have a structure there that is no longer in SAP.

20 A. Right.

21 Q. In this case we have an entire transmission line
22 that's not there that's still in SAP; right?

23 A. Yes. So this RW was created. And if you see
24 from (WITNESS #9) to Mike Franks. Mike Franks is our
25 mapping person. So I sent this to him with my note
26 "Please let me know how I should proceed with this

1 request." And I wrote "T-man indicates these structures
2 are gone."

3 He's out -- you know, he's out there. There was
4 pictures that were attached to the notification, to the
5 RW it looks like.

6 And then I wrote "Can you shed some light on
7 this for me." And that's what Mapping does. At that
8 point it's out -- we don't -- we're not responsible.

9 Q. Okay. Let's move on to 628. Do you recognize
10 628?

11 A. Yeah. Just another long e-mail.

12 Q. If you could explain to us what we're looking at
13 here at 628.

14 A. So it's my original e-mail I received from
15 (WITNESS #21). So this is another RW notification. It
16 comes to our asset strategists. It says "Asset data
17 correction." And then under "Work Type" it has "ETAS."
18 That means planners.

19 So these are requests to come to us in SAP. We
20 go and make the updates. This was in 2016. And this is
21 when the transition was coming from us to Mapping
22 Department. So it looks like (WITNESS #21) sent an RW.
23 And that little highlighted part "There was no
24 attachment." I wrote "No attachment on notification" and
25 sent it back to (WITNESS #21).

26 (WITNESS #21) wrote "The patrol is attached now.

1 Thanks."

2 Q. Okay. Let's stop here. What should have been
3 attached to this RW?

4 A. I think the object list. What has changed out
5 there? So the patrol has been done, but she needs
6 equipment. I think her e-mail said for equipment
7 changes. Yeah, her e-mail says "Went to the detailed
8 patrol 2012. Please complete the equipment changes. See
9 attachments." And then I wrote back "There is no
10 attachment." But it is the object list.

11 Q. So the object list itself was being uploaded
12 into the SAP?

13 A. Well, it wasn't. She forgot to attach it.

14 Q. But it should have been?

15 A. Yeah. She scanned it with all the notes and put
16 it on the RW.

17 Q. All right. And then moving on to this --
18 through this -- through this change of e-mails. So
19 (WITNESS #21) attaches the object list and sends it to
20 you. And then what happens next here?

21 A. Well, then it looks like the -- I wrote "The
22 patrol shows that there are 52 single wood poles that now
23 should be light duty steel pole structures."

24 Q. What does that mean?

25 A. It means those 52 poles were changed out to
26 light duty steel structures at some point. And I wrote

1 "I do not see anything in Mapping. Please let me know
2 once you contact the T-man." Because now I need to
3 verify it in the field. So, you know, talk to the T-man
4 and have him call me.

5 Q. So are there different standards for wood poles
6 and light duty metal pole structures?

7 A. I don't know what you mean by "standards."

8 Q. For example --

9 A. One is wood and one is steel.

10 Q. Right. First, the ETPM. Are there --

11 A. There are different levels. We try to -- as we
12 started replacing poles in the field for many years, we
13 try to do light duty steel poles instead of wood. We
14 replace our old wood poles.

15 Q. So here's where the paperwork is still showing
16 that these 52 single wood poles, that they've actually
17 been replaced at some point by light duty pole
18 structures?

19 A. Yes.

20 Q. And that hasn't been updated in the system?

21 A. No, it doesn't look like it in that e-mail.

22 Q. Okay. Let's move on to the next part of this
23 conversation.

24 A. So then it looks like (WITNESS #21) e-mailed
25 (WITNESS #11) who is the troubleman saying "I need to
26 talk with you about this inquiry." And then (WITNESS

1 #11) -- I mean, not (WITNESS #11). Excuse me. (WITNESS
2 #11) wrote "(WITNESS #12) was talking about having the
3 T-man next week. I was thinking that this may be
4 something we can try and figure out at this time if this
5 works for you. In the meantime, like Ryan can help me
6 figure out the dates. Most of these poles were changed
7 out by contractors."

8 Q. Okay. Who is Mike Ryan?

9 A. Mike Ryan -- I believe at the time he was a
10 foreman in the contract department. So looking at
11 this and (WITNESS #11) says "I'm thinking most of them
12 were changed out in 2014 and 2015." And he'll try to get
13 a copy of the patrol to Mike for his input meaning he's
14 going to show him that these 52 wood poles that are
15 showing on this patrol are really -- they're steel poles
16 now.

17 Q. Okay. And he tried to figure out when this
18 happened?

19 A. Exactly, which means contractors put -- changed
20 out the poles and Mapping was never notified.

21 Q. Yep. And then we get to the final e-mail here
22 from Mike Ryan?

23 A. Yeah. So he's sending something to Mike Ryan
24 about "Do you have any information? Do you have any 2012
25 or 2013, Mike? I only see a few structures on this line
26 for the last couple of years. We may have to look into

1 GC Transmission also to see if they have changed out any
2 of them. I'm thinking (WITNESS #8) crew may have --"

3 And (WITNESS #8) is the GC crew on the
4 transmission line.

5 Q. Okay.

6 A. And they may have changed it.

7 Q. Okay.

8 A. And then "Per Stacie Doyle I was informed that I
9 can just update the existing SAP equipment number
10 changing them from a single wood pole to a light duty
11 steel pole. There is no need to look for any forms that
12 may or may not have been submitted," which we then --
13 this was right in the transition of Mapping taking over,
14 but we still were in charge so we updated them to steel
15 poles.

16 Q. Okay. All right. So we've done an inspection.
17 The transmission poles aren't what they're supposed to
18 be. And that sets off a lengthy search to find out why
19 this hasn't been recorded and when it actually happened?

20 A. Right. But they were identified by the T-man to
21 be changed out.

22 Q. Right.

23 A. And that was identified on the object list.

24 Q. And what is the procedure within PG&E if a T-man
25 finds that a structure is gone or a structure that's not
26 supposed to be there is there or a structure is changed?

1 It's gone from wood to metal or something?

2 A. With the steel. So they should identify that.
3 They write it on their object list. They try their best
4 to figure out what -- you know, what kind of a pole it
5 is; light duty wood pole, steel pole. And the
6 headquarters will contact Mapping.

7 Now, at this time it was right in that area
8 where Mapping was starting to take over. So we may have
9 tried to get as much information on a form, you know, a
10 new change-out equipment if we could.

11 Q. So prior to 2016 who would have been responsible
12 for making the changes in SAP and GIS?

13 A. We did; the strategists. The asset
14 strategists/asset maintenance planners. The troublemen
15 would have a form to create a delete form or change. And
16 they would turn it into us so we would make the updates.

17 Q. And they were supposed to do that at any time
18 there were changes to the actual --

19 A. Yes. And we received many.

20 Q. All right. Let's move on to 629. Do you
21 recognize 629?

22 A. Yeah. It looks like an e-mail from -- well, it
23 started out from Andrew Franzen who at that time was the
24 Clerical Support Services Supervisor for the clerical
25 personnel in transmission line. And he wrote "Would you
26 be --"

1 And he's sending this to Anthony Alexander who
2 at that time was a program manager.

3 So he wrote "Would you be the contact -- would
4 you be the contact for a clerk that needs 100,000 plus
5 moved from orders or is that an asset strategist duty?"

6 Q. What does he mean by "needs 100,000 plus moved
7 from orders"?

8 A. So without knowing what order, it could have
9 been the crew went out and did some work on -- expense
10 work and maybe got -- poles needed to be changed out.
11 They need to go to capital orders. So they wanted to
12 move the \$100,000 from expense to capital.

13 I'm not sure of the scenario here. There are
14 times where people use order numbers, transpose numbers,
15 and charge time or we need to move it out.

16 Q. All right. And jumping up to the top of this
17 e-mail, you're not involved in this e-mail chain;
18 correct?

19 A. It doesn't look like I'm involved for a -- yeah,
20 not at all.

21 Q. Just up here (indicating).

22 A. Not at all.

23 Q. But in the last e-mail on this 9/26 2:50 p.m. it
24 says "I already talked to (WITNESS #9) about moving
25 monies."

26 Do you recall having such a conversation with

1 (WITNESS #21)?

2 A. Well, I think (WITNESS #21) knew, but Andrew
3 didn't. I can't -- there might have been a -- I can't do
4 journal entries for monies. That's not what we do.

5 Q. Okay.

6 A. And I think I -- well, he -- it looks like
7 Andrew might have contacted me, but we don't do that.
8 It's somebody in Business Finance.

9 Q. Okay. Somebody in Business Finance?

10 A. Yes.

11 Q. All right. They are the people who would be
12 responsible for moving money from one thing to another?

13 A. Yeah.

14 Q. All right.

15 A. And that's happened, you know, several times.
16 This isn't an isolated one-time event.

17 Q. Is it common for people to expect you or when
18 you were supervising the clerical support system to do
19 things out of your class, out of your --

20 A. No. This isn't our job. We don't do it. We
21 send it to people. And I don't know how Business Finance
22 does it.

23 Q. I guess that was how I was trying to frame that
24 question. Is it common for people to ask you to try to
25 do things that are not within your job?

26 A. No.

1 Q. All right. And finally, let's go to 630. Do
2 you recognize 630?

3 A. Okay.

4 Q. Please tell us what we're looking at at 630.

5 A. So this is a notification, it looks like, from
6 (EMPLOYEE #16). A T-man went out on a regular patrol and
7 came across this work on this structure.

8 "It looks like it was done by a contractor last
9 year. We use proper connectors to avoid fire hazards."
10 And then he wrote "Shitty work."

11 Q. All right.

12 A. Which they generally don't do. I've never seen
13 it.

14 Q. So this box that is outlined in red in here,
15 what is this? Where does that work come from?

16 A. That's a corrective notification.

17 Q. Okay. So this is a notification. Is that part
18 of PG&E's computer system?

19 A. Yes.

20 Q. Is that in what is called the SAP system?

21 A. Yes.

22 Q. All right. And this is part of the business
23 records of PG&E?

24 A. Yes.

25 Q. And so Mr. (EMPLOYEE #16) has identified a
26 problem?

1 A. Yes, on his patrol. So he's doing -- or
2 inspection. He's probably doing a ground inspection.

3 Q. Okay. Is this the correct way for dealing with
4 such a problem?

5 A. Everything is perfect except for what's
6 highlighted in yellow, yes.

7 Q. Normally you wouldn't put --

8 A. No.

9 Q. But in terms of his reporting and everything?

10 A. Everything else is perfect on it.

11 Q. Okay. He created the notification?

12 A. Yes.

13 Q. And then it's put down as "Priority E."

14 A. Yes, which is a one-year tag.

15 Q. Okay. And that was created when?

16 A. It was created on September 12, 2017, with his
17 AMI mobile pick. That's the hand-held device like the
18 iPad.

19 Q. Okay. And then it has to be done by when?

20 A. 9/6/2018. One year.

21 Q. All right. And then you're reviewing this on
22 July 26, 2018?

23 A. Yes. So -- yes. I go through all the
24 corrective orders to make sure that all work has been
25 completed by the requirement end date.

26 Q. Had this work been completed?

1 A. No. Well, this tag right now in this picture
2 was not completed. I'm certain it was properly completed
3 before the end -- before 9/6 because we don't go over.

4 Q. What is the transmission line this is occurring
5 on?

6 A. It's the Hat Creek number 100 PIT number one.

7 Q. Do you know --

8 A. And it's structure 4/52.

9 Q. Do you know where that is located?

10 A. It's way up north. Like, I'm going to say
11 towards Burney, California. Like way up there. I know
12 PIT One is.

13 Q. Okay.

14 A. I don't know exactly where that line is located.

15 MR. NOEL: Okay. All right. Thank you. I have
16 nothing further.

17 Mr. Fogg.

18 MR. FOGG: A couple questions.

19 THE COURT REPORTER: Mr. Fogg, can you keep your
20 voice up best you can.

21 MR. FOGG: I'll try to speak as loudly as
22 Mr. Noel.

23 Could we go back to 629, Marc.

24 MR. NOEL: Sure.

25 **EXAMINATION**

26 BY MR. FOGG:

1 Q. So I want to go back to Exhibit 629, (WITNESS
2 #9). When there is a discussion of moving 100 K from
3 order to order, what does that mean?

4 A. So by looking at this without knowing it, I
5 think they probably had an expense order and maybe the
6 work became capital work.

7 Q. Is it common for orders to change like that?

8 A. Yes, it can be.

9 Q. Okay.

10 A. By the work that they went out to do, it might
11 have been worse and then they had to create a capital
12 order which is a three series number. So we want to take
13 it off of expense because now it's capital work.

14 Q. Could it have also been just a data entry error?
15 Somebody crunching the wrong numbers or something?

16 A. There could easily be a data error. And it
17 could have been from anybody at PG&E. It doesn't
18 necessarily mean just transmission line.

19 Q. And is \$100,000 an unusual amount for that kind
20 of error?

21 A. We don't do a lot of \$100,000, but it's not
22 abnormal.

23 Q. I want to jump back now to -- you had some
24 questions about a policy to notify the asset strategist
25 of some towers that were not there anymore.

26 Do you recall being questioned about that?

1 A. No.

2 Q. So we can go back a few exhibits. So going
3 back -- I think this is Exhibit 628. At the end of this
4 there is a discussion about a single wood pole to light
5 duty steel pole.

6 A. Okay.

7 Q. Is there a policy at PG&E that the team mentions
8 in the report that "Hey, these structures aren't there
9 anymore"?

10 A. Well, yes. The structures are still there based
11 on this e-mail. They're just not wood anymore. So
12 somebody has replaced them with steel.

13 Q. And so if a T-man sees a change that's not on
14 the object list, he needs to -- it's PG&E's policy to
15 report that?

16 A. Yes.

17 Q. Does that policy extend if there's a temporary
18 change in the line? So if there are temporary wood poles
19 put up and then they're later meant to be replaced by
20 metal poles?

21 A. I don't know. I haven't put up a lot of
22 temporary -- I haven't seen that so I can't really answer
23 for that. I don't know.

24 MR. FOGG: Thank you, (WITNESS #9). I don't
25 have any other questions.

26 THE WITNESS: You're welcome.

1 MR. NOEL: All right. Do the jurors have any
2 questions? It looks like we have at least three
3 questions. And we will review these real quick.

4 [Conferring off the record.]

5 **CONTINUED EXAMINATION**

6 BY MR. NOEL:

7 Q. All right. We have a couple of questions for
8 you from the jurors. And I will start with the easiest
9 one first.

10 A. Thank you.

11 Q. In the description that says "Transmission OH
12 Detailed Inspection," what is the OH in the description?

13 A. Overhead, overhead line. Or OH overhead.

14 Q. Now, as an asset maintenance planner did you or
15 anyone above you organizationally consider or propose
16 consideration of asset functional age as an inspection
17 trigger of any kind?

18 A. No. That's not -- our group doesn't do that.
19 So no.

20 Q. As an asset strategist are you aware of the age
21 of the assets that you're planning for?

22 A. I am not.

23 Q. Would it be fair to say that PG&E Business
24 Finance had the final determination as to how much time
25 will be budgeted for each inspection patrol conducted for
26 each structure during any given year?

1 A. Yes. That's a Business Finance job. When they
2 do the budget every year, they budget on what patrols and
3 inspections we have for the following year.

4 MR. NOEL: Okay. Thank you.

5 Anything further? Any follow-up?

6 All right. Madam Foreperson is going to read
7 you an admonition to you and then you'll be done.

8 GRAND JURY FOREPERSON: (WITNESS #9), you are
9 admonished not to discuss or disclose at any time outside
10 of this jury room the questions that have been asked of
11 you or your answers until authorized by this grand jury
12 or the Court. A violation of these instructions on your
13 part may be the basis for a charge against you of
14 contempt of court. This does not preclude you from
15 discussing your legal rights with your own attorney.

16 (WITNESS #9), what I have just said is a warning
17 not to discuss this case with anyone except the Court,
18 your lawyer, or the district attorney.

19 Do you have any questions?

20 THE WITNESS: I do not. Thank you.

21 GRAND JURY FOREPERSON: Okay. Thank you for
22 your time.

23 THE WITNESS: Okay. Thanks.

24 MR. NOEL: All right. Thank you, (WITNESS #9).

25 [Witness exits the courtroom.]

26 MR. NOEL: We've been going for an hour and a

1 half. So this is a good time for a break. And
2 hopefully, the last witness of the day is out there
3 waiting for us.

4 GRAND JURY FOREPERSON: Yes. Fifteen minutes.

5 [Recess taken from

6 2:44 until 3:04 p.m.]

7 GRAND JURY FOREPERSON: All members of the grand
8 jury are back. We are ready to proceed.

9 MR. NOEL: The next witness will be Dr. Keith
10 Casey.

11 [Witness enters the courtroom.]

12 MR. NOEL: Please stand up and she will swear
13 you in.

14 GRAND JURY FOREPERSON: Dr. Casey, do you
15 solemnly swear that the evidence you shall give in this
16 matter pending before the grand jury shall be the truth,
17 the whole truth, and nothing but the truth so help you
18 God?

19 THE WITNESS: I do.

20 GRAND JURY FOREPERSON: Thank you. Have a seat,
21 please.

22 **EXAMINATION**

23 BY MR. NOEL:

24 Q. For the record, can you please state your full
25 name spelling your last name.

26 A. Yeah. It's Keith Casey. Last name is

1 C-a-s-e-y.

2 Q. And you're a doctor or Ph.D.?

3 A. I am.

4 Q. And what is your Ph.D. in?

5 A. It's in environmental and resource economics
6 from U.S. Davis.

7 Q. Are you currently employed?

8 A. I am.

9 Q. By whom?

10 A. California Independent System Operator.

11 Q. Is there an acronym for that.

12 A. CAISO, C-A-I-S-O.

13 Q. What is the California Independent System
14 Operator?

15 A. The California Independent System Operator is a
16 private corporation that operates the high voltage power
17 grid for most of California. Not all of it but most of
18 it. It was created in 1997 as part of California's
19 efforts to restructure wholesale electric industry in
20 California.

21 And essentially what we did is we took over
22 operational control of the high voltage transmission
23 facilities from the three major utilities in California;
24 San Diego Gas & Electric, Southern California Edison, and
25 Pacific Gas & Electric.

26 Importantly, those utilities still operate and

1 maintain their transmission facilities, but we manage the
2 flow of power over the transmission lines. That's our
3 core function. In addition to that, we operate wholesale
4 electricity markets for energy and ancillary services.
5 And we also do long-term planning for the transmission
6 grid and we facilitate a process for generators that want
7 to interconnect to the transmission grid to actually be
8 able to physically connect to the grid.

9 And last but not least, as part of our duties
10 and as part of the legislation that created the ISO, it
11 called for developing transmission maintenance standards.
12 And we have a program established at the ISO where we've
13 developed those standards and we have a process for doing
14 review of transmission maintenance for the transmission
15 owners that are part of our operation.

16 But again, I'll stress the work. We are not a
17 state agency. We are not a regulator. We are a
18 nonprofit public benefit corporation. And I'll stop
19 there.

20 Q. How long have you been with CALISO?

21 A. Since its inception. So 22 years.

22 Q. All right. In front of you you have a binder
23 containing a document marked as People's -- or Exhibit
24 Number 609. See Exhibit 609?

25 A. I do.

26 Q. Do you recognize Exhibit 609?

1 A. Yes, I do.

2 Q. What is Exhibit 609?

3 A. Exhibit 609 is the amended and re-stated
4 transmission control agreement. And essentially, this is
5 the agreement where when California passed legislation
6 establishing the California ISO and directing the
7 utilities to turn over operational control of their
8 transmission facilities, this agreement was the vehicle
9 for enabling that turn over of transmission facilities.

10 So it basically at a high level summarizes what
11 the obligations are for the transmission owners as being
12 part of the California ISO as well as what the California
13 ISO's obligations are to them. It describes the process
14 for turning over transmission facilities. And
15 importantly, it also includes as a sub-element in this
16 agreement provisions around transmission maintenance
17 standards. That's a part of this agreement as well.

18 And I would just note this is a mutual
19 agreement. It's a contract between the ISO and the
20 transmission companies that joined the ISO.

21 Q. For some reason this is not showing up on the
22 board, and I'm trying to figure this out. I'm sorry.

23 All right. I am not sure why this is not
24 displaying on the screen.

25 GRAND JUROR NUMBER EIGHTEEN: You touched it.

26 MR. NOEL: I touched it, exactly.

1 BY MR. NOEL:

2 Q. So we're just going to have to go through it
3 without it being up on the screen.

4 So you kind of went through the basics of what
5 the Transmission Control Agreement is. And it's signed
6 by all of the various transmission -- or users of the
7 transmission system in the state of California?

8 A. All of the transmission owners that joined the
9 ISO and turned over operational control. So they have
10 all signed this document.

11 Q. Are there transmission owners in the state of
12 California that are not part of the ISO?

13 A. Yes, a couple of them. Examples would be SMUD,
14 Sacramento Municipal Utility District, and LADWP, Los
15 Angeles Department of Water and Power.

16 Q. All right. So I want to go through some
17 different things in it. And I wish we had it up on the
18 board for you.

19 But Subsection I "Under this agreement it is
20 made with reference to the following facts." And it
21 references Assembly Bill 1890.

22 Is that the legislation you talked about
23 earlier?

24 A. Yes.

25 Q. And what does that bill do?

26 A. The primary purpose of that bill was to

1 restructure the California electric industry in order to
2 increase competition in the provision of electricity.
3 And it called for, among other things, the formation of
4 the California Independent System Operator.

5 Q. All right. I will skip over to page 6, which is
6 Subsection X. And can you read us that section, please.

7 A. I can. I hope I have the right section.
8 Unfortunately, this does not have page numbers.

9 Q. Yeah, this is not easy not having the screen.

10 A. Yeah. But you can correct me if I've got the
11 wrong section. But it says "The parties' desire to enter
12 into this agreement in order to establish the terms and
13 conditions under which TOs --" that stands for
14 transmission operators "-- will become participating
15 transmission operators and how the ISO and each
16 participating transmission operator will discharge their
17 representative duties and responsibilities."

18 Q. Sorry. We're trying to figure this thing out.

19 A. Yep.

20 Q. Why didn't it do that when I did that before.
21 All right. So we finally got it back.

22 All right. So here we're talking about "The
23 parties' desire to enter into this agreement in order to
24 establish the terms and conditions."

25 When it talks about each of the CAISO and
26 participating TOs, and TOs is what?

1 A. Transmission operators. Transmission owners.
2 Excuse me.

3 Q. "-- and will discharge their representative
4 duties and responsibilities." Is that correct?

5 A. Yes.

6 Q. So both sides have duties and responsibilities
7 according to the agreement here?

8 A. Yes.

9 Q. Now we can skip ahead. I don't know why I'm
10 doing that. We will do it this way. Let's go to page 63
11 and Subsection 14: Maintenance standards.

12 A. I'm sorry. Are you in Appendix --

13 Q. No. We're not to Appendix C yet.

14 A. Okay.

15 Q. We can just use what's up on the board. We can
16 go through it.

17 So we're talking about maintenance standards.
18 And you started off a little bit earlier and said that
19 the legislation which created the ISO and set up the
20 program also created or expressed a desire for the ISO to
21 set up maintenance standards. Is that correct?

22 A. That's correct.

23 Q. Did I say that correctly?

24 Okay. So why are maintenance standards relevant
25 to the ISO?

26 A. The relevance of the maintenance standards to

1 the ISO deal primarily with ensuring the availability of
2 the transmission systems for operations. And if you read
3 the original legislation establishing the ISO AB 1890, it
4 talks about wanting to make sure that this electric
5 restructuring and turning over operational control to the
6 California ISO did not result in a degradation of the
7 ability of transmission facilities.

8 So I would say the primary motivation for
9 establishing the maintenance standards was to ensure that
10 the level of availability that had been available
11 historically was preserved going forward. And there were
12 also general provisions in there or general language
13 around ensuring a safe, reliable electric operation as
14 well.

15 Q. Right. So we have Section 14.1 up here. Can
16 you read us the section, please.

17 A. Yes. "Section 14.1: ISO Determination of
18 Standards. The ISO has adopted and shall maintain in
19 consultation with participating transmission owners
20 through the transmission maintenance coordination
21 committee in accordance with the requirements of this
22 agreement the standards for the maintenance, inspection,
23 repair, and replacement of transmission facilities under
24 its operational control in accordance with Appendix C.

25 These standards as set forth in Appendix C are
26 and shall be performance-based or prescriptive or both in

1 providing for high quality, safe, and reliable service
2 and shall take into account costs, local geography and
3 weather, applicable reliability criteria, national
4 electric industry practice, sound engineering judgment,
5 and experience."

6 Q. Great. So this sets forth the criteria that
7 you're going to be looking at to determine the
8 maintenance standards. Am I reading that correctly?

9 A. Yes. Section 14.2 gets at the primary measure
10 of maintenance standards which is the -- having metrics
11 around the availability of the transmission system for
12 each transmission owner and benchmarking that
13 availability against historical baseline.

14 Q. Okay. Now I want to skip to 66 and Section
15 17.2. Starting with 17.2.1 can you read us that section.

16 A. Yes. "17.2.1: Existing Maintenance Standards.
17 Each participating transmission owner shall provide to
18 the ISO as set forth in Appendix C hereto, one, the
19 participating transmission owner's standards for
20 inspection, maintenance, repair, and replacement of its
21 facilities under the ISO's operational control and, two,
22 information, notices, or reports regarding the
23 participating transmission owner's compliance with the
24 inspection, maintenance, repair, and replacement
25 standards set forth in Appendix C hereto."

26 Q. So they have to abide by the ISO's maintenance

1 standards and they also have to make available to you the
2 records showing that they're doing so. Is that --

3 A. Yes. What this section is getting at is item
4 one in this section is referring to what we call
5 maintenance practices. So each transmission owner is
6 obligated under this agreement to provide its maintenance
7 practices for transmission facilities. And then item two
8 is the -- what we refer to as the maintenance records,
9 which is the information we need to be able to assess how
10 well the transmission owners are following their
11 maintenance standards.

12 Q. Why is that information important to the ISO?

13 A. Well, it gets at really the objective of making
14 sure that the maintenance standards that they provide to
15 us are followed. So that is really the core purpose of
16 this provision or for getting this information.

17 Q. All right. So let's skip ahead here to the very
18 end. So the signature page. Signature page by PG&E. So
19 PG&E has signed this Transmission Control Agreement with
20 the ISO?

21 A. Yes.

22 Q. And by doing so they have bound themselves to
23 the terms and conditions of this agreement?

24 A. Yes.

25 Q. And then Transmission Control Agreement that
26 we're looking at itself, is that a business record kept

1 by the ISO?

2 A. Yes.

3 Q. Is that maintained -- required to be maintained
4 by the ISO?

5 A. I believe, yes.

6 Q. And is it kept in the regular course of business
7 at the ISO?

8 A. It is. And it's also published on our public
9 website.

10 Q. All right. So we have talked about some of the
11 issues in the agreement itself, but one of the things
12 that it talked about was Appendix C. So let's flip over
13 to Appendix C.

14 Oh, come on. Why did you do that? All right.
15 See Appendix C?

16 A. Yes.

17 Q. And Appendix C is titled "CAISO Transmission
18 Maintenance Standards." Correct?

19 A. Yes.

20 Q. So let's go through those maintenance standards.
21 The first section is definitions. Can you read me the
22 definition of maintenance.

23 A. Yes. "Maintenance: Maintenance as used herein
24 unless otherwise noted encompasses inspection,
25 assessment, maintenance, repair, and replacement
26 activities performed with respect to transmission

1 facilities."

2 Q. And maintenance practices. If you could read
3 that also.

4 A. "Maintenance Practices: A confidential
5 description of the methods used by a PTO and adopted by
6 the ISO for maintenance of that participating
7 transmission owners, transmission facilities."

8 Q. And these are the definitions -- the specific
9 definitions of terms that are used in the Transmission
10 Control Agreement; correct?

11 A. Yes.

12 Q. Next up is maintenance procedures. Could you
13 read us that.

14 A. "Maintenance Procedures: Documents developed by
15 the Transmission Maintenance Coordination Committee for
16 use by the ISO and the participating transmission owners
17 to facilitate compliance with the ISO Transmission
18 Maintenance Standards. These documents shall serve as
19 guidelines only."

20 Q. All right. Now, we want to move on to
21 Section 2, the introduction which is on the next page
22 at 165. Can you read us the introduction to --

23 A. Yes.

24 Q. -- Appendix C.

25 A. "This Appendix C delineates the ISO Transmission
26 Maintenance Standards and has been developed through a

1 lengthy consensus-building effort involving initially the
2 ISO Maintenance Standards Task Force and currently the
3 TMCC."

4 Q. And do you know or are familiar with what TMCC
5 is?

6 A. Yes. That is the Transmission Maintenance
7 Coordination Committee.

8 Q. And do you know who is on that committee?

9 A. That committee consists of representatives from
10 the transmission owners, from labor unions. There's a
11 representative from the California Public Utilities
12 Commission, California Energy Commission, and the
13 California ISO. There may be others, but those are some
14 of the main members.

15 Q. All right. Go ahead and go on with the
16 introduction. Might as well read the second paragraph.
17 Most of it's highlighted anyway.

18 A. "Flexibility in establishing these ISO
19 transmission maintenance standards is implicit in the
20 goal of optimizing maintenance across the system
21 characterized by diverse, environmental, and climatic
22 conditions, terrain, equipment, and design practices. To
23 provide for flexibility while ensuring the reasonableness
24 of each participating transmission owner's approach to
25 maintenance, each participating transmission owner will
26 prepare its own maintenance practices that shall be

1 consistent with the requirements of these ISO
2 Transmission Maintenance Standards.

3 The effectiveness of each participating
4 transmission owner's maintenance practices will be gauged
5 through the availability performance and monitoring
6 system. Each participate transmission owner's adherence
7 to its maintenance practices will be assessed through a
8 ISO review."

9 Q. So real briefly, effectiveness gauged through
10 availability performance, monitoring system. What does
11 that mean?

12 A. It means fundamentally that the approach that
13 was allowed under the legislation AB 1890 in their
14 approach that was adopted here was very much a
15 performance-based approach where the -- the entities that
16 established these maintenance provisions rather than
17 trying to have a prescriptive approach apply to each
18 transmission owner left it to each transmission owner to
19 develop their own maintenance practices and then with the
20 ultimate assessment of how well they're working being the
21 availability of performance monitoring.

22 So as long as the availability of their system
23 did not degrade under the ISO operation, the maintenance
24 practices would be viewed as being affective in
25 maintaining availability.

26 Of course, there are other aspects of the

1 maintenance review program such as the ISO's review of
2 each transmission owner's maintenance practices and the
3 annual review we do of their maintenance practices that
4 supplement this.

5 Q. Before we go on, I'll probably have you define
6 for us what you mean by availability or what the
7 Appendix C means by availability.

8 A. Yeah. It really gets to how frequent
9 transmission facilities are forced out of service. So --
10 and when they are forced out of service, meaning they're
11 not in operation, how long are they out as well as how
12 many facilities does a transmission owner have in a given
13 year that are never forced out of the service?

14 So it's really getting at the availability of
15 the transmission system to support reliability of the
16 power grid.

17 Q. And next it says "The PTO's adherence to its
18 maintenance practices will be assessed through a
19 California ISO review."

20 What does that mean?

21 A. We have an annual review process where the
22 maintenance practices that each transmission owner
23 provides to the ISO, we have a process for going out and
24 spot checking for a subset of the transmission
25 facilities, the records that the utility has for those
26 facilities to crosscheck, is the work that was actually

1 done on those facilities in that year consistent with
2 what their maintenance practices call for.

3 So we do that every year for a subset of
4 facilities. And in addition to doing the record review
5 for a subset, we also go out and do some field
6 inspections to look for indications that the maintenance
7 work that they indicated they did was actually performed.

8 Q. So in other words, you get the records saying
9 they painted a tower or painted this tower line and you
10 may go out and look at one or two towers to see if they
11 were freshly painted?

12 A. Yes.

13 Q. Or put your finger on it and find out the hard
14 way; right?

15 A. Right.

16 Q. All right. So let's move on to the objectives.
17 I think we've already covered the next paragraph there.

18 And it's section 2.1: The Objectives of
19 Appendix C. And if you can please read for us the
20 objectives, and we'll talk about them.

21 A. Sure. This Appendix C provides for a high
22 quality, safe, and reliable ISO controlled grid by
23 meeting the following objectives: Ensuring that the
24 availability of the performance levels inherent in the
25 transmission facilities are maintained, restoring
26 availability to the levels inherent to the transmission

1 facilities when degradation has occurred, economically
2 extending the useful life of the transmission facilities
3 while maintaining inherent levels of availability, and
4 achieving the aforementioned objectives at a minimum
5 reasonable total cost for maintenance with the intent of
6 minimizing customer impact.

7 Q. So working backwards what does it mean to keep
8 costs at a reasonable minimum intending to minimize
9 customer impact?

10 A. That last statement really gets at making sure
11 that maintenance is done in a cost-effective way to
12 manage the overall costs of the utility and, you know, in
13 an effort to, you know, really keep costs down and
14 keeping customer rates down. So there's a balance there
15 between, you know, being smart about how you undertake
16 maintenance practices to recognize that there needs to be
17 a balance with cost and how you approach maintenance
18 work.

19 Q. And above that "Economically extending the
20 useful life of the transmission facilities while
21 maintaining inherent levels of availability"?

22 A. That provision, I believe, gets at -- I think
23 this is in the spirit of cost savings where to the extent
24 proper maintenance can extend the useful economic life of
25 a transmission facility so it doesn't have to be
26 replaced, for instance, that there can be cost savings

1 with that provided that can be done in a way that
2 maintains the availability of the transmission system.

3 Q. So if you take care of it, it will continue to
4 work?

5 A. Basically, yes.

6 Q. All right. Now, let's go on to 2.2:
7 Availability. And in the middle of that middle paragraph
8 "Availability is a function of several variables
9 including transmission facility maintenance, initial
10 design, extreme exposure, capital improvements, and
11 improvements in restoration processes. It is important
12 to consider that maintenance is one of the many variables
13 that impact changes in availability."

14 Can you kind of explain that to us.

15 A. Yes. The other factors that would impact the
16 availability of a transmission facility could be its
17 initial design. If it was a poor design, it may suffer
18 from operation problems where it's forced out of service.
19 If it's in a location where it's subject to extreme
20 exposure like in a coastal area where there's a lot of
21 salt air and corrosion, that can exacerbate availability.

22 And the issue or the item on improvements and
23 restoration practices get out when you lose the facility
24 where it's no longer available, how quickly can you
25 restore it and get it back in service to minimize the
26 impact of it? So these are all other things that can

1 impact transmission availability in addition to
2 maintenance.

3 Q. All right. And dropping down to the next
4 paragraph "If maintenance is being performed by a PTO
5 consistent with good utility practice, increasing
6 maintenance activities by a significant order may not
7 result in a corresponding increase in availability. And
8 if maintenance is not performed consistent with the good
9 utility practice, availability may decline."

10 That was a mouthful. Can you explain to us what
11 it means.

12 A. The first provision around is if maintenance is
13 being performed with good utility practice, doing more of
14 it may not result in a corresponding increase in
15 availability. You really get that kind of concept of
16 diminishing a return where if you're already maintaining
17 your transmission facility very well, then you probably
18 already have a high level of availability and spending a
19 lot more on maintenance will not bring about a
20 commensurate amount of increase to availability.

21 So I guess an analogy would be if you maintain
22 your car really well, you change the oil every 3,000
23 miles, if you decide to change the oil every thousand
24 miles, you're probably not going to extend the life or
25 availability of your car. There's a certain point where
26 there's diminishing returns to additional maintenance

1 work.

2 And then the second item is that if a
3 transmission owner fails to perform maintenance on a
4 basis consistent with good utility practice -- oh, it
5 says "Unless the PTO fails to perform maintenance." It's
6 basically making the same point.

7 Q. Okay.

8 A. Yeah.

9 Q. We've gone over this. All right. On to the
10 next page. If you could read to us the paragraph of
11 variety of techniques.

12 A. Yes. "A variety of techniques can be used to
13 monitor maintenance effectiveness. However, techniques
14 that do not account for random variations in process have
15 severe limitation in that they may yield inconsistent
16 and/or erroneous assessments of maintenance
17 effectiveness. To account for random chance variations
18 while enabling the monitoring for shifts and trends,
19 control charts have been widely accepted and utilized.

20 Control charts are statistically data graphs
21 which illustrate both an expected range of performance
22 for particular process based on historical data and
23 discrete measure of recent performance.

24 The relative position of these discrete measures
25 of recent performance and their relationship to expected
26 range of performance are used to gauge maintenance

1 effectiveness."

2 Q. Am I reading this right that statistics will
3 show us how affective the maintenance is? Is that it?

4 A. I think a more accurate reading. And this is a
5 very confusing paragraph.

6 Q. That's why we have you here to explain it to us,
7 Doctor.

8 A. Okay. So at a very high level I mentioned that
9 the availability monitoring looks at the availability of
10 transmission facilities in a particular year relative to
11 a historical benchmark. And what this paragraph is
12 getting at is in establishing those historical
13 benchmarks, which is kind of a median level of
14 performance based on historical and then a bandwidth
15 around, you know, what is a reasonable range of deviation
16 from that?

17 There are statistical techniques employed to
18 establish both the -- what we call the center line, kind
19 of the expected performance level, and then the bandwidth
20 around that. So this paragraph is really getting at the
21 statistical techniques used to establish those
22 parameters.

23 Q. All right. Let's skip down to 2.3: Maintenance
24 Documentation Requirements. And if you could read that
25 to us, please.

26 A. "Two specific requirements regarding maintenance

1 documents are incorporated into these transmission
2 maintenance standards. First, these standards require
3 that each participating transmission owner develop and
4 submit a description of its maintenance practice to the
5 ISO. Second, these standards require that each
6 participating transmission owner retain maintenance
7 records as set forth in Section 6.1 of this Appendix C
8 and make those records available to the ISO as set forth
9 in the maintenance procedures in order to demonstrate
10 complies with each element of its maintenance practices."

11 Q. And next three at the bottom of that page.

12 A. "Facilities Covered by the ISO Transmission
13 Maintenance Standards: The ISO Transmission maintenance
14 standards set forth in this Appendix C shall apply to all
15 transmission facilities. Each participating transmission
16 owner shall maintenance its transmission facilities in
17 accordance with its maintenance practices as adopted by
18 the ISO in accordance with these ISO transmission
19 maintenance standards."

20 Q. So taking these last two together and the other
21 things that are in there, this contract covers all
22 maintenance assets basically. Maintenance facilities
23 with a participating transmission owner; correct?

24 A. I would characterize it as this covers the
25 transmission assets that were turned over to the ISO's
26 operational control. So there are facilities mostly at

1 the distribution level that are not part of the ISO's
2 control. So it does not pertain to those.

3 Q. And for all of those that are under the CAISO
4 control records must be kept and available?

5 A. Yes.

6 Q. How important is it to the ISO that those
7 maintenance records are complete and accurate?

8 A. It's very important. One of the functions we
9 perform is, as I mentioned, to go out and review their
10 maintenance practices for a subset of facilities. And
11 we're relying on accurate and complete records to
12 affectively assess whether the work that was actually
13 performed was consistent with what the filed maintenance
14 practices called for.

15 Q. Okay. Let's go to Section 5. And this is the
16 section entitled "Maintenance Practices." And if you
17 could read this introduction to the section, please.

18 A. "These ISO transmission maintenance standards as
19 they may be periodically revised in accordance with the
20 provisions of the Transmission Control Agreement and this
21 Appendix C and as they may be clarified by the
22 maintenance procedures shall be followed by each
23 participating transmission owner in preparing,
24 submitting, and amending its maintenance practices.

25 The maintenance practices will provide for
26 consideration of the criteria referenced in Section 14.1

1 of the TCA including facility importance."

2 Q. And what is Section 14.1 of the TCA?

3 A. That section we covered earlier.

4 Q. Okay. I guess a bad question. Maybe I should
5 put it this way. TCA is the abbreviation for
6 Transmission Control Agreement; right?

7 A. Correct.

8 Q. Okay. And that's what I meant. Section 14.1 is
9 the section that we talked about earlier in the
10 Transmission Control Agreement itself?

11 A. That's right.

12 Q. Okay. All right. Let's move on to 5.21.

13 A. "5.2.1: Transmission Line Circuit Maintenance.
14 As may be appropriate for the specific transmission line
15 circuits under the ISO's operation control, each
16 participating transmission owner's maintenance practices
17 shall describe the maintenance activities for the various
18 attributes listed below."

19 Q. And that's 5.2.1.1?

20 A. Which reads "Overhead transmission line patrols
21 and inspections scheduled and unscheduled."

22 Q. And it goes on and lists other things, but
23 that's the highlighted portion; correct?

24 A. Correct.

25 Q. All right. So your maintenance practices has
26 got to include this stuff? This is mandatory if you have

1 overhead transmission lines?

2 A. Yes, that's correct.

3 Q. Let's go to 5.2.3, Descriptions of Maintenance
4 Practices.

5 A. "Each participating transmission owner's
6 maintenance practices shall include a schedule for any
7 time-base maintenance activities and a description of
8 conditions that will initiate any performance-based
9 activities. The maintenance practices shall describe the
10 maintenance methods for each substantial type of
11 component and shall provide any checklists/report forms
12 which may be required for the activity.

13 Where appropriate the maintenance practices
14 shall provide criteria to be used to assess the condition
15 of a transmission facility. Where appropriate the
16 maintenance practices shall specify condition,
17 assessment, criteria, and the requisite response to each
18 condition as may be appropriate for each specific type of
19 component or feature of the transmission facility."

20 Q. All right. Below that 5.3.1.

21 A. "5.3.1, Initial Adoption of Maintenance
22 Practices. In conjunction with its application to become
23 a participating transmission owner, each prospective
24 participating transmission owner shall provide the ISO
25 with proposed maintenance practices which comply with the
26 requirements set forth in this Appendix C and

1 Section 14.1 of the Transmission Control Agreement.

2 This information shall provide sufficient detail
3 for the ISO to assess the proposed maintenance practices.
4 The ISO shall review the proposed maintenance practices
5 and may provide recommendations for an amendment."

6 Q. So the transmission owners must submit the
7 proposed maintenance practices to the ISO?

8 A. Yes.

9 Q. And when did the ISO begin again?

10 A. The ISO began operations in spring of 1998.

11 Q. Okay. So since 1998 since signing into the
12 Transmission Control Agreement, a transmission owner like
13 PG&E would have to submit their maintenance plans to the
14 ISO for both approval, review, and also to follow up; is
15 that correct?

16 A. Not entirely. First off, it's not their
17 maintenance plan. It's their maintenance practices.
18 They are required to submit their maintenance practices
19 to the ISO. The ISO does review the proposed practices
20 and provides recommendations, but we don't approve them.

21 Q. Okay. All right. Bad use of language.

22 The maintenance practices that are provided, is
23 there a name for that document?

24 A. Yes. They're referred to as the Transmission
25 Owner Maintenance Practice Overhead Electric Transmission
26 Lines.

1 Q. TOMP for short; correct?

2 A. Yes.

3 Q. Now, just a couple more and we'll get out of
4 this. Let's go to 5.3.2.1.

5 A. "Each PTO shall have in place maintenance
6 practices that have been adopted by the ISO set forth in
7 this Appendix C. The ISO shall periodically review each
8 PTO's maintenance practices having regard to the ISO
9 transmission maintenance standards and maintenance
10 procedures."

11 Q. And 5.3.2.2.

12 A. "5.3.2.2.: Amendments Proposed by a PTO. Each
13 PTO may provide to the ISO its own recommendation for an
14 amendment to its own maintenance practices by means of a
15 notice delivered in accordance with the Section 26.1 of
16 the Transmission Control Agreement."

17 Q. All right. So you can change your maintenance
18 practices just as long as you do it through us; correct?
19 Or inform us?

20 A. That is correct.

21 Q. Got it. Let's go on to six. And now we're up
22 to page 196 "Maintenance Record Keeping and Reporting."

23 A. "The minimum record retention period for the
24 transmission facilities subject to time-base scheduled
25 intervals shall be the designated maintenance cycle plus
26 two years. The minimum record retention period for all

1 transmission -- excuse me -- for all other transmission
2 facilities, maintenance activities identified through
3 inspection, assessment, diagnostic, or another process
4 shall be a minimum of two years after the completion
5 date."

6 Q. So stopping right there, in reality in terms of
7 numbers of years what is this requiring in terms of
8 record keeping?

9 A. Well, for facilities subject to maintenance that
10 is time-base such as they will inspect a transmission
11 facility every three years. The requirement for record
12 retention is -- the maintenance cycle is three years plus
13 we want every two years. So that would be five years.

14 For other types of maintenance activities that
15 are not time-base the record should be kept for a minimum
16 of two years after the date of completion.

17 Q. Okay. So if you're on a five-year inspection
18 schedule, then that would mean that all the records have
19 to be kept for at least seven years?

20 A. Yes.

21 Q. And we skipped over this, but the preamble to
22 this says "A PTO shall maintain and provide to the CAISO
23 records of its maintenance activities in accordance with
24 Section C." Correct?

25 A. Yes.

26 Q. So by signing into this agreement PG&E is

1 telling the ISO "We're going to keep these records and
2 make them available to you?"

3 A. Correct.

4 Q. So now dropping down to the next paragraph, a
5 PTO's maintenance records.

6 A. "A PTO's maintenance records shall at a minimum
7 include, one, the responsible person; two, maintenance
8 date; three, transmission facility; four, findings if
9 any; five, priority rating if any; and six, description
10 of the maintenance activity performed."

11 Q. All right. So in signing into this PG&E is
12 promising that their records are going to include the
13 reasonable -- or the responsible person; right?

14 A. Yes.

15 Q. What's the date of the maintenance. This has
16 got to be accurate; correct?

17 A. Yes.

18 Q. And then the responsible person accurate. It
19 doesn't make any difference if it's not accurate; right?

20 A. That's correct.

21 Q. And the facility what findings, priority
22 ratings, and a description of. All of that -- is any of
23 that information any good if it's not accurate?

24 A. It's not as good if it's not accurate. You may
25 be able to glean some things from it, but ideally you
26 would want all of this information to do a proper job of

1 assessing their maintenance practices.

2 Q. And how about if it's not complete?

3 A. Again, it really depends on the degree to which
4 it's not complete. You know, in terms of the level of
5 detail, in terms of the findings, if there's enough
6 information there that we can sort of intuit what was
7 done, that may be adequate. But if there's nothing on
8 findings, that's a real problem.

9 Q. And so when the ISO review teams are going out
10 to -- for instance, PG&E doing their site reviews, they
11 would be looking at the description of maintenance
12 activity performed and then going out to make sure that
13 that's what was actually done; correct?

14 A. Yes, for a subset of facilities that we
15 reviewed.

16 Q. So if the report for an inspection said "This
17 tower is great," they wouldn't necessarily be going out
18 to inspect that tower to make sure it's great; right?

19 A. Not necessarily. But if in the course of
20 inspecting that transmission circuit they saw an obvious
21 problem with the tower, they would record it in their
22 maintenance review. And PG&E would need to address it,
23 but it would have to be something very obvious.

24 Q. So let's go to 6.2, the maintenance reporting.

25 A. "6.2.: PTO Maintenance Reporting. Each PTO
26 will submit a standardized maintenance report as outlined

1 in the maintenance procedures. The ISO will accept at
2 the PTO's option a standardized maintenance report in
3 either electronic or paper form. If the PTO retains
4 records in a manner that includes additional information,
5 such records may be submitted in that manner. Each PTO
6 shall provide to the ISO maintenance records as described
7 in Section 6.1 and as set forth in maintenance
8 procedures."

9 Q. And then final 6.3.

10 A. "6.3.: ISO Visits to PTO Transmission
11 Facilities. The ISO may visit transmission facilities in
12 accordance with this Section 18.3 of the Transmission
13 Control Agreement to determine if the maintenance
14 practices are being followed by the PTO."

15 Q. And finally, let's move on to Appendix D which
16 is the definitions; correct?

17 A. Yes.

18 Q. And so any of the terms that are used in that --
19 in the Transmission Control Agreement or any of the
20 appendices will be defined.

21 So if we have questions as to the definitions,
22 this is where we'd go; correct?

23 A. That is correct with one notable exception that
24 I only discovered yesterday. And that relates to
25 Section 6.2 where the term "Standardized Maintenance
26 Report" is capitalized indicating it should be a defined

1 term in this document. But, in fact, when you go to
2 Appendix D, there is no definition for it. So that
3 appears to be an oversight in the documentation that I
4 just recently discovered.

5 Q. And that's a very good point I forgot to raise.
6 When we're talking about these different terms like you
7 pointed out "Standardized Maintenance Report" being
8 capitalized in the text of the section, you're saying
9 that that capitalization usually indicates that it's
10 going to be a defined term in Appendix D?

11 A. Yes.

12 Q. Great. All right. So that was fun. Two
13 hundred thirty pages. We didn't go through all of them,
14 but it may have seemed like it.

15 All right. Now, we're going to move on to our
16 other exhibit that's up there. You have a red or white
17 binder up there with you.

18 Now, we talked about the TOMP; the Transmission
19 Owner Maintenance Practices. So you should have in front
20 of you what's marked at the very front of that binder the
21 number one section of the binder Exhibit 609.

22 Do you see that?

23 A. I'm sorry. I see 610. So 609 I think was the
24 Transmission Control Agreement.

25 Q. Oh, you're right. I'm misreading this.
26 Exhibit 610. Thank you for catching that.

1 What is Exhibit 610?

2 A. Exhibit 610 is the Transmission Owner
3 Maintenance Practices overhead electric transmission
4 lines dated December 30, 1997.

5 Q. Is this the TOMP that is required by the
6 Transmission Control Agreement?

7 A. Yes.

8 Q. And what is the date of this TOMP?

9 A. December 30, 1997.

10 Q. And the submitting transmission owner?

11 A. Pacific Gas & Electric Company.

12 Q. Now, just to clarify here, this says submitted
13 December 30th, 1997. You said that the ISO actually came
14 into being in April of 1998 or in the spring of 1998.

15 A. Yes. We -- we effectively took over operation
16 and control on April 1, 1998, but there was a lot of work
17 being done in advance to prepare for that go-live date.
18 So preparation of these documents was really with
19 anticipation of the ISO going live. Actually, we were
20 supposed to go live with our operation in the fall of '97
21 and it got delayed to April '98.

22 Q. All right. So the ISO was actually in
23 existence. It had been created. It was just once you
24 were ready to take over and run the line or the system.

25 A. That's correct. We were standing up the
26 organization, hiring people, and building the

1 infrastructure and the systems that take over control.

2 Q. All right. And this TOMP from December 30,
3 1997, this is something that PG&E was required by the
4 Transmission Control Agreement to file with the ISO?

5 A. Yes.

6 Q. And is this maintained by the ISO in the regular
7 course of business?

8 A. Yes. I believe we keep all of the older
9 agreements on file.

10 Q. That's going to be the next question is does the
11 ISO routinely keep the records of the -- the historical
12 records of the TOMP?

13 A. I believe so, yes.

14 Q. Do you know if there's a duty to keep those
15 or --

16 A. I'm not sure.

17 Q. All right. So let's walk through the TOMP here,
18 please. We have the introduction section up.

19 A. Okay.

20 Q. Section one, if you could read that to us.

21 A. "This maintenance practice outlines the uniform
22 process to prioritize, inspect, and maintain Pacific Gas
23 & Electric Company overhead electrical transmission lines
24 placed under the control of the California Independent
25 System Operator. This document is prepared in accordance
26 with ISO maintenance standards identified as Appendix C

1 of the Transmission Control Agreement between the PG&E
2 and the ISO on the date such agreement is completed and
3 will be adopted by the ISO as an integral part of the ISO
4 maintenance standards.

5 Q. So the TCA is what we just got finished reading;
6 right?

7 A. Yes.

8 Q. Exhibit -- I've all of a sudden forgotten. 608?

9 A. It's 609.

10 Q. Exhibit 609. And Appendix C is the last part of
11 that where you could find their maintenance standards and
12 record keeping; correct?

13 A. Yes.

14 Q. All right. So go ahead and read the purpose of
15 the maintenance practice section two

16 A. "The purpose of the maintenance practice is to
17 provide for high quality, safe, and reliable service in
18 accordance with the requirements of California Assembly
19 Bill 1890. The PG&E overhead line inspection process is
20 designed to allow system inspection, frequency,
21 prioritization, identify component and element
22 criticality, determine the best position for visual
23 inspection of the various components, and provide a
24 consistent methodology for the types of inspection being
25 performed.

26 This practice incorporates reliability-centered

1 maintenance philosophies and continues to be consistent
2 with California General Order 95, (G.O. 95), Rule 31.2."

3 Q. Are you familiar with the term
4 "reliability-centered maintenance"?

5 A. No, I'm not.

6 Q. Okay. And then we have the next section of the
7 TOMP is a definition of terms section three. And there's
8 one term I'd like to focus on, and that is the term
9 "Inspector." If you could find that and read it for us.

10 A. Yes. "Inspector: PG&E employed inspector
11 commonly referred to as a troubleman."

12 Q. Pretty succinct and to the point definition.

13 All right. Now, we're getting into inspections.
14 Now, this is what PG&E filed with the ISO in 1997
15 representing this was their inspection and maintenance
16 practices at that time; correct?

17 A. Yes.

18 Q. So Section 5: Inspection. If you could read us
19 the start of subsection A.

20 A. "Subsection A: Establishment of Inspection
21 Frequency. System priority ranking will establish the
22 minimum system inspection frequency. PG&E transmission
23 line supervisors will develop a prioritized ranking of
24 the systems they're accountable for inspecting and
25 maintaining. The ranking considers age of the system,
26 number and type of customers on the system, surrounding

1 geography and environment, accessibility, impact of
2 system failure on the transmission grid and historical
3 performance.

4 A priority ranking of one (highest) is assigned
5 to the most critical systems of the transmission grid, a
6 priority ranking of two is assigned to less critical
7 systems, and a priority ranking of three (lowest) is
8 assigned to the least critical systems on the
9 transmission grid."

10 Q. And then below that there's a -- we're going to
11 skip over the next couple of paragraphs. But there's a
12 handwritten note. It looks like an arrow and it says
13 "Should be D." Do you know where that came from?

14 A. I'm not sure who made the note, but I believe
15 there was an error in the referenced appendix where the
16 table was being referred to in that paragraph should be
17 Appendix D as opposed to Appendix A.

18 Q. So this is an old-fashioned grammar check;
19 right?

20 A. Yes, I believe so.

21 Q. All right. Now, I want to go to Table One,
22 Inspection Frequency and Priority. You see that?

23 A. Yes.

24 Q. And we talked about the priority up above. And
25 we have priority rankings one, two, and three.

26 Can you read for us out of there what the

1 inspection frequency would be for a priority ranking one
2 system.

3 A. For a priority ranking one facility the aerial
4 inspection frequency would be every 12 months, ground
5 inspection frequency would be every 12 months, and a
6 climbing inspection would be as triggered.

7 Q. And priority ranking two.

8 A. For a priority ranking two facility the aerial
9 inspection would be every 24 months, ground inspection
10 would be every 24 months, and climbing inspection would
11 be as triggered.

12 Q. And priority number three.

13 A. For priority ranking three transmission facility
14 aerial inspection would be every 36 months, ground
15 inspection every 36 months, and climbing inspection as
16 triggered.

17 Q. And going on "Transmission line supervisors are
18 to consider staggering aerial and ground inspections at
19 intervals of one-half the recommended frequency."

20 Do you see that paragraph?

21 A. I do.

22 Q. Do you understand what that means?

23 A. Not entirely. I think what it's getting at is
24 that rather than doing aerial and ground inspections at
25 the same time, you would stagger them. So every
26 12 months you're doing an aerial inspection. Say, June

1 to June but every January to January you'd be doing a
2 ground inspection. So essentially you're having eyes on
3 the facility every six months as opposed to every
4 12 months.

5 Q. Right.

6 A. That's my belief in what this means.

7 Q. So according to this, back in 1997 or at least
8 December of 1997 if it was a priority one system, it was
9 being inspected both by land and by air every year?

10 A. Correct.

11 Q. If it's a priority two system, it's basically
12 rotating according to this next paragraph underneath.
13 But aerial inspection one year, ground inspection the
14 next, then back to aerial and then back to ground. So
15 it's basically rotating every year for priority two?

16 A. I think it was the -- the recommendation below
17 that table, but it simply says "are to consider." So
18 it's not required under the procedures.

19 Q. And then if you were priority three, it's every
20 three years or at least some type of inspection
21 potentially every 18 months?

22 A. Correct.

23 Q. Okay. And one other thing. In this -- this
24 doesn't differentiate between aerial patrol or aerial --
25 or ground inspection or climbing inspection. It uses the
26 term "inspection" for everything.

1 A. That is correct.

2 Q. Now, we have a definition in here of triggers.
3 And according to what PG&E is telling you are triggers,
4 that would bring about -- potentially bring about
5 climbing inspections. And what does PG&E list?

6 A. "Triggers included --" excuse me. "Triggers
7 included but are not limited to the following: Component
8 failure (like components) or proven defective by
9 testing."

10 Q. Let me stop you there. What -- how do you
11 interpret this first section "Component failure or like
12 components"?

13 A. Well, component failure would be, you know,
14 something broke, and it was obvious from an inspection
15 either from aerial or ground. "Like components." I'm
16 not entirely sure what they're referring to in the
17 parameter there.

18 Q. So if you had a whole bunch of towers that were
19 all built identically and the same components on each and
20 if a component on one tower broke, would you expect under
21 this agreement or under this practice that PG&E would
22 inspect the other towers -- the like components on the
23 other towers to make sure the same problem didn't happen?

24 A. Yep. I think that is likely. And now that
25 you've said that, I think like components would mean if a
26 component failed on a particular tower, if you knew the

1 other towers had similar components, that could trigger a
2 climbing inspection of those towers as well.

3 Q. Okay. And this is specifically -- this is the
4 PG&E's maintenance practices that they're representing to
5 the ISO they're using; correct?

6 A. Correct.

7 Q. All right. Let's jump down now to B, the
8 inspection methods. And that defines what inspection
9 methods PG&E was representing they were doing; correct?

10 A. Yes.

11 Q. And could you please read those for us.

12 A. "Inspection Methodologies. Number one, ground
13 inspections. Ground inspections are performed in such a
14 manner and at the optimal location as to inspect the
15 components listed under table two, inspection sequence
16 for components, ground inspection (below ten-foot level),
17 period.

18 Number two, claiming inspections. Climbing
19 inspections on the supporting structure are performed in
20 such a manner as to inspect the components listed under
21 table two, inspection sequence for components, climbing
22 inspection, (above ten-foot level), period.

23 Number three, aerial inspections. Aerial
24 inspections are performed from aircraft in such a manner
25 as to inspect the components listed under table two,
26 inspect sequence for components, aerial inspection,

1 period."

2 Q. All right. The next section is C, components
3 inspected. And that's where we find Table Two that is
4 referred to in all three of those definitions; right?

5 A. Yes.

6 Q. And we pulled up Table Two. And what is Table
7 Two?

8 A. Table Two lists the inspection sequence for
9 components by type of inspection starting with aerial
10 inspection. The components included insulators and
11 hardware, conductor fittings, conductor, right-of-way
12 encroachments.

13 For climbing inspection above ten foot level the
14 components include structures and guys, insulators and
15 hardware, conductor and fittings, overhead ground wire,
16 switches, and associated elements.

17 For ground inspection below the ten-foot level
18 components include right-of-way access, foundations,
19 anchors and guys, structures, arm braces, insulators and
20 hardware, conductor and fittings, electrical clearances,
21 and switches and associated elements.

22 Q. All right. Now going down to E, internal data
23 collection and reporting. At this point, PG&E is telling
24 the ISO that we have a system for accurately saving and
25 collecting all of this data; correct?

26 A. Yes.

1 Q. And please read to us what it says.

2 A. "Inspection reports are developed and recorded
3 using a PG&E owned and designed computer software program
4 titled "Overhead Line Inspection; OLI." Initially stored
5 on personal computers, inspection reports are later
6 downloaded in an electronic database accessible to the
7 authorized users. The inspection report is comprised of
8 four folders labeled "Line, segments, structures, and
9 inspections." A sample of the inspection report is
10 contained in Appendix B.

11 Q. And then it goes on. There's six summarizing
12 reports in use in OLI. And briefly, if you could just
13 name us the six reports to identify for the ISO.

14 A. Yes. The six summarizing reports used in OLI
15 are, one, inspection status of line; two, work required;
16 three, inspection due; four, work overdue; five, line
17 criticality by segment; and six, vegetation reports.

18 Q. All right. So let's skip ahead here to Table
19 Three. Let's go ahead and go by this. And I want to go
20 down to Appendix D. This is the appendix that we were
21 talking about earlier.

22 And in the appendix is the overhead transmission
23 lines and the inspection frequency checklists.

24 Do you see that?

25 A. Yes. I am recalling the confusion as I believe
26 we had two Appendices D in this document.

1 Q. Yes. Sorry about that.

2 A. That's all right. So, yes, I see the Appendix D
3 you are referring to.

4 Q. Okay. And going back to where we were up above
5 when we were talking about determining the priority of
6 the control cycles or inspection cycles, we talked about
7 frequency checklists. Is that the frequency checklist?

8 A. Yes.

9 Q. And some of the things that PG&E indicated to
10 the ISO at least in 1997 that they were looking at to
11 make decisions as to how frequently they should inspect
12 their lines included age of system; correct?

13 A. Yes.

14 Q. And they break that down by greater than
15 30 years, greater than 50 years, or greater than
16 70 years; correct?

17 A. Correct.

18 Q. Adverse terrain?

19 A. Correct.

20 Q. Extreme weather conditions?

21 A. Correct.

22 Q. And accessibility --

23 A. Correct.

24 Q. -- is another factor?

25 These are all factors that PG&E represented that
26 they are using to determine how frequently they should

1 inspect these things?

2 A. That's correct.

3 Q. Structures down would be another one?

4 A. Yes.

5 Q. Critical component problems reported is another?

6 A. Yes.

7 Q. All right. So now I want to move on. Let's go
8 to Appendix C in here. Do you see Appendix C?

9 A. Yes.

10 Q. Do you understand what Appendix C is?

11 A. If you bear with me one moment, I think we again
12 suffer from the --

13 Q. Exactly.

14 A. -- multiple appendices.

15 Q. It should be on page 19.

16 A. Yes, I see it now.

17 Q. I was trying to figure out what this refers to
18 because it lists things like salt, fog, and warthogs.

19 A. I'm afraid I don't know what those are referring
20 to.

21 Q. All right. And finally going on to Appendix D.

22 A. The second Appendix D?

23 Q. The second Appendix D. And one of the things
24 that caught my eye on this that is highlighted up on the
25 big board is it refers to cold-end use for insulators and
26 hardware; correct?

1 A. Yes.

2 Q. All right. So this is what PG&E was telling the
3 ISO in December of 1997. "These are our maintenance
4 practices and reporting requirements." Correct?

5 A. Yes.

6 Q. All right. So let's go on to the next in line,
7 which should be number 611. Now, just to make sure we
8 understand, is there any requirement that the
9 transmission owners file a new TOMP every year?

10 A. No.

11 Q. How often are transmission owners supposed to
12 file a new TOMP?

13 A. There is no fixed time requirement. It's
14 really -- it's just any time they need to make changes to
15 it, they would file those amendments for our review.

16 Q. So in 1999 PG&E wanted to make changes to their
17 TOMP; is that correct?

18 A. Yes.

19 Q. And the changes were all related to the
20 vegetation management which really wasn't addressed in
21 the original TOMP; correct?

22 A. That is correct other than very limited
23 reference to vegetation right-of-way maintenance, but
24 there wasn't a lot of detail. So I think the intent of
25 this amendment was to provide more details.

26 Q. And that is -- Exhibit 611 is PG&E's supplement

1 to the TOMP dealing with vegetation management?

2 A. Yes.

3 Q. And this again is kept as a business record at
4 CAISO?

5 A. Yes.

6 Q. And it's kept in the normal course of business?

7 A. That is my understanding, yes.

8 Q. All right. And this was filed on August 6th of
9 1999?

10 A. Yes.

11 Q. Now, we're going to kind of skip through here.
12 We have highlighted a bunch of stuff in here but kind of
13 a discussion in here we want to get to is the differences
14 and the interplay between the Public Resources Code
15 Section 4292 and Public Resources Code Section 4296.

16 You see that in I believe --

17 A. Page 6.

18 Q. Yeah, starting on page 6.

19 A. Yes, I do.

20 Q. And it cites 4292?

21 A. Yes.

22 Q. Now, I'm going to go back over here, and I'm
23 going to pull this up. And here we have 4292.

24 Are you familiar with code section 4292?

25 A. I have read it, yes.

26 Q. All right. And 4292 says "Except as otherwise

1 provided in 4296." And then down below there we have
2 4296.

3 A. Yes.

4 Q. Now, the one thing I wanted to bring up is do
5 you know individually by lines if 4292 is applicable?

6 A. I'm sorry. Which one?

7 Q. 4292. Is that -- well, let's start off with is
8 4292 applicable to all transmission lines?

9 A. My understanding -- and I'm not an expert on the
10 particulars here, but it is applicable to some of the
11 transmission lines. But I don't believe it covers all of
12 them. It kind of clarifies the types of structures that
13 this would pertain to.

14 Q. Right. It would be any pole or tower which
15 supports a switch, fuse, transformer, lightening
16 arrester, line junction, dead end, corner pole, fire
17 break, and on and on and on?

18 A. Yes.

19 Q. So if the line or the tower itself includes
20 those things, 4292 applies. If not, it doesn't?

21 A. Correct.

22 Q. And even if 4292 applies but it's less than
23 750 -- or 750 volts or less, 4296 would exempt it?

24 A. Correct.

25 Q. All right. Okay. So we just want to make sure
26 that's clear with 611. Let's move on to 612.

1 A. Okay.

2 Q. You have 612 in front of you?

3 A. Yes, I do.

4 Q. Do you recognize 612?

5 A. Yes, I do.

6 Q. What is 612?

7 A. Exhibit 612 is the Transmission Owner
8 Maintenance Practices for overhead electric transmission
9 lines for Pacific Gas & Electric which were adopted in
10 January of 2002.

11 Q. Okay. So now we're in 2002 and PG&E is changing
12 their maintenance practices or at least changing
13 something in their maintenance practices?

14 A. Correct.

15 Q. So they file with the ISO a new updated
16 Transmission Owner Maintenance Practices?

17 A. Yes.

18 Q. And one of the interesting things that starts --
19 and it's neither here nor there but really starts popping
20 up on this is this proprietary and confidential note on
21 the top.

22 Are you familiar with that?

23 A. Yes, I am.

24 Q. Any idea why the maintenance practices would be
25 proprietary and confidential?

26 A. Not specifically other than the definition of

1 the transmission maintenance practices in the
2 Transmission Control Agreement refers to them as
3 confidential documents.

4 As you noted in the prior maintenance practices,
5 there was no notations on the practices that they were
6 confidential, but they started it in 2002. So I don't
7 know what motivated them to make the change other than
8 maybe this was a housekeeping correction that they
9 applied going forward.

10 Q. All right. Now, let's go down. And we're going
11 to start off just like we did before. We have a lot more
12 table of contents here and we have a lot longer
13 introductions than we had before.

14 A. Yes, I have it.

15 Q. So there's stuff here that we haven't had
16 before. Can you start with the PG&E electrical overhead.

17 A. "The PG&E Electrical Overhead Transmission Line
18 Inspection and Maintenance Program incorporates both the
19 preventative maintenance as well as corrective
20 maintenance. Preventative maintenance is a scheduled
21 inspection or maintenance of transmission line components
22 and their elements at specific points in time to retain
23 functionality.

24 Corrective maintenance is the immediate response
25 to failed components and their elements to restore
26 functional capabilities."

1 Q. Go on.

2 A. "This maintenance practice provides flexibility
3 for adjustment to local conditions based on local
4 triggers, experience, and sound judgement. Trigger
5 examples may include substantially different local
6 environment conditions or local activities near lines
7 such as construction projects."

8 Q. And go on to purpose. And let's see what we got
9 here. All right. Another change.

10 Now, we have a definition of inspection.
11 Remember in the first one we had a definition of an
12 inspector. Now we have a definition of inspector --
13 inspection but no definition of inspector here.

14 How does PG&E define an inspection?

15 A. An inspection is a detailed visual observation
16 of the facility installed looking for abnormal conditions
17 that will negatively impact safety, reliability, or asset
18 life. In an inspection individual pieces of equipment
19 and structures are carefully examined through visual
20 and/or the use of routine diagnostic tests and the
21 condition of each is graded and/or recorded. This
22 inspection can be performed by air, foot, or climbing as
23 conditions dictate."

24 Q. So we also have an added definition of trigger.
25 Can you read that for us.

26 A. "Trigger: A condition that requires inspection

1 and/or maintenance of a component at a frequency
2 different than the intervals determined by the line
3 prioritization or condition assessment."

4 Q. And next the definition of "qualified company
5 representative."

6 A. "A person who by reason of training and work
7 experience is able to complete an accurate assessment of
8 the electric transmission facilities that he/she is asked
9 to inspect."

10 Q. All right. So now let's skip ahead. Let's go
11 to Table 5.1. We've got some changes, it looks like, to
12 the minimum circuit priority ranking table that we had
13 before.

14 A. Okay. I see it.

15 Q. All right. And what now in 2002 is PG&E using
16 for ranking?

17 A. PG&E is using for a high impact priority one
18 ranking. The number of boxes checked on certain
19 inspection is greater than 14. For a medium impact
20 priority two ranking. The number of boxes checked on the
21 circuit inspection frequency checklist is 6 to 14. And
22 for a priority three low impact ranking. The number of
23 boxes checked on circuit inspection frequency checklist
24 is less than six.

25 Q. All right. So now we're going to talk about the
26 frequency. And we remember what the frequencies were

1 before. What, according to Table 5.2, are the
2 frequencies now in 2002?

3 A. "For a circuit priority ranking one high impact,
4 the ground inspection frequency is once every year,
5 aerial inspection frequency is once every year, climbing
6 inspection as triggered by condition.

7 For circuit priority ranking two medium impact,
8 ground inspection frequency is once every two years,
9 aerial inspection frequency is once every two years, and
10 climbing inspection is as triggered by condition.

11 For circuit priority ranking three low impact,
12 ground inspection frequency is once every three years,
13 aerial inspection frequency is once every three years,
14 and climbing inspection as triggered by condition."

15 Q. Okay. So some changes now in the inspection
16 frequency but not really anything major. Is that about
17 correct?

18 A. That is my perspective, yes.

19 Q. Before we had 36 months or 24 months or
20 12 months. Now we have years. We used to have priority
21 one, two, and three. Now we have high, medium, and low
22 impact but nothing else.

23 One of the other things in comparison from the
24 two that looks to me is we have this term "as triggered."
25 In the 1998/1997 TOMP wasn't there a lengthy definition
26 underneath 5.1 of "triggered"? What constituted as

1 triggered?

2 A. I would have to look at that to confirm that.

3 Q. I think it's back this way still. Yeah, there's
4 Table One.

5 A. Yeah. So it's in the 19 -- 1997 Transmission
6 Order Maintenance Practices for PG&E on the section on
7 page 4 that talks about triggers. They list a number of
8 possible triggers indicating it's not limited to them,
9 but there is a list of specific types of triggers.

10 Q. And in the '97 table which shows the frequency
11 intervals for inspections as Table One. Now in 2002 it's
12 Table 5.2. Is that about right?

13 A. Yes, that is correct.

14 Q. All right. Now we have 5.1.1.3 Ground
15 Inspections. And if you could read us the first half of
16 this, please.

17 A. "Ground Inspections: Ground inspections are
18 performed in such a manner in an optimal location as to
19 inspect the components listed in Table 5.3. And Table
20 5.3 for ground inspection components include right-of-way
21 access, structures, conductors and fittings, foundations,
22 arm braces, electrical clearances, anchors and guys,
23 insulators and hardware, and switches and associated
24 elements."

25 It goes on to say "A ground inspection of
26 overhead electric transmission facilities is a detailed

1 visual ground-based observation of the facilities
2 installed looking for abnormal conditions that may
3 negatively impact safety, liability, or asset life."

4 Q. So in 2002 PG&E is telling the ISO that when you
5 do a ground inspection, we're going out and we're looking
6 at right-of-way, structures, the conductor, and all of
7 its fittings; correct?

8 A. Yes.

9 Q. The foundations, the arms and braces, and the
10 electrical clearances?

11 A. Yes.

12 Q. And the anchors and guys, insulators and
13 hardware, and switches and associated elements?

14 A. Yes.

15 Q. So what's being represented to the ISO under the
16 TCA is this is the level that we're doing when we do a
17 ground inspection?

18 A. Correct.

19 Q. Now we go on and we have Table 5.4. It talks
20 about element codes and descriptions. You see that?
21 This is part of your TOMP?

22 A. Yes, I do.

23 Q. One of those is AG05 which, according to its
24 description, is attachment hardware. And we have more,
25 lots more.

26 All right. Now, we get to 5.1.1.4 which is now

1 the definition of aerial inspection. And if you could
2 read us the definition of aerial inspection.

3 A. "Aerial inspections are performed from aircraft
4 in such as manner and at optimal locations as to inspect
5 the components listed in Table 56. Table 56 lists the
6 following components for aerial inspections: Insulators
7 and hardware, right-of-way encroachments, conductor
8 fittings, conductor."

9 And it goes on to say "An aerial inspection of
10 overhead transmission facilities is a detailed visual
11 aerial-based observation of the facilities installed
12 looking for abnormal conditions that may negatively
13 impact safety, reliability, or asset life."

14 Q. So in this TOMP PG&E is asserting to the ISO
15 that their aerial inspections are being done so that they
16 can look at all of these individual components and find
17 problems. Is that correct?

18 A. Correct.

19 Q. And then we have 5.1.1.5 Climbing Inspections.
20 If you can read that for us.

21 A. "Climbing inspections are performed from the
22 supporting structure in such a manner as to inspect the
23 components listed in Table 57. Table 57 lists the
24 following components for climbing inspections:
25 Structures and guys, overhead ground wire, insulators and
26 hardware, switches and associated elements, conductors

1 and fittings."

2 This section goes on to say "A climbing
3 inspection of overhead transmission facilities is a
4 detailed visual supporting structure-based observation of
5 the facilities installed looking for abnormal conditions
6 that may negatively impact safety, reliability, or asset
7 life. Routine climbing inspections is triggered by
8 condition."

9 Q. Thank you.

10 Okay. A couple more things to go over in this.
11 We have non-routine inspections 5.2., 5.2.1.

12 A. So Section 5.2.1 is titled "Circuit."
13 Non-routine circuit inspection is triggered by condition.
14 During routine ground or aerial inspections, specific
15 conditions or inspection findings may trigger a
16 non-routine inspection or a climbing inspection.
17 Triggers include but are not limited to component failure
18 or components proven defective by testing, wire structure
19 strength, fire burned area or area of high fire hazard,
20 component failures caused by natural disasters or storms,
21 third-party observations and/or complaints, marginal
22 capability components of a re-rated circuit segment, and
23 known recurring conditions that jeopardize the circuit
24 integrity."

25 Q. Does this description sound familiar? Does this
26 passage sound familiar to you?

1 A. It sounds very familiar to the triggers they
2 listed in their 1997 Transmission Maintenance Practices.

3 Q. Right. In 1997 it was listed at the very
4 beginning under the -- the -- basically the schedule that
5 Table One, which that is off the -- what's the term I'm
6 looking for? -- cycle of inspections; correct?

7 A. Yes.

8 Q. And now we have it and it's now moved back in
9 and it's now part of the non-routine inspections;
10 correct?

11 A. That's correct.

12 Q. All right. Let's go on. We don't need to -- we
13 can go ahead and skip over some of the vegetation
14 management stuff.

15 We have repair and response codes in here;
16 correct? In Table 6.1?

17 A. Yes.

18 Q. And this indicates how long they have to do a
19 repair or respond to a condition?

20 A. That's correct.

21 Q. And then could you read 6.3.

22 A. 6.3 is titled "Repair, response, reassessment.
23 PG&E will make every effort to correct identified
24 abnormal conditions by the established due date. It will
25 not be general or routine practice to re-asses items for
26 the sole purpose of deferring necessary work. Any

1 reassessments will have sound business or technical
2 supporting reasons and documentation. Factors which may
3 drive the reassessment of scheduled work include but are
4 not limited to the inability to obtain clearances,
5 material, access, storms and weather, or subsequent
6 testing or re-evaluation of the actual condition.

7 A revised completion date will be established
8 appropriate to the current field conditions. The revised
9 completion date as with the original assigned completion
10 date will take into account minimizing the potential for
11 hazards to third parties, PG&E employees, or property or
12 risk to the reliability of the electric system.

13 Updated information on the condition of the
14 facility will be used in any reassessment of the required
15 completion date. Documentation shall consist of but not
16 limited to clearance requests, clearance denials, event
17 reports, storm reports, updated information on
18 conditions, access refusal letter from property owner or
19 regulatory agency, et cetera. This documentation will
20 support the reason for the work schedule reassignment."

21 Q. Can you explain this paragraph to us, your
22 understanding of this paragraph.

23 A. My understanding of this paragraph is that it's
24 basically stating that as a general matter there have to
25 be special conditions for deferring identifying necessary
26 work. And the paragraph provides samples of those. But

1 if I had to characterize them generally, it's things that
2 are somewhat outside the control of PG&E.

3 For example, the inability to obtain clearances.
4 What that's referring to is if they need to take a
5 transmission line out of service to do maintenance work,
6 they need to get approval from the ISO that it's okay for
7 them to take it out.

8 If they don't have access to the material
9 because of things outside of their control or weather is
10 prohibiting them from accessing the site to do the repair
11 work, these are the kinds of extraneous things that would
12 be permissible for deferring necessary work. But it's
13 not simply because of resource constraints or they're
14 just too busy.

15 Q. Right. Or just because they don't feel like
16 doing it.

17 A. Correct.

18 Q. So, for instance, if they -- if PG&E were to
19 identify a defective component on transmission lines and
20 that gets put down to be replaced and replaced within
21 24 months, under this section PG&E is telling the ISO
22 that "If we defer that, if we push that back another two
23 years and another two years, we'll have good documented
24 reason to do so." Correct?

25 A. That is what this paragraph is indicating.

26 Q. Okay. All right. I don't think we need to

1 worry about any of this (indicating).

2 Okay. Finally, let's go down to section eight,
3 record keeping. Do you see that section?

4 A. Yes, I do.

5 Q. And does this section match up to record keeping
6 requirements of the Transmission Control Agreement?

7 A. I believe what's being described here is
8 consistent with what's required under the Transmission
9 Control Agreement.

10 Q. Now, one of the other things that was
11 interesting about the change as we're talking in the 1997
12 TOMP, they were talking about a computer system and then
13 all the -- the -- what was it? The overhead line
14 inspection database or something.

15 A. Yes. Something like that, yes.

16 Q. That kind of gets dropped here in 2002; right?

17 A. Yes. It seems they're referring to a different
18 name. They call it the SAP Work Management Overhead
19 Transmission Line Inspection. Or I guess they call it
20 the SAP Work Management Database.

21 Q. Okay. So they changed computer systems again or
22 they changed computer systems also?

23 A. It would appear to be the case.

24 Q. All right. So now we go back to the priority
25 chart where we're determining the frequency with which
26 they have to inspect and the type of inspection.

1 Now, we're at attachment one, the circuit
2 inspection frequency checklist. Do you see that?

3 A. Yes.

4 Q. And according to what we read, this is what they
5 go through to determine what priority the transmission
6 line is for inspection?

7 A. Yes.

8 Q. And some of the things that they look at on
9 here, again we've got the age of the system?

10 A. Yes.

11 Q. We've got the geographic conditions including
12 adverse terrain or extreme weather?

13 A. Yes.

14 Q. We've got accessibility?

15 A. Yes.

16 Q. And as the -- I forgot to ask you on the earlier
17 one. Up above where it says "transmission customers,"
18 what does it mean to be metered transmission service or
19 radial feed?

20 A. I am speculating a bit, but I think a metered
21 transmission service my might be a customer who's
22 receiving service directly from the transmission facility
23 itself as opposed to at a distribution level, which would
24 be a lower voltage.

25 Radial feed means simply that the transmission
26 is, you know, a single circuit to its customer. There

1 isn't a second circuit. There is only one circuit to
2 that customer. And distribution substation with major
3 customer load just indicates that, you know, that's a big
4 facility. And if that failed, there would be a lot of
5 customers impacted by it.

6 Q. All right. Now we're already past 4:30 so we've
7 got to speed it up. So let's go on finally to 613. Do
8 you see 613 there?

9 A. Yes, I do.

10 Q. And what is 613?

11 A. Exhibit 613 is the ISO Transmission Owner
12 Maintenance Practices for electric overhead transmission
13 lines for Pacific Gas & Electric dated December of 2004.

14 Q. All right. And again, this is a business record
15 kept by the ISO?

16 A. Yes.

17 Q. This is kept in the regular course of business
18 at the ISO?

19 A. Yes.

20 Q. This is part of the Transmission Control
21 Agreement; correct?

22 A. These maintenance practices are required as part
23 of the Transmission Control Agreement, yes.

24 Q. Right.

25 MR. NOEL: I think everybody is getting tired so
26 maybe we won't go through this one and we'll just put it

1 in evidence.

2 Any questions, Mr. Fogg?

3 MR. FOGG: (Shakes head.)

4 MR. NOEL: Any questions, Ladies and Gentlemen
5 of the Jury?

6 [Conferring off the record.]

7 MR. NOEL: All right. They all look good.

8 BY MR. NOEL:

9 Q. All right. Mr. Casey -- Dr. Casey, I'm sorry.
10 It's getting late.

11 A. That's all right.

12 Q. There are some questions from the jurors that I
13 am going to read to you. We have reviewed them and
14 determined that they are admissible or potentially are
15 admissible.

16 "Has CAISO inspected PG&E maintenance records
17 and found that PG&E has falsified inspections and/or
18 repairs?"

19 A. No. We do find records that are at times
20 inaccurate, but falsifying suggests an intent to
21 potentially falsify the -- the records that we found
22 inaccurate appear to be data entry errors that were not
23 intentional.

24 Q. So let's say, for instance, they submitted
25 records that -- or reports of inspections that didn't
26 give accurate dates. Would that be a big thing?

1 A. Well, as I said earlier in my testimony, any
2 time there are inaccurate dates in the records, it makes
3 verifying their compliance with the practices more
4 challenging. So, you know, we obviously don't want to
5 see that.

6 But there was a period, what I've heard from my
7 staff, where there were field entities that weren't being
8 done. And those field entries were being brought back to
9 the main office, and they were translated into a
10 database. And there were times where what got translated
11 into the database was not consistent with the field
12 entry.

13 Those appear to be clerical errors that were
14 caught. So I don't think there was, based on what I have
15 heard, any indication that this was intentional.

16 Q. Okay. And we're actually talking more about the
17 actual handwritten reports that would be submitted by the
18 troubleshooters or the qualified company representative who
19 was doing the inspections.

20 For instance, if one person put down in an
21 inspection that they inspected all of these towers when,
22 in fact, there were multiple people who were out doing
23 inspections, would that potentially be a big thing?

24 A. It could potentially be a big thing if they were
25 reporting conditions of facilities that were facilities
26 that they didn't actually inspect.

1 Q. Another example would be if they were inspecting
2 transmission towers and passing those towers when those
3 towers don't even exist anymore. So basically inspecting
4 nonexistent towers.

5 A. That would be a problem, yes.

6 Q. Or they are not updating their records to show
7 the towers have been moved so when you're reviewing --
8 when the ISO is reviewing the inspection records, outside
9 of those records how would you know that those towers had
10 been moved?

11 A. Well, that's where some of the field inspections
12 that we do could help with that. If we did an actual
13 field inspection and it was obvious that the towers were
14 moved but the records didn't reflect that, we could catch
15 that.

16 Q. But that would be on the chance that you just
17 happened to be doing field inspections on that very line
18 and chose those couple of towers out of several hundred
19 towers?

20 A. That's correct.

21 Q. Now, has ISO found PG&E maintenance practices to
22 be in violation of the agreement?

23 A. No. As a general matter, no. We do find
24 through the annual reviews that there are what we call
25 findings or observations where for particular facilities
26 what we found was in our view not consistent with the

1 maintenance practices. But overall, I would say that in
2 general their transmission work is very consistent with
3 the maintenance practices.

4 Q. How does ISO address falsified records
5 violations of the agreement related to maintenance?

6 A. Well, as I said, we have not found records that
7 were intentionally falsified. If we had, we do have a
8 provision in the maintenance provisions where we could
9 report a transmission owner to FERC. The Federal Energy
10 Regulatory Commission is the federal government entity
11 that oversees the California ISO and could recommend
12 penalties for something like that. But that is not
13 something we've had to do because we have not been in
14 that situation.

15 Q. Would you consider the functional age of either
16 metallic or non-metallic structures as a reasonable
17 subject for sound engineering judgment to apply to
18 maintenance standards?

19 A. Could you repeat the question.

20 Q. Would you consider the functional age of either
21 metallic or non-metallic structures as a reasonable
22 subject for sound engineering judgment to apply to
23 maintenance standards?

24 A. I would consider that, but I will caveat my
25 response with I'm not a field expert in transmission
26 structures or inspections. I'm an executive who oversees

1 a group of experts. So based on my limited knowledge of
2 having interacted with the experts in this area, that
3 sounds like a reasonable thing to consider.

4 Q. Does CAISO or has CAISO examined metallurgical
5 age and stress conditions in setting or meeting CAISO
6 maintenance standards?

7 A. I'm really not qualified to answer that. It
8 gets into a level of detail I'm just not familiar with.

9 Q. Okay. Does CAISO actually physically review the
10 PTO's actual field implementation of the PTO's
11 maintenance standards as opposed to review of the
12 self-policing documentation?

13 A. As I said, in addition to examining the
14 maintenance records for a subset of transmission
15 facilities, we will then take a subset of that subset and
16 actually go out and do a field inspection to look for
17 evidence that the work reported in the maintenance record
18 was actually done.

19 Q. Would you say that CAISO's maintenance standards
20 were reasonably affective as they applied in November of
21 '18 prior to the Caribou-Palermo Camp Fire which started
22 on the PG&E transmission line between Caribou and
23 Palermo?

24 A. I would say they were reasonably applied for
25 their intended purpose, which again was to ensure the
26 availability of the transmission facilities to the power

1 grid. So from that standpoint, yes.

2 Q. Does CAISO have any section whose sole
3 responsibility is the examination and detail of specific
4 PTO's maintenance reporting?

5 A. Well, that role is really part of the
6 maintenance review that the ISO performs. So it is
7 looking at the maintenance records for a subset of
8 facilities it selects for review each year. But it does
9 not -- the ISO does not do a comprehensive review of all
10 the records that PG&E keeps.

11 Q. To what degree, if any, is the CAISO subject to
12 CPUC control or oversight?

13 A. The ISO is not regulated by the Public Utility
14 Commission. As I stated, we are a private corporation.
15 We are regulated by the Federal Energy Regulatory
16 Commission. So I guess that answers the question.

17 Q. Does CAISO have any means of determining that a
18 PTO is actually considering age of critical structure
19 components in its inspection and maintenance practices?

20 A. Well, that certainly wasn't explicit
21 consideration in maintenance standards. Excuse me. The
22 maintenance practices we reviewed today. I would note
23 the -- beginning in 2006 the age of the facility was not
24 explicit. They moved away from the priority ranking and
25 based inspection frequency on voltage levels.

26 So under that new maintenance practice approach

1 I don't know specifically how they consider ages of
2 facilities and how they approach inspecting them.

3 Q. All right. And there are further TOMPs after
4 2004 where we stopped there today; correct?

5 A. Yes.

6 Q. And are you familiar with the PG&E ETPM, the
7 Electric Transmission Preventative Maintenance Manual?

8 A. No.

9 MR. NOEL: Okay. All right. Anything further?
10 Any follow up?

11 GRAND JUROR NUMBER FOURTEEN: That creates a
12 question. You guys are nonprofit. How are you guys
13 funded?

14 THE WITNESS: We are funded by a charge for
15 the -- what we call the low-serving entities that
16 ultimately provide the wholesale power to end users like
17 yourself. So there's a per kilowatt hour charge. It's
18 kind of an administrative charge that is collected and
19 provided to the ISO. And those fund our annual operation
20 costs.

21 GRAND JUROR NUMBER FOURTEEN: So you have a
22 surcharge on our PG&E bill?

23 THE WITNESS: Yeah. It is imbedded in the PG&E
24 bill as a charge.

25 MR. NOEL: All right. Dr. Casey, thank you for
26 coming today.

1 THE WITNESS: Thank you.

2 GRAND JURY FOREPERSON: Madam Foreperson will
3 have an admonition for you and then you're free to leave.

4 GRAND JURY FOREPERSON: Dr. Casey, you are
5 admonished not to discuss or disclose at any time outside
6 of this jury room the questions that have been asked of
7 you or your answers until authorized by the grand jury or
8 the Court. A violation of these instructions on your
9 part may be the basis for a charge against you of
10 contempt of court. This does not preclude you from
11 discussing your legal rights with your own attorney.

12 Dr. Casey, what I have just said is a warning
13 not to discuss this case with anyone except the Court,
14 your lawyer, or the district attorney.

15 Do you have any questions?

16 THE WITNESS: No, I do not.

17 GRAND JURY FOREPERSON: Okay. Thank you for
18 your time today.

19 THE WITNESS: Thank you.

20

21 [DISCUSSION OMITTED.]

COURT REPORTER'S CERTIFICATE

This is to certify that I, Lisa McDermid Welch, a Certified Shorthand Reporter of the State of California was present at the time and place the foregoing grand jury proceedings were had and taken in the within matter; and that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings; and afterwards caused my said shorthand writing to be transcribed into typewriting; and the foregoing pages, beginning at the top of Page 1 to and including Page 220 hereof, constitute a full, true, accurate, and complete record of the proceedings.

DATED: This 6th day of June, 2022.

3 (Confidential Special Grand Jury Hearing Proceedings)

4
5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 [Witness enters the courtroom.]

10 GRAND JURY FOREPERSON: Good morning.

11 Mr. Daye, before you have a seat, would you
12 please raise your right hand to be sworn.

13 Mr. Daye, do you solemnly swear the evidence you
14 shall give in the matter pending before the grand jury
15 shall be the truth, the whole truth, and nothing but the
16 truth so help you God?

17 THE WITNESS: I do.

18 GRAND JURY FOREPERSON: Thank you. Have a seat,
19 please.

20 **EXAMINATION**

21 BY MR. NOEL:

22 Q. Mr. Daye, can you please state your full name
23 and spell your last name for the record.

24 A. My name is Fadi Daye, the last name spelled D,
25 as in David, a-y-e.

26 Q. By whom are you employed? By whom are you

1 employed?

2 A. I'm employed by the California Public Utilities
3 Commission.

4 Q. What do you do for the Public Utilities
5 Commission?

6 A. So currently my position is as a program and
7 project supervisor. The commission is divided into many
8 divisions. Every division has a specific function within
9 the commission.

10 Our division is called the Safety Enforcement
11 Division. It's in charge of the safety of many utilities
12 in California.

13 Every division has branches. My branch is the
14 Electric Safety and Reliability Branch.

15 So what we do is we audit and inspect electric
16 utilities to make sure they are in compliance with the
17 rules that are set by the commission.

18 Would you like me to you give the structure of
19 how --

20 Q. Let's back up a little bit and we'll walk
21 through that in just a second.

22 How long have you been employed by the CPUC?

23 A. Either since 1990 or 1991.

24 Q. What is your educational background that
25 qualifies you for your position?

26 A. I have a Bachelor's degree in electrical

1 engineering. I have a dual Masters's degree, one in
2 Business Management and one in International Relations.
3 And currently I hold the PE license. It's called
4 professional engineering license in the state of
5 California in electrical engineering.

6 Q. Walk us through your career with the CPUC, what
7 jobs you've done, what titles you've held.

8 A. So when I joined the commission, I joined as a
9 junior utility engineer, as a junior utility engineer to
10 basic audit an investigation of utilities system. At
11 that time my branch oversaw electric and gas utilities in
12 California. So we used to audit and inspect gas and
13 electric utilities.

14 After two years you get promoted to an assistant
15 utility engineer where you start doing more challenging
16 work. And then from an assistant you get promoted to an
17 associate utility engineer once you obtain your PE
18 license. I obtained my PE license in '95, '96. Maybe
19 something like that.

20 And then after I obtained my PE license, I had a
21 chance to apply for senior utility engineer supervisor.
22 So as a senior utility engineer supervisor your job is to
23 supervise a crew of engineers or to audit inspections.
24 You review their work. You assign them work. You review
25 their reports. You train them.

26 After I became a -- I became a senior utility

1 engineer supervisor in 2000. From 2000 until 2014 I held
2 the position of the senior utility engineer supervisor in
3 the Los Angeles office. All of my staff are located in
4 the Los Angeles office. I supervise anywhere between
5 five to a maximum of eight engineers at a time.

6 In 2014 I became a program and project
7 supervisor in the Los Angeles office which mean I was
8 responsible to all of the staff that was in the Los
9 Angeles office. These staffs are junior engineers,
10 senior utility engineer supervisors, and other senior
11 specialist engineers.

12 Q. Can you explain to us just briefly in very
13 general terms what is the CPUC.

14 A. The CPUC is a regulatory agency that is in
15 charge of regulating investor-owned utilities. They
16 regulate the rates and their safety.

17 Q. From where does the CPUC get its power to
18 regulate?

19 A. I believe it's from the Public Utilities Code.

20 Q. Now, you were talking earlier about you are in
21 the SED, the Safety Enforcement Division of the CPUC; is
22 that correct?

23 A. That's correct.

24 Q. Explain to us what the SED is and what you do.

25 A. So at SED -- since I've been with the
26 commission, our division has went through many revisions.

1 At one time we used to call Safety Division and then we
2 changed to Safety -- Consumer Protection and Safety
3 Division and then we went back to Safety Enforcement
4 Division.

5 So basically again, as I said, the commission is
6 divided into many divisions. Each division has a task or
7 a function. The task of our division as it stands today
8 is to oversee the safety of the electric and gas
9 facilities within the state of California.

10 So this division has many branches. It has a
11 branch that is in charge of the electric facilities. It
12 has a branch that is in charge of gas utilities and it
13 has some other branches called Risk and Assessment
14 Branch, the risk and assessment work and some security.

15 Q. And now what exactly does your unit within the
16 Safety and Enforcement Division do?

17 A. Okay. So our branch is the called the Electric
18 Safety and Reliability branch. What we do is we audit
19 utilities electric and investor-owned utilities. We also
20 audit municipality and we audit co-ops to ensure that
21 their facilities comply with the rules that are set by
22 the commission.

23 We also investigate accidents that meet certain
24 reporting requirements. We also advocate for more safety
25 rules when we think some changes are required.

26 Q. Now, we talked earlier about the power of the

1 CPUC being derived from the California Public Utilities
2 Code.

3 You should have in front of you a document
4 marked as Exhibit Number 631. It's right there on the
5 top of the stack. Do you see that?

6 A. Yes, I do.

7 Q. And it starts off with Public Utilities Code
8 Section."

9 A. Yes, I do.

10 Q. And first of all, we have Public Utilities Code
11 Section 701 that's in there that talks about the
12 commission being the California Public Utilities
13 Commission. They supervise and regulate every public
14 utility in the state, and they do all things whether it's
15 specifically designated in this part or in addition
16 thereto which are necessary and convenient in the
17 exercise of such power and jurisdiction."

18 That's essentially -- it grants the power to the
19 CPUC; correct?

20 A. I mean, you could correct. But again, these are
21 legal questions. And we have a legal department that
22 addresses these issues. But, yes, I don't have any
23 reason to doubt this.

24 Q. Right. Now we have 702; Compliance. 8037; the
25 Commissioner's Power To Grant.

26 All right. So let's get to the heart of this.

1 As a regulatory agency does the commission have or does
2 the commission to your knowledge promulgate rules for the
3 utilities?

4 A. Yes.

5 Q. And are you familiar with the rules promulgated
6 by the commission pertaining to the investor-owned
7 electric utilities?

8 A. Yes. The rules that are -- that address the
9 construction and design of the owner-held facilities,
10 yes.

11 Q. Describe for us briefly those rules.

12 A. Okay. So those rules date back to 1911. Back
13 then there is legislation enacted, a new law called -- I
14 believe it's Chapter 499 to address the construction, the
15 erection of poles, and overhead wires.

16 At that time the commission used to be called
17 the Railroad Commission. It used to have a different
18 name. And later on the legislation give the Railroad
19 Commission the authority over utilities in California and
20 the authority to modify the rules as the commission deems
21 appropriate for technologies and for advancement.

22 Since that time those rules have been going
23 through revisions. And I believe the Railroad Commission
24 issued a general order sometime in 1922. It's called
25 General Order 64 which addresses the rule of overhead
26 construction facilities and that it modified it to

1 General Order 64-A.

2 And then after long reviews with industry expert
3 from the utilities, from the public, from consultants, in
4 1941 the Railroad Commission adopted General Order 95
5 which is this general order that addresses the
6 construction of overhead and communication lines.

7 And since that time there are many rules in
8 GO 95 that have changed or been modified or deleted since
9 it was adopted.

10 Q. So you have in front of you the binder, the big
11 white binder. If you want to flip over that binder, the
12 first page should be marked as Exhibit Number 632. See
13 that?

14 A. Yes, I do.

15 Q. Do you recognize Exhibit 632?

16 A. Yes, I do.

17 Q. What is Exhibit 632?

18 A. It's a copy of General Order 95 with a December
19 2017 version.

20 Q. So is this the version that would have been in
21 effect in November of 2018?

22 A. Yes, Sir.

23 Q. So exactly what is GO 95?

24 A. So GO 95 covers the requirement for every
25 utility or any jurisdictional entity within the state of
26 California. These are rules that they have to follow

1 when they design, construct, maintain, operate their
2 overhead facilities whether it's communication or whether
3 it's electric facilities.

4 Q. All right. Switch up here. All right. We are
5 going to bring up on the big board the copy of GO 95 that
6 you're looking at. And let's walk through it. Let's
7 start at the beginning with the preface. And you can
8 just use the big board if you want instead of flipping
9 through there.

10 So this is what -- the preface which you were
11 talking about. CPUC came into existence in 1911 as the
12 Railroad Commission. In 1922 General Order 64 is
13 adopted. And it goes through the history and eventually
14 64-A changed to or was adopted as 95; is that correct?

15 A. That is correct.

16 Q. Okay. So let's go to the rules themselves. All
17 right. Section One. Can you read for us the basics Rule
18 11 and 12.

19 A. "Rule 11: Purpose of the rules. The purpose of
20 these rules is to formulate for the State of California
21 requirements for overhead line design, construction, and
22 maintenance the application of which will ensure adequate
23 service and secure safety to persons engaged in the
24 construction, maintenance, operation, or use of overhead
25 lines and to the public in general."

26 "Rule Number 12: Applicability of Rules. These

1 rules apply to all overhead electric supply and
2 communication facilities that come within the
3 jurisdiction of this commission located outside of
4 buildings including facilities that belong to nonelectric
5 utilities as follows."

6 Q. Okay. And then it goes through a bunch of stuff
7 in 12.1.

8 You spent a great deal of the last 30 years
9 working with and supervising the auditing of the
10 investor-owned utilities; correct?

11 A. That's correct.

12 Q. Are the rules contained in GO 95 applicable to
13 PG&E?

14 A. Yes, they are.

15 Q. And is PG&E bound to follow the rules of GO 95?

16 A. Yes, they are.

17 Q. And what steps are taken by the CPUC to ensure
18 that PG&E is complying with the rules of GO 95?

19 A. So what we do is we have an audit inspection
20 program where we audit utilities including PG&E. We have
21 other procedures that identify the steps required for us
22 to follow when we schedule audits. Every utility divides
23 their facilities into districts or regions. Every year
24 we select either a district or region to audit to make
25 sure that the utility is complying with these.

26 So do you want me to go over step by step?

1 Q. Nope. We'll come back to that. I just wanted
2 to go through that as an introduction.

3 So let's drop down to 12.1(d). If you could
4 read that for us.

5 A. "The replacement of poles, towers, or other
6 structures is considered to be reconstruction and
7 requires adherence to all strength and clearance
8 requirements of these rules. The clearances of the spans
9 adjacent to the new support need not be changed but the
10 new support shall be such that when the adjacent support
11 is replaced the span between will meet all the provisions
12 of this Order."

13 Q. Can you explain that to us very briefly.

14 A. I wish I can.

15 Q. Using use your engineering background.

16 A. Okay. You're going to notice that there are
17 many rules in GO 95 that are open to interpretation. And
18 sometimes it's very hard for just one person to make up
19 an opinion about them. This is why it takes a team to
20 actually analyze them.

21 These rules are not written by people with -- by
22 technical people. Some of these rules are written by
23 either attorneys or they're written by whoever the
24 utilities at that time decided to present them or the
25 consultant or the public.

26 So in GO 95 when the system is built, when the

1 facility is built, it's required to comply with the rules
2 that existed at that time. Later on in the future if the
3 rule changed, the facilities are not required to comply
4 with the new rules. They're still required to comply
5 with the rules at the time they were designed or they
6 were installed.

7 However, there are exceptions to these rules.
8 The exception has to do with the strength. So basically
9 what it says is if the facility was built in 1920 and the
10 strength requirement changed in 1950, for example, so we
11 expect the strength requirement of this facility to meet
12 the new rules in 1950 even if it was built in 1920.

13 But how about if the rule changed that did not
14 involve strength? If the facility was built in 1920 and
15 it required certain towers and then the towers changed in
16 1950, this rule -- the new rule in 1950 will not be
17 retroactive which means the facility will not have to
18 meet the new one but unless there was reconstruction or
19 replacement.

20 So in this case if you have two towers, for
21 example based on this rule, that were built a long time
22 ago and you decided to replace one of these towers,
23 eventually the conductors that go from this tower to this
24 tower -- I'm pointing from my left hand to my right hand.
25 So the conductors on these facilities, depending on the
26 length of the towers, depending on where you're attaching

1 your facilities on the tower, the clearances may change.

2 So what this is saying is these clearances
3 should still follow the older rule even though you put
4 new towers in its place. However, if the adjacent tower
5 later changed, then the clearances will have to meet the
6 new rules.

7 Q. And by clearances you mean the distance from the
8 energized line to some other point at its lowest point?

9 A. So the clearance is between the conductor and
10 ground, the clearance between the conductor themselves or
11 any other structure that exists on the tower that they
12 use.

13 Q. All right. Let's move on to 12.2: Maintenance
14 of Lines. I'll have you read that for us.

15 A. "All lines and portions of lines shall be
16 maintained in such condition as to provide safety factors
17 not less than those specified in Rule 44.3. Lines and
18 portions of lines constructed or reconstructed on or
19 after the effective date of this Order shall be kept in
20 conformity with the requirements of this Order.

21 The restoration of clearance originally
22 established prior to the effective date of this Order,
23 where the original clearance has been reduced by
24 additional sagging or other causes, is not considered to
25 be reconstruction and the reestablished clearance shall
26 conform to the requirements of the rules in effect at the

1 time the original clearance was established. The
2 changing of clearance for any other purpose is
3 reconstruction and clearances so changed shall comply
4 with the rule of this Order applicable to
5 reconstruction."

6 Q. And then 12.3 if you can read that.

7 A. "Lines Constructed Prior to this Order. The
8 requirements of this Order, other than the safety factor
9 requirements specified in Rule 12.2, do not apply to
10 lines or portions of lines constructed or reconstructed
11 prior to the effective date of this Order. In all other
12 particulars, such lines or portions of lines shall
13 conform to the requirements of the rules in effect at the
14 time of their construction or reconstruction.

15 Lines or portions of lines constructed or
16 reconstructed before July 1, 1942, may conform to and be
17 maintained in accordance with the requirements of this
18 Order, instead of the requirements in effect at the time
19 of such construction or reconstruction."

20 Q. All right. So let's move on to Rule 13: Scope
21 of Rules. Can you read that to us.

22 A. "Scope of Rules. These rules are not intended
23 as complete construction specifications, but embody only
24 the requirements which are most important from the
25 standpoint of safety and service. Construction shall be
26 according to accepted good practice for the given local

1 conditions in all particulars not specified in the
2 rules."

3 Q. And 17.

4 A. "Investigation of Accidents. Each owner or
5 operator of supply lines shall establish procedures for
6 the investigation of major accidents and failures for the
7 purpose of determining the causes and minimizing the
8 possibility of recurrence. Nothing in this rule is
9 intended to extend, waive, or limit any claim of attorney
10 client privilege and/or attorney work product privilege."

11 Q. And then we have the definition of major
12 accidents and failures.

13 A. Do you want me to read it?

14 Q. Just real quickly, major accidents are anything
15 over \$50,000 or causes injury or death; correct?

16 A. That's correct.

17 Q. All right. Now, let's get to the meat. Rule
18 18. What is Rule 18?

19 A. Okay. So after the 2007 fires that occurred in
20 Southern California, the commission adopted new rule.
21 It's called Rule 18. So this rule basically required the
22 utilities to prioritize problems or violations they found
23 on their system and to implement a corrective action plan
24 for each violation or problem they discovered during
25 their inspections. They will give each violation, for
26 example, a priority level either 1, 2, or 3. Every

1 priority level has a limit to when such a violation has
2 to be corrected.

3 This rule identified exactly what those limits
4 are and what those intervals are. And it has also a
5 requirement what the utility would do when they find
6 violations on their system, if they found a violation on
7 a communication system. And the same thing. What would
8 the communication company do if they discovered a
9 violation that doesn't belong to their facilities if they
10 do their own inspection?

11 For example, if Cox Communication or Comcast was
12 doing an inspection and they found a violation for PG&E,
13 what they should do? This rule would tell them exactly
14 what they should do.

15 Q. In your role as essentially the supervisor of
16 the team that audits the investor-owned utilities such as
17 PG&E, what part does this rule play?

18 A. So when we do an audit, part of the records we
19 check are inspection records of the utility's inspection
20 records. These are the actual inspection records that
21 tell us how often the utilities do their own inspections,
22 what kind of problems or violations they discovered when
23 they were doing the inspection. Did they prioritize them
24 based on this rule? Did they have a corrective action
25 plan for every violation they discovered? Was the
26 violation fixed within the timeframe as required by this

1 rule?

2 Q. All right. So let's start off with the first
3 paragraph in this rule, the definition is safety hazards.
4 If you'd read that for us.

5 A. "For the purpose of this rule safety hazard
6 means a condition that poses a significant threat to
7 human life or property."

8 Q. And then if we could start off with
9 Subsection A. If you could start reading that for us.

10 A. "Resolution of Safety Hazards And General
11 Order 95 Nonconformances. Each company including
12 utilities and CIPs --" CIP stands for communication
13 infrastructure providers --" is responsible for taking
14 appropriate corrective action to remedy safety hazards
15 and GO 95 nonconformances posed by their facility."

16 Q. And let's skip down to Subsection 2(a). If you
17 could read that for us.

18 A. "All companies shall establish an auditable
19 maintenance program for their facilities and lines. All
20 companies must include a timeline for corrective actions
21 to be taken following the identification of a Safety
22 Hazard or nonconformances with General Order 95 on the
23 company's facilities.

24 The auditable maintenance program shall
25 prioritize corrective actions consistent with the
26 priority levels set forth below and based on the

1 following factors as appropriate: Safety and reliability
2 as specified in the priority levels below; type of
3 facility or equipment; location, including whether the
4 safety hazard or nonconformance is located in a high fire
5 threat district; accessibility; climate; direct or
6 potential impact on operations, customers, electrical
7 company workers, communications workers, and the general
8 public."

9 Q. What does it mean to have an auditable
10 maintenance program?

11 A. So an auditable maintenance program is a
12 pull-down word. If somebody was able to look at it and
13 inspect it, it must include all the following: It must
14 include the violation that somebody discovered, must
15 include who discovered the violation, how the company
16 discovered the violation or the safety hazard, where they
17 discovered it, the type of equipment that is involved,
18 the locations, how accessible it is. I mean, as
19 specified here.

20 Q. Okay. Let's move on now to the second half of
21 (2) (a), Subsection (2) (a): The Priorities. If you can
22 go ahead and read that for us.

23 A. "There shall be three priority levels. Level 1:
24 Immediate safety and/or reliability risk with high
25 probability for significant impact. Take action
26 immediately, either by fully repairing the condition, or

1 by temporarily repairing and reclassifying the condition
2 to a lower priority.

3 Level 2: Variable (non-immediate high to low)
4 safety and/or risk reliability or reliability risk. Take
5 action to correct within specified time period (fully
6 repair, or by temporarily repairing and reclassifying the
7 condition to a lower priority.)

8 Time period for correction to be determined at
9 the time of identification by a qualified company
10 representative but not to exceed, one, six months for
11 nonconformances that create a fire risk located in tier
12 three of the high fire threat district; two, 12 months
13 for nonconformances that create a fire risk located in
14 tier two of the high fire threat district; three,
15 12 months for nonconformances that compromise worker
16 safety; and four, 59 months for all other Level 2
17 nonconformances.

18 Level 3: Acceptable safety and/or reliability
19 risk. Take action to re-inspect, re-evaluate, or repair
20 as appropriate.

21 b) Correction times may be extended under
22 reasonable circumstances such as: Third party refusal,
23 customer issue, no access, permits required, system
24 emergencies such as fires, severe weather conditions.

25 (3) Companies that have existing General Order
26 165 auditable inspection and maintenance programs that

1 are consistent with the purpose of Rule 18A shall
2 continue to follow their General Order 165 programs."

3 Q. All right. And then we have B.

4 A. "B: Notification of Safety Hazards. If a
5 company, while performing inspections of its facilities,
6 discovers a safety hazard on or near a communications
7 facility or electric facility involving another company,
8 the inspecting company shall notify the other company
9 and/or facility owner of such safety hazards no later
10 than ten business days after the discovery. To the
11 extent the inspecting company cannot determine the
12 facility owner/operator, it shall contact the pole owners
13 who shall be responsible for promptly notifying the
14 company owning/operating the facility with the safety
15 hazards normally not to exceed five business days after
16 being notified of the safety hazard. The notification
17 shall be documented and such documentation must be
18 preserved by all parties for at least ten years."

19 Q. All right. And -- oops, I want to go back. I
20 skipped over.

21 So down here on the bottom at the end of Rule 18
22 there's a note "Added August 20th, 2009, by decision
23 number 0908029."

24 You see that?

25 A. Yes, I do.

26 Q. Do you have an understanding of what that means?

1 A. Okay. So every time there's a change in a rule,
2 at the bottom of the rule it will tell you the date the
3 rule was changed or modified or added and how by decision
4 or by resolution.

5 So in this case the first one here is saying
6 that this rule was added in 2009. So it did not exist
7 before 2009. And it gives you the decision -- the
8 commission decision to edit the rule. And then it says
9 "Revised January 12, 2012."

10 So on January 12th of 2012 the rule was revised
11 the first time by decision and the decision number. And
12 again, it was revised on December 14th, 2017, by the
13 decision shown here.

14 Q. And this version that we just read is what was
15 in effect in 2018; right?

16 A. That's correct.

17 Q. All right. Let's move on to Rule Number 19.

18 A. "Rule Number 19: Cooperation with Commission
19 Staff; Preservation of Evidence Related to Incidents
20 Applicability of Rules.

21 Each utility shall provide full cooperation to
22 Commission staff in an investigation into any major
23 accident as defined in Rule 17 or any reportable incident
24 as defined in CPUC Resolution E-4184 regardless of
25 pending litigation or other investigations including
26 those which may be related to a Commission staff

1 investigation. Once the scene of the incident has been
2 made safe and service has been restored, each utility
3 shall provide Commission staff upon request immediate
4 access to: Any factual or physical evidence under the
5 utility or the utility agent's physical control, custody,
6 or possession related to the incident; the name and
7 contact information of any known percipient witness; any
8 employee percipient witness under the utility's control;
9 the name and contact information of any person or entity
10 that has taken possession of any physical evidence
11 removed from the site of the incident; any and all
12 documents under the utility's control that are related to
13 the incident and are not subject to the attorney-client
14 privilege or attorney work product doctrine.

15 Any and all documents or evidence collected as
16 part of the utility's own investigation related to the
17 incident shall be preserved for at least five years. The
18 Commission's statutory authorization under California
19 Public Utility Code Section 313, 314, 314.5, 315, 581,
20 582, 584, 701, 702, 771, 1794, 1795, 8037, and 8056 to
21 obtain information from utilities, which relate to the
22 incidents described above, is delegated to Commission
23 staff."

24 Q. All right. Now, going back to 631 that you have
25 in front of you, the first one we looked at.

26 A. Yes.

1 Q. And that's the list of code sections that are
2 actually quoted in there; correct?

3 A. It's one of them, yes.

4 Q. All right. And if you'd go through it to check
5 and see and make sure all of the code sections that are
6 listed at the end of Rule 19 are contained in that
7 packet.

8 A. I think it's missing so far 771.

9 Q. Okay. We'll try to remedy that.

10 A. So it also has other sections that are not in
11 here.

12 Q. Okay. We'll get to those later.

13 All right. So that's Section 19. Now we go on
14 to the next section which is definitions; Section 2:
15 Definitions of Rules. Can you tell us very briefly what
16 Section 2 does.

17 A. It defines terms that are used in General
18 Order 95.

19 Q. Okay. So relevant terms, if you want to look it
20 up, there is where you go to find it?

21 A. That's correct.

22 Q. So things like conductor?

23 A. That's correct.

24 Q. Districts?

25 A. That's correct.

26 Q. Most importantly maintenance?

1 A. Yes.

2 Q. All right. So let's move on from that and jump
3 to Rule 31. And this is in Section 3.

4 Can you explain to us the significance in your
5 job of Rule 31.

6 A. So Rule 31 is probably the most important rule
7 in General Order 95. Basically, this rule requires the
8 utility to design their system, to operate it, to install
9 it, and to maintain it in a safe and reliable way. Not
10 only this but if local condition -- if there are some
11 condition that require the utility to exceed the minimum
12 requirement of this rule, based on this rule the
13 utilities are supposed to exceed their requirements
14 according to the local condition.

15 Q. So if somebody was looking for the requirements
16 that PG&E would have to uphold with the transmission
17 line, Rule 31 would be a good place to start; is that
18 correct?

19 A. That's correct.

20 Q. All right. So we have Rule 31, 31.1.

21 A. Can I say something? Can I add more to 31?

22 Q. Sure.

23 A. As I said before, GO 95 address the construction
24 and maintenance of the rule. So when it comes to
25 maintenance, you always apply to current. It doesn't
26 matter when the system was designed. If you maintain

1 your facility today, you apply the maintenance order as
2 of today. This will be used both in construction and
3 maintenance.

4 So if, for example, we want to know local
5 conditions about a facility to see did the local
6 conditions require the utility to exceed the minimum
7 requirement, this rule also change over time. So we have
8 to go to the rules that existed at the time the
9 construction was conducted to see what were the local
10 conditions at that time that required the utility --
11 whether to discover the utility was required to exceed
12 those local requirements for construction purposes. But
13 for maintenance purposes, it doesn't matter when
14 something at the utility was installed. You always
15 comply with the latest maintenance rule.

16 Q. So a line that was built, say, in 1921 would
17 still have to comply with the maintenance policies in
18 effect in 2018; correct?

19 A. It's my opinion, yes, it does. If the condition
20 changes for maintenance and the utility know that right
21 now we need to strengthen our system or if there is any
22 kind of change that requires the utility to exceed their
23 maintenance standards, I believe yes.

24 Q. So 31.1 applies to design, construction, and
25 maintenance. Let's go on to 31.2. And this one is
26 relatively brief. Can you read that for us.

1 A. "Lines shall be inspected frequently and
2 thoroughly for the purpose of ensuring that they are in
3 good condition so as to conform with these rules. Lines
4 temporarily out of service shall be inspected and
5 maintained in such condition as not to create a hazard.

6 Communication lines (see Rule 80.1.)

7 Supply lines shall be inspected in compliance
8 with the requirements of General Order 165."

9 Q. And what are communication lines?

10 A. Communication lines are lines that belong to the
11 communication company whether it's cable TV, telephone
12 line, whether they're even lines that belong to wireless
13 facilities, fiberoptic lines.

14 Q. And what are supply lines?

15 A. Supply lines are power lines, actual power lines
16 that deliver electricity.

17 Q. Okay. All right. Let's skip ahead to 43.
18 Let's go to Rule 44, another brief one. If you could
19 read it for us.

20 A. "The safety factors specified in these rules are
21 the minimum allowable ratios of material and/or line
22 element strengths to the effect of design loads as
23 specified in Rule 43."

24 Q. So then 43 is what? Go ahead and read 43 for
25 us.

26 A. "The following conditions of temperatures and

1 loading shall be used for the purposes of these rules in
2 determining the strength required of lines (See
3 Rule 22.1). Loading or loads as used in this section
4 includes vertical, transverse, and longitudinal
5 components of all loads. More stringent conditions may
6 be used in the design of lines. The use of less
7 stringent conditions or modified loading district limits
8 may be authorized by this Commission upon application and
9 presentation of data from United States weather records
10 or other adequate and authenticated meteorological data
11 which in the Commission's opinion justifies such change."

12 Q. Let's go down to 43.2. And read that for us.

13 A. "Light loading. Light loading shall apply in
14 all parts of the State of California where the elevation
15 above sea level is 3,000 feet or less (See Appendix A for
16 map). This loading shall be taken as the resultant of
17 wind pressure and deadweight under the following
18 conditions: A, wind. A horizon wind pressure of
19 8 pounds per square foot of projected area on cylindrical
20 surfaces, and 13 pounds per square foot on flat surfaces
21 shall be assumed. Where latticed structures are used,
22 the actual exposed area of one lateral face shall be
23 increased by 50 percent to allow for pressure on the
24 opposite face, provided this computation does not
25 indicate a greater pressure than would occur on a solid
26 structure of the same outside dimensions, under which

1 conditions the latter shall be taken.

2 B: Ice. No ice load is to be considered.

3 C: Temperatures. Conductor temperature shall
4 be assumed to be 25 degrees Farenheit at the time of the
5 maximum loading. A conductor temperature of at least 130
6 degrees Farenheit shall also be assumed for computing sag
7 and its effect on structural loads due to weight span."

8 Q. Any idea what any of that means?

9 A. Yeah. I can explain to you but --

10 Q. Okay. Go ahead, please.

11 A. But I just want this to be known I'm not the
12 most qualified person to address loading. That is a job
13 of civil engineers, but I do have an idea about it.

14 So when you're designing a new system of poles
15 and conductors --

16 You want me to explain the section using
17 temperature?

18 Q. Yes, the entire thing if you could, please.

19 A. Okay. So there are strength requirements that
20 your poles, conductors, insulators, anything you use,
21 they must be able to extend. This rule tells you exactly
22 what are these requirements.

23 For line loading any time you're designing a
24 facility or building a facility that is 3,000 feet above
25 sea level or below, you use requirement of light loading.
26 So basically what you do when you're designing your

1 system, you have to assume wind pressure of 8 pounds per
2 feet -- per square -- 8 pounds per square feet hitting
3 the surface of the facility or design. The 8 pounds per
4 square feet is used on cylindrical surfaces like
5 conductors or like poles.

6 If it was flat surface like, for example, a
7 transmission tower has bars that are flat, then you have
8 to assume that 13 pounds per square foot is hitting those
9 surfaces. That's how you design your system. And then
10 you pick up and then you choose which facility can
11 support this wind pressure.

12 Now, also -- what's also we haven't gotten to
13 yet is the safety factors because this 8 pounds per
14 square foot or 13 pounds per square foot does not include
15 the affect of the safety factor.

16 Do you want me tell about the safety factor?

17 Q. Go ahead.

18 A. Okay. So safety factor is a safety margin that
19 engineers use and the company use when they are designing
20 any structures. For example, if you want to design a
21 chair that supports somebody that weigh 100 pounds,
22 you're not going to design a chair that can only support
23 100 pounds or that could only withstand 100 pounds. If
24 you do so, you'll have a safety factor of one. The chair
25 can support 100 pounds and the person sitting on it weigh
26 100 pounds. If you give a person the chair that weighs

1 200 pounds, the chair will break.

2 So to accommodate for this there is something
3 called a safety factor. You have safety of margin. So
4 if I'm going to design a chair for a person who weigh 100
5 pound and I design a chair that can withstand 300 pounds,
6 the safety factor will be three. It's three times -- the
7 chair has three times strength as the load that is
8 imposed on it.

9 If I decide to design a chair that can support
10 400 pounds, which means the safety factor will be four,
11 the chair can support 400 pounds and we have a person who
12 is 100 pounds who is going to sit on it. That's very
13 important because especially on wood poles -- because
14 wood poles deteriorate all the time. They don't keep the
15 same strength as when they're installed. So you have to
16 account for this deterioration.

17 Now, this safety factor is only -- there are two
18 safety factors. One is at the time of construction. So
19 when you construct the facility, you have to account for
20 safety factor, let's say, four. And then you have to
21 replace your facilities at any time when the safety
22 factor is used by two-thirds of the design safety factor.

23 Am I getting too technical?

24 Q. No, no. You've done a great job explaining.

25 A. Okay. So if you go back to the chair. For
26 example, let's suppose the chair had a safety factor of

1 four. And you put somebody on it. You know the maximum
2 is 100 pound. So you want to design a chair that can
3 support 400 pound at the time of construction. And the
4 safety -- and then you need to replace the chair or
5 reinforce it before the safety factor falls two-thirds of
6 the actual design safety factors.

7 So in this case if the design safety factor is
8 four, two-thirds of four is 2.67. So in this case if the
9 chair is unable to support 2.67 times 100 pounds, which
10 is the load component which is 267 pounds, then you
11 need to replace the chair. So any time the chair cannot
12 support more than 267 pounds, you are wanting to replace
13 it even though it only support 100 pound.

14 So this is what a safety factor is. So what
15 this rule says is when you are designing a facility, you
16 need to consider wind pressure of 8 pounds per square
17 foot that is hitting the pole. And if you take the
18 safety factor into account at the time of design, you
19 need to assume 32 pounds per square foot is hitting your
20 pole. And you will use a pole that can support 32 pounds
21 per square feet at the time of construction. That is for
22 round surfaces.

23 For lattice surfaces or flat surfaces you will
24 assume 13 pounds per square inch times the safety factor
25 that are hitting the pole or the flat surface. In this,
26 case the tower.

1 Now, there are other things that go on in the
2 design that is for the pole. But then you have other
3 things you need to account for. So we accounted for the
4 wind. Now we have to account for temperature.

5 So pole or transmission tower also have
6 conductors installed on them. Conductors -- they
7 contract and they expand based on heat and environment.
8 So during hot weather the conductor expand and during
9 cold weather the conductor contract.

10 What happens is when the conductor contracts,
11 they cause more tension. So here you have to assume
12 25 degrees. That is cold weather. This will give you
13 the maximum tension of the conductors to include in your
14 calculations. Again, when you're trying to do full load
15 calculations, you want to know: Okay, how much of the
16 load I am going to impose on this structure, on a pole,
17 or on transmission towers.

18 This will tell you. Okay. So if you want to
19 know what kind of load you're going to impose on the
20 structures, you have to take each piece by itself and you
21 see how much is -- how much load this piece is imposing
22 on this pole. First, you do the calculation for the
23 wind. This is wind at 8 pounds per square feet pressure.

24 Then you come to the equipment. So for the
25 equipment, for conductors you will say: Okay. What is
26 the maximum tension on this conductor at 25 degrees? And

1 this is the tension you use in your calculation to
2 determine what kind of load I'm going to install on a
3 pole.

4 The 130 degree Fahrenheit you use it -- part of
5 your pole loading calculation is you want to know the
6 tension, the weight of equipment, and how far is it from
7 the ground? For conductors -- because they expand and
8 they contract, their clearance from the ground varies.
9 So what this rule is saying is the way you determine the
10 clearance from the ground in order to include in your
11 calculation you will assume 130 degree Fahrenheit of
12 temperature of the conductors.

13 This cannot -- when you assume this, this is
14 going to cause more sag on the conductor because it's
15 going to expand and the clearance from the ground will be
16 used. So this is the clearance that you will use when
17 you do your pole load calculation.

18 Q. Let's skip ahead real quick -- and then we'll
19 come back and talk about this a little bit more -- to
20 Rule 49.5. And this is for insulators. If you could
21 read to that us.

22 A. "Insulators, supports, clamps, and other
23 miscellaneous attachments shall be designed to withstand,
24 with at least the safety factors specified in Rule 44,
25 the mechanical stress to which they are subjected by
26 conductors, wires or structures, under the loading

1 conditions as specified in Rule 43. Pin insulators shall
2 effectively engage the thread of the pin for at least two
3 and one-half turns."

4 Q. So we just talked about Rule 43, Rule 43.2,
5 Rule 44, and now 49.5 which directly applies to
6 insulators. How do these rules play into your audit,
7 maintenance, and inspection programs?

8 A. Okay. So for maintenance and inspection
9 programs we make a distinguish -- distinction between
10 distribution facilities and transmission facilities. So
11 the distribution facilities are more -- they include more
12 review than transmission facilities because this is where
13 most of the problems occur.

14 Now, how does this play in our audit? Part of
15 our audit is we will ask the utilities for their pole
16 loading calculations during our audits. And we determine
17 whether the number that they have used to determine their
18 safety factors determine the extent of whether the
19 facilities comply with these rules or not.

20 Q. Okay. So the safety factors -- do they just
21 apply to things as they're built or as they've worn?

22 A. Okay. So there are two safety factors. There's
23 one design safety factors and we can call the other one
24 the maintenance safety factors. So you apply it -- you
25 apply the design safety factors when you are building
26 something. And then you have to replace the equipment

1 before the safety factor falls below the maintenance
2 safety factor which is two-thirds of the design safety
3 factor.

4 Q. So explain that concept to us, this two-thirds
5 of the design safety factors.

6 A. Okay. So let's go back to the chair example I
7 gave. So if something was intended to support 100 pound,
8 you apply four safety factors. A safety factor of four.
9 So you design it to withstand 400 pound. This is a
10 construction safety factor.

11 In a case, for example, of a pole, the pole must
12 be designed to withstand the wind pressure of 8 pounds
13 per square feet times the construction safety factor. So
14 the pole must be able to withstand 32 pounds per square
15 in or square foot at the time of the construction. The
16 pole deteriorates. You add new equipment to the pole.
17 So what happened is the safety factors are going to be
18 reduced.

19 The rules allow for reduction for the safety
20 factor up to a certain level. Any time the safety factor
21 falls below this level, then you need to replace the
22 pole.

23 Go back to the chair example. With a safety
24 factor of four, GO 95 allows for not more than two-thirds
25 reduction which means any time the safety factor of the
26 chair falls below 2.67, you need to replace the chair or

1 fix it.

2 So if the chair was designed to support 400
3 pound with a safety factor of four and then if the safety
4 factor falls to 2.67 which mean you have to multiply 100
5 by 2.67 which means now the chair can only support
6 267 pounds. Any time the chair cannot support anything
7 more than 267 pounds you need to replace it even though
8 only 100 pounds of support is imposed.

9 So it's the same concept with a pole. So for
10 wind speed any time the pole or the facility is not able
11 to withstand 8 pound of pressure times -- in this case
12 instead of four, 2.67 or whatever the number is, you need
13 to replace the facility.

14 Q. So does this apply to all the components on, for
15 instance, a transmission tower?

16 A. Every single -- yes, all the hardware. They may
17 have different safety factors. But when it comes to
18 strength, every component has its own safety factors.

19 Q. Right. Are you familiar with what the safety
20 factors would be for a C-hook holding a jumper conductor
21 on the tower?

22 A. There is a table that tells you what the safety
23 factor should be.

24 Q. Is that contained within GO 95?

25 A. Yes, it is.

26 Q. And is this Table 8 that we're talking about or

1 can you identify for us which -- what table it is?

2 A. It's Table 4.

3 Q. Table 4?

4 A. Table 4.

5 Q. Let see. What section is that in?

6 A. It's in Section 4, page 10.

7 Q. I'm going the wrong way.

8 So where on this Table 4 would the C-hooks that
9 would hold insulators to the tower or connect the
10 insulators to the tower be listed?

11 A. Okay. So you'll see the first one where it says
12 "Conductors, splices, and conductor fastenings (other
13 than tie wires)."

14 Q. Yes, Sir.

15 A. Yeah, this would apply to anything that support
16 conductor.

17 Q. Okay.

18 A. The one specific for the hook would be a part of
19 the insulator.

20 Q. Right.

21 A. Okay. So if you look where it says "Pole line
22 hardware."

23 Q. Right.

24 A. Yeah. So this would be in the pole line
25 hardware.

26 Q. Okay. And then down at the bottom under (a),

1 (b), and (c) we have some special rules for insulators?

2 A. Yes.

3 Q. So "(a) Insulators are to be replaced before
4 safety factors have been reduced (due to the
5 deterioration or changes in construction, arrangement, or
6 other conditions subsequent to installation) to less than
7 95 percent of the safety factor specified in Rule 44.1."

8 A. That's correct.

9 Q. And then "(b) Insulator are to be replaced
10 before safety factors have been reduced (due to
11 deterioration or changes in construction, arrangements
12 or, other conditions subsequent to installation) to less
13 than 75 percent of the safety factor specified in Rule
14 44.1."

15 And so how do you make a difference -- how do
16 you decide whether (a) or (b) -- whether it's 95 percent
17 or 75 percent?

18 A. So (a) and (b) here is based on the rate of
19 construction if it's grade B construction or grade C
20 construction.

21 Q. Okay. And how do we determine if it's grade B
22 or grade C? How do we find that out?

23 A. Okay. So if you take a look at Rule 42, which
24 is page 5 of this section, it talks about grade B and
25 grade C construction. It defines what grade B and grade
26 C construction.

1 And then the next page on Table 3 there is a
2 table that would tell you what kind of construction this
3 should be considered A, B, or C.

4 Q. Okay. Thank you.

5 All right. Let's move away now for a second
6 from GO 95. We had talked in here -- you should have in
7 front of you 633. This is going to be another document.
8 It should be in the stack of documents when you moved
9 them. You should have 633. You see that?

10 A. Yes, Sir.

11 Q. And what is 633?

12 A. It's General Order 165.

13 Q. What is General Order 165?

14 A. General Order 165 is the general order that
15 establish the rules of inspections. Basically, it has a
16 requirement of inspection cycles, how often a utility
17 should inspect their system, and what they should do when
18 they inspect their system. So it lays down the
19 procedures on how an inspection should be conducted.

20 Q. All right. And this is what was referenced in
21 Rule -- GO 95 Rule 31.2 where it says "Supply line shall
22 be inspected in compliance with the requirements of GO
23 165." Correct?

24 A. I'm not sure if that's 31.1.

25 Q. Yeah. 31.2: Inspection of Lines.

26 A. Yes.

1 Q. Okay. So let's get to the applicable section of
2 GO 165 which is Subsection 4; correct?

3 A. Correct.

4 Q. This is short, concise, and to the point. So
5 can you read what GO 165 tells us about the inspection
6 and maintenance for transmission lines.

7 A. "Transmission Facilities: Each utility shall
8 prepare and follow procedures for conducting inspections
9 and maintenance activities for transmission lines.

10 Each utility shall maintain records of
11 inspection and maintenance activities. Commission staff
12 shall be permitted to inspect records and procedures
13 consistent with Public Utilities Code Section 314(a)."

14 Q. So is this the heart of what your unit does
15 right here?

16 A. When it comes to transmission facilities?

17 Q. Yes.

18 A. No.

19 Q. Okay. You said your unit does audits; correct?

20 A. Correct.

21 Q. And what are they auditing?

22 A. Okay. So we're auditing compliance with GO 95
23 and GO 165. GO 95 also have inspections.

24 Q. Right.

25 A. And GO 95 also requires the utility to do
26 certain things for its covered violations. These apply

1 to more distribution and transmission. Now, there are
2 certain things in GO 95 that the utility is required to
3 do that are not included here. For example, the
4 utilities when you do their audit, you have to document
5 the violations and to give the corrective action dates.
6 That's not included here. We expect the utility to do
7 this.

8 Q. Okay. So GO 165 requires each utility to
9 prepare and follow procedures for conducting inspections
10 and maintenance activity for transmission lines; correct?

11 A. Correct.

12 Q. Does the CPUC mandate or supervise the policies
13 that the investor-owned utilities adopt or conduct the
14 inspections and maintenance on their transmission lines?

15 A. Okay. So let me see if I can answer the
16 question. So what you're asking is do we have -- do we
17 dictate how they do their inspection?

18 Q. Well, even before that do you dictate their --
19 what policies they must set for their inspections?

20 A. No. We just tell them what they should
21 accomplish or what the end result should be.

22 Q. Okay. And ultimately, what is the result? What
23 is it the result should be?

24 A. Compliance with GO 95.

25 Q. Okay. And that goes back to 31.1; is that
26 correct?

1 A. 31.1, 31.2, yes.

2 Q. That essentially says it has to be safe?

3 A. Safe, reliable. It has to be in compliance with
4 GO 95, yes.

5 Q. Right. Okay. But you don't tell them how to do
6 their -- you know, set their policies for when they're
7 going to do inspections and how they're going to do
8 inspections; correct?

9 A. No.

10 Q. When you do your audits of investor-owned
11 utilities, for instance, PG&E, do you go through their
12 policies, for instance, the inspection cycles or how
13 often they inspect and pass judgment on those policies?

14 A. So our engineers when they do their audit,
15 they're supposed to go over there. Before they do their
16 audit, they review the previous audits. They review any
17 specific problems that the district or the area is
18 experiencing to have an idea about the area they will be
19 auditing.

20 And during the audit our engineers talk to --
21 they're supposed to talk to the inspectors that are
22 conducting the audits. They're supposed to review the
23 records and to formulate an opinion as to is the utility
24 conducting their inspection in a time that will allow
25 them to detect problems in time? Are they fixing
26 whatever they're discovering on time? And is their

1 interval cycle appropriate or not? Because when it comes
2 to transmission facilities, there's no specified interval
3 cycle defined by any general orders as to the
4 distribution facilities.

5 So our engineers should -- when they do their
6 audit, they should make an opinion whether the inspection
7 cycle for the transmission facility is enough to comply
8 with GO 95.

9 Q. Okay. Well, let's talk about the inspections
10 themselves. You should have in front of you Exhibit 634.
11 See that?

12 A. Yes.

13 Q. All right. And CPUC has a website; correct?

14 A. Correct.

15 Q. And that website is publically available;
16 correct?

17 A. Correct.

18 Q. And what is 634?

19 A. Exhibit 634 - this says every time we do an
20 audit, we post our audit reports on line. 634 is a link
21 to all of our audit reports.

22 Q. Great. So let's get into 634, 2018 audits
23 broken down by distribution level and communication
24 infrastructure provider. Is that correct?

25 A. That's correct.

26 Q. Did CPUC do any transmission audits in 2018?

1 A. If we did, it will be here.

2 Q. Okay. So this doesn't show any were done. So
3 that would indicate that none were done?

4 A. If it doesn't show any were done or we did one
5 or whatever and we did not post them, but I am not aware
6 of any audit that we did that we did not post.

7 Q. Okay. 2017. Again, we have distribution level
8 audits, we have communication, infrastructure providers
9 but no transmission level audits; correct?

10 A. If it doesn't have it, then that is correct.

11 Q. For 2016 we show distribution level, now
12 substation level, transmission level, and communication
13 infrastructure provider level; correct?

14 A. Correct.

15 Q. So in 2016 the CPUC did do transmission level
16 audits of the investor-owned utilities?

17 A. Yes, that's what it shows.

18 Q. And which ones were done in 2016?

19 A. So this one shows that PG&E Moss Landing,
20 Imperial Irrigation District El Centro, PG&E Midway
21 Region, Plumas Sierra Rural Electric Co-op, and PG&E
22 Victor Region.

23 Q. Okay. 2015. Is this correct that CPUC did four
24 transmission level audits?

25 A. If that's what it says, yes.

26 Q. And that's all from your website showing what

1 you did?

2 A. Yes.

3 Q. 2014 five transmission level audits; correct?

4 A. That's correct.

5 Q. 2013 three transmission level audits?

6 A. That's correct.

7 Q. And 2012 three transmission level audits;
8 correct?

9 A. That's correct.

10 Q. Now, prior to 2012 did you do any transmission
11 level audits?

12 A. No, we did not.

13 Q. Why not?

14 A. We didn't have a program for transmission
15 facilities. Our program started in 2012.

16 Q. Okay. So you did them in 2012, 2013, 2014,
17 2015, and 2016; correct?

18 A. Correct.

19 Q. Have you ever done a transmission level audit of
20 the North Valley Division of PG&E?

21 A. Myself?

22 Q. Or your unit?

23 A. I'm not familiar with the PG&E system because I
24 work in Los Angeles office, but I know this year we have
25 done an audit. I don't know which region for PG&E, but
26 it's not posted yet because the report is not final.

1 Q. Okay. But prior to 2018, according at least
2 from what's been posted, you've never done an audit of
3 the North Valley Division of PG&E?

4 A. If it's not here, we have not done it.

5 Q. All right. So let's talk about audits itself.
6 One of the audits that was listed there was the Victor
7 Division that you did an audit in 2016. So look at
8 Exhibit 635 in front of me or in front of you.

9 I'm sorry. And do you recognize 635?

10 A. Yes, I do.

11 Q. What is 635?

12 A. It's an audit report that we sent to the utility
13 after our audit.

14 Q. And this audit report is signed by yourself?

15 A. That's correct.

16 Q. All right. So this is an audit somewhere else
17 in the State of California in the PG&E system; correct?

18 A. Correct.

19 Q. Specifically, this is the PG&E Victor Division?

20 A. Correct.

21 Q. So walk us through what goes into a CPUC audit
22 and SED audit of PG&E transmission level facilities.

23 A. So we have an audit procedure that the engineers
24 are supposed to follow when they do an audit. So during
25 the audit we meet with the -- we supposed to meet with
26 the staff from PG&E that do their own inspections and

1 maintenance. We inspected inspection records. We see
2 how often are they inspecting their facilities, when was
3 the last time the facility was inspected, are they
4 following their procedures that they have established in
5 inspecting their facilities.

6 We look whether or not they are documenting any
7 violations they have discovered, are they correcting the
8 violation that they have discovered, are they
9 prioritizing the violations that they are discovering as
10 required by GO 95 Rule 18, are they giving corrective
11 action dates for those violations, and we talk to the
12 inspectors to see if the inspectors are even qualified to
13 do an inspection of their system.

14 Then we take samples from the -- from their
15 facilities to the field. And we actually go and we see:
16 Okay. Did they actually document all the violations
17 during the last inspection?

18 I'm talking about PG&E. Did they actually
19 correct those violations that they discovered like
20 they're saying to just confirm that their records are
21 accurate.

22 Q. All right. So let's go on to page 2 of 635 and
23 starting off it talks about audit findings and
24 Subsection 1, records review. And it lists records that
25 were reviewed as part of the audit.

26 A. That's correct.

1 Q. And can you tell us exactly what records were
2 reviewed by your team as part of this audit?

3 A. Okay. So do you want me to read them?

4 Q. Sure.

5 A. "PG&E's GO 95 & GO 128 Inspection Program
6 Records."

7 Q. Now, let me stop you right there. What is
8 GO 128? We haven't talked about that.

9 A. GO 128 is a General Order that is for
10 underground facilities.

11 Q. Okay. Go ahead.

12 A. "Circuit map for Stockton and surrounding area;
13 Closed and open notifications from 2015 & 2016; Pole
14 loading and intrusive test records; PG&E's procedures on
15 infrared inspections, insulator washing, and metal pole
16 inspections; Field inspection records for 10 overhead
17 circuits."

18 Q. What does it mean "Field inspection records for
19 10 overhead circuits"? What are that?

20 A. So if you view the actual inspection for 10
21 different circuits that PG&E inspected that they have
22 documented.

23 Q. Okay. And then the next section is "Field
24 Inspections. My staff inspected the following
25 facilities."

26 Explain to us this.

1 A. So these are the actual facility either poles or
2 towers that we inspected.

3 Q. Okay. So you -- your people inspected five
4 consecutive towers on the Tesla-Tracy 500 kV line?

5 A. Those are the towers, yes.

6 Q. Right. And then one, two, three, four, five,
7 six, seven, eight. Eight towers on the Webber-Tesla
8 230 kV line?

9 A. Correct.

10 Q. And the towers that you did on the Webber -- or
11 your team did on the Webber-Tesla 248, 237, 223, 224, 25,
12 22 --

13 So between 220 and 248; correct?

14 A. Correct.

15 Q. So we assume that that line had at least 248
16 towers on it. Would that be fair to say?

17 A. I really don't know.

18 Q. Okay. Then you did one, two, three, four, five,
19 six on the Tesla-Tracy line; is that correct? That's
20 what it says.

21 A. That's correct.

22 Q. Okay. And then we go in -- there's more here.
23 Five towers on the Kyoho Tap 115 kV line. That's what
24 the report indicates.

25 All right. So when you go out and physically
26 inspect -- when your people go out and physically inspect

1 these facilities, explain to us what they're doing.

2 A. First, we inspecting to confirm that the
3 utility's records are accurate. So we go to a tower that
4 has been inspected previously or pole or whatever. So we
5 inspect it to see if there are any violations of GO 95.
6 And if there are, we determine whether the utility has
7 actually documented these violations and has a corrective
8 action plan to correct them.

9 So we are trying to confirm that the records
10 that are provided to us by the utilities are accurate.
11 That is the first thing we do. The second thing is we
12 just confirm that they fixed what they told us we fixed.

13 And then we will just to get an idea about the
14 inspection system -- for example, if we start finding
15 violations that the utility does not document, they are
16 not in the record, this will tell us that your inspection
17 program is not accurate. It's not -- I mean, it's not
18 credible because we're finding violations that are not
19 documented by your own inspectors.

20 Q. How do you decide which facilities to go out and
21 spot check?

22 A. We don't. We just pick some facilities.

23 Q. Okay. I mean, what factors go into which
24 facilities that your auditors are going to go out and --
25 your inspectors are going to go out and check the work of
26 PG&E?

1 A. Okay. So as I said before, before we do an
2 audit, the engineers supposed to review previous audit,
3 supposed to get complaint we received from the public in
4 the area. And we need to focus on those area. If we
5 know there's an area that has many complaint or we know
6 there's an area that we have received many incidents that
7 are in this area or if we know there's a specific problem
8 in an area, then the engineers would have to focus on
9 this area and spot check this area.

10 Otherwise, if they see something in the record
11 that may indicate problems for them, they may decide this
12 area. But we don't have a scientific method to decide
13 which area to go and spot check.

14 Q. Okay. Going on to your field inspections
15 document, we don't need to talk about that.

16 All right. For your auditing program and for
17 your supervision of the investor-owned utilities in the
18 state of California, how important is it that the
19 utilities keep complete and accurate inspection and
20 maintenance records?

21 A. It's extremely important especially when there's
22 no specific guideline of what to keep and what not to
23 keep. If the utility's records are not accurate, their
24 own inspection program is questionable. The people that
25 do their own inspections, the qualification is
26 questionable. We rely on the utility to give us correct

1 and thorough records. If we believe these records are
2 not accurate, then the entire program is not credible
3 anymore.

4 Q. So if inspections were routinely inspecting --
5 or inspectors were routinely inspecting tower structures
6 that no longer existed, would that -- what would that
7 tell you about a maintenance or an inspection program?

8 A. Well, this will tell us, first, there's a
9 problem with the certification of one of the inspectors.
10 There's a problem with how they keep records.

11 There is always an exception, but we have to get
12 to the bottom of it. So if PG&E or Edison or any
13 utilities are sending inspectors to inspect facilities
14 that don't exist, it's my opinion that the inspection
15 program is not in compliance with any safety rules.

16 Q. How about if the records don't accurately
17 reflect who actually did the inspections?

18 A. So what you're saying is if there's someone
19 else's name?

20 Q. So, for instance, if one person essentially acts
21 as a scribe and takes credit for doing an entire
22 inspection that was actually done at least partially by
23 other people.

24 A. Well, if the utility is aware of this, we will
25 look to see what have they done to correct it? Is it a
26 mistake by an individual or is it something systematic

1 that the company allowed to happen? It depends.

2 Q. Why is it important to you as the auditor, as
3 the regulator of the investor-owned utilities that
4 records clearly and correctly identify who did
5 inspections or maintenance?

6 A. Well, the reason it's important because part of
7 our audit is to talk to the inspectors who did the actual
8 inspection to see if they're qualified to do the right
9 type of inspection. Are they familiar with the rules?
10 Do they know how to identify problems? Do they know how
11 to identify violations?

12 So it's very important the qualifications the
13 inspectors have. It's very important. So it's important
14 for us to have the name of the actual person who did the
15 inspection.

16 MR. NOEL: Thank you. I have nothing further.

17 The jury have any questions for this witness?

18 Just a moment. We have some questions here.

19 [Conferring off the record.]

20 MR. NOEL: Okay. The jurors have some questions
21 for you. I'm going to ask you to -- read them to you
22 really quickly. We have gone over them. Actually, I'm
23 going to read them to you not quick.

24 **CONTINUED EXAMINATION**

25 BY MR. NOEL:

26 Q. Were you aware in November of 2018 or before

1 then of any inspection or audit of PG&E Caribou-Palermo
2 transmission lines that would indicate this line was not
3 in compliance with CPUC rules?

4 A. Myself I wasn't aware. I don't work for PG&E.
5 As I said, I work in the Los Angeles office. I deal
6 mostly with Edison. So personally, I'm not aware.
7 Someone else in the commission is aware probably. I
8 don't know.

9 Q. Would you characterize CPUC regulations as being
10 effective in maintaining the safety of lines?

11 A. Okay. So the rules in GO 95 are not rules that
12 ensure safety of communication line or electric line.
13 Somebody a long time ago decided that there's a certain
14 safety level that should be maintained and decided this
15 is the safety levels that is acceptable. And they came
16 up with these rules. That's why we have Rule 31.1 that
17 says if for any reason under local condition you need to
18 exceed this rule, we expect you to exceed this rule. But
19 again, I don't think there's any rule that guarantees
20 safety.

21 Q. Does the CPUC have any method for determining
22 the reliability of a utility's inspection program?

23 A. Okay. So we can determine whether the authority
24 is complying with the rules, whether the inspection
25 program is reliable or not. Again, our mandate is to
26 determine whether they comply with GO 95 or GO 128 or

1 GO 165.

2 Q. What, if any, enforcement mechanism does the
3 CPUC have to mandate compliance?

4 A. Okay. So we have three type of enforcement
5 actions. The first one is called notice of violation;
6 NOV. So we find a violation, we send the utility a NOP
7 and tell them "Here's the violation. Correct it."

8 The second rule of enforcement -- we were just
9 given this authority in 2015. It's a citation.
10 Basically, the only entity within the commission that
11 have the jurisdiction to impose penalty on the utility is
12 the commission itself, the commissioners. Staff don't
13 have this jurisdiction or authority.

14 In 2017 the commission gave the division
15 authority to issue a citation when necessary for a
16 violation of any of the commission rules. A citation is
17 limited to \$8 million per violation. And only the
18 division director have the authority to determine whether
19 to issue a citation or not.

20 So I cannot issue a citation. My staff cannot
21 issue a citation. The director will decide whether a
22 citation is warranted or not. And if the director decide
23 a citation is warranted, then we can issue one. And the
24 limit on the citation is up to \$8 million.

25 The third mechanism is called an OII; Order
26 Instituting Investigation. This is a formal proceeding

1 that's opened against a utility. In an OII it's like an
2 Order to Show Cause for the utility why they should not
3 be fined because of a violation they committed. It's a
4 proceeding that lasts like 16 months up to 18 months.

5 In it there can either be a supplement agreement
6 reached in which the utility will pay a penalty and will
7 revise their system and inspection system or whatever
8 policy they have or we go to a hearing and the commission
9 will make a decision about the final outcome.

10 But when an OII is issued, usually what's
11 involved in the penalty is some kind of change of the
12 utility policy. And it will be the commissioner who will
13 decide this, not the staff. This is completely different
14 mechanism of how to enforce our rules.

15 Q. So I believe you've already answered the next
16 question. To your knowledge have you or any of your
17 subordinates ever audited the PG&E overhead transmission
18 facility known by PG&E as the Caribou-Palermo line?

19 A. I have not audited it. Again, all of the audits
20 are here listed. They were listed. As I said, I became
21 aware that we have conducted an audit for PG&E this year.
22 I just don't know where because it's our San Francisco
23 office that handled this.

24 Q. Were you or anyone or to your knowledge anyone
25 in the CPUC aware that the Caribou-Palermo line was
26 almost 100 years old as of November 2018?

1 A. I don't know.

2 Q. Is there, to your knowledge, any CPUC safety
3 rule or regulation that requires overhead transmission
4 lines and associated equipment be inspected or audited
5 more frequently based upon the age of such equipment?

6 A. Of course. It's Rule 31.2. Rule 31.2 that's
7 how I define it. If you have a violation in your system,
8 you don't have any good inspection program because an
9 inspection program -- based on Rule 31.2 you need to
10 audit and inspect your facility to make sure it complies
11 with the rules, with every rule in GO 95. So if you have
12 a violation, you're not inspecting your facility as
13 frequently or as thoroughly.

14 That's how I define it.

15 MR. NOEL: Uh, we have one more.

16 [Conferring off the record.]

17 MR. NOEL: All right. So we've got one more
18 question here.

19 BY MR. NOEL:

20 Q. In your opinion, is it a violation to complete
21 an inspection on multiple days filling in the temperature
22 of the line and the sag distance from ground, basically
23 the clearance, by guessing what the temperature was on
24 the day that the inspection was done but without
25 physically taking a temperature at the locations?

26 So let me see if I can put this -- you're out

1 doing an inspection. Part of that inspection is
2 clearance measurements every mile or, you know, ever so
3 often sections. You don't take the temperatures as you
4 were doing the clearance and then later you go back and
5 add in a guesstimate as to the temperature. Would that
6 be a violation?

7 A. Okay. Okay. So when it comes to temperatures,
8 we're talking when you do your pole loading calculations
9 or installing something on your system. Many equations
10 are different. There are certain equations --

11 THE COURT REPORTER: I'm sorry. What is the
12 beginning of the sentence?

13 THE WITNESS: Okay. So the 103 degree Fahrenheit
14 we talked about, this is involved in the calculating and
15 the equation you use when you're installing in your
16 facilities. You need to -- when you do your pole loading
17 calculation, part of your calculation is tension times
18 the distance of your facility from the ground. And the
19 way you do it is you assume 130 degrees. This will give
20 the biggest sag and the shortest distance.

21 But when you do an inspection or an audit,
22 you're looking for clearance. Clearance requirements are
23 specified in GO 95. This is totally different.

24 So I don't know if that answers the question or
25 not.

26 MR. NOEL: Okay. Anything further?

1 It doesn't look like we have any further
2 questions for you. Madam Foreperson is going to read you
3 an admonishment and then you are done.

4 THE WITNESS: Okay.

5 GRAND JURY FOREPERSON: Mr. Daye, you are
6 admonished not to discuss or disclose at any time outside
7 of this jury room the questions that have been asked of
8 you or your answers until authorized by the grand jury or
9 the Court. A violation of these instructions on your
10 part may be the basis for a charge against you of
11 contempt of court. This does not preclude you from
12 discussing your legal rights with your own attorney.

13 Mr. Daye, what I have just said is a warning not
14 to discuss this case with anyone except the Court, your
15 lawyer, or the district attorney.

16 Do you have any questions?

17 THE WITNESS: No, Ma'am.

18 GRAND JURY FOREPERSON: Okay. Thank you for
19 your time today.

20 THE WITNESS: Thank you.

21
22 [DISCUSSION OMITTED.]

23
24 [Matter adjourned at 10:31 a.m.]

(Confidential Grand Jury Proceedings)

[PROCEEDINGS OMITTED.]

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: Mr. Manegold, before
you have a seat, would you please raise your right hand
to be sworn.

WILLIAM MANEGOLD

having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. Mr. Manegold, for the record, can you please
state your full name, spelling your last name.

A. William, William Joseph Manegold,

1 M-A-N-E-G-O-L-D.

2 Q. What do you do for a living, Mr. Manegold?

3 A. Retired.

4 Q. How long have you been retired?

5 A. Since near the beginning of 2014.

6 Q. I'm going to pull this microphone down for you.

7 A. Thanks.

8 Q. What did you do before you retired?

9 A. I worked for PG&E for 35 years.

10 Q. In what capacity?

11 A. Different jobs. When I retired, I was, like
12 the sign said, supervising engineer, but I had a lot of
13 different jobs in the 35 years I worked there.

14 Q. All right. Let's start from the beginning.
15 Walk us through your educational background.

16 A. I have a, I have a, I have a BS in engineering,
17 civil and nuclear engineering, from UC Berkeley. I have
18 a master's degree in geotechnical engineering from
19 Berkeley.

20 Q. When did you get your bachelor's degree in
21 engineering?

22 A. December '78.

23 Q. You said you had -- your degree was in two
24 types of engineering, civil and technical?

25 A. Civil and nuclear.

26 Q. I'm sorry, civil and nuclear. And when did you

1 get your master's?

2 A. June of 1983.

3 Q. What is geotechnical engineering?

4 A. It's the study of soil and buildings and how
5 they work with civil structures from tunneling, to dams,
6 to building foundations, earthquake design, anything to
7 do with the earth.

8 Q. Are you a licensed engineer?

9 A. I am.

10 Q. And what fields are you licensed in in
11 engineering?

12 A. In California, mechanical and civil.

13 Q. Just to remind us, what does a mechanical
14 engineer do?

15 A. As a mechanical engineer, it's a wide field,
16 but what I did was I worked on analysis of piping
17 systems.

18 Q. When did you start working for PG&E?

19 A. January of 1979.

20 Q. Walk us through your PG&E career from the start
21 all the way up to 2005.

22 A. I started as a field engineer at Diablo Canyon
23 Nuclear Power Plant, as I did design work there as well
24 as oversaw construction of the facilities. I worked
25 there until 1982 when I transferred to our San Francisco
26 office and oversaw a design group also working on Diablo

1 Canyon. I worked there until the fall of that year when
2 I went back to school for my master's degree.

3 In June of 1983, I graduated, I went back to
4 work for PG&E. And at this time I was working at Diablo
5 Canyon Nuclear Power Plant again. And I worked there
6 until I think spring of 1984 when I took a job at the
7 Mechanical Engineering Department. And I worked on our
8 fossil fuel power plants. It would be like -- at the
9 time, that was the Pittsburgh Power Plant, Contra Costa,
10 Moss Landing, Morro Bay, and Avon, Martinez.

11 And then, after about I believe six months or a
12 year, I took a job as an estimating -- not estimating --
13 a design unit supervisor overseeing design of piping
14 facilities at all our power plants. And I worked there
15 until, I don't remember the year, it was '85, '86, I took
16 a rotational assignment in our Steam Generation
17 Department. That was the department of PG&E that ran the
18 power plants. And I worked on a system, a management
19 system that we installed in the plants trying to automate
20 how we did our work.

21 I came back to the Mechanical Nuclear
22 Engineering Department in the late '80s, I don't remember
23 the year, as an instrument and controls engineer. And I
24 did design, worked on the design of instrument and
25 controls systems for our Pittsburgh Power Plant.

26 In the late '80s we reorganized our system and

1 I took a new job as a design supervisor for our
2 electrical and mechanical systems at the power plants.
3 And I worked there until I think 1996.

4 And I took a job in our De Anza division in
5 Cupertino as the gas planner and project manager for
6 different sorts of relocation projects in De Anza.

7 And in 1998 I took a job in our Fremont office
8 as the supervisor of the design group that designed gas
9 and electric distribution facilities in Fremont, Newark,
10 and Union City.

11 In 2005, I took a job in our Gas Transmission
12 Department as a senior engineer in our system integrity
13 group.

14 And in September of, September-October time
15 period of 2006, I became the supervisor of the, of the,
16 of the Integrity Management Group in Walnut Creek. And I
17 worked there until I think June of 2011 when I
18 transferred to our Pipeline Safety Enhancement Program,
19 which was developed in the aftermath of San Bruno. I
20 worked there until I retired, ultimately retiring as a
21 supervising engineer.

22 Q. What is Diablo Canyon?

23 A. It's a nuclear power plant.

24 Q. Is it a nuclear power plant or the nuclear
25 power plant?

26 A. It's the only operating nuclear power plant in

1 the state of California right now, commercial nuclear
2 power plant.

3 Q. What was your jobs with the Diablo Canyon?

4 A. In the Construction Department, I did design
5 work for what we call small bore piping. And I also
6 oversaw projects like the reconstruction of pipe supports
7 for the containment spray rings at Diablo Canyon. And
8 I'm trying to remember what other products I oversaw. I
9 think we did some work -- after Three Mile Island we did
10 work on the, a new system, the reactor heading. In the
11 event of a melt down, hydrogen can built up to --

12 (Court reporter interrupted proceeding.)

13 A. To get the hydrogen from the reactor head. So
14 I oversaw some of that work.

15 Q. And what is a field engineer? What was your
16 job as a field engineer is probably a better way to say
17 it.

18 A. Those things that I just described.

19 Q. And you said later you were a mechanical and
20 nuclear engineer?

21 A. I worked in the Mechanical and Nuclear
22 Engineering Department.

23 Q. Okay. What is that?

24 A. It was the Engineering Department at PG&E that
25 did the, that did the responsible engineering work for
26 the nuclear and non-nuclear power plant at PG&E, which

1 included everything except for the hydroplant.

2 Q. During your career with PG&E, did you ever work
3 in the Electrical Transmission division?

4 A. No.

5 Q. All right. Now, we want to concentrate on your
6 time in the Integrity Management division of the Gas
7 Transmission. So 2005 to 2011; is that correct?

8 A. Yes.

9 Q. So describe for us further your first job when
10 you came into the Gas Transmission, the Integrity
11 Management Program.

12 A. The first job that I had was to review audit
13 change log in our GIS system. And I -- do you want me to
14 describe what that is?

15 Q. I was going to ask you, what is the audit
16 change log.

17 A. The audit change log was a computerized system
18 that tracked the changes to our GIS system on a daily
19 basis for fields that were important to the System
20 Integrity Group.

21 GIS, Geographic Information System, was a
22 mapping system that we used to track all our transmission
23 lines. And GIS is a system that maps things with
24 databases and allows you to add different layers,
25 depending on what you want to look at. So one layer
26 might be the physical arrangement of the pipeline, saying

1 that it runs down this street, that street. Another
2 layer might be this is where all the landslides are in
3 the area. Another layer might be these are all the
4 earthquake faults. Another layer was, and the one that I
5 was most concerned about, was pipeline features; things
6 like the pipe diameter, the seam type, the coatings, the
7 year the pipe was installed, the -- any test information
8 that had been transferred into GIS. And there's probably
9 60 or 70 other fields.

10 Then there are a whole bunch of other layers
11 that are, that may or may not be important to the work
12 that I did. But the system was widely used, and if there
13 was something that was important to the group, there
14 might be a layer associated with that. Might be things
15 like parcel data, like where houses are along -- within
16 our service territory that we would then lay down on top
17 of that map where all our piping facilities were in
18 relation to those buildings.

19 Q. Why is the audit, why is the audit change log
20 important to the System Integrity Group?

21 A. Probably forgetting, probably forgetting some
22 of the reasons, but the most, probably the most important
23 reason was to see on a fairly current basis what new
24 information that had come into the system might tell us
25 about plans that we already had in the works for the
26 pipelines. So if the pipeline diameter changed, that

1 could affect whether it was in a high consequence area or
2 not.

3 Under the System Integrity rule, which is what
4 the System Integrity Group was concerned about, the HCA
5 was defined, in large part, by the diameter of the pipe.
6 And so a change in that piece of information could change
7 whether we considered it in or out of our program.

8 Q. What does the Integrity Management Group do?

9 A. There's a whole bunch of stuff. I don't think
10 I could remember it all. But we described it in our
11 procedure, RMP 6, which was a document we prepared to
12 comply with the federal code of regulations for
13 pipelines, 49 CFR 192, Subpart O.

14 Q. All right. So you started off in the audit,
15 doing the audit change logs, then you said in 2006 you
16 were promoted?

17 A. That's correct.

18 Q. So what was your next job?

19 A. I was a supervisor of the group that I had been
20 part of.

21

22 (Grand Jury Exhibit 636 was marked for identification.)

23

24 Q. So I'm going to break this down. You have in
25 front of you Exhibit 636. I have it up on the big board.
26 Do you recognize Exhibit 636?

1 A. I recognize most of the names but not all of
2 them.

3 Q. Okay. Do you recognize what 636 is?

4 A. It's an organization chart.

5 Q. Okay. And an organization chart from May 14th,
6 2010?

7 A. That's what it says, yes.

8 Q. All right. So walk us through this. This is
9 for the Integrity Management Group; correct?

10 A. Correct.

11 Q. And who was the manager of the Integrity
12 Management Group?

13 A. Sara Burke.

14 Q. Did Sara Burke have another name that she used?

15 A. Well, Sara was married at one point and I don't
16 remember if Burke or Peralto (phonetic) is her married
17 name or maiden name.

18 Q. Okay. So Sara Burke and Sara Peralto are the
19 same person?

20 A. Yes.

21 Q. She at some point changed her name during the
22 time you were in the unit?

23 A. Yes, sir.

24 Q. All right. Sara was your boss; is that
25 correct?

26 A. In May of 2010, yes.

1 Q. All right. And then down below that, directly
2 below her, it says "Supervisor Supervising Engineer,
3 William Manegold." Is that you?

4 A. That is.

5 Q. And WJM8@PGE.COM, is that your email address?

6 A. It was, yes.

7 Q. Now, who were the other people, if you can tell
8 us?

9 A. Michael Boles, I don't recognize that name.
10 Alexis Jones-Anderson was the unit clerk. Frank Dauby
11 was the supervisor of the ILI group. And Kevin Armato
12 was the supervisor of the DA group.

13 Q. This is as of 2010?

14 A. May of 2010.

15 Q. Okay. Now, let's delve a little bit more into
16 yours, which is Exhibit 638.

17 A. 367?

18 Q. Maybe I put the wrong number on here. Should
19 be 637.

20 A. Okay.

21 Q. Put the wrong number on the slide, I'm sorry.

22

23 (Grand Jury Exhibit 637 was marked for identification.)

24

25 Q. Do you recognize 637?

26 A. I recognize this chart, yes.

1 Q. And what is Exhibit 637?

2 A. It's a list for the people who worked for me on

3 May 14th, 2010. That's what it says. I don't think it's

4 quite right, but --

5 Q. Okay. Why don't you think it's quite right?

6 A. I don't think Chang Liu worked for me in May.

7 And I don't remember that Jeremy did either. The other

8 names look right.

9 Q. Okay. So this is the division that you were

10 supervising in 2010?

11 A. In May, yes.

12 Q. And let's walk through the people. Who is

13 Janet Volker?

14 A. She was a gas engineer in our group.

15 Q. So is she an engineer?

16 A. Yes.

17 Q. A licensed engineer?

18 A. No, I don't think so. I don't think she had a

19 license.

20 Q. Trained engineer?

21 A. Yes.

22 Q. What is a Gas Technical Specialist?

23 A. I don't remember the form that I filled out to

24 create (NAME REDACTED's) position, but the work that he

25 did for us was support of our GIS System primarily.

26 Q. Okay. What is a Senior Application Support

1 Specialist?

2 A. Dave Baker supported a number of different
3 software programs that we used to provide field support
4 to our gas distribution system.

5 Q. What is a Gas Engineer Associate?

6 A. It's an entry-level engineering spot.

7 Q. That's occupied by someone named Calvin Lui?

8 A. Calvin Lui, yes.

9 Q. Is Calvin Lui an engineer?

10 A. Yes, he is.

11 Q. A licensed engineer?

12 A. Yes, he is, but I don't think he was at this
13 time.

14 Q. Okay. And what is Senior Transmission
15 Specialist?

16 A. R. L. Mulder also supported our GIS system.

17 Q. And then we have a Senior Consulting Gas
18 Engineer. What is that position?

19 A. Chih-Hung Lee did a number of things for us.
20 Probably the most important for System Integrity was he
21 was the lead author for our long-term Integrity
22 Management plans.

23 Q. And was Mr. Lee actually a licensed engineer?

24 A. Yes, he is.

25 Q. Okay. So let's talk about Risk Management now.
26 Define some terms. You've used the term HCA a couple of

1 times. Can you define that for us?

2 A. A HCA is a high consequence area. It's a, it's
3 an area around a pipeline that has enough people in it
4 that would be significantly impacted by a explosion to
5 the pipeline that the that the federal government
6 specifically defines it as an area that requires special,
7 that requires application of inspection rules under
8 Subpart O.

9 Q. Okay. So, so a place where there's a high
10 concentration of people, would that be fair to say?

11 A. High concentration of people within an area
12 that would be affected by an explosion of the pipeline.

13 Q. Okay. So downtown San Francisco, would that be
14 an HCA?

15 A. It would depend on the pipe, but most likely
16 yes.

17 Q. The middle of Death Valley, if there was a
18 transmission pipe running through there, would that be a
19 HCA?

20 A. If there was a visitor center, probably. If
21 there wasn't, probably not.

22 Q. Okay.

23 A. If it was near an area where a lot of people
24 would gather on a regular basis, then it would be. Like
25 a camping area, that could be an HCA, even in Death
26 Valley. And in San Francisco it might not be if the pipe

1 was small enough, because if the pipe was really small
2 the area that it affects would be small as well.

3 Q. So are there special rules, statutes, that deal
4 with inspection and maintenance of gas transmission pipes
5 in high consequence areas?

6 A. Yes, there are.

7 Q. Who make those rules?

8 A. The federal government.

9 Q. So those are codified?

10 A. And amended by the state governor.

11 Q. Okay. So talk to us about what is the job of
12 Risk Management.

13 A. So, like I said, our jobs -- I think I told you
14 when we spoke a few weeks ago, that the job changed with
15 time. In May our job was to identify HCAs, prioritize
16 them for assessment using risk management techniques;
17 identify threats to the pipeline; and then coordinate
18 remediation efforts after the assessments of pipelines
19 had been performed.

20 Q. When you say "risk management techniques," or
21 "risk assessment techniques," explain to us what you're
22 talking about.

23 A. The risk management techniques refers to how we
24 perform a risk analysis. There's different types of risk
25 analyses that are allowed under the code. There is
26 what's called SME method, which means subject matter

1 experts. The people that know the most about the thing
2 that you want to assess risk for will get together and
3 talk about all the things that go into causing a line to
4 be at risk. That's one kind of risk analysis.

5 Another kind of risk analysis is a relative
6 risk analysis. And that's one of the methods that we
7 used, is the second method we used. We used both subject
8 matter expert method that I just mentioned and a relative
9 risk method. And the relative risk method means that you
10 take a look at attributes of the pipe and you determine
11 not necessarily what the likelihood is of anything to
12 fail, but what the likelihood is that one thing will fail
13 before another.

14 So in a relative risk model, I could say, "I
15 think this thing in this component of the pipeline will
16 probably fail first, but I don't know if that's going to
17 be next year or a hundred years from now." I just know
18 that when I'm looking at things, I want to look at this
19 thing first.

20 Then there's probabilistic methods that
21 actually will tell you, yeah, there's a one-in-five
22 chance in the next year that this will fail. And those
23 kind of methods require a lot of information about the
24 pipeline.

25 And I think there's another method, too, and I
26 don't remember what it was. But we used primarily the

1 first two.

2 Q. All right. So when you referred to "when we
3 talked before," are you talking about the interview we
4 did with you in San Ramon a few weeks ago?

5 A. That's correct.

6 Q. That would have been myself, Investigator
7 Moore, and Investigator Haggerty?

8 A. Yes.

9 Q. And you've been interviewed about this stuff
10 multiple times; correct?

11 A. Yes, but not for several years, which is why
12 I'm kind of stumbling here a little bit.

13 Q. And you previously have been asked to testify
14 about all of these things in other court proceedings?

15 A. Yes.

16 Q. So one of the terms that, that you've talked
17 about in the past was "calculating and managing risk."
18 Can you explain that process to us first.

19 A. So we used risk analysis for, under the System
20 Integrity rules, for two things: One was to determine
21 which pipes we needed to assess first. And maybe I
22 should back up a little bit and explain a little bit
23 about the assessment process.

24 We have to, under the federal rules that were
25 passed in I think 2002, every pipeline, every
26 transmission pipeline owner needs to assess within ten

1 years all pipe that are within HCAs for risks as they are
2 prescribed in both the CFR 192 as well as in ASME B31.8S,
3 which is incorporated by reference into the code. And to
4 know which ones you're going to assess first, you need to
5 do a risk analysis, risk analysis so that you will
6 concentrate your assessment efforts on those that are
7 most at risk first. But all pipes need to be assessed in
8 the first ten years, then they need to be assessed
9 subsequently every, I think, seven years at a maximum,
10 and possibly more frequently, depending on what you might
11 find in your first assessment.

12 We used our relative risk assessment to make
13 that determination of which pipes needed to be assessed
14 first. And then once you've done your assessment, you
15 need to integrate the information that you got about that
16 assessment with all of the other information that you
17 have about the pipeline and make a determination as to,
18 one, when you're going to assess it the next time; and
19 two, what other remediation efforts you may need to
20 undertake.

21 So you may need to assess it in seven years,
22 but before the seven years is out, you may determine that
23 you need to recoat a pipeline or replace it. You may
24 need to put in ground movement monitoring stations. You
25 may need to do a number of different things.

26 So, so that's -- and that second risk analysis

1 is that subject matter expert, but that's what we did and
2 that's what my group did as part of risk assessment.

3 Q. Okay. Let's talk a little bit about assessing
4 risk. You said that in PG&E you used a relative risk
5 assessment; correct?

6 A. That was the first method we used, yes.

7 Q. If I understand right what you said, that means
8 you look at the likelihood of an event happening and the
9 consequences of the event happening; correct?

10 A. That's correct.

11 Q. So walk us through that.

12 A. You mean how we did it?

13 Q. What that means. How you'd assess something on
14 a relative risk.

15 A. Well, so the likelihood of an event is sort of
16 straightforward. It's what's the likelihood that a
17 particular part is going to fail.

18 It doesn't matter, as Marc said, whether it's
19 in Death Valley or San Francisco, what that number is
20 going to be. If -- you'll make some sort of a
21 determination. And in a relative risk model, again,
22 you're not saying it's going to happen this year or next
23 year, the year after, you're just going to say with a
24 relative risk model, "We think this piece is going to
25 fail before this other piece." And then the consequences
26 of that failure would be what would happen if it actually

1 fails.

2 And for the System Integrity rule, what they
3 were really looking at was, in defining HCAs, the pipe
4 blowing up. A double-ended rupture of the pipeline that
5 ignites. And then the pressure from the gas continues to
6 feed that fire.

7 And so there's all sorts of ways to calculate
8 the consequences, but for the work that we did in, in,
9 the risk analysis that we did for HCA work -- and I sort
10 of skipped over that we did risk analysis for non-HCA
11 work as well. But for the risk analysis that we did in
12 HCA work, we looked at the impact on people, whether --
13 how people would be affected by that event.

14 Other kinds of consequences, which weren't used
15 for our HCA analysis but were used for other work that we
16 did, might be what are the impacts on reliability to the
17 system? Would we lose gas to a certain town or area if
18 that line failed?

19 So those are other kinds of consequences, but
20 they weren't part of what we considered for the System
21 Integrity Program.

22 And when you take those two numbers together,
23 the likelihood of an event times the consequence, that's
24 how you wind up with the risk number.

25 Q. Okay. How do you prioritize assessments?

26 A. For -- we prioritize the highest risk items

1 first.

2 Q. Explain to us how this process works.

3 A. So under the federal code, it says you need to
4 assess the highest risk segments of your pipeline first,
5 but it doesn't tell you what a high-risk item is. Each
6 operator was left to their own devices as to figure out
7 what a high-risk number was.

8 For us, what we did was to assign weight to
9 each one of the threats that we looked at in our system
10 based on past leak history that we had. So, for
11 instance, the most common and usually the most dangerous
12 kind of leaks are third-party leaks, because -- they
13 happen because somebody hits the pipeline. And they tend
14 to be the most dangerous because somebody's right there
15 when it happens. The back hoe digs into the line or a
16 homeowner hits the service line with a shovel and the gas
17 comes out immediately and they're right there. Other
18 kinds of leaks -- and they also tend to be much larger.
19 If a back hoe hits a pipeline with a tooth and tears it
20 open, you get a tremendous amount of gas instantly.

21 Other kinds of leaks, like corrosion leaks, for
22 instance, might start out very small. You might get a
23 lot of warning. Somebody will call in and say, "I smell
24 gas in my neighborhood." And that could be true whether
25 that's a transmission line or distribution line.

26 So we weighed the different -- and I think I

1 may have wandered a little bit. Can you repeat your
2 question?

3 Q. We were just talking about how you prioritize
4 risk assessments.

5 A. So we look at all those things and we come up
6 with a number. And there are -- and those numbers are,
7 because it's a relative risk analysis, those numbers are
8 sort of arbitrary. We, we assign the numbers so that we
9 get a pretty big spread of numbers. We didn't want to
10 have -- there's about 25,000 pipe segments in PG&E's
11 system at that time, and we didn't want to have the
12 highest risk number to be 1 and the lowest risk number to
13 be .99 because we couldn't differentiate anything. So we
14 assigned the numbers so that we could get some spread.

15 And then we said, we took a certain percentage.
16 And I don't remember how exactly the number was arrived
17 at. I think it had to do with the number of standard
18 deviations above the mean. And we assigned all the pipe
19 segments that were above that number as high risk. And
20 we did those first.

21 But the intention was, again, that between 2002
22 and 2010 every pipe segment that was in an HCA would be
23 assessed and then every seven years after that would be
24 reassessed, at a minimum.

25 Q. You explained to us earlier what GIS is. Can
26 you explain to us the role of GIS in the risk management

1 and the calculating and managing of risk?

2 A. So it's two things. The -- but it's --
3 primarily, it's the location of the pipeline, which is
4 the mapping portion of GIS.

5 And then there's a database with the pipeline
6 attributes that I talked about. And those pipeline
7 attributes, primarily the diameter of the pipe and the
8 pressure determine whether, what the impact circle is,
9 how big an impact would occur if the pipeline were to
10 rupture. And then the, and then you count the buildings
11 and -- within that circle. And then the risk number
12 itself is arrived at based on a whole bunch of other
13 attributes, including the diameter of the pipeline, the
14 pressure in the line, the type of coating that it might
15 have, the leak history of the pipeline, the wall
16 thickness of the pipe. And I can't remember them all,
17 but there's probably 12 or 15 other attributes that we
18 looked at, maybe 20.

19 Q. Where do you find these attributes?

20 A. They're in GIS, but where we got them from
21 initially, we started with our Pipeline Survey Sheets as
22 well as project information.

23 So the GIS system was started in the mid '90s,
24 mid-early '90s.

25 Then, as projects and the Pipeline Survey
26 Sheets were returned, drawings that showed pipeline

1 attributes that were developed around 1970 to comply with
2 the new, what at that time was the new Pipeline Safety
3 Act of 1968, which required pipeline operators to
4 identify class locations along the pipeline and to make
5 sure that the pipelines were safely operating at certain
6 pressures within those class locations.

7 Q. How thorough was the information in GIS that
8 you needed for your risk assessments?

9 A. Could you be a little more specific about what
10 you mean by "thorough"?

11 Q. Were you able to find all the information that
12 you needed in the PG&E records to adequately assess risk?

13 A. We found what we needed to do to make the risk
14 assessment, but a lot of times that information was
15 assumed.

16 Q. One of those factors would be leak history;
17 correct?

18 A. Yes.

19 Q. And were you able to find leak history on
20 lines?

21 A. We did, but I don't know that it was complete.
22 And it was constantly being improved. And that's true
23 for all of GIS. It was started as a -- with a framework,
24 and it was built on as time went on, and it continually
25 got better.

26 Q. So explain to us the concept of assumed values

1 in GIS.

2 A. So it depends on the field that was involved,
3 but for some fields we wouldn't necessarily have
4 information, and we would make assumptions about the
5 value that, for that piece of data. I'd have to look at
6 the instructions which said this is, these are how we're
7 going to come up with assumed values. But, as an
8 example, I think, for instance, if we had a piece of pipe
9 in the ground and we didn't have a record to say what the
10 specified minimum yield strength was, the federal code
11 says if it's steel, you can assume that it will at least
12 have a strength of 24,000 pounds per square inch. And so
13 we would assume something like that. But that's very
14 conservative.

15 So, in addition to that, we supplemented that.
16 The code says there's -- as I'm talking I'm sort of
17 remembering some stuff. The code says that where you
18 don't have information, you can use information from a
19 book prepared by John Keefner in the, I think the late
20 '80s, maybe '90s, I'm not sure, about the history of
21 pipeline manufacturing in North America. And then if you
22 have reason to believe that you have better information,
23 you can use that.

24 And we used the information that was gathered
25 by two of our senior gas engineers who went back through
26 all our purchasing records and said, for instance, when

1 we had this size pipe, this is the minimum stress pipe
2 that we bought for any of our projects. It could go as
3 high as 60 ksi, but the lowest might have been 30 ksi.
4 So the 30 ksi value would have been the one that was
5 populated in GIS until we could show something better.

6 Q. So when you're assessing risk, you're looking
7 at the attributes of an individual pipe to determine the
8 likelihood of a failure; correct?

9 A. Correct.

10 Q. But the attributes that you're looking at
11 aren't real in many cases, those are assumed attributes
12 because PG&E didn't actually know what they had under the
13 ground; correct?

14 A. We thought they were conservative.

15 Q. Okay. But, first up, you didn't actually have
16 the information. PG&E didn't go out and examine each of
17 the pipes to determine what actually was underground;
18 correct?

19 A. Correct. Although, just to add on, that was
20 when we did the initial risk analysis. When we did the
21 assessments, we would pick up the pipe and look at it.

22 Q. So you kind of jumped the gun on me a little
23 bit there.

24 A. Sorry.

25 Q. Can you explain to us what it means that it's
26 conservative assumptions?

1 A. Well, conservative in that the assumption that
2 we made we thought would tend to result in a higher risk
3 number.

4 Q. And why is that important?

5 A. For purposes of the assessment, it would tend
6 to, it would mean that -- if it was high risk, it would
7 mean that it would be assessed in the first half of the
8 program.

9 Q. Okay. All right. So let's move on.

10 September 9th, 2010. Were you still in charge
11 of the Risk Management and HCA ID group?

12 A. Yes.

13 Q. What happened on September 9th, 2010?

14 A. Pipeline exploded in a neighborhood in San
15 Bruno and killed eight people.

16 Q. What kind of pipeline?

17 A. Steel pipeline. What do you mean?

18 Q. More general than that. Gas transmission?

19 A. Gas transmission line.

20 Q. All right. A PG&E gas transmission pipe?

21 A. Yes.

22 Q. And that's something that your group would have
23 been looking at; correct?

24 A. Yes.

25 Q. Assessing risk on; correct?

26 A. Yes.

1 Q. You said it killed eight people?

2 A. Yes.

3 Q. Destroyed at least 35 houses?

4 A. I thought it was higher, but yes.

5 Q. As a result, PG&E was charged with federal
6 felonies?

7 A. I don't think they ever tied the -- I think
8 that's what happened, but I don't think the Court ever
9 made that determination. I think the charges were not
10 about line 132.

11 Q. You testified as a witness in the federal
12 criminal trial?

13 A. Yes.

14 Q. You testified under a grant of immunity from
15 the United States Attorney; correct?

16 A. I did.

17 Q. Ultimately, PG&E was convicted of multiple
18 federal felonies, violations of the Pipeline Safety Act?

19 A. Correct.

20 Q. Okay. After San Bruno, you said sometime in
21 2011 you went to work in the Pipeline Safety Enhancement
22 Program?

23 A. I did.

24 Q. What was the Pipeline Safety Enhancement
25 Program?

26 A. It was a plan that, a program that initially

1 was conceived by PG&E and ultimately mandated by the
2 state for PG&E to upgrade its natural gas transmission
3 lines.

4 Q. This is something that was initiated in the
5 wake of the San Bruno explosion; correct?

6 A. Yes.

7 Marc, I'd like to go see my attorney, if I
8 could?

9 MR. NOEL: Okay.

10 THE WITNESS: Thanks.

11 MR. NOEL: Okay. I guess it's almost break
12 time anyway, so let's -- want to take a 15-minute break?

13 GRAND JURY FOREPERSON: Admonition first?

14 MR. NOEL: Pardon?

15 GRAND JURY FOREPERSON: Admonition first?

16 MR. NOEL: Yes. Absolutely.

17 THE WITNESS: To me?

18 MR. NOEL: She's going to give you an
19 admonition real quick.

20 GRAND JURY FOREPERSON: Mr. Manegold, you're
21 admonished not to discuss or disclose at any time outside
22 of this jury room the questions that have been asked of
23 you or your answers until authorized by the Grand Jury or
24 the Court. A violation of these instructions on your
25 part may be the basis for a charge against you of
26 contempt of court. This does not preclude you from

1 discussing your legal rights with your own attorney.

2 Mr. Manegold, what I have just said is a
3 warning not to discuss this case with anyone except the
4 Court, your lawyer, or the district attorney. Do you
5 have any questions?

6 THE WITNESS: No. I'm glad you told me that.
7 Thanks. I would have.

8 [DISCUSSION OMITTED.]

9 THE WITNESS: Supposed to tell me I'm still
10 under oath?

11 GRAND JURY FOREPERSON: Yes. You're still
12 under oath.

13 THE WITNESS: Thank you.

14 GRAND JURY FOREPERSON: Sorry.

15 Q. (By MR. NOEL) You've gone through this a few
16 times.

17 A. I have. I saw you looking like you were
18 expecting it.

19 There's one other thing I wanted to add about
20 the Org Charts that I should have mentioned before, which
21 is that Kevin had other duties besides being supervisor
22 of the DA under Sara.

23 Q. Okay. Thank you.

24 When we left off, we started talking about post
25 San Bruno, the Pipeline Safety Enhancement Program. You
26 were assigned to the Pipeline Safety Enhancement Program;

1 correct?

2 A. I was.

3 Q. What was your job within the Pipeline Safety
4 Enhancement Program?

5 A. I had helped develop the decision tree that was
6 used to decide which pipes were within the program and
7 which ones weren't. And I helped review and confirm the
8 projects that we would undertake to repair and replace
9 pipes. And I was ultimately in charge of the group that
10 determined the subset of projects from pipeline
11 replacement, where we looked at individual features along
12 the pipeline that posed significant individual risks,
13 things like Dresser couplings or wrinkle bends, or
14 historic pipe features that are, that reflect the
15 materials or types of construction that are no longer
16 used today and that we, we thought should be removed from
17 the pipeline.

18 Q. Describe for us in a little bit more detail
19 exactly what the Pipeline Safety Enhancement Program did.

20 A. There's a bunch of different parts of it.
21 There was a part that looked at installing automatic
22 shutoff valves around the system at key spots. That was,
23 again, in response to what happened after -- with San
24 Bruno.

25 There was a portion of it that looked at leak
26 surveying pipelines more frequently.

1 There was a section that looked at -- very
2 important part of the program was to hydrotest all
3 untested lines.

4 And then there was the portion that I worked
5 on, which was primarily pipeline replacement.

6 Q. So is it true that as a part of the Pipeline
7 Safety Enhancement Program, that PG&E did complete and
8 enhanced reinspections of the gas transmission system?

9 A. I wouldn't put it that way. Let me add one
10 other thing, too, another part of the pipeline safety
11 program. And I was to look at enhancing the information
12 that was in GIS. We talked before -- I talked before
13 about there was a lot of assumed values in GIS.

14 Q. We're going to get to that in just a minute.
15 Under the term lessons learned.

16 A. That was part --

17 Q. Part of the program was reinspection?

18 A. I included the hydrotesting, but the
19 inspections like we did under -- and we were making pipes
20 ready for ILI, but that all still stayed -- the ILI and
21 DA work that was done under System Integrity stayed under
22 System Integrity.

23 Q. Explain to us briefly what is the hydro
24 pressure testing you're talking about?

25 A. One of the things that was what the state
26 mandated after the explosion in San Bruno was that any

1 pipe that hadn't been tested to the requirements of
2 Subpart J, which is just a part of a federal code having
3 to do with gas transmission lines and how they are to be
4 tested with under pressure prior to being put into
5 service, it required that we test all lines that hadn't
6 been tested at code to that standard. And that included
7 pretty much, I would think, most of the pipes that were
8 installed before 1970, if not all of them, because that's
9 when the new federal rules came into effect and that's
10 when Subpart J was created.

11 Pipelines had been tested prior to that time
12 under state rules, but the state rules weren't as
13 rigorous as the federal rules.

14 Q. Why would a pipeline that was being used,
15 transmission pipeline that was being used, not have been
16 hydro pressure tested prior to the Pipeline Safety
17 Enhancement Program?

18 A. So it wasn't industry practice when PG&E first
19 started putting in pipelines in 19 -- gas transmission
20 pipelines in 1929, 1930, to do those tests. But in 1955,
21 '56, the American Society of Mechanical Engineers
22 developed a new standard for the construction and
23 operation of gas pipelines.

24 Q. Let me -- we'll get into that in a minute.

25 A. Okay. Sorry.

26 Q. The question is -- maybe I didn't phrase the

1 question right -- was hydro pressure testing available
2 before San Bruno?

3 A. Yes.

4 Q. Was hydro pressure testing used on the
5 transmission lines prior to San Bruno?

6 A. Prior to 2000 -- September 9th, 2010?

7 Q. Yes.

8 A. Yes.

9 Q. How often was it used?

10 A. For all pipes installed after 1970, it should
11 have been done. And for all pipes that were installed
12 after 1961, it should have been done. And for all pipes
13 installed after 1950, but to a lesser level. And most
14 pipes installed after 1956, it should have been done.

15 Q. Okay. But you had a lot of pipes that were
16 installed before 1956 that were still in service on
17 September 9th, 2010; correct?

18 A. Correct.

19 Q. And those were never pressure tested?

20 A. Most of them weren't. There are sections.

21 Q. Pressure testing was available?

22 A. It was.

23 Q. It could have been done?

24 A. Yes.

25 Q. The federal regulation actually mandated that
26 at some point you had to do that, correct, under certain

1 circumstances?

2 A. Under certain circumstances, pipelines that
3 were installed before 1970 do need to be pressure tested.

4 Q. But that wasn't the regular part of the
5 inspection process within PG&E?

6 A. Under the System Integrity rule, no, it was
7 not.

8 Q. You spent almost three years in the Pipeline
9 Safety Enhancement Program; correct?

10 A. Yes. Two and a half, yeah.

11 Q. From your experience, in Integrity Management
12 prior to San Bruno, through your experience in the
13 Pipeline Safety Enhancement Program, what lessons did you
14 learn?

15 A. The -- probably the most important lesson that
16 I learned was that, that if you haven't tested pipe, you
17 need to test it. I think that's the biggest lesson that
18 came out of San Bruno. And it was one I learned as a
19 result of San Bruno, and we applied in the Pipeline
20 Safety Enhancement Program.

21 Q. Okay. Other things we talked earlier, about
22 the GIS system and the attributes of pipes?

23 A. Yes.

24 Q. And those attributes were very important to the
25 risk assessment; correct?

26 A. They were important.

1 Q. And you said in a lot of times that those
2 attributes were assumed?

3 A. That's correct.

4 Q. And that they were what you thought were
5 conservative assumptions?

6 A. Correct.

7 Q. As part of the Pipeline Safety Enhancement
8 Program, did they actually go back and check the actual
9 pipes against the assumed values?

10 A. They did.

11 Q. What was the finding?

12 A. It varied. I don't -- there's no summary that
13 I can give you right here.

14 Q. Okay. Were what you thought were conservative
15 values determined to be conservative values in some
16 cases?

17 A. There were cases where they were not
18 conservative.

19 Q. Meaning that your entire risk assessment for
20 that section of pipe was off; correct?

21 A. Well, again, we were risk assessment, whether
22 it was high or low risk. And I can't say on a
23 case-by-case basis whether it was off or not. It still
24 might have been a different value, but it still could
25 have been labeled as "high risk," or might have been a
26 low value and it changed but it still remained a low

1 risk. I don't know. We didn't never do that kind of
2 analysis afterwards.

3 Q. Okay. How about leak records? What did you
4 learn about the leak records in PG&E's record-keeping
5 system?

6 A. Well, what we learned was that the -- and I
7 don't know that this was a, something that we didn't know
8 beforehand, but that GIS wasn't complete as far as the
9 number of leaks we had in the system.

10 I think I've talked to you about this before,
11 but if not, I'll tell you. We, at each time that we did
12 an assessment of a pipeline that had been labeled high or
13 low risk but required assessment under the Subpart O of
14 the, for System Integrity, the group that was doing the
15 assessment would go out and try to find all leak records
16 they could. So they would add to whatever was in GIS as
17 well.

18 Now, after San Bruno there were leak records
19 that were found that those groups doing their enhanced
20 look for leaks hadn't found either. So we found, we
21 found new leak reports that we weren't aware of.

22 Q. How important were historic leak records to
23 risk assessment?

24 A. For risk assessment, probably not real
25 important. For threat assessment, very important.

26 Q. That was going to be my next question. What is

1 threat assessment as opposed to risk assessment?

2 A. So the federal code references that ASME
3 standard I mentioned before. It identifies nine
4 different threats to a pipeline that an operator needs to
5 look at and manage. Most of those threats don't require
6 a particular assessment, like the DA and the ILI process
7 that I -- or even a hydrotest that I previously
8 mentioned. But some of them can't. If it's a, if it's a
9 stable type of a threat that becomes unstable, or if it's
10 a time-dependent threat, it needs to be assessed.

11 And leak records can be particularly important
12 for the, whether it's a stable or unstable threat.
13 Because things like a leak on a seam in a pipe, if there
14 is a leak on a seam and it's a particular type of a seam,
15 then that's considered to be a manufacturing threat
16 that's unstable. Not all leaks on seams are
17 manufacturing threats that need to be assessed, but some
18 are because the way that they can leak is by rupturing.
19 It's not an uncommon way for them to fail.

20 Q. So what exactly is a manufacturing threat?

21 A. There's a bunch of different ways to make pipe.
22 Today, the most common way today to make it is either a
23 seamless type of pipe, which means they -- I don't know
24 all the different ways that pipe can be made, but you can
25 take a big block of very hot steel and push a mandrel
26 through it and they'll make a pipe out of it.

1 For really big pipe, a more common method is to
2 take big plates or even rolls of steel, looks like a,
3 looks like a roll of toilet paper, but it's steel. And
4 they'll unroll that in a big factory, they'll send it
5 through a bunch of machines that will form it up into the
6 shape of a tube, and they'll press it together and apply
7 an electric current to it, and that will force that steel
8 together and fuse it and make the pipe. That's how it's
9 done typically today. But historically, there have been
10 a bunch of different ways it's been done. And some of
11 those ways, they work great, but when they fail, they can
12 fail catastrophically. And the manufacturing threat
13 assessment is particularly concerned about those types.

14 Q. So are there actually gas transmission lines in
15 the ground today with manufacturing threats, known
16 manufacturing threats?

17 A. There are pipes that have those kind of, that
18 were manufactured under those older techniques, yes.
19 Especially, because one of those techniques is what's
20 called the -- that last method I described where you take
21 this big tissue roll of pipe and you form into a cylinder
22 and then apply an electric current and push it together
23 and heat it up and melt it to make that, make that pipe,
24 it's called electric resistance welding. And that method
25 today is different than the way that they would have made
26 electric resistance welding pipe 50 years ago, something

1 like that. And that pipe is what's called "Low Frequency
2 Electric Resistance Welding Pipe," L-F-E-R-W. And that
3 pipe, because of the way that that seam is formed, it
4 tends to be more brittle and tends to be, it can have
5 cracks and flaws in it. And it can be great, but if it
6 fails, it can fail catastrophically. And there's a lot
7 of that around.

8 Q. So if you have a pipe in the ground, let's say
9 a 50-year-old pipe with a manufacturing threat being it
10 was, it was low intensity electrical, electrical
11 resistance welding, and you have a leak history, what are
12 you required to do?

13 A. If you have a seam weld leak on one of those
14 pipes and you have that kind of pipe in an HCA, whether
15 the leak was in the HCA or not, you need to assess that
16 seam's integrity.

17 Q. And how do you do that?

18 A. There's a couple different ways. It can be --
19 in certain instances, it can be assessed with an in-line
20 inspection. And it can always be assessed with a
21 pressure test.

22 Q. As part of your job, or as part of the Pipeline
23 Safety Enhancement Program, did you find examples of
24 documented historical leaks on lines that had
25 manufacturing threats that weren't known to you prior to
26 San Bruno?

1 A. PG&E might have. I don't know the answer to
2 that question, though.

3 Q. Did you find records of leaks that you, that
4 were unknown prior?

5 A. Yes. To make clear, Marc, there was a big
6 effort to look for those leak records. I just wasn't --

7 Q. Right.

8 A. -- I don't remember being involved with it. I
9 could have been, but I don't remember that.

10 Q. Well, one -- let's talk about one in
11 particular. What was the line that was involved in the
12 San Bruno explosion?

13 A. Line 132.

14 Q. Prior to the explosion, were you aware of any
15 leak history on line 132?

16 A. There were a lot of leaks on line 132.

17 Q. After, during the post Pipeline Safety
18 Enhancement Program, did you become aware of additional
19 leaks on line 132?

20 A. I remember very distinctly hearing about,
21 during the course of the NTSB investigation which
22 followed the explosion, of a leak that came to light on
23 132, yes.

24 Q. And prior to the explosion, you were in charge
25 of Risk Management and the Integrity Management Group;
26 correct?

1 A. Yes.

2 Q. And your job was to assess risks and threats to
3 the pipeline and prioritize inspections and maintenance;
4 correct?

5 A. Inspections, correct. There's a lot of
6 maintenance that goes on along the pipeline. It's
7 unrelated to the System Integrity Group.

8 Q. Okay. So at least in the case of San Bruno,
9 after the explosion you found out that there was a leak,
10 there was a historical leak on that line that you didn't
11 know anything about; correct?

12 A. That's correct.

13 Q. So that one didn't come into play when you were
14 doing your risk assessment on that line?

15 A. That's true. It would have -- I don't think it
16 would have made a difference in the risk assessment,
17 because we had already identified that line as a high
18 risk line due to the high consequences of a failure in
19 that area.

20 Q. And the San Bruno line was in a high
21 consequence area?

22 A. Yes.

23 Q. HCA?

24 A. Yes. One of the first lines we assessed.

25 Q. That line had never been pressure tested?

26 A. Not under Subpart J, no.

1 Q. Okay.

2 A. Not the part that failed.

3

4 (Grand Jury Exhibit 638 was marked for identification.)

5

6 Q. All right. Going to move on. And you have in
7 front of you Exhibit 638, an email. Do you recognize
8 Exhibit 638?

9 A. Yes.

10 Q. What is Exhibit 638?

11 A. It's an email that I wrote to my friend Wayne
12 Ciardella, and his response.

13 Q. Okay. Well, let's start off with defining some
14 terms. Who is Wayne Ciardella?

15 A. He was a friend of mine that had worked in the
16 Mechanical Engineering Department with me.

17 Q. A fellow engineer?

18 A. He was, yes. Is.

19 Q. Did Mr. Ciardella work for PG&E?

20 A. He did.

21 Q. And do you know where Mr. Ciardella worked in
22 PG&E at the time of this email?

23 A. He worked in the Safety, Health, and Claims
24 Department.

25 Q. Do you know what the Safety, Health, and Claims
26 Department is?

1 A. I don't -- I know that my interactions with him
2 as a supervisor previously had been when there were
3 employees that had workers' compensation claims.

4 Q. Okay.

5 A. And -- but he probably prepared a lot of the
6 safety materials for the company, too. I, I don't know,
7 though, that for sure.

8 Q. Don't want you to speculate. You said that the
9 two of you worked together previously in the Nuclear
10 Engineering?

11 A. In the Mechanical Engineering.

12 Q. Mechanical and Nuclear, I'm sorry.

13 What did Mr. Ciardella do in Mechanical and
14 Nuclear Engineering?

15 A. He was a supervisor in the instrument and
16 control group.

17 Q. So a few other things. Let's go through some
18 of these names. Who is Dan Curtis?

19 A. Dan Curtis was another friend of mine.

20 Q. Was Dan Curtis also a PG&E employee?

21 A. He had been, but he was not at this time. He
22 was a contract employee. He was contracted back to PG&E,
23 working for me.

24 Q. When Dan Curtis worked for PG&E, do you know
25 what he did?

26 A. He had been, he had also a bunch of different

1 jobs. His last job before he retired was the job that I
2 took when he retired.

3 Q. So you succeeded him in Risk Management HCA?

4 A. System Integrity at that time. Yes.

5 Q. System Integrity.

6 Okay. You said at this point he was working
7 for a contract with PG&E?

8 A. Correct.

9 Q. All right. Do you know which contractor?

10 A. Mears Cooperation.

11 Q. Now, you start off somebody named Glen. Do you
12 know who Glen is?

13 A. Glen is Glen Carter.

14 Q. Who is Glen Carter?

15 A. He was the -- I don't remember what his job
16 title was, if he was the manager or a senior director or
17 director, but he was in charge of the Gas Transmission
18 Engineering group.

19 Q. Okay. Next name, Chris Johns?

20 A. He was the president of PG&E.

21 Q. Somebody named Thach?

22 A. Thach.

23 Q. Thach, okay.

24 A. He was on -- you didn't ask me about him, but
25 he was one of the engineers on the organization chart
26 that we went through earlier for my group.

1 Q. Okay. Then later the name comes up, Peter?

2 A. Let me read it. I've seen this a million

3 times, but I haven't read it recently. Where is it?

4 Q. It's in Mr. Ciardella's response.

5 A. All right. Well, I'm speculating, but I think

6 he's talking about Peter Darbee.

7 Q. Who is Peter Darbee?

8 A. Peter Darbee the CEO of PG&E.

9 Q. So that would make sense, because you said

10 Chris Johns was the president of PG&E; correct?

11 A. Right.

12 Q. And Peter Darbee, the CEO, Chief Executive

13 Officer?

14 A. Right. CEO, Chief Executive Officer, of PG&E

15 Cooperation, I think.

16 Q. All right. Finally, Dick Clarke. I'm going to

17 assume that it's not the guy from the radio shows on New

18 Year's Eve?

19 A. I would make the same assumption.

20 Q. Do you know who Dick Clarke is?

21 A. I think he's -- but I don't know -- I think

22 he's talking about the CEO.

23 Q. All right. So as we've learned on the emails,

24 we start at the bottom, work our way up. Can you read us

25 your email that starts this conversation.

26 A. I sent this to Dan Curtis.

1 Q. Okay. Hold on. First, let's do the
2 foundational stuff. This is from you, William Manegold;
3 right?

4 A. Correct.

5 Q. When did you send this?

6 A. It says I sent it on October 21st, 2010, at
7 10:22 in the morning.

8 Q. So this is 12 days after the San Bruno
9 explosion; correct?

10 A. Sounds right, yeah.

11 Q. And you sent this to Wayne Ciardella?

12 A. Correct.

13 Q. Ciardella?

14 A. Correct.

15 Q. And the subject?

16 A. It says, forwarded, "I blew my chance."

17 Q. Okay. Now, go ahead, read it to us, your
18 email.

19 A. And I know I start out I said, "I sent this to
20 Dan Curtis. Glen brought Chris Johns to different
21 offices today, Thach was in a DIMP meeting, but I'm stuck
22 writing explanations on why something went up or down
23 from one year to the next in the top 100. Fortunately,
24 it's for someone else to explain why they never did
25 anything with any of them. And when they stopped by,
26 Glen said I could say what I thought. This was after an

1 explanation by Chris that we were looking at all our
2 processes. I said our problem wasn't our processes, that
3 we had a lot of well-maintained but old pipe and that we
4 should spend more to replace it and add people to manage
5 that spending. That well-maintained 1956 Cadillac is not
6 as safe as a new car."

7 Q. All right. So you're talking at this point to
8 Chris Johns, who is the CEO of PG&E; correct?

9 A. I had talked to him. I wrote -- by the time I
10 wrote this note.

11 Q. You're writing this describing your
12 conversation with Mr. Johns?

13 A. To Wayne and to Dan, correct.

14 Q. Right. Now, this referenced processes that
15 Chris -- "We were looking at all of our processes."

16 And your response, "I said our problem was our
17 processes."

18 What are you talking about?

19 A. I interpreted what Chris told me. And this is
20 -- I'm trying to remember what I thought in 2010, but I
21 -- what I remember is that I thought Chris was thinking
22 that we needed to change a lot of our procedures and
23 that, that is where our focus for post San Bruno needed
24 to be, was our procedures. And they were going to look
25 at all of them, change what they needed to change.

26 Q. And you disagreed with that?

1 A. Well, I did. It probably wasn't right. We
2 probably did need to look at a lot of our processes. A
3 lot of things probably did need to change. And they did,
4 of course, afterwards, but I thought it was the wrong
5 place to focus on initially.

6 Q. How about your reference to "old pipe." Would
7 you explain that to us?

8 A. I talked to you already about how they made
9 some of that older pipe. It's good, it's serviceable.
10 If it's cathodically protected, it can last a thousand
11 years, but it's not made as well as pipe that's made
12 today.

13 Q. Probably should have you define what you mean
14 by "cathodically protected." Probably start with
15 spelling cathodically for our court reporter.

16 A. C-A-T-H-O-D-I-C-A-L-L-Y. Cathodically. I
17 think that's right.

18 You put pipe in the ground or leave it out in
19 the air, and it's going to, if there's any moisture at
20 all, it will start to corrode. But you can put a current
21 on that pipe when it's buried in the ground, and you can
22 keep it from corroding. It can last -- like I said, it
23 can last, look brand new when you take it out of the
24 ground, clean off, clean it off. But pipe that's
25 cathodically protected since, say, 1940, you take it out
26 of the ground, it will look brand new.

1 And for gas lines, most gas lines, they can --
2 at the time I probably would have thought they could last
3 forever. I found out afterwards that that's probably too
4 long. But they can last more than a hundred years;
5 couple hundred years if they're properly maintained.

6 Q. You go on to say, "We should spend more to
7 replace it." Explain to us your thinking on that.

8 A. Let's see here. I want to read the sentence.
9 I've got to find it.

10 Yeah, I was thinking that the processes around
11 maintaining the pipelines is what, what Chris was talking
12 about. I didn't think that was the issue. I thought we
13 needed to replace more pipe.

14 Q. Okay. And you go on to analogize that "a
15 well-maintained 1956 Cadillac is not as safe as a new
16 car"?

17 A. Right.

18 Q. Can you explain that to us, please.

19 A. Well, just like a new car has all sorts of -- I
20 mean, you all have new cars. New cars have
21 collision-avoidance systems, when they get in a crash
22 they have crush zones, you wear seat belts. They have
23 better head lights. They have better braking lights,
24 better braking systems. Everything is better about a new
25 car than an older car, even a really well-maintained car.
26 A lot of great old cars, but for safety-wise, a new car

1 is better. And that's true in a lot of cases for pipe.
2 Some of those pipes that I talked about with those older,
3 older manufacturing methods, they're just not as good as
4 the pipe that's made today.

5 Q. So you said that even with those issues, with
6 seam weld threats and other manufacturing threats, that
7 if it those pipes are properly maintained, that they
8 should last over a hundred years; correct?

9 A. Yes.

10 Q. Properly maintained, does that include properly
11 inspected?

12 A. I don't think that's necessary to make them
13 last. I think it's necessary to ensure that the, that
14 the, that the maintenance systems that you have in place
15 are working.

16 Q. How do you maintain a pipe that's buried
17 several feet underground?

18 A. Well, as I was, as I was explaining about the
19 cathodic protection system, you can apply it, you can
20 impress a current on the pipeline, and you can make sure
21 that that pipe doesn't corrode.

22 Q. Okay. That's from the exterior. What about
23 from the interior?

24 A. If it's a dry gas, it's not going to corrode on
25 the inside either.

26 Q. What's the difference between a dry gas and a

1 wet gas?

2 A. Well, when gas comes out of the wells, there
3 can be a lot of fluids that are associated with them.
4 Natural gas comes out of the ground. It's pressurized in
5 rock formations, and they drill down and they release
6 that gas. And the, a lot of fluids often come up with
7 it. And those fluids have to be separated out.

8 Q. So would the PG&E gas transmission pipes have
9 dry gas or wet gas in them?

10 A. All the contracts that PG&E has I believe call
11 for dry gas.

12 Q. So what are the internal threats to Gas
13 Transmission pipes?

14 A. Well, if those, if those systems, to make sure
15 that you have dry gas break down, you can have corrosion
16 on the inside.

17 Q. Okay. All right. Let's go on, pick up where
18 we left off, the second paragraph.

19 A. "But, of course, they are going to spend more
20 dough anyway, so it was a wasted opportunity. What I
21 should have said was that in this review process don't
22 assume that the people working on this stuff now are
23 idiots that should be ignored, as seems to me has been
24 done. Secondly, let me know we are not prepared --
25 secondly, let him know we are not prepared for major
26 earthquakes. Oh, well."

1 Q. Why did it seem to you that people like Chris
2 Johns were assuming that you were all a bunch of idiots?

3 A. It's embarrassing to say it, but I was, I was
4 feeling sorry for myself. It's kind of stupid, but
5 that's how I felt that day. And, in any event, I think I
6 felt that because I was doing a lot of stuff that wasn't
7 involved in either looking at the accident, which I
8 thought was very important to understand what happened so
9 it couldn't happen anywhere else, and that there was a
10 lot of work going on that I thought was natural for our
11 group to be involved in and we weren't.

12 Q. Okay. Now, let's move up to Mr. Ciardella's
13 response to you. If you can read that to us.

14 A. "Excellent way you put it. Think about this as
15 I said, this is not the complete fault of Peter or Chris
16 since 2004, this is a deliberate and tragic strategy, a
17 bleeding problem that started with the completion DCP
18 and Dick Clarke. Five to 10 percent or more cutbacks
19 each year and funneling money out for other investments
20 outside of the infrastructure where it should have gone.
21 Money that engineers would have used to add safety
22 margins, replacements, et cetera over all these years.
23 And yes, maybe not meeting the authorized rate of return.
24 This problem is across gas and electric. I only thought
25 about electric and thought, I thought is just, is was
26 just there, but now we see the gas side, too. The piping

1 and valves and design. The old '56 Cadillac that runs
2 like a top but is not up to current standards and safety
3 criteria.

4 This is the near criminal fault of all the
5 financial people running the show since the 1980s. And
6 Peter and Chris continued that same philosophy,
7 therefore, are not free from fault.

8 This truth needs to be fully aired out to the
9 state and federal authorities."

10 Q. What was the DCPD?

11 A. Diablo Canyon Power Plant.

12 Q. Mr. Ciardella talks about 5 to 10 percent or
13 more cutbacks each year. Is that consistent with your
14 experience?

15 A. I don't remember that one way or the other.

16 Q. Okay. "Money that engineers would have used to
17 add safety margins, replacements, et cetera, over all
18 these years. And yes, maybe not meeting the authorized
19 rate of return." Do you agree with that statement?

20 A. I, I talked to Wayne a little bit afterwards.
21 I told him I did not agree with him.

22 Q. Okay. Why not?

23 A. I just hadn't seen that.

24 Q. Okay. Now, you had been in the System
25 Integrity Management since 2005; correct?

26 A. Correct.

1 Q. You had been a supervisor in that system since
2 2006?

3 A. Yes.

4 Q. We'll save this for a minute.

5 Now, before we get into the next stuff, let's
6 talk about the history of pipeline safety. If you could
7 walk us through the history of pipeline safety in the
8 state of California as well as the federal government.

9 A. So my knowledge is incomplete. I'll tell you
10 what I know. Some of the stuff that I tell you might be
11 wrong, but it's what I understand happened.

12 B31.8 is a, is an offshoot of a, of a national
13 standard that's maintained by the American Society of
14 Mechanical Engineers for the design and construction of
15 gas transmission/distribution lines. And I should know
16 this, but I, but it wasn't the group that I worked in. I
17 think it also covers offshore, some offshore piping as
18 well.

19 In 1955 or so there was a major effort to
20 upgrade that code. PG&E's involvement with that for a
21 goal point was Rosco Smith, who later became the head of
22 the gas department. He might have been the head at that
23 time. Was a member of that committee that promulgated
24 that standard so that when it was implemented as a
25 national voluntary standard, he brought it back to PG&E.

26 1961, the State of California enacted GO 112,

1 General Order 112, which governs how the state required
2 companies that ran gas lines to operate -- to build,
3 maintain, and operate those lines. They largely adopted
4 the ASME standard from 1958. I think the '58 standard
5 had been -- they had the standard in '55, and they had
6 enough experience after a couple years and they upgraded
7 it in '58. And the standard the state adopted in '61 was
8 based on that '58 standard. They added a lot of
9 requirements. The ASME code is a voluntary standard, and
10 the state added a number of different requirements. Like
11 I think, for instance, the length of time for a hydrotest
12 I think was part of that '61 change from the ASME '58
13 standard. I think the ASME standard required a pressure
14 test, but I don't believe it set a time period, you know.
15 I'm not sure. But, as an example, there were things that
16 were made mandatory in the '61 code that were not in the,
17 in the '58 code.

18 Then, as a result of a number of accidents, I
19 think especially sparked by a big explosion down in
20 Louisiana, the Pipeline Safety Act of 1968 was passed and
21 it went into effect in essentially in 1970. And PG&E
22 works under that system along with GO 112, which has been
23 updated to match the federal standard. Then they've
24 added, the state has added some additional requirements
25 on top of what the federal requirements are. They've
26 operated under those rules since that time.

1 Do you want me to say something about 2004?

2 Q. Yep.

3 A. So the federal rules are part of 19 -- 49 CFR
4 192. And there's a bunch of different parts to that.
5 And in 19 -- or in 2002, as a result of a number of new
6 explosions that said, that told the federal government
7 and the industry then all these safety rules that we've
8 had up to now weren't enough because these two events
9 happened. One was on a liquid line up in Bellingham,
10 Washington; one was on a natural gas line down near
11 Carlsbad, New Mexico. The federal government passed a
12 new Pipeline Safety Act, and that led to the rules that
13 are part of Subpart O, and that went into effect in 2004.
14 But the rule, because the law was passed in 2002, some of
15 the requirements of this 2004 act are retroactive to
16 2002.

17 Q. All right. Somewhere in the mid '50s -- '54,
18 '55, '56, somewhere in there -- the American Society of
19 Mechanical Engineers passes the new standard B31.8 for
20 gas transmission pipes nationally; correct?

21 A. Yes.

22 Q. One of the people involved in that you said was
23 Rosco Smith, who was the head of Gas Transmission for
24 PG&E?

25 A. Uh-huh.

26 Q. Remember, answer out loud for her.

1 A. Yes.

2 Q. All right. So prior to the new B31.8, there
3 was already gas transmission pipe in the ground; correct?

4 A. There was.

5 Q. So what happens to all that old pipe when 31.8
6 comes into play?

7 A. It depends. There's different parts of B31.8.
8 Some of them are for construction; they don't apply
9 because the pipeline's already built. But those that
10 apply to maintenance and operations would apply.

11 Q. Okay. So somewhere around 1958, PG&E adopted
12 the American Society of Mechanical Engineers' B31.8
13 standard for the company; correct?

14 A. '58, I believe so, but I -- the research that I
15 did indicated that.

16 Q. Okay. Then in 1961, the State of California --

17 A. Let me add that I think, I think they had also
18 looked at adopting the 1955 standard. But, again, I'm
19 not a hundred percent sure about that.

20 Q. Okay. 1961, the state adopts that standard?

21 A. GO 112. And they incorporated B31.8.

22 Q. And that's CPUC, in the California Public
23 Utilities Code, or Commission, General Order 112 that
24 we're talking about; correct?

25 A. Correct.

26 Q. Then in 1968, the feds adopt the first pipeline

1 safety, national pipeline safety laws; correct?

2 A. Yes.

3 Q. So in 1968 was there still pre B31.8 pipe in
4 the ground?

5 A. There is today.

6 Q. So pipe that was put in there, installed, and
7 is still being used that wasn't manufactured up to the
8 standards of B31.8; correct?

9 A. That might not have been correct.

10 Q. So how does that happen? How is that allowed?

11 A. I can't answer that question.

12 Q. Okay. Have you heard of what's called a
13 "grandfather clause"?

14 A. Yes.

15 Q. Okay. Was there a grandfather clause in the
16 federal legislation that allowed under certain
17 circumstances for preexisting pipes to continue in use?

18 A. Yes.

19 Q. Then in 2004, feds come back --

20 A. Yeah. The grandfathered -- to be a little more
21 specific, the grandfathering clause specifically applies
22 to what pressures you can operate those pipelines at.

23 Q. Okay. In 2004 we have the pipeline, the gas
24 pipeline integrity rules that are enacted by the feds;
25 correct?

26 A. Yes.

1 Q. And that included Subpart O?

2 A. Correct.

3 Q. What was Subpart O?

4 A. It's identified as the System Integrity Rule.

5 Q. Okay. And can you give us a brief description
6 of Subpart O.

7 A. It required an operator to identify pipelines
8 that are in high consequence areas and to inspect those
9 pipelines and to remediate what they find and develop
10 programs to manage those pipelines with rules that are
11 above and beyond what's required in the rest of the code.

12 Q. And were there special rules for pre B31.8
13 pipes, anything installed prior to 1955?

14 A. Not specific to that year, no.

15 Q. Okay.

16 A. Not that I am aware of.

17 Q. Were there specific rules for these aging and
18 older pipes that were still underground and still being
19 used in 2004, 2005?

20 A. I'm not sure what you're looking for.

21 Q. Well, were there any requirement that they be
22 hydrotested?

23 A. No.

24 Q. Any requirement of any type of enhanced
25 inspection for those older pipes?

26 A. Yes. And that could include it, but it didn't

1 require it.

2 Q. Okay.

3 A. Could include hydrotesting. It didn't require
4 hydrotesting.

5 Q. Okay. Explain to us.

6 A. What the rule required was that those pipes
7 that are in HCAs need to be assessed regularly for
8 time-dependent threats like corrosion, which if it's left
9 unmitigated will get worse with time. And the methods
10 that are, that the operator was allowed to use included
11 in-line inspections, direct assessments, other
12 technologies which aren't specified but was put in the
13 code because they understood that there might be things
14 that would be developed with time that weren't developed
15 at the time the code was written. And pressure testing.

16 Marc, can I take a break? I want to talk to my
17 lawyer.

18 Q. Sure.

19 A. Thanks.

20 Q. It's actually up to her.

21 GRAND JURY FOREPERSON: Okay.

22 THE WITNESS: William Manegold.

23 GRAND JURY FOREPERSON: Mr. Manegold, you are
24 admonished not to discuss or disclose at any time outside
25 of this jury room the questions that have been asked of
26 you or your answers until authorized by this Grand Jury

1 or the Court. A violation of these instructions on your
2 part may be the basis for a charge against you of
3 contempt of court. This does not preclude you from
4 discussing your legal rights with your own attorney.

5 Mr. Manegold, what I have just said is a
6 warning not to discuss this case with anyone except the
7 Court, your lawyer, or the district attorney.

8 THE WITNESS: Thank you.

9 GRAND JURY FOREPERSON: Thank you.

10 MR. NOEL: Take a brief recess. Come back in,
11 finish before lunch.

12 (Break taken.)

13 GRAND JURY FOREPERSON: We are ready to resume.
14 You're still under oath.

15 THE WITNESS: Thank you.

16 MR. NOEL: We make our record of we're all
17 here?

18 GRAND JURY FOREPERSON: We're all here. All
19 juror members are present and ready to resume.

20 THE WITNESS: I'd like to amend something that
21 I said earlier. Wayne had written that, about cutbacks
22 that had been going on since Diablo Canyon. And I said I
23 didn't agree with that. And I didn't. But I wanted to
24 make sure that at the time that I was in System Integrity
25 there were cutbacks.

26 Q. (By MR. NOEL) We're going to talk about that

1 in depth probably after lunch.

2

3 (Grand Jury Exhibit 659 was marked for identification.)

4

5 Now, next I want to call your attention to
6 what's on the deck in front of you, Exhibit No. 659. And
7 in the PowerPoint it is misnumbered as 688 -- or 668, I'm
8 sorry. It's actually 659.

9 Do you see that document?

10 A. Yes.

11 Q. Do you recognize that document?

12 A. I believe so.

13 Q. What is Exhibit 659?

14 A. It was a report prepared for the CPUC on our
15 Gas Transmission program mandated, I think, as part of
16 our -- the PUC.

17 Q. I have 659 up on the big board behind you. And
18 this is entitled the 2007 Gas Transmission Facilities
19 Risk Management Annual Report; right?

20 A. Yes.

21 Q. Did you play a part in the drafting of this
22 report?

23 A. I could have. I wrote it one or two years,
24 maybe three, I'm not sure. And before I wrote it, Chris
25 wrote it. I don't know if this is the one Chris wrote or
26 I wrote. Let's see, who signed it? Is it signed? Bob

1 Fasset. Probably I wrote this, but I'm not sure.

2 Q. Okay. You mentioned --

3 A. At least most of it.

4 Q. We'll get to the end of that. We'll get to
5 that when we get to the end of it.

6 Now, it starts off, "The mission of PG&E's
7 Integrity Management Program." You were part of the
8 Integrity Management Program; correct?

9 A. Yes.

10 Q. "And Risk Management Program." You were
11 actually the supervisor of the Risk Management Program;
12 correct?

13 A. Not at the -- well, I mean functionally, yes,
14 but I don't think that title existed in 2007.

15 Q. Okay. What would your title have been in 2007?

16 A. Probably Supervisor System Integrity Group.

17 Q. Okay. So why don't you read us the first
18 paragraph of this report.

19 A. "The mission of PG&E's Integrity Management
20 Program and Risk Management Program is to operate a safe
21 and reliable gas transmission system by ensuring
22 compliance with the Gas Transmission Integrity Management
23 Program Rule CFR 49 Part 192, Subpart O, and effectively
24 invest PG&E's resources in ongoing assessment,
25 investigation, and mitigation of the high-risk pipeline
26 in station facilities not cover by this rule. In 2007,

1 the IMP and RMP directed \$49,600,922 to projects focused
2 on achieving these goals."

3 Q. All right. Talking about the mission of the
4 program, in your experience, is that an accurate
5 depiction of your mission and the Integrity Management
6 Program?

7 A. I -- as part of the group effort, yeah, that's
8 what we did, and that's what I did.

9 Q. Now, the next section talks about Subpart O.
10 If you'd read that for us.

11 A. "On December 17th, 2003, the Office of Pipeline
12 Safety issued a new rule, CFR -- 49 CFR Part 192, Subpart
13 O, requiring integrity assessments for pipelines in high
14 consequence areas. Currently, 935 miles of PG&E's gas
15 transmission lines are in HCAs that need to be assessed
16 by December 17th, 2012. Due to the over testing required
17 to assess the HCA pipelines, approximately 2,200 miles of
18 PG&E's gas transmission lines will be assessed by 2012.
19 In spite of the scope of this rule, over 60 percent of
20 PG&E's transmission lines will not be assessed. The
21 higher risk pipelines in this population will continue to
22 be assessed and mitigated under PG&E's RMP."

23 Q. So explain to us what that means.

24 A. I don't know how far back to go. If I'm going
25 beyond when they invented the wheel, tell me. But PG&E
26 had two risk management programs that they worked to.

1 One was required by Subpart O, which I described to you
2 previously where the risk assessment was done primarily
3 to prioritize when we assessed pipes and when we didn't.
4 But starting in about 1985, we had approached the
5 Commission about developing a program to replace older
6 at-risk pipes, the Gas Pipeline Replacement Project, to
7 look at pipes that fell into the category that Marc
8 talked about that were made before these rules that went
9 into effect in 1970 or '61 mostly.

10 On the Gas Transmission side, that was focused
11 in the beginning in the mid '80s on pipes that were in
12 fault zones. We were particularly concerned that older
13 girth welds would be more brittle and might fail.
14 Usually a girth weld is not a point of failure on a
15 pipeline. But if in an earthquake, if it is brittle, we
16 were concerned it could fail. So we had gone to the
17 Commission in the mid '80s, and we had said on the
18 Distribution side there's this class of pipes we'd like
19 to replace, and on the Transmission side we'd like to
20 focus on pipelines in earthquake areas.

21 Q. Let me interrupt you real quick. You didn't
22 get involved in the Gas Transmission line business until
23 2005; correct?

24 A. I wasn't in the department, but I had done some
25 work before that.

26 Q. Okay. When you're saying, talking about in the

1 '80s, that "we," "we," "we"?

2 A. I'm talking about PG&E.

3 Q. Right. Okay. And you weren't involved at that
4 point?

5 A. Correct. But you were asking me for a history
6 of what happened.

7 Q. Not necessarily a history. We're talking about
8 what this means right here, that you've got --

9 A. I'm talking about the wheel. So to speed it up
10 then, what we said was that, when we came up with a new
11 risk program, that we were -- we came up with a new risk
12 program in the early 2000s that said we wanted to replace
13 pipe in more than just earthquake zones. And that's what
14 this is referring to.

15 Q. Okay.

16 A. This is not related to Subpart O, but it does
17 look at other pipes that might be at risk.

18 Q. All right. Next, "Both programs are directed
19 by the Risk Management Procedures, RMP." What is RMP 06
20 and RMP 01?

21 A. RMP 06 is the program document that defines how
22 we ran the risk management, how we did most of the work
23 the required under Subpart O. RMP 1 was the -- so under
24 RMP 6 might be this, this is how we're going to identify
25 HCAs, high consequence areas; these are the people that
26 are going to do the work; these are the qualifications

1 those people need to have; this is the training these
2 people need to have in order to do that work; this is how
3 we're going to do assessments. And it steps through each
4 of the requirements that were set out in Subpart O. And
5 it tried to address each one of those and identified the
6 people that were responsible for the different parts of
7 Subpart O and what they were going to do.

8 And it referred to other RMPs as well. For
9 instance, it might say, "ILI work will be done in
10 accordance with RMP 11." Then if you looked at RMP 11,
11 it would have the same thing, how we're going to conduct
12 ILI inspections.

13 RMP 01 was the document that was prepared
14 before there was a Subpart O. It described initially how
15 we were going to do the risk analysis for pipes that we
16 were to replace under that non-Subpart O portion of the
17 rule. The part that dates back to the 1980s, when we
18 first wanted to look at pipes that were at risk as
19 earthquake zones and expanded that to a broader group in
20 the early 2000 to look at pipes across the system that
21 might be at risk.

22 Q. All right. Next paragraph: "The risk
23 assessments that are utilized in these procedures were
24 developed and are being maintained using a deliberative
25 process that employs" what?

26 A. "Industry best practices for risk management

1 and steering committees composed of subject matter
2 experts and the Risk Management Team."

3 Q. What are industry best practices for risk
4 management?

5 A. Those are the kind of practices that are
6 described in B31.8S. B31.8S is the -- so at that time,
7 it included B31.8S, but it was developed before that
8 time. Did you want me to talk about that?

9 Q. No, that's good.

10 A. All right.

11 Q. What is a steering committee composed of
12 subject matter experts and the Risk Management Team?

13 A. The RMPs looked at risk. RMP 1 described the
14 overall risk program and defined how we determined what
15 the consequences component of that risk equation that
16 Marc had on the board earlier. Risk being the likelihood
17 of an event times the consequence. RMP 01 described
18 those consequences and how we would calculate them. And
19 they were different between these two programs. The
20 consequence portion, for instance, for, for the Integrity
21 Management Rule only looked at the impact on population.
22 The consequence factor for the, that earlier program,
23 looked at things besides population, like reliability.

24 And then RMP 2, 3, and 4 were this, which is
25 the -- looked at individual threats. And the steering
26 committees that you asked about are, are made up of

1 people who are experts in each one of those areas that
2 would participate in reviewing the, that risk analysis,
3 the risk analysis component, the weightings that we gave
4 them in calculating what the likelihood of failure was or
5 the consequence of failure, and they would revise them
6 based on their experience and based on what we would see
7 in the system.

8 Q. Is there a name for these steering committees?

9 A. Yes, but I don't remember what they all are.

10 Q. Is this something within the structure of PG&E,
11 within the structure of the Gas Transmission Division?

12 A. They were -- yes. And they're defined by these
13 RMPs.

14 Q. Next up, if you can read the next paragraph.

15 A. "Risk is calculated using a relative
16 calculation methodology that assesses individual pipeline
17 segments for both the likelihood and the consequence of
18 failure. The relative risk of each unique pipe segment
19 and calculated by integrating more than 30 different data
20 sets that are managed within PG&E's geographic
21 information system."

22 Q. This is what we were talking about earlier, the
23 relative risk calculation?

24 A. Correct.

25 Q. And that, the relative risk, comes from the GIS
26 system; correct?

1 A. The calculation of it.

2 Q. Calculation of it?

3 A. Almost all of it, but not all of it. We also
4 use data sets, data information that was outside of GIS
5 as well.

6 Q. Right. We already talked about that GIS
7 sometimes used assumed values?

8 A. Yes.

9 Q. And the GIS was missing leak information?

10 A. Some leak information, yes.

11 Q. And the other information was just completely
12 missing from GIS?

13 A. I didn't know that it said that. That's
14 probably -- that may be true, but I am not sure what
15 you're talking about right now.

16 Q. All right. And then we start going through
17 "project selected based upon two methodologies." Let's
18 see, we have anything else in here?

19 All right. Next paragraph, "Starting in 2004,"
20 if you can read this paragraph for us.

21 A. "Starting in 2004, PG&E began to make
22 significant investment in assessing the integrity of IMP
23 covered pipeline segments. Since many of the
24 highest-risk segments -- since many of the highest-risk
25 pipelines are covered by the IMP Rule, the voluntary
26 spending in the RMP decreased. However, there's a

1 substantial overall increase in pipeline safety resulting
2 from the combination of both programs."

3 Q. So, again, what is IMP?

4 A. Integrity Management Program.

5 Q. That's referring to the 2004, 2003 legislation
6 that went into effect in 2004 to federally include
7 Subpart O?

8 A. Right.

9 Q. So that created new requirements for you,
10 mandated new inspections that had to be done; correct?

11 A. Correct.

12 Q. So am I reading this right, that because of
13 that, because you had more inspections that were now
14 covered by the IMP, by Subpart O, that non-Subpart O
15 inspections had to decrease?

16 A. No. They're not talking about -- I don't think
17 -- I mean, it's been a long time since I read this and
18 wrote it. I think what it's talking about is the number
19 of pipeline replacement projects that were performed were
20 less.

21 Q. Okay. Says, "Voluntary spending and the RMP
22 decreased"?

23 A. It wasn't all replacements. I think there was
24 some work that overlapped what we did in IMP. I think,
25 for instance, cathodic protection surveys that would have
26 been done under the IMP program, if there were some, they

1 might have been less. Because I know we did some of
2 those even after, even after the rule went into effect.
3 And so those would have been less because we're already
4 doing those as part of the IMP.

5 Q. So let me make sure I got this straight.
6 Basically, we're talking about a zero sum gain, that if
7 you spend more on the left side, you spend less on the
8 right side, so it all balances out in the middle?

9 A. I don't think that's true.

10 Q. Okay. So --

11 A. But I'd have to look at the dollar numbers to
12 know that. I don't think that's true, though.

13 Q. But that's what it seems to be saying in here,
14 that because some of the highest risks are covered by the
15 IMP, the voluntary spending in the RMP decreased. So
16 because we're spending more in the IMP, we're spending
17 less on RMP?

18 A. That could be true without them being equal.
19 In other words --

20 Q. Okay. Well --

21 A. -- for this to go up, this, this might go down
22 a little, but it's not going to go down this.

23 Q. Okay.

24 A. To know for sure, you'd have to look at the
25 spent numbers for those years.

26 Q. Now this goes into the various programs. And

1 we're not going to go through each one.

2 All right. If you could read for us the
3 conclusion.

4 A. "After the eighth year of formalizing its Gas
5 Transmission Risk Program -- Risk Management Program,
6 PG&E continues to improve and expand its impact. A total
7 of \$49,600,922 was spent to evaluate and reduce the risk
8 to more than 5,766 miles of transmission pipelines. This
9 work included a system-wide review for over 13 miles of
10 new HCAs and an updated system-wide risk analysis to be
11 used in evaluating future projects. By December 17th,
12 PG&E had assessed 509 miles, or 56 percent, of PG&E's HCA
13 pipe and 83 percent, or 23 miles, of StanPac HCA pipe as
14 identified in their respective 2004 base assessment
15 plans. The federal requirement was to assess 50 percent
16 of our HCA piping by December 17th, 2007, and this
17 requirement was met."

18 Q. All right. So explain this requirement of 50
19 percent, 56 percent, 83 percent.

20 A. So for the -- the federal rule required that by
21 December 17th, 2007, five years after the law was signed,
22 which I think was December 17th, 2002, that the operators
23 that, that operated pipelines -- and PG&E operated them
24 under two ownership groups, one as part of PG&E the
25 company and one as part of a joint venture with Chevron
26 that dated back to the '30s, thus the name StanPac,

1 because Chevron used to be Standard Pacific or Standard
2 Oil. StanPac is PG&E. It required that in five years
3 that 50 percent of those lines be assessed. And that was
4 completed that year. In fact, we assessed, it looks
5 like, 56 percent of the PG&E pipelines and 83 percent of
6 the StanPac lines.

7 Q. What's StanPac?

8 A. That is that company, that joint company, that
9 I mentioned that's owned by PG&E and Chevron, and
10 operated by PG&E.

11 Q. Okay. All right. And so 50 percent by
12 December 17th, 2007. What about the other 50 percent?

13 A. That was scheduled to be finished by 2012.

14 Q. Okay. December 17th?

15 A. Yes.

16 Q. All right. And now, this includes a letter, a
17 cover letter that goes with it. And I just want to get
18 down to the bottom here. Who is Robert Fassett?

19 A. In July of 2008 he would have been my
20 supervisor. I think he was my supervisor at this time.

21 Q. Your direct supervisor?

22 A. I believe so. Sara Burke, slash, Peralta
23 became my supervisor, but I didn't think she became
24 supervisor until that fall or maybe even 2009. I'm not
25 sure. In fact, I think -- I don't know. I don't know.
26 I don't remember. But at one time he was my direct

1 supervisor.

2 Q. All right. So let's talk about pipelines,
3 pipeline inspection programs. And first, before,
4 probably leading us up to lunch, let's talk about the
5 inspection methods available and define them and discuss
6 each one.

7 Now, to start with, what are the utility -- the
8 universally accepted standard methods for inspecting gas
9 transmission pipe?

10 A. So I think I talked a little bit earlier about
11 how there are a number of different threats that we look
12 at on a pipeline. There's nine of them.

13 Q. Right. We're going to get into that in a
14 second. But let's just talk to --

15 A. But it relates to the inspection methods.

16 Q. That's what we're going to talk about in a
17 minute, is how we -- how we associate methods of
18 inspections with threats.

19 A. Right.

20 Q. But right now we just want to go into --

21 A. So direct assessment is a method of looking at
22 different types of corrosion. It's a way to assess
23 whether a pipeline is susceptible or has problems with
24 external corrosion or internal corrosion or stress
25 corrosion, cracking.

26 Q. So describe for us what would go into a direct

1 assessment of a gas transmission pipe?

2 A. There are tools used to, to -- it depends on
3 whether it's internal, external, or stress corrosion,
4 cracking. But for external corrosion, it involves
5 looking at the cathodic protection system. And then
6 there -- tools are used to go along the pipeline and
7 measure how effective that cathodic protection system is
8 working. And where there are indications that it's not
9 working as well, those spots are identified. They call
10 out types of anomalies they find along the pipelines
11 using those tools. Then they dig them up and examine
12 those anomalies and repair them as necessary.

13 Q. So how do you assess something that is buried
14 underground?

15 A. So these indirect tools let you look at how
16 well that cathodic protection system is working. I think
17 I mentioned earlier that if you have effective cathodic
18 protection system, the pipe isn't going to corrode. And
19 these tools, even though the pipe is buried, let's you
20 look and see is that system working or not.

21 There are some other tools, too. They look at
22 what condition the coating is in. I'm not an expert in
23 DA, but I was familiar with the product they produced.
24 And I, I went along on different inspections and, et
25 cetera, but I may be leaving things out.

26 Q. Next, what is in-line inspection?

1 A. In-line inspection is when you put what's
2 called a "pig" into the pipeline and you, through
3 different types of tools, inspect either the geometry of
4 the pipeline, you might want to look and see if somebody
5 -- I talked before about how oftentimes the most
6 dangerous kind of damage is third-party damage because if
7 it breaks through the pipeline, the person is right
8 there, they can get injured right when it happens. They
9 don't have time to get away from whatever it is that
10 fails. And in-line inspections can look at deformities
11 or, or where the pipe's been hit or damaged. There's
12 other types of pigs that can look at where there's metal
13 loss in the pipeline. And of those metal loss tools,
14 these so-called "smart pigs," there's different kinds of
15 them, some that are better at looking at axial flaws,
16 some better at looking for radial-type flaws.

17 Q. Finally, what is hydro pressure testing?

18 A. There's different-- hydro is one type of
19 pressure testing that's allowed, it's the most common,
20 and it's where you fill the line with water and you
21 pressurize it to some value above what you normally
22 operate the pipeline at with the idea being that if it
23 can operate at a higher value than what it normally
24 operates at, then it's proved itself safe to operate at
25 the pressure you've designated as the normal operating
26 pressure.

1 Q. CFR 192.921, Subpart A. "An operator must
2 select the method or methods best suited to address the
3 threats identified to the covered segment"?

4 A. Right.

5 Q. Is that an accurate summary of Subpart A?

6 A. I'd have to pull out the book to be sure. But
7 it sounds right.

8 Q. Okay. How do you select the appropriate method
9 or method of inspection based upon the threats
10 identified?

11 A. If it's a -- some tools are good for assessing
12 some threats. There's an overlap among the tools. For
13 instance, DA, ILI, and hydrotesting can all check for
14 significant corrosion damage. Some tools are not good
15 for types of threats. If one of the threats that is
16 identified is a seam threat on the pipeline -- I talked
17 about how the pipes are made together, if you make the
18 seam. There's older types of pipes that were made that
19 had a seam that wasn't necessarily as good. Some of
20 these -- one of these inspection methods, in particular,
21 direct assessment, is not a tool that you can use to
22 inspect for that kind of a threat if you need to assess
23 for it. And ILI is a tool that can sometimes assess for
24 it and sometimes can't. It depends on the pipe.

25 Q. So let's talk about that, because we have spent
26 some time with it. If you have a pipe with a known

1 manufacturing threat, for instance a seam weld, an ERW
2 seam weld, under 192.921 A, what would be the best method
3 of inspecting that pipe?

4 A. Depending on -- could be either in-line
5 inspection or pressure testing.

6 Q. But direct assessment would not be the
7 appropriate method?

8 A. Correct. If it needed to be assessed.

9 Q. How do you make a determination if a pipe has a
10 manufacturing threat?

11 A. Not all threats need to be, not all
12 manufactured threats need to be assessed, but a
13 manufacturing threat is defined in both the B31.8S and in
14 the CFR 192, Subpart O, under "Threat Identification,"
15 which is, I think, section 917.

16 Q. Other than manufacturing threats, what are the
17 other threats that you'd be looking at to determine the
18 inspection method to use?

19 A. External corrosion, stress corrosion, cracking,
20 internal corrosion, and -- let's see -- I think that's
21 it. There are other threats to the pipeline, but they're
22 managed through other means than these tools.

23 Q. Right. Things like external threats, no amount
24 of inspection is going to lessen or account for; correct?

25 A. Correct. Even third-party damage, which can be
26 assessed for under ILI, is normally handled through the

1 management of excavation programs around the pipeline.
2 The USA program that you've all hopefully heard about,
3 "You call before you dig," that's part of that effort.

4 Q. So walk us through how you would assess the
5 threats and identify the best inspection method available
6 to deal with, to deal with threats on a segment of pipe.

7 A. It's described in RMP 06. And I don't have it
8 in front of me. And it's been a while since I've looked
9 at it. But threats, the nine threats to the pipeline are
10 divided into three categories, those that are
11 time-dependent need to be assessed if they affect the
12 pipe. The three time-dependent threats are the types of
13 corrosion.

14 PG&E had said that because all our pipes are
15 made of a ferrous material, steel or cast iron, that they
16 all need to be assessed for external corrosion. The
17 internal, whether they are susceptible to a threat of
18 internal corrosion and external corrosion, is the process
19 that is developed in RMP that I'm not real familiar with.
20 It would have normally -- that work would have normally
21 been performed outside of my group. And the product
22 would have given us, been given to us and we would have
23 just been told this line has internal-corrosion threat or
24 this line has stress-corrosion cracking threat. That's
25 the time-dependent threats.

26 Then the time -- then the stable threats that

1 do need to be assessed, the manufacturing threats are the
2 seam weld threats, would have come to us through leak
3 histories and through pressure monitoring.

4 If a line is -- there are some rules, and I'm
5 sure Marc will go through them a little later on, but
6 when a pipeline exceeds a certain, that's susceptible to
7 one of these manufacturing threats that has a seam that
8 needs, that can potentially have an active threat, sees a
9 pressure higher than it should see, then that threat
10 becomes activated, then they need to be assessed for.
11 That's one criteria. Then the other criteria would be is
12 if it has a history of leaks on the seam.

13
14 (Grand Jury Exhibit 639 was marked for identification.)
15

16 Q. I'm going to pull up and I have in front of me
17 Exhibit 639. Do you see Exhibit 639?

18 A. I do.

19 Q. Do you recognize Exhibit 639?

20 A. No.

21 Q. Okay. Well, let's walk through Exhibit 639.
22 It's up on the board.

23 A. Okay.

24 Q. "Decision Making In-Line Inspection Versus
25 Direct Assessment." That's the title of 39; correct?
26 639?

1 A. Yes.

2 Q. Presented to NACE External Corrosion Direct
3 Assessment Seminar. Do you know what that is?

4 A. I don't know what the seminar is. I know what
5 NACE is.

6 Q. What is NACE?

7 A. NACE is the National Association of Corrosion
8 Engineers.

9 Q. And this was presented by Robert P. Fassett,
10 Pacific Gas & Electric. Do you know Mr. Fassett?

11 A. Yes.

12 Q. Who is Mr. Fassett?

13 A. I believe I said he was my supervisor. And at
14 this time I think that was still true.

15 Q. Okay. It says on here, "Director Integrity
16 Management and Gas Issues, Pacific Gas & Electric." Was
17 that his position?

18 A. I don't know, but it sounds right.

19 Q. So this appears to be a presentation by
20 Mr. Fassett comparing in-line inspection versus direct
21 assessment; correct?

22 A. Yeah.

23 Q. So the introduction, "The decision as to what
24 technology to utilize for the baseline inspection of a
25 pipeline within an HCA must take into consideration a
26 number of criteria"; do you see that?

1 A. Yes.

2 Q. Do you agree with that statement?

3 A. Yes.

4 Q. What is a baseline inspection?

5 A. It's the first inspection done under that
6 Subpart O rule that we talked about.

7 Q. So one of those inspections that had to be done
8 between 2004 and 2012?

9 A. Actually, 2002. Some inspections that were
10 performed prior to the introduction to the rule can be
11 counted under the rule as meeting the requirement. As
12 long as it was done between 2002 and 2004 -- 2012.

13 Q. So goes on, "Subpart O of CFR 192 has some
14 sections which are prescription -- prescriptive.
15 However, it is mostly a performance-based standard which
16 allows gas transmission pipeline operators flexibility in
17 meeting the regulations as long as they can demonstrate
18 that they are operating a safe pipeline."

19 Do you agree with that statement?

20 A. Probably not.

21 Q. Why not?

22 A. Well, there are parts of regulation that allow
23 a operator to implement a performance-based program, but
24 we weren't one of the companies utilizing that system.
25 And it's separate from the -- we were using the
26 prescriptive work rule, and it is separate from

1 performance-based program. That's how I would read it.
2 I didn't write it, so I don't know what, exactly what Bob
3 means.

4 Q. What is a performance-based standard?

5 A. A performance-based standard under the rules
6 would be, these are the kind of results we're getting,
7 everything is working great, so we don't need to assess
8 quite as often. The prescriptive part of the rule would
9 say you can't -- you have to assess everything every
10 seven years after that first baseline assessment. And in
11 some cases every five years or less. But there are -- it
12 says, you know, you have to do this. You can't go beyond
13 seven years. Under a performance-based system, it could
14 be longer. But I don't know -- but PG&E didn't use that.

15 Q. Basically under a performance-based, as long as
16 it's operating safely, you don't have to inspect it?
17 Wouldn't that be a --

18 A. No. Well, you don't have to do the DA work.
19 There may be other requirements. Again, we didn't use
20 it, so -- and I'm talking about what I read into the
21 code. Again, I don't know what Bob means when he's
22 talking about this here.

23 Q. "Additionally, the methodology and technology
24 selected must be that which is best suited to address the
25 threats to a given pipeline section."

26 Do you understand that sentence?

1 A. I think he's referring to the section of the
2 code that you referenced earlier.

3 Q. I was going to say, that sounds a lot like the
4 language from 192. -- 192.921, Subsection A; correct?

5 A. That sounds right. Again, I just don't -- that
6 code section I don't have memorized.

7 Q. Do you agree with the statement in this
8 sentence?

9 A. I'd want to pull up the language of the code to
10 compare it to it. It sounds like, it sounds like that's
11 true. But, again, I want to have it right side by side.

12 Q. Okay. Let's go on. What's DOT?

13 A. Department of Transportation. PHMSA falls
14 under the umbrella of the Department of Transportation.
15 The Pipeline Hazardous Material Safety -- I can't
16 remember what the A is. But, in any event, all the rules
17 fall -- this rule is -- the Pipeline 192 is a DOT rule.

18 Q. We probably need to stop and define that. I'm
19 getting sideways looks from our court reporter. PHMSA is
20 P-H-M-S-A. And what is it, Pipeline --

21 A. -- Hazardous Material Safety Administration, I
22 believe.

23 Q. All right. So part 192.919. Will you read
24 that to us.

25 A. States, "The methods selected to assess the
26 integrity of the line pipe, including explanation of why

1 the assessment method was selected to address the
2 identified threats to each covered segment."

3 Q. And down below.

4 A. "Currently, pipeline operators have no industry
5 guidance on the assessment method to comply with
6 regulations and ensure pipeline integrity."

7 Q. Do you recall if that was true?

8 A. I would not agree with that statement, no.

9 Q. Basically when this was done in 2008, there was
10 -- what would be industry guidance?

11 A. B31.8.

12 Q. Okay. Okay. So you don't agree that there was
13 no industry guidance on the assessments that could be
14 used to comply with regulations and ensure pipeline
15 integrity?

16 A. In my opinion, no, but I don't know what Bob
17 was thinking of. Sure, if he gave this as a
18 presentation, he talked about it in addition to having
19 the slides.

20 Q. Right. We don't care about what Bob was
21 thinking. We're just going through with your impression
22 and helping us to understand this and whether you agree
23 or disagree with it.

24 A. All right.

25 Q. I think we're going to jump down to page 7,
26 PG&E draft process. Do you understand what the, this

1 section is talking about?

2 A. I'm not sure. I think so, but I'm not sure.

3 Q. Okay. There's ten things listed on this
4 presentation. Do you recognize any or all of those ten
5 items?

6 A. Yeah, although I can't explain all of them
7 anymore -- each one of them anymore, but I can explain
8 some of them.

9 Q. Okay. Let's start off with do you know what a
10 failure curve is?

11 A. That I can't give you good definition of. I
12 know it was -- and I can -- okay. No, offhand, I can't.
13 I'll let you ask the questions.

14 Q. How about CP shielding?

15 A. Yes. Cathodic protection shielding. The way
16 cathodic protection works is you apply a current to the
17 pipeline. And by applying that current, it completes a
18 circuit back to the point where your, the current
19 originates from by going, the current throwing along the
20 pipeline from outside the pipeline. And if the pipeline
21 is prevented from having the current come onto the
22 pipeline, that's called shielded, and it means that the
23 cathodic protection system won't work.

24 Q. Pig-able?

25 A. That means whether you can run one of the -- I
26 think it's talking about whether you can run one of those

1 smart pigs through the pipeline. There's all sorts of
2 different kinds of pigs, but the one that would have been
3 of interest for purposes of anything to do with System
4 Integrity would have been a smart pig.

5 Q. External corrosion threat?

6 A. It means the threat that the pipeline had to
7 external corrosion. Although plastic transmission lines
8 are allowed under the rules, they wouldn't necessarily be
9 susceptible to external corrosion, but steel pipelines
10 are.

11 Q. Internal corrosion threats?

12 A. We've talked about that already. That's the
13 threat of the pipe corroding from the inside out.

14 Q. CP interference?

15 A. That would be where you have two pipelines that
16 are right next to each other, they have their own
17 protection systems. One might be by company A, one could
18 be by company B. And they each have a cathodic
19 protection system that they applied. And those systems
20 can interfere with each other. The current can actually
21 cross from one pipe to the other. They can dig a hole
22 into the other pipe. That CP interference is talking
23 about the conflict between those systems.

24 Q. Long seam threat?

25 A. That refers to pipes that have a manufacturing
26 threat along the seam.

1 Q. Third-party damage?

2 A. That's dig-ins to the pipeline from people
3 operating around the pipeline.

4 Q. Ground forces threat?

5 A. That could be landslides, in California. And I
6 mentioned it in my email, earthquakes.

7 Q. And DA-able?

8 A. Means can the pipeline be DA'd? If there's a
9 lot of shielding, if there's -- there are times when,
10 even with just external corrosion, DA would not be an
11 appropriate technique.

12 Q. Go ahead, read to us the next paragraph.

13 A. "Although the TG is still in its infancy, PG&E
14 went ahead starting to revamp the tool selection process
15 we use internally. The new selection process at PG&E is
16 not finalized yet, but the following slides and
17 discussions are what make up the draft. These slides
18 make up the items PG&E is considering in the final draft
19 of our Risk Management procedure to address the tool
20 selection."

21 Q. What is TG, if you know?

22 A. I don't. I don't know.

23 Q. We've talked a little bit about failure curves.

24 Next page, page 8. Do you recognize?

25 A. Yes.

26 Q. What is this?

1 A. It's a curve. It's a series of curves showing
2 how -- when a pipe fails -- the most important part of
3 this curve is this one right here.

4 Q. So that's the --

5 A. Pipes that are --

6 Q. Darkest?

7 A. Pipes that have flaws that are on this side of
8 that line will tend to fail by rupture; those that are on
9 this side of the line tend to fail by leak. Rupture is
10 much more hazardous.

11 Q. When you say "this side," there's this dark
12 line that's marked M-A-O-P; correct?

13 A. Correct.

14 Q. When you say less likely to rupture, you're
15 talking about above that line?

16 A. No, this line right here.

17 Q. Right. Okay. Now you're talking about the
18 dark side?

19 A. Anything on this side is likely to fail by
20 rupture. That's what this mark is right here. Anything
21 on this side is chanced to fail by leak.

22 Q. The problem is she can't tell which is "this
23 side." So there we go. I'm going to give you a pen. So
24 now you can write on this. We've got all different
25 colors.

26 And, first, let's talk about the line we're

1 talking about. Make that red. Trace the line you're
2 talking about.

3 A. The leak versus rupture line.

4 Q. Okay. You've now traced that line in red.
5 We'll switch off to blue.

6 So when you're saying this side -- yes, this
7 side -- no, let's use some blue, another colored ink to
8 define terms.

9 A. Blue is where it's going to fail by leaking.

10 Q. Okay. Now green.

11 A. Green is where it's more likely to fail by
12 rupture.

13 Q. Okay. What part did this dark line that says
14 MAOP play in that calculation?

15 A. The -- what this is saying right here is that
16 the higher the -- well, let's see. That these curves are
17 different for each MAOP. And for this area for Maximum
18 Allowable Operating Pressure and this flaw depth in here,
19 that's indicated in the upper right side of this graph,
20 it's saying that this is the leak-versus-rupture line
21 that you're going to get.

22 Q. Okay. So this is something that somebody at
23 PG&E presumably would plot out these failure curves for
24 segments of line?

25 A. I don't think that's what happened with this.
26 I think this is from another report that's, that -- I

1 don't know that, but I know that as we're talking about
2 this, I do remember working on a process to, that was
3 referenced in one of the other slides about how we're
4 developing this new methodology for selecting inspection
5 tools. And I do remember looking at different failure
6 curves, and they were not anything PG&E developed, they
7 were from industry papers.

8 Q. Okay. All right. And we have saved your work,
9 and we will mark that later as --

10 A. Worthless.

11 Q. Nope.

12

13 (Grand Jury Exhibit 639A was marked for identification.)

14

15 GRAND JURY CLERK: 639A.

16 MR. NOEL: Yep. 639A.

17 It's now 11:59, so let's take a break for
18 lunch.

19 GRAND JURY FOREPERSON: Okay.

20 MR. NOEL: Okay?

21 GRAND JURY FOREPERSON: Yes.

22 MR. NOEL: You can read him the admonition.
23 He's getting used to this. He's already waiting.

24 GRAND JURY FOREPERSON: I could read it right.

25 THE WITNESS: I like to hear you talk.

26 GRAND JURY FOREPERSON: Thank you.

1 Mr. Manegold, you are admonished not to discuss
2 or disclose at any time outside of this jury room the
3 questions that have been asked of you or your answers
4 until authorized by the Grand Jury or the Court. A
5 violation of these instructions on your part may be the
6 basis for a charge against you of contempt of court.
7 This does not preclude you from discussing your legal
8 rights with your own attorney.

9 Mr. Manegold, what I have just said is a
10 warning not to discuss this case with anyone except the
11 Court, your lawyer, or the district attorney.

12 MR. NOEL: Got it? Break until 1:30.

13 GRAND JURY FOREPERSON: Break until 1:30.

14 MR. NOEL: Be back about 1:20, 1:25 so we're
15 ready to go.

16 (Lunch break taken.)

17 [ROLL CALL OMITTED.]

18 [DISCUSSION OMITTED.]

19 Q. (By MR. NOEL) Hi, Mr. Manegold. You're back,
20 you understand you're still under oath?

21 A. Yes.

22 Q. Before we start, I realized at the break going
23 through my notes that I never asked you to describe for
24 us or define for us what a "pig" is.

25 A. It's an instrumented device that -- well,
26 there's different types of pigs. A pig is a device that

1 goes through the pipeline, travels through the pipeline.
2 There's cleaning pigs, which is like a big styrofoam
3 thing that travels through the pipeline and pushes stuff
4 out of the pipe, whether it's water, oil, whatever else
5 is in the line. There's -- an ILI guy could tell you
6 more about them than I could. But that's what the pigs
7 do. There's pigs that have calipers on them that can
8 measure deformation as they travel along the pipeline, so
9 you can look for dents and deformations in the pipeline.

10 Then there's -- there's a smarter kind of a
11 pig. And then there's pigs that are called MFL tools.
12 And they induce a magnetic field around the pipe and they
13 measure the deformations in that magnetic field as they
14 travel. And those deformations are then interpreted by
15 an expert to say this change in the field means that
16 there's a loss of metal at this spot. And they use those
17 reads to -- and they're made up of a whole bunch of
18 sensors. And, and they use those reads to say, "Uh-huh,
19 we have damage here," and then it gets dug up and it gets
20 confirmed either it's what the damage they say.
21 Sometimes that damage needs to be repaired, sometimes it
22 doesn't need to be repaired, even though it's damage.
23 There's a small amount of wall loss, it doesn't
24 significantly affect the pipe's ability to handle the
25 pressure, and so they just leave it alone, or they could
26 put a repair sleeve on it or do something else.

1 Then there's another type of a smart pig, and
2 that's where they take those magnets that are on this pig
3 that create that magnetic field and they rotate them 90
4 degrees. And those pigs, which tend to be bigger than
5 the pig that's typically used, are really good at finding
6 axial flaws. And they're the kind of pigs that would be
7 used if you were interested in looking for seam defects,
8 which is what those failure curves that we looked at
9 before are used for as well. They're used in conjunction
10 with each other.

11 If the failure occurred -- we didn't talk about
12 it, but -- I did talk about it, but some of the curves on
13 there showed flaw depth-to-wall thickness, I think a
14 ratio. And if the flaw is a certain size -- the bigger
15 flaws show, are the ones that cause ruptures. If the
16 smallest of the flaws that can cause a rupture can be
17 found by that smart pig, the one that where the magnets
18 are rotating 90 degrees, then you can use that pig to
19 look for seam weld defects. And if the smallest defect
20 that can cause a rupture is beyond the resolving capacity
21 of the pig, then you can't use pigging as a tool.

22 Q. So in short, a pig that you're referring to as
23 an ILI tool is a man-made tool and not a four-legged
24 mammal?

25 A. Yeah. I guess I should have said that at the
26 start.

1 Q. So we're not setting loose little piggies
2 through the system?

3 A. No.

4 Q. All right. Now, going back one slide -- or one
5 page that we missed is page 5 of the Exhibit 539 -- 639,
6 sorry, entitled "Next Steps." And starts off,
7 "Initially: Stress, operation, and cost." And then goes
8 down and talks about cost, involvement of cost in the
9 tool selection process. "As stated before, originally
10 the main drivers for tool selection were stress level,
11 operational constraints, and cost, as was evidenced in
12 the previous slide."

13 Can you explain to us the role of cost in
14 determining the method of assessment.

15 A. Not just in assessment, but in any engineering
16 endeavor. If you have a bunch of different ways to
17 achieve the same result, you're generally going to use
18 the one that's the cheapest. And that's what this is
19 talking about.

20 Q. Okay. Is there a cost difference between
21 pressure testing versus ILI versus direct assessment?

22 A. Yes.

23 Q. Of those, which is the cheapest?

24 A. I'm not sure. I think DA. I say I'm not sure
25 because I know DA is cheaper than ILI, but I don't -- at
26 one time, I was familiar with the cost of all three of

1 them, but I never worked on all three of them together,
2 so I don't remember what the costs are for hydro testing.

3 Q. Was hydro testing a regular part of your
4 assessment methods?

5 A. Only for pipes that were brand new.

6 Q. Okay. So --

7 A. Because we were required to test anyway.

8 Q. When you're doing your assessments in the
9 normal course, hydro testing was not -- I mean pressure
10 testing was not one of the methods available for you;
11 correct?

12 A. No, I wouldn't say that. I'd say it was the
13 method of last resort. If, for instance, we talked about
14 the -- I talked about. I don't know why I say "we." I
15 talked about how smart pigs, the TFL tool, the one with
16 the 90-degree rotating magnets, can look for a seam weld
17 defect. We did that on one line where we had a seam weld
18 defect, we used a smart pig. But if we had determined
19 that the pig was not capable of resolving that defect
20 that could cause a rupture, we would have had to hydro
21 test the line. And that was a consideration.

22 Q. Okay. So your normal method would be ILI or
23 DA, and if for whatever reason you couldn't use ILI, then
24 pressure testing is on the table?

25 A. For seam weld defects, yeah. We didn't really
26 consider it for second assessments. We didn't consider

1 it for things that weren't manufacturing defects.

2

3 (Grand Jury Exhibit 640 was marked for identification.)

4

5 Q. All right. Let's move on to 640. This, again,
6 is a series of emails. Should have it in front of you.
7 It's four pages of emails.

8 A. Want me to read it through?

9 Q. Look through it and tell me if you recognize
10 640.

11 A. I recognize it's an email I was on the chain of
12 and participated in writing.

13 Q. So the initial email is sent Thursday, June
14 18th, 2009, by somebody named Frank Maxwell; is that
15 correct?

16 A. Yes.

17 Q. Who is Frank Maxwell?

18 A. Wait. I'm sorry, did you say -- yeah. 2009
19 you said?

20 Q. Yeah.

21 A. Frank was the, I believe at this time he was
22 the program manager for the expense budget in Gas
23 Transmission.

24 Q. Okay. Then this email was sent with -- to
25 someone named Les Buchner?

26 A. Buchner.

1 Q. Buchner. Do you know who he is?

2 A. I think he was Frank's boss.

3 Q. Steve Whelan, Trista Berkovitz, Robert Fassett,
4 Todd Hogenson, Glen Carter. Can you tell us who those
5 people are?

6 A. They were all people that, in the gas
7 department. Trista and Steve, I knew them, but I don't
8 know what their jobs were. Bob Fassett was, at this
9 time, again, I think he was my boss. Todd Hogenson was
10 the -- I don't know if he was a manager or director of
11 the pipeline group, I believe. And then Glen Carter was
12 the overall head of the gas engineering group.

13 Q. Okay. Then there's an additional list of
14 people to whom this was CC'd --

15 A. Right.

16 Q. -- correct? One of those being Sara Burke?

17 A. Right.

18 Q. Who we also know is Sara Peralta?

19 A. I don't think -- I could be wrong, but -- I
20 don't think she's my boss yet. I think Bob's including
21 her -- or, well, Frank did. I don't know why he put her.
22 I don't think she was my boss then. I don't think she
23 was in the department.

24 Q. At some point did Sara Burke, or Sara Peralta,
25 become your direct supervisor?

26 A. Yes.

1 Q. At that point, did Robert Fassett become Sara's
2 direct supervisor?

3 A. Yes.

4 Q. Okay. And this is an email about budgeting for
5 2010; correct?

6 A. Yes. That's what it looks like.

7 Q. And you're not included in that?

8 A. Not in that first incoming.

9 Q. But then in the second email from Robert
10 Fassett to yourself and Frank Dauby. Same day; correct?

11 A. Yes.

12 Q. And this is a -- he forwarded you the original
13 email from --

14 A. Next day.

15 Q. -- from Maxwell?

16 A. Next day.

17 Q. Next day?

18 A. First one, June 18th. This is June 19th.

19 Q. You're right. Sorry.

20 All right. So can you read us the email.

21 A. "Attached is the first cut of the 2010 budget
22 and prioritized final request is due by close of
23 business," COB, which stands for close of business,
24 "6/25/09. Please provide me with a list of the ILI jobs
25 for 2010, 2011, and 2012. And let me know if you've
26 already determined, one, whether or not they could be DAs

1 or not, and if they can be, what's the add to the DA
2 budge and the delete from the ILI budget; two, if all the
3 proposed jobs are in an HCA. If they're not in an HCA,
4 please provide justification. I'll need your response by
5 close of business 6/22."

6 Q. Okay. So let's start with number two first.

7 A. Okay.

8 Q. If the jobs aren't in an HCA, why do you have
9 to provide justification?

10 A. Okay. Okay. So you read what it said. Is
11 there a question?

12 Q. Yes. Why is that so?

13 A. Why is he asking that?

14 Q. Right.

15 A. I don't know.

16 Q. Why are you being told --

17 A. I assume he's thinking -- if I was to ask --
18 when I was asked that question, I would probably have
19 guessed he was thinking that since it was not in an HCA,
20 it would have been a discretionary job. It's one that we
21 could -- we would not have to, would not be compelled to
22 do by the code.

23 Q. Okay. And then this part, "Please provide me
24 with a list of the ILI jobs." This is the inline
25 inspection jobs; right?

26 A. Right.

1 Q. "For '10, '11, and '12." And then he wants to
2 know whether or not DAs can be substituted for the ILI
3 jobs?

4 A. Yes.

5 Q. Why would you substitute DAs for ILIs?

6 A. I don't know why he wrote that. I assume it's
7 cost, but I don't know.

8 Q. Okay. Let's go up. The second one from him,
9 then your response.

10 All right. So then on Monday, June 22nd, you
11 respond. Can you read the first paragraph of your
12 response.

13 A. "Our current assessment plan is based on our
14 current assessment criteria, which we have been working
15 to revise. The current criteria does not really address
16 reassessments, so if it was ILI'd the first time, it
17 would be ILI'd the second, et cetera. The effort Kevin
18 has been leading will address that issue. Kevin is
19 planning one last get-together to review the assessment
20 selection criteria we've come up with prior to presenting
21 you our results for comment. Currently that criteria
22 will still probably lead to most of the first-time
23 assessments for these lines remaining ILI. To pick
24 another method, as you know, we will need to be able to
25 say that the other method is the best method for
26 assessing the threats to the lines that require

1 assessment."

2 Q. So explain this last sentence to us, please.

3 A. When I wrote that, I believe that the section
4 of the code that we previously referred to meant that if
5 we had two, the same threat of external corrosion to be
6 assessed by ILI or DA, if we thought one was better at
7 doing that, we had to pick the better of those two. I
8 didn't think that later on, but I did think that when I
9 wrote this.

10 Q. Okay. Then you give a list of different lines.
11 You talk about the cost for DA; correct?

12 A. Yes.

13 Q. All right. So Frank -- or Bob Fassett is
14 asking you guys what scheduled ILI assessments can be
15 changed to DA assessments; correct?

16 A. Correct.

17 Q. He's doing that in response to an email talking
18 about the budget for the coming year; correct?

19 A. That's what it looks like.

20 Q. And your response to him is, we got to use the
21 best method to do the assessment?

22 A. That's one of the things that I wrote in here.

23 Q. So now Bob Fassett responds to you that same
24 day. And where I want to go is starting the second
25 paragraph of, "Also."

26 A. "Also, I'm not familiar with the requirement of

1 picking the best method for assessing the threats to the
2 line that require assessment for assessing the HCA
3 portion of a pipeline or what criteria the codes provides
4 for determining best method for assessing the threats to
5 the line that requires assessment."

6 Q. Okay. This is in June of 2009; correct?

7 A. Correct.

8 Q. If we go back to 639, this is a presentation in
9 January of 2009; correct?

10 A. Correct.

11 Q. By Mr. Fassett, the same guy who is writing
12 that email?

13 A. Correct.

14 Q. In this email, doesn't Mr. Fassett say that the
15 code requires that you pick the best method based upon
16 the criteria?

17 A. It looks like that.

18 Q. Again, "Additionally, the methodology and
19 technology selected must be that which is the best suited
20 to address the threats to a given pipeline section."

21 So that's basically what he's asking you about
22 in that email, saying, "I had no idea"; is that correct?

23 A. It appears that way.

24 Q. This is the guy that's the boss of the
25 Integrity Management Program; right?

26 A. Yes, he was the, he was the lead supervisor.

1 Q. Now, you responded to Mr. Fassett the next day.
2 I want you to read the second paragraph.

3 A. "The requirement I paraphrased is 192.921(a).
4 An operator must select the method or methods best suited
5 to address the threats identified to the covered
6 segment."

7 Q. So somehow Mr. Fassett wasn't aware of that; am
8 I reading the email correctly?

9 A. I don't know what Bob was thinking.

10 Q. So he wants to do DA instead of ILI, and you're
11 trying to explain to him why you can't do that; correct?

12 A. I'm trying to tell him what some of the
13 considerations are and make sure that he's considered
14 all, make sure he's considered everything that he needs
15 to consider in making changes.

16 Q. Now, eventually Bob Fassett became the big
17 boss; correct?

18 A. "Big boss." What does that mean?

19 Q. It went Bob Fassett, then Sara Peralta, slash,
20 Burke, then you; right?

21 A. I think Sara was inserted in that hierarchy,
22 but I think Bob is already in charge of the System
23 Integrity Program I think at this time.

24 Q. Okay. When you started in System Integrity
25 back in 2005, what was Bob Fassett's position?

26 A. I think he was the supervisor of the DA group.

1 Q. So the group that did the DA assessments?

2 A. Correct. That's my recollection.

3 Q. What's the job of Frank Dauby?

4 A. He was in the Pipeline Engineering group, and
5 he supervised the ILI.

6 Q. During your time in Integrity Management, was
7 there friction between Fassett and the DA group and Dauby
8 and the ILI group?

9 A. I wouldn't characterize it that way. It may be
10 true, but it's, it's not what I observed. What I
11 observed was there were disagreements sometimes between
12 what Bob thought should be DA'd and what Frank did. But,
13 yeah, so I don't know if that's friction. I observed
14 that.

15 Q. Would it be fair to say that Mr. Fassett and
16 the DA group were pushing DA for everything?

17 A. Bob thought it was a good tool; he would want
18 to use it for a lot of different projects.

19 Q. It was also the cheapest tool; correct?

20 A. From what we just saw, almost always, yes. Not
21 always, but almost always.

22 Q. So what role did the budget play in determining
23 which assessment tools were used?

24 A. I'd have to go back and look at the assessment
25 criteria. It's in RMP 6. And then I referred to it in
26 email, but proof that Kevin talked about it. I'd have to

1 say what they said. I don't remember off the top of my
2 head.

3 Q. But in reality, what role did cost play?

4 A. Well, it was important, but obviously it wasn't
5 definitive or we wouldn't have been ILI'ing lines,
6 because we could have DA'd almost everything. And it was
7 cheaper, but we didn't do it. So it was a consideration.
8 But, again, to give you a better answer, I'd want to look
9 at the criteria and then look at when they -- when they
10 originally decided what they were going to ILI and DA,
11 there was a study done. That was before I got there, but
12 the results of that study would probably be some
13 information about that as well. I don't have it.

14

15 (Grand Jury Exhibit 641 was marked for identification.)

16

17 Q. Let's talk about budgeting. Let's start with
18 the 2008 budget. You have in front of you what's marked
19 as 641.

20 A. Okay.

21 Q. Recognize 641?

22 A. I don't remember it, but I wrote it, so.

23 Q. Okay. Well, it starts off, the initial email
24 in the chain is from Frank Maxwell again, on July 3rd,
25 2008. It's addressed to yourself and Kevin Armato. And
26 remind us who Kevin Armato is.

1 A. It's addressed to Bob. The first one down
2 below? Kevin was the, at this time, 2008, I think he was
3 the head of the DA group, but I'm not sure. I'm not sure
4 is my answer. I don't know. And the reason I say that
5 is because there were just a lot of organization changes,
6 and I just don't remember the timing on them --

7 Q. Okay.

8 A. -- real well.

9 Q. So what is the subject of this initial email
10 from Frank Maxwell?

11 A. IM Expense Program -- reforecasting and
12 reductions.

13 Q. Explain to us the topic of this email.

14 A. Well, it's Frank's title, but I assume what
15 he's saying is that he's been asked -- or he's performing
16 a new forecast, end-of-the year forecast for spend on --
17 doesn't say in here, does it? Yeah, it does. Looks like
18 he's looking at trying to get a new estimate of what the
19 cost will be at the end of the year and the expense
20 program and looking for, probably looking for reductions.
21 I don't know if it says that, but I would guess it does
22 because of what I wrote on the top.

23 Q. Specifically says, asks you, "Please work with
24 the project managers to reduce spending in 2008 while
25 still accomplishing program objectives."

26 A. Okay.

1 Q. Is that correct?

2 A. Where do you see that?

3 Q. That's right in the middle of the third -- the
4 second paragraph. "As a second step --"

5 A. Okay. Yes, I see that.

6 Q. So we're talking about budget problems here?

7 A. He's looking for budget reductions. That's
8 what it looks like.

9 Q. Okay.

10 A. Starts it off by saying that the program is at
11 great risk of overrun. So whatever has been forecast is
12 now expected to go above that forecast. He's looking for
13 reductions.

14 Q. And then you respond to this on July 17, 2008?

15 A. Yes.

16 Q. And go ahead, read us your response.

17 A. "We met" -- I'm writing this to Bob Fassett and
18 Kevin Armato. "We met with Frank Tuesday and let him
19 know that we could make some reductions through the rest
20 of the year. For my part, I let him know that I had
21 budgeted my time to the year completely for Transmission
22 and would be charging more to Distribution throughout the
23 end of the year, so I gave back 50k." I didn't make that
24 much. But, "Kevin was able to make even larger
25 reductions. I let him know, though, that I may be asking
26 for more money later for the semi-annual leak surveys.

1 Most of that work is in the future, and there are a
2 number of factors that could cause our forecasted costs
3 to be in error. We won't really know until they do that
4 work, mostly in the September-October time frame."

5 Q. All right. So in 2008, summer 2008, you're
6 running into budget problems in Integrity Management;
7 does that accurately summarize?

8 A. It looks -- well, Frank is looking at
9 reductions in the overall spending for GT. That's what
10 his email is about. He's looking at different
11 departments to make reductions in. The email he wrote to
12 Kevin and me was to look at IM in particular. He's
13 asking if we can reduce what was projected for spending
14 year.

15 Q. Let's move on to 642.

16 A. What page are we on?

17 Q. Well, first, do you recognize 642?

18 A. Doesn't look like I was copied on it, and I
19 don't recognize it.

20 Q. Okay. Well, I want to go over -- okay. So
21 strike that one then.

22

23 (Grand Jury Exhibit 643 was marked for identification.)

24

25 Q. Let's go on to 643. Do you recognize 643?

26 A. I'm copied on it. Again, these are all, this

1 one is, what, 11 years ago? I don't remember it.

2 Q. Right. But it's the, an email chain that
3 you're part of?

4 A. Yes.

5 Q. So this is an email chain, starts with an email
6 from Frank Maxwell on July 2nd; is that correct?

7 A. Yes. 22nd, yes.

8 Q. 22nd. This was CC'd to you?

9 A. Correct.

10 Q. So what is the subject of Frank Maxwell's
11 initial email?

12 A. He says, "Follow-up to IMP discussion at work
13 prioritization meeting 7/18."

14 Q. What is IMP?

15 A. Integrity Management Program.

16 Q. Okay. And in general, what is the topic of
17 this email?

18 A. Let me read it a little more carefully.

19 It looks like it's steps that we can take to
20 reduce the IM cost for the end of the year, and what, and
21 what we can't change. What we can and what we can't
22 change, both.

23 Q. Okay. And then above that there is a response
24 from Bob Fassett that's again CC'd to you and others.

25 A. Yes.

26 Q. What's a weekly LT meeting?

1 A. I think, but I don't know, I think -- I should
2 say I don't remember, but I knew at the time, I think it
3 means local -- yeah, local -- leadership team. I think
4 that means leadership team.

5 Q. So can you read us the text of Mr. Fassett's
6 email.

7 A. "Frank, at Bob Howard's weekly LT meeting
8 today, Les mentioned we're forecasting a 1- to \$1.3
9 overrun for Transmission expenses. Any chance you can
10 call a meeting with Todd, Dan, Kevin, Bill, and myself to
11 review the overall Transmission expense budget and see
12 where we might be able to make some tough cuts?"

13 Q. So you're having to cut budget in the middle of
14 the year; is that correct?

15 A. That's what it looks like, yeah.

16 Q. Who is Les?

17 A. Les Buchner; I believe was Frank Maxwell's
18 boss.

19

20 (Grand Jury Exhibit 644 was marked for identification.)

21

22 Q. All right. Let's go on to 644. Do you
23 recognize 644?

24 A. Same thing. It's -- I mean, I wrote this, at
25 least the top part, and -- but I don't remember writing
26 it. Obviously, it's too long ago, so --

1 Q. All right. Just, in general, what's the topic
2 of the emails in 644?

3 A. It looks like -- let's see. Let me read the
4 bottom part.

5 Looks like what Frank is asking is he's letting
6 us know that the, that the budget is, for 2009 is low,
7 and it looks like it's the same as 2008, and he wants to
8 know if there's things that we planned for the year that
9 can be deferred until later but still be in compliance.
10 That's what the, "can we still catch up" refers to. I
11 talked before about that we have five years, we have
12 until 2012 to complete all of the work, but there's no
13 requirement that it be done 2010 or '11 or '8, it just
14 has to be done by December 17th, 2012.

15 Q. Okay. So the initial email here is from Frank
16 Maxwell; is that correct?

17 A. Yes.

18 Q. And, again, it's to yourself and several other
19 people: Kevin Armato, Frank Dauby, Bob Fassett, Brian,
20 Brian Daubin?

21 A. Yes.

22 Q. Can you read the email, please.

23 A. "Bill, Kevin, Frank, as expected, we got
24 saddled with a very low 2009 budget. What was unexpected
25 was how low it was, basically equivalent to 2008.

26 The below are the IM projects planned for 2009.

1 I am meeting with Bob Howard and Les to discuss what can
2 be reduced to make ends meet. I realize you have already
3 significantly scrubbed this list, but I must ask again if
4 there are any reductions that can be made while
5 maintaining compliance. Maintaining compliance needs to
6 be broadened to now include deferring some projects a
7 year or more while still retaining feasibility to meet
8 the goals in December 2012. That is, if we can fall
9 behind the 2012 pace a little and still retain
10 feasibility to catch up, I ask that you consider that
11 option when looking for reductions. The comments column
12 below has some questions I need answers to as well as
13 some ideas for places to look.

14 Thanks for your help. Anything I hear from you
15 by Wednesday would be helpful in my meeting with Bob and
16 Les.

17 Q. And then there's a bunch of columns that are
18 very difficult to read. Can you tell us what these
19 columns represent?

20 A. The heading -- so if you scroll back up a
21 little bit, I think there's the heading.

22 The Budget PV, I don't know what that is.

23 The PSRS ID was the job tracking tool that we
24 had that was online that allowed us to share cost of the
25 different projects we were working on.

26 The District and the Job Name. So the district

1 would apply to -- again, these are headings for a general
2 system. In this case, the job name I think is probably
3 the only thing that's relevant.

4 The Project Manager is who was in charge of
5 that particular project. So, for instance, at the bottom
6 of the chart, on the semi-annual leak surveys and the
7 risk and Integrity Management budget.

8 The Forecast for 2008 is the next column over,
9 which shows what we planned for 2008. And I don't think
10 it shows what we, I don't think that's an actual spend, I
11 think that's a forecast. And I don't know what date that
12 forecast was made, but presumably it's in the past.
13 Unless it's forecasted for 2009. So I'm not sure what
14 that column is at this point.

15 Operational Plan Budget Request for 2009 is
16 listed as the next column over.

17 Then the Cumulative Total, I don't know what
18 that means.

19 Q. Okay. So as we go down, these are, these are
20 projects that Maxwell is asking for you to see if
21 anything you can cut money out of them; correct?

22 A. Yeah, looks that way, although some of these
23 people aren't in our groups.

24 Q. But there's projects on here with project name,
25 ILI, Project Manager Frank Dauby. Multiples of those;
26 correct?

1 A. Correct.

2 Q. So those would be ILI projects scheduled for
3 the next year?

4 A. ILI projects were multiple-year projects, but
5 there was work planned to be done as part of that ILI.
6 It doesn't mean that the ILI would be performed, but
7 means there was work done for it.

8 Q. Okay. But one of the suggestions is we cut,
9 cut budget on ILI projects?

10 A. That's one of the suggestions. They could all
11 be run this year, I just don't know.

12 Q. Right. What was unexpected was how low it was,
13 basically equivalent to 2008. That's what Mr. Maxwell
14 says; correct?

15 A. Correct.

16 Q. Now we just went through the second half of
17 2008. And your budget appears to have been woefully
18 insufficient in 2008; is that correct?

19 A. Woefully insufficient? I guess I wouldn't
20 characterize it that way. I think I told you when,
21 again, when we met earlier, that for my group it was
22 enough.

23 Q. Okay. But for other groups with Integrity
24 Management, cuts were having to be made at the end of
25 2008 to stay within the budget?

26 A. That's what it looks like. Changes were made,

1 right.

2 Q. So now you're going into 2009 with the same
3 budget that you had in 2008; correct?

4 A. Correct. Pretty much. It says very low,
5 basically equivalent.

6 Q. Now, two days later, on October 22nd, 2008, you
7 responded to Mr. Maxwell. Can you read us your response.

8 A. "Frank, here are some comments on the budget.
9 We can probably knock the leak investigation budget down
10 to 200k again in 2009."

11 Q. What's the leak investigation budget?

12 A. The code requires that, the federal code for
13 pipelines, the CFR 192 part -- 49 CFR 192 requires that
14 all leaks be investigated. But we -- and there are a
15 lot, there were a lot of leaks in the system; maybe,
16 between distribution and transmission, maybe 17,000 a
17 year. But we had very few leaks in the -- on HCA piping;
18 maybe 12 a year. Around that. It was that order of
19 magnitude, the number of leaks.

20 And the typical leak investigation on those
21 17,000 would be the foreman would have the leak dug up,
22 looked at it, it's rusted out and it's leaking, okay,
23 mark it as a corrosion leak or they find out that
24 somebody hit it with a back hoe and they put it down as
25 third-party damage. And that would be the investigation
26 that they'd do.

1 But for HCA leaks, the very small number of
2 them, we thought we needed a more in-depth analysis of
3 what happened. And we assigned money to look at some of
4 those leaks, especially to be able to -- leaks that have
5 been repaired. Dig them up, cut them out, and do
6 detailed metallurgical examination of the failed
7 sections. That money was allocated to my group, because
8 we used that to, as part of our risk analysis that we did
9 after the assessments. And sometimes they were in areas
10 that had not been yet assessed. And occasionally they
11 were in areas that we had already assessed. And those
12 were really important, because when we're getting leaks
13 in areas that we've already assessed, that's a big flag
14 that maybe there's something that we need to re-look at
15 in our assessment system.

16 The money that we had in the budget was based
17 on the first year that we started doing this when we had
18 to dig up a section of line 153 in Oakland. It's a large
19 pipeline. I think it's --

20 Q. We will get to that in a minute.

21 A. Well, that's -- so the budgets were based on
22 cutting -- digging that up, cutting it out, and examining
23 it. And it was, it was a very expensive dig. But in
24 subsequent years what we found was -- so that's what I
25 asked for every year based on that. Let's say we
26 multiply that by X, this is how much money we need. But

1 we just weren't getting that many leaks. We were winding
2 up with money unspent at the end of the year. And I had
3 talked to Frank about it, and I told him, "You know what,
4 we're not getting these leaks, but I really don't want to
5 give up this money, because if we get a bad leak, you
6 know, I won't be able to have it investigated."

7 And he assured me, "If you need to do this, if
8 you can give me this money now, if you really need it,
9 we'll get it back."

10 Q. Okay. So this was the money that was put aside
11 for doing root cause analysis on leaks in high
12 consequence areas?

13 A. Primarily, although if there was a leak outside
14 of a high consequence area that was significant, the
15 money would also be spent on one of those.

16
17 (Grand Jury Exhibit 645 was marked for identification.)
18

19 Q. So let's go on to Exhibit 645.

20 A. Okay.

21 Q. Recognize 645?

22 A. Same comment. Well, part of this is exactly
23 what we just read. And there's stuff that's been added
24 on.

25 Q. Starts off with the same October 20th email
26 from Frank Maxwell?

1 A. Right.

2 Q. Then multiple responses from Frank Dauby.

3 A. Right.

4 Q. You're CC'd in on the ones, you're included in
5 the two lists for the responses?

6 A. Right.

7 Q. So the first one says, "My team is evaluating
8 again and looking into options regarding L-300A, but, of
9 course, it's not without risks."

10 Do you know what that alludes to?

11 A. I mean, I know it's 300, line 300A, but -- we
12 have two lines that parallel each other, 300A and B, that
13 run from the border with Arizona all the way up to
14 Milpitas station. And we have a number of different
15 projects along the line. Which one in particular, I'm
16 not sure of. I sort of think I know what it is, but I am
17 not sure.

18 Q. Well, was 300A slated for an ILI?

19 A. Not the whole line, but part of it. So we
20 divided it -- for the pig runs, it's a very long run of
21 pipe, it's a couple hundred miles, so we would have
22 divided that up, the sections that were going to be ILI'd
23 I think at that time. And it would have been the whole
24 line, but we had two different projects I think planned
25 for 300A at that time. But again --

26 Q. Okay.

1 A. -- the -- if you have a copy of the list from
2 that time, it would be more complete. And I don't have
3 that right here.

4
5 (Grand Jury Exhibit 646 was marked for identification.)
6

7 Q. All right. Let's go on to 646 -- 646, I'm
8 sorry. Do you recognize 646?

9 A. Well, the top part I didn't get, but the bottom
10 part I did. So let me look at that.

11 Q. Okay. So starts off, again, with an email at
12 this time from Frank Dauby.

13 A. Right.

14 Q. CC'd to you?

15 A. Yes.

16 Q. And this is specifically as to the L-300A
17 reinspection project?

18 A. Yes. Is it the same one? It may be the same
19 one. Okay.

20 Q. Okay.

21 A. Okay.

22 Q. Why don't you go ahead and read us the first
23 paragraph.

24 A. "Guys, I understand you are considering ways to
25 reduce the 2009 expense budget and wanted to let you know
26 my take on the L-300A reinspection for 2009. Both

1 sections from Panoche to Hollister and Hollister to
2 Milpitas were inspected by Rosen in 2002, and the HCA
3 portions of both sections are due for reinspection 2009,
4 seven years. The southern section only has 2.1 miles of
5 HCA out of 57.5 miles, while the northern section has
6 23.7 miles of HCA out of 52.1 miles of pipeline. As most
7 are aware, the Rosen run in 2002 was flawed and the
8 resulting work required a, over \$5 million to perform
9 inspections, repairs, and replacements in 2003. The lack
10 of good correlation between the ILI run and the field
11 conditions were eventually addressed by Rosen, and they
12 reissued their reports to PG&E in January 2005, having
13 used a section of pipe cut out of L-300A to calibrate the
14 results. PG&E performed an additional 4 digs on L-300A
15 in 2005, and Chih-Hung issued amendment reports for both
16 sections of L-300A and the final version of the L-300A
17 south, attached.

18 Q. Who is Rosen?

19 A. Rosen was an ILI vendor. There are a number of
20 different companies that sell the service of performing
21 ILIs. PG&E doesn't do that. Most operators, but not
22 all, most operators don't do it themselves, they contract
23 out. Rosen is one of those contractors. I think an
24 international firm.

25 Q. So let's go on.

26 A. "I believe we have several options as to how to

1 proceed with the reinspection of L-300A.

2 One, the original plan was to re-ILI both
3 sections of L-300A. And we have been working toward that
4 goal the last several weeks. Forecast cost is 2.4
5 million for 2009. When we had our project kickoff
6 meeting on October 16th, it was suggested that we
7 consider inspecting the entire line in one run. Since
8 then, we have confirmed that this is feasible and should
9 be significantly cheaper than performing the runs
10 separately. Forecast cost, approximately \$1.7 million
11 for 2009. There is an increased risk of having the tool
12 damage prior to getting into the HCA section of north of
13 Hollister, but the pipeline has been previously cleaned
14 and inspected and the vendors support this option.

15 Two, another option is to inspect either the
16 north or south portion of L-300A in 2009 in order to gain
17 more confidence in the reissued results from Rosen's
18 original run and use those results to decide if pigging
19 the remaining section is justified or not. We would also
20 need to DA the HCA not ILI'd, but that would only be 2.1
21 miles for the southern section. The unfortunate part
22 about this option is that it could drive us to ILI the
23 remaining section, probably southern, in a subsequent
24 year and the combined cost of both projects would then be
25 more than inspecting them together in 2009. Forecast
26 cost \$1.2 million for the ILI plus point one thousand,

1 plus point -- \$100 --" I think that's a mistake. I think
2 that means "\$1,000 for DA in 2009. Note this does not
3 include ILI digs or future reinspections."

4 Q. So there's a pretty significant cost difference
5 between ILI'ing and DA'ing; is that true?

6 A. In this case. But, again, as he points out,
7 they're going to ILI a heck of a lot more than DA. In
8 general, the ILI would be more expensive.

9 Q. Then keep ongoing.

10 A. The final option is to not ILI either section
11 and rely entirely on DA for the 2009 reinspection. If
12 the Rosen inspection had been flawed, I believe this
13 would be a very reasonable option. The concern about
14 DA'ing the HCA portions of either pipeline section --

15 Q. Let me interrupt you. It says, "If the Rosen
16 inspection had not been flawed"; correct?

17 A. Correct.

18 Q. Okay. You skipped over the "not."

19 A. Oh, I'm sorry.

20 Q. So go ahead.

21 A. "Had not been flawed, I believe this would be a
22 very reasonable option. The concern about DA'ing the HCA
23 portions of either pipeline section is the probability of
24 having locations that were not identified by the original
25 ILI tool in 2002 and would not be inspected by the DA in
26 2009, say non-HCA locations, or not identified by the DA

1 technology and the resulting risk that such an anomaly
2 could result in leak or rupture prior to the next
3 reinspection in 2016. This is a very difficult situation
4 to analyze because we can't rely on tool tolerance or
5 other data to calculate this probability. Forecast cost
6 25.8 miles times \$50,000 per mile, equals 1.29 million in
7 2009."

8 I'm reading, but I'm not understand some of
9 this stuff, just because I'm reading out loud. Do you
10 want me to go on?

11 Q. No. No, but I think we've hit everything.

12 Basically summarize it, Mr. Dauby here is
13 saying we're supposed to ILI this line and justifying why
14 it should be ILI'd; correct?

15 A. That's part of what he's doing, yes.

16 Q. Okay.

17 A. That I think he's doing, yes.

18 Q. All right. So let's move up to the response
19 from Todd Hogenson.

20 A. And read that?

21 Q. Yes.

22 A. "Frank, thank you for your analysis and
23 recommendation. Let me provide some insight into 2009
24 GT," that's Gas Transmission, "expense budget situation.
25 We have currently budgeted \$18.5 million to Major Work
26 Category II, Gas Transmission Integrity Management

1 Program in 2009. This leaves \$8.5 million for all other
2 GT expense work, which includes engine/compressor
3 overhauls, compressor rentals at McDonald Island,
4 pipeline class location and uprates, emergency
5 unforeseen, leaving about \$10 million in projects
6 unfunded."

7 Q. So would the assessment program be considered
8 expense work?

9 A. Part of it is. There's expense and capital to
10 the IM Program. Frank's work was the purest mixture of
11 both.

12 Q. All right. Go ahead.

13 A. "Suffice it to say, the project expense budget
14 cuts are very deep. We're not able to fund all Priority
15 1 work at this time."

16 Q. What is Priority 1 work?

17 A. I don't know.

18 Q. Okay. Go ahead.

19 A. "As much as I would like to support your
20 recommendation to ILI L-300A north of Hollister, I'm not
21 sure it's the highest priority work within GT if ECDA is
22 an option. The Pipeline Integrity Team should take the
23 lead and identify ways to further reduce Major Work
24 Category II 2009 expense costs. Everyone is being asked
25 to make significant cuts to address the 2009 expense
26 budget."

1 Q. Basically, Mr. Hogenson is saying, our budget
2 cuts are deep, we don't have enough money, so you're not
3 going to do ILI if DA is an option; is that correct?

4 A. No, I wouldn't say that. I think what he's
5 saying is he can't support it, but he's not -- I don't
6 think he's saying this is the final word at this point.

7 Q. Okay.

8 A. I think there was -- because I do remember a
9 meeting about the line that Rosen and I ILI'd between.
10 That must have come after this time, because it was at
11 that meeting that a decision was made.

12

13 (Grand Jury Exhibit 647 was marked for identification.)

14

15 Q. Let's move on to 647. This one's a little
16 difficult to read.

17 A. Okay.

18 Q. All right. So starting at the end, this starts
19 with an email from Daniel Menegus?

20 A. Dan Menegus.

21 Q. Who is Dan Menegus?

22 A. At this time, I think he was the supervisor of
23 the station group. I think. But I'm not sure. And from
24 what he's writing here, it looks like that's right.
25 That's what he was, supervisor of the station. That's
26 what I believe he was.

1 Q. And you're not involved in the initial email?

2 A. I don't know if I'm involved in any of these,
3 am I? Yeah, I don't think I'm on any of them.

4 Q. Okay. What I want to go through is right in
5 the middle, this is on page 2, and this is a November
6 26th email from Frank Maxwell.

7 A. Okay.

8 Q. This is going to Todd Hogenson and Daniel
9 Menegus. See that?

10 A. Yes. Did you want me to read it out loud?

11 Q. Sure.

12 A. "Dan, Todd, I have finished the analysis to
13 determine what must be done to meet the 2008 \$1 million
14 expense reduction commitment. Unfortunately, we will
15 have to defer work into 2009. While I thought we could
16 capture enough monies to avoid deferral, some forecasts
17 could not be reduced as expected, and LT," which means
18 Local Transmission," mark and locate costs have jumped
19 due to new time reporting processes in the division."

20 Q. That's good enough. So here we are now at the
21 end of 2008 and we're deferring work because of budget
22 cuts; correct?

23 A. Right. It looks like this is before that last
24 email I read; is that right?

25 Q. Uh-huh.

26 A. Okay. So it's deferring.

1 Q. And do you recall that condition in 2008?

2 A. No.

3 Q. You don't recall that work was being deferred?

4 A. No, I don't recall it.

5 Q. All right. So now we're going to go to the

6 top, the last in the -- who is Jack Dunlap?

7 A. I don't remember.

8 Q. Okay. What is Gas Operations Engineering?

9 A. Where is that?

10 Q. Down below in the signature line.

11 A. I guess that's his group.

12 Q. Okay. So it says, "The 2009 expense funding

13 appears to be even more challenging than 2008, so making

14 the best possible spending decisions will be critical";

15 is that correct?

16 A. Yes, that's what it says.

17 Q. Do you know what the F-O-G process is?

18 A. No, I don't.

19

20 (Grand Jury Exhibit 648 was marked for identification.)

21

22 Q. Okay. Let's go on to 648. Do you recognize

23 648?

24 A. No.

25 Q. Have you ever seen budget documents like this?

26 A. Not that I recall.

1 Q. Okay. Well, we start off 2009, approved
2 budget, 94.6. I'm going to assume that's millions of
3 dollars; correct?

4 A. I've never seen -- it says at the top "millions
5 of dollars."

6 Q. Pipeline Integrity Management, that's column
7 number 2, under Decreases and Costs; correct?

8 A. Yeah. So I was wrong, it's not II, it's 11.
9 So I misrepresented.

10 Q. Okay. That's --

11 A. Well, I take it back. I don't know if that's
12 what that means or not, but it's line 11 on this form.

13 Q. That's your group; correct?

14 A. I'm under that group. I don't think I had any
15 capital work assigned to my group, so I think everything
16 we did was under that category.

17 Q. Okay. So your budget is being reduced for
18 Pipeline Integrity Management work going into 2009;
19 correct?

20 A. The work that my group fell under falls under
21 this, but it's not all the work, so I don't know if my
22 group was cut besides what I volunteered to Frank or not.

23 Q. Okay. Well, it says, "Reduce forecast of
24 Pipeline Integrity Management work"?

25 A. Okay.

26 Q. Is that -- and that's your group; correct?

1 A. It also includes Frank and Kevin and everybody
2 else. But I'm in there.

3 Q. Okay.

4 A. Yeah.

5 Q. You were in the Risk Division, Risk Management
6 Division, of the Pipeline, of the Integrity Management
7 Group?

8 A. At this time, it would have been called System
9 Integrity, but yeah.

10

11 (Grand Jury Exhibit 649 was marked for identification.)

12

13 Q. Let's go on to 649. Another email chain. This
14 one from October of --

15 A. Can I see, go see my lawyer?

16 Q. Sure.

17 A. I'll be back in about five minutes.

18 MR. NOEL: Actually, you've got to ask her.

19 THE WITNESS: Can I leave?

20 GRAND JURY FOREPERSON: Yes.

21 MR. NOEL: Take a break? We've been going an
22 hour.

23 GRAND JURY FOREPERSON: Yes, let's take a
24 break.

25 (Break taken.)

26 GRAND JURY FOREPERSON: All members of the jury

1 are present and accounted for.

2 MR. NOEL: Ready to resume?

3 GRAND JURY FOREPERSON: Yes.

4 Q. (By MR. NOEL) All right. We were talking
5 about this email in October, October 8, 2009. This is
6 from Frank Maxwell again. You said he's the -- what was
7 the term you used for his title?

8 A. Gas Expense Program Manager. I believe that's
9 what his title was.

10 Q. So can you read the first paragraph to the
11 email.

12 A. "GT expense steering team and representatives:
13 Last week Les and I met with Bob Howard to discuss the
14 year-end forecast for Gas Transmission expense. At the
15 time of the meeting, we still had 1, a \$1.1 million gap
16 to close, and I proposed a short list of available
17 actions, both known actions and potential actions, to
18 close the gap. In the meeting, our prior plan was
19 reaffirmed to seek further reductions or deferrals to
20 close the gap and return to budget. Additionally,
21 because of increasing overruns on Gas and Electric
22 Distribution, we have been asked to reduce the year-end
23 forecast to as low as possible with the goal of \$93.6
24 million, or \$1 million under."

25 Q. Again you're being asked to cut your budgets in
26 the Gas Transmission Division; correct?

1 A. I'm not copied on it, but that's what it looks
2 like is happening.

3 Q. Okay. Do you remember that happening again?

4 A. Again specifically no, but again, ten years ago
5 and the impact on my group was generally pretty small
6 with these things.

7 Q. Right. Let's go back. We don't have to pull
8 up the slide. We started off with the email exchange in
9 October of 2010 between you and Wayne Ciardella.
10 Remember in that there was the statement that the budget
11 was being cut 5 to 10 percent every year?

12 A. By Wayne, right.

13 Q. Right. Looks like the years leading up to San
14 Bruno that your budget was, at best, staying stagnant?

15 A. For these last couple years, that's what the
16 emails would indicate, but it doesn't have the numbers
17 right. I don't know what they actually spent.

18

19 (Grand Jury Exhibit 650 was marked for identification.)

20

21 Q. Now we're moving on to 650.

22 A. Do I have that? Here it is.

23 Q. Do you recognize 650?

24 A. Yes.

25 Q. Again, let's start at the end. It starts with
26 an email from Frank Maxwell. We're not going to spend

1 too much time on that, but suffice it to say, it's about
2 budget issues again; correct?

3 A. Yes.

4 Q. And then we go through a response from Chris
5 Warner. Again, budget stuff. This time --

6 A. Is this the same one, same exhibit?

7 Q. Should be. 650?

8 A. Okay. I missed -- so early on Chris had
9 something. Okay. All right.

10 Q. So you get involved in this conversation in the
11 middle on page 3 with an email from Janet Volkar. Now,
12 who is Janet Volkar?

13 A. She was an engineer that worked for me.

14 Q. Can you turn to that page and read us what
15 Janet Volkar sent to you.

16 A. "Out of the EO9 segments, a total of 283
17 segments are high risk, 149 are first assessment, and 134
18 are second assessment. These segments are included in
19 the 21 NSEGs scheduled to be completed this year, which
20 includes the NSEGs listed below."

21 Q. Can you explain to us the meaning of that.

22 A. Out of the EO9 segments, those are the segments
23 scheduled for DA in 2009. And we break up the pipeline
24 into segments that are based on common properties along
25 that particular segment. They have the same HCA ID, same
26 diameter, all the same pipe properties. So there's 283

1 of these segments. And the segments can vary from a foot
2 to a mile long. They're not of any determined length.
3 They just go as long as the properties stay the same.

4 Q. These are all segments that are scheduled for
5 inspection in 2009?

6 A. That's what it says. Right.

7 Q. And these are high risk?

8 A. Correct.

9 Q. What does it mean to be high risk?

10 A. I think we talked about it before. It's a, it
11 refers to a section of the, of Subpart O that talks about
12 doing high-risk segments in the first half of the program
13 from 2002 to 2007. But it's left to each operator to
14 determine what a high-risk segment is.

15 We did our risk analysis as required by the
16 code every year. And each year, because we would add
17 HCAs and subtract HCAs, we might get new high-risk
18 segments. So it wouldn't have been a high-risk segment
19 in 2002, but it might have been a high-risk segment in
20 2005. In that case, we would have five years to assess
21 it. If it had been originally identified as an HCA in
22 2005, if it's one of those, means we really need to get
23 it done by 2010. If it had been a high-risk segment in
24 2006, we have until 2011, et cetera.

25 Q. So read us your response to Ms. Volkar.

26 A. "Thanks, Janet. I probably should have been

1 more specific. We are looking at having to defer some
2 assessments this year in order to meet budget. Which of
3 the NSEGs have high-risk segments. Thanks."

4 Q. So you're not doing inspections, you're
5 deferring some of your inspections because of budget
6 issues in there?

7 A. That's what I'm telling her, yes.

8 Q. Okay.

9 A. We're planning on it. We haven't done it yet,
10 but that's what we're planning to do. And I'm asking her
11 -- she had given me a list of -- out of all the different
12 assessments we had planned, 283 of them were high risk,
13 and I want to know which of the specific segments, which
14 of the specific assessments for DA have high-risk
15 segments.

16 Q. All right. So she sends you a list of NSEGs
17 with high-risk segments scheduled for EO9. And then you
18 respond to her May 27th, 2009, 4:34 p.m.?

19 A. I respond, I sent this to Kevin actually, not
20 to her.

21 Q. Oh, I'm sorry.

22 A. Kevin would have been -- the reason I'm writing
23 to him, presumably, is because he would have been in
24 charge of the DA group at this point. Want me to read
25 what I wrote?

26 Q. Yes, please.

1 A. I don't know if it makes sense in English
2 looking at it now.

3 "Given the list I have is all high risk, if we
4 have to defer, we can defer any that are not
5 reassessments. Let me know which NSEGs are most
6 convenient to reassess. Thanks, Bill."

7 Q. So basically all of these are high-risk
8 segments; correct?

9 A. Yeah. "We can defer any that are not
10 reassessments."

11 Q. Why can't you defer reassessments?

12 A. Okay. The reassessments, they would have been
13 scheduled for -- so the first assessment, the baseline
14 assessment that started in 2002, we had that flexibility
15 to reschedule segments, provided they all get done by
16 2012. Even the high-risk segments can be done later in
17 the program. The rule only says you need to start with
18 the high-risk segments, but PG&E's goal, and one that we
19 met after the first half of the program, was to get them
20 all done in the first half. But once you've assessed it
21 once, the longest reassessment interview you have on a
22 prescriptive reassessment program is seven years. And so
23 they would have been scheduled for the seventh year. And
24 this is saying that seventh year is up, coming up, and,
25 therefore, can't be deferred and still be in compliance.

26 Q. So the ones that are being deferred are the

1 ones that have never been assessed in the first place?

2 A. Correct. They might have been identified
3 recently. But once you identify a new segment, normally
4 you have ten years to assess it from whenever you
5 identify it.

6 Q. How do you identify a new segment?

7 A. Each year we would get new parcel data, which
8 we would overlay on our HCA pipelines. And we would look
9 at that parcel data with new aerial photography and
10 identify any new HCAs within our system. And if we had
11 new HCAs, then we have new segments.

12 Q. Okay. So segments can become HCAs?

13 A. Correct. About -- at the time that we were
14 doing this, out of about 5,700 miles of transmission
15 line, maybe 950 were HCAs.

16 Q. Okay. Now, moving up, Kevin Armato responds.
17 If you can read that.

18 A. "Bill, per our discussion last week, we will
19 have to start cutting the budget by delaying the NSEG 105
20 survey. This should save us about \$600,000.

21 Frank, can you fund us this in 2010? Also, as
22 we continue to defer other NSEGs this year, I will need
23 funding for them in 2010."

24 Q. What is NSEG 105?

25 A. So 105 refers to the pipeline number. PG&E's
26 pipelines all have unique numbers. The -- generally it's

1 the biggest lines, but not always, have a three- or
2 two-digit number. And that's a whole scheme. It goes by
3 number. In any event, it's a Gas Transmission line
4 number.

5 And NSEG has to do with how the DA team has
6 defined an area for survey based on a whole bunch of
7 criteria they have for how lines are DA'd, the soil types
8 and a bunch of other things.

9 So this is the, so NSEG 105 is referring to the
10 105 line that Janet listed when she sent me the email on
11 May 27th.

12 Q. All right. Next, there's a response to Kevin
13 Armato from Frank Maxwell. If you can read that for us.

14 A. "Kevin, I will support a dollar-for-dollar
15 increase in 2010 budget request for any 2009 deferrals.
16 That said, the preliminary 2010 budget is expected to be
17 equal to the 2009 budget, which will leave us extremely
18 short of Gas Transmission expense funds. So for 2010, we
19 will need to find offsets within the program whenever
20 possible. I will work with you and the team to find ways
21 to fund all IM work that absolutely must be done in 2015,
22 but you, Bill, and Frank need to work to reduce costs."

23 Q. Okay. That's good. So now we're going into
24 2010. More budget problems in 2010; right?

25 A. Budget remains flat, right.

26 Q. So essentially the only inspection work you're

1 doing is the bare-minimum that's being required by the,
2 by the Pipeline Safety Act and the Integrity Management,
3 Pipeline Integrity Acts; is that correct?

4 A. For DA work, that's, looks like that's true.
5 The ILI stuff isn't mentioned in here yet. At least I
6 haven't read anything about ILI, so --

7
8 (Grand Jury Exhibit 651 was marked for identification.)
9

10 Q. So let's go on to 651.

11 A. Okay.

12 Q. Do you recognize 651?

13 A. The bottom half, I think we looked at it
14 before; the top half, no.

15 Q. This is in the 2010 budget. It's an email to
16 you from Bob Fassett wanting to know about --

17 A. It's an email from Bob Fassett to Glen Carter.

18 Q. The original one looks like it says from Bob
19 Fassett to Manegold, William.

20 A. I'm looking at this one here. Am I in the
21 wrong spot?

22 Q. Should be 651.

23 A. I'm on 651. I'm at the --

24 Q. You're right. I'm sorry, I was on the wrong
25 page. You're right. The original one was Frank Maxwell
26 to Les Buchner. And then that's followed up with the

1 Fasset email to --

2 A. Yes.

3 Q. -- yourself and Dauby?

4 A. Yes.

5 Q. And you're looking at substituting DAs for ILIs
6 because of budget cuts?

7 A. I think that's what Bob had been proposing,
8 right. That's what it looks like.

9 Q. And then there's a response here from you from
10 June 22nd.

11 A. Right.

12 Q. If you can read us your response?

13 A. "Bob, our current assessment plan is based on
14 our current assessment criteria, which we have been
15 working to revise."

16 We read this before; right? I think.

17 Q. Yep.

18 A. "The current criteria does not really address
19 reassessments. So if it was ILI'd the first time, it
20 will be ILI'd the second, et cetera. The effort Kevin
21 has been leading will address that issue. Kevin is
22 planning one last get-together to review the assessment
23 selection criteria, and we have come up -- we have come
24 up with prior to presenting you, prior to presenting you
25 our results for comment. Currently, that criteria will
26 still probably lead to most of the first-time assessments

1 for these lines remaining ILI. To pick another method,
2 as you know, we'll need to be able to say that other
3 method is the best method for assessing the threats to
4 the line that require assessment."

5 Q. All right. So then there's the alternate email
6 chain that takes off from there; correct? And this is --

7 A. Looks like it.

8 Q. -- to Glen Carter. Can you read us that.

9 A. "Glen, I'm still working on it, but the
10 following email from Bill provides a breakout of the pig
11 runs for 2010 through 2012 and shows the breakout of HCA
12 miles to total miles. On some of the lines where the HCA
13 miles is a small portion of the total miles, I've asked
14 that the team look closer into why we have to ILI over
15 DA. I hope to have something by the end of this week, if
16 not early next week."

17 Q. So who is Glen Carter?

18 A. Bob's boss. The head of our engineering
19 department.

20 Q. So Bob is specifically saying, he's telling,
21 he's asking you to look at doing ILL instead of DA;
22 correct?

23 A. For where the HCA miles is a small portion of
24 the total. He's asking us to look at why we would ILI
25 over DA. And I think, I assume he's referring to the
26 assessment criteria we've been developing.

1 Q. Okay. And this is in reference to the budget?

2 A. Bob's note to Glen, that's what it appears to
3 be.

4
5 (Grand Jury Exhibit 652 was marked for identification.)
6

7 Q. All right. Let's move on to 652. Ask you if
8 you recognize 652.

9 A. No. Doesn't look like I was copied on this.

10 Q. Okay. Well, let's go over some of the
11 information on here.

12 A. All right. Do you want me to read it from the
13 beginning?

14 Q. Sure. You can go ahead.

15 A. Out loud or --

16 Q. No.

17 A. -- to myself? Okay.

18 Q. All right. So, first off, an email from Frank
19 Maxwell to Greg Kiraly and Robert Howard?

20 A. Yes.

21 Q. Do you know who those people are?

22 A. I don't know Gregory Kiraly. Bob Howard was
23 the vice-president of Gas Engineering Operations, I
24 believe.

25 Q. CC'd to various people that include Robert
26 Fassett, who was your boss?

1 A. At this time I think Sara was my boss.
2 Q. Okay.
3 A. But yeah.
4 Q. Sara Burke is on this chain?
5 A. He was, he was in my line of supervision.
6 Q. So Sara Burke would have been your direct boss
7 at this time, and Robert Fassett would have been her
8 direct boss?
9 A. Yeah, I think she joined in like September or
10 October time frame or something like that.
11 Q. Okay. So, according to this, the 2010 budget
12 for GT expense, first draft is \$89.8 million; correct?
13 A. That's what it says, yes.
14 Q. Now, going back to the '80 -- to the '08 and
15 '09 budgets, those were 92- and \$93 million?
16 A. Those were the budgets. I don't know what was
17 spent, but that's what it said was the budget.
18 Q. So in 2010 now your budget has gone down about
19 \$4 million?
20 A. About 5 percent, right.
21 Q. Yep. And then go up, and the next is from
22 Mr. Fassett to Mr. Maxwell. If you can read that for us,
23 please.
24 A. "Frank, where did you come up with a \$4 million
25 reduction in IM? In the meeting the other day, I
26 committed to a \$900 reduction. Bob."

1 Q. So IM, that's Integrity Management; correct?
2 A. That's what I believe he's talking about, yes.
3 Q. That's your division?
4 A. Yep.
5 Q. Is looking at a \$4 million budget reduction for
6 the year 2010?
7 A. That's what Frank is proposing in October,
8 correct.
9 Q. Okay. So what are you having to do in 2010 to
10 cover for a \$4 million budget deficit -- or reduction?
11 Sorry.
12 A. I don't know. I mean, I didn't see this, so I
13 don't know.
14 Q. Okay. But you were working it; correct?
15 A. Working? I was working in IM.
16 Q. Integrity Management?
17 A. Yeah. Yeah, but I wasn't -- the only budget I
18 was responsible for was my own.
19 Q. Okay.
20 A. And that didn't see much of a reduction.
21
22 (Grand Jury Exhibit 653 was marked for identification.)
23
24 Q. Move on to 653. Do you recognize 653?
25 A. Yes.
26 Q. We had talked earlier, you had brought up seam

1 weld leak failure investigation, and specifically one in
2 '05.

3 A. Correct.

4 Q. Is this 29-page document in reference to that
5 incident?

6 A. 2007? 2008. Once the leak happened, it took
7 us quite a while to get the clearance and cut it out and
8 everything else. I think it is. I believe it is.

9 Q. Okay. Who is Dave?

10 A. I don't remember another leak on 153.

11 Q. Who is David Aguiar?

12 A. David Aguiar was a metallurgist, a corrosion
13 specialist, within the IM group. He worked for -- at
14 this time I think he worked for Bob.

15 Q. Okay. So can you read us the first paragraph.

16 A. Might have worked for Kevin.

17 "All, the cause of the subject leak was not
18 corrosion, but was related to the pipe fabrication
19 process. Specifically, the leak was caused by weld metal
20 solidification problems and porosity that was created
21 during the seam welding process. That leaked only after
22 approximately 56 years of service. Since we did not find
23 any evidence of service-related progression of any kind,
24 we speculate that the porosity was sealed all those years
25 with high temperature oxide, which eventually cracked and
26 was blown out by line pressure. Since internal or

1 external corrosion was not a factor in the leak, the
2 effectiveness of the year 2005 ECDA inspection is not an
3 issue. More details gleaned from the Anamet failure
4 investigation and my interpretation of it follow."

5 Q. Okay. So, first of all, is it safe to say this
6 is a manufacturing threat?

7 A. By the code, no, it's not.

8 Q. Why not?

9 A. The code B31, references B31.8S criteria for
10 defining manufacturing threats, and it specifically
11 identifies certain types of seam welds as having that
12 threat. And the kind that the seam weld -- and the
13 reason that they're identified is because those kind of
14 seams tend to, when they fail, can open up and cause a
15 rupture. Other kinds of welds don't or are -- don't
16 generally, and they're not required to be treated that
17 way. It doesn't mean that an operator can't treat it
18 that way, but it's not required.

19 Q. Okay. What is a 2005 ECDA inspection?

20 A. So this was one of the early ECD inspections
21 that we did. And it was an assessment of the pipeline
22 for a time-dependent threat of external corrosion. And I
23 think I mentioned before that one of the reasons that we
24 were particularly interested in leaks in HCAs, especially
25 if it had been on an area that had already been assessed
26 was, it went to the heart of our program's effectiveness,

1 if something leaked after we inspected it. So it drew
2 extra attention.

3 And Dave is addressing the fact that, because
4 it was probably something I was beating him over the head
5 about, was that the ECDA problem wasn't, program wasn't
6 at fault for not finding this leak before it happened.
7 It's nothing that ECDA would find.

8 Q. So this leak wasn't found during a direct
9 assessment?

10 A. Well, the leak hadn't happened yet. But the
11 flaw wasn't found, that's correct.

12 Q. When did the leak happen?

13 A. Well, I don't know. Is there a leak form in
14 here? It says, it acknowledges the root cause leak was
15 detected after the 2005 survey through the area. So I
16 don't know exactly when the leak happened. It may say in
17 here someplace.

18 Q. It says, "Further investigation --"

19 A. Probably 2005 or '6 something like that.

20 Q. "Further investigation showed the leak may have
21 been present prior to 2005"?

22 A. Where does it say that?

23 Q. Second star, right here. "The leak was
24 detected after the 2005 ECDA survey through the area.
25 Further investigation showed the leak may have been
26 present prior to 2005."

1 A. Okay. It does say that. It may have been such
2 a small leak that they couldn't detect it --

3 Q. So --

4 A. -- when they went by.

5 Q. They did an inspection and they missed it,
6 potentially?

7 A. Well, not -- the ECDA group doesn't, doesn't
8 have the tools to look for leak survey to leaks. They
9 may -- I'm not familiar enough with the ECDA process to
10 know if they schedule a leak survey or not, but it's
11 different set of tools. They use a flame pack, which
12 goes over the pipeline and has a bunch of -- it ionizes
13 -- it burns any kind of gas that it collects, along with
14 the hydrogen in the detector. And any increase in the
15 flame tells it, hey, there's a leak here. But that's a
16 totally different set of tools than the DA tool. DAs are
17 just looking for corrosion.

18 Q. Okay. The DA in this case was not designed to
19 be looking for things like leaks?

20 A. Right. We have a separate program for that.
21 Transmission lines are inspected every year, and some are
22 inspected semi-annually for, there's a leak survey done.
23 But if it's a really small leak, even with the flame pack
24 that we do, it's, at that time -- I mean, there are more
25 sensitive tools today than there were in 2005. It's
26 possible that a small leak could evade detection.

1 Q. All right. Can you read us the next star down,
2 starting with "The leak."

3 A. "The leak was caused by a seam weld
4 solidification defect. The defect was created at high
5 temperature during welding, wherein a void was created
6 between the solidifying front from both sides of the weld
7 toes. It appears that inadequate feeding of molten metal
8 into the centerline of the weld combined with porosity
9 formation was the problem. The solidification and
10 porosity problem during welding is related to the filler
11 metal/flux selection and the essential welding
12 variabilities, most notably heat input. This is as
13 opposed to hot cracking that is caused by segregation.
14 The other 13 defects found in the 39 inches of seam
15 examined by radiography are of identical origin. These
16 defects do not represent a rupture concern, as
17 demonstrated they are a leak-before-rupture concern
18 only."

19 Q. So 39 inches of the pipe -- or the seam were
20 examined?

21 A. As part of the cylinder that we cut out, right.

22 Q. Thirteen other defects in that 39 inches?

23 A. That's what it says.

24 Q. That means 14 total defects in 39 inches?

25 A. Right. Teeny little pieces of oxide in there.

26 Right.

1 Q. Okay. But those are defects that the --
2 A. Correct.
3 Q. Leaks?
4 A. Could.
5 Q. Okay.
6 A. In 50 years it led to one.
7 Q. All right.
8 A. Or whatever the number of years was he said.
9 Fifty-six years.
10 Q. So after you find a leak like this -- and, by
11 the way, we talked earlier about, and how this came up,
12 we were talking about your budget for leak research, leak
13 investigation; correct?
14 A. Correct.
15 Q. This is what we're talking about; right?
16 A. This is the leak that generated a lot of the
17 subsequent budget estimates, because it was very
18 expensive to dig this thing out.
19 Q. Right. You dug that out, you can out that
20 piece of pipe or had it done?
21 A. We cut it out. Anamet did the analysis. Dave
22 did the review, and he worked with Anamet on it.
23 Q. He did a root cause analysis report?
24 A. Right.
25 Q. Which is included in the exhibit?
26 A. Right.

1 Q. Sent it off for forensic work at Anamet lab?

2 A. I told you before that they didn't require that
3 we -- this kind of a defect wouldn't have required a, us
4 to do a seam weld assessment. And that's normally true.
5 But if Dave had come back and said, talking about those
6 failure curves about leak before rupture, if he had said
7 this was rupture-before-leak threat, even if it hadn't
8 done it this time, we would have probably looked at doing
9 something different.

10 Q. Okay. Okay. So after an incident like this,
11 what do you do to ensure that there's no other pipe out
12 there like this?

13 A. There probably is, but -- so we accept the fact
14 that once every 56 years we may have a small leak that we
15 have to repair.

16 Q. Well, I'm guessing that this probably wasn't
17 the only pipe that was installed in 19 -- or 56 years
18 ago; correct?

19 A. 153 I think goes -- I can't remember what the
20 name of the station, something like Fairview Crossover in
21 Hayward, goes from Fairview Crossover up to Romana
22 (phonetic) Station. So, I don't know, 15, 20 miles,
23 something like that, of pipe. And that would -- most of
24 it would have all been installed at the same time.

25 Q. Okay. Probably there were other gas
26 transmission line installments that same year in other

1 parts of the state; right?

2 A. It wouldn't surprise me. I don't know if they
3 would have used this size of pipe, but we would have put
4 in other pipe in 1949.

5 Q. Well, when you have a leak like this, what do
6 you do to ensure that you don't have other situations
7 just like this in other parts of the system?

8 A. For something like this, we wouldn't. The code
9 says that certain kinds of leaks that are nonhazardous,
10 inherently nonhazardous like this one is, you fix them
11 when they fail. And -- now, and we weren't getting a lot
12 of leaks in the system, like I said, maybe 10, 12 a year,
13 so it wasn't much of a concern. It was a concern until
14 we got the report. And even after the report, I was
15 concerned some, but -- so if -- some of what I tell you
16 is based on -- it's kind of hard to put myself back in
17 that time and say this is what I thought then. Part of
18 what I tell you is based on everything that I've learned
19 since then. And it's hard to distinguish those two. But
20 I know Dave was pretty emphatic that it wasn't that big a
21 deal. And I'm looking back at that time, he was right.
22 I think.

23 Q. So this is a leak in a pipe on Alameda Avenue
24 in the city of Oakland; correct?

25 A. Right.

26 Q. This is definitely a high consequence area?

1 A. Given the size of the pipe, it's a low, it's a
2 relatively low pressure line. Part of this line, I
3 believe, operated less than 20 percent SMYS, which is one
4 of those criteria that's used to define a transmission
5 line. But if it's not below 20, it's very close to it.
6 But yes, I'm sure it's a high consequence area. Not all
7 of the pipeline is, but this particular section, if I
8 remember correctly, was.

9 Q. Okay. So you find this, you do all this
10 analysis of this pipe, you figure out what the problem is
11 that basically it's bad seam welds; correct?

12 A. It's seam welds with defects. I wouldn't call
13 it bad.

14 Q. And 14 defects in 39 inches of the section of
15 pipe?

16 A. Very tiny defects, right.

17 Q. Do you go out and inspect the rest of the pipe
18 to see if it's the same as this 39-inch section that
19 you've pulled out?

20 A. No.

21 Q. Do you look for other similar pipe in the
22 system to go out and inspect?

23 A. No. I don't know how you could inspect for it.
24 An ILI probably wouldn't pick it up; it would be too
25 small. It might even be too small for a pressure test.
26 Because this was older and hadn't been pressure tested,

1 after San Bruno we did pressure test this line. And my
2 recollection, and I could be wrong, but my recollection
3 is that, that the, that the, after they tested it they
4 found no leaks, and a month later after they had tested
5 it they said they had found a leak. And to me -- they
6 said they would have been able to detect that leak at
7 that time. And I -- my own belief is that if it passed
8 the hydro test, probably wouldn't leak after that. So it
9 means that with the hydro test it was probably leaking,
10 but the rate was just so small they couldn't see it.

11 Q. All right. Good segue into our next topic,
12 which is your policy for nonhazardous leaks. If you can
13 start off by defining for us what is a nonhazardous leak.

14 A. It's a leak that's -- again, there's a more
15 formal definition in the leak survey guides, but from
16 speaking from memory, it's a leak that's, that's
17 nonhazardous and it's expected to remain so until the
18 next leak survey.

19 Q. Okay.

20 A. We graded leaks 1, 2, or 3. Grade 3 is that
21 nonhazardous. Actually, a grade 2 leak is one that
22 requires action, but doesn't require immediate action.
23 And a grade 1 is a leak that requires immediate and
24 continuous action until it is no longer a grade 1 leak.

25 And that doesn't necessarily mean it's fixed.
26 It could mean, for instance, that it's a leak that it's

1 -- one of the reasons that it's happening is because the
2 gas could migrate to a building and could cause a gas
3 buildup. And by just opening up the pipeline around the
4 leak, it can vent to the atmosphere, vent safely to the
5 atmosphere, and, therefore, it can be downgraded to a
6 grade 2.

7 Q. Prior to 2008, what was the policy for dealing
8 with nonhazardous leaks?

9 A. We're talking about the email?

10 Q. I'm not talking about an email yet. It's not
11 related to an email.

12 A. Okay. So we had -- so, again, if it was a
13 grade 3 leak, nonhazardous, we would, we wouldn't do
14 anything with it, we'd just look for it the next time
15 that we did a leak survey in the area. And the leak
16 survey frequency varied depending on the kind of pipe it
17 was and the location it was at. There were different
18 rules for leak surveys between Distribution and
19 Transmission.

20 Distribution lines generally were on a
21 five-year survey schedule. But in business districts,
22 areas where there was, it was wall-to-wall paving, where
23 if you did have a leak, the leak couldn't vent out
24 through the paving, or out to the atmosphere like might
25 if it was a side building, those would be done more
26 frequently. I don't remember what the frequencies are

1 anymore.

2 Then on transmission lines, I believe it was
3 annual, and I think some of them were semi-annual. But,
4 again, the leak survey guide has that information, and I
5 just -- it's been too long, I just don't remember.

6 Q. So you didn't fix the leaks?

7 A. For grade 3 that were nonhazardous, no, we did
8 not --

9 Q. At some --

10 A. -- before 2005.

11 Q. Okay. At some point did that policy change?

12 A. For transmission lines, yes, it did.

13 Q. Why?

14 A. In 2005, we were -- the System Integrity
15 Program was audited by the CPUC with the assistance of
16 PHMSA. And the lead PHMSA inspector, Jeff Guillen, who
17 was there as an adviser but in reality acted as the lead,
18 told us -- when he asked us to explain our policy, we
19 did, I think probably Chris did the explanation, and he
20 said, "No, no, no, that's no good. You can't do that.
21 If you have a leak in an HCA, you need to fix it. So we
22 changed our policy for gas transmission lines in HCAs.

23 So we went out and all the ones that were open,
24 what are called "open" leaks, meaning they're out there,
25 we have paperwork on them, we know where they are, we
26 haven't fixed them, all the ones identified for HCAs, we

1 went out and fixed. And, of course, as it turned out, a
2 lot of them we thought they were on the transmission
3 line, but they were really on a distribution line that
4 was right next to them. But some of them were on the
5 transmission lines, and those were fixed. I think one or
6 two of them.

7 Q. Are you familiar with the accelerated leak
8 survey?

9 A. Not enough to talk intelligently about it.

10 Q. Just in general, can you tell us what it was?

11 A. I think, but I don't know, that there were,
12 that there were irregularities found in how some of the
13 leak surveys were done, and the accelerated leak survey
14 went back and, rather than wait the typical five years
15 that would have been allowed between these surveys,
16 accelerated the leak survey. But I'm sort of guessing.
17 I probably shouldn't answer that question.

18 Q. Was that an outgrowth of the PHMSA and CPUC
19 2005 investigation --

20 A. No.

21 Q. -- and the -- okay.

22 A. If it's the one that I'm thinking of, it was
23 based on what was found in, at a division level. The
24 PHMSA survey was of the Transmission and System Integrity
25 Programs.

26 Q. All right. So let's start historic leak

1 records. How important are historic leak records to your
2 risk assessment?

3 A. Well, I don't know if we read it or not, but
4 there are I think around, I think I did read it, that
5 there's something around 40 different factors used for
6 assessing the risk on a pipeline, that we used, relative
7 risk assessment, that we used to figure out is this a
8 high or low risk item. Any one of them doesn't change
9 the number very much. So as far as changing the risk
10 assessment, it didn't have a very big effect one way or
11 the other, but it's, better information is better.

12 Q. How about the threat assessment?

13 A. More important. It made a difference on the
14 manufacturing threat.

15 Q. So if you haven't identified a leak, especially
16 a seam weld leak, more and more stuff kicks in; correct?
17 More requirements?

18 A. Yeah. In fact, so part of the assessment
19 process, the DA process, is to go back and do a much more
20 in-depth look for things like leak survey records and
21 what exists in GIS. And it was such a survey, for
22 instance, for DA on line 21E up in here in Santa Rosa,
23 that found a record of a seam weld leak that caused us to
24 flip the planned assessment method from DA to ILI. So
25 those records are very important.

26

1 (Grand Jury Exhibit 654 was marked for identification.)

2

3 Q. All right. So let's look at Exhibit 654.

4 A. Okay.

5 Q. See if you recognize 654.

6 A. Okay.

7 Q. All right. So this is a series of emails in
8 January of 2009 regarding leak data; correct?

9 A. Correct.

10 Q. Eventually you get included into this email
11 chain?

12 A. Right.

13 Q. All right. So let's start at the beginning
14 again. Who is John D. Hunter?

15 A. John Hunter is a graduate of the Washington
16 State University, and he is, was the gas engineer out in
17 area 5.

18 Q. How about Matthew Pender?

19 A. Matt was the Gas Distribution expense manager
20 at this time, I believe.

21 Q. David Baker?

22 A. David Baker worked for me. And his title was
23 on one of those O charts we looked at earlier. I don't
24 remember what his title is, but Dave supported software
25 applications primarily aimed at folks doing distribution
26 work.

1 Q. So the email chain starts off with John Hunter
2 asking how far back does our leak data go; correct?

3 A. Yes.

4 Q. And if you can take it from there with the
5 response from David Baker.

6 A. "John, there was data migrated into IGIS from
7 the old PC leaks program when IGIS started up back in
8 1999. I've run queries to pull data back as far as
9 1985."

10 Q. Is IGIS the same as GIS?

11 A. No.

12 Q. What is IGIS?

13 A. Integrated Gas Information Systems, I believe.

14 Q. And what is that?

15 A. It was, I think, the mainframe program that we
16 used to track leaks system-wide. I think so.

17 Q. So next somebody named Dennis Marenberg jumps
18 into the conversation?

19 A. Yes.

20 Q. Do you know who Dennis Marenberg is?

21 A. I did. Yeah.

22 Q. Who is Dennis Marenberg?

23 A. He worked in our IT group, or Information
24 Technology, group, but he was, even though he was in the
25 Information Technology group, he was very knowledgeable
26 about -- well, he'd helped develop a lot of the leak

1 system computer software that we had, and he was familiar
2 with the history of the system.

3 Q. All right. So read to us his email.

4 A. "Folks, a fuller explanation of John's question
5 follows. In 1999 gas leak data existed in two locations,
6 our mainframe system and our local PC systems. The
7 mainframe gas leak system contained historical gas leak
8 data dating back to the beginning of our gas leak
9 application in the 1970s. The PC gas leak systems
10 contained data dating back to the beginning of the PC gas
11 leak system about 1987. Although, the PC gas leak system
12 tracked a few more fields than the mainframe system did,
13 the mainframe system was uploaded with the data from the
14 local PC gas leak systems on a monthly basis and thus
15 contained pretty much the same data as the PC gas leak
16 systems did, except for all of the pre-1987 historical
17 leak data.

18 When we cut over to using IGIS in 1999, we used
19 the PC gas leak system as our data source and imported
20 all of the active data in these systems into IGIS.
21 Active data was all of the data for active leaks as well
22 as data for inactive leaks that had not been archived.
23 The PC leaks system gave users the options of archiving
24 all data for inactive leaks, but different locations used
25 this function to different degrees. Since each location
26 used the archiving function differently, some not at all

1 and some as often as annually, how far back our IGIS data
2 goes depends on the location of the data.

3 We have determined the IGIS has all historic
4 leak data back to the beginning of 1997, but starts to
5 lose data from some locations as you go back further in
6 time.

7 Meanwhile, we copied the 1999 mainframe leak
8 data to an MS, Microsoft, Access database and still have
9 the ability to extract data from the database and thus
10 have access to just about all historic leak data.
11 However, in extracting or querying data from this
12 database, we need to understand that the data set is much
13 smaller than today's IGIS database, that the validity
14 rules changed quite a bit since the first gas leak
15 application, and that querying this data is more
16 difficult and time-consuming than with IGIS, and thus we
17 need to carefully consider the cost and benefits before
18 we start dealing with this database.

19 Any questions, please let me know. Dennis."

20 Q. Okay. Okay. The response from John Hunter?

21 A. "Thanks, Dennis. I think we can all understand
22 why this question comes up now. In my case, I have three
23 incidents that folks are asking me what the leak history
24 is on the pipe. When I look at IGIS, I have nothing
25 showing up. The piping in one case in early 1970, early
26 '70s vintage, so from Dennis' summary, I can assume that

1 I don't have all the info just by running an IGIS leak
2 history report. With that in mind, do you have any
3 suggestions for situations where we need to do a complete
4 review of the leak history?

5 Really appreciate your help."

6 Q. And finally, the response from David Baker.

7 A. "John, could you provide Dennis and myself with
8 a map, plat, and block of each of the three incidents?
9 This will be needed for a leak history query of the
10 pre-1999 leak data, which is contained within an archive
11 Access date database. Dave."

12 Q. Sounds to me, reading this email chain, that
13 pre-1999 leak data is pretty difficult to get to, hard to
14 find, takes a lot of work, and incomplete; is that true?

15 A. For distribution leaks, I think that's sort of
16 what this is saying.

17 Q. Distribution, where does it say distribution as
18 opposed to transmission?

19 A. It doesn't, and I'm not sure that that's the
20 case. But John Hunter is the local gas engineer, he's
21 not a pipeline engineer. And David supported the
22 division, and Dennis Marenberg mostly worked on those
23 issues.

24 Q. Okay.

25 A. So it could be some transmission, I just, I
26 don't know. But I'm guessing it's distribution. But I

1 don't know that.

2 Q. All right. So let's move on and talk about the
3 GIS system itself.

4 A. Okay. GIS?

5 Q. Yes.

6 A. Okay.

7 Q. So what's the importance in GIS in risk
8 assessment and calculation?

9 A. Well, given the method that we used to, the
10 method that we selected, relative risk assessments, for
11 prioritizing work in GIS, it is, it's critical. We have
12 to have the information in GIS in order to identify all
13 the pipeline segments that we're going to assess and
14 whether we're going to range them as a high or low risk.

15 We could have done risk analysis another way,
16 but we didn't. And given the way that we did it, we had
17 to, which was the probabilistic method, we needed -- a
18 relativistic method, we needed to have, we needed to have
19 information in GIS.

20 Q. So did you rely upon GIS for historical leak
21 records like we just talked about?

22 A. Yes.

23 Q. And you relied upon GIS for -- all of a sudden
24 I forgot the word for it, but the specific, specifics as
25 to pipes or pipelines?

26 A. Attributes.

1 Q. Attributes. That's the word I was looking for.

2 A. For the risk assessment, yes. And for the

3 threat assessment, initial threat assessment, yes.

4 Q. You also, there was also a lot of assumed

5 values in GIS; correct?

6 A. Correct.

7 Q. And could you briefly for us define what is the

8 proven margin of safety?

9 A. No, I don't know what, I don't know what you

10 mean.

11 Q. Okay. You don't know what proven margin of

12 safety is?

13 A. I don't know what you mean by it.

14 Q. What's a margin of safety, to start with?

15 A. It would be, I think what you're asking me is

16 the, a margin of safety would be the difference between

17 what something is operating at and what would cause it to

18 fail.

19 Q. Okay.

20 A. The difference between those two things would

21 be the margin of safety.

22 Q. Okay. And is there any such thing as a proven

23 margin of safety?

24 A. If you pressure test the line, yes.

25 Q. Okay. So if you're dealing with assumed

26 values, do you have a proven margin of safety?

1 A. If it had been pressure tested, you could, yes.

2 Q. Okay. But if it's pressure tested, then you

3 definitely have a proven margin of safety?

4 A. Correct.

5 Q. Let's assume it hasn't been pressure tested,

6 you're dealing with assumed values, do you have a proven

7 margin of safety?

8 A. No.

9 Q. If you're dealing with assumed values and you

10 don't have a test to prove what the margin of safety is,

11 then you'd be dealing --

12 A. Wait. I'm sorry. Can you re-ask that? I may

13 have answered that incorrectly. Could you re-ask that

14 last question, the one that I answered no to about

15 assumes?

16 Q. If you have assumed values --

17 A. Yes.

18 Q. -- and you have to pressure test, you're not

19 dealing with a proven margin of safety; correct?

20 A. Without a pressure test, you have no proven

21 margin of safety whether you have assumed values or not.

22 Q. Okay. What about if you know all of the values

23 of the attributes?

24 A. You still haven't proven it. That's why you

25 have the pressure test.

26 Q. Okay. All right. That was a long way to

1 explain it.

2 So when you're doing a risk assessment and
3 calculation on a gas transmission line, what's the effect
4 of having missing records and assumed values?

5 A. If the assumed values are not conservative, it
6 means for your risk assessment -- well, for risk
7 assessment, again, it's not that important for the
8 reasons that I specified before, which is that you're
9 just dividing things into these two boxes, high and low,
10 you're going to assess them all anyway, it's just a
11 matter of priorities. But if the information that you
12 have is wrong, and it's not conservative, it could mean
13 you're operating the pipeline at a much higher, at a
14 higher calculated specified strength than you think you
15 are. And you could be operating it in a way that's
16 unsafe. It's possible.

17 Q. Okay. All right. So let's talk about 2010,
18 CPUC audit. Do you remember that?

19 A. Yes.

20 Q. Before we get into it, what is a CPUC audit?

21 A. An audit is where the CPUC comes in and looks
22 at procedures and records for compliance with
23 requirements of the, of GO 112, the General Orders of the
24 state. Which for -- California incorporates the federal
25 standards, the 49 CFR 192, and it adds additional
26 requirements that the state has determined are important.

1 Q. Describe for us the process of a CPUC audit.

2 A. Depends on the kind of audit. There -- I've
3 been in a couple different kinds. But for the Integrity
4 Management Program, the CPUC comes in, they, they give us
5 -- first, maybe a couple weeks before the audit, they
6 will send us a list saying we want to see all these
7 documents, please send them to us prior to the audit.
8 And a lot of times that will be things like procedures,
9 that they can just review the procedures, be familiar
10 with what we have.

11 Then they'll come in and they have a series of
12 protocols, and those protocols are questions that they
13 ask to show compliance with each different part of
14 Subpart O of the System Integrity section of the code.
15 And, and they'll ask us to show in the procedures where
16 we meet that particular requirement.

17 And then they'll ask for the documentation that
18 shows that we followed our procedure. Generally, that's
19 what will happen. And they'll step through each -- the
20 protocols cover, you know, everything from HCA
21 identification to risk/threat analysis, including all the
22 different threats, to how we do all our ILI work, how we
23 do all our DA work, how our RTOA program works, all the
24 different elements that are required in Integrity
25 Management Program.

26 Q. So was Integrity Management involved in the

1 2010 CPUC audit?

2 A. Yes. There was -- the CPUC does a lot of
3 audits every year. There was an IM audit in addition to
4 a bunch of other audits they did in 2010 in Walnut Creek.

5 Q. Did you personally participate in the May 17th
6 -- May 18th I think through, what was it, the 22nd?

7 A. Typically, there are two-week audits that are
8 -- they usually come for a week, they gather a lot of
9 stuff up, they take it back to their office, and they
10 examine it. And then they come back out a week after
11 that, and then they -- there's another week of auditing,
12 then they take all that stuff back. And I did
13 participate in the audit that started in late May.

14 Q. Okay.

15 A. At least for the beginning of the audit. I
16 wasn't there for the whole thing, but I was there for
17 part of it.

18

19 (Grand Jury Exhibit 655 was marked for identification.)

20

21 Q. All right. So you have in front of you Exhibit
22 No. 655. See Exhibit 655?

23 A. Yes.

24 Q. Do you recognize Exhibit 655?

25 A. I do.

26 Q. What is Exhibit 655?

1 A. 655 is a markup of a memo that I wrote in
2 preparation for that audit.

3 Q. What do you mean a "markup"?

4 A. Well, it looks like it's been edited. I can
5 see there's lines drawn through things, and which I
6 wouldn't have done. So somebody's marked this up.

7 Q. Okay. So who would have marked up a memo that
8 you did?

9 A. Well, at the bottom it says Mears, dash DOJ, so
10 I'm assuming from Mears, so Mears did this.

11 Q. Who is Mears?

12 A. Mears was the corporation that we hired to do
13 DA work. But for the audit, we -- but we also had
14 individuals that were, that assisted us in different
15 parts of our business. Dan Curtis was a Mears employee.
16 He helped us with our risk analysis and HCA analysis each
17 year. And Chris Warner was a, I think at the time a
18 project manager. I don't know what his title was. But
19 he worked at Mears, and he previously had been the head
20 of the System Integrity Group.

21 And Sara Peralta, or Burke, I don't remember
22 which at this point, had invited Chris to -- or asked
23 Chris if he would be willing to help us prepare for this
24 audit. We knew about the audit at the end of 2009 that
25 in 2010 we'd be audited. Chris agreed that he would do
26 that for us. I mean, it wasn't a gift. He would do it

1 as part of a contract that Sara had, had prepared for.

2 So this could be comments that I had received
3 from Chris when I sent this note out for comment.

4 Q. Okay. It's about ten to 4:00. Do we want to
5 take a break before we get into the meat of this memo?

6 A. I would.

7 GRAND JURY FOREPERSON: Ten minutes.

8 (Break taken.)

9 GRAND JURY FOREPERSON: All members of the
10 Grand Jury are present, ready to proceed.

11 Q. (By MR. NOEL) I already forgot the exhibit
12 number.

13 A. 654.

14 Q. Mr. Manegold, you had indicated during the
15 break that you wanted to add something on 654?

16 A. Yeah. I just wanted to emphasize that while I
17 still think this is about distribution leaks, that your
18 underlying questions about the, its application to the
19 transmission system, it may have some, it may involve a
20 transmission system, I just don't remember. I think this
21 email is about the distribution system, but the program
22 could have been used by both sides. I just don't
23 remember.

24 Q. Okay. One of the things that we had pointed
25 out is, we talked earlier, you've testified at the
26 federal criminal trial on PG&E out of the San Bruno

1 explosion?

2 A. Yes, I did.

3 Q. And that is an exhibit that you testified to in
4 the federal criminal trial; correct?

5 A. As I said, if you tell me that's what it was, I
6 will believe you, but I just don't remember that.

7 Q. All right. So now we're getting back to this
8 memo. May 17th, 2010, memo regarding ERW seam threats.
9 Can you give us the background of why you wrote this
10 memo.

11 A. Yes. Sara Peralta had brought Chris Warner on
12 board to help us prepare for the audit. And as part of
13 that preparation, Chris had done a survey of all, of the
14 supervisors of the three work groups, ILA, DA, and my
15 group, to find what our concerns were about the upcoming
16 audit. And my primary concern -- I had a number of
17 different concerns, but probably the most important
18 concern, certainly by the time of the audit, my number
19 one concern was how we addressed manufacturing threats.

20 Specifically, the code requires that we not
21 exceed the five-year maximum operating pressure of any
22 pipe that had a seam manufacturing threat. If in 2002
23 the highest pressure on the line was 400 pounds, the,
24 then up to 2007 we could operate that line at 400 pounds.
25 But on 2008, if it hadn't sometime after 2002 seen a
26 pressure up to 400 pounds, it would be limited to -- if

1 we wanted to avoid activating a manufacturing threat, it
2 would be limited to the pressure of that maximum
3 five-year interval. And so it required operator to track
4 what those pressures were in order to know whether they
5 had exceeded that value.

6 And it seemed like a simple enough thing to do,
7 but in reality it turned out to be extremely difficult
8 and, in my opinion, ultimately impossible. And that's
9 because the pressure that's of interest is the pressure
10 of the segment that you have a concern about. So we'd
11 measure pressure at PG&E, and most operators do it,
12 regulator sets, because you want to make sure that the
13 regulator is working properly. You can remotely monitor
14 it and see that if it's supposed to make sure the
15 pressure doesn't go above 200 pounds that you're at that
16 200-pound limit. And we kept records like that.

17 But the pressure of interest for the System
18 Integrity Rule was the pressure of the segment of
19 interest. And downstream of that regulator, the pressure
20 is less, and it varies. And you don't know how much it
21 varies other than you know it never exceeds the pressure
22 at the regulator at the very beginning of the line. But
23 down the line, as there are homes served or other lines
24 branch off of it, there are pressure drops. And those
25 pressure drops vary from time of year to time of year.
26 They vary from day to day. They vary from morning until

1 night. And you don't have a pressure indicator to tell
2 you what they are.

3 The code says that you can't exceed that
4 five-year value. And the federal government wrote a
5 series of what they call "frequently asked questions,"
6 which provide guidance on their current thinking about
7 how the code is to be interpreted. If it says that
8 you're supposed to do Y, but they feel that there might
9 be some confusion about what doing Y means, they would
10 write an FAQ and explain, this is what we think it means.
11 They make it very clear that their interpretation is not
12 the same thing as a rule. It doesn't have the power of
13 the rule. And it only represents their current thinking.
14 They can change that at another time. But it represents
15 what they think right then.

16 And, generally, for an audit purpose, if you
17 follow their FAQs you'll probably be okay in any kind of
18 an audit they would do. Now, it doesn't mean that
19 you're, that every operator's always going to follow
20 that. And PG&E didn't -- in the first audit that we did
21 in 2005, there was a section, and I can't remember what
22 it was, but we told them that there is a -- they made a
23 point -- the PHMSA inspectors said, "You know this is in
24 disagreement with the FAQ."

25 And we had told them, "We understand that, but
26 we think that we're right about this." We never got a

1 audit report for 2005, so we don't know how they would
2 rule. We don't know what they'd, they had decided. But
3 at that same audit, I'd asked the PHMSA inspector, Jeff
4 Guillen, "When it says you can't exceed the five-year
5 MOP, how much allowance is allowed in that?"

6 He said, "None. The FAQ says, 'If you go over,
7 you go over.'".

8 At the time, that seemed to me to be pretty
9 clear about what we needed to do. But I hadn't looked at
10 the issue at the time, and I didn't realize what that
11 meant, which was that in order to know that we hadn't
12 gone over that pressure by any amount, we'd have to know
13 what that pressure was. And we didn't.

14 And so how we were going to monitor this threat
15 was a big concern for me going into the audit. And we
16 had looked at a bunch of different things. We had --
17 internally, we'd started to monitor -- probably around
18 2008, one of the guys that worked for me was assigned the
19 task of looking across the system at all the pressure
20 records we had. And we had different types. We had --
21 in addition to pressure transmitters, we also had
22 pen-style recorders, where it would measure the pressure
23 on like a 24-hour piece of paper.

24 Q. We're kind of getting into the weeds here.

25 A. Okay.

26 Q. You wrote this CPUC audit?

1 A. I did.

2 Q. This was written to justify --

3 A. Not to -- it was written to explain how we were
4 going to measure the, how we were going to determine when
5 a threat had been activated, a manufacturing threat had
6 been activated. That was solely the purpose of this.

7 Q. What happens if you exceed the maximum
8 operating pressure on a line with a recognized seam weld
9 failure, an established seam weld failure?

10 A. A seam weld threat, you don't have to have had
11 a failure. It's a stable failure -- stable threat until
12 you've had a failure or until you've exceeded that
13 five-year MOP. At that point, then you would have to
14 schedule an assessment of that pipeline as a high-risk
15 assessment.

16 Q. What type of assessment?

17 A. Typically, that would be a pressure test. I
18 believe it could still be a ILI, again, with the caveat
19 that I talked about before, that if, that if it's a large
20 enough flaw that will be produced that could be detected
21 by an ILI device and still not rupture. But most of the
22 time, it would probably -- well, it would be either an
23 ILI or a pressure test.

24 Q. Now, you wrote in the third paragraph,
25 "Currently PG&E uses a five-year rolling historical
26 maximum to define the MOP limits that define the

1 activation of the seam weld threat." What's a five-year
2 rolling historical maximum?

3 A. It means that -- there are two sections where
4 five years are mentioned in the code, but it goes back
5 to what I was describing before when I said that if in
6 2002 the maximum pressure was X, but then you didn't see
7 that pressure again for the next five years, if you
8 didn't, if it didn't get back up to X, you would be then
9 limited to the highest pressure in the proceeding five
10 years after that.

11 So if on December 31st it was at 200 pounds,
12 and five years plus one day after that the highest
13 pressure in that interval was 197 pounds instead of 200,
14 you would, if you wanted to avoid activating a
15 manufacturing threat, be limited to 197 pounds on that
16 line --

17 Q. Okay. Let's move on.

18 A. -- for that segment. For that segment.

19

20 (Grand Jury Exhibit 656 was marked for identification.)

21

22 Q. Let's move on to 656. Now, prior to presenting
23 this memo, or taking this memo to the CPUC audit, did you
24 seek peer review at that audit?

25 A. I did.

26 Q. And to whom did you send that memo? I mean, to

1 whom do you send that memo?

2 A. The names are listed at the bottom. Sara. I
3 sent it to Sara, I sent it to Calvin Lui, Thach Ha,
4 Chih-Hung Lee, Chris Warner, Dan Curtis, and Frank Dauby.

5 Q. Okay. When you say it's listed at the bottom,
6 you're referring to the bottom of 656?

7 A. 656, that's correct.

8 Q. And 656 is an email exchange with regard to the
9 memo between yourself and Frank Dauby?

10 A. Yes, it is.

11 Q. So how did Frank Dauby react to your memo?

12 A. He thought the memo was reasonable and
13 defendable.

14 Q. And read us your response to Mr. Dauby.

15 A. "That's what Custer told the lieutenant who
16 said, 'Let's stop here.'"

17 Q. What did you mean by that?

18 A. I think I thought Frank was wholly
19 underestimating the size of the problem. To me, as we
20 were getting into the weeds, I was trying to describe, to
21 me it's a very complicated problem. And the response
22 that I wrote in my memo was very simplified and
23 incomplete. It wasn't adequate.

24 Q. Okay. What happened to Custer after they
25 stopped there?

26 A. Well, at the Little Bighorn, he was killed.

1 Q. So did you expect on your memo that when you
2 went in front of CPUC audit that you were going get
3 killed?

4 A. That's what I testified at the trial.

5 Q. Not literally.

6 A. Figuratively. It was a very poor choice of
7 words that I said.

8 Q. CPUC does not employ capital punishment; right?

9 A. Well, given the case at the trial, it was also
10 especially a poor choice of words.

11 Q. I think the word you used in the federal trial
12 was "slaughtered."

13 A. I think I used both.

14 Q. Why did you feel you were going to be
15 slaughtered or killed by the CPUC on that memo?

16 A. Because, as I said, it's just a very
17 complicated issue, and it's -- I don't think that memo
18 addresses it. If I was the -- the PUC's job -- what the
19 memo that I wrote did was, in essence, it invited a
20 conversation with the PUC about what we would find
21 acceptable. But the PUC's job isn't to converse with us
22 about what we both think is the best way to do things.
23 Their job is to tell us what we're doing is either right
24 or wrong. And they may not know what to do either. As I
25 said, I think it's an impossible problem.

26 I think -- as it happens, I think the only

1 solution was to test all untested pipes. That's the only
2 way that you can really be sure that you're not going to
3 activate that threat. But I didn't realize that at the
4 time, I just knew this memo didn't do it. And I thought
5 that the lead auditor for the CPUC, Sunil Shori, was a
6 very sharp guy, and he wouldn't know what to do either,
7 but he'd know that the memo that I wrote was inadequate.

8 Q. So you say you believed that ultimately you had
9 to test the pipes?

10 A. After San Bruno I realized that.

11 Q. Okay.

12 A. Especially because of San Bruno. San Bruno
13 failed at a pressure where the regulator pressure was
14 lower than it had been before. But, as it turned out,
15 the pressure at the failure spot was the highest we'd
16 ever measured it at. So that whole idea of trying to
17 measure things at the regulator, which is what we were
18 trying to do to use as a proxy for measuring the pressure
19 at a given point, because we didn't have pressure
20 transmitters everywhere, wouldn't work. And it didn't
21 work. And the only way that you can know it's safe is to
22 test it. But, again, at this time I didn't realize that,
23 I just knew that this wasn't enough, but I didn't know
24 what to do instead.

25
26 (Grand Jury Exhibit 657 was marked for identification.)

1
2 Q. All right. So let's go on to 657.
3 A. Okay.
4 Q. Do you recognize 657?
5 A. I believe so.
6 Q. All right.
7 A. I believe so.
8 Q. So 657 starts off with an email from Bob
9 Fassettt dated May 18th, 2010, to a bunch of people.
10 "Subject: CPUC IMP audit notes, day one."
11 A. Right. So I wouldn't have seen this top part
12 because it's not addressed to me, but I would have seen
13 the stuff below.
14 Q. The second email is addressed to numerous
15 people, including yourself, is also regarding CPUC IMP
16 audit notes, day one, 5/17/10?
17 A. Right.
18 Q. And then describe for us the rest, what makes
19 up the rest of this exhibit.
20 A. It looks likes it's the notes that Calvin took
21 on that first day of the audit.
22 Q. So Day 1, 5/17/10, that's the same day as your
23 memo is dated; correct?
24 A. Yes. Yeah.
25 Q. And the same day that you told Frank Dauby that
26 -- well, that you mentioned Custer in your conversation?

1 A. Right.

2 Q. In your conversation with Frank Dauby?

3 A. Right.

4 Q. So you said the auditors were Sunil Shori and
5 who else?

6 A. Aimee Cauguiran. I'm not sure -- Cauguiran --
7 I'm not sure I'm pronouncing her name correctly. Dennis
8 Lee and Paul Penny.

9 Q. And who were the PG&E team for the audit?

10 A. For the first day, Sara Burke, myself, Thach
11 Ha, Frank Dauby, Calvin Lui, Jeff Nicholson, R. L.
12 Mulder, and Debra Zearbaugh.

13 Q. And what were the items of discussion?

14 A. You want me to read it?

15 Q. Sure.

16 A. "Key items of discussion:

17 Concerns that distribution mapping back log may
18 affect our ability to identify a new HCA in a timely
19 manner. PG&E explained that while the plats are one of
20 many sources used in HCA review, they are not the primary
21 source of information."

22 Second bullet, "MAOP versus MOP continued
23 discussions on PG&E's use of MOP as equivalent to MAOP.
24 PG&E reaffirmed its position and definition as stated in
25 RMP 06 and TD, dash, 4125S."

26 Q. Okay. Let me stop you right there. What's the

1 difference between MAOP and MOP?

2 A. The federal code says that the, that the code
3 -- the pressure that a pipe or a pipeline segment may
4 operate at is -- the highest pressure that it may operate
5 at is the MAOP. Stands for maximum allowable operating
6 pressure.

7 Q. What's MOP?

8 A. But a pipeline is made up of a bunch of
9 segments, and the segments may have different allowables
10 than, than each other. And the pressure that you can
11 operate the pipeline at might be less than you can
12 operate some of the segments at, because you're limited
13 by the weakest link in that pipeline.

14 So PG&E wanted to -- in order to be able to
15 manage the pipeline and decide, gee, should we replace a
16 bunch of this pipe so we could potentially raise the
17 pressure on it, we tracked the pressure of both, the
18 allowable pressure of segments of pipe as well as the
19 pipeline as a whole. And to differentiate between those
20 two, we looked at the whole pipeline and said the -- and
21 I could be getting the two mixed up. One was one, one
22 was the other. But I believe the MAOP was the maximum
23 allowable operating pressure of the pipeline, and the MOP
24 was the maximum allowable pressure for the pipe segment.

25 So if we -- if you had a pipeline that was
26 qualified to 200 pounds and you replaced 1,000 feet of it

1 with brand new pipe with much thicker wall and you
2 pressure tested it so that it was qualified to 300
3 pounds, the MOP, all those little segments on the end
4 would be 300 pounds, but the MAOP of the whole pipeline
5 would still remain at 200, and the MOP of the first
6 segments would also be at 200.

7 And we had had a big discussion with Sunil
8 because his concern was that we should calculate our high
9 consequence areas using the MOP, that higher value even
10 though we could never operate the pipeline at that
11 pressure. And we so we had -- so that's what this is
12 referring to.

13 Q. Okay. So go on. Well, we can skip that.

14 A. Okay.

15 Q. These are the items that were discussed on that
16 first day. Were you involved with the audit after the
17 first day?

18 A. I believe so, but I don't remember. I'd have
19 to look at the notes. There's -- the CPUC, when they do
20 an Integrity Management audit, they have, as I described,
21 a series of protocols, they step through the whole
22 program. And I would have stayed as long as they were
23 talking about HCA identification and threat
24 identification. And when they got into DA and ILI work,
25 I wouldn't have been there.

26 Q. Did the subject of your memo come up?

1 A. It did not.

2 Q. Did you raise the subject of your memo?

3 A. I did not.

4 Q. Why not?

5 A. Well, because I didn't think it was a very good
6 memo. And, as I described to you before, the discussion
7 with the PUC was that they're looking for compliance with
8 the rules, they're not looking to give you engineering
9 advice on how to fix something. So if I had talked to
10 them about it, all it would have done was to start a
11 clock to say, "You've got to get this done in X down the
12 road, in X amount of time." And I didn't know how to do
13 it. But I expected it to be discussed because it was
14 part of the protocol. I don't know why they didn't
15 discuss it.

16 Q. So you prepared the memo because it was, that
17 topic was one of the possible subjects --

18 A. I expected it to be discussed.

19 Q. -- of the audit? And it didn't come up during
20 the audit?

21 A. It did not.

22 Q. And you didn't bring it up during the audit?

23 A. I did not.

24 Q. But it was a question of compliance; correct?

25 A. Yes. Although, I think we argued previously,
26 not to you or, but in other forums, that the rule says

1 that you start with a framework and you build from there.
2 And so they audited us in 2005, and we didn't have a
3 policy then either, but they didn't find us in
4 noncompliance I believe in part because they saw it as a
5 framework and we would get better, we would fill it out
6 as we went along.

7 So they might have just said -- they might not
8 have said it was a noncompliance item, but they might
9 have said, "You have to get this done, this is no longer
10 -- you're no longer framework stage, you need to have a
11 mature program, you need to provide us an answer on what
12 to do about this." That's what they could have said.
13 They could have also said noncompliance, but it wasn't
14 guaranteed.

15 Q. And you didn't have a mature program?

16 A. Not for this. We had a pretty mature program
17 when we were measuring, but we weren't measuring what we
18 needed to measure to be able to say whether we'd
19 activated the threat or not.

20 Q. Going into the audit, were you given any
21 instructions by your supervisors?

22 A. During the audit, yes; not that I remember
23 going into it.

24 Q. What type of instructions?

25 A. During the audit, after I gave a particularly
26 long and involved answer, I was pulled aside both by Bob

1 Fasset and Sara to remind me -- or to ask me to answer
2 the questions that were asked, don't answer a bunch of
3 questions that aren't asked.

4 Q. Bob Fasset wasn't part of the audit; correct?

5 A. His name's not on here, but I thought he was
6 there, because I don't think he would have said anything
7 if he wasn't in the room. I think he was there. I think
8 at least when we discussed the issue that, that, that
9 they talked to me about after I -- when we talked about
10 MOP, I thought they were, I thought Bob was there. I
11 know his name's not on here, but I thought he was there.
12 Because what I remember is that at a break Bob pulling me
13 aside and giving me that instruction. I've had the
14 chance to think about it the last couple weeks, because I
15 think you asked me about this before. That's what I
16 remember.

17 Q. Well, we'll come back to that.

18 All right. Let's move on to 658.

19

20 (Grand Jury Exhibit 658 was marked for identification.)

21

22 A. Okay.

23 Q. Do you recognize 658?

24 A. Yes.

25 Q. What is 658?

26 A. It's an email between Gene and me and Thad

1 Quaas, who was the -- says it's to me -- actually, I take
2 it back. I'm not sure what the heck is going on here.
3 Starts out by saying "Thad," but it's written to me. I'm
4 not sure. Take it back, I'm not sure.

5 Q. All right. Let's walk through this. Who is
6 Thad Quaas?

7 A. I believe he was a transmission planning
8 engineer. He worked for Rick Brown.

9 Q. Okay. Who is Rick Brown?

10 A. He was the supervising engineer manager of the
11 Transmission Planning Group.

12 Q. All right. So this email's asking questions
13 about MAOP and a line, line 191S. So explain to us the
14 question in this email.

15 A. Let me read it. Okay. I'm not sure I
16 understand all of it, but okay.

17 Q. Well, this is a question about MAOP; correct?

18 A. Yes.

19 Q. And how that's established?

20 A. Right. That's correct.

21 Q. Okay.

22 A. Partly. In part. It's a lot about the
23 limitations that the seam threat reviews its -- Gene has
24 done is putting on the system that Thad is planning on
25 using that winter.

26 Q. Who is Gene Muse?

1 A. Gene worked for me. He was a, he was an
2 engineer that was tasked with helping us identify
3 potential areas where we had a manufacturing seam threat.

4 Q. All right. So read to us Gene Muse's response.

5 A. To me. So maybe sent this to me for comment.

6 "Thad, I've reviewed the code again and can,
7 unfortunately, offer you no different guidance than what
8 we -- when we first talked towards the beginning of the
9 year. HCA pipe with a seam weld threat, that is pipe
10 formed with a low frequency ERW process or pipe with a
11 joint efficiency less than 1, cannot, by code, be
12 operated above the five-year maximum historical operating
13 pressure on that line. When this rule went into effect,
14 that five-year maximum was 257 psig. And that remains
15 the current maximum allowable operating pressure. We can
16 set the primary regs at this station to that value,
17 provided the monitors are set to a value not more than 10
18 percent above this number. To go to a higher operating
19 pressure requires an assessment of that seam. The
20 preferred assessment method is a pressure test to 1.25
21 times the new MAOP.

22 The 261 psig value that was recorded on
23 7/1/2007 is an increased operating pressure above the
24 five-year high, and we may have to do a reassessment of
25 the pipe segments that were potentially affect by the
26 increased pressure. That pressure excursion, however,

1 does not establish a new five-year maximum."

2 Q. And then it cites the code.

3 A. "For reference, CFR 192.917(e) (4) ERW Pipe,
4 which states, 'If a covered pipeline segment contains low
5 frequency electric resistance welded pipe, ERW, lap
6 welded pipe, or other pipe that satisfies the conditions
7 specified as ASME/ANSI B31.8S, Appendices A4.3 and A4.4,
8 and any covered or noncovered segment in the pipeline
9 system with such pipe has experienced seam failure, or
10 operating pressure on the covered segment has increased
11 over the maximum operating pressure experienced during
12 the preceding five years, an operator must select an
13 assessment technology or technologies with a proven
14 application capable of assessing seam integrity and seam
15 corrosion anomalies. The operator must prioritize the
16 covered segment as a high-risk segment for the baseline
17 assessment or a subsequent reassessment.'

18 If you have any questions about this, please
19 give me a call.

20 Bill Manegold and I met and discussed what, if
21 any, options we had in using the highest MAOP for line
22 191S, line 191, dash, 1. In the end, we are held to the
23 code that's outlined in," then it's blank.

24 "As we have discussed, I have determined the
25 baseline five-year historical high MOP -- MOP for this
26 pipeline to be 257 psig on 12/11/2002. The MOP which you

1 can operate the pipeline is 257 psig. If we want to use
2 the 268 psig MAOP/MOP, we have three options: Hydro test
3 pipe segments, replace pipe segments, or assess the pipe
4 with proven technologies, smart pig." That was one of
5 the options left off when we discussed before about what
6 we could do for assessments.

7 Q. So this seems to be dealing with the same topic
8 as your memo; correct?

9 A. It is, but it's much earlier. It's towards the
10 beginning of the -- well, it's not the very beginning of
11 the program, it's probably -- program probably started in
12 January, just to look at the issue, but 2010 was much
13 further along.

14 Q. So basically, make sure I understand this
15 correct, you would determine the MAOP or MOP based upon
16 the highest historical pressure on that line five, within
17 five years of that becoming or being identified as a
18 high-risk segment; correct?

19 A. No, I wouldn't say that. What I'd say is that
20 what Gene is telling him is that -- this is a pipeline
21 that looks like it's one of those grandfathered
22 pipelines. I don't know that, but I think it is, because
23 it hasn't been tested. So it would have been limited to
24 an operating pressure, the highest pressure you had seen
25 between the years 1965 and 1970. That might be at, say,
26 300 pounds.

1 Then the Integrity Management Rule comes along
2 and says, "You can't outdate your pipeline, with one of
3 these manufacturing threats, without activating it at a
4 higher pressure than it's seen in the last five years.
5 Nevermind what it saw in '65 or '70. So if in, if in
6 1970 you were qualified to operate it at 300, but now in
7 the last five years the highest it's seen is 268, you
8 can't operate it above 268 without activating that
9 threat.

10 And Gene and I, we, again, we had decided we
11 were going to measure at the regulator station at this
12 point, and we said, "We're going to tell them that if
13 they -- if we've got a five-year maximum, they shouldn't
14 be going above that."

15 Q. So, in this case, this line had been being run
16 in excess of its maximum?

17 A. The five-year. That's what this is indicating.

18 Q. Right. The maximum allowable pressure was set
19 at 257, but according to the original email, in 2007 this
20 line was being run at 261?

21 A. Yeah. And it may not exceed the -- let's see.
22 Where is the 261 part? Above the five-year. Right.
23 It's above that five-year; 257 versus 261. Right.

24 And, again, the -- because that is operating on
25 the assumption that he can operate it at anywhere up to
26 that five-year maximum that was established in the '65

1 through '70 period, which, like I said, may even have
2 been higher still.

3

4 (Grand Jury Exhibit 660 was marked for identification.)

5

6 Q. Okay. All right. So let's walk through one
7 more real quick.

8

9 Finally, we've got 660. Should be the last
10 exhibit in front of you we haven't talked about.

11

12 A. You don't have another box of exhibits under
13 your desk, do you?

14

15 Q. Nope.

16

17 A. Good.

18

19 Q. This is it. This is the last one.

20

21 All right. So what is 660?

22

23 A. It's an email written from me to Todd Arnett
24 and Keith Slibsager.

25

26 Q. This, again, is talking about that five-year
maximum operating pressure?

27

28 A. Right.

29

30 Q. And what happens if that five-year is exceeded;
31 correct?

32

33 A. Correct. And I'm warning both Keith, who
34 worked in Gas, who is the supervisor in Gas Control, and
35 Todd, that Todd's memo about potentially exceeding the
36 five-year maximum is something that we can deal with

1 fairly simply is going to be a, not a simple thing at
2 all. It's going to be a big deal if he exceeds it.

3 Q. Let's go down to Todd's memo and have you read
4 the first couple of sentences.

5 A. "Keith, this is an interesting and somewhat
6 complex issue, one we're not likely to have resolved
7 anytime soon. Here's my current thinking on this.

8 Let me frame it this way: I see this as a
9 business decision, not a code compliance decision. As
10 such, we don't need to change alarm set points to meet
11 code. This is not an MAOP issue, because the code
12 doesn't require a change in the MAOP, and code doesn't
13 restrict us from operating above the five-year high.
14 Based on that, my advice is to not alter the MAOP
15 standard or alarm policies.

16 It merely states that if these pipelines
17 operate above the preceding five-year high pressure, we
18 must take extra steps. The code reference is
19 192.717.e.4. 'The operator must prioritize the covered
20 segment as a high-risk segment for a baseline assessment
21 or a subsequent reassessment.' I don't know all of the
22 implications of adding a segment to an assessment plan as
23 a high-risk segment, but possible outcomes may include
24 ECDA surveys, direct inspections, hydro testing it, ILI,
25 or pipe replacement. I think the Integrity Management
26 Group is working on that angle.

1 So the business decision is whether or not to
2 lower alarms to reduce the likelihood of these certain
3 segments from potentially getting added to assessment
4 plans as high-risk segments. A case-by-case analysis may
5 be more cost-effective than wholesale approach."

6 Q. Explain to us what Mr. Arnett is talking about
7 here.

8 A. Well, to fully understand it, you'd have to
9 read some of these other notes.

10 Q. Okay.

11 A. But what he's addressing was, I think, was
12 Keith's request to Todd, or inquiry to Todd about whether
13 they should change alarm points on the system. When
14 high-pressure alarms should be sounded for them, that
15 would necessitate them to take an action. And he's --
16 what Todd is saying is that there's no code requirement
17 that we can't exceed these five-year maximums, which is
18 true, and that if we exceed them and we have to do an
19 assessment, then we'll just do the assessment.

20 Q. Okay. And you're saying that's not a good
21 idea?

22 A. Well, I didn't think so, because I thought that
23 the pressure tests would be difficult.

24 Q. Okay. And you actually say that if you do
25 exceed, DA is not an option; correct?

26 A. Well, indirectly I say that. I don't know if I

1 said it directly. Yeah, I do say it direct. "DA is not
2 an option."

3 Q. "DA is not an option."

4 A. Right.

5 Q. You say, "In rare instances, we may be able to
6 ILI"?

7 A. Correct.

8 Q. "But if you do this, we either have to pressure
9 test or replace"?

10 A. Right.

11 Q. And that's an expensive proposition; correct?

12 A. Among other things, yes.

13 Q. All right. So let's move on to our last topic.
14 Try and go through this really quick.

15 You mentioned earlier, just briefly, a top 100
16 list?

17 A. Okay.

18 Q. Can you explain to us what the top 100 list is?

19 A. It was a list our group came up with to try to
20 highlight what we considered to be the highest risk
21 segments in our system using the risk algorithms that we
22 developed in RMPs 1 through 5. We had developed a risk
23 profile for our system that showed all the segments that
24 had risk number that exceeded a certain value. And that
25 value started from the lowest risk value, which would
26 have been zero -- and in a relative risk system, a zero

1 doesn't mean that there's no risk, it just means that
2 it's the lowest of the group -- up to the very highest.

3 So that -- and then the Y axis on this chart
4 was the total number of segments. The X axis was the
5 total risk. So this curve that was generated looked like
6 a ski slope. Really high on the upper left, meaning all
7 the segments would have been at this value that was
8 greater than the very lowest, lowest of the low values.
9 And then dropping down so that at the very end, where you
10 had the very highest risk segments, you only had one or
11 two segments there. Very low number at the very far end,
12 very high number at the very close end.

13 Our goal in the risk program is to try to cut
14 off the nose of that curve. We wanted to try to
15 eliminate the segments that had the highest risk. But
16 it's a, it's a very small nose. A hundred segments,
17 which is what we looked at in the top 100 list, and that
18 would be a hundred segments of which maybe 40 of them
19 might be those that have the highest overall risk, then
20 10 of them might be those that have the highest
21 likelihood of failure for materials, 10 of them might be
22 those that have the highest likelihood for failure for
23 corrosion.

24 There are a number of different ways that we
25 made up that 100, but it was these highest-risk segments.
26 Sometimes it didn't even add up to a hundred. Some years

1 we took a bigger sample; we might have taken 20 or 30, so
2 it ended up to 180 segments. But because we used this
3 from year to year, people knew the term, we kept it, we
4 called it "the top 100."

5 Q. Okay. So basically you risk-ranked your entire
6 system every year?

7 A. Yeah, all 24,000, whatever it was, segments.
8 Right.

9 Q. That's making a risk calculation based upon the
10 risk that it's going to occur, the consequence that's
11 going to occur; right?

12 A. Right. Although, like I said, some of the top
13 100 could have also been made up of things that we're
14 just concerned about the likelihood of failure of a
15 component for one particular thing. Because if we said,
16 for instance, we're very concerned about earthquakes, but
17 this pipe is, has low values for everything else, but for
18 earthquake it's really high, it's still never making it
19 in the top 100. So we sometimes said, "Okay, we realize
20 there's flaws in our methodology, so -- but we know
21 earthquakes are important, so we're going to take the top
22 10 ground-movement threat segments. Even though
23 everything else about them looks good, we're still
24 concerned because it crosses, say, an earthquake fault."

25 Q. The top 100, or whatever the number ended up
26 being, not actually 100, were the most riskiest segments

1 in your system for whatever reason?

2 A. That's what we had calculated. That's right.

3 Q. What was that list used for?

4 A. The first year that I got there, it was used to
5 develop a list of projects that were to be included in
6 the CPUC rate application.

7 Q. What is the CPUC rate application?

8 A. I'll explain, but I'll let you know I wasn't
9 done with that part, too.

10 Q. Okay.

11 A. But the CPUC rate application is where we go
12 before the CPUC and say, "We would like to do these
13 projects, we would like to raise rates to cover this
14 work."

15 And the PUC would either say, "Yes," or, "No,"
16 or, "We agree with part of it, but not all of it, and
17 this is what we accept, this is what we don't accept.
18 And this is how much money we're going to give you to do
19 that work, this is how much you can raise your rates to
20 cover that."

21 Q. So the CPUC regulates what you can charge for
22 gas?

23 A. Correct. I'm not an expert on the rate
24 application process. It's different between Transmission
25 and Distribution.

26 Q. Right. And to raise rates on the Transmission

1 side, which is bulk delivery of gas, you have to go to
2 the CPUC and justify to them why you need to raise the
3 rates; correct?

4 A. Correct.

5 Q. And to justify, you present the CPUC with a
6 list of projects and say, "These are high-risk projects
7 that we have to do, here's how much they're going to
8 cost"?

9 A. Yeah. Yeah.

10 Q. Okay. So the top 100 list was done, in some
11 part, to support your CPUC rate cases?

12 A. For one year, yes.

13 Q. Okay. How many of the top 100 riskiest
14 projects on that top 100 list that were used to support
15 that rate case were actually done after CPUC gave you a,
16 a rate increase to do those projects?

17 A. I think there were -- in that rate case, I
18 think there were like five projects that we identified;
19 five or six, something like that. Because what we would
20 try to do is we would, in that top 100, there might be 10
21 segments in a row all together that would be all high
22 risk. We would clump those together to make that a
23 project. And I believe those were all pipeline
24 replacement projects and, in that year. As far as I
25 know, none of those were done. I could be wrong, but I
26 don't believe any of them were done. That's what I wrote

1 in that email that I sent to Wayne.

2 Q. So PG&E went to CPUC and said, "We need to
3 increase our rates to pay for these projects," and then
4 never did those projects?

5 A. That's correct. It doesn't mean that they
6 didn't do other projects, but they didn't do those
7 projects.

8 MR. NOEL: It's been a long day. That's all I
9 have. Does the jury have questions?

10 (Counsel and Grand Jury Foreperson confer.)

11 THE WITNESS: Can I add one thing still? On
12 the record?

13 MR. NOEL: What's that?

14 THE WITNESS: When I talked to you about what
15 Bob and Sara told me, I think that might have been a
16 topic that we discussed a few weeks ago. I don't
17 remember if it was or not. But I don't remember what I
18 said then. I do know if I talked to you about it, then I
19 don't believe I told you the part about the, what the
20 timing of it, because I didn't remember it at that time,
21 but I've had a chance to think about it since then.

22 Q. Well, that was something you also testified to
23 in your federal testimony; correct?

24 A. I believe so. Both in the Grand Jury and in
25 the, and in the trial. I think so.

26 Q. And I believe in your federal testimony the

1 essential conclusion that was asked was basically they
2 were telling you not to volunteer or bring up anything
3 unless the CPUC asked?

4 A. They said, "Don't answer questions that aren't
5 asked," that's correct.

6 Q. And then there was an entire discussion about
7 the CPUC had no idea about the, this issue with MAOPs and
8 so how would they have known to ask?

9 A. And, as I said, they had a series of protocols,
10 which is why we expected them to ask, but they didn't. I
11 don't know why they didn't go through the protocols.

12 Q. All right. These are questions from the jurors
13 that I'll read to you.

14 A. Okay.

15 Q. The first question deals with the federal
16 convictions.

17 This isn't the witness to ask that to. We'll
18 deal with that later on. We'll have further witnesses
19 that can deal with that. This is not within the scope of
20 this witness's knowledge.

21 All right. In assessing risk, was there any
22 weight given in the likelihood of event to environmental
23 factors, such as wind, temperature, age of materials,
24 humidity, et cetera?

25 A. For gas pipelines, not that I remember, no. We
26 looked at environmental factors, but that was only for

1 consequences, not so much what it would do to the gas
2 system, but what would happen in a gas system failure,
3 what it would do for the environment. But wind,
4 temperature -- I'm not sure about temperature. There
5 might be something. I just don't remember. I'd have to
6 have the standards in front of me.

7 Q. Do you have any knowledge about the electrical
8 transmission and distribution side of the company?

9 A. A little about the distribution, because I
10 worked as an estimating supervisor for I think seven
11 years in Fremont.

12 Q. To your knowledge, in your experience, were the
13 electrical transmission and distribution systems of PG&E
14 subject to a similar or identical System Integrity
15 Management Program?

16 A. Identical, definitely not, because they're not
17 governed by the same federal regulations. There are
18 state requirements, yes. There's the General Orders for
19 overhead and underground construction. I can't remember
20 what the numbers are. I think they're -- I can't
21 remember what they are. There's one for overhead
22 construction and one for underground. I think 128 -- I
23 do remember. I think underground construction is General
24 Order 128 and overhead is something GO 95, I think. I'm
25 not sure. And I don't know if it does anything with
26 transmission. I believe it covers the distribution lines

1 only.

2 Q. When utilizing or considering industry best
3 practices, was any consideration given to utilizing
4 practices that exceed industry best practices?

5 A. Chris Warner, our -- the supervisor in charge,
6 and Alan Eastman, the supervisor who was Chris' boss at
7 that time when the program was conceived back in 2002, I
8 think their goal was to do that. I think they wanted to
9 have the best program in the country. It was their goal.

10 Q. What happened to that goal?

11 A. Well, I think we did a lot of work towards
12 building towards it, but San Bruno happened and things
13 changed.

14 Q. Why did San Bruno happen?

15 A. Because in 1956 PG&E put into the ground a
16 piece of pipe that wasn't intended to be used as pipe.
17 And they covered it up, again, they thought it was like
18 the other pipe that they put in the ground, and it wasn't
19 at all. And in 2010, it blew up.

20 Q. How was it that that piece of pipe was left in
21 the ground for all of those years?

22 A. Because once it's buried, they can't -- and
23 even when they built that line, they couldn't, they
24 didn't see that -- the way that it was manufactured.
25 They saw on the outside of the pipe that there was a seam
26 weld, and they didn't look on the inside to see that

1 there wasn't any seam weld, which, which there should
2 have been. There was no weld at all.

3 Q. The ultimate question is would that pipe have
4 continued in that condition had PG&E had a thorough and
5 vigorous inspection program?

6 A. I don't think that would have -- in my opinion,
7 it wouldn't have changed anything. If we had been
8 required, however, to pressure test all untested lines,
9 we would have found it, which is why the state required
10 us to do that for all our lines after that date.

11 Q. So if you throw into that equation, if PG&E had
12 a centralized record-keeping base and thorough and
13 complete records, and it would have been known that there
14 had been a previous seam weld leak on that line, would
15 that line have been allowed to remain in the ground for
16 that long without being pressure tested?

17 A. We talked about this at the interview a few
18 weeks ago. I don't think it would have made any
19 difference, in my opinion. The line that had the leak,
20 which I'm not convinced was even on the seam, but it, it
21 may have been, and as I told you, the reason I don't -- I
22 question whether it was on the seam or not is because I
23 had talked to the engineer who was in charge when it was
24 removed, or at least it's my understanding he was in
25 charge, and I read the report about how they had tested
26 that pipe after they had pulled it out of the ground back

1 in, whenever it was, whenever it failed, 1988, that where
2 they couldn't find the leak at all. And since there was
3 desawed (phonetic) pipe and it didn't fall into one of
4 those categories that automatically activated a seam
5 threat when it leaked, I don't think they would have
6 found it.

7 And if it had found it, it would have been an
8 extremely lucky thing because, again, the reason that one
9 pipe failed and the other pipe failed was very, very
10 different. It was different material. It wasn't pipe
11 that was meant to be pipe that was put in the ground in
12 San Bruno that blew up. And the pipe that leaked in 1988
13 was regular line pipe, but it just leaked.

14 Q. Okay. Finally, in your opinion as an engineer,
15 do you think cost was given an outsized influence on
16 decisions regarding risks of failure?

17 A. I didn't think so. And looking back on it,
18 because of what I told you about San Bruno, I still don't
19 think so. That's my opinion. At least for the work that
20 I was involved with.

21 Q. Cost played a huge factor in the inspections,
22 the assessments that you did on lines; correct?

23 A. On some of them, yes. And we talked about some
24 of those today. It did make a big difference there.

25 MR. NOEL: Anything further?

26 That's it. Finally, you're done.

1 THE WITNESS: Thank you.

2 MR. NOEL: A lot shorter than your previous,
3 but still a long day.

4 THE WITNESS: Thank you.

5 GRAND JURY FOREPERSON: Mr. Manegold, one more
6 admonition before you leave.

7 THE WITNESS: Goody.

8 GRAND JURY FOREPERSON: Mr. Manegold, you are
9 admonished not to discuss or disclose at any time outside
10 of this jury room the questions that have been asked of
11 you or your, or your answers until authorized by the
12 Grand Jury or the Court. A violation of these
13 instructions on your part may be the basis for a charge
14 against you of contempt of court. This does not, this
15 does not preclude you from discussing your legal rights
16 with your own attorney.

17 Mr. Manegold, what I have said is a warning not
18 to discuss this case with anyone except the Court, your
19 lawyer, or the district attorney. Any questions?

20 THE WITNESS: No.

21 GRAND JURY FOREPERSON: Thank you. Thank you
22 for your time today.

23 THE WITNESS: Thank you.

24 MR. NOEL: All right.

25 [DISCUSSION OMITTED.]

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 209

are certified to be a complete transcription of said stenographic shorthand notes.

DATED: THIS 6TH day of JUNE 2022

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: Will you, please, raise
your right hand to be sworn.

THOMAS WRIGHT, JR.
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you.

Have a seat please.

EXAMINATION

BY MR. NOEL

Q. Mr. Wright, for the record, can you state your
full name, spelling your last name.

A. Sure. Thomas Joe Wright, Jr. W-R-I-G-H-T.

Q. Mr. Wright, by whom are you employed?

1 A. Pacific Gas & Electric.

2 Q. In what capacity?

3 A. Presently I am the director of Transmission and
4 Substation Risk Analytics.

5 Q. How long have you been with PG&E?

6 A. With PG&E since July of 2010, so almost ten
7 years; 9 1/2 years.

8 Q. What does a director of Transmission --

9 A. -- Risk Analytics?

10 Q. Transmission Risk Analytics do?

11 A. So, I am, presently I'm in charge of the WSIP
12 Program is what I'm dealing with now, which is a Wildland
13 Safety Inspection Program.

14 Q. Okay. We'll get to that in a second. But what
15 else does your job as a director entail?

16 A. So most of my group looks at data that comes in
17 from the field, we make judgments as far as what our,
18 what we're finding on condition assessments, and we set
19 plans to either make repairs or replacements, things like
20 that --

21 Q. What do you mean by --

22 A. -- of equipment.

23 Q. What do you mean by equipment condition
24 assessments?

25 A. Well, we take data that comes in from
26 inspections and data that we have from things that we

1 have done to take a look at our, whether they be
2 transformers or they could be some of our line equipment,
3 could be towers, could be poles. And we take a look at
4 Condition Inspection Reports, and we make determinations
5 what the best way to handle some of that information,
6 whether it's repair, replace, you know, or, you know, use
7 the work, use the -- continuous of the equipment or shut
8 it off or --

9 Q. All right. When you're talking about
10 inspections, would that include, for instance, the annual
11 inspections or patrols of transmission lines?

12 A. So annual inspections and patrols do not fall
13 within WSIP, so I don't have --

14 Q. I'm talking about your other --

15 A. My other role, no, I do not have the annual
16 patrols and inspections. Those are handled in our line
17 business. Those would be handle by our T-line or
18 substation organization.

19 Q. Okay. But what I'm asking is you said you
20 take, you take the inspection reports and determine what
21 to do, repair --

22 A. Yes.

23 Q. -- replace. The inspection reports you're
24 talking about, are those the inspection reports, the
25 annual inspection or patrol reports done on, on the
26 transmission lines themselves?

1 A. Yes. So the data we get are anything that
2 comes in from the field as far as assessments that are
3 done.

4 Q. Okay. So if the troubleshooters at Table Mountain
5 go out and do a inspection or patrol of one of the Table
6 Mountain transmission lines, that report ultimately makes
7 it to your division to determine what to do with that
8 information?

9 A. Yes. We'll come in and they will make a, there
10 will be a preliminary determination by the field and then
11 we would have an, we would have people in my organization
12 that would take a look at that and make sure that other
13 situations that are in the, that are to have occurred in
14 other places are handled similarly. So yes.

15 Q. Okay. Explain to us what you mean by that.

16 A. Okay. So if you have a piece of equipment that
17 -- you have an insulator string that has flash marks on
18 it. And you -- we would sit there and make sure that if
19 a notification was put on it, did they have the right
20 prioritization associated with it. And you'd want to
21 make sure that the prioritization is the same for that
22 one as it is for other ones that could be in other parts
23 of our territory based on what you see in the, as far as
24 the material that's given to us.

25 Q. Okay. So you would only see reports if they
26 found problems; is that correct?

1 A. No, we have a condition assessment that's given
2 to us as well.

3 Q. Okay. What's a condition assessment?

4 A. So we can have, we'll have people that will go
5 do inspections or gather data, and it can tell us whether
6 something's in good shape. Could be rated anywhere from
7 1 to 5, 5 being the worst. So you get a 1 condition
8 would be something that would be in good for condition,
9 and a 5 would be something we'd need to address
10 immediately.

11 Q. So these condition assessments, is that
12 something separate from the annual inspections or
13 patrols?

14 A. No. We do that -- so, if I understand you
15 correctly, we would, if you're -- I think what you're
16 asking is when they do these patrols, do they provide a
17 condition assessment? Is that what you're --

18 Q. Well, yeah. We can start there.

19 A. Okay. So we have -- when our folks do a
20 condition assessment of the assets, they make a
21 recommendation. So it's a qualified electrical worker,
22 which is a lineman or troubleman, would come in and he
23 would make an assessment based on what he's seen in the
24 field. And when he does that, then my group would sit
25 there and take a look at that, the data that he provides,
26 and make sure that we have the same -- in similar

1 situations have been handled similarly across the
2 territory.

3 Q. I guess, getting back to the question, is the
4 condition assessment done separately from the year, the
5 yearly patrol or inspection?

6 A. I'm not sure. So we have -- I'm trying to make
7 sure I answer your question. But it -- we have a guy in
8 the field, he's doing -- when he goes out and does his, a
9 qualified electrical worker goes out and he looks at the
10 equipment, he takes a look at it and he makes a
11 recommendation. He could say, "Hey, this is in great
12 shape," and he could take a picture of it and send it
13 back to us.

14 And we can come back and say, "Hey, you know,
15 this is -- you know, we need to make sure that we address
16 these flash marks," or these, these conditions that we
17 see.

18 And then a lot of those are due to the fact we
19 have, you know, a set of industry experts looking at
20 this. So there could be engineers or subject matter
21 experts or other linemen or other troublemen that are
22 taking a look and giving us a second opinion on some of
23 that information.

24 Q. So has there ever, to your knowledge, been a
25 condition assessment of the Caribou-Palermo 115 line?

26 A. Yes.

1 Q. When?

2 A. So we did, we did inspection in September of 20
3 -- August and September of 2018, and then we did one in
4 shortly after the Camp Fire.

5 Q. Okay. The inspection in August, September of
6 2018, are you talking about the annual patrol that was
7 done by, I believe, (WITNESS #18)?

8 A. I don't remember if it was (WITNESS #18), but I
9 believe -- I am talking about the one that was done
10 during that. I believe it was (WITNESS #18), but I don't
11 recall.

12 Q. Okay. So that's what, that's the annual
13 patrol, you're also saying that's a condition assessment?

14 A. Yes. They go out and -- let me back up.

15 They're not doing condition. They didn't do a
16 condition assessment in 2018. 2018, that was an
17 inspection that was done, which is different than an
18 assessment. Post Camp Fire, we became the WSIP program,
19 which included assessments --

20 Q. Right.

21 A. -- of our assets.

22 Q. And we'll get to that in a few minutes.

23 A. Okay.

24 Q. But, to your knowledge, when was the last time
25 there was a condition assessment done on the
26 Caribou-Palermo 115 line prior to the Camp Fire?

1 A. To the best of my knowledge, I would say, using
2 the criteria that we had in WSIP, we did not use that
3 criteria before the Camp Fire.

4 Q. So is a condition assessment something that is
5 post Camp Fire?

6 A. Well, I can answer to the, what we do post Camp
7 Fire.

8 Q. Right.

9 A. Previous to the Camp Fire I cannot answer to,
10 as far as the how that information was dealt with.

11 Q. Okay. So going back to pre Camp Fire, as part
12 of your group, did, as part of the Risk Assessment Group,
13 you were, said you're the ultimate recipient of the
14 inspection and patrol reports that are done by the
15 troublemen on each of the lines, and you make decisions
16 about fixing things, replacing things based upon those;
17 correct?

18 A. Right. We set prioritization based on the
19 conditions that we see, yes.

20 Q. So what you do or do not do is wholly dependent
21 upon those inspections then and patrols; correct?

22 A. Yes.

23 Q. So if the inspections and patrols are not
24 complete and accurate, then those would affect what your
25 decision does?

26 A. So we would be evaluating the information

1 that's being given to us, that's correct.

2 Q. Right. So if the troublemen are missing
3 things, you would never know about them to determine if
4 they need to be replaced or repaired; correct?

5 A. Well, depends on what kind of inspection is
6 done. So post Camp Fire --

7 Q. We're still talking about pre.

8 A. Pre Camp Fire. Okay. Pre Camp Fire, it would
9 be based on the, only the information that we were given.
10 And remind you, that this organization that I'm in now,
11 we didn't exist as it is before the Camp Fire.

12 Q. Okay. What was your job before the Camp Fire?

13 A. So before the Camp Fire, most of my, I spent
14 most of my career at PG&E in substations. And so I've
15 been in everything from asset management in substations
16 to I was the director of substation maintenance
17 construction, and I've also been director of project
18 delivery and engineering for substations.

19 At the -- within -- in July of 2018, I was
20 sitting in the asset management chair on an interim basis
21 while the asset manager, senior director was helping with
22 our Accelerated Wildfire Program that was doing the tree
23 trimming.

24 Q. Who was that person?

25 A. That would be Dave Gabbard.

26 Q. And what is the accelerated wildfire treatment?

1 A. It was our accelerated program where we looked
2 at our enhanced vegetation management program. And I'm
3 not super familiar with everything on there, but I -- it
4 is a program where we looked at our veg practices and,
5 vegetation management practices, and, you know, looked to
6 make them -- you know, to increase the right of ways that
7 we had in, where we could.

8 Q. Do you know when that program started?

9 A. I can give you a -- first, second quarter of
10 2018, somewhere in there.

11 Q. Okay. So after the fires of 2017?

12 A. I'm not a hundred percent certain. It's in
13 the, in that ballpark.

14 Q. Right. In October of 2017 there were a lot of
15 fires; correct?

16 A. Yes. Yes.

17 Q. We had the fires in the wine counties; Napa,
18 Sonoma, Mendocino, and Lake Counties. Right?

19 A. Yes.

20 Q. We had fires here in Butte County. We had
21 three separate fires. Also Yuba and Nevada County all
22 had fires in October '17 due to vegetation management
23 issues?

24 A. Correct. I believe that's correct, yes.

25 Q. All right. So tell us what asset management
26 does.

1 A. So in the asset management organization, we
2 look at -- we have asset plans, so we look at our
3 infrastructure and find -- you know, we, either through
4 condition assessments or capacity needs or low growth or,
5 you know, we set, we set our program as far as where we
6 should be putting our resources to enhance to make our
7 system better.

8 Q. When you say "resources," what are you talking
9 about?

10 A. The, you know, time, money, and, you know, our
11 men and women, our construction resources.

12 Q. Okay. How do you decide where to put your
13 resources?

14 A. That's, so that's not my expertise. My
15 previous experience has been more dealing with what that,
16 when that plan comes across and executing that plan.

17 Q. Okay. Now, you said earlier most of your
18 experience prior to 2018 was in substations; correct?

19 A. And through most of '18 as well.

20 Q. Through most of '18. Can you explain to us
21 what, for the record, what substation is?

22 A. Yeah. Substation is where we take, you know,
23 higher voltages that come off of our generating stations
24 and such, and we step down the voltages so it can become
25 part of our distribution system so we can serve our
26 customers. So we go into our, you know, we feed our

1 distribution network through the substations.

2 Q. How long had you been working in the area of
3 substations?

4 A. So I have, with PG&E, I was about 8 1/2 years
5 here in substations, and then previous to that I had
6 done, at other places I've worked in the substation
7 world, yes.

8 Q. Okay. And I neglected to do so, I'm sorry,
9 could you walk us through your educational background.

10 A. Absolutely. So in 1992 I graduated from the
11 University of Arkansas with a bachelor's of science in
12 electrical engineering.

13 In 2000, I graduated from the University of New
14 Orleans with a master's of engineering in engineering
15 management.

16 Q. What is engineering management?

17 A. So engineering management was, I liken it to
18 kind of a technical MBA. You learn how to deal with
19 engineering issues, the financial side of engineering
20 issues.

21 Q. So in November of 2018 you said that your role,
22 your job changed?

23 A. Absolutely.

24 Q. So give us a little overview of how your job
25 changed.

26 A. So in November of last year, post Camp Fire, my

1 -- I went, I moved from filling in for the gentleman in
2 the asset management organization to becoming the
3 director of transmission and substation analytics. And
4 so what that entailed is a setting up a team to take a
5 look at how we can improve or inspection program. And
6 we, we devised, my team put together and devised a way to
7 look at the, our assets in making sure we can get a
8 condition assessment versus just identifying
9 deficiencies.

10 Q. And was there a name for your program?

11 A. Absolutely. It was called the WSIP, which is
12 Wildfire Safety Inspection Program.

13 Q. All right.

14 A. And for the transmission piece.

15 Q. So before we get to that, the WSIP, are you
16 familiar with the Nine Lines Inspection Program?

17 A. I was -- yes, I'm familiar with the Nine Lines
18 Program.

19 Q. What is a Nine Lines Program?

20 A. So the Nine Lines Program that we put together
21 to take a look at what we felt were nine lines that were
22 very similar to the lines that were in the
23 Caribou-Palermo area and set up an inspection program to
24 take a look at those lines to make sure that we're, we
25 were, we had everything identified due to the fact that
26 there, that the location of where they were.

1 Q. All right. So let's back up. This is
2 something that occurred post Camp Fire?
3 A. Absolutely.
4 Q. Do you have an approximate date as to when the
5 Nine Lines Inspection Program started?
6 A. I believe it was the 10th of November,
7 somewhere about that time; 9th or 10th time frame.
8 Q. So while the fire was still burning, PG&E was
9 starting inspections?
10 A. Correct. These were detailed climbing
11 inspections.
12 Q. And you said that they were, the inspections
13 were of nine comparable lines to Caribou-Palermo?
14 A. Yes.
15 Q. What do you mean by comparable lines?
16 A. So the -- they were in, they were in the tier
17 1, tier 2 -- or excuse me -- tier 2 or tier 3 high fire
18 threat area, which was based on the Cal Fire maps of, I
19 believe, 2018. And they had similar terrain, and they
20 had similar consequence of, and they had similar weather
21 conditions, known to have similar weather conditions.
22 Q. Okay. Let's -- we'll come back to that in a
23 second. You should have in front of you what's marked as
24 662, Exhibit 662. Should be the other stack, I'm sorry.
25 I'm sorry, should be the second document in there because
26 I screwed up. I changed the --

1 All right. See 662? What is 662?

2

3 (Grand Jury Exhibit 622 was introduced.)

4

5 A. It's the, it's the CPUC fire threat map.

6 Q. That is what you were referring to with the
7 nine lines?

8 A. Yes. Yes.

9 Q. And where does this map come from?

10 A. So the CPUC publishes this on a periodic basis.
11 It determines, shows the areas that are, have the highest
12 fire or highest consequence due to fire.

13 Q. Okay. And this is a map that was adopted by
14 the CPUC January 19th, 2018, according to its own
15 heading?

16 A. Correct.

17 Q. Explain to us how to read this map.

18 A. So the highest threat area is in the red. And
19 then the second highest threat is in the yellow. And
20 then the white would be what we would call "tier 1." So
21 you have your tier 3 is red, tier 2 is yellow, and then
22 the tier 1, or the least hazardous, would be in the
23 white.

24 Q. Okay. So tier 3 is defined, according to the
25 map, as the extreme fire threat areas?

26 A. That would be correct, yes.

1 Q. And tier 2, the elevated fire threat areas?

2 A. That's correct.

3 Q. So exploded a view here, up there, this shows
4 Butte County; correct?

5 A. Yes.

6 Q. So would it look like in this, that a large
7 portion of eastern Butte County would be considered tier
8 3, including a large portion of the Feather River Canyon;
9 is that correct?

10 A. Yes.

11 Q. All right. So let's go back. So that's what
12 we're talking about when we're talking about high fire
13 threat areas. So the lines that you picked have many
14 comparables, including that they were in those tier 3 --
15 tier 2, tier 3 elevated fire risk areas; correct?

16 A. Yes. Yes.

17 Q. What were you inspecting those lines for?

18 A. So they were inspected under our previous
19 program we had that had a list, it was a list of possible
20 conditions and we marked for conditions. There was no --
21 they were -- he gave us a list of things to look on our
22 assets I guess is the best way to put it. If you had a
23 tower or you had a pole, he gave you a list of items to
24 look at on there. And if there was a problem, you noted
25 it at the bottom of the sheet.

26 Q. By that time, PG&E had a pretty good idea of

1 what failed on 27/222 and caused the fire; correct?

2 A. I'm not -- well, I'm not sure exactly what date
3 that was all truly determined, though. I mean, we
4 started this pretty quickly, so we're not -- I'm not a
5 hundred percent certain what date that was determined.

6 Q. Okay. Well, were you aware that PG&E had
7 troublemen flying this line, flying over the tower,
8 taking pictures on November 8th and November 9th?

9 A. I never saw them, but I heard that, yes, it was
10 done that way.

11 Q. So by the afternoon of November 8th, PG&E knew
12 that a jumper line on a transposition tower, the
13 insulator had come loose and was hanging upside down off
14 the tower?

15 A. Again, yeah, I, I think that was, I think there
16 was -- you know, there was condition -- there was an
17 assessment done on that line shortly after the fire
18 began.

19 Q. Well, shortly after the fire started --

20 A. Yeah.

21 Q. -- not when the fire ended; correct?

22 A. No, I said "began."

23 Q. Okay. I'm sorry.

24 So when people were set out to inspect the nine
25 comparable lines, were they given information about what
26 started it or what potentially caused the Camp Fire and

1 told to inspect those specific components?

2 A. I don't know. I don't know what -- I -- you
3 asked me what I know about the nine lines. I know that
4 they were done, and I know that they were used by our
5 previous inspection methods, ground power, detailed
6 inspection methods.

7 Q. All right. So now let's get into the WSIP.
8 And WSIP stands for what?

9 A. Wildfire Safety Inspection Program.

10 Q. And this is a post Camp Fire inspection
11 program?

12 A. Correct.

13 Q. Tell us what WSIP is.

14 A. So I had a team, we assembled a team, and the
15 team that reported to me looked at ways to inspect our
16 assets and then also be able to put a condition
17 assessment based on what we were finding. So we were
18 able to take our towers and poles and such and even items
19 at our substations and say then, do an, an assessment of
20 those. So we looked at all the failure modes that could
21 occur, anything that could occur on those towers, and we
22 detailed out 47 different items that we could look for,
23 and how would you look for those items. And that's what
24 we determined.

25 So some of those we could determine through a
26 visual inspection. But some of them you couldn't. And

1 some of them we had to do more. So you had to do either
2 an infrared inspection, a corona inspection, you know,
3 some electrical tests, things like that. But we were, we
4 took and put a method together to look at each one of
5 those.

6 We also sat down and devised what was the best
7 way to get the information that we needed to make the
8 right assessments. And what we determined is that we
9 could do a lot of these visually, but we needed to have
10 really good looks at this. So we were able -- we took
11 our, we took our assets and detailed the 50,000 assets
12 that we determined that were in the high, high wildfire
13 threat areas, and we determined that we needed to do some
14 form of an aerial inspection in order to get a much
15 better look.

16 So not only did we do a ground or climbing
17 inspection where we had our linemen or our contract
18 linemen come in and go and walk pole to pole or structure
19 to structure and climb the tower and take pictures, but
20 we also then instituted where we used a drone or
21 helicopter to help us get information off those. And we
22 were able to document all of the condition assessment of
23 the, of those assets.

24 Q. All right. So let's back up a little bit and
25 define some of your terms.

26 A. Sure.

1 Q. What is failure mode analysis?

2 A. So our failure mode analysis was we looked at
3 anything that could cause some form of an ignition
4 source. Anything that could fail on that tower or pole
5 that could create an ignition source. And we, and when
6 we looked at that, we also, the second part of it was is
7 how do you detect when there's a problem with that asset?
8 So we knew that the towers and poles fit into six
9 different types of materials that are used on our towers
10 and poles.

11 Q. All right. When you say "visual analysis for
12 identification," what are you talking about?

13 A. So we have, we got a guy that can -- I say a
14 guy or gal -- a qualified electrical worker, they would
15 go out and they would go out to the site where our asset
16 was, and they would either, if it was a wood pole
17 structure, they would stand on the ground and they would
18 look up and they would detail, look -- use a form. And I
19 don't know if -- I know we got some examples here, but we
20 have, we devised a form in which asked them questions.
21 And they went through and they answered the questions
22 based on the asset condition that they saw. And they did
23 that from the ground.

24 If it was a tower, the individual -- we would
25 have a team of four individuals who would go to the
26 tower, and three of the individuals would climb, and they

1 would be checking the members. And as they climbed, they
2 would go up and they would give assessment information to
3 the guy that was taking notes on the ground. And they
4 would put those notes in the system and they would fill
5 out a form. And it was asking similar questions. So it
6 was based on, you know, what they were seeing as they
7 were climbing those towers.

8 Q. All right. So you said you identified 47 items
9 in the tower that could fail and be an ignition source?

10 A. Yes.

11 Q. Of those, all but 19 could be inspected
12 visually. So that would mean 28 could be inspected
13 visually. Then you started to go through other nonvisual
14 inspection methods?

15 A. Uh-huh.

16 Q. I think you said infrared and corona. Can you
17 go through those nonvisual inspection methods and explain
18 them to us, please.

19 A. So we had some other nonvisuals. We had, there
20 -- we could do infrared, which is IR, is, you know, we,
21 basically taking a look at anything that's generating
22 heat. So if the line is energized while we're doing it,
23 we could pick up hot spots. The corona is contamination
24 or dirt or something like that. And this particular
25 camera would show that, you know, you would have, for
26 lack of a better term, the pictures looked very similar

1 to like an infrared-type picture, but it was based on
2 emittance of impurities due to dirt contamination on the,
3 on the structure.

4 We also had other electrical tests that we can
5 do. You know, some of it was like a ground test. Like
6 we could test the ground wire that was on a pole, which
7 was more of a continuity type test. We could do a Megger
8 test, which is kind of a little higher, little more
9 sophisticated ground test.

10 I was trying to think of any of the others that
11 we had. Those were the -- we had destructive testing as
12 well. One of the things that we did, as we were finding
13 things and we were replacing items that were on the
14 tower, we were taking some of those things off the tower
15 and, you know, where they, before they had, you know, in
16 the condition that they were, and we would take them and
17 send them to our ATS group and they would do destructive
18 testing on those. So they would take it and they would
19 put it in a machine and try to break it or bend it or
20 determine how much life was left in that. So we were
21 able to get that information as well.

22 Q. That kind, did that kind of testing include
23 things like C hooks?

24 A. So -- yes. We did, we did take some of those,
25 some of those components off, but I'm not sure we, I'm
26 not sure that -- now that I think, we may not have done C

1 hooks because I think those were under a different
2 protocol. I think those were under the protocol -- I'm
3 not sure if it was dealing with evidence collecting or
4 what was going on, but there was a protocol with C hooks
5 that we could not take and do destructive testing with.
6 So I was mistaken on that.

7 Q. So the methods of inspection that you went
8 through, I'm going to go through them one at a time. You
9 talked about ground inspections. So explain to us, under
10 the WSIP, what goes into a ground inspection.

11 A. So we had our qualified electrical workers that
12 we had contracted from all across the country. Each
13 person was qualified through the IBEW, had to be, and
14 they had to have their journeyman's license. And they
15 went through and they walked pole -- or structure to
16 structure, and they did a, an assessment from the ground
17 based on a form that we had derived earlier that detailed
18 each item that we wanted them to look at on that
19 structure.

20 So we had, we had a form that was developed for
21 wood poles, we had one that was developed for towers, we
22 had one that was developed for a 500 kV tower. And that
23 -- so from the ground, they would take -- not only would
24 they do an assessment, they would also take a picture of
25 the assets that are, of the items or the components that
26 were on the tower.

1 Q. You also mentioned climbing inspections?

2 A. That's correct.

3 Q. So just tell us about climbing inspections on
4 the WSIP.

5 A. So the climbing inspection, we sent a team, it
6 was either four or five guys, and they would go out and
7 -- once again, they were qualified electrical workers
8 certified by the IBEW -- and they would go out and they
9 would climb the towers. And as they would climb the
10 towers, they would be testing for strength of the members
11 of the tower, and they would also be doing condition
12 assessments as they worked their way up the tower. And
13 they would be doing much the same as the guy that was on
14 the ground, except this guy was, or gal, was climbing the
15 tower and they were making these assessments and taking
16 photos as they went up. So -- and they were looking at
17 each item as they went through.

18 I guess the information was inputted into what
19 we call the ProntoForms. So you may hear people talk
20 about ProntoForms. And our ProntoForms were forms that
21 we generated to capture this data and put it into a
22 database for us to be able to save and to use.

23 Q. You said the forms were developed earlier.
24 What are we talking about?

25 A. So earlier would have been in the month of
26 November. Because we started WSIP inspections somewhere

1 around the 10th of December.

2 Q. So post Camp Fire but December?

3 A. Yes. It was about in the three weeks there
4 between the nine lines inspection and the, and the WSIP
5 program kicked off.

6 Q. All right. And then you also mentioned two
7 different types of aerial inspections; correct?

8 A. Correct. We had one where we used drones, and
9 we -- and then a drone was brought out. We had a drone
10 and operator, usually two guys. One was a guy, one was
11 an operator of the drone, a certified pilot, who met the
12 qualifications of using it; then the other was a
13 gentleman or a lady that was used to, as far as safety
14 was concerned. We wanted to make sure that we were
15 operating the drones and have awareness of conditions
16 that were around us. And this person would come out and
17 they had what they called a "shot sheet." And it would,
18 they would fly the drones and get these pictures at
19 particular angles that we had prescribed and asked them
20 to get for us. And they would not do an assessment while
21 they were out there on site. They, the assessment was
22 then sent -- that information was entered, the photos
23 were taken back, and they were sent to our, what we call
24 our "drone inspection review team." And those guys would
25 make the determination.

26 Q. Now, you also said that the WSIP included

1 helicopter inspections; correct?

2 A. Correct.

3 Q. Were those helicopter inspections the same
4 inspections that were done pre Camp Fire?

5 A. No.

6 Q. How were the post Camp Fire WSIP helicopter
7 inspections different?

8 A. So pre Camp Fire, the helicopter inspections
9 were more looking for just deficiencies or -- you know,
10 could be anywhere from, you know, broken cross arm, tree
11 on line, mostly, you know, those type things. And a lot
12 of the patrols -- we either called them patrols, and some
13 of the times we used a helicopter inspection as well, but
14 those, you know, those were mostly looking for just
15 deficiencies.

16 Our helicopter program that we implemented in
17 WSIP was much along the lines the same as the drones. We
18 would take that -- we were generating information to get
19 back to our central team to be able to look at and make
20 the determination of the condition assessment from our,
21 basically our DIR Team, what we called our DIR Team,
22 which was a Drone Inspection Review Team.

23 One of the things that was very fascinating
24 about that was is we determined through looking at the,
25 these helicopter photos that we were not able to get to
26 inspect each and every one of our assets using the

1 helicopter. So we had to specialize and only use that
2 helicopter on certain types of structures. And those
3 structures were typically our single wood-pole
4 structures. We could not get, we could not get a --
5 well, what we deemed, my team deemed as a quality
6 inspection using a helicopter on towers, or anything that
7 where the insulators were hanging on, vertically under
8 the cross arm.

9 Q. You mentioned photographs from the helicopters?

10 A. Uh-huh.

11 Q. Did PG&E actually mount cameras on helicopters
12 to use to video inspections from their review?

13 A. Not the video; we were taking pictures.

14 Q. Okay.

15 A. So we did -- yeah, we, to answer your question,
16 yes, we had a camera, high speed camera, that was a
17 hundred megapixel camera that was mounted on a gimbal.
18 And the gimbal is a, lack of a better term, it's
19 basically a head that, free-moving head. And this camera
20 could, based on the way we had our -- I'm trying to think
21 of the best word. We could preset it to take pictures of
22 what -- the angle, the assets that we wanted to take a
23 picture of. Based on when the helicopter was flying, we
24 had some software that we had developed that was able to
25 help us take pictures of the assets that, and in a manner
26 in which we could do our inspections.

1 Q. So it sounds like the, that the WSIP inspection
2 program was keeping a lot of detailed data on each tower;
3 is that correct?

4 A. Absolutely.

5 Q. And using photographs to confirm that data?

6 A. Yes. And we had -- yes.

7 Q. So when you had guys doing ground inspections,
8 they were taking pictures of the tower from the ground;
9 right?

10 A. Uh-huh. Yes.

11 Q. And those photographs would be attached to the
12 report?

13 A. Yes.

14 Q. And that wasn't just if they found something
15 wrong, they were taking pictures of every tower as they
16 did their inspections; correct?

17 A. Yes.

18 Q. And, actually, they were taking pictures of
19 every leg of every tower; correct?

20 A. They were taking pictures of every item that
21 was on our, our -- we documented every condition that was
22 out there on --

23 Q. Right.

24 A. -- on the asset, yes.

25 Q. And same thing with the climbing inspections.

26 You were documenting the, all of the 47 -- or actually 28

1 visually inspectable items?

2 A. Correct. Now, even on the other ones, the
3 other items, all 47 had some form or fashion -- whether
4 we could do a complete inspection, we still took a
5 picture of it.

6 Q. Right.

7 A. So if it was a piece of hardware and we didn't
8 know if for some reason it might have had a little
9 surface rust, we didn't know exactly how to tell how much
10 life was left in there, so if we wanted to know that, we
11 had to pull it and do destructive testing. But we could
12 still document whether it had surface rust on it.

13 Q. And then climbing inspections, same thing,
14 they're taking pictures of each one of the 28 --

15 A. Yes.

16 Q. -- visually inspectable items?

17 A. Yes.

18 Q. And then the same with the aerial, whether it
19 was drone or helicopter, they were taking photographs of
20 all the visible, visually inspectable items?

21 A. Little different with the drones and the
22 helicopter in the fact that they were taking photos and
23 they were, and we were then, with a high-resolution
24 camera, we were able to take that and put it, it on a
25 high-definition screen, and we were able to zoom in to
26 what we wanted to see. So while we were, we were taking

1 pictures of these assets from different angles, we were
2 still taking a, typically the view was from out a ways
3 from the asset, but it had such great resolution that we
4 were able to zoom in and see some pretty incredible
5 things.

6 Q. So a couple more basic questions on this. Did
7 the assets have to be de-energized to allow for climbing
8 inspections?

9 A. No.

10 Q. Did the assets have to be de-energized to allow
11 for the drone inspections?

12 A. No.

13

14 (Grand Jury Exhibit 661 was introduced.)

15

16 Q. All right. You should also have in front of
17 you what's marked as -- re-marked as 661. So everybody's
18 going to have to stay awake today, because I used the
19 wrong numbering scheme on the PowerPoint. So we changed
20 640 on your screen to 661.

21 What is your Exhibit No. 640?

22 A. We would call it a ProntoForm. So it was an
23 inspection form that looks like for a detailed climbing
24 inspection for non 500 kV structure.

25 Q. Okay. And this one looks like this is a
26 structure on what line?

1 A. I'm looking for it, too, here.

2 Q. Looks like it's --

3 A. Drum-Rio Oso.

4 Q. Drum-Rio Oso, number 1 line, a 115 kV line?

5 A. Yes.

6 Q. So how many pages is this inspection report?

7 A. Looks like 28.

8 Q. And that's for one tower; correct?

9 A. That would be for one structure, that's

10 correct.

11 Q. One structure. And in this case, it was

12 structure number 005 over 063?

13 A. Yes.

14 Q. And walk us through Exhibit 661 -- 661, please.

15 A. Okay. I'm not sure I follow exactly what

16 you're looking for. Line by line?

17 Q. Well, kind of page by page let us know what

18 kind of information is in there.

19 A. So the first page has got some general

20 information about the, about the structure line. We got

21 -- you know, one of the key components on here was the

22 latitude-longitude. We had a GIS system so we could

23 actually find this asset in our GIS system. So we were

24 checking to make sure that these coordinates were

25 accurate as well. So this was a big -- that was a big

26 check for us. Anyway, the rest of it is general

1 information.

2 If you go to the second page, we did a
3 verification. That's the verification of the asset
4 number. So you can see -- do you want to -- are you
5 going to follow on this?

6 Q. No, we didn't put all 28 pages into the
7 PowerPoint.

8 A. So do you want me to go through each page?

9 Q. Just go through real quickly. Basically let me
10 see if I can do this, then it's about time to take a
11 break.

12 We talked about those 28 visually inspectable
13 items that were identified for each tower, the items that
14 if they failed they could be an ignition source. Are
15 each one of those covered in this inspection report?

16 A. They should be. I haven't gone all the way
17 through, but --

18 Q. Right.

19 A. That was the purpose of this ProntoForm, yes.

20 Q. And we don't really -- what was being inspected
21 there is not real important. It's just the fact of the
22 form?

23 A. Correct.

24 Q. Right. So this is the form that you guys built
25 sometime after the Camp Fire for the climbing
26 inspections; correct?

1 A. That is correct.

2 Q. Are there similar forms for helicopter
3 inspections and drone inspections?

4 A. So we have a form that's set up that is -- it
5 was not in Pronto, it was -- but there is a different
6 form for a helicopter and a drone inspection, yes. There
7 is an aerial inspection form.

8 Q. What is done with the information with those
9 forms and the information therein?

10 A. So as you go through this, and I -- one of the
11 examples is on page 5, it talks to, it goes, it details
12 condition assessment for everything. And as you go
13 through, you know, on page 5 it, there's a -- it said,
14 they ask about is the anchor rod, is there any damage,
15 you know, on the anchor rod. And we -- we checked yes.
16 Or the inspector checked yes. And at that point in time,
17 once that person checked yes, there was a -- it was said,
18 "Please go fill out a" -- or it says, "Create an LC
19 notification." So basically an LC is a line corrective
20 order.

21 So they asked -- we asked the guys to detail,
22 further detail, what they were finding on a notification
23 form about the, what they saw here that raised their
24 attention to the fact that they saw something. Then it
25 says, the comments underneath it, it says there was a
26 rusty anchor rod, and it was all below grade. So they

1 were concerned about the condition that was, of that
2 anchor rod.

3 So each time you marked a yes, we -- the QEW
4 was directed to an additional app. on the iPad that
5 basically said, hey, can you give me some more of the
6 information, and how bad do you think that this is? So
7 we were getting his take on the assessment of that
8 deficiency.

9 Q. So are there any protections built into this
10 reporting system to ensure that the qualified electrical
11 worker inspects all of the components?

12 A. Absolutely. So you must answer every one of
13 these questions, whether it was yes, no, or not
14 applicable. Had to be answered for each one of these
15 items or you cannot close the form or go to the next
16 item, go to the next asset.

17 Q. Is there a secondary protection also built into
18 that system?

19 A. We had -- well, our teams would review and make
20 sure we reviewed each ProntoForm as they came in.

21 Q. Right.

22 A. So if there was, if for some reason somebody
23 didn't, if it was the end of the day and they didn't
24 finish the last form, we could sit there and call them
25 out and say, "Hey, we noticed that this form didn't get
26 closed out properly, could you have the guy go back?"

1 Q. Right. I guess my question is in the form
2 itself, and maybe the question is bad. The form also
3 requires that the qualified electrical worker take
4 pictures of it --

5 A. Oh, I gotcha.

6 Q. -- and have it in form; is that correct?

7 A. Correct. Anything that he found, or the person
8 found, they had to take a picture of it as well.

9 Q. Well, not just found, just --

10 A. Yes.

11 Q. -- overall different places in the tower --

12 A. Correct.

13 Q. -- that required to take pictures; right?

14 A. Correct.

15 Q. So the information that's compiled in these
16 inspections, whether they be climbing inspections, aerial
17 inspections, drone inspections, what is done with all of
18 that information?

19 A. So all this information is then compiled and it
20 is sent back from the ground, this is a ground inspection
21 form, so the ground inspection form would then be sent
22 into our, what we called our CIR Team, which is C-I-R-T,
23 which was Centralized Inspection Review Team. And that
24 team would take a look at each one of the conditions that
25 was noted on this form.

26 Q. Now --

1 A. And they would do a, they would do a next
2 review.

3 And that team -- do you want to talk about the
4 team?

5 Q. We're going to get to that in just a second.

6 Now, you said there's a similar form for the
7 drone inspections; correct?

8 A. That's correct.

9 Q. And there's a similar form for the helicopter
10 inspections?

11 A. That's correct.

12 Q. Are there similar teams, like CIRT or DIRT, you
13 already talked about DIRT a little bit, but are there
14 similar teams like CIRT to go through those inspection
15 forms?

16 A. So DIRT, there was no in-field inspection done
17 with our drones. All they did was take photos. And we
18 ensured that the quality of the photos were correct. And
19 that was the only thing that that team did when they were
20 out in the field. And that information was sent, those
21 photos were sent back to our drone inspection review
22 team, and those guys did an assessment based on the
23 photos that came in.

24 Q. Okay. At -- who are the people that make up
25 these, this CIRT and the DIR team?

26 A. Our CIRT, they were subject matters experts.

1 And they could be engineers. And they were typically
2 engineers of all disciplines. They were qualified
3 electrical workers. They were people that had been in
4 the industry for long periods of time. They all, we had
5 all -- they were typically people we had brought in from
6 a lot of different places. They weren't necessarily --
7 they were -- a small piece of those were PG&E employees,
8 but a vast majority of those folks were people that we
9 brought in from other places that had experience, a lot
10 of experience, in looking at equipment. And they were
11 considered, you know, experts in their field.

12 Q. You said the WSIP was charged with inspecting
13 over 50,000 assets in tier 2 and tier 3 fire threat
14 areas; correct?

15 A. Correct.

16 Q. How long did it take the WSIP to do those
17 inspections?

18 A. So we had substantially complete in around May
19 1, May 1 of 20 -- this year -- 2019. And what I mean by
20 that, that was the ones we could get to. And there was
21 -- at the time there was still snow, there was still
22 impassable roads, there were still people that -- or
23 areas that we couldn't get to, some of the military
24 bases, some of the private land owners. We were chasing
25 down access to that. So we got roughly 46,000 of those
26 inspections done by May 1. And then we're down to about

1 less than 200 aerial inspections that we were doing. And
2 those are at Vandenberg Air Force Base and Beale Air
3 Force Base. And we're trying to do aerial inspections
4 there. And it -- one of the issues we have with getting
5 on site is our vendors that we've been using for our
6 drones have changed drones. And they, they're
7 manufactured in China, and our military doesn't want
8 Chinese drones on their facilities. So we're dealing
9 with that right now. But we've come up with a way to get
10 that done.

11 Q. So basically in six months, using these
12 enhanced inspection methods, you were able to inspect
13 approximately 46,000 transmission assets?

14 A. That's correct.

15 Q. All of these inspection methods that were used
16 are things that were available prior to the Camp Fire;
17 correct?

18 A. In limited capacity, yes. We had certain
19 things that were not done had been done before. I mean,
20 maybe not with the rigor that has been, that we did them
21 with.

22 Q. Right. Ground inspections. You had ground
23 inspections before the Camp Fire?

24 A. Correct.

25 Q. But not to the detail that you did after the
26 Camp Fire; correct?

1 A. I would agree to that, yes.

2 Q. You didn't use climbing inspections before the
3 Camp Fire?

4 A. We did at times.

5 Q. Okay. Are you aware of the last time there was
6 a climbing inspection on the Caribou-Palermo line?

7 A. I am not.

8 Q. Aerial inspections. Let's start with the
9 helicopters. Was the photography technology used to
10 document the helicopter inspections available prior to
11 the Camp Fire?

12 A. The technology, the -- if -- I'm trying to
13 understand the -- there were cameras and there were
14 helicopters before --

15 Q. Right.

16 A. -- the Camp Fire?

17 Q. And there were companies that were using
18 helicopters and cameras mounted to helicopters for
19 transmission line inspections prior to November 8th,
20 2018; correct?

21 A. Yes.

22 Q. Now, as you explained, and I want to give you a
23 chance to explain it, you guys came up with your own
24 program and you created some new technology?

25 A. That's correct.

26 Q. To deal with the WSIP; correct?

1 A. That's correct.

2 Q. All right. You guys enhanced or improved an
3 existing technology as part of WSIP; right?

4 A. Correct.

5 Q. But the technology itself was available before
6 November 8, 2018?

7 A. Yeah, there was -- it was limited, but yeah,
8 there were. It was limited, but that -- yes, there was.
9 There were people that were using helicopters to do
10 inspections in helicopters.

11 Q. And even more so to document inspections;
12 correct?

13 A. I don't know what the documentation was, but
14 they were taking photos, yes.

15 Q. And same with ground inspections; so it's
16 possible to take photographs to document ground
17 inspections?

18 A. Yes.

19 Q. And drones, drones weren't invented on November
20 9th; correct?

21 A. That's correct.

22 Q. There was drone technology well before November
23 9th?

24 A. That is correct.

25 Q. And there were companies using drones to
26 inspect transmission lines well before November 9th?

1 A. Yes, in limited capacity, very limited
2 capacity.
3 Q. So these are all methods of inspection that
4 were available before the Camp Fire; correct?
5 A. But not with the rigor that we put into this.
6 Q. Right.
7 A. And the quality. The quality and the rigor did
8 not exist before, before the Camp Fire.
9 Q. But it could have existed had you wanted it to?
10 A. I can't answer -- I mean, I want to say yes,
11 okay? But I can't answer that fully as far as I'm not
12 sure when all these technologies came into existence.
13 Q. Right. But, I mean, somebody like Australian,
14 Australian companies have been using helicopter cameras
15 mounted on helicopters for many years to inspect
16 transmission lines; correct?
17 A. Correct. But not with the rigor and quality --
18 Q. Right.
19 A. -- that we, we instituted.
20 Q. But the basic technology was available. Your
21 improvements you could have made prior to the Camp Fire;
22 correct?
23 A. I mean, there wasn't anything preventing us
24 from -- to use helicopters and fix and get the additional
25 information out of the cameras, that's correct.
26 MR. NOEL: I'd say this is a good point to take

1 the break.

2 GRAND JURY FOREPERSON: Okay.

3 MR. NOEL: We'll try and come back and finish
4 him up real quick.

5 So she's going to give you an admonishment; is
6 that correct? And then we'll get a 15-minute break.

7 GRAND JURY FOREPERSON: Mr. Wright, you are
8 admonished not to discuss or disclose at any time outside
9 of this jury room the questions that have been asked of
10 you or your answers until authorized by this Grand Jury
11 or the Court. A violation of these instructions on your
12 part may be the basis for a charge against you of
13 contempt of court. This does not preclude you from
14 discussing your legal rights with your own attorney.

15 Mr. Wright, what I have just said is a warning
16 not to discuss this case with anyone except the Court,
17 your lawyer, or the district attorney. Do you have any
18 questions?

19 THE WITNESS: No, ma'am.

20 GRAND JURY FOREPERSON: Thank you.

21 Thank you.

22 THE WITNESS: Thank you.

23 (Break taken.)

24 GRAND JURY FOREPERSON: We're ready to proceed.

25 All members of the Grand Jury are present,
26 ready to proceed.

1 Q. (By MR. NOEL) Now, there's two stacks of
2 exhibits in front of you. We're -- I'm going to be going
3 back and forth between the two, try and get through them
4 pretty quick.

5 You said that as part of WSIP that you're going
6 back and doing these enhanced inspections, one of the
7 focuses was on the cold end attachment points; right?
8 The hooks and the holes?

9 A. Yes.

10

11 (Grand Jury Exhibit 183 was introduced.)

12

13 Q. All right. You have in front of you 183,
14 what's marked as 183?

15 A. Yes.

16 Q. Do you see that?

17 A. Yes.

18 Q. Is this what we're talking about, focusing on
19 the hooks?

20 A. Yes. We documented -- on our, our own
21 inspections, we documented every hot and cold connection.

22

23 (Grand Jury Exhibit 191 was introduced.)

24

25 Q. Okay. So -- and then moving on to 191, it
26 should be the next in that stack there on the left.

1 A. Yes.

2 Q. Same thing; another picture, hook and the hole?

3 A. Absolutely, yes.

4 Q. The cold end attachment point? Are you saying

5 that this kind of stuff, this kind of view was not

6 possible prior to the WSIP?

7 A. It's much easier to do through the drone

8 program.

9 Q. But the technology was available that you could

10 have been inspecting the cold end attachment points

11 before that; is that correct?

12 A. We did, we did not -- we were checking it, but

13 we did not have photos to document it, that's correct,

14 before.

15 Q. But you were supposed to be checking this?

16 A. Yes.

17 Q. So the troublemen who were doing the

18 inspections and patrols should have been looking at the

19 cold end attachment points prior to --

20 A. If it was on their check list, this is -- then

21 they were supposed to be looking at this.

22

23 (Grand Jury Exhibit 192 was introduced.)

24

25 Q. All right. Let's move on to 196 -- I'm sorry,

26 192.

1 A. Okay.

2 Q. Again, cold end attachment point?

3 A. Yes.

4 Q. This is another WSIP photograph?

5 A. It looks like it came out of ProntoForm. It's

6 got the ProntoForm stamp on the bottom.

7 Q. It's got the PG&E Bates stamp number on the

8 bottom?

9 A. Yes.

10

11 (Grand Jury Exhibit 193 was introduced.)

12

13 Q. All right. 193.

14 A. Okay.

15 Q. Another picture of a cold end attachment point?

16 A. Yes.

17 Q. This is another WSIP photograph?

18 A. I don't see a date. It says 2019. I'm

19 assuming it is. Okay. I don't have anything on here

20 that says what date it was taken.

21 Q. Okay. But this, again, is a PG&E Bates stamp

22 number, so -- the Bates stamp photograph, so it came from

23 PG&E?

24 A. Yes, it would be from, it would be from us, but

25 I don't know what the date was for this.

26 Q. All right. 254 is already in evidence. Same

1 thing, more pictures of cold end attachment points;
2 correct?

3 A. Yes.

4 Q. These are PG&E photographs?

5 A. It says PG&E at the bottom, so I'm, I would say
6 that that Bates number, that was our number, yes.

7

8 (Grand Jury Exhibit 255 was introduced.)

9

10 Q. 255, same question: This is a PG&E photograph,
11 probably the WSIP?

12 A. I guess, yeah. It's the same answer, I mean.

13 Q. All right. Let's move on, 642, really quickly.

14 A. Okay.

15 Q. This is, again, a photograph with the PG&E
16 Bates stamp PG&E camp BC0000024787. What's wrong with
17 this picture?

18 A. This is on the other stack. Okay. Got it.

19 Q. Sorry if I didn't -- I'm sorry, 662 -- 663.

20 A. Looks like a bent member.

21 Q. Is there anything else wrong with this picture?

22 A. And looks like the anchor has got some rocks on
23 top of it, or the foundation, yes.

24 Q. So you've got a bent member on there and the
25 foundation is covered with rocks; correct?

26 A. That's what it looks like, yes.

1 Q. Why would this not be found prior to the WSIP?
2 A. I don't know.
3 Q. Did we need enhanced technology to find these
4 issues?
5 A. I don't know. I mean, doesn't look like it.
6
7 (Grand Jury Exhibit 664 was introduced.)
8
9 Q. Okay. Let's go on to 664. What's wrong with
10 this picture?
11 A. Looks like we have a bent member, and then we
12 have some, looks like dirt or rock on top of a
13 foundation.
14 Q. Okay. So do we need enhanced technologies to
15 find these issues for this tower?
16 A. I wouldn't think so.
17
18 (Grand Jury Exhibit 665 was introduced.)
19
20 Q. Okay. All right. And this, 665. We'll skip
21 through, withdraw that.
22 666, we'll withdraw.
23 I thought -- okay. So let's go back to 665.
24 Do you see a problem with that tower?
25 A. It's a slight bent member, yes.
26 Q. A bent member?

1 A. Uh-huh.

2 Q. Is that yes?

3 A. Yes.

4 Q. Okay. So that's a problem in a tower; correct?

5 A. Can be. We have, we have -- these towers are
6 designed that such that there is, there's not supposed to
7 be a single failure point, so --

8

9 (Grand Jury Exhibit 666 was introduced.)

10

11 Q. Okay. So let's do 666. See a problem with
12 that photograph, the tower in this photograph?

13 A. I'm trying to look here. Looks like there's
14 another bent member, but that is, that's not a load
15 bearing member, so it's just a, it's just for stability.
16 So it's not -- with not being a load member, load bearing
17 member, it's not as critical to the tower.

18 Q. You said that's just for stability; right?

19 A. It's for additional stability, that's correct.
20 And those members are redundant. There's multiple
21 members like that --

22 Q. Right.

23 A. -- on the tower.

24 Q. But this one's bent. And that's something that
25 should have been --

26 A. Typically, we would put a notification in to

1 document that that is there, yes, correct.

2

3 (Grand Jury Exhibit 670 was introduced.)

4

5 Q. All right. Let's -- we'll withdraw 667, 668,
6 and 669, and go on to 670. Do you see a problem in this
7 picture?

8 A. That's, those are stability, those are bent
9 stability members for the -- looks like a insulator, a
10 drop down insulator, bottom end insulator.

11 Q. So is this a problem that should have been
12 noted during an inspection or patrol prior to the WSIP?

13 A. Well, there's -- we would -- you should be able
14 to see this, but also, this is on the underside of -- the
15 conductor's actually running up the top of this insulator
16 and there's another member that's holding it from the
17 top. So this would be a, these are just, just to prevent
18 that, that insulator, for that cable from swinging.

19 Q. Right.

20 A. So it's not, there's no load bearing associated
21 with that.

22 Q. That's something that was definitely noted in
23 WSIP inspections; correct?

24 A. We did note it in the WSIP inspection. I don't
25 know what notification it was, priority it was given, but
26 -- because I don't have that documentation here.

1 Q. Right.

2 A. But we did put some form of a notification in
3 on that, yes.

4 Q. And you should have 464 -- I'm sorry, not 464.
5 I keep forgetting. Should be -- this is 464, previous
6 exhibit, should have it in one of those stacks up there.
7 You can just look at it on the board if you want to.

8 A. Okay.

9 Q. Do you know what this form is?

10 A. Looks like, looks like a notification on
11 Caribou-Palermo 27 over 21 --

12 Q. Okay.

13 A. -- 221.

14 Q. In general, when you say "notification," this
15 is the kind of form that's filled out when a problem is
16 found on a, on an asset; correct?

17 A. Yes.

18 Q. And when -- you've alluded over and over again
19 to notifications and notifications. This is what you're
20 talking about, is this form right here?

21 A. Yes. That would be a form and a document what,
22 what was the, what item was found on that tower.

23 Q. All right. Going back to the climbing
24 inspection form that we went over before and looked in a
25 little bit more depth, you said if the inspector checks a
26 yes on any of those boxes that will all of a sudden

1 prompt them to do a notification; correct?

2 A. Correct.

3 Q. And this is the notification that it would have
4 to be filled out?

5 A. That would be, the information on there, that
6 would be -- yes. To answer your question, yes.

7 Q. Right.

8 A. That's an example of a notification that would
9 be filled out; correct.

10 Q. And these notifications then go up to asset
11 management for a decision on repair, replace?

12 A. Well, they go -- first off, they would, this
13 information would come off and it would go to our CIR
14 Team. And our CIR Team would do an additional review.
15 And at that point in time, the notification would either
16 be, would be sent to the field crews to be worked, or if
17 it was determined that that was, you know, for some
18 reason it wasn't needed for what have you, we would
19 cancel that notification, that's correct. But more than
20 likely this would end up with our execution folks to be
21 able to go out and correct this.

22 Q. And this is a pre Camp Fire notification;
23 correct?

24 A. Looks -- I'm seeing the required end date of
25 9-11-19. So it --

26 Q. Did you get the date down here in the long

1 text, 9/13/18?

2 A. 9/13/18.

3 Q. All right. And what's the condition that this
4 notification is reporting?

5 A. That's the hold down. It's a hold down
6 insulator string that's come loose.

7

8 (Grand Jury Exhibit 466 was introduced.)

9

10 Q. Okay. So go to Exhibit 466. Do you see an
11 insulator string, hold down insulator string in this
12 photograph?

13 A. Yes.

14 Q. And it's not connected where it's supposed to
15 be?

16 A. That would be correct.

17 Q. Now, when we were talking earlier, when we were
18 going through Exhibit 670, you were talking about that
19 the arm there that we're looking at is the hold down arm
20 that holds the insulator in place from the bottom;
21 correct?

22 A. Correct. But it just holds it in one place.
23 It doesn't -- it's not a load bearing --

24 Q. Right.

25 A. -- member.

26 Q. And here we have the same thing, similar

1 configuration; correct?

2 A. That would be correct.

3 Q. Okay. So here's another photograph of that

4 that's marked as 195. Tell me what problems you see in

5 this photograph.

6 A. The connection has come apart.

7 Q. Okay. Anything else?

8 A. And it looks like we got a bent arm there as

9 far as the one that's holding, it would be stabilizing

10 that --

11 Q. Right.

12 A. -- insulator string.

13 Q. We have a couple bent arms. We have this arm

14 here that's bent pretty severely; correct?

15 A. Well, I'm calling that whole thing an arm, is

16 what I'm calling it, because typically it's an arm and

17 then there are support structures there. So you've got

18 different members that are bent, but overall, the arm is

19 drooping. So that's how I was distinguishing it.

20 Q. Okay. Okay. So why would something like this

21 not be noted prior to the Camp Fire?

22 A. If this is structure -- I believe that this is

23 structure, what --

24 Q. 221.

25 A. 221. I think there is a notification on this.

26 Q. There is for the -- we just looked at it.

1 A. Yeah, but I think there was one done on the, in
2 September as well.

3 Q. If there is, could you please find it for us?
4 And it's not going to be in there. You're going to have
5 to dig in the records and provide it to us.

6 A. Sure.

7 Q. Because that has not been provided at this
8 point.

9 A. Okay.

10 Q. Then here's another look. See any problems
11 with this picture?

12 A. Yeah. This arm has got some, couple of the
13 members are bent. The arm looks like it's got some
14 damage to it.

15
16 (Grand Jury Exhibit 671 was introduced.)
17

18 Q. All right. Let's move on. 6, 672. And let's
19 go on to 6 -- no, 671, withdrawing 672, we have up there
20 on the board. You have in front of you?

21 A. Yeah.

22 Q. And what do you see with this issue?

23 A. Looks like a, got a little -- the cable looks
24 like it is coming apart a little bit.

25 Q. Okay. The caption on this says, "Tower 94 wire
26 damaged"; correct?

1 A. That's correct.

2 Q. So that's something that should be caught in an
3 inspection or patrol; correct?

4 A. Typically, typically it would. But you also
5 got to remember that some of this is being hidden from
6 the way the insulator is and how it's can obstruct some
7 of the view as well.

8 Q. Of what good is an inspection or patrol
9 procedure if it's not designed to find problems like
10 this?

11 A. Yeah, I can't answer that. I guess, you know,
12 going -- my function was to go forward and find these
13 things. And so when I put it, my, my team to get put
14 together to find these things, and we went out and
15 identified and put a process together to help us get
16 better looks at our, our equipment. And this is -- I
17 don't have a hundred percent confidence because this
18 looks like a drone photo that was able to sit there and
19 give us that view, a much closer and much better view.

20 Q. So you're almost completely done with all of
21 the WSIP inspections; correct?

22 A. Yes.

23 Q. The only ones that are still outstanding are on
24 the two air force bases?

25 A. That's correct.

26 Q. Where -- so you've done over 50,000 of WSIP

1 inspections in the last eleven months?

2 A. Correct.

3 Q. How many issues, previously unknown,
4 undocumented, unfound issues, did you find, or did the
5 WSIP find in the PG&E assets throughout the tier 2 and
6 tier 3 fire areas?

7 A. We found -- make sure I -- so I don't know
8 exactly how many -- I didn't count up the ones that were
9 before, that were in the system before.

10 Q. Right.

11 A. But the ones coming out, the ones that we
12 found, and they were in varying degrees of prioritization
13 or severity, but we found somewhere in the neighborhood
14 of about 60,000 items that needed some form of attention.

15 Q. How many?

16 A. Sixty thousand.

17 Q. Sixty.

18 A. And now I will clarify that a little bit with
19 the fact that a lot of them were pole numbers --

20 Q. Right.

21 A. -- high voltage signs, markers, things like
22 that. And it was a large, I would say two thirds of them
23 were probably in that, in that range.

24 Q. And that's going to be my next question.

25 A. Yeah.

26 Q. That includes things like high voltage signs

1 missing?

2 A. Correct.

3 Q. And aerial markers missing for planes?

4 A. I believe. I don't know. There will be some
5 of those. There would be some that could be missing or
6 could have been faded.

7 Q. That also includes things like bent members and
8 bent arms?

9 A. Some of them could have been, yes.

10 Q. And tower foundations that were buried?

11 A. Yes.

12 Q. And some of the different things that we've
13 looked at and some illustrated in some of these
14 photographs here today; right?

15 A. Correct.

16 Q. Those are things that you need to have enhanced
17 inspection procedures for; right?

18 A. Some of them you do have to have enhanced
19 inspections for, some of the things that we found.

20 Q. Right. Some of the things you do. But a great
21 many of them you don't need, you don't need a drone to
22 tell you if the high voltage sign is missing; correct?

23 A. That's correct.

24 Q. Another area that we didn't go into where there
25 were things missing was climbing guards?

26 A. Correct.

1 Q. Those are things that you don't need to have
2 these enhanced inspection techniques to see?

3 A. That would be correct.

4 Q. But yet they weren't found?

5 A. Well, in some areas they were. And, like I
6 said, I don't know what was in the system before. I
7 don't have, I don't, I don't have the documents that say,
8 hey, what was in there pre Camp Fire, but then coming out
9 of the Camp Fire, we not, we did not use any prerecords
10 for when -- I call them prerecords, pre Camp Fire
11 documents -- to offset any notifications that we already
12 had in the system. We put the, we put the modifications
13 in the system as we found them in WSIP. So everything
14 was documented regardless of what it was.

15 Q. Okay.

16 A. And that was, that was the fundamental premise
17 of this; we wanted a safe -- based on safety, quality,
18 and rigor. We wanted to find all of these items.

19 Q. So why weren't these types of inspections
20 happening before the Camp Fire?

21 A. I don't know. I can -- like I said, I can talk
22 to what was going on with WSIP.

23 MR. NOEL: Anything?

24 MS. DUPRE-TOKOS: Not at this time.

25 MR. NOEL: I'm through. The jurors can ask,
26 can submit questions to be asked to you, and if they have

1 any questions, I will ask them in just a second.

2 Since she can't come up to you, I'm going to
3 review them real quick with her.

4 (Counsel and Grand Jury Foreperson confer.)

5 MR. NOEL: These are some questions that have
6 been reviewed by myself and Ms. Dupre Tokos and the
7 foreperson.

8 THE WITNESS: Okay.

9 MR. NOEL: I'll read them to you.

10 Q. (By MR. NOEL) What type of training have you
11 had with PG&E and what type of training do your employees
12 have in your department?

13 A. So what as far as my training is, I've been,
14 I've been dealing with substation and maintenance and
15 utility business for about almost 30 years. I've had --
16 you know, in my career, I've led maintenance teams, I've
17 led construction teams, I've led engineering teams, and
18 I've had -- you know, so I've seen a lot. I've performed
19 a lot of maintenance and I've seen equipment assessments
20 over my career. My -- while most of it was not dealing
21 with transmission lines, it was dealing with failures.
22 You know, failures and maintenance and things along those
23 lines and problem solving.

24 My team continues -- and to speak for my team,
25 we have, we have brought in industry experts that have
26 quite a resume as far as their qualifications, meaning

1 from some of the top engineering firms in the nation we
2 brought in.

3 Q. You're talking about post Camp Fire?

4 A. Post Camp Fire. That's my team. And so I
5 assumed that was what the question was, my team; correct?

6 Q. Right.

7 A. So post Camp Fire we brought in people from
8 across the US that were industry leaders. Some of them
9 were former utility workers from other utilities, some of
10 them were post -- or previous employees from PG&E, a lot
11 of them were previous engineers, subject matter experts
12 from, from that. We -- and then, as a continuous
13 improvement, we do have, we do have ways to continue to
14 look at, periodic reviews of the decisions we've made,
15 and to take a look at, you know, how could we -- if a
16 scenario comes up and we have differing opinions, we will
17 always bring in somebody that could have that special
18 expertise as well. And we would sit there and develop a
19 process to deal with those things going forward, and even
20 back up to could involve changing some of the decisions
21 that we made in the past as well. And the past being the
22 recent past as part of WSIP program.

23 Q. All right. To your knowledge, do a lineman and
24 troubleman get training on the electrical towers before
25 ever working on them?

26 A. Yes. So our troublemen and linemen, they go

1 through the apprenticeship, the apprenticeship program at
2 PG&E. We have an apprentice program. It's a five-year
3 or six-year program. And it's sponsored by, joint
4 sponsored by the IBEW and PG&E. It is a rigorous
5 program. And it requires them, before they are turned
6 loose to do inspections, they are, they have to finish
7 this whole program, this whole apprentice program, and
8 become a journeyman. So there's a lot of training that
9 goes into that. So it's approximately six years for a
10 journeyman lineman. And then for a troubleman, it can be
11 an additional -- a troubleman is actually an advancement,
12 just above a journeyman lineman. So he's going to also
13 have several years of experience on top of that.

14 Q. So several years experience doing what?

15 A. Doing electrical work, doing electric line
16 work, doing -- could be -- most of it could be
17 maintenance type of work, or work, you know -- you're
18 doing utility work. I guess that's the way to put it.

19 Q. Will drones be used more than helicopters now?

20 A. So our system, we will be using drones more on
21 our system than we've been using them in the past. So
22 previous to WSIP it was very minimal, very, very minimal.
23 Going forward, we feel like we're going to be using
24 drones. Some -- there will be a program used for drones.
25 I don't know exactly the numbers, the amounts, but we
26 will be doing, we will be using drones. And we will also

1 be using helicopters. Helicopters are going to be a good
2 tool for us. And we've identified the areas in which it
3 can provide as good of an inspection as a drone. So
4 we're going to be using helicopters as well. But to say
5 it's going to be more than a helicopter, I can't say that
6 right now.

7 Q. Prior to 2018, November 8th, were you aware of
8 the general age of the Caribou-Palermo transmission
9 equipment?

10 A. I mean, in general, yes. I mean, I was, but it
11 really wasn't my -- I didn't have any direct dealings
12 with the line itself other than I did have some storm
13 restoration stuff that I had participated in up this way
14 dealing with the Caribou-Palermo line. I knew that there
15 was -- I didn't know the exact age, but I did know that
16 it was one of our older assets.

17 Q. In your understanding, what exactly defines a
18 qualified electric worker?

19 A. So a qualified -- so we, at PG&E we've got a
20 qualified electrical worker is somebody that's been
21 working on our system for more than two years; okay? So
22 they come in, and they, and they've gone through, and
23 most of it's OJT work, so on-the-job training. But
24 they've got -- been on our system and have worked under
25 our system for over two years. Most of these guys have
26 been, and mostly a qualified electrical worker is a

1 person that has good awareness of the hazards associated
2 with the job and understands our grounding practices.
3 And so that's, that basically sums up what I understand.

4 Q. Prior to November 8th, '18, were troublemen
5 required to be qualified electrical workers?

6 A. Absolutely.

7 Q. What are the qualifications for a journeyman's
8 license given by, I think should be the IBEW?

9 A. Yeah, the IBEW is, like I said, it's a joint
10 program. It's a six-year joint program that -- let me
11 back up. So there's -- a journeyman lineman is, a
12 journeyman lineman is a six-year program. And there's a
13 journeyman electrician that we have that is a five-year
14 program. So we have -- and the difference is when you're
15 doing the lineman, you learn some additional skills about
16 how to deal with certain hazards as you're going up,
17 climbing poles and towers and things like that. So there
18 is a five -- it's a six-year program for linemen, and
19 it's a five-year program for electricians.

20 Q. What is the IBEW?

21 A. Oh, International Brotherhood of Electrical
22 Workers. So it's the union, it's the union that our
23 linemen belong to, the bargaining unit that they belong
24 to.

25 Q. If the ProntoForms could be instituted within
26 just two to three weeks after the fire on 11/8/18, could

1 it not have been instituted prior to that date?

2 A. Well, we did, so we did have a form that we
3 used prior to the November 8th. We had a form that was
4 used by our, our linemen or our inspectors when they went
5 out. They had a, it was a form that listed all the
6 components on the, on the pole that they went and they,
7 and as they inspected it or looked at it, they checked it
8 off. So they were able to go down, if it said insulator,
9 they could, they would look at the insulator, review it,
10 and then check it off and then go to the next item and
11 look at that.

12 Q. So where exactly would we find this form?

13 A. I know for a fact it would be in the
14 maintenance offices. And there is -- and we typically
15 have, we could, they would be on file with -- you know,
16 I'm not a hundred percent certain, and I'd rather get it
17 right and tell you -- I know we can get it, we can
18 provide that, they are available, and they're already in
19 our -- I think we scan them and put them in our
20 maintenance records on NSAP. But I can tell you that we
21 do put them in the maintenance headquarters. So our
22 maintenance headquarters has those. And they're in a
23 file system based on the line that they're a record of.
24 So we do have those.

25 Q. So these jurors have subpoenaed from PG&E all
26 of the inspection and maintenance records for the

1 Caribou-Palermo that exist.

2 A. Okay.

3 Q. They've seen records all the way back to 2001,
4 and not a single one of these checklists that you're
5 talking about. So --

6 A. I want to --

7 Q. -- I'm not sure where to find them.

8 A. I want to make sure we're talking about the
9 same item as well --

10 Q. Yes.

11 A. -- okay? I definitely would work with you to
12 help make sure you have the right document.

13 Q. Right.

14 A. We may be calling it the same thing.

15 Q. There are climbing inspection forms --

16 A. Okay. That could be.

17 Q. -- that give out a checklist of what to look
18 for.

19 A. That could very well be. I believe that would
20 be the proper name for the form.

21 Q. Okay. So you're talking about the climbing
22 inspection forms?

23 A. Correct. But not, not the ones that was
24 Pronto.

25 Q. Right. Right. So those would only be
26 available for lines that have been climbed in the last 20

1 years; correct?

2 A. The climbing inspection form, yes.

3 Q. Right.

4 A. But there would be -- we could do a variation
5 of those based on ground inspections or -- based on
6 ground inspections.

7 Q. But there's no checklist, component checklist,
8 for ground inspections prior to November 8th, 2018?

9 A. Not to my knowledge.

10 Q. Okay. So make sure I got that right.

11 A. I want to apologize for creating that
12 confusion. There is a, there is a pre WSIP climbing
13 checklist, or climbing -- yeah.

14 Q. All right. Is it fair to say that PG&E Risk
15 Assessment Analytics changed substantially after 11/8?

16 A. Absolutely.

17 Q. And then does there need to be training, does
18 there need to be training to identify components that are
19 cracked, bent, broken, or missing?

20 A. I think -- I don't know if we need training. I
21 think what we've done now is we've got additional eyes on
22 this. So one of the great enhancements about the
23 inspections that we're doing now today is not only do I
24 field this, do I get this information coming in from the
25 field and do I get these great pictures, I've got
26 multiple sets of eyes looking at this, each and every,

1 each and every asset. So as this stuff comes in, if for
2 some reason somebody has work to, you know, not identify
3 something, we've got methods to check that and make sure
4 that we catch these, each piece of -- or each one of
5 these deficiencies and create that notification and
6 create that work order to get it taken care of. So the
7 safety, quality, and rigor that's in this program is
8 unprecedented in the industry right now.

9 Q. Let me see if I can sum it up real quick. It's
10 been said that, that pre Camp Fire the inspection policy
11 was if it's hanging, it's good. Based upon your, your
12 experience running the WSIP and evaluating the results
13 from inspections throughout the PG&E service area, how
14 would you respond to that statement?

15 A. Well, until today, I have not heard, heard that
16 quote. So I would, I would say that we, our program that
17 we had in pre WSIP was not unlike a lot of the utilities
18 that are out there today in other parts of the country.
19 The game changer was we got some conditions and
20 consequences associated where our assets are located that
21 we had to do something better. And that's what we've
22 done.

23 Q. How many other utilities cause massive fires
24 every year?

25 A. I mean, I can't answer that question. I
26 mean --

1 Q. How many other utilities have wind?

2 A. A lot of them. Most of them.

3 Q. How many other utilities have drought, deal
4 with drought?

5 A. I can't answer that.

6 MR. NOEL: All right. Madam Foreperson is
7 going to have an admonishment for you. Thank you very
8 much for subjecting yourself to this all day.

9 GRAND JURY FOREPERSON: Mr. Wright, you are
10 admonished not to discuss or disclose at any time outside
11 of this jury room the questions that have been asked of
12 you or your answers until authorized by the Grand Jury or
13 the Court. A violation of these instructions on your
14 part may be the basis for a charge against you of
15 contempt of court. This does not preclude you from
16 discussing your legal rights with your own attorney.

17 Mr. Wright, what I have just said is a warning
18 not to discuss this case with anyone except the Court,
19 your lawyer, or the district attorney. Any questions?

20 THE WITNESS: No, ma'am.

21 GRAND JURY FOREPERSON: Thank you for your time
22 today.

23 THE WITNESS: Thank you.

24 (Pause in proceeding.)

25 MR. NOEL: Please remain standing so she can
26 swear you.

1 GRAND JURY FOREPERSON: I'm sorry, I didn't see
2 you come in.

3 Please raise your right hand.

4
5 JOSCELYN WONG

6 having been called as a witness in
7 the matter now pending, having been first
8 duly sworn, testifies as follows:

9
10 THE WITNESS: Yes.

11 GRAND JURY FOREPERSON: Thank you. Have a
12 seat, please.

13
14 EXAMINATION

15
16 BY MR. NOEL

17 Q. Ms. Wong, for the record, can you please state
18 your full name, spell your last name. Probably spell
19 your first name, too, because it's a little unusual.

20 A. Unique. Full name is Joscelyn Marie Wong,
21 J-O-S-C-E-L-Y-N. Last name Wong, W-O-N-G.

22 Q. Ms. Wong, are you employed?

23 A. Yes.

24 Q. By whom?

25 A. Pacific Gas & Electric Company.

26 Q. How long have you been employed by PG&E?

1 A. Since 2012; 17 years.

2 Q. I'm sorry?

3 A. 2002. Can't do math. I'm sorry, long day.

4 Q. All right. What kind of educational background
5 do you have that qualifies you for PG&E?

6 A. So I have a bachelor's of science in electrical
7 engineering from Cal Poly, San Luis Obispo. That's it.

8 Q. Okay. You said Cal Poly, San Luis Obispo?

9 A. Yes. Correct.

10 Q. I spend way too much of my money at that
11 school.

12 All right. So what do you do for PG&E?

13 A. I'm currently the Manager of Strategic
14 Governance.

15 Q. What is Strategic Governance?

16 A. Strategic Governance handles all the
17 compliance, governance, regulatory rate case filings for
18 Transmission Asset Management within PG&E.

19 Q. All right. I'm going to pull this microphone
20 up to you a little bit closer. You can sit back and be
21 comfortable. We can pull the microphone, so we can move
22 it. So you get comfortable. And we need to be able to
23 hear you.

24 All right. How long have you been manager of
25 Strategic Governance?

26 A. Since mid 2018.

1 Q. What did you do before Strategic Governance?

2 A. Starting in 2013, I was the manager for
3 Transmission Asset Development, which was responsible for
4 transmission projects.

5 Q. How -- what do you mean by transmission
6 projects?

7 A. These would be projects to repair or upgrade
8 transmission lines or substations.

9 Q. How are you responsible for those?

10 A. So my team acted as what we called the "Project
11 Sponsor Representatives" that work with the project team
12 to actually implement the project.

13 Q. Prior to that what did you do?

14 A. Prior to that, for 2012, the year of 2012, I
15 was the manager for Transmission Line and Substation
16 Asset Strategy.

17 Q. What is that position?

18 A. That position is responsible for developing the
19 over all strategies for how we want to handle our
20 transmission line substation assets.

21

22 (Grand Jury Exhibit 674 was introduced.)

23

24 Q. All right. So you should have in front of you
25 exhibit -- again, we need to change these, because I
26 screwed up the numbering system. This should be Exhibit

1 674. Do you see Exhibit 674?

2 A. Yes, I do.

3 Q. What is Exhibit 674?

4 A. This is an organizational chart as of October

5 of 2018.

6 Q. All right. Now, at the top we have somebody

7 named Tom Wright?

8 A. Yes.

9 Q. Where are you on this chart?

10 A. I am on the last row, on the right. Right.

11 Q. That says your position is what?

12 A. Says I'm the Manager of Strategic Governance.

13 Q. And you reported directly to Tom Wright?

14 A. In this org chart, yes.

15 Q. And go on to page 2 in that exhibit. Tell me

16 what page 2 is.

17 A. Page 2 is an organizational chart for my

18 organization, for my group.

19 Q. Okay. The group that you manage?

20 A. Correct. Yes. Strategic Governance.

21 Q. Describe it for us a little bit.

22 A. I'm sorry, describe this chart?

23 Q. Your group, yes.

24 A. It was comprised of a combination of engineers,

25 engineering assistants, as well as contractors.

26 Q. Now, this org chart is dated as of October

1 31st, 2018; correct?

2 A. Correct.

3 Q. But were you actually functioning as the
4 manager of Strategic Governance in October of 2018?

5 A. In October of 2018 I was asked to join what was
6 called the "Accelerated Wildfire Risk Reduction Program,"
7 which was essentially our enhanced vegetation effort.

8 Q. Now, that was in October or in August of '18?

9 A. That was starting in October. I'm sorry,
10 starting in August through early November was when I was
11 supporting AWRR.

12 Q. And AWRR was what again?

13 A. Accelerated Wildfire Risk Reduction.

14 Q. What is AWRR, what is Accelerated Wildfire Risk
15 Reduction?

16 A. It was a, essentially enhanced vegetation,
17 cutting back more trees than the requirement.

18 Q. And when did that program start?

19 A. I was asked to join in August. I can't tell
20 you exactly when that program was started.

21 Q. And was this enhanced vegetation management
22 everywhere or targeted?

23 A. Well, that specific program, to my knowledge,
24 was based off of what tiers 2 and 3, according to the
25 High Fire District, according to the CPUC fire map.

26 Q. So that's the CPUC High Fire Threat Map, which

1 defined tier 2 and tier 3 fire danger zones; correct?

2 A. That's my understanding of it.

3 Q. Okay. And you don't know when exactly that
4 program started?

5 A. I can only tell you when I was asked to join.

6 Q. We'll go on.

7 We already went over this.

8 So you're here to talk about RIBA.

9 A. Yes.

10 Q. So what is RIBA?

11 A. RIBA stands for Risk Informed Budget
12 Allocation. It's a tool that PG&E uses to prioritize
13 projects so we can understand which projects can mitigate
14 the most risk, and so we can prioritize and rank those
15 first.

16 Q. So I've tried to summarize this real quick.
17 You prioritize risk by determining risk occurrence plus
18 the severity of the risk, and those give you a risk
19 score; is that about right?

20 A. There were three categories that projects were
21 scored against. They were safety, environmental, and
22 reliability. And each of those had, in order to develop
23 the score, you would have the probability of an event
24 happening and then the impact of that happening.

25 Q. Now, this is kind of my, you know, "RIBA for
26 Dummies" slide here, trying to set the basic

1 understanding of it; right?

2 A. Yes.

3

4 (Grand Jury Exhibit 675 was introduced.)

5

6 Q. So let's get into the actual workings of it.
7 You have in front of you Exhibit 675?

8 A. Yes, I do.

9 Q. And it's being displayed now on the big board.
10 Can you tell us what is Exhibit 675?

11 A. This is quite a large packet, but this was a
12 spreadsheet that was used to help score projects, or to
13 help record the scoring of projects.

14 Q. Okay. So explain -- look at page 1 that we're
15 looking up here and explain to us what we're looking at.

16 A. So page 1 is the high level overview of what
17 RIBA is and how it should be applied for each project.

18 Q. Okay. Walk us through it.

19 A. I haven't read this in a while, so forgive me
20 for a second.

21 So this was intended for someone who was
22 facilitating the overall effort to walk through with a
23 subject matter expert as far as how to score projects.
24 As example, if -- I'll use Marc as an example. If Marc
25 was the engineer that was the most knowledgable about the
26 project, then I would sit down with this guy and walk him

1 through the overall RIBA process and how using his
2 information to score a project.

3 So do you want me to talk about the overall
4 RIBA process?

5 Q. Sure.

6 A. Sure. So, as I mentioned, there were three
7 categories that a project is scored on. Just to be
8 clear, these are projects, this is not overall risk to
9 the companies, they're very specific projects, and what
10 the risk is if we don't do that project. And so there
11 are three categories. There's safety, environmental, and
12 reliability. And within each of those, there is what we
13 call the impact of that, of that project not being
14 completed, as well as the, what the probability of that
15 if it did fall. For the probability of an event would
16 be, essentially the frequency could be, if we don't do
17 the project. So within each of those there is a score of
18 1 to 7. And this gets a little complicated, and I know
19 there's a few slides that kind of help visualize these a
20 little bit.

21 Q. Right. We can go into those in a minute. Just
22 an overview right now.

23 A. Sure. So essentially you would score each of
24 those for each of those categories. Then between those
25 you could get a score anywhere from 1 to a -- 1 to
26 10,000. I cannot speak today, sorry. 1 to 10,000 for

1 any, each of those categories, meaning a total project
2 could range anywhere from a score of 3 to 30,000.

3 Q. All right. So let's walk through this. And
4 you're free to get up and move around. We can use the
5 big board. This is a Smartboard. We can do all kinds of
6 things.

7 But step one, "Agenda items: Hold initial
8 detailed session with the engineer; introduce the
9 investment planning effort; for each project; assess."

10 Explain to us what this means.

11 A. Which piece?

12 Q. This first section in here under "hold initial
13 detailed session with engineer."

14 A. So, as I mentioned, we would have folks that
15 would be familiar with the process. Myself, I was one of
16 those. And we would sit down with the engineer and go
17 through their portfolio of work and walk them through
18 that process.

19 Q. Okay. What is investment planning efforts?

20 A. I don't know specifically what that is
21 referencing to, but investment planning by itself is an
22 overall process that the company uses to develop its
23 budget and forecast for every year moving forward.

24 Q. Okay. "Assess what potential incidents the
25 project is designed to mitigate"?

26 A. So that's kind of what the risk is the project

1 mitigates.

2 Q. "Evaluate expected time to each incident based
3 upon supporting information"?

4 A. So this is sort of what I was talking about
5 with the impact and then the frequency. So that second
6 bullet -- sorry, third bullet, "Evaluate the expected
7 time for each incident." That's the frequency
8 calculation.

9 Q. All right. We'll go over, "Review detailed
10 information collected matching against the scoring
11 taxonomy."

12 A. Yes. Based off of what the engineer is aware
13 of for that project, they would use the RIBA guide and
14 score each project for each of the three categories.

15 Q. Then after that, we do "Review with the project
16 engineer"; correct?

17 A. Yes. We would talk it through and make sure it
18 makes sense.

19 Q. And then the key questions are the questions
20 that the scorer would ask the subject matter expert, the
21 engineer?

22 A. That's correct.

23 Q. And those deal with scope, impact, and
24 frequency?

25 A. Yes.

26 Q. All right. Okay. So let's move on in to page

1 2 of this document, 675. And tell us what we're looking
2 at here.

3 A. So this is the, what we call the taxonomy for
4 safety. There is a score of 1 to 7. This doesn't just,
5 this does not translate to the score of 1 to 10,000 I
6 talked about. We'll see that in a little bit. But based
7 off of the potential impact of what that project may have
8 if we do not complete it, then we will come up with what
9 the score is.

10 Q. Okay. So this is the safety taxonomy?

11 A. This is the safety taxonomy; correct.

12 Q. This scores everything from negligible, which
13 would be a 1, to catastrophic, which is a 7; right?

14 A. Correct.

15 Q. Okay. Next up, page 3.

16 A. The next slide should be the environmental
17 slide. It's a very similar type of situation. You can
18 see there's a lot more detail here for environmental.
19 But overall, once again, this is a, the score of if you
20 do not do the project, what the risk would be from an
21 environmental standpoint. And, generally, environmental
22 is concerned about, you know, habitat, endangered
23 species, that type of thing.

24 Q. Okay. Again, from 1, being negligible, to 7,
25 being catastrophic?

26 A. Correct.

1 Q. Next up?

2 A. I think I'm missing a reliability slide in
3 here, but I can speak to it.

4 Q. The reliability slide is missing?

5 A. From my package, but it's okay. I can speak to
6 it.

7 Q. I'm sorry, we'll have to get that taken care
8 of.

9 A. So, similar to safety and environmental,
10 reliability, this is more about the customer impacts, so
11 number of customers, the duration of outages, large
12 cities, metropolitan areas. It's what we call critical
13 locations. This can be anywhere from towns to cities.

14 Q. Before you make a note to make a copy of this
15 and add it into the packet later.

16 All right. And, again, this goes from
17 negligible at 1 to catastrophic at 7?

18 A. Correct.

19 Q. Next up?

20 A. So the three slides that you saw before that
21 were all regarding the consequence of impact, due to
22 impact. This is the frequency slide -- I'm sorry --
23 frequency taxonomy that applies to each of those
24 categories. With the 1 being once every -- more than 100
25 years of likelihood, to a 7, which is more than 10 times
26 a year.

1 Q. Okay. Now, how do you turn these things into
2 an overall score for a project?

3 A. So for each of the categories you would have an
4 impact score and then a frequency score. So depending on
5 what those two numbers are, it translates to a box in
6 this grid. So meaning a, the impact score is a 1 and a 1
7 -- or frequency of 1 is the bottom left corner of a
8 overall score of 1 versus the other extreme is a 7 for
9 impact score and a 7 for frequency, it translates to
10 10,000.

11 Q. And this type of -- I guess I'm forgetting the
12 word for it, but you do this for three separate types of
13 issues with each project?

14 A. Correct. So we would do each for safety,
15 environmental, and reliability for each project.

16 Q. All right. That's where we get the scale from
17 3 to 30,000?

18 A. Correct.

19 Q. All right. So let's talk about -- well, let's
20 go in on through this, the next page. You can explain
21 this, the flags.

22 A. So in addition to the score, there are what we
23 call flags that may be applied to a project, because
24 there may be reasons that we are required to do a
25 project, even if it doesn't have a high risk score. Such
26 as, it could be a compliance thing, meaning we're

1 obligated to do it for certain laws or whatever the
2 situation is. Basically these are different flags that
3 could be applied. So we can identify projects that may
4 still need to be completed even if it doesn't have a high
5 risk score.

6 Q. Okay. And, I believe, the final page?

7 A. So this is a list of, list of the top 10 and
8 what we call enterprise risks for PG&E in 2014.
9 Essentially these are what the company was concerned
10 about at the time.

11 Q. And the top enterprise risk was what?

12 A. The first risk is the, listed as wildfire.

13 Q. And what's the description of that list?

14 A. It says, "PG&E assets may initiate a wildfire
15 that is not easily contained and that endangers the
16 public, private property, sensitive lands and/or leads to
17 long-duration service outages. Focus on overhead
18 electric assets."

19 Q. All right. Final page.

20 A. This is an overall listing of all the
21 definitions or -- of all the columns that someone would
22 have to fill out during a RIBA scoring process.

23 Q. And we'll tie back to this in a second; right?

24 A. Yes.

25

26 (Grand Jury Exhibit 676 was introduced.)

26

Q. All right. So I want to walk through kind of the RIBA process for a single event. And this is Exhibit 676 that you should have in front of you.

A. I'm looking for the actual RIBA scoring?

Q. No, no, the Business Case. Do you see the tag on it? There should be a white tag on it that says number 676?

A. Yes.

Q. All right. So you got it?

A. Yes.

Q. So what are we looking at in Exhibit 676?

A. So this is a, what we call a "Business Case" for the project to replace the damaged towers that collapsed in 2012 event. And a Business Case is essentially a request to, for dollars to complete the project.

Q. Okay. So this is dealing with the December 2012 incident that took out six towers on the Caribou-Palermo line?

A. Impacted five towers, but the project was to replace six.

Q. Are you involved in this project?

A. Yes. My name is listed as the program manager.

Q. So what does that mean?

A. So, as I mentioned, my role was, was

1 responsible for overall transmission line and substation
2 projects. So this being one of those.

3 Q. So let's walk through some of the names on
4 there then. The name directly above you is somebody
5 named Pat Hogan?

6 A. Correct. He was the senior vice-president at
7 the time.

8 Q. Then business owner, somebody named Manho
9 Young?

10 A. Yes. He was the senior director of System
11 Planning and Reliability. Essentially my direct
12 supervisor.

13 Q. And then Project Manager Duane Cobb?

14 A. Yes.

15 Q. Who is that?

16 A. He was the project manager for the project.

17 Q. How does project manager differentiate from
18 program manager?

19 A. Oh, so the project manager is, essentially
20 coordinates with the entire project team that's listed
21 there. It's a very long list that comprises of
22 engineering, construction, permitting. And they actually
23 were kind of more the boots on the ground to make sure
24 the project is constructed.

25

26 (Grand Jury Exhibit 677 was introduced.)

Q. All right. So let's move on to 65 -- 677, I'm sorry. We're looking at an email from February 26th, 2014. Do you see that?

A. Yes, I do.

Q. Do you have it in front of you?

A. Yes.

Q. All right. This is an email from Manho Young. And you said Manho Young is who?

A. My direct supervisor.

Q. And this is addressed to several people. Does that include you?

A. Yes, it does.

Q. And who are the other people?

A. So the other folks were, played a similar role that I did, which is facilitating the overall process. Basically, we would work with the engineers that had the actual project to develop the scores.

Q. And this is a response to the email below it from Carlos Gonzalez to Manho Young; correct?

A. That's what it appears to be.

Q. All right. And, also, the same list of other people?

A. Yes.

Q. That includes you?

A. Yes.

1 Q. And who exactly was Carlos Gonzalez?

2 A. So, as I mentioned, Carlos was another person
3 that was helping with the scoring process, working with
4 the engineers to walk them through it.

5 Q. And then there's some other people on the list
6 that have an email address that says mckinsey dot com?

7 A. Correct. McKinsey was a contract consultant
8 that was brought in in 2014 to help us develop the
9 overall framework, the framework that is pretty -- not
10 common, but was used in other industries as well to
11 identify risk.

12 Q. Okay. Now, the start of the email from
13 Mr. Gonzalez says, "Manho, per my email earlier in the
14 week, I will not be able to attend the EO RIBA check-in
15 meeting tomorrow." Can you explain to us what that
16 means?

17 A. I don't know exactly what Carlos was saying,
18 but it implies that he was not able to attend a check-in
19 meeting. So this was a summary of his desk.

20 Q. What is a check-in meeting?

21 A. So because this was a new process that we were
22 rolling out, there were pretty periodic check-ins with
23 our leadership to make sure we were going the right
24 direction.

25 Q. All right. So I want to skip down to the first
26 entry under "Observations." Do you see that?

1 A. Yes.

2 Q. Do you see it says "Caribou-Palermo"?

3 A. Correct.

4 Q. And could you read that section to us.

5 A. Section says, "Less than 200 score because
6 there is no likely large environmental event. If
7 structures fail, it will be likely due to heavy rain, and
8 no wild fires are possible then. Also, no likely public
9 safety issue with the live wires down because it is in a
10 remote area. Reliability score is not that high, because
11 although the likelihood of failed structures happening is
12 high, the affected customers are likely in order of more
13 than a thousand customers."

14 Q. So we talked earlier about the scores being
15 between 3 and 30,000; correct?

16 A. That is the potential range with RIBA.

17 Q. And the Caribou-Palermo scored less than 200?

18 A. That is what this says, yes.

19 Q. All right. Now, why are you doing a RIBA
20 analysis of the Caribou-Palermo?

21 A. So, to be clear, this is not an assessment of
22 the overall line. This was for a specific project on the
23 line. At the time there were actually two projects that
24 were on the Caribou-Palermo line. And to determine which
25 project this was, we had to do a comparison of the
26 overall score as well as the details that are listed

1 here. And when you look at the two projects based off of
2 how it was scored, this was for the replacement of the
3 structures that fell down.

4 Q. Okay. And you're familiar with what was the
5 other project on the Caribou-Palermo at the time?

6 A. The other project was to relocate about ten
7 towers on the line.

8 Q. And so both of those projects were scored using
9 the RIBA process to determine what?

10 A. So the RIBA process is, the score is the
11 consequence of if we don't complete that project. In
12 this particular case, this is if we, if we do not replace
13 the steel structures or install the new steel structures.
14 I do want to clarify that at the time we had installed
15 wooden structures where the towers had fallen down, what
16 we call a "shoo-fly," very fun technical term. But the
17 wooden poles were installed in a permit fashion and,
18 therefore, the scoring of this project was really the
19 consequence if we keep those wood poles up and not put in
20 the steel structures.

21 Q. So it sounds like a less than 200 score for the
22 Caribou-Palermo project is pretty low?

23 A. I wouldn't say that. The -- my experience,
24 transmission line projects were generally in the range of
25 100 to 300.

26 Q. So what are the chances with an under 200 score

1 that the Caribou-Palermo replace-six-towers project is
2 going to get done in 2014?

3 A. I can't speak exactly at the time, but because
4 it is in the general range of what we're seeing for
5 transmission projects, it would have been something that
6 would have been discussed, actively discussed.

7 Q. So with the RIBA, you're making decisions on
8 which projects are going to be actually completed that
9 year; correct?

10 A. Not completed, per se, but which -- what will
11 be allocated resources, meaning people dollars.

12 Q. How is this related to the FERC transmission
13 owner rate case?

14 A. I'm not sure I understand your question.

15 Q. Well, you're familiar with the FERC
16 transmission owner rate case process; right?

17 A. Yes.

18 Q. That is the process by which PG&E requests
19 permission to raise rates from FERC; correct?

20 A. To recover rates, yes.

21 Q. And they do so by giving FERC a list of capital
22 projects that they intend to do, and this is how much
23 it's going to cost, so this is how much we have to charge
24 our people; correct?

25 A. That is my understanding.

26 Q. Okay. So would it surprise you if the

1 Caribou-Palermo wasn't already on the 2014 FERC rate
2 case, in terms of its funding had already been approved?

3 A. Would it surprise me?

4 Q. Yeah.

5 A. If it was or was not on there?

6 Q. If it was on there.

7 A. No, the project would have been in our plan.

8 And so if it was planned for the following year, we would
9 have included it in that rate case.

10 Q. So why, if you've already gone to FERC and
11 asked them for the money to do these projects, are you
12 now deciding whether or not you're going to do them?

13 A. No. So this wasn't -- the overall RIBA process
14 wasn't just for this project.

15 Q. Right.

16 A. It was the entire portfolio of work we had
17 planned. So -- and there could be reasons that any
18 project could be deferred at any given year, meaning you
19 could run into weather issues, you could run into other
20 constraints. There are a lot of reasons that a project
21 may move, the scheduling move.

22

23 (Grand Jury Exhibit 678 was introduced.)

24

25 Q. Okay. So let's get into the next slide. This
26 is 678. Explain to us what we're looking at here.

1 A. So this is essentially the overall scores for
2 the project. So this is essentially the details for the
3 scoring for this project.

4 Q. Okay. So let's walk through this. There's
5 actually two projects on here; right?

6 A. Yes.

7 Q. These are both of Caribou-Palermo projects that
8 were pending approval to get done; correct?

9 A. These were projects on specific sections of the
10 line, but yes.

11 Q. So we start off B column says "Total Risk
12 Score"; correct?

13 A. Yes. So that's the sum total of the three
14 categories.

15 Q. Right. So in line 10 column, we have the
16 "Caribou-Palermo 115 kV relocate." That's relocate 10
17 towers; correct?

18 A. Yes.

19 Q. And its risk score was 581?

20 A. That's what it says.

21 Q. And then on line 116, this has been annotated
22 to take that out, we have the "Caribou-Palermo replace 5
23 damaged towers"; correct?

24 A. Yes.

25 Q. And its risk score is only 180?

26 A. That's what it says, yes.

1 Q. So you said that most of the transmission line
2 risk scores are between 100 and 300; correct?

3 A. It's a range. You'd have projects that can be
4 above or below them.

5 Q. But the relocate actually is 581?

6 A. That's what it says.

7 Q. Are you familiar with what actually they were
8 trying to do in the relocate project?

9 A. I don't recall all the details, but it was for
10 access issues; it was to relocate 10 towers so we could
11 actually get to them easier.

12 Q. Actually, by this time all they were looking at
13 was building a road to access the towers where they were
14 at; correct?

15 A. I don't know that. I can't remember the exact
16 timing of anything.

17 Q. Okay. So then we have 581. Next column, C,
18 the safety risk score; correct?

19 A. That's what it says.

20 Q. What is that?

21 A. That's, as we talked about earlier, the score
22 on the grid for the safety.

23 Q. Okay. So for the relocate, 18. So that would
24 be an average of 6, correct, on the 1 to 7 scale?

25 A. No. So that's just for safety as well.

26 Q. Okay.

1 A. So -- and I don't know what -- I'd have to look
2 at the grid to tell you what combination of scores that
3 could be.

4 Q. I forgot all about that we have a third project
5 down here, which is the Caribou-Palermo 115 NERC Alert
6 project --

7 A. Yes.

8 Q. -- also; correct?

9 A. Yes.

10 Q. And we don't have scores on that; right?

11 A. It doesn't -- well, I can't read it. It's not
12 very clear. It has a score. At least a completed score.

13 Q. I forgot we put this in here. This would
14 actually be an example of a compliance, something that
15 you were mandated to do?

16 A. NERC Alert wasn't necessarily a compliance
17 item, it was a firm guidance from NERC to do some work on
18 our transmission lines.

19 Q. That was with relation to clearance
20 requirements on transmission lines?

21 A. It had to do with how high our conductors were
22 from the ground.

23 Q. All right. So safety score for the relocate,
24 18; safety score for replace the 5 damaged towers, 1.

25 A. That's what it says.

26 Q. Environmental risk score for relocate, 1; for

1 replace, 1. And then reliability risk score, 562 to 178.

2 A. That's what it says.

3 Q. So what's the difference between a reliability
4 risk score and total risk score?

5 A. So the total risk score in column B is
6 basically the sum of the next three columns; the safety,
7 environmental, and reliability. So if you add up the
8 562, the 1, and the 18, that should be 581.

9 Q. Okay. All right. So let's go through the rest
10 of this.

11 "2015, draft rank," what does that mean?

12 A. I actually do not know, or cannot recall.

13 Q. Okay. And project manager. Who was Rich
14 Pettingill?

15 A. Rich Pettingill was a project manager of the
16 project in 2014 when we scored this project.

17 Q. Is he listed on 676, the Business Case?

18 A. He is listed sort of halfway down the page as
19 the supervisor of Electric Project Management.

20 Q. Next up, asset engineer, John Culbertson. Who
21 is John Culbertson?

22 A. John Culbertson was the engineer that acted as
23 what we call the project sponsor representative for the
24 project in 2014.

25 Q. All right. And then Mr. Culbertson is also the
26 asset supervisor?

1 A. I cannot speak to why he's listed twice.

2 Q. What's an asset supervisor?

3 A. I don't know exactly, but my guess is this

4 would be the supervisor of the asset engineer.

5 Q. All right. Let's move on to the next page of

6 that document.

7 All right. Let's move across. "MAT

8 Description," do you know what that is?

9 A. So MAT stands for, I believe it was Material --

10 I can't remember what the A stands for. But it's

11 basically a code that PG&E uses to categorize projects,

12 group them together.

13 Q. And then "MAT," with numbers?

14 A. Yes.

15 Q. I'm going to skip over, over here, and

16 "In-Service Date"?

17 A. These would have been the in-service dates at

18 the time of the scoring.

19 Q. Okay. For the Caribou-Palermo -- or for the

20 replace 5 towers, that date is October 1st, '15; correct?

21 A. That's what it's showing.

22 Q. Okay. What is "2015 Status," what does this

23 mean?

24 A. I don't know if I remember.

25 Q. Okay. And then "High Level Scope," what is

26 that category?

1 A. This is a high level description of what the
2 project will be doing.

3 Q. All right. And then "2015 Forecast," what does
4 that tell us?

5 A. So these are the dollars that are being, what
6 -- how much the project team thinks they need in 2015 to
7 continue doing the project.

8 Q. Okay. So for relocate, it's 750,000; correct?

9 A. For that year, for 2015.

10 Q. And for replace, it's 3 million?

11 A. Yes, that's there.

12 Q. Okay. All right. So let's start getting into
13 the, into the meat of this. We're now on to page 3,
14 "Project score, Carlos Gonzalez"?

15 A. Yes.

16 Q. That's the person, you told us, he's kind of
17 the expert that's leading somebody through this; correct?

18 A. He was facilitating the process, yes. So he
19 was helping the engineer walk through the process.

20 Q. Who is the engineer?

21 A. John Culbertson.

22 Q. That's listed in column AJ?

23 A. Yes. Yes.

24 Q. So John Culbertson is the engineer that's
25 supposed to be the expert on this project?

26 A. He's the most familiar with the overall

1 project.

2 Q. All right. So let's move on to the next page.
3 Now we're starting to talk about the actual project
4 itself.

5 So there's a column, "AN," that says "Impact
6 Notes." What does that mean?

7 A. So this is, these are the notes that would
8 explain the scores, reasoning behind the impact scores.
9 So if you actually flip back to page 3, the far right
10 column, "AM," has the impact score of 1.

11 Q. The impact score on this project for safety is
12 1?

13 A. Yes.

14 Q. That's because?

15 A. It's on the next page. And it's a little bit
16 cut off here. I'm going to have to go off the other
17 notes. Basically that it's -- there was no significant
18 of public safety concern because of the location of the
19 structures. It was in a remote area. And the concern is
20 that -- and these impact notes are based off what we call
21 "the worst reasonable direct impact." Basically in this
22 particular case, would a structure fall down and hit
23 somebody? And based on how remote the area was, that's
24 why it has a score of 1. You're not likely going to have
25 someone walking around in this area.

26 Q. So who makes that determination?

1 A. Of what?

2 Q. What, that there's no significant public or
3 employee safety issue?

4 A. Well, remember the concern for this project was
5 that we had a wet and windy storm that caused some towers
6 to fall down. So that was what we were trying to
7 mitigate overall with this project. Basically, we didn't
8 want more structures to fall down in this area. So in
9 order -- because that's what our concern was, was a wet
10 and windy storm, that was the reasoning behind this. At
11 least I'm speculating that is John's reasoning behind
12 this.

13 Q. Well, all we have is the records; correct?

14 A. Correct.

15 Q. Is John Culbertson still with PG&E?

16 A. He has since retired.

17 Q. So Mr. Culbertson makes a determination that
18 there's no significant --

19 (Proceeding interrupted by deputy.)

20 Q. All right. So then we move over to column
21 "AO," and then we have a 1 frequency score. What's that?

22 A. So this is the likelihood that something would
23 fall down and hit somebody. So has a score of 1, which
24 would be negligible -- I cannot speak.

25 Q. All right. And next we move into the
26 environmental risk score; correct?

1 A. Yes.

2 Q. And, again, a score of 1?

3 A. For the impact. And then the concern here is
4 the note says that the structures would go down during
5 rainy and wet storm. And what's not shown here is that
6 the wildfire is not likely, because on the wet ground not
7 likely to have wildfire.

8 Q. Who is making that determination, based on
9 what?

10 A. Once again, the concern about what the project
11 was trying to fix was structures that were impacted
12 during a windy and wet storm.

13 Q. So you only care about your structures going
14 down in windy and wet storms?

15 A. That's not what I would say. Once again, we're
16 talking about the worst reasonable direct impact for this
17 project and then what the scoring is based off of what
18 we're trying to actually fix here. So in this particular
19 case, our structures are designed to withstand certain
20 amount of wind and other sort of situations. We have
21 design standards that we follow. And so I don't know, I
22 wouldn't agree with what you're trying to say.

23 Q. So the worst reasonable direct impact is simply
24 what this project is to mitigate?

25 A. No. That's how we would use to calculate the
26 score for each of these categories.

1 Q. But we can come up with a lot of very bad
2 direct impacts of issues happening to this shoo-fly;
3 correct?

4 A. Well, to clarify, there are other scores that
5 are done from a company-wide perspective. You saw the
6 list, the 10 top list, listed in one of the earlier
7 packets. So there's a different scoring for those. The
8 scoring for this is, this is a very specific project.

9 Q. So I don't understand why we're only looking,
10 that we're saying, "Well, we're only looking at wet,
11 windy events," as opposed to any possible events that
12 would happen on this line?

13 A. So, just to rephrase, the shoo-fly that was put
14 in, even though it was for, it was wood structures
15 instead of steel structures, they were built to what we
16 consider permanent standard, meaning it was intended to
17 last. So the expectation that something would just fall
18 apart is low. So the concern would be a storm situation,
19 sort of an outside influence, that could cause something
20 to happen.

21 Q. I'm going to guess that everything PG&E builds
22 is supposed to be built to withstand conditions and not
23 fall down right away; correct?

24 A. In some situations there may be some what we
25 call "temporary structures" that, for construction
26 purposes, an example, we may build some things in order

1 to help us with the construction. And those are usually
2 not permanent. But in this particular case, for this
3 section of line, the structures that, the wood pole
4 structures that were put in were permanent, or designed
5 to be permanent.

6 Q. You -- generally, just does PG&E generally hang
7 115 kV transmission lines on wood poles?

8 A. We do have 115 on wood poles.

9 Q. So why would you use steel structures for
10 those?

11 A. I don't understand.

12 Q. Well, for instance, the -- you were trying to
13 replace the structures that fell down ultimately with
14 H-frame steel structures; correct?

15 A. That's correct.

16 Q. Why not just leave them on the permanent wood
17 poles?

18 A. Well, that's -- one of the purposes of scoring
19 this project is to understand if we left the wood poles
20 there what would be our risk versus putting in steel?

21 Q. And somehow you guys made a decision that these
22 wood poles were only at risk in rainy and wet conditions?

23 A. Well, as I stated, these were newly installed
24 at the time. So in 2014, these poles are only about a
25 year old. So my understanding is the shoo-fly was
26 installed in January of 2013. So at the time of scoring,

1 this is less -- year and a half maybe. And so the
2 expectation, these are new structures, they shouldn't
3 just be falling down.

4 Q. All right. So let's go on to the next page,
5 and let's go to the frequency score. Reliability

6 Now, under the frequency score and reliability,
7 the frequency score is 6?

8 A. That's what's listed there, yes.

9 Q. And the notes next to it says, "Probably could
10 happen this next season"?

11 A. I don't know what John was thinking about when
12 he came up with this score. I can only tell you --

13 Q. The thing that can probably happen this next
14 season is those poles could fall down; correct?

15 A. He could also be referring to there could be a
16 big storm in the next season as well. I don't know.

17 Q. Right. But he's saying frequency, that this is
18 scoring very high on the frequency under the reliability
19 chart, and specifically, "Probably could happy this next
20 season."

21 A. I can't speak to what John was assuming there.

22 Q. Right.

23 A. It's possible he could have thought that the --

24 Q. Well, let's not talk about what's possible.

25 A. Okay.

26 Q. You're just here as designated PG&E to testify

1 about these records; correct?

2 A. Understood.

3 Q. You said John Culbertson is the subject matter
4 expert on this project?

5 A. Yes.

6 Q. John Culbert was assigned to do the RIBA
7 scoring on this because it's his project?

8 A. Yes. In 2014, yes.

9 Q. All we know is what he put in his records, that
10 these things could probably fall down this next season?

11 A. That's what's written down, yes.

12 Q. Okay. And despite the fact that these poles
13 could probably fall down next season, this project was
14 only given a 180 score?

15 A. Once again, it's based off the overall matrix
16 of -- with the giant grid, based off of what is listed
17 here is the impact, and then the probability that that
18 translates to, I believe, 178.

19 Q. So on the other hand, the relocate project had
20 a total risk score of 581?

21 A. That's what it says.

22 Q. Okay. And would it surprise you that if after
23 2010 -- prior to 2010, everything was canceled on that
24 program other than building a road?

25 A. I'm sorry, can you repeat the question?

26 Q. The only thing this project was to do was to

1 build a road to access the towers?

2 A. Well, remember, the original project was to
3 relocate towers.

4 Q. Right. The original project was to relocate
5 deteriorating towers that were a threat to fall into the
6 Feather River Canyon?

7 A. No, that wasn't the case.

8 Q. Okay.

9 A. The concern was that the structures that they
10 were looking at were difficult to access, meaning you
11 would have to hike there or do other means to get there.
12 So the concern was access to getting to those structures
13 so that we could maintain and operate them.

14 Q. All right. The original, the AA -- we talked
15 about what an AA is; right?

16 A. Not with me.

17 Q. Okay. I'm sorry. The original that was put
18 forward for this project in 2007 by a guy named (WITNESS
19 #5), he applied for funds out of the Deteriorating Assets
20 Fund; correct?

21 A. I don't know.

22 Q. Okay. And the original of this was to replace
23 -- or to relocate ten deteriorating towers?

24 A. I don't believe that's what it said. My
25 understanding was these were existing structures that
26 needed to be relocated so that we can have access to

1 them.

2 Q. Now, let's assume that I'm correct, that by
3 this time the relocate ten towers project was down to
4 simply building an access road to get to some towers.
5 How is that more safety than replacing
6 temporary-permanent towers on a section that's fallen
7 down?

8 A. So I'd have to look at the actual scoring in
9 order to tell you what the thought process behind it is.
10 I can't speak just off the top of my head.

11 Q. Okay.

12 I have nothing further.

13 Do any of you have any questions for this
14 witness?

15 I'm sorry, I forgot. I'm still getting used to
16 having a prosecutor back in with me.

17 (Counsel and Grand Jury Foreperson confer.)

18 Q. (By MR. NOEL) All right. The jurors have a
19 couple of questions for you. I'm going to read them to
20 you.

21 Is doing a risk score for the structures on the
22 Caribou-Palermo line, or any other line, is there a risk
23 matrix weight given to the actual age of the line?

24 A. Just to clarify, so is there a consideration
25 for age?

26 Q. Yes.

1 A. Is that the question? So age would factor
2 potentially into several areas. It could be resulting in
3 larger -- not necessarily larger, primarily be a
4 frequency issue, meaning that an older structure may have
5 more of a likelihood of failure. That's the only where I
6 can think of that would come in, where age would come in.

7 Q. Has PG&E, to your knowledge, ever given weight
8 to the absolute age of the materials involved?

9 A. Not from a RIBA perspective, but it is
10 considered in how we develop our overall strategies for
11 how we want to handle our assets. Meaning that,
12 obviously, you want to target some more older,
13 deteriorated assets, but age is not the only aspect that
14 we take a look at when we consider what we need to
15 replace. There could be some -- like the condition of
16 the material may weigh more than the actual age itself.

17 Q. How do you know the condition of the material?

18 A. The -- so the condition is based off of
19 multiple things. It could be the actual inspections that
20 -- so there's information that comes from the
21 inspections. There are materials' strength tests that
22 can be done. There are other tests that can be done on
23 the equipment as well.

24 Q. And what would cause somebody to do these other
25 tests on, on assets?

26 A. Well, some of them are periodic, essentially

1 part of our inspection and patrol process. So that's
2 where some of the information comes from.

3 Q. So wouldn't something like five towers falling
4 down kick into gear some kind of process to evaluate that
5 asset?

6 A. Well, so the reason that the five towers fell
7 down wasn't the age or condition issue, it was because of
8 the wet and windy storm that happened. Basically, we had
9 -- the ground was wet, we had potential ice on the wires
10 themselves, and with the wind blowing, essentially what
11 happened is one of the legs pulled out of the ground and,
12 as a result, the one tower falling down took out two --
13 five -- I'm sorry -- four others.

14 Q. Are towers supposed to do that?

15 A. They're not supposed to do that. And, once
16 again, it was a wind storm, wet and windy storm event,
17 that caused that, the damage.

18 Q. How was that storm any different from any of
19 the other storms that we have yearly through this Feather
20 River Canyon?

21 A. I definitely cannot speak to that.

22 Q. Was there any root cause analysis for why those
23 towers fell down?

24 A. There may have been, but I wasn't involved in
25 it.

26 Q. Have you ever seen that?

1 A. I'm sorry?

2 Q. Have you ever seen one?

3 A. I have not seen one, but that doesn't mean
4 there wasn't one done.

5 Q. Right. Is there a root cause analysis
6 mentioned at all in the Business Case that we were
7 looking at earlier?

8 A. Business Cases don't typically include any root
9 cause analysis. They're more focused on why we should do
10 the project.

11 MR. NOEL: Anything further?

12 I think that's all we got. Thank you for your
13 patience today for being here.

14 And Madam Foreperson has an admonition for you,
15 then you are free to leave.

16 GRAND JURY FOREPERSON: Ms. Wong, you are
17 admonished not to discuss or disclose at any time outside
18 of this jury room the questions that have been asked of
19 you or your answers until authorized by the Grand Jury or
20 the Court. A violation of these instructions on your
21 part may be the basis for a charge against you of
22 contempt of court. This does not preclude you from
23 discussing your legal rights with your own attorney.

24 Ms. Wong, what I have just said is a warning
25 not to discuss this case with anyone except the Court,
26 your lawyer, or the district attorney. Do you have any

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 109

are certified to be a complete transcription of said stenographic shorthand notes.

13
14 MR. NOEL: Are we ready for our first witness or
15 our only witness today?

16 GRAND JURY FOREPERSON: We are ready.

17 MR. NOEL: Do you want to summons Mr. Salas.

18 [Witness enters the courtroom.]

19 GRAND JURY FOREPERSON: Mr. Salas, would you
20 mind standing to be sworn.

21 Mr. Salas, do you solely swear that the evidence
22 that you shall give in this matter pending before the
23 grand jury shall be the truth, the whole truth, and
24 nothing but the truth so help you God?

25 THE WITNESS: I do.

26 GRAND JURY FOREPERSON: Thank you. Have a seat,

1 please.

2 **EXAMINATION**

3 BY MR. NOEL:

4 Q. Mr. Salas, for the record, can you please state
5 your full name spelling your last name.

6 A. Edward Alfonso Salas, S-a-l-a-s.

7 Q. Mr. Salas, are you currently employed?

8 A. No, Sir.

9 Q. At some point were you employed?

10 A. Yes.

11 Q. What did you do for a living?

12 A. I've done a variety of jobs. For most of my
13 career I worked for telephone companies, first the wire
14 line Pacific Telephone/Pacific Bell. Then the wireless
15 side Airtouch and Airtouch International. I worked
16 overseas. And when they were sold and there was a merger
17 with Vodafone, that became part of what became Verizon
18 Wireless. And so I worked for Verizon Wireless from its
19 inception until 2007.

20 After that I was living in New Jersey. I was
21 hired by PG&E. And I came to PG&E in 2007 and left in
22 2011. Really was without a job for two years and then
23 was hired by my pastor. And I worked for my church for
24 four years in the East Bay of San Francisco Bay Area.

25 Q. What did you do for PG&E?

26 A. Senior vice president of engineering and

1 operations.

2 Q. How did you come to work for PG&E from the
3 telecom industry?

4 A. I was headhunted by PG&E.

5 Q. What does that mean?

6 A. That means there were people that were seeking
7 to reach out to me and convinced me that it was a good
8 place to be and that I could add value to PG&E there.
9 The CEO at the time -- I think that was his title -- Bill
10 Morrow had been somebody I had worked with while in the
11 telecom phase.

12 Q. What skills did you have coming from the telecom
13 industry that would make you valuable to PG&E?

14 A. I had -- well, you have to talk to PG&E in terms
15 of what they wanted. Okay. So I can't -- I can tell you
16 what I've done.

17 I've been responsible for technical
18 organizations managing large engineering organizations.
19 Prior to being at Verizon, I had responsibility for
20 engineering, planning, and strategy standards. And so we
21 supported the nationwide network in terms of engineering
22 standards and people designing the system, procurement of
23 technology, technology management and standards in that
24 work.

25 Q. Why were you told that you would be valuable to
26 PG&E?

1 A. As I recall, they were interested in -- I had a
2 lot of operational background. I had experience with
3 folks that actually made the system work, process level,
4 focus, results. And I was able to manage large groups of
5 people and I had experience in that area. They were
6 looking for somebody with, I guess, more operational
7 experience than they had at the time.

8 Q. What is your educational background?

9 A. I've got a Bachelor's degree in psychology.
10 I've got a number of technical schools with a bell
11 system, technology schools, and then with Airtouch went
12 to engineering school for radio technologies. And the
13 company had sent me to a couple of business programs; one
14 at Harvard and one at Michigan. Business schools.

15 Q. Are you an engineer?

16 A. No, Sir.

17 Q. So when did you arrive at PG&E?

18 A. April 11th of 2007, as I recall.

19 Q. Describe for us what your job at PG&E entailed.

20 A. It was a pretty broad job. I was responsible
21 for engineering and operations for their gas as well as
22 electric systems both transmission and distribution.

23 Q. You should have in front of you Exhibit 679. Do
24 you see the exhibit?

25 A. Yes.

26 Q. Do you recognize what that exhibit is?

1 A. Yes.

2 Q. What is that exhibit?

3 A. It's a high-level organization chart.

4 Q. Organization chart for who?

5 A. For Jack Keenan.

6 Q. Who is Jack Keenan?

7 A. He was the chief operating officer for the
8 utility.

9 Q. The utility being PG&E?

10 A. Correct.

11 Q. Can you kind of walk us through the
12 organizational chart.

13 A. It's really representing the leadership of the
14 electric transmission and distribution organizations. So
15 under Jack Keenan I had responsibility for engineering
16 and operations and Geisha Williams had responsibility for
17 energy delivery. So she would have the -- kind of the
18 people that are -- you would recognize as PG&E in the
19 trucks and the vehicles that are out in the communities.
20 I had the engineers that work on the front end of that
21 process for designing and working the projects.

22 Q. And then in the middle between you and Geisha
23 Williams is somebody named Bill Arndt.

24 A. Bill Arndt was a shared vice president. I think
25 he reported to me directly on paper, but he reported to
26 both of us. The transmission and distribution

1 organizations were hopelessly linked together. So they
2 were both ends of the same stick.

3 And so we would have the front end usually of
4 the design of the system and the work that was being
5 generated and then she would have the execution side, the
6 people that were doing the physical work.

7 Q. All right. When you arrived at PG&E, did you
8 have any experience -- any prior experience or knowledge
9 about an electrical utility?

10 A. No.

11 Q. So what did you do when you started at PG&E?

12 A. I spent a lot of time learning both about the
13 electric transmission and distribution systems as well as
14 the gas transmission and distribution systems as well as
15 storage.

16 Q. How did you learn?

17 A. A variety of ways. So a lot of time in the
18 field with people doing the work. I spent a lot of time
19 reading a lot of material that had been produced in the
20 past, a lot of seminars and reports that had been
21 generated. So it was really consuming. Standards
22 information as well as interior presentations.

23 Really just a deep dive in anything and
24 everything that I could put my hands on relative to the
25 industry, its history, and PG&E's industry and history.

26 Q. So in Engineering and Operations can you give us

1 an idea as to the different areas of focus that you had
2 with PG&E?

3 A. Well, primarily the four areas. Okay. So there
4 was electric transmission focus. There was electric
5 distribution focus, gas transmission focus, gas
6 distribution. There was a regulatory component to all
7 those entities because they were different jurisdictions
8 from a regulatory standpoint that you had to be mindful
9 of and understand.

10 The distribution part of the business was really
11 overseen and managed through the California Public
12 Utilities Commission. The electric transmission was
13 under federal jurisdiction so you had to work with FERC.
14 And gas transmission was also, I believe, legally under
15 federal jurisdiction, but I think they had a proxy
16 through CUPC to have authority.

17 So I've worked in those areas. And there were
18 other areas, but those were the primary ones.

19 Q. Once you started at PG&E and started to do your
20 homework and learn about the company and the business of
21 being a utility, can you tell us your impressions of
22 PG&E.

23 A. I would say the systems were less complicated
24 than a cellular business, but the systems were more
25 consequential. So they were not as complicated but more
26 things would happen if things went wrong. So they

1 were -- you had to be very conscience of the consequences
2 of outages or the system, you know, not working.

3 Q. Once you got your feet wet in PG&E, did you
4 endeavor to make changes to the way business was done in
5 Engineering and Operations? Sorry.

6 A. Yes.

7 Q. Talk to us a little bit about some of the
8 changes that you wanted to make.

9 A. The organization was largely geographic. It was
10 broken up into geographic entities. And so one of the
11 issues that was a challenge for me was -- well, you know,
12 electricity is common throughout the system. The way it
13 was administered and run and designed could be different
14 in the different geographies throughout the service
15 territory. So 70,000 square miles or so. I forget. I
16 haven't worked for them for eight and a half years so I
17 forget a lot in terms of the detail.

18 But it was -- it was built over the years by a
19 lot of merger and acquisitions with smaller companies.
20 And those companies were all designed uniquely,
21 differently. And then when they came together under the
22 large umbrella, it made it hard to implement improvement
23 because work was getting done a little bit different in
24 most places. And so one of the challenges was trying to
25 standardize work process and upgrade systems.

26 Q. What about the culture of the company?

1 A. It was -- it was a culture that was a challenge
2 for me to work in and through.

3 Q. Okay. We'll talk about that again in a minute.

4 Now, you were with PG&E for almost exactly four
5 years; correct?

6 A. Correct.

7 Q. And would it be safe to say it was a busy time?

8 A. That would be an understatement, yeah.

9 Q. I want to go out to the next Exhibit 680. And
10 you recognize 680?

11 A. Yes, I do.

12 Q. And what is 680?

13 A. It was part of a document that I had sent to the
14 chief executive of the business when I was in the process
15 of leaving PG&E to remind him and the president of the
16 utility at the time of the challenges that I had faced
17 when I came to PG&E in the course of time in my four
18 years.

19 Q. So I'm going to walk through some of these
20 challenges. The first one says "Angry employees at 2007
21 Annual Shareholders Meeting."

22 Can you explain that situation to us.

23 A. So I arrived in April of 2007. In May of 2007
24 there was the annual shareholders meeting. As I recall,
25 it was conducted in San Ramon, California. And it was a
26 standard annual shareholders meeting.

1 Part of that meeting allows shareholders to get
2 in line and address the speaker, typically the chairman
3 of the company. And we had a number of employees that
4 were standing in line wanting to communicate about
5 concerns they had with the business.

6 Q. Why did that present a challenge?

7 A. It was a little bit shocking to see employees
8 that frustrated talking about what they saw as being a
9 situation that was wrong in the North Bay of San
10 Francisco.

11 Q. Was an investigation initiated into the
12 allegations made by the employees?

13 A. Yes.

14 Q. And did you take part in that investigation?

15 A. I did not have overall responsibility, but I had
16 people involved in the investigation. So I was involved.

17 Q. So what was found with regard to the employees'
18 complaints in 2007?

19 A. It confirmed a number of their complaints.
20 Records had been falsified in the North Bay as related to
21 gas survey information. And so we had clearly to take
22 action to sort out root cause and what was going to be
23 needed for corrective action in the North Bay.

24 Q. Now, gas survey. Is that related to the
25 inspection and maintenance of the gas lines in the North
26 Bay?

1 A. It's -- as I recall -- so I could be wrong. If
2 I get this wrong, forgive me. I think the requirement
3 was -- I don't know what it is today. But eight years
4 ago we had to survey all of our gas lines transmission
5 and distribution. Basically once every five years you
6 would do the entire system. So you would do 20 percent
7 of your system every year.

8 And you would have people out basically
9 physically inspecting, sniffing the lines using equipment
10 that would allow them to detect any gas that was escaping
11 inappropriately, and then identify that and get crews to
12 make repairs as necessary. And that was the process that
13 had been a problem in the North Bay.

14 Q. And you found evidence that records of those
15 inspections or those surveys were being falsified?

16 A. Yes, Sir.

17 Q. All right. Let's move down to the "Gas Matters
18 findings system wide - leak survey consistency." Explain
19 to us what that is.

20 A. So when we became aware that we had a problem --
21 and just to mention this, apparently this had been -- I
22 learned that this had been the third time employees had
23 come to an annual shareholders meeting to make that
24 report.

25 And so when it was finally investigated and
26 determined that there were issues in the North Bay that

1 were valid, we felt we had to look at the rest of the
2 system to make sure that we didn't have a similar set of
3 problems going on elsewhere.

4 What we found were -- we did not find, as I
5 recall, the same kind of falsification of documents, but
6 we found that the way people were doing their job and the
7 way the work was getting done was a little bit different
8 in different places. So the results were not necessarily
9 consistent or comparable. And we felt that was
10 unacceptable.

11 And so we -- with the work and permission and
12 authority given to us by the board ultimately, we went to
13 endeavor to resurvey the entire system in a very, very
14 aggressive and accelerated way.

15 Q. That ties in down below "The Accelerated Leak
16 Survey"?

17 A. Correct.

18 Q. And what was the Accelerated Leak Survey?

19 A. It was -- we took a five-year process and we
20 compressed it into, I want to say, two years and a
21 quarter or something like that. And we basically had to
22 resurvey the entire system. But before we could do that,
23 we had to standardize the process, the tools, how we
24 calibrate equipment, how we track.

25 We had to kind of re-engineer the entire process
26 to make it standard and then we had to run everybody

1 through training and qualify them on that new process and
2 new set of tools. And then we had to go about the
3 business of actually doing the resurvey.

4 And when you do a resurvey, you're looking for
5 leaks. So that means as you find leaks, you have to
6 repair them. And so we had a phenomenal amount of
7 construction work going along with that resurvey.

8 Q. Going along with that, not on this list, were
9 you familiar with the -- and I don't know if there was a
10 name for it but the low-risk leak issue that the Gas
11 Transmission Division had in 2007/2008?

12 A. I don't ever recall that.

13 Q. Okay. Now, you mentioned that the shareholders
14 meetings and that this was the third time that the
15 employees had come to address these issues.

16 A. That was my understanding.

17 Q. Are there shareholders annual?

18 A. Yes.

19 Q. So it would have been three years in a row?

20 A. That's what I had been led to believe.

21 Q. Okay. So other issues. Multiple DC system
22 failures in San Francisco?

23 A. Yes.

24 Q. What is DC?

25 A. Direct current.

26 So the majority of the systems in AC alternate

1 current. So it's a form of electricity and the way the
2 electrons flow. The DC systems which existed in downtown
3 San Francisco and in downtown Oakland were kind of custom
4 systems built, as I recall. And again, I'm fuzzy. But I
5 think it energized mostly elevator systems throughout the
6 core of these downtown areas. So elevators worked on DC
7 voltages. And so these systems were designed in order to
8 support that.

9 They were very, very old systems as you might
10 imagine.

11 Q. The systems or the elevators?

12 A. Both. We had antique elevators everywhere. And
13 they would only work on DC service. And so you needed to
14 have the system to support that.

15 Q. And then you add another problem in San
16 Francisco due to explosions. Can you tell us about that.

17 A. Which explosions?

18 Q. There were more than one?

19 A. Yes.

20 Q. Well, the transformers.

21 A. The network transformers?

22 Q. Yes, Sir.

23 A. So in large urban environments utilities
24 frequently design systems that are a little bit more
25 robust than in outlying areas, suburban or rural areas.
26 And they design systems in a ring so that the service

1 that is supplied, the electrical service, if there's an
2 interruption on any single leg of that ring, it continues
3 to flow in the opposite direction. So you have service
4 that's pretty reliable. And that's a network -- it's a
5 network system. Okay?

6 And so there was a network system in largely the
7 Financial District, as I recall, in San Francisco. I
8 think we had a small network in Oakland. I don't believe
9 there were any others.

10 And when I arrived on the scene -- I think it
11 was in July. Yeah, I think it was in July -- we were
12 having a number these transformers let go. So we were
13 having explosions, failures, massive catastrophic
14 failures of some of those transformers.

15 Q. And you were involved in the lead investigation
16 into why that was occurring?

17 A. Yes.

18 Q. And you noted in Exhibit 680 that there were
19 maintenance and engineering breakdowns as well as record
20 issues; correct?

21 A. Correct.

22 Q. Can you explain those a little bit to us.

23 A. As I recall, we had quite a time, I think,
24 getting to the root cause on these failures, these
25 outages. And, you know, I was, I think, pushing the
26 group in a way they hadn't been before. I did not want a

1 superficial proximate cause of these outages. I wanted
2 to understand kind of the physics underneath this and
3 understand really what was driving the failures.

4 What we found in, I think, the July explosion is
5 that we had had people trying to maintain the system that
6 didn't know quite what they were doing. And as I recall,
7 we actually had, I think, an employee that was removing
8 oil from the transformer which is kind of the opposite of
9 what you'd want to do to keep a transformer functioning.

10 And it just -- and it came down from, I think, a
11 variety of breakdowns in terms of management not
12 understanding its role, engineers not being connected
13 enough to how the system needed to be designed and
14 maintained and tested. You know, the rigger round. I'm
15 remembering. The digital gas analysis.

16 So we test the oils in transformers for the
17 presence of substances that would indicate that that
18 system is starting to fail, break down. And so you can
19 take action on a transformer before it fails
20 catastrophically if you see the chemistry of its oil.

21 And so we were discovering that we had a number
22 of issues with these old systems that required a lot more
23 maintenance than a new system might. And there was
24 breakdowns in the way we administered and managed,
25 trained, and tracked the activity.

26 Q. Were there issues with inspection and

1 maintenance policies being correctly followed?

2 A. Yes.

3 Q. And with the gas -- the problems in the North
4 Bay, did you have the same -- find the same problems?

5 A. I think generically yes. Details would be
6 different.

7 Q. Right. But problems with inspection and
8 maintenance policies being followed?

9 A. Yes.

10 Q. And that was on the gas transmission side?

11 A. As I recall, the sense that I had was the gas
12 transmission was actually more under control than the
13 situation on the distribution side.

14 Q. And going down you have "gas matters findings
15 system wide, leak survey consistency, emergency valves
16 and regulator station records, maintenance processes,
17 cathodic protection records and processes."

18 Is that part of the same problem emanating out
19 of the North Bay or is that separate problems?

20 A. The North Bay. They had issues detected with
21 cathodic protection. So, yeah, I think that was part of
22 the North Bay. Also I think emergency valves and
23 regulator too as I recall.

24 Q. And then Diablo Canyon electric yard events.
25 What was that about?

26 A. There were a couple of outages in the high

1 voltage electric yard in Diablo Canyon successive
2 summers, I think, as I reference here eight and nine.

3 Q. Were there also issues with inspection and
4 maintenance policies in that investigation?

5 A. I don't remember the details of Diablo Canyon.
6 I know we had issues with documentation. There were --
7 there was a struggle getting correct engineering record
8 information for the electric yard. We struggled with
9 locating employees that retired because they weren't the
10 ones that were the best -- had the best information and
11 knowledge of the system. So we didn't have good solid
12 records. And that was frustrating.

13 Q. So after you found the problems with the North
14 Bay, you said you extended that investigation out to the
15 entire gas transmission system; correct?

16 A. No.

17 Q. Oh, did I misunderstand that? You didn't --

18 A. Distribution and transmission.

19 Q. Okay.

20 A. Mostly distribution.

21 Q. Okay. I was going to follow that up with
22 distribution, but we'll keep them together.

23 So that included records reviews, inspection and
24 maintenance policies throughout the gas transmission and
25 gas distribution?

26 A. Correct.

1 Q. Now, the issues in San Francisco with the
2 exploding transformers and the DC current, those were all
3 electrical distribution; correct?

4 A. Correct.

5 Q. As a result of those investigations, did you
6 extend any of those investigations out to the rest of the
7 electrical distribution network?

8 A. We looked at -- I think we had a small DC system
9 in Oakland. Like I said, we also looked at our network
10 trans -- electric network transformers that were in
11 Oakland. And we made the same -- we made changes to
12 process and to inspection requirements and training. We
13 included Oakland in that.

14 Q. Okay. But based upon the issues you found with
15 recordkeeping and inspections and maintenance in San
16 Francisco, did you extend that part of the investigation
17 out to the rest of the electrical distribution network?

18 A. No. As related to this, no.

19 Q. And at any time you found problems with
20 inspection, maintenance, and recordkeeping, gas
21 transmission and distribution, and you found problems
22 with inspection, maintenance, and recordkeeping and
23 electrical distribution, at any time did you take a look
24 at electrical transmissions to determine if there was the
25 same problems occurring in that division?

26 A. I don't remember uniquely addressing the

1 electric transmission records aside from the records that
2 were associated with new reliability requirements coming
3 from the federal government, the NERC. And associated
4 with a whole set of new reliability requirements coming
5 from the NERC we had to inventory a number of devices
6 throughout our system on the -- on the transmission side.
7 And we found issues as it related to records. So we had
8 to physically kind of review and inventory every
9 substation, every transmission substation in the system
10 in order to update records to be accurate so that we
11 could do the right upgrades the regulations require.

12 Q. So I guess where I'm going is you knew that in
13 the North Bay on the gas transmission and especially the
14 distribution side that those records -- those survey
15 records were being falsified; that the inspections were
16 not being done or weren't being done the way they were
17 supposed to be done; correct?

18 A. Correct.

19 Q. Did anybody go out to see if you had the same
20 issues and look at the actual inspection records in the
21 electrical transmission side?

22 A. No. But just to be clear, to explain the gas
23 issues in the North Bay weren't everybody, but there was
24 a couple isolated people. They're supervisors. So it
25 was confined to a smaller group.

26 The bigger problem was that work was getting

1 done differently at different places and it wasn't
2 standard. And that was -- that was the huge concern. So
3 we had to fix the misconduct. Okay. But that was pretty
4 focused. The bigger issue was broader than that.

5 Q. Okay. Let's move on. Was Enterprise Risk
6 Management a part of your job with PG&E?

7 A. Yes.

8 Q. What is Enterprise Risk Management?

9 A. Enterprise Risk Management, as I understand it,
10 was -- was a pretty standard program amongst large
11 corporations throughout the United States that sought to
12 manage, to the extent they could, the huge, enormous
13 risks that they would identify that were relevant to
14 their business.

15 So there would be a process where they -- each
16 business would assess itself, look for the big risks that
17 could impact the business financially, reputationally,
18 and then find a way to help mitigate some of those risks.

19 So the Enterprise Risk Management cut across all
20 parts of the business. It wasn't just about transmission
21 and distribution. It could be generation. It could be
22 customer service. It could be financial management. It
23 could be all the aspects of the business.

24 Q. Prior to coming to PG&E, did you have any
25 experience with risk management?

26 A. I typically was represented to the risk group

1 within Verizon as we assessed the system risks in kind of
2 a similar fashion, but it was really obviously for a
3 large cellular business.

4 Q. I'm going to assume that the risks of a public
5 utility, electrical or gas transmission and distribution
6 utility, would be somewhat different than those in the
7 telecom industry?

8 A. Technically, yes.

9 Q. How did you go about educating yourself about
10 the specific risks inherit to the public utility
11 business?

12 A. Well, I'm going to answer that in two ways.
13 Nearly everything a utility does involves risk. Okay.
14 So everything I did to learn about the business in
15 everyday. Both the gas side of the business as well as
16 the electric, transmission, and distribution all involved
17 management of risk. So that was just the day-to-day
18 business.

19 The Enterprise Risk Management was kind of a
20 process that was looking at the business from, you know,
21 100,000 feet, from a very high level, and sorting out
22 risks in that area. So that was the different discipline
23 and therein was a different staff and group working for
24 the chief risk officer in the business.

25 And so they spent a fair time educating me, as I
26 recall, on the -- on their program. And there were

1 existing risk documents that I reviewed and got briefed
2 on.

3 Q. Do you know who the chief risk officer was when
4 you started?

5 A. I believe it was Ken Harvey.

6 Q. How -- when you first started, how did PG&E
7 manage risk?

8 A. You'd have to be more specific.

9 Q. I was afraid you'd say that.

10 What was the -- I guess trying to keep it
11 general, the culture at PG&E when it came to managing and
12 dealing with risks?

13 A. I can't speak for the entire business. I was
14 only exposed really to transmission and distribution.

15 Q. Well, what you did then?

16 A. I think there was -- I think it was a huge
17 sensitivity to safety programs and, you know, how work
18 got done, you know, in terms of risk to the community.
19 So there was, I think, a lot of sensitivity and culture
20 of consciousness for it.

21 I would just say that I don't think everybody
22 was on the same page as related to how they would address
23 risks and manage processes and systems and the like.

24 Q. And just to make some things clear, when we're
25 talking about -- when I'm asking questions about PG&E,
26 we're always going to be talking about your personal

1 experience at PG&E, the businesses you worked at, or the
2 areas in the business you worked at while you were there.
3 And if we're going to divert from that, I will try and
4 make it perfectly clear.

5 Now, are there different ways that risk is
6 addressed?

7 A. I would say yes.

8 Q. Are you familiar with the term "relative risk"?

9 A. Yes.

10 Q. What is relative risk?

11 A. It was a term that was used, as I recall,
12 largely in the gas distribution world. As we were moving
13 towards a new mandated distribution integrity management
14 plan that was taking us from a world of relative risk
15 assessment, that's where you would assess risk of your
16 assets by comparing one asset to the other.

17 So you would look at a set of assets and you
18 would kind of work the worst ones relative to the -- you
19 know, the others. And so it was kind of a less
20 scientific assessment of risk than other methodologies,
21 but it was what was used.

22 People kind of assessed based on inspection of
23 the condition of an asset and then you would record that.
24 And you'd make decisions about what needed to be
25 addressed first, second, and third.

26 Q. Do you have personal issues with relative risk?

1 A. Well, yeah.

2 Q. Why's that?

3 A. I was used to working with data in everything I
4 did historically. And the data would be gathered in a
5 more scientific fashion than kind of a relative risk. A
6 relative risk kind of depended on the engineer, an
7 employee, or a craft person that was doing the
8 assessment.

9 So I didn't feel comfortable in making decisions
10 based on people's kind of non-database assessment. I
11 would have preferred a little more kind of science as it
12 relates to assessing asset condition.

13 Q. Would it be fair to say that the relative risk
14 assessment includes a lot of subjectivity?

15 A. I would say so, but I would say the industry
16 didn't have a lot of methodology to do the kind of risk
17 assessment that I was used to. Not in this industry, not
18 in the utility space.

19 Q. Are you familiar with the term "probabilistic
20 risk"?

21 A. Yes.

22 Q. What's probabilistic risk?

23 A. It is risk that is derived from looking at a
24 whole lot of data, different attributes of a given asset.
25 So you would measure different pieces of it, different
26 elements of it, and you would assemble different ratings

1 to the value or the impact of those different attributes.
2 And you'd have some sort of computational model that
3 would spit out an overall global kind of assessment as to
4 what the risk was relative to that given asset.

5 Q. So it would be fair to say that probabilistic
6 risk assessment is an objective risk assessment?

7 A. I don't think it's perfect, but it's far more
8 rigorous than I think the relative assessment method
9 would be. But it's only as good as the methods you put
10 in place to get the data.

11 Q. Garbage in, garbage out still applies; right?

12 A. True.

13 Q. When you arrived at PG&E in 2007 in the
14 Enterprise Risk Management area, was PG&E applying more
15 of a relative risk assessment or an objective risk
16 assessment in the areas you worked?

17 A. As it relates to the Enterprise risks?

18 Q. Yes.

19 A. I don't think they characterized how they got
20 their data or risk data. I would say it was more
21 realistic in nature. There wasn't -- if there was data,
22 we would introduce it. But I think when the corporation
23 would vote on their most prominent risks, it was -- it
24 was not based on a ton of data, as I recall.

25 Q. It sounds like you prefer personally
26 probabilistic risk?

1 A. In a perfect world, yeah. But again,
2 probabilistic methods are worthless if you don't have a
3 really good way of gathering data that is reliable that
4 you have confidence in.

5 Q. So after you started with PG&E, did you try to
6 make changes with regard to risk assessment?

7 A. I'm not sure I'd characterize it that way. I
8 tried to make a difference in terms of process trigger.
9 I tried to make a difference in terms of how we measured
10 things with data for tracking performance and results. I
11 tried to make a difference in how we held people
12 accountable. So it was, I think, a broader set of things
13 that I tried to make a difference in.

14 Q. Okay. Let's move on to Exhibit 681. You should
15 have that in front of you.

16 Do you recognize 681?

17 A. Yes.

18 Q. What is 681?

19 A. I made notes to myself when I had -- toward the
20 time following the San Bruno transmission pipeline
21 explosion. It was a tough time in the business, as you
22 might imagine, with that tragedy. And I would just say
23 that at some point, you know, in kind of the aftermath of
24 that disaster there was internally to the business a lot
25 of recrimination and kind of subtle finger pointing. And
26 some of it not so subtle.

1 And I kind of got the sense -- at some point my
2 Spidey senses sensed that they were looking to perhaps
3 blame somebody. Because everybody wants to blame
4 somebody in a disaster. Okay. And this, you know, San
5 Bruno disaster happened on my watch. I was there. I had
6 global responsibility for the transmission system and
7 gas.

8 And so I started to sense that maybe they were
9 looking to blame me internally and perhaps fire me for
10 cause, which I felt was unjust and without basis. In
11 fact, I created this list just to remind myself because,
12 you know, days were, you know, 18 hour days seven days a
13 week. It was -- there was a lot going on. And I just
14 wanted to make a note to remember kind of the set of
15 challenges that I faced when I walked in the door.

16 So this list represents kind of some of the
17 challenges, the most prominent challenges I experienced
18 when I first walked in the door in 2007.

19 Q. Okay. Now --

20 A. That's why it says "Historic" at the top.

21 Q. Yep. And we've got a blown-up copy of this.
22 And this is, of course, copies of copies of copies of
23 copies by now.

24 So you and I met several weeks ago and went over
25 this list; correct?

26 A. Correct.

1 Q. And I asked you on each one to read it to me so
2 we'd get it right; correct?

3 A. I recall you reading some and asking me about
4 what it meant.

5 Q. Okay. So we took your list and put it into --
6 typed it out so we can read it. So I want to ask you
7 about a few of these things.

8 Now, the two columns "Issues" and "Impact," can
9 you explain those things to us.

10 A. I just wanted to characterize the business
11 challenges that I had walked into in 2007 in my opinion.
12 It's my opinion only so I don't know how many people
13 would vote or agree with what I characterized. And then
14 I outlined the challenge, the "So what" of those
15 challenges. So this was a challenge. What was the
16 impact in my estimation? So this is my view.

17 Q. Okay. So the first one "Decentralized
18 operations across service territory," why is that an
19 issue?

20 A. When you want to have standardization and you
21 want to have a consistent look and feel of the
22 performance of a business, if you're doing business in
23 different ways and different places even the same
24 activity, you can't guarantee the same outcome and you
25 can't compare results really well between one turf and
26 another turf. They're kind of doing work a little bit

1 differently. It's harder to make improvements. It's
2 harder to make corrections that are standard across the
3 whole service territory. So that was for me a challenge.

4 Now, I understand the history of the business
5 had been, you know, local John decides where the road
6 ended and everybody thought he did it right.

7 Q. Explain to us what you mean by "Siloed view of
8 operations" and why that was an issue.

9 A. This utility -- and I don't think it was just
10 PG&E. It was, I think, a number of utilities that I
11 looked at. Their businesses were set up in separate
12 units. So you had, you know, a group of distribution
13 engineers working in kind of their own world or
14 transmission engineers working in a different world. And
15 the same on the gas side. And so there was wasn't a lot
16 of -- and then you had the field entities. You know, the
17 linemen, troublemen organizations.

18 So everybody had kind of their own groups that
19 they operated in, and there wasn't a lot of cross-dialog
20 between these different groups. And sometimes that could
21 be a problem. That's why I had increased complexity.

22 Q. "Standards based rules versus process based."
23 Can you explain that to us and why it's an issue.

24 A. There were a lot of standards. The way the
25 business had defined the operation was really -- in terms
26 of requirements was in terms of outcomes. So the

1 standard defined kind of the rock bottom of what was to
2 occur with the given activity. There was less
3 standardization of how the work got done.

4 So when you knew what needed to be done and you
5 would characterize, you know, the right -- you know, the
6 complete job, but that's just -- for me it was
7 incomplete. I wanted to have process standardization as
8 well as just the outcome. I didn't want to just know
9 what the right result was. I wanted to know how you got
10 those results, and I wanted that to be standardized.

11 Q. What do you mean by "culture of no bad news."

12 A. Within my organization there was a fair amount
13 of fear. You know. And I'm not here to tell you why it
14 was there because I don't know. I just know what I faced
15 when I showed up.

16 So my engineers were not inclined to deliver bad
17 news for fear of getting slapped hard. So people tended
18 to just not report bad stuff, things that were wrong or
19 where they were at fault; human work errors. Fessing up
20 to making a mistake was not something that happened
21 easily readily because they were typically punished in
22 the past when they did that.

23 Q. "Budget versus work based success criteria."

24 Can you explain that to us and why it's an issue.

25 A. There was tremendous focus on budget performance
26 so nobody operated with a blank check. There were

1 budgets for different parts of the business. Everybody
2 had a budget for the work they had to do. But when I
3 showed up, success was more about conforming to the
4 budget than ensuring completion of all the work that
5 needed to be done.

6 So that was problematic for me. Because while I
7 was interested in the budget, I was more interested in
8 making sure that the programs that needed to be completed
9 were completed. So as I was interested in the work as
10 well as the budget, then if there were overruns that I
11 could understand, you know, it wasn't a productivity
12 issue. It wasn't a bad engineering issue. You know,
13 who? Kind? Where? Where is the problem? Solve the
14 root cause stuff.

15 Q. All right. Let's skip down a little bit. "Form
16 over substance - ERM." What does that mean?

17 A. I was -- the -- the Enterprise Risk Management
18 model was a high-level executive look at risk in the
19 business. And a lot of work and a lot of staff time got
20 poured into, you know, generating reports and doing
21 analysis. And I wasn't -- I wasn't sure that it was
22 yielding a lot of real results from where I stood in my
23 organization.

24 So we were pouring, you know, hundreds of hours
25 of people time into doing all kinds of the bureaucratic
26 stuff associated with, you know, generating reports and

1 analysis and so on and so forth. And I just wasn't sure
2 that it was -- it was the best use of my people's time.
3 I understood that we had to do it. It was a requirement.
4 So I tried to make it more relevant and useful over my
5 time there.

6 Q. And under "Impact" on that you have written
7 "False security." Could you explain that to us.

8 A. My sense of things was -- as we looked at
9 reports that assessed condition of assets, condition of
10 our work processes, they were largely more favorable
11 than, you know, the reality of the situation.

12 So I think if you saw -- again, if you had a
13 culture that either didn't value a lot of bad news, you
14 didn't want to kind of reveal how ugly your baby was. So
15 you would get a false sense of security at least in my
16 organization at T&D, you know, if you weren't willing to
17 expose some of the warts of the organization so that you
18 could address what needed to be fixed.

19 Q. The next one down is "Non operational view of
20 utility." And the impacts of that is
21 "Regulatory/financial/political." Could you explain that
22 to us.

23 A. My sense was that -- again, my impression at the
24 time 2007 was that there was a lot more focus on
25 regulatory filings, legal arena as it related to the
26 business and a financial performance and not enough of

1 the business -- the whole business understanding and
2 appreciating, you know, the pipes and wires side of the
3 operation.

4 And so -- and I think that that was due in large
5 part to the siloed characteristic of the business. The
6 T&D executives didn't share a lot of what really
7 happened, you know, in the business. So you know,
8 ignorance is kind of bliss.

9 Q. "Leadership syndicates risk." What does that
10 mean?

11 A. Again, my impression of the way we made
12 decisions as a leadership group was more of a consensus
13 as opposed to a lot of debate.

14 I had come from a different culture in Verizon.
15 It was a New Jersey based company. And where I lived and
16 worked and the culture on the east coast is much more
17 confrontational and aggressive. And so it was just a
18 different culture that -- the culture on the west coast
19 of PG&E was more "We need to get along." And, you know,
20 it was just less confrontation.

21 I'm not saying confrontation is necessarily
22 good. It's not healthy in the way it's done, but there
23 wasn't enough of blunt talk, you know, to make sure that
24 we were getting after the right stuff.

25 Q. You put down the impact of leadership
26 syndicating risk as "accountability gaps." Will you

1 explain that for us.

2 A. It just comes from if everybody owns a decision,
3 then nobody owns it is kind of my philosophy.

4 Q. So nobody is at fault?

5 A. Yeah. Nobody is fully accountable.

6 Q. Now --

7 A. Again, in 2007 that was my impression.

8 Q. Right. So overall did we do a pretty good job
9 of interpreting your handwriting on the typed-out chart
10 that we have up on the big board?

11 A. I think you did.

12 Q. I think there was one question. "Latent issues"
13 under "Budget versus work based success criteria." We
14 couldn't figure out what you wrote.

15 A. I'm sorry. Say that again. Which one?

16 Q. "Budget versus work based success criteria."
17 And the impact says "Latent issues."

18 A. I've got a fuzzy copy here. "Latent issues
19 masked."

20 Q. Masked. Okay. Great.

21 MR. NOEL: Let's see. We have been going for a
22 little over an hour. Do you want to take a break here, a
23 natural break here of 15 minutes? And then hopefully,
24 we'll be able to get through the rest fairly quickly.

25 GRAND JURY FOREPERSON: Yes.

26 MR. NOEL: Give him the admonishment.

1 GRAND JURY FOREPERSON: Okay. Mr. Salas, you
2 are admonished not to discuss or disclose at any time
3 outside of this jury room the questions that have been
4 asked of you or your answers until authorized by this
5 grand jury or the Court. A violation of these
6 instructions on your part may be the basis for a charge
7 against you of contempt of court. This does not preclude
8 you from discussing your legal rights with your own
9 attorney.

10 Mr. Salas, what I have just said is a warning
11 not to discuss this case with anyone except the Court,
12 your lawyer, or the district attorney.

13 Do you have any questions?

14 THE WITNESS: No.

15 GRAND JURY FOREPERSON: Thank you.

16 MR. NOEL: All right. Let's take a break real
17 quick.

18 [Recess taken from
19 2:58 until 3:16 p.m.]

20 MR. NOEL: Ready to go back?

21 GRAND JURY FOREPERSON: All members of the grand
22 jury are present and ready to proceed.

23 **EXAMINATION CONTINUED**

24 BY MR. NOEL:

25 Q. All right. Mr. Salas, in front of you you
26 should have Exhibit Number 682.

1 A. Yes.

2 Q. Do you recognize 682?

3 A. I mean, I see the document. I don't necessarily
4 remember anything about it.

5 Q. Okay. Take a second to look it over.

6 Do you recognize the document?

7 A. Yes, but I'm not going to say that I understand
8 all of the components of it. But, yeah, I have seen the
9 document.

10 Q. All right. First up, this document is entitled
11 "Risk Management in ED and E&O."

12 A. "Energy Delivery and Engineering & Operations."

13 Q. So Engineering & Operations would be your
14 division?

15 A. Correct.

16 Q. And ED would be the -- would have been Geisha
17 Williams?

18 A. Not at that time.

19 Q. That was going to be my next question. This is
20 dated May 1st, 2007; is that correct?

21 A. Correct.

22 Q. And when did Geisha Williams come in and take
23 over ED?

24 A. As I recall, it was toward the end of the year.
25 So I'm thinking it was in the December timeframe of 2007.
26 I could be wrong.

1 Q. So a couple things I wanted to point out here.
2 Going down to "Enterprise Problem," the second section.
3 And it says "The first problem is that PG&E lacks a well
4 defined, documented risk policy/standard at the
5 enterprise level that explains PG&E's overall risk
6 assessment methodology, defines the lines of business
7 roles and responsibilities, specifies the requirements
8 for performing and documenting risk, links risk
9 assessments to controls, self assessment reviews, and
10 audits, specifies the requirements for metrics to track
11 the risks."

12 Do you agree that that was a problem when you
13 started in 2007?

14 A. Generally, yes.

15 Q. And going down to section impact of problem on
16 ED and E&O and the potential impacts. "The risk
17 assessment methodologies for determining what work is
18 funded and is not funded and is different than the risk
19 assessment methodology used by ED and E&O to determine
20 high-risk work processes."

21 A. I don't remember who produced this document so I
22 can't really speak to what is behind the words. But,
23 yeah, I think there was an issue that I had that reflects
24 pretty much what that's saying although I'm not sure it's
25 identical.

26 The Enterprise Risk Management were very high

1 level. And when you identified risk in that process,
2 that process from a corporate wasn't linked to budgeting.
3 So if you identified risk or work, there wasn't unique
4 ways of getting new activity funded through that process.

5 Q. And the next statement in there "The difference
6 in methodologies and the lack of a link to the risk
7 assessment effort may lead to important items not
8 receiving the required funding."

9 Do you agree with that statement?

10 A. I think it's possible, but I think that may have
11 been the case in May of 2007. We tried to over time link
12 more real activities to what was going on in support of
13 any given enterprise risk. So we tried to bring that
14 together so not to identify mitigating work that was
15 disconnected from the enterprise risks.

16 Q. Now, there's some handwritten notes on this
17 document specifically on page 2. Is that your
18 handwriting?

19 A. Yes.

20 Q. And that goes on and starting on page 3 are
21 "Inherent Risk Ranking Results." And again, there's some
22 handwritten notes on the document.

23 Do you recognize those notes?

24 A. That's my writing.

25 Q. Okay.

26 A. I'm not sure I can tell you what it meant.

1 Q. Okay. Can you explain the risk ranking results
2 that are showed out in these charts on pages 3, 4, 5,
3 and 6.

4 A. No, I can't explain it because I don't actually
5 remember the different criteria for the different ratings
6 and rankings. Again, this was a long time ago. Probably
7 wasn't -- since this was delivered in May of 2007 and I
8 showed up in April of 2007, I wasn't involved in the
9 creation of the document. It was a staff exercise. So I
10 think at that time I was just more trying to understand
11 what was being presented than -- than necessarily
12 agreeing with it.

13 Q. Okay.

14 A. So anyway, this obviously distinguished between
15 inherent risks, whatever that meant, and residual risk
16 items. And again, I'm not sure. They were trying to
17 assess all processes within the transmission and
18 distribution organizations.

19 Q. So just from a basic standpoint on the left side
20 of the document written is "high and low" and then in
21 between them an arrow pointing up.

22 A. Right. So there was a continual risk going from
23 low to high on that -- on that access.

24 Q. Okay.

25 A. Okay.

26 Q. And then we have the same thing on the bottom of

1 the document moving left to right "low and high" with an
2 arrow pointing to the right.

3 A. So that again is another continuum on the
4 likelihood access here of these -- of assessing risk
5 looking at all these work processes.

6 Q. So what is the difference between likelihood and
7 significance?

8 A. Again, I didn't design this, and I'm not sure.
9 I'm giving you my opinion today. Okay. 2019.

10 Q. Yep.

11 A. I think the English here just means you're
12 looking at these processes and again ranking the
13 likelihood of risk in these various categories increasing
14 from left to right and then you're looking at the
15 significance of those risks from bottom to top.

16 So if you're looking at ranking, I would assume
17 that those processes in the upper right-hand corner would
18 be the most significant processes you've got with the
19 highest likelihood occurring of having risk.

20 Q. So applying relative risk assessment you'd say
21 that those in Box 9 would be the highest?

22 A. In theory those would probably be the most
23 impactful sets of processes. If you were going to focus
24 on making improvements, you might want to focus on that
25 set first --

26 Q. Okay.

1 A. -- if you agree with what was done.

2 So I don't know who made these assessments and
3 what basis they made these assessments on. Okay. So I
4 can't tell you that is right. I can just tell you that
5 is how I read the document.

6 Q. Right. Do you know what the numbers in the
7 parentheses behind each process means?

8 A. No. I don't remember.

9 Q. All right. All right. Let's move on and go to
10 683. Do you recognize 683?

11 A. Generically, yes.

12 Q. What is 683?

13 A. Status reports for Enterprise Risk Management.
14 Quarterly there would have to be a status report that
15 would be delivered to the risk management organization.
16 And as I recall, there was a steering committee of
17 executives that would also get an update, not necessarily
18 all the details, but they'd get a summary update of where
19 you were as it related to that particular risk and all
20 the stuff you might be doing to mitigate the risk.

21 Q. Okay. Now, on the caption it lists "Risk owner,
22 supporting officers, and risk manager." Do you see that?

23 A. Yes.

24 Q. And your list is supporting officer; correct?

25 A. Yes.

26 Q. What does it mean to be a supporting officer?

1 A. It means you are not fully -- you're not in
2 control of the administration of that risk, but you are
3 supporting the officer that is responsible. So you are
4 kind of the co-owner somewhat but not fully responsible
5 for the -- for the end product necessarily.

6 So in this case the risk owner was Jeff Butler
7 who was the executive that had energy delivery. Again, I
8 just had shown up, you know, in that second quarter of
9 2007. So I was brand new and so having engineering and
10 operations I was shown as a supporting officer.

11 Q. Okay. So was Jeff Butler the predecessor to
12 Geisha Williams?

13 A. Yes.

14 Q. And what does it mean to be a risk owner?

15 A. It just means you have responsibility for that
16 particular risk, that enterprise risk as it pertains to
17 ensuring that assessments are taking place, that
18 mitigating actions or component activities are being
19 identified and they are being tracked, and that you're
20 making progress on doing the things that we declared
21 needed to be done to help mitigate the risks.

22 Q. And finally, there's a risk manager listed.
23 What is a risk manager?

24 A. It's the person that is really kind of the
25 day-to-day arms and legs for that particular risk making.
26 You know, making sure the meetings are taking place that

1 need to take place, the right experts are coming
2 together, that they're producing documents that show what
3 is being done, recording what is happening, and kind of
4 in charge of producing the overall end product documents.

5 Q. And who was Lise Jordan?

6 A. Lise Jordan was, as I recall, a manager.

7 Q. Was she someone in your chain of command?

8 A. I don't remember if she was in mine or in Jeff's
9 at this time. Ultimately, she did report to me for a
10 time in vegetation management.

11 Q. Okay. So let's walk through this. This is
12 21 pages. Emerging concerns, progress on existing risk
13 management. It talks about overall gaps.

14 If you could take a look at that for us. It
15 should just be on the second page.

16 A. Nope. I don't see it. I'm not finding that
17 page.

18 Q. Okay. We will take care of that.

19 All right. And then let's go on. As part of
20 that document there's a slide show "Enterprise Risk
21 Management, Gas & Electric T&D, System Safety Risk
22 Review."

23 A. Yes.

24 Q. And that's where we walk through this. There's
25 some handwritten notes on this.

26 A. Yes.

1 Q. Are those your notes again?

2 A. Yes.

3 Q. So I want to skip to page 6 in the risk

4 definitions.

5 A. I'm not sure I'm looking at the same dec.

6 Q. Let's see.

7 A. You said page 6. This is on page 2.

8 Q. Oh, page 6 of the overall documents.

9 A. Okay.

10 Q. So yeah, yep.

11 Okay. All right. So risk definition. If you

12 could read us the definition of risk.

13 A. So is this from 2007?

14 Q. Yes.

15 A. Okay. "System condition that PG&E knows or

16 should reasonably know could cause a hazardous event but

17 does not take expeditious or sufficient action to

18 mitigate that risk."

19 Q. And what's a system condition according to this?

20 A. "Any condition associated with gas or electric

21 transmission and distribution facilities that poses a

22 threat to public and employee safety."

23 Q. And what is a hazardous event according to this?

24 A. "It includes events that possess a significant

25 risk to the -- significant safety risk to employees and

26 the public. Examples: Fire, explosion, and health

1 threats. Example: Environmental affixation, and
2 electrocution."

3 Q. Okay. And now what kind of risks are in scope?

4 A. "All gas and electric transmission,
5 distribution, substation, and regulated facilities."

6 Did you want me to read the rest of that?

7 Q. No. We can probably -- you don't need to read
8 it all.

9 A. It's basically everything.

10 Q. Well, and I guess where I was going with that --
11 I lost my train of thought -- is what does it mean to be
12 in or out of scope?

13 A. In terms of the work and analysis that would go
14 on for coming up with strategies to try to attack these
15 risks, you would go after the in-scope stuff and you
16 would agree that the out-of-scope things would be not
17 addressed in this particular risk.

18 Q. Now, the next page talks about risk drivers.
19 What is a risk driver?

20 A. I'm not seeing that page.

21 Want me to answer the question?

22 Q. Go ahead and answer the question. Somehow that
23 page is missing. We will submit it.

24 So go ahead. What is a risk driver?

25 A. So a risk driver would relate to activities or
26 to facts that help drive that particular risk, that helps

1 make that risk present and exist. So one of the things
2 that are driving that risk making it more acute.

3 Q. Okay. And let's see if there's anything else we
4 need to touch on here. I think that's all we want to hit
5 on in this document.

6 So let's go -- now I want to go out of order to
7 691. It should probably be at the bottom of the stack.
8 It's the last -- the last one.

9 Do you see 691?

10 A. Yes.

11 Q. All right. So 691 looks to be exactly the same
12 report. So this is also Enterprise Risk Management
13 quarterly status report for the second quarter 2007;
14 correct?

15 A. Yes, but for a different risk.

16 Q. Okay. So explain that to us.

17 A. This is for urban wildfire, not system safety
18 which was the one first we looked at.

19 Q. Okay. So this is specifically for urban
20 wildfire?

21 A. Correct.

22 Q. And what is urban wildfire?

23 A. I think we have to read the definition here. I
24 don't want to mislead you in terms of what it was.

25 Q. Okay. All right. So let's walk through this
26 first of all. Under "Emerging Concerns" in the first

1 column "Describe any significant new studies, regulatory
2 changes, or press reports concerning this risk."

3 And as of this report in 2007 were there any
4 significant new studies, regulatory changes, or press
5 reports concerning this risk?

6 A. Well, what's reflected here is the fact that
7 apparently 2007 was expected to be a particularly dry
8 year.

9 Q. Why would that affect the risk?

10 A. Because there would be an increase in
11 combustible fuel in the service territory.

12 Q. All right. So next up there's a -- the next
13 section is "Progress on Existing Risk Management
14 Activities." And explain to us what this means. What is
15 progress on existing risk management activities?

16 A. I think it's just that. I think the author here
17 was trying to characterize what's been done on the
18 activity that had been outlined for the urban wildfire
19 risk. So it's kind of where things stand as it relates
20 to some of the action items under the urban wildfire
21 risk.

22 Q. Okay. And then in the next section or going
23 down a section to metrics, if you can explain to us what
24 metrics are.

25 A. So there should be metrics or measurements
26 associated with the activities or ways of assessing the

1 risk. And we want to make sure that you're bringing data
2 to the work wherever you can.

3 Q. And the risk owner's assessment -- what is that?

4 A. So the risk owner -- in this case it would be
5 me. There should be a message that says here from the
6 risk owner regarding the risk for the Enterprise Risk
7 Management Committee and the chief risk officer.

8 Q. And what was the risk owner's assessment at this
9 time?

10 A. It says "We are making progress in addressing
11 this risk. The identification of specific urban wildland
12 interface areas provides us with a basis recommending any
13 actions that will take place in the identified areas.
14 However, more focused attention is needed to ensure we
15 meet our milestones for many of the actions."

16 Q. So we never did address -- well, and then --
17 let's go back. Then pages 4 through 8 are a chart.

18 A. It's an eye chart.

19 Q. And what's an eye chart?

20 A. Well, they have a very small font so it's not
21 for old people like me.

22 Q. So you just give us a high level overview of
23 what this chart is.

24 A. So every risk -- in this case, every urban
25 wildfire -- has a lot of proposed actions that need to be
26 taking place on some frequency or some basis. And so

1 this is the laundry list of all the different items
2 relative to urban wildfires that have been outlined.

3 Each one has a different deliverable or
4 different set of activities that needs to take place.
5 And this chart will describe the action area. The header
6 says "Ease of implementation," the value of doing that
7 particular item.

8 I can't read the next box. I could read the
9 presentation, I hope. No. That means estimated cost.

10 Interdependencies. So if there are
11 interdependencies for that work to be done, you are
12 depending on another work group or other organizations.

13 Proposed metrics. What are you proposing to
14 measure on that item? You know, whether you're making
15 progress or failing.

16 Responsible persons. Status, overall status at
17 that moment in time, and then the milestones associated
18 with the last column.

19 Q. And what does milestones means?

20 A. The significant items that need to be
21 accomplished by a certain time in order to show progress
22 on achieving that particular item.

23 Q. Okay. It looks like at least for the urban
24 wildfire that the entire first page and first couple of
25 columns or rows, the second page, all have to deal with
26 electric T&D equipment failures. Is that correct?

1 A. That's what it says, yes.

2 Q. So is it safe to say by the time you started in
3 2007 that urban wildfires started by PG&E equipment
4 failures was a major concern for the company?

5 A. Yes.

6 Q. Okay. Now, we'd asked a little bit earlier
7 about what is an urban wildfire. Can you explain that.

8 A. I can't remember the textbook definition, but
9 fundamentally it was limited areas where you had an urban
10 environment. So higher density of population of people
11 with homes that was kind of interfacing with a
12 mountainous, high-vegetative growth geography. And so we
13 had an overlap of a lot of people and fuel.

14 You identified pieces of geography that
15 represented the greatest risk. And I think the best
16 description I could have -- at the time I think what I
17 recall hearing was this risk was somewhat related when it
18 started to the Oakland fires where you had a lot of
19 people living in close proximity in a dense environment,
20 mountainous area, a lot of growth.

21 Q. All right. Let's move on to 684. That should
22 be a big packet there in front of you. See 684?

23 A. Yes.

24 Q. Do you recognize 684?

25 A. No. I mean, I recognize the name, but I don't
26 remember all the details here.

1 Q. Okay. Well, we'll start walking through it.

2 First up, "2008 Utility Offsite Strategy
3 Discussion May 8, 2008."

4 So do you recall attending a utility offsite
5 strategy discussion about in May of 2008?

6 A. You know, I remember a strategy discussion
7 roughly at that time. It was right when I showed up. So
8 it was -- no. It was a year after that. I think this
9 was conducted by Bill Morrow, if I recall.

10 Q. Okay. This is a 200-and-something page
11 document. We're not going to go through all of it.

12 A. I had a lot of 200-page documents. That doesn't
13 make it significant.

14 Q. Yep. So I want to go to page 5 of the document,
15 page marked "PG&E's strategy."

16 A. Got it.

17 Q. Could you look through that and tell us if that
18 looks familiar.

19 A. No. I don't recall it, but I can read it
20 so . . .

21 Q. Okay. Does that sound familiar in terms of
22 PG&E's overall strategy around 2008?

23 A. It sounds very much like, yeah, what would be
24 discussed about that time.

25 Q. Okay. Let's move on to page 6 "Translating
26 Strategy to Action." Can you see that page?

1 A. Yes.

2 Q. Can you explain this page for us.

3 A. So if you look at the left-hand side, you've got
4 the broad categories. At the top is "Vision: The desire
5 to be a leading utility in the U.S.

6 Goals: Customer loyalty in the top decile.

7 Environmental leadership: Top decile.

8 Employment engagement: Top decile.

9 And shareholder return: Top quartile."

10 Q. What does it mean to be in the top decile or top
11 quartile?

12 A. I think top decile is the top ten in the United
13 States. I think that was kind of more likely -- you
14 know, similarly situated utilities in size and
15 complexity.

16 Q. So the company was -- their goal was to be in
17 the top ten percent of the top 25 percent?

18 A. Basically speaking, yeah. I don't know if
19 that's quartile.

20 Q. What does "shareholder return" mean?

21 A. Whatever their shareholder targets were, I would
22 assume, or whatever goals they communicated to the
23 street --

24 Q. Okay.

25 A. -- in terms of shareholder return which would be
26 the price appreciation of stock and/or earnings returned

1 to shareholders.

2 Q. Okay.

3 A. I'm not the financial guy so you'd have to talk
4 to the financial executives.

5 Q. Right.

6 And then there's a bunch of things called
7 imperatives.

8 A. The imperatives would be a set of priority
9 areas, you know, broad priority areas. And then specific
10 business priorities, I guess, is below that.

11 Q. Okay. And listed as customer satisfaction,
12 improved reliability, organization performance, benefits
13 of transformation, and earnings and growth.

14 A. Correct.

15 Q. Do you know what earnings and growth would refer
16 to?

17 A. Just what I referred to. Just earnings would be
18 earnings as it relates to how the business is measuring
19 itself and reporting to Wall Street. And earnings
20 growth, I assume, is what the growth component is
21 referring to.

22 Q. All right. Next up page 7. If you can explain
23 the chart for us, please.

24 A. Okay. Just for the record, I didn't produce
25 this document. So I'm not sure who actually developed
26 this. So I'm giving you kind of how I read it. I'm not

1 necessarily -- I'm not the guy that made it up.

2 Q. Right. No. We understand.

3 A. So this is a strategic planning architecture.
4 So I guess this is a way of thinking about the strategy
5 of the business. And it starts with competitors. And
6 when you have a utility that's got a franchise, you don't
7 really have competition within your service territory
8 because you have a franchise for it.

9 So the surrogate for competition is the
10 regulator, regulations, and legislation and technology.
11 Those are the two sources of competitive forces. Also
12 input costs, supply. So the cost of energy, the cost of
13 fuel, gas, you know, methane, customer demand. So those
14 four drivers are kind of the competitive forces.

15 I think it's kind of an academic model for
16 thinking about competitive forces usually made for
17 competitive businesses. This is not really a competitive
18 business. So we have to adapt it.

19 Then the next box says "which must be addressed,
20 managed, and executed by PG&E employees and management."
21 So those are the folks that deal with those drivers.

22 "In the context of best meeting the needs of the
23 stakeholders we serve." Shareholders and customers.

24 Q. All right. Let's move on to page 45. And there
25 are numbers on the bottom of the pages, but there are
26 multiple presentations so . . .

1 A. Okay. So it's --

2 Q. So the numbers system is just based upon -- we
3 can go from the big board if you want.

4 So objectives for the May 8th and 9th offsite.
5 What was -- what were you trying to accomplish or what
6 was PG&E trying to accomplish with this meeting?

7 A. I think the executive that was running the
8 meeting said that -- I think it was Bill Morrow, if I
9 recall. I could be wrong.

10 The discussion and debate around the 2009
11 through '11 strategic imperatives and utility business
12 priorities. And what that means is how we run our
13 business and to generate input to be used in creating
14 planning guidelines for the '09 through '11 planning
15 process.

16 Q. Okay. Now, go ahead to page 47. So two more
17 pages. "Ground rules for discussion." And there's two
18 different areas there; what is up for debate and what is
19 not up for debate.

20 So let's start with what is not up for debate.
21 Tell us what topics were not up for debate at this
22 conference.

23 A. Eight percent earnings for shared growth and
24 legislative and regulatory activity.

25 Q. What is 8 percent earnings per share growth?

26 A. It's a target.

1 Q. What do you mean target?
2 A. It's an earnings target.
3 Q. Earnings for who?
4 A. For the stock. It's PG&E's --
5 Q. So --
6 A. -- financial performance.
7 Q. So that refers to how much money the
8 stockholders are going to earn off of their PG&E stock
9 during the year; correct?
10 A. Correct.
11 Q. And that's not up for debate?
12 A. Correct.
13 Q. But what is up for debate?
14 A. The '09 through '11 -- 2009 through '11 business
15 priorities, metrics and targets, program and project
16 trade-offs, input on strategic imperatives. Other topics
17 including safety, reliability, productivity, labor
18 strategy, outside-of-the-box ideas, use of outsourcing.
19 Q. Okay. So basically what you're being told here
20 is "We're not going to debate 8 percent growth. That's
21 off the table. But we are going to debate things like
22 safety, reliability, and productivity." Correct?
23 A. Correct.
24 Q. Okay.
25 A. But people that establish the earnings growth
26 targets aren't in the room.

1 Q. Who is in the room?

2 A. It looks like the utility executives.

3 Q. Okay. Including you?

4 A. Including me. I believe I was there.

5 Q. All right. And page 54 again, what we're trying
6 to accomplish.

7 Now, page 55 we have a repeat of what's up for
8 debate and what's not up for debate. The same as we just
9 read; correct?

10 A. Correct.

11 Q. All right. Let's go on a little bit.

12 A. And again, just so you're clear, what is up and
13 what is not up for debate of the earnings is a target
14 established by the board of directors so . . .

15 Q. Right.

16 A. So the group of people in that room don't have
17 the ability to make that call.

18 Q. You're stuck with it no matter what?

19 A. Correct.

20 Q. Figuring out how you're going to get to that
21 8 percent and how you're not going to reduce that
22 8 percent?

23 A. Well, to the extent that it falls in the areas
24 that we are responsible for. I think you would need to
25 have the CFO here talking to all the different -- because
26 this is a corporate target, not the utility's target. So

1 it was a corporate umbrella, okay, not just the utility.
2 And there's different sources of how you arrive at an
3 earnings target.

4 Q. All right. We're going to skip through the rest
5 of this, I think. Oh, we'll go to page 147. Again, more
6 on the EPS. I was wondering if you could explain any of
7 this to us.

8 A. So this chart is called "Objectives." This is
9 being presented, the prior page, by Barbara Barcon who
10 was, I think, the utility CFO. I'm not sure. I think
11 that was her role. So she was presenting the shareholder
12 perspective. So that's what these objectives are are
13 the -- I guess pursuant to the shareholders' perspective.

14 So she was going to describe why earnings share
15 growth is important, explain how that growth target was
16 established, highlight how functional areas impact the
17 earnings per share growth, quantify the earnings
18 challenge over the next couple of years, and discuss what
19 we must do to meet that earnings challenge.

20 Q. Okay. All right. Here's another one. "Ground
21 rules reminder." Again on page 162 what is up for debate
22 and what is not up for debate.

23 A. Got them.

24 Q. Any idea why this would be -- this slide
25 basically -- or this -- the up-for-debate and
26 not-up-for-debate would be repeated over and over and

1 over again during this presentation?

2 A. I guess so that the officers in the room would
3 be complaining about the financial target.

4 Q. Okay.

5 A. I assume that had already been communicated to
6 the street or perhaps it was public.

7 Q. Okay. Now, you were present at this conference;
8 correct?

9 A. I believe I was.

10 Q. And I want to ask you about some statements that
11 were attributed to you, if you remember them, and, if you
12 don't, what you think about the statement itself.

13 Okay. Is it true that at this meeting you told
14 everybody in attendance that you had concerns about the
15 methodology that was used for assessing risk at the
16 company?

17 A. I may have. I don't remember saying it.

18 Q. Was that consistent with your beliefs at the
19 time?

20 A. I think it was.

21 Q. Did you tell everyone that based upon your
22 review of the Enterprise Risk Management System or
23 Enterprise Risk Management, everything in Enterprise Risk
24 Management was broken?

25 A. I don't recall that statement.

26 Q. Is that consistent with your beliefs at the

1 time?

2 A. No. That sounds more like a system safety risk
3 which we've already kind of touched on.

4 Q. Okay.

5 A. If you read the detail on that, it identifies
6 virtually every aspect of the transmission and
7 distribution organization in terms of a source of risk.
8 And so my concern with that kind of statement is if
9 everything is important, than nothing is important.

10 So, yeah, we had these complex charts that
11 showed everything needed to be addressed, but that
12 doesn't help fixing things. And that was my complaint.

13 Q. Okay. Did you tell everyone at the meeting that
14 in your opinion PG&E lived in a world of isolation?

15 A. I don't remember that at all. It sounds like
16 me.

17 Q. Was it consistent with what you were thinking
18 around 2008?

19 A. I don't remember what I was thinking in 2008.

20 Q. Do you remember or did you say to everybody that
21 PG&E had adopted a culture where it did not want to hear
22 bad news?

23 A. Again, that sounds like me, but I don't remember
24 what I was saying or doing at that particular conference.
25 But again, that sounds like something I would say.

26 Q. And is it consistent with what you believed at

1 the time?

2 A. Again, I don't remember. But if you go back to
3 my earlier chart that we talked about, my observations
4 and challenges, it's consistent with that. So I would
5 say it's not inconsistent with what I was saying.

6 Q. Yep. And did you say that based upon your
7 review of the methodology that was used to do risk
8 assessments for the company, that there was no fix that
9 you saw that could be had?

10 A. I'm not sure I even understand that.

11 Q. So as part of your authority over risk
12 management you went through and assessed what the company
13 was doing at that point; correct?

14 A. For transmission and distribution?

15 Q. Right.

16 A. I would never say there was no risk. I meant no
17 fix possible.

18 Q. Okay.

19 A. But if I was referring -- again, I don't
20 remember saying that. But if it refers to something like
21 system safety where they're basically declaring that
22 everything needs to be addressed, then that's not easily
23 fixable. If you have to boil the ocean, if you have to
24 fix everything, then that's too broad to actually take
25 specific action.

26 Q. Okay. So it would be more consistent to say

1 that with the existing methodology there is no way to
2 fix --

3 A. Correct. We needed --

4 Q. They need to fix the methodology?

5 A. Correct. What I wanted was a methodology that
6 boiled things down to fewer things that we could address
7 and make progress on that would have an impact on the
8 system safety instead of a thousand things, ten things.
9 You know, just something that could give us better focus.

10 Q. That's a good word. You wanted focus, not
11 generalities; correct?

12 A. Correct.

13 Q. And was that a consistent theme of your time --

14 A. Yes.

15 Q. -- and your beliefs while you were at PG&E?

16 A. Yes.

17 Q. All right. Next up let's go to 685. Do you
18 recognize what 685 is?

19 A. Broadly, yes.

20 Q. What is 685?

21 A. I believe, if I recall correctly, that we had an
22 obligation in T&D every year to give a five-year Capital
23 and Expense Asset Management plan to finance so that
24 finance can look at long-term capital needs to fund the
25 business.

26 They're doing this with every organization.

1 They're asking for five-year capital expense assessments
2 so they can -- on their asset management plans because
3 that's really what is driving the business is the assets
4 that you have in place.

5 What you're planning at a broad level, at a high
6 level is so that can begin to get a feel for what the
7 capital demands of the business may be among other things
8 and expense.

9 Q. Yeah. There's some highlighting and some notes
10 throughout this document. Is that your work?

11 A. I don't remember whose -- I don't know if I did
12 that. I would highlight, but I don't -- the one on
13 page 06 -- 206 where it says "issue," that's my writing
14 so . . .

15 Q. Okay.

16 A. So I would say, yeah, it's very likely that I'm
17 the guy that is highlighting. If you ask me why the
18 different colors, I have no idea.

19 Q. All right. There's some terms they use in here
20 I want to ask you about. For instance "CAPex."

21 A. Capital. Capital. It's a category of money for
22 a business.

23 Q. Okay.

24 A. Usually.

25 Q. So is that capital expenditures?

26 A. Yes.

1 Q. Okay. So CAPEX is capital expenditures.

2 A. OPEX would be operational expenditures.

3 Q. Okay.

4 A. From an accounting standpoint that would be
5 expense items.

6 Q. What's the difference between all of those
7 different things in your experience?

8 A. Again, you're best talking to a CFO or financial
9 CPA or somebody. But it's again you fund the business
10 through capital. Your investments typically are on the
11 capital side. And when you have assets that are being
12 deployed with capital, those asset items have
13 depreciation life and so they depreciate over the course
14 of years. And every asset has a different life assigned
15 to it based on what the regulators permit. Okay. So
16 it's a way of accounting for recovery of the costs on
17 your capital investment items.

18 Operational expenses not amortized over years is
19 recognized in the period that you're taking that
20 expenditure. So salaries typically aren't expenditures
21 for that year. You know, fuel for your vehicles is an
22 expenditure -- operating expenditure for the current
23 period. You don't amortize that over time.

24 Q. Okay. So I wanted to highlight a couple of
25 things in here. And this is on page 32 which on the BAIT
26 stamp would be page 231.

1 A. Okay.

2 Q. And this is under "Electrical Transmission and
3 Line Maintenance." See that?

4 A. I see the line maintenance, yes.

5 Q. Okay. In the middle of that paragraph it states
6 "A majority of the installed transmission infrastructure
7 is over 40 years of age and is beginning to require an
8 increased amount of maintenance due to equipment
9 condition." See that sentence?

10 A. Yes, I do.

11 Q. Now, this is in 2007; correct? This is . . .

12 A. Yeah, I see that. This was in May of 2007.
13 That's when it was produced.

14 Q. So safe to say that at that point in time there
15 were already concerns about the age of the transmission
16 infrastructure?

17 A. Yes. I would think that we had concerns in all
18 categories of infrastructure, distribution, gas, and
19 electric.

20 Q. Okay. In your time with PG&E and in your
21 position of PG&E, was that a big worry?

22 A. Yes.

23 Q. Both?

24 A. Well, it was a big worry for those in T&D.

25 Q. Yeah.

26 A. And it was incumbent on me to explain that to

1 the rest of the business so there was a good
2 understanding.

3 Q. Okay. And then it goes down and says "Going
4 forward new programs will need to be initiated and
5 current programs expanded to address structure,
6 foundation, conductor, line hardware, and insulator
7 issues associated with the 60/70kV, 115kV, and 230kV
8 systems." Is that correct?

9 A. That is what it says.

10 Q. So again, were you familiar with any programs
11 that were in place in 2007 to address those issues with
12 regard to the 115 kV transmission lines?

13 A. I don't recall specifically. We had hundreds of
14 programs and hundreds of projects scheduled in all
15 categories. So I don't remember specifically what was
16 outlined.

17 Q. All right.

18 A. The information is attainable. I just don't --
19 I couldn't tell you.

20 Q. Where would you go to obtain it do you think?

21 A. To the asset managers, the people that are
22 responsible for the asset categories.

23 Q. Were you familiar with a program within PG&E
24 something to the effect of the deteriorating towers
25 replacement project or --

26 A. Not specifically. I mean, if that -- we had

1 issues with towers and assessments and making sure
2 that -- that, you know, footings weren't eroding and
3 there wasn't corrosion. That was a concern that we were
4 addressing more closely and measuring so we knew what
5 needed to be addressed first, second, and third.

6 Q. All right. If we go on to the next page page 33
7 and down under "New capital replacement work for 60/70kV
8 115kV, and 230kV systems will include --"

9 Do you see that?

10 A. I'm sorry. Where?

11 Q. It should be the following page.

12 A. Got it.

13 Q. Got it? So this is new capital expenditure work
14 that is being -- supposed to be done over the next five
15 years. Am I understanding that right?

16 A. Yeah. That's -- I guess that depends on what
17 you mean by "done." This is looking at a block of time.

18 Q. Right.

19 A. Okay. And these programs could span decades.
20 So these were categories of work that the investment
21 needed to be made over that timeframe 2008 and 2012, but
22 I think it would be incorrect to assume that in 2012 it's
23 all done.

24 Q. Okay.

25 A. There's just a need for incremental new spending
26 in those areas to begin in 2008, 2009. I don't know how

1 much progress was being -- could be made or would be
2 made.

3 Q. And whose job would it have been to push these
4 initiatives forward and make sure that these jobs at
5 least were on track?

6 A. Primarily engineering. Typically, the asset
7 manager working in conjunction with the line field
8 getting the right kind of assessment data, looking at
9 their asset responsibility areas, and getting the data
10 they need to characterize what they require in terms of
11 funding and, you know, condition and what needs to be
12 done.

13 Q. Okay. And number one on that project in the
14 first bullet point "Tower replacement due to steel
15 corrosion associated with age, environment, and direct
16 buried structures." Is that correct?

17 A. Right. That's what the asset manager outlined
18 there, correct. Now, that's not listing projects.
19 That's just listing a category of things that need to be
20 done.

21 Q. Right.

22 Okay. So let's move on to our next exhibit
23 Exhibit 686. Do you have 686 in front of you?

24 A. Yes.

25 Q. Do you recognize 686?

26 A. Well, I'm not sure. I may have reviewed this.

1 This is dated October of 2006. So I wasn't an employee,
2 but it was my habit to read all historical data on
3 anything that I was responsible for. So I probably read
4 this, but I can't tell you for sure unless you have my
5 note summary here or highlights that I did.

6 Q. Well, we know that by May of 2007 -- so a month
7 into your employment with PG&E you were in charge of the
8 urban wildland fire?

9 A. Correct.

10 Q. And so this had been a few months before you
11 started? Six months before you started; right?

12 A. Correct.

13 Q. So what do you think the chances are that you
14 probably reviewed this?

15 A. Pretty high.

16 Q. All right. So I want to go through a couple
17 things here. We've got the overview, the definition of
18 risk.

19 Can you read us what the definition of risk is.

20 A. "Risk from wildfires in urban interface areas
21 with high population densities and difficult geographic
22 terrain resulted from PG&E activities and/or asset
23 contact with vegetative fuels."

24 Q. And what is an urban wildland interface area?

25 A. So you could have a database that shows land
26 morphology makeup, that kind of terrain, the complexity

1 of the terrain, the altitude, the makeup of the forest,
2 brush, you know, whatever. And you overlay population
3 data on that same terrain and you begin to look where
4 there is an overlap between the high-fuel areas and the
5 high population density areas, and that's what this risk
6 is attempting to address is those areas.

7 Q. And how does this document define the urban
8 wildland interface area?

9 A. I don't recall specifically other than what you
10 would read here.

11 Q. Right. Go ahead and read it.

12 A. "Urban wildlife interface areas and geographical
13 areas where structures and other human developments meet
14 and intermingle with wildland or vegetative fuels."

15 Q. And there's also a definition of wildfire.

16 A. "A wildfire is an uncontrolled fire spreading
17 through vegetative fuels, damaging and possibly consuming
18 structures."

19 Q. All right. And we talked a little bit earlier
20 about in and out of scope.

21 A. Yes.

22 Q. And what are scope assumptions?

23 A. So within the scope of the work that you're
24 doing, you're trying to characterize specifically which,
25 I guess in this case, systems are going to be included in
26 that assessment or network. So in this case an example

1 says "This is going to include gas distribution and
2 equipment for the purpose of emergency response."

3 Q. Okay.

4 A. I think that relates to the wildfire. There
5 were issues with gas distribution. So as meters were
6 burned off structures, you have gas flowing and that
7 aggravated restoration.

8 Q. Now, the next section is entitled "Context."
9 Could you read that to us, please.

10 A. "There is an extremely low probability that
11 PG&E's activities or assets caused an urban wildland
12 vegetation fire as demonstrated by PG&E's history of
13 never having caused any such fire and by our many
14 existing programs that mitigate this risk. This effort
15 has, however, preliminarily identified several areas
16 where further action may be worth considering referring
17 to as potential gaps."

18 Q. Do you remember reading this in 2007?

19 A. No. I'm sure I did.

20 Q. Does it sound at all familiar?

21 A. No, but it was -- it was a statement that, like
22 many statements in these programs, there are risks. I'm
23 not sure of its accuracy or what it's based on. So I
24 would ask for data, you know, to kind of help me
25 understand why this is the conclusion that is being
26 reached.

1 Q. Okay. I was going to say do you recall ever
2 asking anybody about the statement "PG&E's history of
3 never having caused any such fire"?

4 A. I find that hard to believe. So, you know,
5 it's . . .

6 Q. All right. So let's move on and try to get
7 through this a little quick.

8 There is one other thing I wanted to bring up on
9 here. Again, potential gaps. If you could read this for
10 us.

11 A. What page is it?

12 Q. Eleven. Or -- yeah, 11. Hey, these page
13 numbers actually jive.

14 A. "Despite the very low probability in urban
15 wildlife fire and the existing actions by PG&E to
16 mitigate this risk, the team along with the group of
17 subject matter experts from the field has preliminarily
18 identified 15 potential gaps where further actions may be
19 worth considering."

20 Q. Do you understand what that means?

21 A. It means that a group of people thought that
22 there were things that they felt needed to be addressed
23 in spite of the declaration that there's low probability
24 of a wildland fire.

25 Q. Okay. So I want to go to page 13. And this is
26 called potential gaps. And under "Proposed Solutions"

1 see the one that says "replaced parallel groove
2 connectors"?

3 A. Yes, I do.

4 Q. Are you familiar with parallel groove
5 connectors?

6 A. I mean, the word is descriptive. I don't
7 remember anything unique or particular about the item
8 here. That's why I have a question mark next to that.
9 When I read this, apparently I needed to do follow-up to
10 see what the hell a parallel groove connector was.

11 Q. Okay. I think that's all we'll go through in
12 this.

13 All right. So let's move on to the next
14 Exhibit 687. So now we are skipping ahead a little bit.

15 Do you recognize 687?

16 A. No. I mean, I recognize the document we see.
17 It's not one that I recall the details on, but I could
18 speak to it if you --

19 Q. Absolutely. If you can speak to it, tell us
20 what this is.

21 A. This is dated January 19, 2010. So it's a
22 summary document that would go to the executive
23 management committee. And it was an update on this
24 particular risk and where we stand based on 2009
25 activity.

26 Q. Okay. And at this point in time you're the risk

1 owner over the urban wildland fire risk; correct?

2 A. Yes.

3 Q. Okay. So go ahead and explain the document to
4 us.

5 A. You want me to read it? Is that what you're
6 asking?

7 Q. No. Just in general tell us what it is.

8 A. Well, like I said, it's a summary. So this goes
9 to the definition so that the others that are going to be
10 reviewing this document have an idea as to what it
11 represents. And so the third paragraph down talks about
12 using Cal Fire criteria and the locations, the geography
13 that were included were the highest density areas from a
14 population standpoint.

15 [Court reporter interrupts.]

16 THE WITNESS: Oh, I'm sorry.

17 So again, just the higher density population
18 areas that overlapped with the vegetative fuel
19 conditions.

20 BY MR. NOEL:

21 Q. So are we now -- have we now limited the urban
22 wildland fire interface to the East Bay Hills, the Marin
23 County Hills, part of the Peninsula, and Folsom?

24 A. It was limited to the areas that met the highest
25 density of people over the territory.

26 Q. Okay.

1 A. And so I think the intent was to begin moving
2 through. So as you work on the highest density areas and
3 completed whatever mitigating work you're going to do,
4 you would then expand that to include the next area and
5 the next and the next assuming your activities have
6 favorable impacts.

7 Q. Right.

8 A. And so does this define scope?

9 Q. Yep.

10 A. Out of scope. We talked about some of those.

11 Q. What does UWIA mean?

12 A. Urban wildland interface area.

13 Q. Okay. And then out of scope are wildland fires
14 caused by gas and electric transmission and distribution
15 facilities located outside the urban wildland interface
16 area?

17 A. Correct.

18 Just to be clear, it doesn't mean that we are
19 not doing work out of those areas. Enterprise Risk
20 Management activity represented a thin layer of activity
21 for the utility T&D. So this is just a more global look
22 based on the criteria the corporation had for an
23 enterprise risk. It doesn't mean that there wasn't these
24 risks dealt with in the field day to day because that's
25 kind of what the field would do in line engineering.

26 Q. Okay.

1 A. So this is just for the Enterprise Risk Program.

2 Q. But, for instance, Paradise/Magalia would not be
3 considered an urban wildland interface area; correct?

4 A. No. It could very well have been. I
5 would assume it would have been, but it wouldn't have
6 been within the highest density areas as compared to the
7 others. So there would have been in some document, a
8 document that reflects a population density in that
9 geography along with the presence of the right vegetative
10 fuel makeup.

11 Q. Right. Now we go on to page 2. There's a list
12 again of owners and responsibilities. It lists you as
13 the risk owner.

14 A. Correct.

15 Q. And then supporting officers, risk manager, all
16 the rest?

17 A. Correct.

18 Q. All right. Let's go down to current mitigation
19 activities. And the activities -- these are activities
20 that were currently being done at the time this was
21 authored to mitigate the fire risk in the urban wildland
22 interface areas?

23 A. Correct.

24 Q. Do I understand that right?

25 A. Yes.

26 Q. Okay. All right. Let's go on to the next

1 Exhibit 688.

2 A. So this is --

3 What do you want me to do?

4 Q. First of all, do you recognize this document?

5 A. Again, no. I read these sorts of documents so I
6 know what it is, but I don't recall the details of this.

7 Q. Right.

8 A. So once a year there was an exercise that the
9 senior officers of the business went through to rate and
10 rank all of the risks that faced -- the enterprise faces
11 and then arrive at, you know, ultimately the top ten.

12 The -- most of the officers participated in kind
13 of making the case, laying out the risks as they might
14 characterize them, but the ultimate decision, as I
15 recall, was made by the chairman, the risk officer, and
16 maybe the CFO or the chief operating officer.

17 So the actual decision making on which of the
18 ten risks ended up on the list to make this part of the
19 top ten, that wasn't a vote necessarily among the people
20 that were working on it.

21 Q. Okay. So the executive management committee,
22 who is that?

23 A. It's typically the senior officers of the
24 business from all different lines of the organization,
25 you know, from customer service to finance to T&D,
26 generation, energy procurement, all the -- customer care,

1 all the lead officers.

2 Q. Okay. So were you on the executive management
3 committee?

4 A. Yes, I was.

5 Q. All right. And then who is Enterprise Risk
6 Management then?

7 A. I don't remember who the lead officer was in
8 2010.

9 Q. Okay. So what would this risk review report be
10 used for by the executive management committee?

11 A. I think this was used to formally communicate
12 what the top ten were for the coming year.

13 Q. Okay.

14 A. So the risk owners would know who they are.

15 Q. And the urban wildland fire risk was one of
16 those top risks?

17 A. Yes.

18 Q. Okay. Let's move on to 689. And what is 689?

19 A. This looks like a board update, something going
20 to the finance committee. So it's a subset of the board
21 of directors and different committees on that board.
22 This is, I think, going to the finance committee. And so
23 the practice, as I recall, to the risk owners -- or at
24 least I remember I had to. Periodically, whenever one of
25 my risks that I was responsible for was due to be
26 reviewed by the board of directors, I would do it. I

1 would show up and walk them through a high-level summary
2 of the activity and where we stand.

3 Q. All right. So it says "Over 30 candidate risks
4 were identified for possible inclusion in the program.
5 The top ten risks were selected by a panel of senior
6 officers for inclusion in the program."

7 A. Correct.

8 Q. So this would be the next step in the program?

9 A. So one top ten we looked at that in the previous
10 document.

11 Q. Right.

12 A. What that top ten was. So this is simply a
13 document that is communicating that to the board of
14 directors. Or the finance committee, not actually the
15 whole board. At least I didn't see any.

16 Q. And this includes again the urban wildland fire
17 risk?

18 A. Yes, because that was one of the top ten, I
19 believe.

20 Q. Okay.

21 A. It's the same. Both the energy procurement risk
22 and the wildland fire risk have been updated since they
23 were last discussed in April of 2007 and December of
24 2006.

25 Q. And again, it goes down to risk drivers listed;
26 transmission and distribution equipment failure,

1 equipment contact with vegetation, and inadequate
2 response by PG&E to a fire regardless of the source of
3 the ignition; correct?

4 A. Correct.

5 Q. All right. I think we'll get to the last
6 Exhibit 690. What is Exhibit 690?

7 A. This is dated July 2010. And this is, I guess,
8 a risk review summary document that's going to be sent to
9 the executive management committee.

10 Q. What does that mean?

11 A. The executive management committee was just
12 the -- kind of the group of senior executives that had
13 kind of global responsibility for the utility operation.

14 Q. All right. Now, if we skip ahead down there,
15 there's -- the third page turns into a PowerPoint.
16 There's a PowerPoint slide "ERM Portfolio of Risks."

17 A. Yes.

18 Q. What is the portfolio of risks?

19 A. That would be the top 10 or 7 of the risks that
20 are being included under the Enterprise Risk Management
21 Program.

22 Q. Okay. So the top ten are on the left. And then
23 what are the --

24 A. The risks are on the left in at least the
25 shorthand form. The owner is the next column.

26 Q. And then what is the third column under

1 "Significant Business Risks"? What does that mean?

2 A. I think -- I'm not sure I remember exactly other
3 than what it says. It just -- it looks like there were
4 other risks that were considered in that area that
5 aren't -- did not make the top ten, but I guess they
6 wanted to mention them for completeness so that people
7 understood that they were related or aggravating risks.

8 Q. Now, the next slide is entitled "Approach." If
9 you could take a look at that and tell us who is
10 approaching that we're talking about here.

11 A. This is the Enterprise Risk Management
12 executive. It is their staff that is responsible for the
13 whole enterprise and the approach that they're asking
14 each of these owners to take in addressing their
15 particular risk.

16 Q. Okay. And then skip to seven. Part of this
17 document there's another Enterprise Risk Management
18 System Safety Risk Review 2009/2010.

19 A. So I don't know if this is connected to that
20 same meeting in July of 2010, but this is just a
21 high-level review. This is the kind of review that would
22 have gone to the Enterprise -- I'm sorry, to the
23 executive management committee. If you didn't give them
24 the full blow-by-blow detail of all the work you were
25 doing, they wanted a more abbreviated document to
26 summarize what you're doing. And that is what this is.

1 Q. Then we get examples of in-scope events. And
2 some of those sound familiar. They're electrical,
3 transmission, and distribution system. Well, for gas
4 also.

5 A. Yes.

6 Q. "Explosion or fire caused by underground
7 equipment such as transformers or splices in vaults with
8 manholes."

9 That's the definition of the issue in San
10 Francisco, isn't it?

11 A. Correct.

12 Q. Now, the bottom one "Multiple explosions or
13 fires caused by aged equipment failure that PG&E had not
14 taken timely action to replace." Is that correct?

15 A. Correct.

16 Q. So that is something that is in scope there?

17 A. Yes.

18 Q. And was already a concern?

19 A. Yes.

20 Q. So as far back as 2007, 2008, 2010, the idea of
21 PG&E's aging infrastructure causing -- failing and
22 causing fires was a major enterprise risk concern;
23 correct?

24 A. Correct.

25 Q. Do you recall what was being done to mitigate
26 that risk?

1 A. We'd have to go through more hundreds of
2 programs, replacing assets, trying to prioritize asset
3 replacement. You could go through the regulatory filings
4 where the utility is seeking money or funds to go make
5 these changes and get that work programed in and
6 scheduled.

7 Q. But how were those decisions being made at the
8 time of what programs to go forward and where to spend
9 the money to replace?

10 A. The detail -- if you're asking at a high level
11 or a detail level, that is being done by the asset
12 managers that are responsible for the asset category.
13 They have the best knowledge working with again the
14 available data within the field, getting manufacturer
15 data, getting whatever -- whatever industry data might
16 exist, which wasn't a lot typically, to -- to best
17 characterize their priorities for what assets they need
18 to go after and with what urgency and then make sure that
19 we were filing for the funds. We need to do that with
20 the regulator as we move forward.

21 Q. We talked in the very beginning about the
22 difference between relative risk assessment and probable
23 risk assessment; correct?

24 A. Yes.

25 Q. Do you recall that?

26 Was relative risk assessment still being used to

1 make a determination which of those -- which projects
2 were going to be done?

3 A. I think it would differ by asset category. Some
4 assets lend themselves to getting data to be able to make
5 more intelligent and informed decisions. Other asset
6 categories you don't have a lot of specific data other
7 than maybe asset age, which is a very, very broad way of
8 looking at something that doesn't really reflect the
9 condition. So, you know, you may be relying more on
10 inspections to make an assessment.

11 So again, it's different for different asset
12 categories. Some of those are more detailed and data
13 driven. Others are more realistic in terms of how do
14 they look compared to other assets.

15 Q. Right. So when we went back to the urban
16 wildland fire interface areas and by 2010, if I
17 understand it right, the Bay Area Hills, the Marin County
18 Hills, and Folsom had already been jumped to the top of
19 that list and projects were being done before anywhere
20 else. Is that about correct?

21 A. I wouldn't assume that at all.

22 Q. Okay.

23 A. I think for the sake of the risk definition
24 those were being called out uniquely. But I think you
25 would have to get the details in terms of what actually
26 is being programed in all the others because 99 percent

1 of the work of the utility T&D is going on with
2 day-to-day business in terms of what programs are being
3 managed.

4 The enterprise risk is just one slice. It's a
5 way of looking at activity that is going on that's
6 largely broadly the same activity that's going on in
7 other places in the utility.

8 Q. Okay. A lot of that that we're talking about in
9 terms of the day-to-day stuff is being done by the
10 people; correct? The linemen, the groundsmen, the
11 towermen? Those kinds of people; right?

12 A. No. The physical work is getting done by those
13 people. The program in terms of their work activity,
14 their work packages are being driven by asset managers,
15 you know, by other processes of the business. So they're
16 not making up the work that they're going to go do.

17 Q. All right. It is past 4:30, and I kept you guys
18 way too late last week and got in trouble. So we will
19 finish it there. We appreciate it.

20 Oh, I forgot. Does the jury have any questions?

21 They do get to ask you questions. Sometimes it
22 gets late in the day and I forget.

23 [Conferring off the record.]

24 BY MR. NOEL:

25 Q. All right. There are a few questions from the
26 jurors themselves that I will read to you.

1 "With the issues that you found wrong with
2 PG&E's systems, did you implement new changes such as
3 training programs for employees, linemen, and troubleshooters
4 for gas and electric departments?"

5 A. Yes.

6 Q. What types?

7 A. A variety of types. We had a whole program
8 aimed to improving and upgrading our training. And we
9 established a whole training facility in San Ramon for
10 gas. We actually created a little mock community with
11 fake houses with gas pipes to train our folks what they
12 need to do when you have gas leak detections. They had
13 tools and other things. We did that on the electric
14 side.

15 I don't recall all of the programs, but we had a
16 number of trainings. There's data that exists that would
17 reflect that.

18 Q. Now, we have the same -- essentially the same
19 question from a couple different people which is "Why did
20 you leave PG&E after four years?"

21 A. After the San Bruno explosion my role was unique
22 largely across the United States. I had one executive
23 responsible for all engineering and operations for gas
24 distribution, gas transmission, electric distribution,
25 and electric transmission. Most utilities had one
26 executive for each one of those areas.

1 So I was -- they were going to restructure after
2 the San Bruno explosion, and the restructure was going to
3 introduce -- and they needed to -- they wanted to bring
4 in experts in each of those areas. Okay. Executives
5 that had worked in each of those specific disciplines.
6 And so my role was getting kind of taken apart to take a
7 whole different, more traditional look at it.

8 Most utilities would have each functional group
9 be separate. And they offered a job that I was not
10 interested in. And so we elected to part company.

11 Q. Do you know if Jack Keenan is still the COO of
12 PG&E?

13 A. He's not. He left roughly the same time I did.

14 Q. Now, in Exhibit 682, the first enterprise
15 problem -- there we go. The first enterprise problem was
16 the lack of a clear overall policy establishing a risk
17 assessment policy for PG&E.

18 Does such -- well, did such an overall clear
19 risk assessment policy exist for PG&E when you left?

20 A. I think it got better. It needed improvement.
21 I don't think it was perfect, but it had gotten a little
22 bit better over time.

23 Q. And then the rest of the question is as of 11/8
24 you don't know anything after you left; correct?

25 A. No, Sir.

26 Q. Do you believe that the Enterprise Risk

1 Management Program of PG&E while you were there had been
2 an effective tool in mitigating enterprise risks?

3 A. I think the vast majority of the work for T&D
4 was what happened day to day. And I think enterprise
5 risk allowed us to focus on some of the broader areas,
6 but I don't think in and of itself the enterprise
7 management was intended to fix the utility. It was just
8 to bring visibility to a certain slice of risk. And I
9 think we were --

10 Q. You keep talking. I'm just going to grab these.

11 A. We were concerned with the day-to-day risk that
12 needed to be managed. All of those impacted enterprise
13 risk. So it was -- I think people view enterprise risk
14 as really the driver of all improvement and risk
15 management. It wasn't. It was really a small slice
16 separate from the bulk of risk management to the
17 day-to-day that went on.

18 MR. NOEL: Anything further?

19 Mr. Salas, thank you. Madam foreperson will
20 have an admonishment for you again.

21 GRAND JURY FOREPERSON: Mr. Salas, you are
22 admonished not to discuss or disclose at any time outside
23 of this jury room the questions that have been asked of
24 you or your answers until authorized by this grand jury
25 or the Court. A violation of these instructions on your
26 part may be the basis for a charge against you of

1 contempt of court. This does not preclude you from
2 discussing your legal rights with your own attorney.

3 Mr. Salas, what I have just said is a warning
4 not to discuss this case with anyone except the Court,
5 your lawyer, or the district attorney.

6 Do you have any questions?

7 THE WITNESS: No.

8 THE COURT: Thank you for your time today.

9 THE WITNESS: Okay.

10 MR. NOEL: You are done.

11 [Exhibits 679 through 691
12 admitted into evidence.]

13
14 [DISCUSSION OMITTED.]

15
16 [Matter adjourned at 4:45 p.m.]

17 ---oOo---

COURT REPORTER'S CERTIFICATE

This is to certify that I, Lisa McDermid Welch, a Certified Shorthand Reporter of the State of California was present at the time and place the foregoing grand jury proceedings were had and taken in the within matter; and that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings; and afterwards caused my said shorthand writing to be transcribed into typewriting; and the foregoing pages, beginning at the top of Page 1 to and including Page 96 hereof, constitute a full, true, accurate, and complete record of the proceedings.

DATED: This 6th day of June, 2022.

REDACTED CONFIDENTIAL GRAND JURY PROCEEDINGS

TUESDAY, DECEMBER 10, 2019

VOLUME 27

OROVILLE, BUTTE COUNTY, CALIFORNIA

LISA MCDERMID WELCH, CSR 10928, OFFICIAL COURT REPORTER

PURSUANT TO CA GOVERNMENT CODE SECTION 69954(d),
any court, party, or person who has purchased a
transcript may, without paying a further fee to
the reporter, reproduce a copy or portion thereof
as an exhibit pursuant to court order or rule,
or for internal use, but shall not otherwise
provide or sell a copy or copies to any other
party or person.

1 OROVILLE, BUTTE COUNTY, CALIFORNIA

2 DECEMBER 10, 2019; 8:40 a.m.

3 (Confidential Special Grand Jury Hearing Proceedings)

4
5 [ROLLCALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 MR. NOEL: All right. We're ready to go. The
10 first witness will be Greg Davis.

11 Does our Sergeant at Arms want to go out and get
12 him? I know it's your first day on the job.

13 [Witness enters the courtroom.]

14 GRAND JURY FOREPERSON: Mr. Davis, before you
15 have a seat, would you please raise your right hand to be
16 sworn in.

17 Mr. Davis, do you solemnly swear that the
18 evidence you shall give in this matter pending before the
19 grand jury shall be the truth, the whole truth, and
20 nothing but the truth so help you God?

21 THE WITNESS: I do.

22 GRAND JURY FOREPERSON: Thank you. Have a seat,
23 please.

24 THE WITNESS: Good morning.

25 MR. NOEL: Good morning.

26 **EXAMINATION**

1 BY MR. NOEL:

2 Q. Before we start, can you please state your full
3 name spelling your last name for the record.

4 A. My name is Gregory Mark Davis, Jr. Last name is
5 Davis, D-a-v-i-s.

6 Q. Mr. Davis, by whom are you employed?

7 A. I work for PG&E.

8 Q. In what capacity?

9 A. Currently I'm supervising a team of transmission
10 line engineers. It's my base job.

11 Q. Okay. First of all, are you an engineer
12 yourself?

13 A. I am, yes.

14 Q. Can you go through your education for us.

15 A. I've got a bachelor's degree from University of
16 California Berkley in engineering physics with a minor in
17 math.

18 Q. Okay. And how long have you been with PG&E?

19 A. I started with PG&E in 2005. So about 14 years,
20 14 and a half years.

21 Q. Would you walk us through your career with PG&E.

22 A. My first year of PG&E I was working in
23 estimating which was doing construction packages for wood
24 pole distribution work mostly hooking up telecom stuff
25 like AT&T or Comcast getting those companies hooked up to
26 small services here and there.

1 From there I moved over to the transmission line
2 engineering group as a project engineer. And in that
3 capacity I was in charge of putting together construction
4 packages for any work that is related to construction
5 that going to happen on transmission lines.

6 My area -- I covered most of the south; Fresno,
7 Bakersfield, San Luis Obispo for the most part. I worked
8 there until 2013.

9 In 2013 my boss retired, and I was promoted into
10 the supervisor position of that group. And so I worked
11 as a supervisor of the transmission line engineering
12 group from 2013 until late 2017 and was temporarily put
13 in rotation to lead a project management team from 2017
14 to 2018 in the north area. And after the Camp Fire
15 happened, I was moved over as a transmission line lead in
16 the litigation team in December of 2018.

17 Q. Okay. Now, you're here today as the PG&E
18 designated subject matter expert on historical documents
19 of the Caribou-Palermo line; is that correct?

20 A. That's correct.

21 Q. And you've done some research into the history
22 of the Caribou-Palermo line?

23 A. So from December of 2018 I had started doing
24 quite a bit of research into the documents related to the
25 Caribou-Palermo line.

26 Q. What type of research?

1 A. What are you looking for specifically on that?

2 Q. Does PG&E have a historical records library?

3 A. We formally had a historical records library
4 that was housed within PG&E. At some point that was all
5 moved offsite to Iron Mountain. And so all of the
6 historical documents which typically would be considered
7 a record for the line I believe would be scanned and put
8 into an electronic format and the hard copies would be
9 stored over at Iron Mountain.

10 Q. And what is Iron Mountain?

11 A. Iron Mountain is a third-party company that
12 holds hard copy records.

13 Q. So since December of 2018, just about a year
14 now, you have been the supervisor in charge of research
15 and the history of the Caribou-Palermo line?

16 A. I have worked with a small group of people, with
17 attorneys, some internal folks, not necessarily as a
18 supervisor though but lead position in doing research.

19 Q. Okay. So are you familiar with the CPUC data
20 request procedures?

21 A. Yes.

22 Q. What is a CPUC data request?

23 A. A CPUC data request would be a set of questions
24 that the CPUC would send over to PG&E. We usually get a
25 letter that had enumerated lists of questions asking
26 about specific things related to the Caribou-Palermo

1 line.

2 Q. What -- how do you come to be someone who's
3 answering data requests from CPUC?

4 A. As a transmission line engineering supervisor
5 having that history, understanding transmission lines in
6 general, the construction of them and standards around
7 them, I got pulled into that group to help answer those
8 questions.

9 So I would -- in that capacity if that was
10 something that was within my realm of expertise, I would
11 be able to help answer that question. Otherwise, I knew
12 lots of people that had that information and I could
13 reach out to them and find out, you know, how to get that
14 information together.

15 Q. So in other words, you're a subject matter
16 expert or you're a designated subject matter expert?

17 A. That depends on the specific question.

18 Q. Right.

19 A. Yeah.

20 Q. And so let's move right into it. You should
21 have in front of you what is marked as Exhibit 704.

22 A. Okay.

23 Q. Do you recognize Exhibit 704?

24 A. I see Exhibit 692. One moment.

25 Q. Oh, it should be at the end. I'm sorry.

26 A. 704?

1 Q. Yep.

2 A. "Question 7: Please provide a schematic of
3 transmission tower 27/222 with all the equipment shown
4 identified. Please indicate --"

5 Q. All right. Go ahead and look at it yourself.
6 Just look at it. And I'm going to ask you some questions
7 about it.

8 A. Okay. Yeah, I'm familiar with this.

9 Q. Okay. So just in general without getting into
10 specifics, what is Exhibit 704?

11 A. So in general the question was asked to
12 provide --

13 Q. Well, before we even get into the question,
14 just -- is this a CPUC data request and a PG&E response?

15 A. Yes, it is.

16 Q. Okay. So do you want to start off basically and
17 describe what these things are.

18 A. Okay.

19 Q. All right. Flip to the back page of this.

20 A. Sure.

21 Q. I believe there's a name there at the end.

22 A. Right. That's Amanda Maino.

23 Q. Who is Amanda Maino?

24 A. Amanda Maino was one of the folks that we were
25 working with in that data response unit with the
26 litigation team. She was acting as -- at the time that

1 we got pulled in there she was a transmission line
2 portfolio management person.

3 Q. Okay. What's a transmission portfolio
4 management person?

5 A. Probably ask Amanda a little bit more about what
6 her role was there. But she -- she -- you know, prior to
7 being in that role, she would give us a hard time about,
8 you know, how much money we were spending and what
9 direction. And if we said we were going to spend
10 something in a certain way and we did or didn't, you
11 know, she'd get on our case about it.

12 Q. So she's a budget person? A finance person?

13 A. Yeah.

14 Q. All right. Okay. So now that we've got the
15 generalities in, what was the question that was asked of
16 PG&E by CPUC?

17 A. So question seven was "Please provide a
18 schematic of transmission tower 27/222 with all the
19 equipment shown as identified. Please indicate the
20 equipment that the Cal Fire took as evidence."

21 Q. All right. And so this question came from CPUC
22 and was referred to the group that you were involved
23 with?

24 A. Uh-huh.

25 Q. Part of the Camp Fire litigation team you said;
26 right?

1 A. Yep.

2 Q. All right. So describe the response from your
3 group to CPUC.

4 A. So the response outlines all of the available
5 records that show this type of tower and the type of
6 equipment that would be installed on it.

7 Q. Okay. What records were reviewed, if you know?

8 A. What records were reviewed?

9 Q. Yes.

10 A. Oh, a ton of records were reviewed. Are you
11 interested in . . .

12 Q. If you could just in general describe for us the
13 process -- the review process that you go through to get
14 to this.

15 A. It seems it's a bit broad and general. But the
16 process we're trying to identify the records that were
17 associated with this, there was many different areas that
18 we'd go to find records. First of all, we have what we
19 call Documentum. It's the electronic database where we
20 can go in and search for documents on line. Most of our
21 records can be found in there.

22 Then we have the hard copies that I was talking
23 about at Iron Mountain. And there's hard copies that
24 were potentially in various other locations such as the
25 powerhouses up and down the Feather River Canyon, at the
26 local headquarters as well. And we went through a very

1 exhaustive search of running search terms, pulling boxes
2 from Iron Mountain.

3 I believe we pulled over a thousand different
4 boxes. We're talking bankers boxes where we take the box
5 out and look at each document inside of that to try to
6 see if what was in there was relative or not.

7 We -- in that process we came across these
8 indexes for GM orders. GM orders would be a list of
9 projects that were done over time. And these books
10 listed pretty much every project that had been authorized
11 from the 1920s into 1980s.

12 And so we searched every one of those lines with
13 every project that had happened in PG&E looking for
14 anything relevant to the Caribou-Palermo line. And when
15 we found something, we would go to that order number and
16 we'd search that order number and try to find boxes
17 associated with that -- with that order and we'd dig
18 through all of those as well.

19 Q. Okay. Was there more? I'm sorry. I didn't
20 mean to interrupt you.

21 A. Well, I mean, we did quite a bit of searching
22 and we went through a ton of documents, a ton of boxes,
23 found an extremely large amount of records associated
24 with the line.

25 Q. All right. So let's walk through the response
26 real quick. So PG&E understands transmission tower

1 27/222 in this question referred to tower 27/222 on
2 Caribou-Palermo 115 kV transmission line. That's how it
3 starts; correct?

4 A. Correct.

5 Q. And then to date PG&E has not found a schematic
6 of tower 27/222 with all equipment shown and identified.

7 So what does that mean?

8 A. That's pretty standard. Typically, in an
9 instruction package you're not going to detail out --
10 you're not going to create an individual drawing for
11 every structure that's out there. Instead, what
12 typically is going to happen is you'll have these
13 standard tower drawings, the standard configurations that
14 go along with that, and then typically there's some list
15 that shows how to put those together for that particular
16 location.

17 Q. All right. Then it goes on to say "PG&E is
18 producing schematics of type SB towers similar in design
19 to Tower 27/222 as well as drawings for the conversion of
20 type 'SB' tower into a tower matching the current
21 configuration of Tower 27/222." And then it lists these
22 drawings based on Bates numbers.

23 So what does "SB" mean? Do you know?

24 A. Yeah. The "S" stands for snow. It's a much
25 more robust type of tower to be able to withstand the ice
26 and snow loading that would occur in the mountainous

1 region. Most of our towers, you know, in the valley are
2 going to be the vertical in configuration where you see
3 three wires on top of each other. It might even have two
4 circuits. So you'd have six wires, two sets where you
5 have three in a vertical plane on both sides of the
6 tower.

7 These towers were designed to be up in the
8 mountains. So they're much stronger towers, and they're
9 also put into a horizon plane. Part of the reason for
10 doing that is because you can imagine that as snow and
11 ice might go on the wire, it will load it. It will start
12 stacking more. At some point that ice will unload and
13 snap up. If we had those arranged vertically, one of
14 those wires could snap up and hit the next wire up and
15 cause an outage on that line.

16 So these towers are the snow type. That's what
17 the "S" stands for.

18 The "B" was due to -- there's two basic kinds of
19 towers on this section of line. So this section of line
20 was originally part of the Caribou-Valona line. So from
21 Caribou to Big Bend.

22 Now that section of line there had two types of
23 towers; the "SA" and the "SB" for the most part. The "A"
24 was for the standard suspension types of towers. They
25 didn't need to be as strong because they had in insulator
26 string that was just holding the wire in place.

1 The "B" type towers were made to be able to
2 withstand conductors being dead ended to the tower
3 itself. So it had to be able to hold the strength of the
4 tension of the wire on the tower itself.

5 Q. All right. Then it goes on. "The drawings from
6 the original construction of the line also include
7 detailed diagrams reflecting components installed on at
8 least some of the towers on that line. Through review of
9 pictures of Tower 27/222 and in-the-field observations
10 PG&E has been able to match catalog numbers or other
11 identifying information associated with certain
12 components on the tower to those original diagrams."

13 And it goes on and then the next couple of pages
14 are a chart.

15 A. Yep.

16 Q. So can you explain to us the chart beginning on
17 page 2.

18 A. Sure. So --

19 The table you're talking about; right?

20 Q. Yes.

21 A. Yeah. What we've listed on here are all of the
22 components that we see that are attached on the tower.
23 Just overall what we're talking about is that there's the
24 tower steel itself that is -- that we call the tower. It
25 has the foundations. It has the stub, the extensions.
26 That's not necessarily what is being listed here. We're

1 talking about the hardware that's on there. We're
2 talking about the steel, the insulators, and then the
3 clamps that are holding the conductor.

4 So what we're looking at here is a list of all
5 of those individual components that would be attached to
6 the tower holding the conductor.

7 Q. So prior to the Camp Fire, did PG&E have a
8 list -- have an inventory of the components on Tower
9 27/222?

10 A. I'm not aware of a list of components on any
11 given structure. We have standards that show what needs
12 to be on a certain line. And these transmission lines
13 are all fairly unique. They're designed for a very
14 specific purpose. And there's typically an engineer that
15 is assigned to any work that is done on one of these
16 larger transmission lines out there.

17 In the wood pole range a lot of that is much
18 more standardized. But due to the strength required of
19 these larger steel towers and the unique areas that they
20 go through, there's always an engineer that would be
21 assigned that is looking at this individually whenever
22 we're doing any kind of construction project on it.

23 As far as the rest of the material, we have the
24 standards that were associated with this line.

25 Q. Okay. You have the standards. But nobody is
26 keeping track of what parts are on what tower; correct?

1 A. There's not a list of what parts are on each and
2 every one of the towers we have in our system. I believe
3 we've got 50,000 or so steel towers in the system, over
4 100,000 wood pole and steel poles essentially as well.
5 So, yeah, we don't have a specific list of what is on
6 each and every tower.

7 Q. So let's look at the second item on there; the
8 suspension hook. And what does the table tell us about
9 the suspension hooks on 27/222?

10 A. Saying that based on the standards, the photos
11 that were looked at, the type of hook that we see on that
12 is an Ohio Brass hook. And it's likely -- this
13 particular catalog number which is the 13394, and we see
14 that referenced on a few different drawings. So when we
15 go to the next column over there, those drawings show
16 that catalog number of that hook on there.

17 And then how many do we see on that tower?
18 We're showing a total count of -- of those hooks on that
19 tower.

20 Q. Okay. And then next up the Bates stamp number.

21 A. Yeah.

22 Q. What does that mean?

23 A. I'd have to ask you a little bit more about that
24 part.

25 Q. All right. So it says on there under "Total
26 Count 4 (see note below re fifth hook)."

1 A. Yeah.

2 Q. What does that mean?

3 A. So that's saying that regarding the other hook
4 that's on that line, there's a total of five hooks on
5 this particular structure, on structure 27/222. We had
6 three jumpers, I believe, across -- or sorry. We had two
7 jumpers across the top of the tower where we had the
8 mast. And then -- let me see. There we go. And then
9 the two jumper arms down below and there was one jumper
10 to the left. So there was a total of five hooks on the
11 tower.

12 What we saw was that none of these hooks really
13 matched each other. We had three hooks that came off.
14 One of them had a stamp with that particular catalog
15 number on it. So we know 100 percent sure that is a Ohio
16 Brass 13394 stamp on it.

17 Another one didn't have that stamp, but it had
18 markings that were similar to the drawings that we saw in
19 our records.

20 And then the third hook, the broken hook, didn't
21 have markings that were similar to any drawings that we
22 saw.

23 Q. Okay. And you're talking about the drawings in
24 your library?

25 A. Correct.

26 Q. Your records?

1 A. And we also reached out to Ohio Brass, their
2 representatives of the Ohio Brass.

3 Q. So Ohio Brass still exists?

4 A. Ohio Brass is owned by Hubbell today.

5 Q. Right. That's Hubbell Electrical Systems?

6 A. I'm not 100 percent sure of their legal name.

7 Q. Okay. Do you know when Ohio Brass was bought by
8 Hubbell?

9 A. Approximately. I believe it was in the 1970s.

10 Q. Did you do any other historical research into
11 Ohio Brass products?

12 A. We searched for Ohio Brass catalogs. We
13 searched for Ohio Brass in the system I was talking about
14 earlier Documentum to see what else came up in there.
15 Outside of searching personal records and asking some
16 questions trying to understand some things early on to
17 folks at Hubbell I don't know that there's anything else.

18 We did find some very old Ohio Brass catalogs.
19 It was interesting reading.

20 Q. All right. Next up ceramic insulators.

21 A. Correct.

22 Q. Were you able to identify the insulators that
23 were on 27/222?

24 A. So in our -- in our records we found some
25 documents that detailed different types of insulators
26 that were out there. And it gave information that helped

1 identify the insulators that we found on the tower.

2 Q. All right.

3 A. So like what you see here where it says "Based
4 on 7676 Patent Number on the cap." The insulator is made
5 up of three parts essentially. And so the cap -- the
6 steel cap on the top of it had some markings on it that
7 had 7676 and we were able to match that to other drawings
8 to help identify which ones we thought they were.

9 Q. So let's go forward here. With regard to the
10 suspension hooks, there was a Footnote 1 here that says
11 "Please see the paragraph immediately following this
12 table."

13 So let's concentrate on that on page 3. If you
14 could read us the paragraph immediately following the
15 table.

16 A. Yeah. This is along the line of what I was just
17 mentioning earlier here.

18 "Please note that the markings on the suspension
19 hook that broke differ from those that appear in the
20 suspension hook drawings referenced in the table above in
21 that the hook that broke does not bear the 13394 catalog
22 number but is instead marked with a 'B' on one face.

23 While PG&E has identified a drawing from the
24 original construction of the line of a suspension hook
25 with a 'B' on it found at that Bates number, the 'B' in
26 that drawing is on the opposite face of the 'B' on the

1 hook that broke."

2 Q. All right. So during your research into Ohio
3 Brass, did you look into any of their trademarks or --
4 well, their trademarks?

5 A. I mean, I searched images, but I don't know if
6 that's relevant here. The "B" is a class of strength.
7 It's not -- it's not the trademark.

8 Q. Well, prior -- at one point wasn't Ohio Brass's
9 basically symbol that they put on all of their equipment
10 that they made just the raised letter "B"?

11 A. I'm not aware of that, no.

12 Q. Okay. And at some point their trademark became
13 the circle "B." Correct?

14 A. I've only seen variations of the circle "B."

15 Q. Okay. Circle "B" and "O" for Ohio with the "B"
16 for Brass inside of it?

17 A. Yeah. There has been various changes to what
18 that "OB" looked like.

19 Q. Yeah.

20 A. But when we refer to catalogs, the "B" on there
21 designated the difference between an "A" and "B" in terms
22 of strength.

23 Q. Okay. In looking at the catalogs, when does the
24 circle "B" make its first appearance in the catalogs?

25 A. I believe the circle "B" went back as far as
26 I've seen.

1 Q. Okay. In your research into the catalogs of
2 Ohio Brass, is it true that Ohio Brass only -- in the
3 early 1900s only published a calendar -- or catalog every
4 ten years?

5 A. I'm not aware of that, no. I had seen catalogs.

6 Q. Did you review a 1921 catalog of Ohio Brass?

7 A. I have seen a 1921 catalog, correct.

8 Q. And in that catalog this part number has the
9 circle "B" on it; correct?

10 A. The catalog doesn't show engineering drawings of
11 the "B." It depicts kind of a picture of what it might
12 look like but doesn't depict what it's actually going to
13 look like.

14 Q. All right. And prior to that there's the 1911
15 catalog for --

16 A. There's several in between those.

17 Q. Really? Where have you found those?

18 A. We have some Ohio Brass catalogs.

19 Q. Okay. Where can we get those?

20 A. I believe they should be available in various
21 libraries.

22 Q. Okay. Well, that's what I want to know is what
23 libraries.

24 A. We can -- I mean, I can look into that --

25 Q. Okay.

26 A. -- after this for you. We can get that

1 information to you about how to access those catalogs.

2 Yeah, so I think the catalog that you're talking
3 about had a specific number on it. And it goes
4 sequentially through there. So the catalogs were
5 published every year or two, I believe, in that
6 timeframe.

7 Q. Okay. Well, we're going to need you to find
8 those catalogs and provide those to the grand jury.

9 A. So to note though, on the hooks you'll see that
10 some of the hooks had the "OB" stamp on one side and then
11 they had this "B" that we're talking about, the raised
12 "B" on the other side and that designated that the raised
13 "B" was the strength designation. It was not specific to
14 Ohio Brass.

15 Q. Okay. All right. So now let's go on. PG&E
16 also notes that the connectors on Tower 27/222 were
17 replaced in 2016. This was described in PG&E's response
18 to another data request.

19 To date PG&E has not found original records
20 indicating the manufacturer of the conductor on 27/222;
21 is that correct?

22 A. It was correct at the time of this printing.

23 Oh, this continues going.

24 Yeah, so we didn't have any of our own records
25 on there. The next line identifies that we found
26 articles that discussed who the manufacturer of the

1 conductor was.

2 Q. All right. The conductor. What are we talking
3 about here?

4 A. The conductor is, I mean, in layman's terms the
5 wire that is strung up there.

6 Q. So are we talking about the inter-tower
7 conductor or the jumper conductor here?

8 A. That would all be the same.

9 Q. Okay. All right. So let me make sure before we
10 move on we get this right. PG&E doesn't have any records
11 with regard to the actual hook that broke on 27/222?

12 A. The hook that broke doesn't match any of the
13 records that we found and what we searched around for.

14 Q. You don't have any records with regard to the
15 conductor?

16 A. We have plenty of records with regard to the
17 conductor; how to string it, the strength requirements of
18 it, information on how it sags. We have tons of
19 information on that. What we didn't find was like a
20 purchase order and a manufacturer name in our records.
21 But we have tons of engineering documents on the
22 conductor itself.

23 Q. Okay. All right. Let's move on. All right.
24 So on to Exhibit 692. Do you recognize Exhibit 692?

25 A. Yes.

26 Q. What is Exhibit 692?

1 A. This is a response to a CPUC data request again.

2 Q. Okay. And this one is specific to the
3 insulators and the transposition jumper on 27/222;
4 correct?

5 A. Correct.

6 Q. And so CPUC asked of PG&E "Question: Name of
7 manufacturer, age, and model of incident insulators,
8 incident transposition jumper, and incident hook between
9 the conductor and transmission structure 27/222."

10 This is something that would have come to your
11 group for research and response; correct?

12 A. Correct.

13 Q. And again, you would have researched the
14 available records to respond to this request?

15 A. Yes.

16 Q. All right. All right. So first, we have a
17 table again defining a few of the components; the
18 insulators, the ball socket-eye, the static shield, and
19 the suspension wire clamp; correct?

20 A. Correct.

21 Q. All right. So let's move to the first paragraph
22 after that that talks about "With respect to the
23 suspension hooks." And if you could read that paragraph
24 to us.

25 A. "With respect to the suspension hooks on the
26 tower, please note that PG&E has identified original Ohio

1 Brass drawings for suspension hooks on the tower other
2 than the hook that broke. Those hooks bear Ohio Brass
3 catalog number 13394 and correspond to PG&E drawing
4 numbers 014831 and 607957sh3. Those drawings have been
5 produced at the following Bates numbers respectively.
6 The markings on the incident hook appear to differ from
7 those depicted in suspension hook drawings referenced
8 earlier in that the incident hook does not bear the 13394
9 catalog number which instead is marked with a 'B' on one
10 face.

11 While PG&E has identified a drawing from the
12 original tower line construction of a suspension hook
13 with a 'B' on it, (see the following Bates) the 'B' in
14 that drawing is on the opposite face of the 'B' on
15 incident hook."

16 Q. Okay. And then the next paragraph specifically
17 with regard to the transposition jumper.

18 A. "With respect to the transposition jumper --"

19 I believe when we're saying transposition jumper
20 here, we're defining that as the conductor again. So
21 this is similar to the same question that we were just
22 talking about.

23 "PG&E has not found original records indicating
24 the manufacturer. PG&E has identified a publicly
25 available article entitled 'Great Western Power Company's
26 165,000 Volt Transmission Line' in Volume 20 of

1 Engineering World. That article states the aluminium
2 strands in the transposition jumper conductor were
3 manufactured by the Aluminium Company of America and that
4 the steel core was manufactured by John A. Roebling's
5 Sons Company.

6 PG&E has also observed that there are pipes and
7 clamps on the lower transposition jumper and one of the
8 two upper transposition jumpers. For the pipes and
9 pipe-conductor clamps specifically no original drawings
10 have been identified to date and PG&E has not yet been
11 able to determine the manufacturer or vintage of those
12 components."

13 Since then we have found some original drawings
14 of the clamps that were there on that line that connected
15 a pipe to the conductor.

16 Q. Okay.

17 A. And we've also found similar drawings. The next
18 line over from the Caribou-Palermo line have drawings
19 with pipe connected with similar clamps as well.

20 Q. All right. So let's move on to 693. Do you
21 recognize 693?

22 A. I do, yes.

23 Q. What is 693?

24 A. What we're looking at here would have been a
25 standard drawing for Great Western Power. It's titled
26 "Standard Suspension Construction 150 kV Transmission

1 Line."

2 You'll notice the voltage is different than
3 everything that we've been talking about so far. You
4 have heard Caribou-Palermo is a 115 volt -- kV volt line
5 now, and you've seen some of the records so far that it's
6 referred to as a 165 kilovolt line in the past.

7 You know, the reason for that is that originally
8 when it was being designed and constructed, 150 kV was
9 the maximum operating voltage that was in the country.
10 It was available anywhere. But at the time voltage kept
11 rising. And when they designed this particular line,
12 165 kV was the largest voltage to go into service
13 anywhere.

14 So they started with the idea of 150 kV and were
15 able to raise that to 165. And then during the history
16 of the line, as lines were reconfigured, the line was
17 repurposed as a 115 kV line.

18 Q. All right. So up the side it says "Identifies
19 the insulator string as OB --" 'OB' being Ohio Brass "--
20 catalog number 11535." Correct?

21 A. Yes.

22 Q. And going back to 704 under the ceramic
23 insulators and the components on 27/222, the insulators
24 were identified as Ohio Brass 11535; correct?

25 A. Or 25620.

26 Q. Right. Okay. Yeah, that's a good point. "Or."

1 But 11535 was one of the types of insulator strings being
2 used?

3 A. I don't know that it was actually ever used. I
4 think this was called out for in the standard. You'll
5 notice the date on this drawing is 1919. And the --
6 there was an Ohio Brass catalog around the same
7 timeframe. And I believe that this particular code
8 disappeared from the catalog between 1919 -- or right in
9 that range. The catalog that came out right around this
10 timeframe, this particular code was taken out and it
11 moved on to the next generation of similar insulators.

12 Q. Okay.

13 A. So a drawing like this would be -- what would be
14 put together. It says "Any time we are going to build a
15 150 kV line, we would use something like this."

16 And so we have drawings like this today for all
17 of our lines that are out there for different voltages
18 and different types of way we put together our lines.
19 We'll say for a certain voltage, for a certain type of
20 tower this is the type of hardware insulators that should
21 be used.

22 Q. And this is, you said, a drawing from 1919?

23 A. Correct.

24 Q. And when was Caribou-Palermo, at least the
25 section in which 27/222 is part of, built?

26 A. It was built between 1919 and 1921.

1 Q. All right. Let's move on to 694. And what is
2 694?

3 A. Six ninety-four is a vendor drawing of an Ohio
4 Brass insulator. It has a stamp on it that says "Record
5 print" that identifies the Caribou-Golden Gate 165kV line
6 and also line number 603, which those are all synonymous
7 with the section of line that we're talking about. From
8 Caribou to Big Bend -- that section of line was
9 originally part of a much bigger line. The section south
10 of Big Bend was not part of that same overall line. It
11 was different construction altogether.

12 But I'm not aware of this particular insulator
13 being installed on the line either. Perhaps it was at
14 one point. But earlier we were talking about the
15 different parts of the insulator and that that cap has
16 markings on it. And the caps that we've seen on the
17 Caribou-Palermo line all had markings of 7676. I
18 shouldn't say "all." I apologize. But most of the ones
19 that I have seen on there had the 7676 marking on it.

20 And when we look at this particular drawing,
21 there's a column here that says "Patent number." It has
22 a number that is like 6792. And that is not the number
23 that's on the cap of the insulators out there.

24 Q. Okay. Let's move on to 695. And what is 695?

25 A. Six ninety-five is an Ohio Brass drawing that
26 has been stamped with a PG&E vendor drawing number. That

1 607957 number is again, you know, the vendor drawing that
2 would take this drawing in from the vendor, stamp it, and
3 keep it in our records for material that's being used.

4 To note, a lot of these drawings that are marked
5 as being Caribou-Golden Gate and they have these PG&E
6 drawing numbers on them, PG&E acquired Great Western
7 Power in approximately 1930 and all the records from
8 Great Western Power had to come in and be assimilated
9 into the company at that point.

10 I don't think that -- I believe that Great
11 Western Power was fully acquired by PG&E in about 1934 I
12 think is when that was completed. So I'm just kind of
13 thinking back to this previous drawing where they had
14 marked Caribou-Golden Gate on there. It might not have
15 all come together perfectly and cleanly necessarily and
16 there might have been some mismarkings on some of them.

17 But in this particular drawing we're looking at
18 the hook that is called out for that is standard on the
19 Caribou-Palermo line. That is the Ohio Brass Company.
20 You'll see the catalog number in the bottom left-hand
21 side; the 13394. I've seen different versions of this
22 same drawing that has been modified a couple times over
23 time.

24 Q. All right. And this one shows a hook with a
25 raised "B" on the face.

26 A. Correct, correct.

1 Q. All right. And then let's go on to 696 speaking
2 of other versions of this same one.

3 A. Oh, yeah. This particular copy is a little bit
4 difficult to read. But, yeah, most of the information on
5 here is the same except that on the bottom of this one we
6 have some revision notes that show how it changed over
7 time.

8 The original drawing was put together in 1912,
9 but it was modified over time. And that's what those
10 notes on the bottom are talking about is the various
11 modifications that happened.

12 Q. What kind of modifications?

13 A. Some of the dimensions changed. That letter "B"
14 was added in 1916 on there. Says "Changed Figure 2 to
15 letter 'B' 1416" and then there's a signature there.

16 Q. And then there's also a note in here about
17 something. And it's so difficult to read, but it looks
18 like it adds a circle "B" at some point. It looks like
19 about --

20 A. It says "Changed dimension from 13/16 to 7/8.

21 Q. Oh, so that's not a circle "B" in there?

22 A. No. It was just telling you which dimension
23 right here. And so it calls out, and you'll notice that
24 next to the 7/8.

25 Right here (indicating) the 7/8, that's the
26 symbol. So it's giving you a symbol of what got changed

1 on there.

2 Q. Oh, okay. All right. And again, this
3 document -- this original drawing was in 2000 -- or 1912?

4 A. Yeah, it was originally drawn in 1912 and
5 revised since then.

6 Q. All right. So let's move on to 6 -- no.
7 Actually, we're going to go to 260. It should be the
8 next in your stack. There should be a 260.

9 A. Two sixty?

10 Q. Oh.

11 A. I don't believe I have 260.

12 Q. Oh, I forgot to get them out. I'm sorry. We
13 got busy and I forgot to do that this morning.

14 A. It's chilly in here, Marc.

15 Q. Just wait long enough. It'll get hot. I'm from
16 the Midwest, and we all say "It's okay to hate the
17 weather. Just wait a few minutes and it will change."

18 All right. There is 260.

19 A. Thank you.

20 Q. Do you recognize 260?

21 A. I do recognize this, yes.

22 Q. What is 260?

23 A. Two sixty shows a standard modification to a
24 standard SB tower for adding transposition arms. It's
25 one of the modifications that would be required to an SB
26 tower to make that tower into a transposition-type tower.

1 Q. All right. And 27/222 was a transposition
2 tower?

3 A. 27/222 was a transposition tower, correct.

4 Q. And that was originally a snow tower, an SB
5 tower that was modified into a transposition tower?

6 A. Right. So there's -- as I mentioned earlier,
7 there's several items that come together to make a tower.
8 You know, specific there's a standard SB tower. For
9 example here, there would be specific leg extensions,
10 then there would be, depending on the type of soil,
11 different types of foundations that might be used. And
12 these would all go together along with the modifications
13 for transposition to make a more unique tower from all of
14 the various standard drawings.

15 Q. All right. One of those changes would be the
16 addition of the transposition arm; correct?

17 A. So yeah. This drawing details how to add on
18 transposition arms.

19 Q. All right. Next we have 259. Do you
20 recognize 259?

21 A. I do recognize this drawing, yes.

22 Q. And what is 259?

23 A. Two five nine is a drawing that was put together
24 by Stone and Webster which was the company that was hired
25 to build the Caribou Power Plant. So these are on the
26 hydro side of the power plant, Folks.

1 So they put together a drawing of the hardware
2 that was used on the line as it came into Caribou Power
3 Plant.

4 Q. All right. So this would be the transmission
5 line actually as it's going out of Caribou Power Plant;
6 correct?

7 A. Yeah. So this would be for the hardware that is
8 on the towers and lines at the Caribou Power Plant as
9 it's coming out.

10 Q. Okay. And that Caribou-Palermo -- what's now
11 Caribou-Palermo was one of the lines coming out of the
12 Caribou Power Plant; correct?

13 A. Correct.

14 Q. When did the Caribou Power plant open?

15 A. We found several different sources of
16 information that all point to a ceremony energizing the
17 Caribou Power Plant in May of 1921.

18 Q. At the same time that what's now known as the
19 Caribou-Palermo line went into service?

20 A. Yeah. So that ceremony put that line into
21 service.

22 Q. Okay. All right. So let's move on to 697. Do
23 you recognize 697?

24 A. I do recognize it, yes.

25 Q. What is 697?

26 A. I was mentioning earlier there's various

1 modifications that need to be put together to make the
2 tower into a transposition tower. This is one of the
3 early modifications that is needed. It's the mast that
4 goes on top of the SB tower to allow the conductors to be
5 transposed over the top of the tower.

6 Q. All right. And next is 698. Do you recognize
7 698?

8 A. I do recognize it, yes.

9 Q. And what is 698?

10 A. Six ninety-eight is an erection drawing for the
11 snow-type SB tower.

12 Q. Six ninety-nine. Do you recognize 699?

13 A. Yes.

14 Q. What is 699?

15 A. This one is similar. It doesn't detail out the
16 connections as well as the last one. So it's kind of an
17 overview drawing of a standard SB tower.

18 Q. All right. And then finally 700. Well,
19 actually that was fine. Now we'll move on to some other
20 stuff.

21 Do you recognize 700?

22 A. Yes.

23 Q. What is 700?

24 A. This is a response to a CPUC data request.

25 Q. And on this one who was the response done by?

26 A. It has my name on this one for the transmission

1 side. We were responding to questions for Location 1 and
2 Location 2. I was responsible for responding to
3 Location 1.

4 Q. All right. What was the question that you were
5 asked to respond to?

6 A. When was the subject conductor installed.

7 Q. And what was your response or what did you find?

8 A. That it was installed between 1919 and 1921 and
9 went into service in May of 1921.

10 Q. All right. So based upon all of the historical
11 records of PG&E it's your understanding that the
12 conductor has been hanging in 27/222 or that conductor --
13 that section of conductor goes all the way back to
14 original installment?

15 A. So based on the records we didn't have any other
16 records that showed any kind of reconductoring project or
17 something out there to that effect. There was evidence
18 in the field that a dead-end arm had been replaced up
19 there as the old arm was still on the ground. And so
20 some conductor could have been replaced with that. But
21 as far as the records go, the records don't show it.

22 Q. So you have no records indicating that the
23 conductor has ever been replaced?

24 A. No.

25 Q. And the best guess based upon the records is
26 that this conductor is 100 years old?

1 A. Not quite but, yeah.

2 Q. Well, it could have been installed between 1919
3 and 1921, but it went into service in 1921?

4 A. Correct.

5 Q. All right. So let's move on to 701. Do you
6 recognize 701?

7 A. I do recognize it, yes.

8 Q. What is 701?

9 A. Similarly, this is a data request. The question
10 was "What type of conductor was installed for each of the
11 incident locations prior to the incident?"

12 Q. And again, you were the person responding?

13 A. Correct.

14 Q. And so what were you able to find in terms of
15 the type of conductor that was . . .

16 A. So, like I said, we had a lot of records of, you
17 know, what conductor was up there. And so this is an
18 ACSR conductor which is a standard kind of conductor that
19 we use where we need higher strength.

20 The ACSR conductor has a steel core that gives
21 it much more -- more strength and ability to be used in
22 like a mountainous region where it might get snow loading
23 or other heavy loading on there.

24 And then its particular size is what the Kcmil
25 number is. Kcmil is thousands of circular mils. It's
26 certain measurements that are used on conductors. That's

1 kind of like the cross-sectional area of the
2 current-carrying part of the conductor. So in this case
3 452.3 Kcmils. In overall the conductor had a diameter of
4 about .8 inches.

5 Q. All right. Let's move on to 702. Do you
6 recognize 702.

7 A. Yes.

8 Q. What is 702?

9 A. Again, this is a data request, response data
10 request. The question being "Please provide the
11 following information regarding the CP 115kV transmission
12 line: Length of the conductor from Caribou to Palermo
13 (a); (b) composition of the conductor. For example,
14 number of miles of copper, number of miles of ACSR, et
15 cetera; and (c) number of structures, period. Please
16 break down into wood poles, steel poles, structures."

17 Q. All right. So did you respond to this data
18 request also?

19 A. This looks like the responding person was
20 Joscelyn Wong.

21 Q. And who is Joscelyn Wong?

22 A. She is manager of Strategic Governance at this
23 point.

24 Q. All right. So this details what kind of
25 conductor there is on the Caribou-Palermo line, the
26 entirety of the line. Is that true?

1 A. Correct.

2 Q. All right. And then how many structures and so
3 on and so forth?

4 A. Correct.

5 Q. All right. Let's move on to 703. Do you
6 recognize 703?

7 A. I do, yes.

8 Q. What is 703?

9 A. It's another response from a data request. This
10 question was "When were the reinforcement hanger brackets
11 installed on the left and right runners on Tower 27/222."

12 Q. And is this a request to which you responded?

13 A. Yes, I responded to this one.

14 Q. And what were you able to find out with regard
15 to the hanger brackets installed on the transposition
16 arms of 27/222?

17 A. Earlier I mentioned that we had searched
18 thousands -- you know, around a thousand boxes or so,
19 bankers' boxes of records looking for specific jobs. We
20 were hoping to find a job that did this particular work.

21 The way we went about it was looking for those
22 GM order numbers. I believe though that the GM orders
23 had a certain value limit. And perhaps this is where it
24 fell below that particular value limit and wasn't
25 recorded in the GM order numbers. But we searched, you
26 know, every job that had reached that threshold looking

1 for something that showed this particular work.

2 Additionally, below that level there's like
3 local maintenance orders. And we started searching
4 through several of these local maintenance orders. The
5 issue is that prior to the mid '90s or so records were
6 organized by date and not by what kind of work was being
7 done, what was being done.

8 We searched through several of these boxes of
9 local maintenance stuff. And it changed from gas,
10 electric, building a house or building a shed, buying a
11 car and found no information on transmission lines while
12 we're going through that. But we searched through boxes
13 and boxes and boxes that had some kind of intern and
14 found, you know, nothing related to this. I believe
15 there might still be a record of this in the company, but
16 we have not been able to find it.

17 Q. So in short as of today you've been unable to
18 find any records relating to the installation of those
19 hanger brackets on 27/222?

20 A. That's correct.

21 Q. Let's move on to 704. Oops.

22 A. I only have a 703.

23 GRAND JURY SECRETARY: Exhibit 704 was the very
24 beginning.

25 MR. NOEL: Oh, we started with 704. That's
26 right. I knew I wasn't losing it. Yeah, only a little.

1 I'm getting punchy after so long.

2 BY MR. NOEL:

3 Q. All right. So to go back in summary, PG&E has
4 no records of the actual hook that failed on 27/222. Is
5 that correct?

6 A. We have not found a record. I don't know that
7 we do not have a record. That's -- we have a ton of
8 records overall.

9 Q. So 13 months in you haven't found any record of
10 that hook?

11 A. Correct.

12 Q. Who made that hook you don't know?

13 A. We don't have that particular hook. That hook
14 was taken into evidence by Cal Fire, and we haven't been
15 able to get ahold of it, take measurements of it, compare
16 it to, you know, information from various manufacturers
17 to try to make a solid match.

18 And additionally, the tip of the hook was never
19 found. So we just have the one side of the hook and --

20 Q. But you have photographs of the hook?

21 A. I have some -- yeah, we have some photographs of
22 the hook which show that it does not match the drawings
23 that we have of the 13394 that is prevalent on that line.

24 Q. So PG&E has no records pertaining to that hook?

25 A. Again, I don't know that we don't have any
26 records, but we have not found any records.

1 Q. PG&E has found no records with regard to any
2 replacement of that hook in the last hundred years;
3 correct?

4 A. Oh, no, we have not found records for
5 replacement of the hooks.

6 Q. And you don't have any records regarding the
7 conductor itself?

8 A. Well, it's apparent that the hooks have been
9 replaced in the sense that if they were all installed
10 together at the same time, they'd all look exactly the
11 same. You wouldn't be pulling something out of a bin and
12 have four -- three or four different types of things
13 coming out of it.

14 PG&E has a history of salvaging material when
15 it's in good shape. And that's a lot of what we found in
16 the records when we were going through different jobs --

17 Q. I -- so you have no records of any of that
18 occurring on this tower; correct? When you say it's been
19 replaced, that's pure speculation on your part; correct?

20 A. I mean, you can say we have no records of this
21 room being painted, but there's evidence of it.

22 Q. Okay. You have no evidence showing that those
23 hooks have ever been replaced?

24 A. I don't have any records that show that those
25 hooks were replaced --

26 Q. Right.

1 A. -- that we found so far.

2 Q. Right.

3 MR. NOEL: I have nothing further.

4 Do the jurors have any questions?

5 THE WITNESS: Now we're going to get some fun
6 ones.

7 MR. NOEL: Yep.

8 [Conferring off the record.]

9 BY MR. NOEL:

10 Q. All right. So these are the -- some questions
11 from the jurors. First, "If the raised 'B' mark on the
12 C-hook was added in 1916, according to Exhibit 696, and
13 the hook in question had no markings, is it probable that
14 the hook was manufactured prior to 1916?"

15 A. That's a very good question. But the hook in
16 question did have a raised "B" on it, but the "B" was on
17 the other side of the hook. And that "B" was a standard
18 designation amongst manufacturers to designate what type
19 of strength it was essentially.

20 So, yeah, had that hook had no markings on it,
21 it would be possible that it was prior to 1916. But this
22 one did have a marking on it. It just wasn't consistent
23 with the markings that we'd seen in our drawings.

24 Q. So why does the "B" indicating the strength rule
25 out that it was made prior to 1916?

26 A. Sorry. Can you repeat that.

1 Q. Why would having the raised "B," which you said
2 is an indicator of strength, rule out that it was made
3 prior to 1916?

4 A. I don't believe that I said that it ruled that
5 out.

6 Q. Okay.

7 A. I've been saying that I don't know -- I don't
8 have a drawing that shows a hook with a "B" on that side
9 of it.

10 Q. All right. Is it fair to say that the CPUC data
11 request in re Tower 27/222 indicates that PG&E does not
12 have a record of the engineering specs or age of the
13 suspension hook that broke specifically?

14 A. Can you repeat that again.

15 Q. Is it fair to say that the CPUC data request in
16 re Tower 27/222 indicates that PG&E does not have a
17 record of the engineering specs or age of the suspension
18 hook that broke?

19 A. So we have the engineering specs and standards
20 for what was installed originally on that line. And for
21 that particular hook I have not found any drawings that,
22 you know, are similar to that particular hook.

23 Q. Is it fair to say that the suspension hook on
24 27/222 that failed could be reasonably -- could
25 reasonably be assumed to be between 98 and 100 years old?

26 A. Again, I don't have information on it, but there

1 are other hooks on that line that that's a reasonable
2 assumption.

3 Q. Are you aware of any effort by PG&E prior to
4 November 2018 to specifically examine and test
5 transmission line components that are 75 to 100 years
6 old?

7 A. We have a program of inspection that goes out
8 and looks at all of our transmission lines. And you'll
9 find several reports that show PG&E's inspection
10 practices are in line with every other utility in the
11 country.

12 We had Quanta come in and pull reports.
13 Exponent has recently done reports that show that our
14 inspection practices that look at these are in line with
15 the industry. And with that we go out and we inspect.
16 We look for particular issues, and we change them out as
17 something starts to exhibit an issue.

18 Q. Interesting you bring up Quanta reports. Are
19 you familiar with the 2010 Quanta report?

20 A. I've read through portions of the 2010 Quanta
21 report. There's also a 2012 Quanta report, too.

22 Q. You just testified that PG&E's inspection
23 policies were consistent, but actually the Quanta report
24 suggested that due to aging towers that more inspections,
25 for instance, climbing inspections be done on the aging
26 towers. And PG&E hadn't climbed these towers in a long

1 time; correct?

2 A. So what I had said was that what we were doing
3 was consistent with what the rest of the industry was
4 doing. And that's true.

5 Q. And that also assumes that the persons who are
6 supposed to be doing the work are actually doing what
7 they're supposed to be doing; correct?

8 A. So I'm familiar with the report. I'm not
9 familiar with the individual inspectors and how something
10 gets specifically inspected.

11 Q. All right. So going back to the question . . .

12 [Conferring off the record.]

13 BY MR. NOEL:

14 Q. Again, going back to the question itself, you're
15 not aware of any effort by PG&E to specifically examine
16 and test transmission line components 75 to 100 years
17 old?

18 A. Our program wasn't age based. It was condition
19 based.

20 Q. Okay. If there is such a program, are you aware
21 of the testing parameters and do they include wind tunnel
22 testing and temperature control testing that would
23 approximate the affects of extremes of weather on such
24 components?

25 A. There's a variety of testing that goes on before
26 we choose a manufacturer. That's at the beginning of

1 selecting equipment and identifying what kind of
2 conditions it needs to be good for.

3 Q. Have you ever been pressured by PG&E management
4 to respond to the economy of a project over specific
5 engineering safety issues? Or I may have misread that.
6 Basically putting cost over safety.

7 A. We're specifically told to put safety first.
8 And that's an instance that is discussed in our trainings
9 that, you know, we have to make sure that safety is
10 number one.

11 Q. All right. So going back to earlier to clarify,
12 you said that the program is condition based, not age
13 based. What program were you talking about?

14 A. So I'm going to have to defer on that one. I'm
15 not an expert on our inspection policies. But we do have
16 several experts in that field, and you can work with our
17 folks to get those guys in here to come talk about that.

18 Q. Okay. You're talking about the inspection
19 policies; correct?

20 A. Correct.

21 MR. NOEL: Okay. Anything else? I think that
22 is it.

23 Madam foreperson will have an admonition for
24 you. And you may leave the exhibits on the desk.

25 GRAND JURY FOREPERSON: Mr. Davis, you are
26 admonished not to discuss or disclose at any time outside

1 of this jury room the questions that have been asked of
2 you or your answers until authorized by this grand jury
3 or the Court. A violation of these instructions on your
4 part may be the basis for a charge against you of
5 contempt of court. This does not preclude you from
6 discussing your legal rights with your own attorney.

7 Mr. Davis, what I have just said is a warning
8 not to discuss this case with anyone except the Court,
9 your lawyer, or the district attorney.

10 Do you have any questions?

11 THE WITNESS: No.

12 GRAND JURY FOREPERSON: Okay. Thank you for
13 your time today.

14
15 [DISCUSSION OMITTED.]

16
17 [Exhibits 692 though 704
18 admitted into evidence.]

19
20 [Recess taken at 10:21 a.m.]

21
22 [PROCEEDINGS OMITTED.]

23
24 [Recess taken from 10:26
25 until 10:33 a.m.]

26 GRAND JURY FOREPERSON: Okay. All members of

1 the grand jury are present and ready to proceed.

2
3 [DISCUSSION OMITTED.]
4

5 [Witness enters the courtroom.]

6 GRAND JURY FOREPERSON: Mr. James, before you
7 have a seat, please raise your right hand to be sworn.

8 Mr. James, do you solely swear that the evidence
9 you shall give in this matter pending before the grand
10 jury shall be the truth, the whole truth, and nothing but
11 the truth so help you God?

12 THE WITNESS: I do.

13 GRAND JURY FOREPERSON: Thank you. Have a seat,
14 please.

15 **EXAMINATION**

16 BY MR. NOEL:

17 Q. Mr. James, for the record please state your full
18 name spelling your last.

19 A. My full name is Bradley Allyn -- and that's
20 A-l-l-y-n -- James, J-a-m-e-s.

21 Q. Mr. James, are you employed?

22 A. Yes.

23 Q. By whom are you employed?

24 A. By Exponent Incorporated.

25 Q. What is Exponent Incorporated?

26 A. Exponent is an engineering and scientific

1 consulting company.

2 Q. Can you explain to us what an engineering and
3 scientific consulting company does.

4 A. Well, so we have lots of different engineering
5 and scientific disciplines. I myself am a metallurgical
6 engineer. And one of the basic functions of my job is
7 looking at things that have -- have broken and figuring
8 out why they broke.

9 Q. All right. So you have in front of you
10 Exhibit 706. Do you recognize Exhibit 706?

11 A. I do.

12 Q. What is Exhibit 706?

13 A. This is -- this is a report that I and my team
14 wrote regarding the repair tags from the Caribou-Palermo
15 line.

16 Q. Okay. How is it that you have come to write a
17 report on the repair tags on the Caribou-Palermo line?

18 A. So I was asked by a law firm called Cravana
19 (phonetic) that they were looking for a company -- well,
20 a person in a company to do an independent investigation
21 for the CPUC and for PG&E as to why the Caribou-Palermo
22 line had more repair tags than other similar lines.

23 Q. Is it common for your company Exponent to do
24 independent investigations such as this?

25 A. Yes.

26 Q. All right. Now, I am going to switch screens

1 real quick. All right. So we have the report. Now,
2 tell us a little bit about the report.

3 A. Well, what do you want to know?

4 Q. Well, first of all, when did you start working
5 on the report?

6 A. We started working on the investigation, if I
7 recall, in March or April of 2019. I probably didn't
8 start writing the report until, you know, September
9 timeframe.

10 Q. And we talked about investigation. What type of
11 investigation did you do?

12 A. So this investigation was mostly looking at
13 data, looking at data that had been supplied by PG&E
14 about their -- the lines and their system in comparing
15 the data from the Caribou-Palermo line to other lines.

16 Q. Now, you used a term earlier "repair tags." You
17 said that you were looking at repair tags on the
18 Caribou-Palermo. What are repair tags?

19 A. So good question. So when somebody goes -- when
20 PG&E employees go inspect the lines, they do a condition
21 assessment and then that condition assessment gets turned
22 into repair tags. And the more severe the problem they
23 find, that creates a different type of repair tag. They
24 have several different types of repair tags which
25 basically say how bad it is and how quickly the problem
26 needs to get fixed.

1 Q. Okay. Can you describe the process of
2 investigation and what you went through to ultimately
3 come up with this report.

4 A. So we went through a lot of data. We talked to
5 a lot of employees from PG&E, folks who had -- who knew
6 about the various lines.

7 One of the big things we had to do was to come
8 up with a good representative set of comparison lines,
9 lines to compare Caribou-Palermo with. We got all the --
10 we got all the data from PG&E and then basically just
11 analyzed the data. We'd ask questions. They'd maybe
12 give us some more data that we asked for.

13 One thing that you all should know is that this
14 was done jointly between PG&E and the CPUC. So talking
15 about this project I only ever talked to the CPUC and
16 PG&E at the same time to get the information and data
17 that we got.

18 Q. All right. So I kind of want to walk through
19 the report. The report is 84 pages; correct? Or
20 actually, about 70 pages of actual text; correct?

21 A. I haven't counted it. I can count it if you
22 want me to.

23 Q. No, you don't need to. But kind of walk through
24 it so that our jurors will be able to understand the
25 report. They can read it. And so let's start with the
26 executive summary.

1 A. Sure.

2 Q. What is an executive summary?

3 A. So the executive summary is really kind of
4 the -- it condenses the entire report in a few pages
5 basically.

6 Q. Okay. And then at the bottom of the executive
7 summary you have some conclusions. So I'd like to spend
8 a little bit of time on those conclusions to start with.
9 And that says "Based on our analysis we have reached the
10 following conclusions."

11 Who is the "our"?

12 A. Exponent.

13 Q. Yourself in particular?

14 A. Yeah. So I led the team that did this analysis.

15 Q. And that's the next question is describe for us
16 your team.

17 A. So my team was a number of engineers who went
18 through all the data, created all the plots. We probably
19 had between five and ten folks working on this while it
20 was happening.

21 Q. What education and training and experience do
22 you have that qualifies you to do this sort of
23 investigation and analysis?

24 A. So I have a Ph.D. in metallurgical engineering.
25 I'm a professional engineer and I've been working in
26 engineering consulting at Exponent actually for 25 years.

1 Q. All right. So can you walk us through your
2 conclusions?

3 A. Happy to. Do you just want me to kind of read
4 them and talk about them?

5 Q. Yep.

6 A. Okay.

7 Q. You can read them, and I'll ask questions to
8 explain them.

9 A. Sure. So conclusion number one "The
10 Caribou-Palermo line was confirmed to have a greater
11 number of post-Camp Fire high priority --" and high
12 priority tags are denoted "A" and "B" tags "-- then all
13 selected comparison lines as well as an increased per
14 structure high priority tag rate when normalized for the
15 number of steel lattice towers."

16 Q. All right. Start with when you're talking about
17 post-Camp Fire repair tags. So you're limiting this to
18 what?

19 A. So, you know, I don't know the extent to which
20 you guys know all this, but after the Camp Fire PG&E did
21 this WSIP program, the Wildfire Safety Inspection
22 Program. And so these were enhanced inspections. They
23 had big teams that went out and looked at all these
24 components.

25 And so apparently because of that, because they
26 had found an increased number of tags on Caribou-Palermo

1 than all the other lines, I believe the CPUC said "Hey,
2 what gives? Let's have somebody do an analysis."

3 And so really this opinion number one is kind of
4 validating that. Basically, this is us saying "Yes, we
5 looked at all the tags and, yes, Caribou-Palermo not only
6 had more tags than the other lines even when you
7 normalize it." And that means --

8 Q. We'll get to that in just a second.

9 A. Okay. So I will stop and I will let you ask
10 some more questions.

11 Q. Let's walk through it. You talked about the "A"
12 and "B" repair tags. Are you referring there to the PG&E
13 priority designations for their notifications or tags?

14 A. Yes.

15 Q. So that would be the A, B, E, F?

16 A. Correct.

17 Q. Okay. Comparison lines. What are comparison
18 lines?

19 A. So comparison lines -- and I don't -- I don't
20 know how many of them there were off the top of my head,
21 but there were 40 some odd lines that we looked at that
22 had -- from PG&E that were similar in terms of -- in
23 terms of the voltage they carried, the elevation they
24 were at, the time that they were constructed. That sort
25 of thing. We wanted to compare apples and apples.

26 Q. All right. And now can you define or explain to

1 us what it means to be normalized.

2 A. Sure. So normalized really just means divided
3 by the number of towers. So if -- let's -- if we have a
4 couple of lines, let's say one has ten tags and one has
5 five tags, that -- you know, comparing ten and five is
6 fine. But if one line has ten times the number of
7 towers, then maybe that ten tag doesn't -- isn't as high
8 a rate as the one that, say, has five tags and far fewer
9 towers.

10 So we basically just divide the number of towers
11 to make it a level playing field basically.

12 Q. All right. Do you compare apples to apples and
13 oranges to oranges?

14 A. Sure.

15 Q. All right. Conclusion number two. Can you read
16 that for us.

17 A. Sure. "Other lines adjacent to Caribou-Palermo
18 such as Bucks Creek, Rock Creek Cresta --" and that's the
19 "BCRC" "-- Cresta Rio Oso and Paradise Table Mountain had
20 the second, fourth, and fifth highest post-Camp Fire high
21 priority tags respectively when normalized for steel
22 lattice towers."

23 PIT 4 Tap had the third highest normalized high
24 priority tag count, but it's not near Caribou-Palermo.

25 Q. And conclusion number three.

26 A. "Cold-end insulator hardware-related issues were

1 responsible for the highest number of 'A' priority
2 post-Camp Fire tags on Caribou-Palermo and the second
3 highest number of 'B' priority tags. Foundation-related
4 issues accounted for the greatest number of 'B' tags."

5 Q. So when you refer to cold-end insulator
6 hardware, can you explain to us what you're -- what that
7 means.

8 A. Right. So the insulators that insulate the
9 electricity from the tower typically hang from the tower.
10 And there's a hot end to the insulator and a cold end.
11 The hot end of the insulator is the part that contacts
12 the conductor. The cold end is the part that contacts
13 the tower. We're particularly interested in the cold-end
14 hardware because that's what reportedly failed and
15 started the Camp Fire.

16 And so that -- so that's what we're focusing on
17 in number three when we're talking about the cold-end
18 insulator hardware is basically the C-hooks and other
19 apparatus that attach the insulators to the tower.

20 Q. All right. Conclusion number four.

21 A. "Wear was the most commonly observed post-Camp
22 Fire damage mechanism for Caribou-Palermo 'A' tags and
23 the second most commonly observed damage mechanism for
24 'B' tags. Nearly all Caribou-Palermo wear-related tags
25 were associated with cold-end hardware. Cold-end
26 hardware wear issues were likely caused by repeated

1 conductor and insulator movement over time."

2 Q. Okay. Can you define the term "wear" for us.

3 A. So wear is the progressive removal of material
4 caused by that material being contacted with something
5 else and taken away over time.

6 Q. Okay. And then it says "Cold-End hardware
7 issues are likely caused by repeated conductor/insulator
8 movement over time." Can you explain that statement.

9 A. So the wear that we -- that is happening on --
10 that was happening on those cold-end insulators was
11 caused by the motion between the insulator and the
12 attachment mechanism. And that's a time event process.
13 It takes time and relative motion over time to cause that
14 wear.

15 Q. Is there a term for that type of wear?

16 A. Well, there are all kinds of engineering terms
17 for that. Fretting is one type of engineering term for
18 that kind of wear.

19 Q. And fretting. Can you spell that for the court
20 reporter.

21 A. F-r-e-t-t-i-n-g.

22 Q. And what exactly is fretting?

23 A. Fretting is the removal of metal due to
24 metal-on-metal contact and small motions between those
25 two pieces of metal.

26 Q. All right. Number five.

1 A. "Caribou-Palermo, Bucks Creek, Rock Creek
2 Cresta, and Cresta Rio Oso lines each located within the
3 North Fork Feather River Canyon exhibited high priority
4 cold-end hardware tag counts more than three times higher
5 than the next highest comparison line when normalized for
6 steel lattice towers."

7 Q. Can you explain that conclusion to us, please.

8 A. So we saw high wear rates. We saw -- we saw --
9 actually, I'll put it this way. We saw high tag counts
10 for basically the three lines in the North Fork Feather
11 River Canyon; Caribou-Palermo, Bucks Creek, Rock Creek
12 Cresta, and Cresta Rio Oso. And those lines are all
13 pretty much parallel to each other in that canyon.

14 Q. Okay. Number six, your conclusion number six.

15 A. "Link connections were observed on only the
16 southern portion of Caribou-Palermo and accounted for
17 approximately 40 percent of cold-end hardware wear tags
18 on the entire line. All of the Caribou-Palermo south
19 wear tags were associated with the link connections."

20 Q. What is a link connection?

21 A. Well, so there are several different types of
22 cold-end hardware connections. And the link connection
23 is, as we learned when we did this analysis, is an older
24 style of connection. And we only saw a link connection
25 on the southern parts of Caribou-Palermo.

26 So basically south of Lake Oroville down --

1 pretty much down in the valley floor. And these link
2 connections had a -- had a higher wear rate than many of
3 the other connections we saw.

4 Q. Okay. Number seven.

5 A. "Roughly one-sixth of drone-imaged
6 Caribou-Palermo north towers contained insulated jumpers.
7 However, over 60 percent of the post-Camp Fire high
8 priority cold-end hardware wear tags on Caribou-Palermo
9 north were associated with structures that contained
10 insulated jumpers.

11 Additionally, over half of all cold-end hardware
12 wear tags on Bucks Creek, Rock Creek Cresta, and Cresta
13 Rio Oso were on towers with insulated jumpers."

14 Q. What is an insulated jumper?

15 A. So an insulated jumper is a conductor that is
16 typically at the tower and is not under tension. It
17 basically hangs from one conductor to the other
18 conductor. I've got pictures in my report that I could
19 show.

20 Q. Okay. We'll go through those in a second.

21 A. Yeah. But it's a -- it's a short hanging length
22 of conductor that is basically used to bridge -- to
23 bridge one conductor to the next across a tower.

24 Q. All right. So conclusion number eight.

25 A. "Caribou-Palermo north and other North Fork
26 Feather River Canyon comparison lines contained an

1 increased number of insulated jumpers and insulated
2 jumper wear tags compared to similar lines. These
3 Caribou-Palermo and other North Fork Feather River Canyon
4 structures with insulated jumpers exhibited a higher
5 incident of cold-end hardware wear than standard
6 suspension structures."

7 Q. What is a standard suspension structure?

8 A. So a standard suspension structure is when
9 you've got a tower and you've got the arm of the tower.
10 And the insulator hangs straight down and the conductor
11 just goes straight along the bottom. And it just hangs
12 from that bottom of the insulator whereas --

13 And that's what you typically see driving down
14 the road looking at towers. What we were talking about
15 in number eight is that those typical standard
16 suspension-style towers exhibited less wear on average
17 than ones that had these hanging no-tension insulated
18 jumpers.

19 Q. All right. Number nine.

20 A. Number nine "Caribou-Palermo north experiences
21 higher annual average wind speeds than non-adjacent
22 comparison lines. Lines analyzed within the North Fork
23 Feather River Canyon may have increased wear tags
24 associated with longer duration high wind conditions. No
25 apparent correlation between wear tags and temperature,
26 precipitation, or peak wind speed --" and that's the

1 50-year return peak wind speed "-- was observed."

2 Q. All right. This one is going to take some
3 explaining.

4 A. Okay.

5 Q. So where do you get wind speeds?

6 A. So we got wind speeds from the National
7 Renewable Energy Laboratory. They've got a website that
8 has wind speeds from, I think it was, years, historical
9 wind speeds on a day-by-day basis down to a pretty fine
10 grid. I believe it was between 2007 and 2013.

11 Q. What is the National Renewable Energy . . .

12 A. Laboratory. It's a government agency that -- in
13 this case I think because they're looking at, you know,
14 how good of an area you might have for wind farms or what
15 have you, that's why they do all these wind studies.

16 Q. So how do you figure that the Caribou-Palermo
17 north has higher annual average wind speeds?

18 A. So -- and by the way, so we divided
19 Caribou-Palermo north and south. There is kind of a
20 natural dividing line in PG&E circuits. Below a thousand
21 feet they typically have one type of tower that might
22 carry two circuits and then above a thousand feet they
23 have a different -- what they call a snow tower. It was
24 a snow tower that was at issue in the Camp Fire. And so
25 that's -- so Caribou-Palermo north is basically snow
26 towers. Caribou-Palermo south is basically dual circuit

1 towers.

2 And how do we come up with -- so we looked at
3 the NREL wind data. We picked a representative year;
4 2010. And we roughly compared 2010 to the other
5 available years. It was -- they were all basically the
6 same on a yearly basis.

7 And so then we looked at -- we looked at peak
8 wind, at average winds. We looked at number of hours
9 above certain wind speeds to assess.

10 One of the questions obviously was -- I'm
11 backing up a little bit, but one of the questions was why
12 does Caribou-Palermo have more tags -- repair -- high
13 priority repair tags than other lines?

14 And so one of the hypotheses, one of the
15 theories that we wanted to explore was, well, maybe part
16 of that is because of where it's located in terms of
17 wind, wind causing this motion between the metal parts
18 and the wear.

19 Q. And based upon the data you were able to
20 determine that there was no apparent correlation between
21 the weather and the wear?

22 A. Not exactly. So you can see that we talked
23 about there -- there was no -- there was no apparent
24 correlation between tags and temperature. So we had
25 temperature all along the line. We didn't see any spikes
26 in tags for cold or warmer temperatures.

1 Same with precipitation. We looked along the
2 line. We didn't see any spikes or clusters as associated
3 with precipitation.

4 And the same with peak wind speed. But there's
5 lots of ways to slice wind speed. And peak wind speed --
6 this 50 year return -- this is basically -- this was
7 basically from a map that says "Okay. What's the hardest
8 the wind is going to blow in 50 years?" That's what
9 50-year return means. So a 50-year windstorm is a
10 once-every-50-year windstorm.

11 We found that the wear tags do not correlate to
12 the once-every-50-year windstorm.

13 Q. Okay. Number ten.

14 A. "From 2001 to November 2018 the Caribou-Palermo
15 line was subjected to similar ground inspections and
16 patrol frequencies as comparison lines. These
17 inspections and patrols yielded comparable normalized
18 high priority tag counts between Caribou-Palermo and
19 comparison lines."

20 Q. Now, where are you getting the information on
21 ground inspections and patrol frequencies?

22 A. That came from PG&E.

23 Q. Okay. Records or people or --

24 A. Records.

25 Q. What type of records?

26 A. Digitized paper records that talked about these

1 inspections.

2 Q. Okay. Did you do any research into the quality
3 of the inspections that were reflected upon by those
4 records?

5 A. I would say indirectly we looked at some of the
6 indications of quality with respect to those records.
7 There's no way for us to tell the quality of the
8 inspection that occurred. We did look at some of the --
9 at some of the things that they were looking for. And
10 indirectly we can look at quality by saying "Okay. Are
11 they assuming?"

12 Yeah. Assuming everything is equal, are they
13 seeing a similar number of tags and inspections and
14 inspection frequencies between the various circuits?

15 Q. Okay. But you're relying upon the PG&E
16 inspection and patrol records to be complete and
17 accurate; is that correct?

18 A. Yes.

19 Q. All right. Let's move on to number 11.

20 A. "Historical ground and patrol --" sorry.
21 "Historical ground and patrol inspection forms did not
22 specify cold-end hardware assessment. Pre-Camp Fire
23 climbing inspection forms did contain assessment fields
24 for structural components such as insulator hardware.
25 However, climbing inspections were not routinely
26 performed on lines less than 500 kilovolts."

1 Q. Again, that's part of PG&E's policy?

2 A. That was -- and we got that from their subject
3 matter experts. But that was -- my understanding was
4 that PG&E's policy was to generally not inspect -- do
5 climbing inspections on the lines that were less than 500
6 kilovolts.

7 Q. Okay. And in terms of the inspection forms,
8 historically how far back did you go?

9 A. 2001.

10 Q. So you didn't look at any of the policies prior
11 to 2001?

12 A. I don't believe we ever saw those.

13 Q. Okay. All right. Number 12.

14 A. "Although climbing inspections were not
15 routinely performed on lines less than 500 kilovolts, 79
16 Caribou-Palermo towers were subjected to climbing
17 inspections in the months prior to the Camp Fire. The
18 tower reportedly associated with the Camp Fire was not
19 inspected. PG&E's post-Camp Fire enhanced inspection
20 procedures including CIRT or DIRT reviews have led to
21 substantial improvements in identifying progressive or
22 wear-related insulator hardware damage."

23 Q. All right. So after the fire now they're
24 looking for damage on cold-end insulator hardware?

25 A. That's true after the fire they were looking for
26 that.

1 Q. All right. Number 13.

2 A. "The Caribou-Palermo line had more normalized
3 equipment-based outages between 2007 and 2018 than
4 approximately 80 percent of the other WSIP transmission
5 lines."

6 Q. Explain that conclusion to us, please.

7 A. Yeah. So PG&E reports outages when the power
8 goes out. We have access to that -- had access to that
9 data. And so we stripped out lots of the -- or some of
10 the types of outages -- planned outages and what have you
11 and just looked at equipment-related outages. So outages
12 caused by equipment failures.

13 And so what we found -- and so this outage data
14 went for 11 years. And what we found is that 80 percent
15 of the lines had fewer outages than Caribou-Palermo. The
16 other way to look at it would be that 20 percent of the
17 lines had more -- and these are all the -- and sorry --
18 the WSIP. Again, that's the Wildfire Safety Inspection
19 Program lines. I think there are about 550 total lines
20 in this -- in the WSIP purview. Twenty percent of the
21 lines would have had more outages than Caribou-Palermo.
22 Eighty percent less.

23 Q. So again, can you define an outage for us.

24 A. An outage -- so this is an equipment-based
25 outage. So these are outages that were caused by
26 equipment problems.

1 Q. I guess just the basics. What is an outage?

2 A. An outage is when the line trips and the power
3 goes out.

4 Q. So the power going through the line is
5 disrupted?

6 A. Sure, yeah.

7 Q. Failure. Another word for failure or momentary?

8 A. Sorry. I didn't quite catch that.

9 Q. Other words for it -- PG&E words for it would be
10 failure or momentary. Is that true?

11 A. I don't know.

12 Q. Okay. All right. So and as opposed to some of
13 the conclusions, what we referred to as comparison lines,
14 you're talking about the entirety of the WSIP; right?

15 A. Right.

16 Q. You're not just limited to the comparison lines?

17 A. Correct.

18 Q. All right. And finally, number 14.

19 A. "Caribou-Palermo and other North Fork Feather
20 River Canyon lines appear to have a unique set of factors
21 contributing to increased rates of high priority cold-end
22 hardware tags relative to other comparison lines.
23 Factors such as design, link connections, a large number
24 of non-insulated conductors, long duration exposure to
25 higher winds, age, and historical inspection
26 methodologies likely all contributed to these cold-end

1 hardware wear issues."

2 Q. What role does age play in that conclusion?

3 A. Well, this is a time-related process. Wear is a
4 time-related process. And so the older something is the
5 longer it has to -- to wear out.

6 Q. Is that a new concept in engineering?

7 A. No.

8 Q. Did you discover something new in looking at the
9 wear on the Caribou-Palermo line?

10 A. I think the thing that we discovered that may be
11 fairly new is this whole non-tensioned conductor issue.
12 I think in general, at least my knowledge of the power
13 industry, has been largely focused on the tensioned
14 conductors, the part of the conductors that span from
15 tower to tower when they're under high stress.

16 The fact that these non-tensioned jumpers also
17 wear and seem to wear at a high rate, I hadn't seen
18 anything in the literature that talked about that.

19 Q. We talked earlier about this concept that you
20 described for us of fretting. Was fretting a known
21 engineering concept prior to the Camp Fire?

22 A. Yes.

23 Q. And how long has fretting been a known
24 engineering concept?

25 A. That's a good question. There's probably some
26 historical papers. Probably 1800s is when people first

1 started figuring out fretting. Fretting happens a lot in
2 bearings. So certainly as long as there have been
3 bearings people have seen fretting.

4 Q. So for a while it's been known or for over
5 100 years it's been known that when you have two pieces
6 of metal rubbing against each other, that one or both is
7 going to wear; correct?

8 A. There are lots and lots of -- I mean, wear is a
9 complicated process. But, in general if you have two
10 pieces of metal rubbing back and forth, that depends on
11 how much they rub, the distance of rubbing, the
12 lubrication and all of that. But you can -- certainly
13 it's well-known you can definitely get wear if you have
14 two pieces of metal rubbing.

15 Q. And there are ways to slow or eliminate that
16 process; correct?

17 A. Sure.

18 Q. All right. So I'm not going to make you go
19 through the entirety of your report.

20 A. Thank you.

21 Q. But I do want to talk about and have you
22 describe this section of limitations and what are
23 limitations and how do they affect the conclusions.

24 A. So limitations are basically something that we
25 put -- as an engineering consulting company we put
26 limitations in every one of our reports. And that's for

1 the reader to understand the limitations of our analysis.
2 And so that first paragraph basically lays out what we
3 looked at, you know, the extent of what our investigation
4 covered. And then we basically say, you know, "We've
5 relied on PG&E to help select representative comparison
6 lines and structures as well as with regard to the
7 quality and completeness of the data that they gave us."

8 Q. Familiar with the term "garbage in, garbage
9 out"?

10 A. I'm -- I'm well -- as an engineer you hear that
11 a lot "Garbage in, garbage out."

12 Q. Is that what that final sentence is talking
13 about in the first paragraph there?

14 A. Maybe not quite as colorfully as that, but it's
15 basically saying, you know, this -- you know, we relied
16 on PG&E for the data and we had no way to independently
17 verify that data.

18 Q. So, for instance, we talked about the inspection
19 and patrol records that you relied upon when -- as part
20 of your investigation. And if those inspection patrol
21 records weren't complete, weren't accurate, then that
22 would affect the final conclusions based upon those
23 records; correct?

24 A. That is fair, yeah.

25 Q. All right. Next, the scope of the services.
26 Can you explain.

1 A. Yeah. So this stuff is, you know -- so this one
2 is the second paragraph. You know, that's basically
3 saying that anybody who is using this is at their own
4 risk, that we're not predicting any future life or
5 performance. You know, you can't read this report and
6 say "Oh, I think all the other lines are good or bad or
7 what have you." It's just specifically about what we
8 have been talking about.

9 Q. All right. And third paragraph.

10 A. Then the third paragraph is basically, you know,
11 our promising that we have made all of these -- these
12 conclusions to a reasonable degree of engineering
13 certainty and we've made every effort to be accurate and
14 completely investigate these areas in our investigation.

15 If something new comes up or if somebody finds a
16 mistake or an issue, we ask that they let us know so that
17 we can take a look at it and see if we need to fix
18 something.

19 Q. All right. And then if you could describe for
20 us the scope and the background.

21 A. So the scope is really the ask. So what were we
22 asked to do in this analysis?

23 Q. All right. And the "PG&E Enhancement Inspection
24 and Repair Tag Process."

25 A. So this is just a background section on how PG&E
26 does their inspection and repair tag process.

1 Q. And that's the information provided to you as
2 provided by PG&E?

3 A. Correct.

4 Q. And then Table 1, the priorities.

5 A. Right. So those are -- you see the A, B, E, F
6 in the column over there. Those are the ratings for the
7 tags. So an "A" tag is something that is -- it's pretty
8 bad and you need to perform immediate corrective action.
9 "B" basically they say "Okay. We need to fix this within
10 three months." "E" is within a year, "F" within -- it
11 needs to be fixed, but you don't need to fix it for a
12 year or more than a year.

13 Q. And then this final paragraph during PG&E's
14 enhanced inspection.

15 A. Right. So this is kind of restating the reason
16 why we got involved. So people found -- CPUC, I suppose,
17 found what they believed to be high rates of "A" and "B"
18 tags as part of this post-Camp Fire enhanced inspection
19 and they want to know "Well, what's going on?"

20 And so we were asked to, one, evaluate whether
21 it really did in fact have a greater number of high
22 priority tags. And that was easy to figure out if it had
23 more tags. Then when we did that normalization, we made
24 sure that, you know, we divided by the number of tags
25 with the number of steel lattice towers and compared that
26 apples-to-apples style for other lines and their tags and

1 their steel lattice towers. So that was number one.

2 And then number two was to help figure out
3 why -- so if number one is true, so why do we have
4 increased high priority tag counts on Caribou-Palermo?

5 Q. All right. And next up is the documents
6 reviewed.

7 A. Right.

8 Q. Kind of walk us through.

9 A. So we -- the first bullet, that's all the
10 corrective action work orders generated on
11 Caribou-Palermo and the comparison lines. And so this
12 includes staging tags, which PG&E denotes as S5 tags.

13 Q. What is staging?

14 A. So that means an inspector saw an issue, but
15 they hadn't -- it hadn't been evaluated yet by their team
16 of inspectors, general inspectors to put it to the next
17 step which was an LC tag.

18 Q. Okay. Go ahead.

19 A. So we looked at all these tags, the S5 tags and
20 LC tags. We eventually were able to not have to include
21 the S5s and everything else. We kept it as LC tags
22 across the board for all the lines. So those are the
23 high priority, the "A" and "B" tags.

24 We also analyzed and cataloged for Camp Fire,
25 the -- the E and F tags, the lower priority tags.

26 Second bullet we looked at all pre-Camp Fire

1 high priority tags from 2000 to 2019. We looked at the
2 enhanced inspection forms. They're called pronto forms.
3 Those are the forms the inspectors fill out.

4 Q. Those would have been post-Camp Fire; correct?

5 A. Correct.

6 Q. Okay.

7 A. And then the next bullet we looked at all the
8 available drone images through -- we had them all through
9 May 2019. We're talking thousands and thousands and
10 thousands of images on there for Caribou-Palermo and
11 these other lines.

12 We used the drone images to -- part of the big
13 thing we did with the drone images was to figure out what
14 kind of components were on the various lines, try to sort
15 out "Well, is one component type more prone to wear than
16 the other component types?"

17 Next, asset information from the GIS data.
18 That's basically their mapping data that shows what steel
19 lattice towers they have, if they have wear, what sort of
20 conductors they have with those towers.

21 Detailed climbing inspection forms for the
22 inspections carried out prior to the Camp Fire. We
23 looked at design books for towers for Caribou-Palermo and
24 several other comparison lines. We wanted to see what
25 sorts of components and hardware they had with the
26 original design and how that might have changed over the

1 years if it did.

2 We've already -- the next bullet we've already
3 talked about which is all the wind and weather records
4 and then the historical maintenance and inspection
5 records from 2001 to 2018.

6 Oh, and there's still more. So we also looked
7 at the outages from 2007 to 2018. We looked at the PG&E
8 Electric Transmission Preventative Maintenance Manual;
9 the ETPM. We had a few interviews with PG&E subject
10 matter experts for them to answer some of our questions
11 and to help us select the comparison lines. Those
12 meetings were done with CPUC personnel in the room as
13 well.

14 And we looked at the Cal Fire Camp Fire
15 investigation photographs. And there is a book that we
16 referenced in the report on -- from Electric Power
17 Research Institute on wind-induced conductor motion.

18 Q. All right. So then it goes through your
19 methodology.

20 A. Yep.

21 Q. And your choice of comparison lines.

22 A. Right.

23 Q. And why don't you talk to us a little bit about
24 choice of comparison lines.

25 A. Yeah. Well, you see the four bullets. So we
26 wanted to compare similar lines. And Caribou-Palermo was

1 a 115 kV line. So we picked 115 or 230 kV lines for
2 comparison. A couple of the -- a couple of the lines in
3 North Fork Feather River Canyon are 230s. 230s and 115s
4 are apparently fairly similar in terms of construction
5 and in terms of inspection methodologies by PG&E.

6 We wanted elevations greater than a thousand
7 feet. We wanted single circuit steel lattice towers and
8 we wanted Tier 2 or Tier 3 fire zones. We also wanted
9 similar age of towers.

10 Q. So how many comparison lines did you ultimately
11 find?

12 A. So ultimately we found -- it says in the next
13 paragraph ultimately we found 43 comparison lines.
14 However, of those 43 there were 15 that had relative few
15 steel lattice towers; less than 30. And the fewer steel
16 lattice towers you have, the more -- the more difficult
17 it is to analyze on an apples-to-apples basis in terms of
18 any kind of rate. So we excluded those 15 leaving us
19 less than 30 towers. So that left us with 28 in the
20 comparison group, nine of which were 115 kilovolt and 19
21 which were 230.

22 Q. So going back to the conclusions from earlier,
23 so of those 28 lines four of the five in terms of the
24 highest tag numbers were in Feather River Canyon?

25 A. Yep.

26 Q. All right. So a couple more things I want to go

1 through. Table 2. Is this list the comparison lines?

2 A. Yes.

3 Q. One of the things that I highlighted on there is
4 that it indicates that the approximate install date of
5 the Caribou-Palermo is 1908. Can you explain that.

6 A. Yeah. So as you folks may or may not know, the
7 hydroelectric Caribou-Palermo dam was put in in the early
8 1920s. A lot of these lines have kind of switched.

9 So there was no original Caribou-Palermo line.
10 It started off -- they started off from multiple
11 different lines from multiple different companies and
12 they basically did merge it and everything else. So the
13 1908 is basically as best we can tell the oldest part of
14 the currently existing Caribou-Palermo line.

15 Q. And I'm going to go back and clarify one thing.
16 On the list of these comparison lines you said there are
17 28. Is that 28 including the Caribou-Palermo or 28 in
18 addition to the Caribou-Palermo?

19 A. I believe it's 28 in addition to the
20 Caribou-Palermo.

21 Q. All right.

22 A. We can go back and check. I'm not sure if it's
23 included or not. Oh, it says right there "including
24 Caribou-Palermo." Very good. Okay.

25 Q. Good. All right. So there are a couple other
26 things. Here we're looking at a map on page 5. And

1 briefly explain this to us.

2 A. So this is a color-coded map of the 28
3 comparison lines including Caribou-Palermo.
4 Caribou-Palermo -- I'll just scooch over.

5 Q. And feel free to stand up and use the board.

6 A. Okay. Sure. So Caribou-Palermo is in yellow
7 right here (indicating). And you can see that there's
8 some other lines that parallel Caribou-Palermo for these
9 parts of the length of Caribou-Palermo.

10 Q. Right. A couple of other terms that I wanted to
11 have you define. First of all, there's binned. You
12 referred multiple times in this report to the term
13 "binned." Here we're on page 6.

14 And did I get this right? Yep. Page 6, the top
15 paragraph under "Corrective action tag review" it says
16 "The lower priority 'E' and 'F' tags were binned."

17 Can you explain to us what it means to binned
18 something?

19 A. So to binned something is to group that data.
20 So we grouped the lower priority "E" and "F" tags.

21 Q. All right. The next term would be "normalized."

22 A. Okay. And so then normalizing is that concept
23 of dividing the number of tags along a line, along, you
24 know, many, many miles of electric transmission lines by
25 the number of towers in that -- in that line to give it
26 equal weight. It's a way for us to compare apples and

1 apples.

2 Q. All right. And then there's this section
3 describing north and south designations.

4 A. Right.

5 Q. And then the maps.

6 A. Right, showing north and south.

7 Q. All right. So basically it looks like the
8 cutoff between north and south is right at about Big
9 Bend.

10 A. Exactly, right.

11 MR. NOEL: All right. Other than that, anything
12 else?

13 Anything else you can think of?

14 MS. DUPRE-TOKOS: No.

15 MR. NOEL: I think that's all I have.

16 Do the jurors have any?

17 Okay. The jurors are allowed to ask some
18 questions.

19 THE WITNESS: Oh, good.

20 MR. NOEL: So we'll go over these.

21 [Conferring off the record.]

22 BY MR. NOEL:

23 Q. All right. So the first question is "In your
24 opinion given the age of the Caribou-Palermo -- PG&E
25 Caribou-Palermo should PG&E upper levels of management
26 been aware of the component issues and the potential for

1 disastrous affects?

2 A. That's an excellent question. That is something
3 that I did not explore at all in this analysis. I was
4 focused on just looking at why Caribou-Palermo had more
5 tags than others. I haven't done any sort of analysis
6 into what PG&E should have known or not.

7 Q. "In your opinion given your analysis could the
8 Caribou-Palermo line be described as critically old and
9 fatigued?"

10 A. The word "fatigued" to a failure analysis
11 metallurgical engineer has specific meaning and that
12 means growing fatigue cracks and that sort of thing. I
13 haven't done any sort of analysis to see if it has
14 fatigued cracks or what have you.

15 I wouldn't necessarily describe it as critically
16 old or fatigued. Like any infrastructure, you have to
17 maintain it. And if you maintain it, they can last a
18 long, long, long time.

19 Q. Have you seen any evidence to indicate PG&E
20 engineering asset management personnel were or should
21 have been aware of the age and potential for catastrophic
22 failure of the components?

23 A. Again, that's not something that I analyzed.

24 Q. In your scientific opinion is age of a metal
25 construction element an important element in evaluating
26 the strength or reliability of such components?

1 A. These are good deep questions. I teach a class
2 at Stanford on occasion in similar things. So I can give
3 you an answer that's not necessarily really part of my
4 analysis. But left by itself as long as it's not
5 corroding away, steel doesn't get weaker with time. It
6 will stay -- it will stay strong. Really corrosion is a
7 process that would cause it to go away.

8 That said, things like wear, things like fatigue
9 do have a time component because the more times you rub
10 that metal against each other, the more chance you have
11 to -- to create wear. The more times you cyclically load
12 the spring in your garage door, the longer you do that,
13 the more chance you are going to initiate a fatigue crack
14 and eventually grow it.

15 But again, I didn't do anything specifically to
16 look at critical ages or chance of catastrophic failure for
17 this -- for these lines.

18 Q. Just a follow up on that. As part of your
19 investigation and your analysis, did you look at any PG&E
20 engineering studies on the wear of the cold-end
21 attachment points?

22 A. I didn't look at any PG&E studies on cold-end
23 attachment wear.

24 Q. Or any PG&E studies on worn C-hooks and tensile
25 strikes?

26 A. I have seen -- it wasn't part of this study, but

1 I have seen pictures of worn C-hooks and cracked C-hooks.

2 Q. And those pictures include the grooving or the
3 fretting like this?

4 A. Right.

5 Q. And how did you see those?

6 A. I don't recall if it was just in the media or
7 what. Oh, actually I do know. It was -- actually, it
8 was part of this. We had the Cal Fire pictures, and I
9 saw the pictures of the C-hooks with grooves and
10 fractured components.

11 Q. So that wasn't part of what PG&E provided to
12 you?

13 A. That was from Cal Fire that I got that.

14 Q. Would that have been of any use to your
15 investigation in your ultimate conclusions?

16 A. Well, I mean, it actually drove our whole
17 investigation. That's why we were focused on the wear
18 was -- was based on those Cal Fire images of the actual
19 accident.

20 But remember, we were limited. Our analysis was
21 limited to does Caribou-Palermo have more tags than the
22 other lines and, b, why does it have more? And so those
23 are the two questions that I was asked to look at.

24 Q. Finally, do you know if PG&E board of directors
25 or the chief of operations or any other PG&E company-wide
26 management personnel are or were briefed on the potential

1 engineering safety issues prior to the Camp Fire?

2 A. Yeah, no idea.

3 MR. NOEL: All right. Thank you, Mr. James.
4 And Madam Foreperson will have an admonishment for you.
5 I appreciate you being here today.

6 THE WITNESS: Okay.

7 GRAND JURY FOREPERSON: Mr. James, you are
8 admonished not to discuss or disclose at any time outside
9 of this jury room the questions that have been asked of
10 you or your answers until authorized by this grand jury
11 or the Court. A violation of these instructions on your
12 part may be the basis for a charge against you of
13 contempt of court. This does not preclude you from
14 discussing your legal rights with your own attorney.

15 Mr. James, what I have just said is a warning
16 not to discuss this case with anyone except the Court,
17 your lawyer, or the attorney district attorney.

18 Do you have any questions?

19 THE WITNESS: No.

20 GRAND JURY FOREPERSON: Okay. Thank you for
21 your time today.

22 THE WITNESS: Thank you.

23 MR. NOEL: All right. Thank you, Sir.

24 I will take this. We've got to make sure the
25 witnesses don't walk out with the exhibits. It has
26 happened. We have had to chase at least one down.

1 THE WITNESS: Thank you.

2 [Witness Brad Mr. James exits the courtroom
3 as witness Frank Dauby enters.]

4 MR. NOEL: All right.

5 GRAND JURY FOREPERSON: Mr. Dauby, before you
6 have a seat, please raise your right hand to be sworn.

7 Mr. Dauby, you do solemnly swear -- pardon me.
8 Just give me a minute.

9 Do you solemnly swear that the evidence you
10 shall give in this matter pending before the grand jury
11 shall be the truth, the whole truth, and nothing but the
12 truth so help you God?

13 THE WITNESS: I do.

14 GRAND JURY FOREPERSON: Thank you. Have a seat,
15 please.

16 MR. NOEL: It's another short one.

17 THE WITNESS: If I could make one comment. I'm
18 not retired.

19 MR. NOEL: We'll get to that in a second.

20 All right. Are we ready?

21 GRAND JURY FOREPERSON: We are ready.

22 **EXAMINATION**

23 BY MR. NOEL:

24 Q. All right. Mr. Dauby, for the record, can you
25 please state your full name spelling your last name.

26 A. My full name is Frank A. Dauby, Jr. Last name

1 is pronounced Dauby, spelled D-a-u-b-y.

2 Q. All right. Now, you said something about not
3 being retired.

4 A. That's correct. I am presently employed by
5 Pacific Gas & Electric Company.

6 Q. What do you do for PG&E?

7 A. My present role is an in line inspection
8 principal engineer which is part of the Gas Transmission
9 Integrity Management Organization. And I support the
10 continuing inspection of our gas transmission system
11 within the service territory.

12 Q. How long have you been with PG&E?

13 A. I have been with PG&E -- it was 35 years in July
14 of this year.

15 Q. First of all, are you an engineer?

16 A. Yes.

17 Q. Can you walk us through your educational
18 background.

19 A. Sure. So I have a Bachelor's of Science in
20 civil engineering from the Georgia Institute of
21 Technology, graduated in 1984 and immediately thereafter
22 came to work for Pacific Gas & Electric Company.

23 Q. Is there a more common name that we might know
24 the Georgia Institute of Technology?

25 A. Yeah. Georgia Tech. And I'm a registered civil
26 engineer in the state of California.

1 Q. How did you get from Georgia Tech to PG&E?

2 A. Well, I was a -- while I was in school, I worked
3 as a Cobb student for Georgia Power mostly on electric
4 major plant construction for an electric generation
5 project. So having utility experience set me up to
6 continue in that career in general although with the
7 Pacific Gas & Electric Company I have essentially only
8 supported the gas transmission facilities infrastructure.

9 Q. If you could, please walk us through your PG&E
10 career, the assignments you've held, the jobs, and a
11 little bit of description of what you were doing.

12 A. Sure. So when I was first hired, I worked as a
13 field engineer. PG&E has a significant construction
14 force that are employees, and I supported the field crews
15 who were installing gas transmission pipeline facilities,
16 either replacement or new pipelines, and some other
17 underground facilities, a little bit of underground
18 electric and underground gas distribution but principally
19 gas transmission.

20 I did that for approximately five years and then
21 I moved into our gas engineering organization first in
22 San Jose and then in San Francisco where I performed
23 design work for new gas transmission pipelines or
24 replacement of gas transmission pipelines. I did that
25 for approximately five years from 1989 to 1994.

26 And then I moved geographically to our Walnut

1 Creek office where I became a pipeline engineer. I
2 covered a specific geographic territory which included
3 what we call mission and vision which is basically most
4 of Alameda County and Stockton division which covers
5 Stockton and that area as well as a couple of our
6 districts which is a slightly different geography
7 covering Tracy and then McDonald Island where our main
8 gas storage facility is located.

9 So I supported those pipelines in those areas
10 for approximately ten years from '94 to mid 2003.

11 In 2002 the federal government issued a new
12 regulation on gas transmission commonly known as the
13 integrity management requirements. And it prompted PG&E
14 to establish an integrity management organization within
15 the gas transmission. At the time it was called
16 California Gas Transmission or CGT for short. And in
17 that organization I became the in line inspection
18 supervising engineer.

19 When we initially started the program, there was
20 only myself and one other engineer in the program. It's
21 continued to grow since then.

22 I was the supervising engineer from 2003 to, as
23 I recall correctly, slightly after San Bruno, which was
24 in September of 2010. So sometime in early 2011 when my
25 supervisor took a different position, I became a manager
26 over the in line inspection engineering team as well as

1 the direct assessment engineering team within the
2 interior management organization.

3 I continued in that role -- I believe it was
4 2016 with a brief rotation as the director for integrity
5 management back in 2012. I continued in the manager role
6 until 2016 and then the gas transmission organization
7 created a new position for an in line inspection
8 principal engineer. And I applied for that position and
9 was named in that role which I continue in to today.

10 Q. You mentioned that in 2002 the federal
11 government changed the rules or changed the law and
12 mandated the creation of the Integrity Management
13 Division, the Gas Transmission Division. Was that the
14 Pipeline Safety Act?

15 A. Yes, that was the Pipeline Safety Act of 2002.

16 Q. Describe for us the Pipeline Safety Act of 2002.

17 A. It became the regulations that are tied to the
18 Pipeline Safety Act. Basically, the Pipeline Safety Act
19 was passed by congress and then PHMSA, which is the
20 regulatory body. It's part of the federal government.
21 Pipeline Hazardous Material Safety Administration then
22 creates actual rules that go into the Code of Federal
23 Regulations or Gas Transmission Code of Regulations
24 referred to CFR-192. It has a large number of parts.

25 So the Pipeline Safety Act added a brand new
26 part called Subpart O. And the Subpart O basically

1 required all US operators to identify all sections of
2 their pipelines that fit the definition of a high
3 concentration area. Basically it's around population
4 density. And it required lines that fell within these
5 high concentration areas, otherwise known as HCAs, to be
6 inspected proactively on a periodic basis.

7 It provided for a ten-year -- what they call a
8 baseline plan where all those high concentration areas
9 had to be inspected between -- the law went into effect
10 the day that the president signed it into effect which
11 was December 17, 2002. And thus all US operators had to
12 inspect all of their high concentration areas by
13 December 17, 2012.

14 And it provided four basic ways of inspecting
15 your pipelines. And those methods were tied to specific
16 threats that each pipeline has. The threat -- as an
17 example, all of PG&E's transmission lines are made of
18 steel. Steel can obviously corrode. So 100 percent of
19 our gas transmission system has external corrosion as a
20 threat. So that's a threat to the integrity of the
21 pipeline if it corrodes.

22 Q. All right. Let's back up a little bit and break
23 that down.

24 A. Sure.

25 Q. Prior to the Pipeline Safety Act of 2002, was
26 there a federal requirement that gas transmission

1 companies routinely inspect their pipes?

2 A. Basically, no.

3 Q. Prior to 2002 and the enactment of the Pipeline
4 Safety Act, was PG&E doing preventative maintenance
5 inspections of its pipelines? It's gas transmission
6 pipelines?

7 A. Well, the -- you know, federal code has been in
8 place since 1970. So in terms of performing maintenance
9 activity PG&E was performing maintenance activities such
10 as doing leak patrol or installing and maintaining
11 protective systems to prevent external corrosion on
12 pipelines. There's a lot of other design and maintenance
13 requirements that were already in existence that PG&E was
14 in compliance with. They were not performing the types
15 of inspections that were then required by the Pipeline
16 Safety Act.

17 Q. Right. And the Pipeline Safety Act basically
18 created a requirement for preventative inspections;
19 correct?

20 A. You could use that term.

21 Q. Right. You weren't waiting for a problem. You
22 were supposed to go out on a regular basis and inspect
23 the pipelines and try to identify potential problems
24 before they occurred; correct?

25 A. That is the intent. The overall intent of the
26 Pipeline Safety Act was to improve upon safety by finding

1 problems with or integrity issues with the pipeline
2 before they either leaked or ruptured.

3 Q. Okay. And prior to the Pipeline Safety Act
4 there was no such requirements?

5 A. That's correct.

6 Q. And prior to the Pipeline Safety Act PG&E didn't
7 have any policy or were not routinely doing preventative
8 inspections with the gas transmission pipelines; correct?

9 A. That's correct.

10 Q. Okay. All right. Now, you talked about -- this
11 is the last thing we'll talk about before we go to lunch.
12 Inspection methods and threats. You said there were --
13 that the Pipeline Safety Act or Subpart O approved four
14 different inspection methods based upon known threats.
15 Can you kind of explain that to us a little bit.

16 A. Sure. So what I said with the example of the
17 external corrosion was one threat. So there's a number
18 of threats. I won't go through each one individually.
19 There's nine basic categories that are laid out in the
20 code and the industry reference that are incorporated by
21 federal code that U.S. pipeline operators have to
22 consider when determining what their assessment methods
23 need to be.

24 So there has to be an alignment between the
25 threat on the pipeline and what the inspection method
26 needs to be so that it can address that given threat.

1 Q. Okay. What are some of the well-known common
2 threats to a transmission -- gas transmission pipeline?

3 A. Well, in addition to external corrosion there's
4 internal corrosion. There's stress corrosion, cracking.
5 There's third-party damage which means someone that is a
6 third party, you know, hits the line through excavation
7 activity or farming. That kind of thing.

8 There's equipment failure that could cause an
9 overpressure event. There's operator error where
10 they're, you know, not operating correctly. Those are
11 some of them.

12 Q. How about manufacturing threats?

13 A. Yes, that's definitely. Manufacturing,
14 construction.

15 Q. What's a manufacturing threat?

16 A. An example of a manufacturing threat is
17 basically something that is inherent in the pipe. It
18 comes out of the mill, the pipe mill such that it has a
19 certain number of defects. No pipe is 100 percent
20 defect-free. There are industry standards that changed
21 over the years in terms of what level of defects are
22 acceptable, but there's certain known threats on certain
23 types of pipes that were manufactured in the United
24 States over the last century or so that exhibit
25 themselves in service and then they could cause the pipe
26 to fail years later.

1 Q. How does the code Subpart O tie inspection
2 methods to known threats?

3 A. There's specific language in -- there's an ASME
4 document that's incorporated by referencing Code ASME
5 31.8S, as in Sam, that spells out what appropriate
6 technologies can be used to address what specific
7 threats.

8 Q. Okay. Are all inspection methods appropriate to
9 assess for all known threats?

10 A. No, they are not.

11 MR. NOEL: This is probably a good time to take
12 our lunch break before we start getting into the
13 exhibits.

14 GRAND JURY FOREPERSON: Okay. Okay. Mr. Dauby,
15 I'd like to read you an admonishment. You're admonished
16 not to discuss or disclose at any time outside of this
17 jury room the questions that have been asked of you or
18 your answers until authorized by this grand jury or the
19 Court. A violation of these instructions on your part
20 may be the basis for a charge against you of contempt of
21 court. This does not preclude you from discussing your
22 legal rights with your own attorney.

23 Mr. Dauby, what I have just said is a warning
24 not to discuss this case with anyone except the Court,
25 your lawyer, or the district attorney.

26 Do you have any questions?

1 THE WITNESS: No, I do not.

2 GRAND JURY FOREPERSON: Okay. Thank you.

3
4 [DISCUSSION OMITTED.]

5
6 [Lunch recess taken from
7 11:53 a.m. until 1:33 p.m.]

8
9 [ROLLCALL OMITTED.]

10
11 GRAND JURY FOREPERSON: Mr. Dauby, just to
12 remind you, you are still under oath.

13 THE WITNESS: Understood.

14 GRAND JURY FOREPERSON: Please have a seat.

15 **EXAMINATION CONTINUED**

16 BY MR. NOEL:

17 Q. All right. So when we broke for lunch, we were
18 talking about the different types of threats to a
19 pipeline. The other half of that is what are the
20 different types of inspection methods that are approved
21 under the Pipeline Safety Act?

22 A. So Subpart O of the integrity management section
23 of federal code allows four assessment methods. The
24 first is strength testing often referred to as
25 hydro-testing because it requires a pipeline be taken out
26 of service, filled with liquid medium meaning water or

1 potentially air or nitrogen, and then tested to a
2 pressure that is significantly higher than it would see
3 in normal operations. And there's provisions for exactly
4 what that pressure needs to be.

5 The second method is in line inspection, which
6 is my area of expertise, where an instrumented device
7 commonly referred to as a PIG or a Smart PIG is inserted
8 into the pipeline for a certain distance. It collects
9 data on the pipeline's integrity and then it is retrieved
10 at the other end. And these Smart PIGs are provided by
11 vendors that operate in a worldwide market. And they're
12 basically -- PG&E would -- or the operator would contract
13 with one of these vendors to provide the in line
14 inspection devices and then analyze the data and provide
15 a report.

16 The third method is called direct assessment
17 commonly referred to as DA. And there's three different
18 types of DA. There's associated with specific threats.
19 There's ECDA for external corrosion direct assessment for
20 the threat of external corrosion, ICDA or internal
21 corrosion direct assessment, and SCCDA which is stress
22 corrosion cracking direct assessment.

23 And then the fourth type of assessment is
24 basically referred to as "other technologies." So the
25 code allows for provisions for change in technology that
26 may occur over time. An operator can apply to the

1 regulator, which in PG&E's case it would be the
2 California Public Utilities Commission -- on the federal
3 level it would be NNSA -- to approve specific technology
4 for an assessment that's not already covered in code.

5 Those are the four types.

6 Q. And what does Subpart O say about how to select
7 your assessment type or your assessment tool for doing a
8 specific inspection of a pipe?

9 A. It required that the operator select the best
10 suited assessment method for the threats that existed on
11 a given pipeline within a high concentration area.

12 Q. What does it mean to be best suited?

13 A. I can provide you my opinion in that regard, but
14 there's no guidance provided in federal code or any of
15 the industry references that I'm familiar with that
16 provide any further guidance regarding what best suited
17 means.

18 Q. Okay. We'll just go on. Now, did PG&E have its
19 own internal policies as to how to choose assessment
20 methods?

21 A. Yes.

22 Q. Can you describe those for us, please.

23 A. Could you help me in terms of what timeframe
24 you'd like me to answer the case based on.

25 Q. Pre-San Bruno.

26 A. Sure. So specifically before San Bruno there

1 was flowcharts that were part of our integrity management
2 standard and procedures which provided guidance as to
3 what technology or assessment method to use based on
4 specific criteria.

5 For example, in an in line inspection they were
6 looking for pipelines that had over five miles of high
7 concentration area within a section and lines operated at
8 adequate pressure such that they were -- I believe it was
9 a threshold of over 30 percent which basically means
10 30 percent of the yield strength of the steel that the
11 pipe is made out of.

12 Q. Were you actually involved in the writing of
13 those policies, those flow charts?

14 A. I had the opportunity to make comments on them
15 in the time period that PG&E was developing the integrity
16 management program in the 2003/2004 timeframe. Yes, I
17 had some influence.

18 Q. Walk us through a first time in line inspection.
19 What goes into actually doing the inspection?

20 A. So an in line inspection project typically takes
21 three to five years from inception through completion.
22 That's because these are PG&E systems. It wasn't built
23 for -- to be PIGable or to be able to run in line
24 inspection devices. So it typically required a large
25 amount of retrofit or replacement of features in our
26 pipelines that were not -- that the in line inspection

1 device could not negotiate.

2 So that would include things like valves that
3 weren't full openings, tees or large tabs that the PIG
4 could get stuck in if they weren't bared, which was
5 basically like a grate to prevent them from going where
6 it's not supposed to go, installation of launchers and
7 receivers at given points along the pipeline system.

8 So those had to be designed and then fabricated
9 and then installed. So that would usually take a couple
10 of years to pay fees and get permits and then perform the
11 inspection. I'm sorry. Then perform the -- what we call
12 upgrade and retrofit.

13 And then usually year three or possibly year
14 four, depending on how long the construction took, we
15 would perform the cleaning and inspection of the
16 pipeline. So that would require running a number of
17 cleaning PIGs to remove any debris or oil, other things
18 that could impede the Smart PIGs from running. And then
19 we would run a geometry tool to confirm the ID of the
20 pipeline in terms of diameter, make sure there's no dents
21 or obstructions, and then we would run an inspection
22 device which would typically be a -- what they call an
23 MFL, magnetic flux leakage, PIG that detects for --
24 inspects for corrosion or wall loss on the pipeline.

25 Following that the in line inspection vendor
26 would analyze the data that they'd collect from the in

1 line inspection tool. They would provide PG&E a report
2 as to the condition of the pipeline and then our
3 engineers would review that report and make a
4 determination as to what needed to be repaired, if
5 anything, as well as do a direct examination of some
6 specific locations on the pipeline to verify that the
7 tool accurately measured the wall loss in the pipeline.

8 And following that there's a fourth phase
9 assessment where you basically document everything that
10 occurred and update your records and determine if there's
11 any longer term mitigation plans that are required to
12 prevent further damage.

13 Q. Is it safe to say that steps one through three
14 for a first-time in line inspection are time consuming
15 and costly?

16 A. Yes, that is correct.

17 Q. Compared to a direct assessment was a first-time
18 in line inspection much more time consuming and costly?

19 A. Yes.

20 Q. And in terms of actual inspection findings, in
21 your experience did in line inspections tend to find more
22 problems than direct assessment?

23 A. Yes. We rarely used both technologies on the
24 same pipeline, but we definitely found more corrosion and
25 other types of damage using in line inspection than
26 similar projects that used direct assessment.

1 Q. In your experience was in line inspection better
2 at finding issues before they became problems within the
3 pipes?

4 A. Yes. Essentially, the same answer. They'd both
5 be technologies that would be looking for problems or
6 threats that they're designed to assess for prior to them
7 deteriorating to the point that the pipe, you know,
8 leaked or ruptured.

9 Q. So what kind of threats would in line assessment
10 be better suited to assess than direct assessment?

11 A. Well, the main threats that PG&E utilized in
12 line inspection for was external corrosion and internal
13 corrosion. So in both those regards I would say that in
14 line inspection provided a more thorough assessment and
15 found more issues than direct assessment.

16 Q. How would an in line inspection find external
17 corrosion?

18 A. Well, the in line inspection tool, as I briefly
19 referenced, uses a magnetic field that saturates the pipe
20 wall with magnetic plugs and then it detects the unit
21 sensors that are basically between the North and South
22 Pole that is -- moves along the inside of the pipeline.
23 And based on changes in that magnetic field, the -- it
24 records when you do the live analysis and then assigns
25 the amount of metal loss to a fairly high degree of
26 accuracy.

1 Q. So let me see. In line inspection could be used
2 to assess manufacturing threats; correct?

3 A. If it's -- if it's -- if the right technology is
4 incorporated on the -- on the underlying tool, then the
5 answer would be yes.

6 Q. Manufacturing threats would be things like
7 long-seam welds which were very common, what, prior to
8 the '70s in gas pipes?

9 A. Well, there's a variety of long-seam welds.
10 Even with, you know, pipe manufacturers today most of it
11 has some type of a long-seam weld. There are different
12 types of welding techniques.

13 Q. I was referring generally to something called
14 ERW. Is that correct?

15 A. Yes. There is -- ERW refers to electric
16 resistance welded pipe. It's a well-known industry issue
17 that the ERW manufactured back in the '50s. 1950s, 1960s
18 they used a welding process they called low frequency.
19 It has to do with the frequency of the current that was
20 induced into the pipe to make it fuse together and that
21 those were problematic.

22 The industry changed to a high frequency fusion
23 method throughout the late '60s and by early 1970s it was
24 all exclusively high frequency.

25 Q. How much would you estimate of PG&E's gas
26 transmission pipeline was built prior to the '60s?

1 A. Definitely would be an estimation. I would say
2 the majority of the system was built prior to 1970s for
3 sure.

4 Q. So would it be safe to say that a very large
5 portion, if not majority, of the PG&E's gas transmission
6 pipeline had the ERW long-seam weld manufacturing threat?

7 A. Well, ERW is one of the types of seams that were
8 used prior to 1970. There was -- as you're sort of
9 eluding to, there was seamless pipes. There was also
10 double-seam welded pipes. So I can't make that
11 projection in terms of the majority was necessarily ERW
12 although we have a substantial amount.

13 Q. Okay. Could DA be used to assess manufacturing
14 threats?

15 A. No, it cannot.

16 Q. Could DA be used to assess internal corrosion?

17 A. If you're using the ICDA, yes. Internal
18 corrosion direct assessment. ECDA could not.

19 Q. And how often did -- to your knowledge of PG&E,
20 did you use ICDA or did the company use ICDA?

21 A. In the pre-San Bruno it was very rare. There
22 was not very much mileage on our system that was
23 considered at that time to have an internal corrosion
24 threat.

25 Q. And how good, in your opinion, was ECDA,
26 external corrosion direct assessment, at actually finding

1 corrosion threats to the pipelines?

2 A. Well, I don't have a statistic available in
3 terms of how often. It was successful in finding
4 corrosion. I can tell you that even though we were
5 assessing a lot more mileage each year in between 2004
6 and 2010 using ECDA then we were on line, we were finding
7 more external corrosion using ILI than we were DA.

8 Q. So ILI cost a lot more to do the first-time
9 inspections because of all the work that had to go into
10 setting up for it; correct?

11 A. Correct, again including the capital costs, the
12 upgraded pipe costs as well as expense costs of running
13 the tools.

14 Q. And ILI tended to find more problems that needed
15 to be fixed; correct?

16 A. That's correct.

17 Q. Now, you had Subpart O that said that you're
18 supposed to use the assessment method best suited for the
19 known threats; correct?

20 A. That's what the code says.

21 Q. And then you had the internal PG&E policies, the
22 flow charts that kind of mimicked that language to
23 determine whether you should do -- for which assessment
24 you should do; correct?

25 A. I don't know if I can agree that it mimicked the
26 language. It was PG&E's attempt to comply with the code.

1 Q. Right. To set up how you determine what
2 assessment method is best suited for that piece of pipe;
3 correct?

4 A. Correct.

5 Q. All right. So in your experience pre-San Bruno,
6 was PG&E always following its own policies and Subpart O
7 when making a determination of what assessment method to
8 use for pipes?

9 A. We didn't always follow our own policies and
10 sometimes routed exception reports to our existing
11 procedures when they wanted to use an assessment method
12 that didn't align with the existing procedures.

13 Q. In your experience pre-San Bruno how big of a
14 role did budget play in determining what assessment
15 method would be used for different pipelines?

16 A. It was definitely a significant factor.

17 Q. Now, you said earlier that you were not the one
18 who determined which assessment method was going to be
19 used; correct?

20 A. Myself and the in line inspection engineers did
21 not make those decisions. We only determined whether in
22 line inspection would be potentially feasible or not for
23 a given pipeline.

24 Q. Who made the recommendation as to which
25 assessment method between ILI or DA was to be used for a
26 specific pipeline?

1 A. That came out of our risk analysis group. It
2 was part of risk management.

3 Q. Would that be Bill Mangold and his group?

4 A. Correct.

5 Q. Okay. Were there times when the recommended
6 assessment was ILI and that was overruled and DA was done
7 instead?

8 A. Yes.

9 Q. Were you aware of any times where DA was
10 recommended and that was overruled and ILI was done
11 instead?

12 A. No, I'm not.

13 Q. In those cases in which ILI was the recommended
14 assessment tool as the tool best suited for assessing the
15 known threats on that pipeline, why was an exception made
16 and DA was used instead?

17 A. I'm thinking -- because I'm trying to remember
18 what all was put on the exception reports that were
19 routed and approved, which is probably part of my
20 exhibits. So I don't have those memorized, but a large
21 part of the decision was economic and part of the
22 decision was an opinion by our director at the time who
23 heavily favored that we utilize DA over ILI.

24 Q. And the director at the time was who?

25 A. Bob Faucet.

26 Q. And prior to becoming the director, were you

1 familiar with what Mr. Faucet did?

2 A. Not comprehensively but I do know that he was
3 responsible for the -- pretty much the creation and
4 implementation of the DA program at PG&E.

5 Q. You talked about exceptions. And we'll get into
6 that real quick here. So 2010, prior to San Bruno, do
7 you recall that the CPUC was doing an audit of the gas
8 transmission division?

9 A. I recall them doing an audit in early 2010,
10 prior to San Bruno, of the integrity management program,
11 yes.

12 Q. Now, you talked about exceptions. What are
13 exceptions?

14 A. Exceptions are documents that are routed to at
15 least the director level that allowed the organization to
16 do something that is not in alignment with the existing
17 procedure but is still in alignment with federal code.
18 Because we cannot take an exception to federal code.

19 Q. Okay. Are exceptions supposed to be done before
20 you do whatever action or later to justify the action you
21 took?

22 A. They are supposed to be completed before you
23 effectively take the exception.

24 Q. Now, at some point prior to the CPUC audit in
25 2010, were you asked to write exceptions justifying the
26 switch from ILI to direct assessment for different

1 pipelines?

2 A. Yes, I was.

3 Q. And by whom were you asked that?

4 A. By my supervisor at the time Sarah Burke.

5 Q. Okay. And did you write those exceptions?

6 A. Yes, I did.

7 Q. And you should have that exhibit in front of
8 you. I don't have the exhibit list right here. If you
9 can find that and we'll talk about it. It should be 713.

10 A. Bottom of the stack. Now I lost that.

11 Q. All right. Find 713?

12 A. Yes, Sir.

13 Q. All right. Tell us what 713 is.

14 A. It's an e-mail exchange between myself and Sarah
15 Peralta who was my supervisor at the time as well as Jeff
16 Janvier who reported to me at the time on my in line
17 inspection team regarding exception reports that I had
18 initiated several months prior and the e-mail train.
19 It's from November -- mid to late November timeframe
20 2010, about two months after San Bruno had occurred.

21 Q. And just to clarify, Sarah Peralta and Sarah
22 Burke are the same person?

23 A. Yes, they are.

24 Q. All right. So --

25 A. Peralta was her married name. She was
26 previously single and subsequently got divorced. So she

1 went back to it.

2 Q. All right. So give us the context for this
3 e-mail chain.

4 A. Well, since we were all extremely busy just
5 subsequent to San Bruno and I had been pulled off work on
6 some specific project related to some of the peninsula
7 pipelines, Jeff Janvier was filling in for me as the in
8 line inspection supervisor at the time. He was asked to
9 review the exception reports that I had written several
10 months earlier prior to our CPUC audit and to endorse --
11 make an evaluation, as I say, as to whether or not the
12 exception reports were truly required or whether we had,
13 you know, been overly conservative in writing exception
14 reports when in fact they weren't an exception after all.

15 So Jeff had indicated to Sarah that several of
16 the reports were not required. And then I weighed in on
17 November 29th, 2010, as to whether I agreed with that or
18 not.

19 Q. Okay. So I want to start this off. And after
20 the second paragraph it says "First, I'd like to indicate
21 that I feel that the justification for changing these
22 projects from ILI to ECDA should have been initiated and
23 approved by those responsible for the budgets at the time
24 the charges occurred."

25 A. Changes.

26 Q. Changes. I'm sorry.

1 A. Correct, that is what I said.

2 Q. What did you mean?

3 A. I meant -- and you can interpret that I was a
4 bit frustrated in being asked to write justifications
5 from a technical standpoint that were really the result
6 of inadequate funding for our organization in order to
7 perform the in line inspection that we had already --
8 several of these projects we had performed. We had done
9 a lot of work on them. We had done engineering. We had
10 done some construction in most of the cases. And they
11 were basically ready to be in line inspected, but we had
12 inadequate funding to perform the in line inspection and
13 thus we were justifying why they were -- they were
14 switched to DA.

15 Q. You go on to say "Obviously, this did not
16 happen. However, all of who were involved at the time
17 were very aware that these decisions were made for
18 financial, not technical reasons." Correct?

19 A. Correct.

20 Q. You still agree with that statement?

21 A. Yes, I do.

22 Q. So is it a valid conclusion or reasonable
23 conclusion that you're being asked by your boss to try to
24 come up with technical or scientific excuses to justify
25 what was done for budget savings?

26 A. In general I would agree with that.

1 Q. Okay. I have no further questions.

2 Does the jury have any questions for this
3 witness?

4 The jurors are allowed to ask you questions. So
5 they will present those questions in writing.

6 Oh, while they're doing that, real briefly I did
7 forget to mention. You testified in the federal trial;
8 correct?

9 A. Correct.

10 Q. And you were granted immunity by the United
11 States attorney to do so?

12 A. Correct.

13 [Pause in proceedings.]

14 MR. NOEL: I'm not quite sure.

15 GRAND JUROR NUMBER FOUR: I'm asking did he
16 agree with the decisions he made?

17 MR. NOEL: Okay. I got that.

18 BY MR. NOEL:

19 Q. All right. Did you agree with your supervisors
20 or the budget people's decisions that the direct
21 assessment inspections were the best suited assessments?

22 A. No, I didn't agree with that.

23 MR. NOEL: Okay. Anything else?

24 All right. Mr. Dauby, thank you very much for
25 being here. Madam foreperson will have an admonition for
26 you.

1 GRAND JURY FOREPERSON: Mr. Dauby -- sorry.

2 Mr. Dauby. Excuse me.

3 Mr. Dauby, you are admonished not to discuss or
4 disclose at any time outside of this jury room the
5 questions that have been asked of you or your answers
6 until authorized by this grand jury or the Court. A
7 violation of these instructions on your part may be the
8 basis for a charge against you of contempt of court.
9 This does not preclude you from discussing your legal
10 rights with your own attorney.

11 Mr. Dauby, what I have just said is a warning
12 not to discuss this case with anyone except the Court,
13 your lawyer, or the district attorney.

14 Any questions?

15 THE WITNESS: No.

16 GRAND JURY FOREPERSON: Thank you for your time
17 today.

18 [Witness exits the courtroom.]

19 MR. NOEL: So before we bring in the next
20 witness, I'm going to withdraw Exhibits 707 through 712.
21 So those are not going into evidence. I would ask 713 to
22 go into evidence.

23 [Exhibit 713 admitted
24 into evidence.]

25

26 [DISCUSSION OMITTED.]

1
2 [Recess taken from
3 2:08 until 2:33 p.m.]

4 GRAND JURY FOREPERSON: Mr. Lee, before you have
5 a seat, would you raise your right hand to be sworn as
6 soon as everybody is ready and as soon as you are ready.
7 Take your time.

8 Mr. Lee, do you solemnly swear that the evidence
9 you shall give in this matter pending before the grand
10 jury shall be the truth, the whole truth, and nothing but
11 the truth so help you God?

12 THE WITNESS: Yes.

13 GRAND JURY FOREPERSON: Thank you. Have a seat,
14 please.

15 **EXAMINATION**

16 BY MR. NOEL:

17 Q. Mr. Lee, for the record can you state your full
18 name and spell your last name.

19 A. Chris Chang-Shik Lee, L-e-e.

20 Q. Probably should have you spell your middle name.

21 A. Oh, my middle name. Okay. C-h-a-n-g, hyphen,
22 S-h-i-k.

23 Q. By whom are you employed?

24 A. The California Public Utilities Commission.

25 Q. In what capacity?

26 A. I work as a utilities engineer.

1 Q. What is a utilities engineer?

2 A. We work with utility companies. And our section
3 in particular works with electric companies and also
4 power plants.

5 Q. What education, training, and experience do you
6 have that qualifies you for your job?

7 A. I have a master's in mechanical engineering. So
8 looking at my entire CPUC career we've been to -- we've
9 gone through multiple formal training done by consultants
10 and on-the-job training.

11 Q. What kind of on-the-job training?

12 A. Well, initially for audits we would participate
13 as observants. So we'd get paired up with more senior
14 engineers who have experience, greater experience in
15 performing audits and other tasks. So initially we go to
16 observe and then we gradually take on greater roles until
17 we are able to lead ourselves.

18 Q. So describe for us exactly what it is that you
19 do with the utilities?

20 A. Okay. It's a little complex because the first
21 16 years or so my work focused on power plants and in the
22 last three years due to reorganization we started
23 doing -- I started doing more electrical work. So --

24 I'm sorry. Could you rephrase or repeat the
25 question, Marc.

26 Q. In terms of your job now dealing with the

1 electrical utilities, describe for us exactly what it is
2 you do.

3 A. Sure. So our regular work includes scheduled
4 audits. So typically at the beginning of the year our
5 management comes up with audits for the entire year. And
6 this would be audits on electrical distribution systems,
7 substations, transmission systems. And then also on the
8 power plant side we do the same thing. So we get
9 assigned to several of those audits either as an
10 observer, trainee, or lead. So audits are a big part of
11 our work.

12 We also get assigned to incidents. So CPUC has
13 a requirement for incident reports, and as they come in
14 we get assigned to handle particular incidents, customer
15 complaints. So they don't meet the incident reporting
16 requirements but some customer has an issue with the
17 utility company. So as they come in, we get assigned to
18 follow up on those as well. Yeah, I think that -- and
19 then scattered between all those is our ongoing training
20 programs.

21 MR. NOEL: Sorry. We've got a few exhibits for
22 this witness. All right. And they did not whole punch
23 them.

24 GRAND JURY FOREPERSON: Thank you.

25 GRAND JURY SECRETARY: It's okay.

26 BY MR. NOEL:

1 Q. All right. What is the Safety and Enforcement
2 Division of the CPUC?

3 A. Well, we -- we regulate utility companies. So
4 there's a gas section and there's the electric facility
5 section. So I belong to the electrical facility section.
6 So generally speaking, we do audits, scheduled audits,
7 handle incidents, customer complaints. Yeah, I think
8 those are the big areas of our work.

9 Q. In November of 2018 were you assigned to
10 investigate on behalf of the CPUC the Camp Fire?

11 A. Yes, I was assigned to it.

12 Q. So describe for us what it means to be assigned
13 by the CPUC to investigate.

14 A. Well, so when the incident occurred, initially
15 somebody needs to look into it. And I believe I was the
16 only one available at that time because we had other
17 audits scheduled and a lot of people were out. So that
18 is how initially I got assigned to it.

19 And -- and also another factor is the workload.
20 A lot of our -- a lot of my more experienced colleagues
21 were already tied up with other investigations at that
22 point. So initially it meant that we'd go out to the
23 site for the initial fact, for evidence gathering. And I
24 was paired up with another engineer from our Sacramento
25 office. And initially it wasn't clear but -- but soon
26 afterwards it was clear that we were actually going to be

1 in charge of the entire investigation to its conclusion.

2 Q. All right. And the other engineer, who was
3 that?

4 A. The other engineer is Anwar Safvi.

5 Q. Common spelling. It's A-n-w-a-r, S-a-f-v, as in
6 Victor, -i.

7 All right. So let's go through a few
8 preliminary things. You are familiar with the General
9 Orders of the CPUC specifically G.O. 95 and G.O. 165?

10 A. I am familiar with the ones that are relevant to
11 this case.

12 Q. Okay.

13 A. Yeah.

14 Q. So I want to walk you through a few of those.
15 First off, G.O. 95, Rule 18. We can go through that real
16 quick.

17 A. Sure. So you want me to just hit the key
18 points?

19 Q. Yes, please.

20 A. Okay. I'm going to -- I marked my notes. I'm
21 just going to open it up so I am looking at this.

22 Q. Yes.

23 A. Okay. So Rule 18 I think the key component is
24 "taking appropriate corrective action." So if there is a
25 potential problem or if there is a problem, then the
26 utility company needs to take the appropriate action.

1 I think I will withhold from going into details
2 because we will probably hit those later on.

3 Q. Okay. So each company is responsible for taking
4 appropriate corrective action to remedy potential
5 violations of G.O. 95 and safety hazards posed by its
6 utilities?

7 A. That's right.

8 Q. And it also says "For the purposes of this rule
9 'safety hazard' means a condition that poses a
10 significant threat to human life or property."

11 A. Yep.

12 Q. And finally "Each company including utilities
13 and CIPs is responsible for taking appropriate corrective
14 action to remedy safety hazards and G.O. 95
15 nonconformances posed by its facility."

16 A. That is correct. It is kind of broad, but I
17 think -- particularly for this case I think the phrase
18 "appropriate corrective action" was very important for
19 us.

20 Q. All right. And then Rule 31.1.

21 A. Okay. Should we read it or should I just hit
22 the key points?

23 Q. You can go ahead and read the actual language.

24 A. Okay. I will read the first paragraph.
25 "Electrical supply and communication systems shall be
26 designed, constructed, and maintained for their intended

1 use, regard being given to the conditions under which
2 they are to be operated, to enable the furnishing of
3 safe, proper, and adequate service."

4 So again, I'm thinking of just in terms of this
5 case what's important for us is the maintain part because
6 it's already been detained. It's been constructed. So
7 how is it being maintained considering the operating
8 condition?

9 So -- so, yeah. The circumstances, the
10 operating condition, local conditions, they have to be
11 taken into consideration. And in light of all that, the
12 maintenance has to be appropriate to make sure that the
13 system is safe and reliable.

14 Q. Okay. The section goes on to say "For all
15 particulars not specified in these rules, design,
16 construction, and maintenance should be done in
17 accordance with accepted good practice for the given
18 local conditions known at the time by those responsible
19 for the design, construction, and maintenance
20 communication -- maintenance of communication or supply
21 lines and equipment."

22 A. Yep.

23 Q. All right. And then there's Rule 31.2.

24 A. "31.2: Lines shall be inspected frequently and
25 thoroughly for the purpose of ensuring that they are in
26 good condition so as to conform with these rules. Lines

1 temporarily out of service shall be inspected and
2 maintained in such condition as not to create a hazard."

3 Generally, the frequency part we do -- we do
4 leave that up to the utility. And unless there's a good
5 reason, I don't think we request the frequency. But the
6 thorough part "thoroughly," now that's the part that we
7 at least in this case had a chance to look at. You know,
8 how is the quality of the inspections? That's a big -- a
9 big question on our minds.

10 Q. Okay. Next "44.3 Replacement."

11 A. Okay. Okay. This one is pretty
12 straightforward. I will just read it.

13 "Lines or parts thereof shall be replaced or
14 reinforced before safety factors have been reduced (due
15 to factors such as deterioration and/or installation of
16 additional facilities) in Grades 'A' and 'B' construction
17 to less than two-thirds of the safety factors specified
18 in Rule 44.1 and in Grade 'C' construction to less than
19 one-half of the safety factors specified in Rule 44.1.
20 Poles in Grade 'C' construction that only support
21 communication lines shall also conform to the
22 requirements of Rule 81.3A. In no case shall the
23 application of this rule be held to permit the use of
24 structures or any member of any structure with a safety
25 factor less than one."

26 Q. Okay. What is a safety factor and how can it --

1 how can those safety factors be less than one or
2 two-thirds?

3 A. Yes. The safety factor tells you how much room
4 you have beyond the failure point. So safety factor of
5 one means you're right at the tipping point of failure.
6 So obviously you want to be well above safety factor one.

7 Now, just to summarize what I just read, so
8 Rule 44.1 says for this particular line, which is Grade B
9 construction, the safety factor at the time of
10 installation has to be two. Now, more relevant to us is
11 so that when it's installed, it's got to be safety factor
12 of two.

13 Now, after that it's going to start degrading.
14 And this Rule 44.3 says "At all time the minimum safety
15 factor has to be -- cannot be less than two-thirds of
16 two," which is 1.33. So basically that's what it's
17 saying here. You know, it's at two when you start off,
18 but it can never fall below 1.33.

19 Q. Okay. Explain to us exactly what the "one"
20 means.

21 A. One means you have just enough strength in the
22 material to match the load. So you got the load that
23 pulls on whatever components you're looking at. Now,
24 that load is exactly equal to the strength of the
25 material in that equipment or part. So at that point it
26 may or may not -- I mean, it's on the verge of breaking.

1 That's what it means. It's on the verge of breaking. So
2 if you go even a bit below that, it's going to fail.

3 Q. So if you were designing a part to hold
4 something that weighed 100 pounds, if you design that
5 part with a limit of 100 pounds, that would be safety
6 factor one?

7 A. That would be safety factor one.

8 Q. According to this, on grade C construction you'd
9 have to design a part to hold 100 pounds that was
10 designed to hold 200 pounds?

11 A. Initially, that's correct.

12 Q. And then with wear and tear you could let that
13 part go down to where it could hold 133 pounds. But once
14 it gets past that point, it has to be replaced?

15 A. That's correct.

16 Q. Pretty good math for somebody who can't count.
17 All right.

18 A. Yeah, that's great clarification -- clarifying
19 example there.

20 Q. Thank you.

21 A. Keep going?

22 Q. Even a deaf, dumb, and blind squirrel finds a
23 nut every once in a while.

24 All right. So now G.O. 165, Section IV.

25 A. It reads "Each utility shall prepare and follow
26 procedures for conducting inspections and maintenance

1 activities for transmission lines."

2 So for transmission lines G.O. 165, Section IV,
3 basically leaves it up to the utility company to come up
4 with their own rules and codes for maintenance, for
5 maintenance inspection. So this would require us to look
6 at their -- their manual and see if they violated
7 anything according to their own rules.

8 Q. All right. Finally, the Public Utilities Code
9 Section 451.

10 A. Okay. So that's kind of a broad one.

11 "Every public utility shall furnish and maintain
12 such adequate, efficient, just, and reasonable service,
13 instrumentalities, equipment, and facilities, including
14 telephone facilities, as defined in Section 54.1 of the
15 Civil Code as are necessary to promote the safety,
16 health, comfort, and convenience of its patrons,
17 employees, and the public."

18 Simply put basically what it's saying is the
19 utility company must make sure that it provides a safe
20 and reliable system for the public. But what that really
21 means is you need to come up with an effective program to
22 make that happen, effective program for inspection
23 maintenance.

24 Q. All right. So let's walk through real quick the
25 resources that you had at your disposal as part of your
26 investigation. All right.

1 A. Sure. Okay.

2 Q. What are -- walk us through this.

3 A. Sure. So, yes, a data request it's kind of a
4 standard. Since the 2017 fires we do have kind of a
5 standard set of initial data that we request from the
6 utilities. So initially it starts out with -- with that
7 standard one and then as we receive the responses and
8 review them as we gather more information, our subsequent
9 requests become more specific.

10 Q. Okay. Let's start off with what exactly is a
11 data request.

12 A. Data request. So we are -- so I believe we can
13 talk about two different categories. One is just the
14 basic facts about the system that's involved. All right.
15 The age, capacity, whatever it may be but just the basic
16 information about the facilities involved.

17 And then -- and then data request also involves
18 questions. What happened? You know. Why? You know.
19 Why? So what, why, who? So I think broadly it's those
20 two questions and basic information.

21 Q. So at its most basic is the data request a
22 formal request by CPUC of information from a utility?

23 A. Yes, it is. Yeah, it goes out as a formal
24 request.

25 Q. And those are done in writing?

26 A. Those are done in writing.

1 Q. And the utility responds?

2 A. Yes, they respond in writing.

3 Q. Okay. Is the utility required to respond to
4 provide you the requested information or answer your
5 questions?

6 A. I believe it is. They may claim confidentiality
7 on any of those, but they provide the information with
8 indication of confidentiality.

9 Q. So the next resource you have is PG&E records.
10 What type of records are we talking about here?

11 A. So these could be part of the request, but
12 mainly we are talking about inspection records. Yeah,
13 audit records, tags. Tags are specific work requests.
14 And I don't know if manuals -- no, I don't think manuals
15 would fit into this. I mean, that's a big part of what
16 we're looking at. So I think manuals would perhaps fall
17 under data requests.

18 Yeah, I think it's mostly those three. It's the
19 audit, inspection. And also if they had any incidents,
20 they would provide those to us.

21 Q. So we're talking about inspections, things like
22 the -- the yearly inspection reports for the
23 Caribou-Palermo?

24 A. That's right. Annual patrol records, their
25 inspection records for the five-year cycle, ground
26 detailed inspections, climbing records which are done as

1 they see fit and needed.

2 Q. How about the ETPM, the Electric Transmission
3 Preventative Maintenance Manual?

4 A. Yes. So that's the manual. I'm not sure which
5 category that would fall under, but that's a huge part.
6 Because I mentioned G.O. 165, Section IV, in order for us
7 to enforce that, which says basically the utility company
8 sets -- for their transmission system they set their own
9 rules. So we need to know what those rules are. And for
10 that we need to look into the Electric Transmission
11 Preventative Maintenance Manual, ETPM. So that was a
12 very big part of what we looked at.

13 Q. All right. And finally, site visits.

14 A. Site visits. We go out to observe, evidence
15 collection. And where we can take evidence ourselves I
16 think we would, but in this case we obviously were not
17 allowed to do that. But, yeah, we try to be there while
18 the evidence is being collected by the proper
19 authorities, take our own pictures. It gives us a chance
20 to ask questions about what's being taken as evidence.

21 So in this case we had -- we went out to the
22 incident location as well as downloading of information
23 from relays at several of the PG&E substations.

24 Q. Okay. And then not listed in here but another
25 resource that you had available in this investigation was
26 Exponent; correct?

1 A. That's correct.

2 Q. So you were able to work with Exponent?

3 A. Well, they basically did a study for PG&E and
4 CPUC. And their study, I believe, turned out to be very
5 helpful in understanding the things that we were looking
6 at and helping us understand why what we saw happened.

7 Q. All right. So let's start talking a little bit
8 about data requests. And you have in front of you a
9 stack of exhibits. And the first one on that stack
10 should be 714.

11 A. Okay.

12 Q. And there you go. It should have an exhibit tag
13 on it that says 714.

14 A. Okay.

15 Q. Is that 692? Oh, there's 714. Okay. There we
16 go. There's 714.

17 So I want you to take a look at 714 and tell me
18 if you recognize 714.

19 A. Yes, I do.

20 Q. What is 714?

21 A. It's information about when the Caribou line was
22 constructed and the dates.

23 Q. Okay. More basic than that, is this a -- is 714
24 the CPUC data request to C -- let me start that over
25 again.

26 Is 714 a CPUC data request made to PG&E as part

1 of the Camp Fire investigation?

2 A. Oh, well, this is PG&E's response. This is
3 PG&E's response to one of our questions in Data Request
4 Number 2.

5 Q. Okay. Well, start off basically at the top. It
6 says "CPUC Data Request SED-002."

7 A. Uh-huh.

8 Q. What does that mean?

9 A. That's our numbering system that we use for the
10 Camp Fire investigation. So this is a second data
11 request that went out to PG&E in our investigation.

12 Q. All right. And then it says "Requestor." And
13 you're going to need to help me pronounce the name.

14 A. Okay. Banu Acimis.

15 Q. Who is Banu Acimis?

16 A. So Banu Acimis is our program manager, and her
17 role in this investigation -- one of her roles in this
18 investigation was being the official person to send data
19 requests to PG&E.

20 Q. All right. And this identifies as question ten?

21 A. Uh-huh, yes, that's correct.

22 Q. All right. And so this response to Question
23 10 -- or Question 10 itself is the question that was sent
24 by the CPUC to PG&E; is that correct?

25 A. That's correct.

26 Q. And then the response to Question 10 is PG&E's

1 response back to you with the information provided?

2 A. That's correct.

3 Q. All right. And I think we already covered this.
4 But just to make sure, what does the SED stand for?

5 A. It stands for Safety and Enforcement Division.

6 Q. All right. So let's go through this real quick.
7 "PG&E has consulted the following records, among others,
8 in preparing this response: A PG&E report entitled
9 'National Register of Historic Places Inventory and
10 Evaluation of Eleven Transmission Lines Associated with
11 the Historical Alignment of the Caribou-Valona
12 Transmission Corridor. This report, which was last
13 updated in 2018, is produced at Bates number
14 PG&E-Camp-CPUC-0000031384. PG&E has also relied on a
15 Great Western Power detailed report regarding the
16 development of the Great Western Power System,"
17 blah-blah-blah.

18 It goes down and then it eventually says "PG&E
19 further understands from its records that that section of
20 the line was designed, excavated, and cleared between
21 1919 and 1921 and that the various original components on
22 that line including towers, insulators, and conductors,
23 were manufactured during that time period or earlier"
24 referring to 27/222. Is that correct?

25 A. That's correct.

26 Q. So PG&E is telling you that section of line that

1 includes the Caribou 27/222 was built between 1919 and
2 1921; correct?

3 A. That's correct.

4 Q. Let's see. And it also goes on to say that
5 another portion of that same line that started off as the
6 Great Western Power line number one was constructed
7 beginning in 1906 and went into service in 1908; is that
8 correct?

9 A. That's correct.

10 Q. All right. Oh, that's right. It also states
11 that the portion of the line that includes 27/222 was
12 brought into service in 1921.

13 A. Yes, that's correct.

14 Q. So that is the information that PG&E provided
15 you guys?

16 A. Yes.

17 Q. All right. Let's move on to 715. Or actually
18 that is 704. We've already talked about it.

19 Do you recognize 704?

20 A. 704?

21 Q. That's up on the bench. There's a copy of it up
22 here on the board.

23 Do you recognize 704?

24 A. Yes.

25 Q. Is this another PG&E response to a data request?
26 A CPUC data request?

1 A. Yes, it is.

2 Q. All right. And next up is 692 which is in your
3 stack right there. Oh, 714 and 692 got out of order.

4 GRAND JURY SECRETARY: The very bottom.

5 THE WITNESS: Oh, yeah, there we go. The last
6 one. Okay.

7 BY MR. NOEL:

8 Q. Do you recognize 692?

9 A. Yes.

10 Q. And what is 692?

11 A. It's asking for the manufacturer and the age of
12 the different components on the incident tower 27/222.

13 Q. All right. So this is a CPUC data request to
14 PG&E?

15 A. Yes, it is.

16 Q. And asking for manufacturer and component
17 number, a catalog number for the components on 27/222?

18 A. Yes.

19 Q. And this includes PG&E's response?

20 A. Yes.

21 Q. All right. And PG&E in terms of -- well, I'll
22 move on for right now.

23 All right. Next up we have number 700. Do you
24 see 700?

25 A. Yes.

26 Q. Do you recognize 700?

1 A. Yes.

2 Q. Is 700 another PG&E response to a CPUC data
3 request from the Camp Fire investigation?

4 A. That's correct.

5 Q. Why don't you read -- this one is relatively
6 brief. So why don't you go ahead and read that to us.

7 A. Okay. The question was "When was the subject
8 conductors installed?"

9 "PG&E's present understanding based upon its
10 records is that the conductor at the Incident Location 1
11 and the associated equipment were initially installed
12 between 1919 and 1921. PG&E understands towers on the
13 Caribou-Palermo 115 kV transmission line first went into
14 service on May 6th of 1921. Portions of this line have
15 been replaced over time as a result of routine
16 maintenance and emergency work. PG&E is not presently
17 aware of any records showing if or when the conductor
18 between Towers 27/221 and 27/222 was replaced."

19 Q. And we don't need to worry about incident two.

20 A. Yeah.

21 Q. Why is it important to -- or why does CPUC want
22 to know the age of the conductor between 221 and 222 on
23 the Caribou-Palermo line?

24 A. Well, we would want to know how long it's been
25 in service. Because depending on the age, that may
26 contribute to affecting parts that are connected to it.

1 Q. All right. So let's move on to 701.

2 A. Okay.

3 Q. Do you recognize 701?

4 A. Yes.

5 Q. And what is 701?

6 A. 701 is also a CPUC data request. It was our
7 first data request, question number 36, and it's PG&E's
8 response to that.

9 Q. All right. Go ahead and read the question and
10 the response.

11 A. Sure. "What type of conductor(s) was installed
12 for each incident location prior to the incident?"

13 "The table below identifies conductor types
14 installed for the incident locations, as defined by the
15 SED's data request IV prior to the incident."

16 Okay. For Location 1 452.3 kcmil Aluminum
17 Conductor Steel Reinforced. Number 2 -- Location
18 Number 2 is number two AWG Aluminum Conductor Steel
19 Reinforced."

20 Q. I want to clarify something you said and what
21 they said. "As defined by SED's data request IV prior to
22 the incident."

23 A. Yeah. I just got confused myself. What
24 happened was when we initially composed and sent our data
25 request number one and two, I believe after that time we
26 discussed with PG&E and we decided it would be very

1 helpful if we could identify -- actually define
2 Locations 1 and 2. I think that's what PG&E did with Cal
3 Fire initially.

4 Q. Okay.

5 A. But we had not done that. So I believe that is
6 what it's talking about.

7 Q. All right. So when it says "prior to the
8 incident," they're talking about the incident location,
9 not the data request prior to the incident?

10 A. Right. It's a location, right. It's referring
11 to locations.

12 Q. Okay. All right. Why is it important to
13 CPUC what type of conductor was on the transmission line?

14 A. Well, one of the things we would want to know,
15 if we needed the information, is whether the amp capacity
16 was sufficient, whether the conductor had sufficient
17 capacity to handle the current. Because we know it
18 spiked up right before it -- right before the incident.
19 So that would be -- at least from, you know, myself as an
20 investigator, that's one of the things I would want to
21 know.

22 But also sometimes we gather at least basic
23 information that may not be useful at the moment, but we
24 may need later on. So those are two reasons.

25 Q. Okay. Let's move on to 715. Do you have 715
26 there in front of you?

1 A. Got it, yes.

2 Q. And do you recognize 715?

3 A. Yes, I do.

4 Q. What is 715?

5 A. 715 is also CPUC data request number seven,
6 question number one, and PG&E's response to it.

7 Q. And this one you're asking about the length of
8 the conductor broken down by type of conductor?

9 A. That's correct.

10 Q. Why would that be important?

11 A. It's similar to the one we just looked at. Just
12 I think having basic information about the system itself.
13 Maybe at the moment we may not see a need for it, but we
14 may need it later on.

15 Q. Okay. All right. 716. Do you recognize 716?

16 A. Yes, I do.

17 Q. What is 716?

18 A. So 716 -- this was actually PG&E's response. It
19 was an attachment to, I believe, data request SED-1,
20 question 39. And in there -- in that question we had
21 asked for the distance between the two towers we've been
22 talking about; 27/222 and 27/221. And I believe we also
23 asked about the drop. You know, the sag. And this is
24 hard to read. But, yeah, it says "Provide the distance
25 between the two towers." I think it says 840 something.
26 Yeah. So this is 222, this is 221, and this is the

1 distance in between.

2 Q. Okay.

3 A. Yeah. We asked for this because at the time
4 that we went out to the site, we didn't notice any issue
5 with sag. But we wanted to make sure -- we wanted to
6 make sure there was no issue with sag.

7 But PG&E actually did not have the information
8 of the lowest sagging point at the time of the incident.
9 So what they provided us is this information that they
10 gathered in November of 2017.

11 Q. So this appears to be kind of like a not quite
12 topographical map but based upon the topographical
13 features under the line at this point; correct?

14 A. That's correct.

15 Q. All right. So the highest point is 27/222?

16 A. That's correct.

17 Q. And am I correct in reading that should be
18 reading from left to right from supply side Caribou
19 Powerhouse on the left going towards Big Bend which would
20 be off to the right?

21 A. That is correct.

22 Q. All right.

23 A. And just one other thing that we looked at was
24 since this information does provide elevation also, we
25 did check that and it falls under 3,000 feet which would
26 have been the requirement for high load.

1 Q. Okay.

2 A. So since it was provided, we looked at it.

3 Q. So, yeah, there's a line here. It looks like it
4 says 2,080 feet.

5 A. Yeah. So I think 27/222 is sitting at about
6 2150 or so. And I guess the top of the tower would be
7 almost 2200.

8 Q. Okay. All right. Thank you.

9 All right. Let's move on. And I want to show
10 you quickly this is Exhibit Number 159.

11 MR. NOEL: Did we have that pulled?

12 GRAND JURY SECRETARY: Yeah.

13 THE WITNESS: I got it.

14 BY MR. NOEL:

15 Q. And so do you recognize 159?

16 A. Yes, I do.

17 Q. What is 159?

18 A. 159 is a line corrective. It's basically, yeah,
19 a work submission form for tower 27/222. And the work
20 that was supposed to be done on this was the replacement
21 of the connectors.

22 Q. All right. Why is this specific document
23 Exhibit 159 important to you?

24 A. It's important to us because this particular
25 work that was initially written up in 2009, it was -- the
26 property was assessed twice and then the condition was

1 reassessed a couple times. And so it ended up pushing
2 the due date for correction to -- I forget the exact --
3 oh, it says "required end date November 30th of 2015."

4 For us this was important because they didn't
5 meet that deadline. It was actually corrected the
6 following year. And the problem that we found with this
7 is, according to PG&E's procedure, if they don't meet the
8 deadline, they have to provide a written explanation for
9 it. But they did not have it.

10 Q. So did you do at data request based upon Exhibit
11 Number 159?

12 A. Yes, we did.

13 Q. All right. First off, did you do any
14 investigation into why these connectors had to be
15 replaced?

16 A. Initially, we did not. And I don't have a
17 timeline very clear, but it is something that was brought
18 to our attention and it is something that we did look at.
19 But I'm not sure if that came before -- I think it
20 probably came after the date of the request.

21 Q. Okay. So let's look at Exhibit 717. You should
22 have it in front of you there.

23 A. Yep.

24 Q. Do you recognize 717?

25 A. Yes, I do.

26 Q. What is 717?

1 A. 717 is CPUC's -- or I should say SED. That's
2 not correct. SED's data request number six, question
3 number two, and PG&E's response to that.

4 Q. And what is it that you were asking for -- SED
5 was asking for in this data request?

6 A. So SED in one of these special reports that we
7 looked at, it mentioned a pre-existing condition on Tower
8 27/222. We asked PG&E to clarify what that meant, and
9 PG&E's response was that the pre-existing condition
10 refers to the replacement of the connectors. And I
11 believe it should be connectors multiple. It's my
12 understanding that it wasn't one connector that was to be
13 replaced but multiple.

14 Q. All right. So let's walk through this response.
15 Now, for one thing, PG&E always responds. "PG&E
16 understands 'pre-existing conditions' as referring to the
17 condition on Tower 27/222 on the Caribou-Palermo line."

18 Is that kind of a standard format?

19 A. That has been their standard format of response
20 for Camp Fire data requests.

21 Q. Okay. So they respond "PG&E understands
22 'pre-existing conditions' as referring to the condition
23 on Tower 27/222 on the Caribou-Palermo 115 kV
24 transmission line identified during PG&E's detailed
25 inspection of the line in August 2009. PG&E previously
26 produced records of the August 2009 detailed inspection

1 in connection with its supplemental response to the SED's
2 Data Request 001."

3 And it gives more. "The pre-existing condition
4 is described in the corresponding work order, line
5 corrective notification 103995542," which is the number
6 on the exhibit; correct? 192?

7 A. Yes, it is.

8 Q. Or 159.

9 A. Yes.

10 Q. "Describes the pre-existing condition as
11 follows: Per buck on inspection need to replace 3 bolt
12 connector with wedge."

13 And then it says "According to PG&E's system of
14 work orders, systems applications, and production SAP, LC
15 Notification 103995542 originally was assigned Priority
16 Code G, a priority code that PG&E no longer uses. In
17 accordance with the April 2009 Electric Transmission
18 Preventative Maintenance Manual that was in effect at the
19 time of the August 2009 detailed inspection, corrective
20 action is required within 12 months from the date the
21 condition is identified for Priority Code G conditions."

22 So initially this was qualified as a Priority
23 Code G and was supposed to be repaired within one year?

24 A. That's correct.

25 Q. All right. "The condition identified was
26 changed to a Priority Code B condition on October 4th,

1 2009, before being changed to a Priority Code F condition
2 on October 27th, 2009. The ETPM Manual that came into
3 effect in January of 2011 was updated to reflect PG&E's
4 adoption of Priority Codes A, B, E, and F. For Priority
5 Code B conditions corrective action is required within
6 three months from the date the condition is identified.
7 For Priority Code F conditions corrective action is
8 required within 24 months except for nominations and
9 notifications of system-wide initiatives identified by
10 Asset Strategy which can have due dates beyond
11 24 months."

12 That's a mouthful.

13 So this started off as a G notification that
14 needed to be done within one year?

15 A. That's correct.

16 Q. And then according to PG&E it became a B
17 notification that had to be done within three months?

18 A. Yep.

19 Q. And then it was changed again to a F which
20 should have been done within two years?

21 A. That's correct.

22 Q. And were you ever able or was PG&E ever able to
23 provide you with any written justifications for why any
24 of those changes were made?

25 A. PG&E could not provide the written justification
26 for any of those.

1 Q. All right. And then going on to the next
2 paragraph. "On the latter occasion the required
3 completion date for connector replacement work was
4 scheduled for November 30th, 2015."

5 Were you ever given any reason from PG&E as to
6 why this didn't -- wasn't even scheduled to be done until
7 2015 and then ultimately didn't get done until 2016?

8 A. No. PG&E could not provide any written
9 justification for those.

10 I don't know if you were going to touch on this,
11 but I think our data request number seven, question
12 number five.

13 Q. That's the next one.

14 A. Okay.

15 Q. 718. We have Exhibit Number 718 in front of
16 you. Let's see if you recognize 718.

17 A. I sure do.

18 Q. What is 718?

19 A. 718 is our data request number seven, question
20 number 5 asking PG&E for explanation as to why the
21 priorities were changed twice and why the condition was
22 reassessed and postponed twice. And they were not able
23 to provide any documentation on any of those.

24 Q. All right. So the response is basically their
25 explanation of why this notification didn't get taken
26 care of; correct?

1 A. That's correct.

2 Q. And it starts off "PG&E's Systems, Applications,
3 and Products SAP system indicates that Line Corrective
4 Notifications 103995542 was changed on October 4, 2009,
5 by an individual with the LAN ID 'S4SJ.' LAN IDs are
6 unique identifiers for PG&E employees and contractors.
7 PG&E understands that LAN ID to have belonged to
8 Siddharth Singh --"

9 That is S-i-d-d-h-a-r-t-h, S-i-n-g-h.

10 "-- a former PG&E contractor who worked with
11 PG&E's SAP Operations group from January 15, 2007, to
12 March 21, 2010. At this time PG&E has not identified any
13 additional documentation to support why the priority code
14 was changed."

15 And then it goes on to say on October 27th the
16 same guy Siddharth Singh again changed the priority code.
17 Is that correct? Is that a correct summary?

18 A. That is correct.

19 Q. And it doesn't provide any explanation for why
20 that was done; is that correct?

21 A. That's correct.

22 Q. And then it goes on and it talks about that
23 actually on those two dates Siddharth Singh not only
24 changed the correction code for 27/222, but he changed it
25 for 85 notifications on the Caribou-Palermo line for
26 change connectors and then again on October 27th he

1 changed all 85; correct?

2 A. That's correct.

3 Q. But it was saying a former contractor got in and
4 did this for some other reason. There was no other
5 justification given for why this work was not done and
6 why these priorities code were changed?

7 A. That is correct.

8 Q. All right. Let's move on to 719. Do you have
9 719 in front of you?

10 A. Yes, I've got it.

11 Q. What is 719?

12 A. 719 is data request number eight, question
13 number 1 regarding what prompted the climbing inspections
14 on the Caribou-Palermo line just before the Camp Fire and
15 PG&E's response to it.

16 Q. What climbing inspections?

17 A. These are detailed climbing inspections on the
18 towers.

19 Q. How did you find out -- or what makes you think
20 that PG&E was doing detailed climbing inspections on
21 towers on the Caribou-Palermo?

22 A. Well, we had some prior data requests from which
23 we had seen the detailed climbing inspection forms that
24 were filled out. So we knew they had done some.

25 Q. Okay. So you asked them basically why?

26 A. That's correct.

1 Q. And what did they respond?

2 A. Well, they said this was -- so this is in their
3 response at the end of the first paragraph. They say it
4 was for their asset management strategy.

5 Q. Okay. They explained how that fits into their
6 asset management strategy?

7 A. I don't believe they did.

8 Q. Did PG&E mention any triggers that may have
9 caused them to do climbing inspections?

10 A. Well, that's what we were interested in because
11 for PG&E to do detailed climbing inspections on the
12 towers it has to be triggered by something.

13 Q. Right.

14 A. And we were looking for that trigger. And the
15 answer that we got was it was a -- it was for asset
16 management strategy. So it didn't sound like there was
17 any specific condition that would be of concern to prompt
18 these inspections.

19 Q. Okay. Were you aware of any possible triggers?

20 A. You mean for --

21 Q. Prior to the climbing inspections in the fall of
22 2018.

23 A. You mean, like as I look back on all this?

24 Q. Well, at the time were you aware that there were
25 any possible triggers or anything that could be
26 considered a trigger?

1 A. Well, we mentioned this in our report. But if
2 the -- I think just looking at the incident tower and,
3 you know, later we got to see a couple other towers. But
4 it was one thing that was very obvious on some of these
5 towers was the original hardware insulators were hanging.
6 They were not being used anymore. They had a
7 replacement.

8 And so the original hanger with the hole was
9 still there, and you could see they wore out. So in our
10 minds if they had to stop using that and use another
11 hanger, that would warrant a known condition that should
12 trigger some sort of follow-up climbing inspection.

13 Q. So as part of your investigation you said it was
14 very important to go through PG&E's inspection and
15 maintenance policies; correct?

16 A. Correct.

17 Q. And you had to learn those. And you just quoted
18 from them, I think, that climbing inspections are as
19 triggered.

20 A. That's correct.

21 Q. And PG&E's policies define what types of things
22 would trigger climbing inspections; correct?

23 A. Correct.

24 Q. So we know from the historical documents that
25 this line went into service in 1921; correct?

26 A. Correct.

1 Q. We know from the historical documents that were
2 provided by PG&E that the components -- the conductor,
3 the insulators, the C-hook -- very well may be original
4 from 1921?

5 A. They may be.

6 Q. And there is probably a really good chance that
7 those are original?

8 A. Yeah. I couldn't say, but I wouldn't be
9 surprised.

10 Q. And in their response to that request from the
11 CPUC, PG&E has stated that they have no records showing
12 that any of those components have ever been changed on
13 27/222?

14 A. Could you repeat the question.

15 Q. According to the data request, the responses to
16 data requests, isn't it true that PG&E has stated that
17 they have no records showing that any of the components
18 on 27/222 have ever been repaired or replaced? And by
19 components I'm limiting it to the conductor, the
20 insulators, the C-hooks.

21 A. I'm not sure that we asked the specific question
22 like that for 27/222.

23 Q. Okay. So we'll go back and look at those. But
24 in terms of triggers, like if they had a failure or a
25 potential failure of hanger plates on another line, would
26 that be considered in your understanding of PG&E policy

1 to be a trigger?

2 A. Yes, it would.

3 Q. So, for instance, if the PG&E lab did an
4 analysis of a hanger plate from a different line that
5 found that hanger plates due to fretting were wearing at
6 approximately .007 inches per year and that the lifespan
7 of a hanger plate is between 94 and 98 years, would that
8 in your understanding of the Transmission Manual be
9 considered a trigger?

10 A. Yes, it would.

11 Q. How about failure of components? Would those be
12 considered triggers?

13 A. Definitely.

14 Q. How about a failure of a component that starts a
15 fire?

16 A. Oh, definitely.

17 Q. Okay. And was the Caribou-Palermo the only line
18 in the Feather River Canyon that had climbing inspections
19 going on in the fall of 2018?

20 A. That I don't know for sure, but I know they
21 inspected -- we were told that they were inspecting other
22 transmission lines as well. I'm not sure if that would
23 have included other lines in that area.

24 Q. Were you aware that PG&E notified you during
25 your investigation that -- earlier in the fall of 2018
26 that the Murphy Fire was caused by the failure of a PG&E

1 jumper in the Feather River Canyon?

2 A. I was not aware of that.

3 Q. PG&E didn't report that?

4 A. Not to my knowledge.

5 Q. Is there a requirement, to your knowledge, that
6 PG&E report fires caused by its equipment to the CPUC?

7 A. If it meets the incident reporting requirement,
8 which I would imagine if it causes a fire, it would be
9 pretty easy to meet that, then they would be required to
10 report to us.

11 Q. All right. Let's move on to 720. Do you
12 recognize 720?

13 A. Yes, I do.

14 Q. And what is 720?

15 A. 720 is our data request number two, question
16 number 29 asking PG&E whether it has ever conducted
17 testing on the tower or the components.

18 Q. And why would that be important to you?

19 A. Well, testing is important just to ensure the
20 equipment and the components have retained their
21 integrity and provide some assurance that it will provide
22 safe and reliable service.

23 Q. Okay. So can you read for us PG&E's response.

24 A. Sure. "PG&E submitted its initial response to
25 this question on April 2, 2019. In this supplemental
26 response PG&E is producing general maintenance GM work

1 orders from 1930s and '40s that called for Megger testing
2 on what is now part of the Caribou-Palermo 115 kV
3 transmission line and was referred to at the time as the
4 Big Bend Oakland line or Great Western Power Line Number
5 One, a portion of which now comprises a part of the
6 Caribou-Palermo 115 kV transmission line."

7 I won't read through the rest of it.

8 "PG&E is also producing at PGE-CAMP-CPUC-88000 a
9 document dated July 28, 1986, related to the electrical
10 resistance testing of conductor and what was then known
11 as the Caribou Sycamore Line, a portion of which now
12 comprises part of the Caribou-Palermo 115 kV transmission
13 line."

14 Q. All right. So your question to PG&E is: Have
15 you ever done any material stress testing on the
16 Caribou-Palermo towers." Correct?

17 A. That's correct.

18 Q. And their response is "Back in the '30s and '40
19 we did some Megger testing and in 1996 we did some
20 electrical resistance testing"?

21 A. Yes, that's what they said.

22 Q. So a 100-year-old line, as far as what PG&E has
23 reported to, they've never done any material stress
24 testing or load testing?

25 A. That's correct. And they didn't really address
26 the section that we were interested in. I believe that

1 the section of Caribou-Palermo was -- when it was under
2 Great Western Power, I believe from one of the earlier
3 documents that it's actually line number three. This one
4 is line number one.

5 Q. Awe.

6 A. So I don't know if they -- if the earlier tests
7 actually covered the section they were interested in.

8 Q. Wow.

9 A. At least in this document here.

10 Q. Okay. All right. So let's move on to 721. Do
11 you recognize 721?

12 A. Yes, I do.

13 Q. What is 721?

14 A. 721 is our data request number two, question 30
15 which asks about whether PG&E has done any remaining life
16 analysis on any of the PG&E -- any of the Caribou-Palermo
17 towers. And this is PG&E's response to that question.

18 Q. What is remaining life analysis?

19 A. So when systems get old, you know, you have to
20 decide whether you need to retire that or whether you're
21 going to maintain it. So this remaining life analysis
22 would kind of help the company determine which direction
23 they're going to take.

24 Q. Okay. So if you took, for instance, a hanger
25 bracket off a tower -- the hanger bracket that had become
26 elongated -- and did some engineering studies on it to

1 determine how long it's taken to wear to the point it's
2 at and based upon that how long it would take to where
3 its safety factor was below 1.33, would that be
4 considered remaining life analysis?

5 A. You know, I think it's probably more than that.
6 That might be a component of this study, but I think they
7 would probably -- to be perfectly honest, I have actually
8 not seen an actual remaining analysis report. But I
9 think they would have to consider many other components
10 along that line.

11 Q. Okay. And the short answer is, no, they have
12 not done so?

13 A. That is correct that is a short answer.

14 Q. And then in that answer they also mentioned the
15 Quanta Technology studies in 2010?

16 A. Uh-huh.

17 Q. You have to answer out loud so that she --

18 A. Yes.

19 Q. And then the 2017 DSTSRMS studies; correct?

20 A. That's correct.

21 Q. And it also talks about "In addition to the
22 studies described above, PG&E tests equipment that has
23 failed in order to determine the cause of the failure."

24 A. That's correct.

25 Q. All right. All right. Let's go to 703.

26 A. Okay.

1 Q. What is 703?

2 A. 703 is SED data request number seven, question
3 number 12 in which we asked when the reinforcement hanger
4 brackets were added to the original system. And it's
5 PG&E's response to that question. And the short answer
6 is they don't know.

7 Q. Perfect. Thank you.

8 All right. Let's go to 722. What is 722?

9 A. 722 is our data request number seven, question
10 number 2. We're asking PG&E basically how much load the
11 two C-hooks on the jumper cable insulators were carrying.

12 Q. Why would that be important?

13 A. Well, that comes back -- that brings us back to
14 safety factor. If we wanted to really pursue this
15 because safety factor has to do with how much load a
16 component is carrying and how much strength is left in
17 that component. So this at least gives us an idea of how
18 much load each of the two C-hooks were carrying.

19 Q. All right. So ultimately without going through
20 this line by line, what load were the C-hooks supposed to
21 be carrying?

22 A. Each one was carrying, I believe, 140 something.
23 Let me see. Okay. So the last row of the table on
24 page 2 142.8 pounds per hook. That's the estimation.

25 Q. All right. Okay. So we have pretty much talked
26 about this, the records that you reviewed, and the

1 inspection of patrol records both routine and
2 non-routine; correct?

3 A. Correct.

4 Q. All the tags or LC notifications on the line?

5 A. Correct.

6 Q. The Electric Transmission Preventative
7 Maintenance Manual?

8 A. Yes.

9 Q. The WSIP results from the Exponent report?

10 A. We didn't really talk about WSIP. But, yeah,
11 Exponent mentioned it, yeah.

12 Q. And then the 2018 climbing inspection records?

13 A. That's correct.

14 Q. All right. Now, let's look at some pictures.
15 Do you recognize 723?

16 A. Yes, I do.

17 Q. What is 723?

18 A. So 723 is -- that is tower 27/222, the one
19 that's adjacent to the incident tower. And what we're
20 looking at is a disconnected hold-down. So that cable
21 that's hanging over, that should be tied to the bottom of
22 that insulator. But when we went out to the -- the first
23 day we went out for evidence collection, that's the first
24 thing we saw.

25 Q. All right. Next 724.

26 A. 724 is Tower 27/222. And that is exactly what

1 we saw when we walked up to the -- near the base of the
2 tower.

3 Do you want me to explain what the picture is?

4 Q. No. I think that they understand that by now.

5 A. Okay.

6 Q. 725.

7 A. So 725 is a picture of the incident hook before
8 they disassembled it from the insulator string. And I
9 think as soon as they brought it down, one of the PG&E
10 linemen just held it for people to take a look and take
11 pictures.

12 Q. 726.

13 A. Okay. So that's taken from one of PG&E's
14 linemen who climbed the tower. And that -- again, we're
15 all talking about Tower 27/222. So before they -- so
16 that's the jumper cable that fell when the -- that fell
17 when the incident clamp C-hook broke and it was just
18 dangling there. And what we're seeing here are marks
19 that were left by arcing. So the burn marks indicate
20 basically arcing. And you can see some metal loss there
21 from the wire.

22 Q. All right. 727.

23 A. 727. So this -- this is the left runner arm.
24 So I mentioned earlier that the jumper cable has
25 transposition jumper cable. It has two insulator hooks
26 tied to it. So this is where the left hook was hanging

1 from.

2 So what we see -- the portions -- so this is
3 actually -- the one that's labeled "left runner," that's
4 the original arm on which the insulator was hanging. And
5 what we see in front of that, the bracket, that's what
6 was added when PG&E stopped using that initial runner arm
7 to hang the insulator.

8 Q. So this is what you were talking about back in
9 SED 007, Question 12 when you specifically asked PG&E
10 when that bracket was added?

11 A. That's correct.

12 Q. And the response was that PG&E doesn't know?

13 A. That's correct.

14 Q. 728.

15 A. That's the right runner before it was taken
16 down. But since they removed the insulator, you can see
17 the holes where they used to hang from. And you can see
18 they're elongated from wear.

19 Q. Finally, 729.

20 A. Well, this was evidence removed on March 29th
21 from Tower 27/199, the right phase hook so . . .

22 Q. Why -- what's significant in this photograph?

23 A. Well, the amount of wear. Actually, if I could
24 point something out.

25 Q. Absolutely.

26 A. When I wrote the report and people read it, they

1 didn't notice this. I guess I just assumed it's obvious,
2 but they thought that was the actual design of the hook.
3 But that part that's missing, that's what wore out. But
4 that -- yeah, if you're looking at it for the first time,
5 it almost looks like it was designed that way because,
6 you know, it's very straight, smooth.

7 Q. All right. Now, we talked about your report.
8 Let's talk about your conclusions.

9 A. Sure.

10 Q. We have the conclusions up here. I'd like you
11 to go through them one at a time and explain them to us.

12 A. Okay.

13 Q. And you have a copy of your report?

14 A. I do have my report, yeah.

15 Okay. "PG&E failed to replace or reinforce the
16 C-hook on the incident tower before its safety factor was
17 reduced to less than two-thirds of the safety factor
18 specified in Rule 44.1, a violation of G.O. 95,
19 Rule 43.3."

20 So again 44.3 says at the time it's installed --
21 excuse me. 44.1 explains when it's installed, it should
22 have a safety factor of two. 44.3 says the minimum that
23 you have to maintain is 1.33. So when it failed,
24 obviously it fell below one. So it was a clear
25 violation, a clear indication that at some point -- at
26 some point probably -- we don't know when but at some

1 point it went below 1.33.

2 Q. So going back to 729, the hook off of
3 Tower 24/199, this hook was still hanging when it was
4 removed from the tower; correct?

5 A. That's correct.

6 Q. So this hook at least had a safety factor of
7 over one at that time?

8 A. That's correct.

9 Q. But the safety hook that failed on 27/222 was
10 worn even more so than this is your opinion?

11 A. Yes. The hook that failed -- I think earlier we
12 saw a picture that showed the cross section of the
13 remainder of the hook that was recovered. You can see
14 that most of it, maybe like 75, 80 percent of it is
15 pretty smooth. And then there's a little part that
16 sticks out. Well, so this smooth part has been grinding
17 away for who knows how long. And then the part that
18 sticks out, that's a point at which the safety factor
19 reached one and probably a little less than one and it
20 just tore off.

21 So I think we can look at that point up to where
22 it was smooth and say, "Yeah, up to that point it somehow
23 maintained a safety factor of one or slightly above."

24 Q. So based upon G.O. 95, Rule 44.3 PG&E had a duty
25 to inspect and not allow that to happen?

26 A. That is correct. They should have known -- you

1 know, they should have had a pretty good idea of when it
2 was going to reach a safety factor of 1.33.

3 Q. All right. Next conclusion.

4 A. Okay. The next one "The failure of the C-hook
5 supporting the transposition jumper on the incident tower
6 demonstrates that PG&E did not maintain the incident
7 tower for its intended use and regard being given to the
8 conditions under which it was to be operated. Therefore,
9 it is a violation of G.O. 95, Rule 31.1."

10 So they have to consider some conditions here.
11 That is a windy area. And then the design -- I don't
12 think it could be ignored. The transposition jumper --
13 it's not very taut. You know, it doesn't have much
14 tension. So it has -- it's going to allow that insulator
15 and the hook to swing. So those are things -- so in
16 other words, it's not rigid. It's vulnerable to motion.

17 So they did not seem to have taken that into
18 consideration and kind of kept their eyes open for the
19 wear that could occur as a result of the condition and
20 the design.

21 Q. All right. So the next one.

22 A. Okay. So "PG&E failed to inspect the incident
23 tower thoroughly. Through its inspections it failed to
24 detect an immediate safety hazard or Priority A condition
25 on the incident C-hook which required replacement before
26 its safety factor fell below 1.33 prior to the Camp Fire.

1 This is a violation of G.O. 95, Rule 31.2."

2 So we were focusing on their inspections not
3 being thorough. In one of our data requests I think they
4 mentioned that when PG&E does its inspections, it notes
5 abnormalities and anything that might negatively impact
6 safety and reliability. And it's just hard to see
7 evidence of that.

8 There again in one of their responses I think
9 they were equipped with binoculars to actually look up.
10 You know, these structures are -- I don't know. I
11 imagine they're a good 50 feet tall. And so it's hard to
12 see with naked eyes what's up there, but they are
13 equipped with binoculars.

14 And when I went out to evidence collection on
15 March 28th, I personally wanted to test it out. You
16 know. Can you actually see with binoculars? And I was
17 surprised at what you could see especially if the terrain
18 allows you to kind of climb up on the hill. If the
19 towers are next to hills, you could actually kind of
20 climb up and almost be at eye level to what you want to
21 see. And I was very surprised at how much you could see.

22 But, you know, from the two C-hooks that we saw,
23 those happened over a long time. And it seems like all
24 those years that they were doing inspections, I'm not
25 sure that they used the binoculars to actually look at
26 those components.

1 So that's where we felt like they were not being
2 thorough. There's no document that we could look at and
3 say "Oh, yeah, these guys -- we know what they looked
4 at." You know, they only record if there's issues. They
5 don't tell you what they actually looked at if there was
6 no issue. So anyway.

7 Q. All right. Next "PG&E failed to follow its
8 procedures in the ETPM."

9 A. Yeah. "PG&E failed to follow its procedures in
10 the ETPM Manual by failing to document the factors and
11 reasons that led to the delay in the repair work on the
12 incident tower which was scheduled to be completed by
13 November 2015. However, it was delayed until June 2016.
14 PG&E did not document the reason for the delayed work
15 which is a violation of its own policy. Therefore, a
16 violation of G.O. 165, Section IV."

17 Yeah, we talked about this in length. This is
18 the replacement of connectors at Tower 27/222. The
19 priorities changed a couple of times. It was reassessed
20 and the completion date was pushed back a couple of
21 times. There was no documentation.

22 But finally, when they did decide upon the
23 completion date, they didn't meet it and there was no
24 documentation as to why they didn't meet that. And I
25 believe that's a violation of Section 153, I believe, in
26 their ETPM Manual.

1 Q. All right. Next up.

2 A. Okay. So number five "PG&E failed to conduct
3 detailed climbing inspections when conditions to trigger
4 climbing inspections were evident as specified in PG&E's
5 procedures. Wear on the original working eyes that
6 remained on the incident tower is an indication of a
7 known condition with potential to recur on the added
8 hanger plates with working eyes, which should have
9 triggered detailed climbing inspection to examine the
10 added hanger plates. This is a violation of G.O. 165,
11 Section IV."

12 So their manual says if certain conditions are
13 met, climbing inspections should be triggered. And what
14 we -- what we noted was among the triggers is known
15 recurring condition. And we looked at the added hanger
16 plates and all the evidence is hanging right there that
17 wear was occurring on the original hole. And if that had
18 been happening, if you move that over a couple inches to
19 a new plate, chances are the same thing will happen
20 again.

21 So that should have warranted some sort of
22 follow-up climbing inspection. But we felt that, you
23 know, anybody could have looked up and saw that, you
24 know, there's something going on there, but it seems like
25 they didn't follow up on that so . . .

26 Q. Known conditions. Would wear on another

1 transmission line on the hanger eyes or the hanger holes
2 on other transmission lines constitute a known condition
3 that could trigger climbing inspections?

4 A. If it's similar parts, similar equipment, sure.

5 Q. How about prior evidence of wear on C-hooks?

6 A. Definitely.

7 Q. Were you aware that in 1987 PG&E's lab was asked
8 to examine worn C-hooks off a transmission line in the
9 Bay Area?

10 A. I was not aware of that.

11 Q. All right. Let's go to the next one.

12 A. Move on? Okay. I think we are on the --

13 Q. Failure of the C-hook.

14 A. -- failure of the C-hook. Maybe mine is out of
15 order. Okay. 31.1. I think mine is kind of out of
16 order here. Okay. I'll just read this.

17 "The failure of the C-hooks supporting the
18 transposition jumper on the incident tower demonstrates
19 that PG&E did not maintain the incident tower for its
20 intended use and regard being given to the conditions
21 under which it was operated. Therefore, it is a
22 violation of G.O. 95, Rule 31.1."

23 Yeah, so the conditions are crucial; the wind,
24 the design, the age. But it seems like they did not --
25 that did not warrant special attention as was needed.

26 Q. You're right. I need go back to the ride slide.

1 A. Oh.

2 Q. Let's see. Where were we? We're at the second
3 condition.

4 A. Oh, yeah, here we go. Okay. The second bullet.

5 "The condition of the C-hook (material loss
6 greater than 50 percent) supporting the transposition
7 jumper on Tower 24/199 demonstrates that PG&E did not
8 maintain Tower 24/199 for its intended use. Therefore,
9 it is a violation of G.O. 95, Rule 31.1."

10 Q. And 24/191 is the photograph that we've been
11 looking at. That number is escaping me right now. I
12 have it in front of me. 729.

13 A. Yes. So similar explanation as my previous one.
14 Yeah, the conditions are very important. And it seems
15 like they did not take that into consideration. So
16 transposition towers in general, I think they tend to be
17 more vulnerable.

18 Q. And the next one goes along with that.

19 A. Okay. "PG&E failed to inspect Tower 24/199
20 thoroughly. Through its inspections it failed to detect
21 the safety hazards of a Priority A condition which
22 requires immediate response until the condition no longer
23 presents a potential hazard. Based on the ETPM Manual,
24 Table 8, the amount of wear greater than 50 percent on
25 the C-hook on Tower 24/199 warranted Priority Code A.
26 This is a violation of G.O. 95, Rule 31.2."

1 So Priority A needs to be addressed immediately,
2 but they didn't even find it so . . .

3 Q. That ties into the next one.

4 A. Yeah. "Based on PG&E EPTM Manual, Table 8, the
5 amount of material loss on the C-hook on Tower 24/199
6 warranted Priority A and immediate response until the
7 condition no longer presents a potential hazard. PG&E's
8 failure to detect and correct this Priority A condition
9 as specified in PG&E's procedures is a violation of G.O.
10 165, Section IV."

11 Yeah, it follows from the previous line. They
12 didn't see it so how could they even fix it?

13 Q. Right. And that should have been G.O. 165,
14 Section IV; correct?

15 A. That's right G.O. 165, Section IV.

16 Q. All right. And finally, let's go through the
17 last four conclusions.

18 A. Okay. "PG&E assigned an incorrect priority for
19 an immediate safety hazard represented by a disconnected
20 insulator hold-down anchor. On September 11, 2018, a
21 PG&E crew observed that an insulator hold-down anchor on
22 Tower 27/221 had come apart. PG&E assigned the condition
23 a Priority Code E. As defined in the ETPM Manual, the
24 Priority E designation is for conditions which must
25 receive corrective action within 12 months. However,
26 several broken insulator hold-down anchors found during

1 enhanced inspections after the Camp Fire were assigned
2 Priority A. Incorrect prioritization is a violation of
3 G.O. 95, Rule 18."

4 Yeah. So it was -- the first photo we saw on
5 tower 27/221 the hold-down anchor was disconnected. But
6 when PG&E after the Camp Fire started conducting enhanced
7 inspections in March, PG&E sent us the first set of
8 results from the inspections. And in their -- I believe
9 we found at least two and I want to say three situations
10 in which they -- the hold-down anchor had been
11 disconnected. And they called those Priority A.

12 So we thought okay. If those are Priority A,
13 this is really the same situation. Maybe how it happened
14 might have been different. We were told that at the
15 incident location that it had been unscrewed. Okay.
16 Maybe that is true, but the result is the same. So we
17 thought it should have been Priority A as -- as they
18 indicated in their enhanced inspections.

19 Q. All right. And the next one.

20 A. Okay. "PG&E failed to follow its procedure by
21 using an outdated inspection form during the detailed
22 climbing inspections that PG&E conducted from
23 September 19th to November 5, 2018. It used TD-1001M-FXX
24 that was implemented in March of 2016 even though the
25 form, effective as of September 2018, was TD-1001M-404.
26 Since PG&E did not follow its own procedure, it is in

1 violation of G.O. 165, Section IV."

2 So prior to these climbing inspections that took
3 place starting from September 19th of 2018, prior to that
4 PG&E had updated its inspection form which actually had
5 some significant changes from its prior version. And
6 what's of interest to us is the list of hardware that got
7 included that were not on the previous form; hardware for
8 insulators. But PG&E used the old form during those
9 inspections.

10 And when we asked about it, they said there's a
11 grace period to switch over. But we didn't get any
12 formal response as to exactly how long that grace period
13 is. We heard it was three months. It was just a verbal
14 response. But until their last inspection in early
15 November, they used the old form. And the new form, from
16 our understanding, is they were technically effective
17 beginning of September 2018.

18 Q. All right. And the next conclusion dealing with
19 the Camp B.

20 A. Okay. "PG&E failed to report the reportable
21 incident on Big Bend 1101 12kV distribution circuit in a
22 timely manner. After learning of a possible second
23 origin of fire through a CAL FIRE press conference on
24 November 15th, 2018, approximately 1800 hours, PG&E
25 submitted an electric incident report to the CPUC on
26 November 16, 2018, at approximately 1600 hours, which was

1 22 hours later. This is a violation of Appendix B of
2 D.06-04-055 as amended by Resolution E-4184, which
3 requires reporting within four hours outside of normal
4 working hours."

5 Yeah, see, initially PG&E was not unaware of the
6 second location being the cause of fire. And after they
7 learned of it, they should have reported to us within
8 four hours of the press release, but it was much later
9 than that.

10 Q. And finally.

11 A. Okay. This is kind of a catchall. "PG&E failed
12 to maintain an effective inspection and maintenance
13 program to identify and correct hazardous conditions on
14 its transmission lines. This is a violation of PU Code
15 Section 451. SED determined that PG&E's transmission
16 inspection and maintenance program prior to the Camp Fire
17 was inadequate to ensure that the Caribou-Palermo
18 transmission line, in particular transmission lines in
19 the North Fork Feather River Canyon, or PG&E's
20 transmission lines in general were in good condition to
21 furnish and maintain service as is necessary to promote
22 the safety and health of its patrons and the public."

23 Yeah, so basically this one requires PG&E to
24 make sure they provide a safe, reliable electrical system
25 for its customers. And they need the programs in place
26 to accomplish that. But as we look at their entire

1 inspection and maintenance program, you know, the
2 different components of it, the patrols, the detailed
3 inspections, the climbing inspections, their repair
4 records, put all of that together and they did not
5 accomplish this in our view.

6 Q. So in summary is it safe to conclude that the
7 CPUC and the General Orders don't really ask a whole lot
8 of -- require a whole lot of PG&E when it comes to the
9 inspection and maintenance of transmission lines?

10 A. We don't ask a whole lot of them.

11 Q. Right. Ultimately, it simply says "You need to
12 have a policy. We don't care what the policy is, but you
13 need to have a policy and you need follow your policy"?

14 A. Well, it needs to be a policy that insures that
15 they maintain safe and reliable systems. So we lay out
16 what they need to accomplish. How they get there that's
17 up to them. But if they don't get there, then we need to
18 look at their program and figure out why they're not able
19 to achieve that.

20 Q. And it sounds like based upon your conclusions,
21 through your investigation as it was, they can't even
22 follow their own policy?

23 A. There is that, yes. That's a big part of it.
24 If they had actually done what they said they would,
25 maybe it would have been different. Yeah. And maybe the
26 policy itself is lacking something too, but it's a little

1 hard to determine. But definitely you put it all
2 together the end result doesn't accomplish what they are
3 required to do.

4 MR. NOEL: All right. That is all I have.

5 Any members of the jury have any questions?

6 All right. The members of the jury can ask
7 questions. They write them down, submit them to us. We
8 make sure that they're appropriate and admissible.

9 THE WITNESS: Okay.

10 MR. NOEL: And once we do that, we'll give you
11 the questions.

12 [Conferring off the record.]

13 MR. Noel: All right. We have reviewed these
14 questions with the foreperson and they appear
15 appropriate.

16 BY MR. NOEL:

17 Q. So has the CPUC ever considered or recommended
18 that utilities operators consider or weigh in their
19 consideration of component reliability the actual age of
20 the components involved in construction and operation of
21 transmission or distribution lines?

22 A. Have we ever considered? I mean, that -- I
23 don't think I could answer that. It's kind of a
24 historical question. I'm not aware of that.

25 Q. Okay.

26 A. And maybe some of our senior members of the

1 group or the management might be able to answer to that.

2 Q. Okay. As regards PG&E's explanation for the
3 work order to replace the conductor on Caribou-Palermo
4 line at 27/222, do you have any reason to believe that
5 the work as ordered and repeatedly delayed was actually
6 done as described in 718?

7 A. Do I believe that it was actually completed?

8 Q. Yes.

9 A. I don't have reason to not believe it. You
10 know, the fact that they were late and they wrote that
11 down, I do think they actually completed it. But it's
12 not our -- it's not our usual practice to actually
13 verify -- yeah, verify particular corrections.

14 During our audits that's part of what we do.
15 Part of what we do is to verify -- you know, sample
16 verify corrections. But, yeah, in this particular case
17 we didn't verify, but I don't have a reason to not
18 believe that the work was done.

19 Q. All right. Now, as to Exhibit 725, which is the
20 broken C-hook, does it appear to you that there is only
21 about ten percent of the thickness of the hook metal is
22 actually broken while the remaining metal appears to be
23 the result of the rubbing?

24 A. That is exactly -- yeah, that is exactly true.
25 That's how I see it. That's how we see it. Yeah,
26 whether the part that was broken was ten percent, I mean,

1 it's a little hard to say whatever that percentage is,
2 but it's a small percentage that was left before it
3 actually snapped.

4 Q. Does the CPUC have any knowledge as to whether
5 or not PG&E briefs its upper corporate officers as to
6 potential issues or safety or component failures?

7 A. Could you repeat that question.

8 Q. Does the CPUC have any knowledge as to whether
9 or not PG&E briefs its upper corporate officers as to
10 potential issues or safety or component failures?

11 A. I believe their system should be set up where
12 they report the problems, you know, report their concerns
13 to their upper management. I think most of it just get
14 written up as work orders.

15 As to whether they bring anything in in some
16 special way to bring to the attention of the management,
17 I'm not -- I'm not aware -- I'm not aware of their
18 practice or their culture to know that.

19 MR. NOEL: Okay. Anything else? Any follow up?

20 Mr. Lee, we thank you. You're done. Madam
21 foreperson will have an admonition for you.

22 THE COURT: Mr. Lee, you are admonished not to
23 discuss or disclose at any time outside of this jury room
24 the questions that have been asked of you or your answers
25 until you are authorized by this grand jury or the Court.
26 A violation of these instructions on your part may be the

1 basis for a charge against you of contempt of court.
2 This does not preclude you from discussing your legal
3 rights with your own attorney.

4 Mr. Lee, what I have just said is a warning not
5 to discuss this case with anyone except the Court, your
6 lawyer, or the district attorney.

7 Do you have any questions?

8 THE WITNESS: I'm sorry. I missed the part
9 about my own attorney. Was that -- am I allowed to
10 discuss if necessary? I do have my attorney here with me
11 today.

12 MR. NOEL: No. You have a CPUC attorney.

13 THE WITNESS: Yeah, a CPUC attorney.

14 MR. NOEL: But he is representing you so . . .

15 GRAND JURY FOREPERSON: Except your lawyer or
16 the district attorney.

17 THE WITNESS: Okay.

18 [DISCUSSION OMITTED.]

19 MR. NOEL: We'd ask the exhibits we dealt with
20 with Mr. Lee this afternoon 714 through 730 go into
21 evidence.

22 [Exhibit 714 through 730
23 admitted into evidence.]

24 [DISCUSSION OMITTED.]

25 [Matter adjourned at 4:30 p.m.]

[ROLL CALL OMITTED.]

[DISCUSSION OMITTED.]

GRAND JURY FOREPERSON: (WITNESS #16), before
you have a seat, would you please raise your right hand
to be sworn.

(WITNESS #16)
having been called as a witness in
the matter now pending, having been first
duly sworn, testifies as follows:

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a
seat, please.

EXAMINATION

BY MR. NOEL

Q. (WITNESS #16), for the record, can you please
state your full name, spelling your last name.

A. My name is (WITNESS #16), spelled (SPELLING

1 REDACTED) .

2 Q. (WITNESS #16), are you employed?

3 A. Yes.

4 Q. By whom are you employed?

5 A. Pacific Gas and Electric.

6 Q. In what capacity are you employed by Pacific
7 Gas and Electric?

8 A. I am an area manager for the hydro De Sabla
9 area.

10 Q. The hydro what?

11 A. De Sabla area. What we call the Feather River
12 Canyon, Camp 1.

13 Q. What's it means to be an area manager?

14 A. Responsible for the operation, maintenance of
15 the power houses in the De Sabla area, including -- I
16 guess there's eighty some employees, ten powerhouses, and
17 multiple dams.

18 Q. Can you tell us a little bit about what is the
19 hydro division of PG&E?

20 A. The hydro division is a, I guess, generation
21 division that incorporates hydro generators. It is -- De
22 Sabla is one of four areas that has hydro generators as
23 part of the generation assets of PG&E.

24 Q. And what did you do as the manager?

25 A. I'm responsible for budget, for maintaining the
26 fleet to make sure it's available when needed, overseeing

1 the maintenance and outages of the units.

2 Q. How long have you been with PG&E?

3 A. Started the 1st of August in 2010.

4 Q. How long have you been an area manager in the
5 hydro division?

6 A. I started as the interim area manager the
7 Monday before the Camp Fire broke out and became the
8 permanentary manager this year sometime.

9 Q. So speaking of the Camp Fire, were you
10 scheduled to work on November 8th, 2018?

11 A. It was my normal workday.

12 Q. What time would you -- were you supposed to
13 report to work on November 18 -- 8?

14 A. Well, normal report time is we have a 6:45
15 call-in meeting. The day of the Camp Fire, though -- the
16 day before, we prepped for a possible PSPS event, which
17 may or may not have been triggered at 4:00 o'clock in the
18 morning. I woke up to my alarm clock, not a call at 4:00
19 o'clock in the morning, so my day started normal, at
20 5:00, 5:05.

21 Q. PSPS is Public Safety Power Shutoff?

22 A. Correct.

23 Q. As -- working at hydro generation, what did you
24 have to do to prepare for the potential Public Safety
25 Power Shutoff?

26 A. The PSPS, that was probably one of the first

1 ones that we participated in. So the day before, we shut
2 down units in the De -- Camp 1 area, which is the De
3 Sabla unit and Toadtown unit, for down, shutdown.
4 Probably Lime Saddle as well. We shut down the
5 generators, and we moved the water around in the canal
6 system, so if they would have shut off power that
7 morning, wouldn't have been disruptive on the water
8 flows. We also had crews scheduled at 4:00 o'clock in
9 the morning coming into the Camp 1 headquarters to put up
10 generators and deal with situations that would have come
11 up.

12 Q. So the Public Safety Power Shutoff never came
13 to pass; correct?

14 A. Correct.

15 Q. So you got up at your normal time, and you said
16 you had to be at work at what time?

17 A. 6:45 is our call-in meeting.

18 Q. And do you have -- or did you in that weekend
19 of November have a regular office you reported to every
20 morning?

21 A. So my regular office is at Rodgers Flat
22 headquarters, which is in along Highway 70 in the Feather
23 River Canyon around, I guess, up from Storey, California.

24 Q. Now, what area do you live?

25 A. In Chico. If you want to consider it more on
26 the north end.

1 Q. Okay. All we need to know is what area.

2 So describe for us how you get from Chico to
3 your office at Rodgers Flat.

4 A. My normal commute is get on 99, 149, and take
5 70 into the canyon to Rodgers Flat.

6 Q. How long did it generally take for you to drive
7 to Rodgers Flat from Chico before work?

8 A. It takes about an hour.

9 Q. So on November 8, 2018, do you remember
10 approximately what time you left home?

11 A. Not exactly. Probably around 6:00 or before
12 6:00. More like 5:30, I guess, thinking about it. So --

13 Q. Did you have weigh points along the route?

14 A. So, like I said, prior to me taking this job, I
15 know if I would make it to the Tobin Bridge in Highway 70
16 at 6:30, I would make it to Rock Creek around 6:40 in
17 time for my 6:45 call. My new position, it takes a
18 little bit longer to get there. So it was kind of timing
19 my route by when I got to the Tobin Bridge.

20 Q. And what time did you believe you had to be at
21 the Tobin Bridge to be at Rodgers Flat in time for your
22 meeting?

23 A. Around 6:20.

24 Q. Okay. Do you remember if you were on time that
25 morning?

26 A. It was around 6:25-ish when I got to Tobin

1 Bridge, so --

2

3 (Grand Jury Exhibit 731 introduced for identification.)

4

5 Q. All right. So you should have in front of you
6 an Exhibit 731. And I have a copy up here on the big
7 board. Do you recognize Exhibit 731?

8 A. It's part of my normal commute.

9 Q. Well. First off, it's a map?

10 A. Yep.

11 Q. Showing starting in the CITY of Chico and
12 ending up in the right, top right corner with Rodgers
13 Flat PG&E Maintenance Station; do you recognize that?

14 A. Yeah.

15 Q. And the blue line on here, is this -- the blue
16 line depicts your normal route from Chico to Rodgers
17 Flat?

18 A. Yep. And looks like maybe I said Tobin Bridge,
19 but it would have been Pulga Bridge.

20 Q. Pulga Bridge?

21 A. Is what I meant.

22

23 (Grand Jury Exhibit 732 introduced for identification.)

24

25 Q. All right. Now I want you to look at Exhibit
26 732.

1 All right. You have 732 right there in front
2 of you. I've got a copy of it here on the big board.

3 Do you recognize Exhibit 732?

4 A. It's down in the canyon, so yes.

5 Q. Okay. So do you recognize 732 to be a Google
6 Earth satellite view of Highway 70 in the Pulga area?

7 A. Yes.

8 Q. All right. So this would have been part of
9 your route to work on November 8th?

10 A. Correct.

11 Q. So as you're coming up towards the Pulga
12 Bridge, did something catch your attention?

13 A. So as I was approaching the bridge, I noticed
14 what appeared to be at the time right at the top of the
15 ridge of the mountains a bright light, which I assumed at
16 the time was the sun kind of peeking over.

17 Q. Okay.

18 Okay. Do you remember approximately where you
19 were when you saw that light?

20 A. Somewhere kind of maybe in the vicinity where
21 it's -- the 70 is.

22 Q. Okay. You can get up and walk around. And
23 we've actually got --

24 A. I assume maybe down in this area. It was
25 before the bridge. I know there's some kind of winding
26 there.

1 Q. Okay. So somewhere right around here?

2 A. Yeah.

3 Q. So we've drawn a black circle on Highway 70.

4 So -- and this would be the Pulga Bridge right

5 here; correct?

6 A. Yeah.

7 Q. The black line going over the river?

8 A. Yep.

9 Q. All right. So you said as you're approaching

10 the Pulga Bridge you see something bright in the sky off

11 in the distance?

12 A. Correct.

13 Q. You said you thought maybe it was the sun

14 starting to come up?

15 A. Yep.

16 Q. All right. Did you continue on?

17 A. Yes.

18 Q. Eventually did you realize that that light was

19 not the sun?

20 A. Yes. Somewhere --

21 Q. Describe for us what happened.

22 A. So somewhere I believe between Pulga Bridge and

23 by the Sandy Beach area, which is -- I noticed that the

24 light wasn't actually the sun coming over but it was

25 actually a fire underneath the power lines.

26 Q. Okay. Do you know approximate location under

1 the power lines?

2 A. It was at the, kind of the base of a tower.

3 Q. Okay.

4 A. In the cleared section underneath.

5 Q. All right. So in more general terms, was the

6 fire on the same side of the river as the highway or on

7 the other side of the road?

8 A. Opposite side.

9 Q. Opposite side on the river?

10 A. On the railroad wide.

11 Q. Was the fire -- do you know where the railroad

12 tracks are that parallel the river?

13 A. Yes.

14 Q. Was the fire above or below the railroad

15 tracks?

16 A. It was above the railroad tracks, more up on

17 the mountains.

18 Q. Okay. And on 732, one of the landmarks that we

19 have marked on here is Sandy Beach in green; correct?

20 A. Correct.

21 Q. And that's about where you saw the light was

22 actually a fire?

23 A. In that area, yeah. I don't really exactly --

24 I believe -- in that area was multiple towers and the

25 lines run along there.

26 Q. Okay. Got to save that before we go on.

(Grand Jury Exhibit 733 introduced for identification.)

Q. All right. So I'm going to back up and have you look at -- all right.

Now you have in front of you 732 -- I'm sorry -- 733. Do you recognize 733?

A. Yes.

Q. What is 733?

A. The bridge you see is the Pulga Bridge with the road that veers off to the left of Pulga, and the railroad bridge underneath. And you can see the mountaintops, probably even the transmission tower kind of on the top of the mountains.

Q. Is this photograph taken from approximately where you saw the light that you initially thought was the sun?

A. Yes. Close to it, yes.

Q. So where was the sun, approximately?

A. If this is correct what I'm seeing, this is probably the towers right here. So it would have been right in this area.

Q. Let me -- go ahead and draw. We can erase, then do it again.

A. Keep my other finger out of there.

Q. Here. The best thing we have to use is the

1 back end of that pen. There we go.

2 A. All righty.

3 Q. So you've drawn a red circle around the
4 approximate location where you saw the glow in the sky?

5 A. I'm assuming if that's the towers, yes. Kind
6 of looks like it's the towers.

7 Q. Saving.

8 A. At the time I guess I didn't see the towers,
9 but, I mean, I wasn't looking for the towers.

10

11 (Grand Jury Exhibit 734 introduced for identification.)

12

13 Q. All right. Now let's move on to 734. Do you
14 recognize 734?

15 A. Yes.

16 Q. What is 734?

17 A. Another Google image of about the same
18 location, looks like between Pulga Bridge. I see the Cal
19 Trans yard, what you're calling Sandy Beach is also
20 referred to the same area as Beer Can Beach, and Poe Dam,
21 and further down the street.

22 Q. So down here in the bottom left-hand side
23 corner?

24 A. The Pulga Bridge.

25 Q. Okay. And --

26 A. Cal Trans yard and Poe Dam.

1 Q. Once you realized that the light was a fire
2 under the transmission lines, what did you do?

3 A. I, I was in a PG&E work truck. In the work
4 truck are PG&E company radios. So I called the Rock
5 Creek Switching Center, which is our normal protocol for
6 calling in fires, and reported the fire to the Rock Creek
7 Switching Center operator.

8 Q. Do you remember approximately your location
9 when you made the initial radio call?

10 A. Somewhere, I would imagine, between Pulga
11 Bridge and the Cal Trans yard.

12

13 (Grand Jury Exhibit 735 introduced for identification.)

14

15 Q. I'm going to go to 735. Do you see Exhibit
16 735?

17 A. I do.

18 Q. Do you recognize Exhibit 735?

19 A. It is the Cal Trans yard off to the right,
20 along with their area where they store gravel and road
21 base. And then you can see the transmission towers up on
22 the hillside on the side.

23 Q. Where approximately was the fire when you saw
24 it when you called it in?

25 A. It may have been around this location, just
26 because the vegetation kind of opens up in this area

1 where you can actually probably get a better glimpse.
2 Prior to this there's trees kind of along the roadside,
3 makes it a little bit harder to look at. So could have
4 possibly been in this area where I called it in, was able
5 to see.

6
7 (Grand Jury Exhibit 132 introduced for identification.)

8
9 (Grand Jury Exhibit 132A introduced for identification.)

10
11 Q. All right. So next I want to go on to Exhibit
12 132. And I'm going to show you, we have a copy here of
13 132A, which is a transcript, and so you can follow along.

14 And we have copies of 132A in the PowerPoint so
15 everybody can follow along. Why don't you listen.

16 (Audio plays.)

17 Q. So I'm going to stop it right there.

18 Do you know (WITNESS #7)?

19 A. Yes.

20 Q. Who is (WITNESS #7)?

21 A. He's an operator at the Rock Creek Switching
22 Center. He's a hydro operator. He's one of the board
23 operators who was on the shift.

24 Q. Okay. Somebody you supervise?

25 A. Prior to that Monday, he was my direct report,
26 yes. But he still received the Rock Creek switching

1 center.

2 Q. You said when you realized it was a fire on the
3 transmission line, you used your radio to contact Rock
4 Creek. Was (WITNESS #7) the person you contacted?

5 A. Yes.

6 Q. All right.

7 (Audio plays.)

8 Q. All right. Interrupt it again.

9 Do you hear that disembodied voice in the back
10 that says "Rock Creek 2-0"?

11 A. Yes.

12 Q. Do you recognize that voice?

13 A. (EMPLOYEE #2), another Rock Creek Switching
14 Center Operator.

15 Q. And are you familiar with the term "2-0"?

16 A. My radio call number is 6420, so he just used
17 the last two from caller ID.

18 Q. So 2-0 is you?

19 A. Yes.

20 (Audio plays.)

21 Q. All right. So is that you describing the fire?

22 A. Yes.

23 Q. So do you recall where you were at when you got
24 the radio call for more, asking for more information?

25 A. I'm not sure exactly. I was kind of looking
26 back over my shoulder at the fire to get a -- when I got

1 the call back.

2 Q. Okay. So were you past the Poe Dam?

3 A. I don't recall the location of Poe Dam, but I
4 wasn't -- I can't say for sure.

5 Q. Okay.

6 A. It was in that area.

7 Q. But as you were describing the fire, you were
8 describing what you were seeing at the time?

9 A. Correct.

10 Q. All right. Did you make it in time for your
11 6:45 call?

12 A. I went to Rock Creek Switching Center and did
13 the call from there. Also -- yes.

14 Q. All right.

15 I have nothing further of this witness. If any
16 of the jurors have questions?

17 Seeing none, I believe that's all we have for
18 you this morning. Madam Foreperson is going to read you
19 an admonition.

20 GRAND JURY FOREPERSON: (WITNESS #16), you are
21 admonished not to discuss or disclose at any time outside
22 of this jury room the questions that have been asked of
23 you or your answers until authorized by Grand Jury or the
24 Court. A violation of these instructions on your part
25 may be the basis for a charge against you of contempt of
26 court. This does not preclude you from discussing your

1 legal rights with your own attorney.

2 (WITNESS #16), what I have just said is a
3 warning not to discuss this case with anyone except the
4 Court, your lawyer, or the district attorney. Do you
5 have any questions?

6 THE WITNESS: No.

7 GRAND JURY FOREPERSON: Okay. Thank you for
8 your time today.

9 THE WITNESS: Thanks.

10 MS. DUPRE-TOKOS: Did everyone get the
11 PowerPoint for Captain Ascencio?

12 GRAND JURY FOREPERSON: All members of the
13 Grand Jury are present.

14 Captain Ascencio, if you would raise your right
15 hand to be sworn, please.

16
17 CAPTAIN ABEL ASCENCIO
18 having been called as a witness in
19 the matter now pending, having been first
20 duly sworn, testifies as follows:

21
22 THE WITNESS: I swear to God, so help me God.

23 GRAND JURY FOREPERSON: Thank you. Have a
24 seat, please.

BY MS. DUPRE-TOKOS

Q. Good morning.

A. Good morning.

Q. It is still morning?

Are you employed?

A. Yes.

Q. Could you tell us where?

A. I'm employed by the State of California. I'm a fire captain in the Butte unit. I'm currently working at the station in the Stirling City.

Q. So you work with -- for Cal Fire?

A. Yes.

Q. So you said you're currently stationed in, at Stirling City?

A. At Stirling City Fire Station.

Q. How long have you been there?

A. At that station I have been permanently for the last six years, I believe.

Q. Okay. What is your job title with Cal Fire?

A. I'm a fire captain.

Q. And how long have you been a fire captain?

A. Approximately 13 to 15 years.

Q. And what were you before you became a fire captain?

1 A. I was a fire apparatus engineer.
2 Q. How long were you a fire apparatus engineer?
3 A. I believe around eight years.
4 Q. And prior to that?
5 A. Firefighter.
6 Q. For about how long?
7 A. About 13 years.
8 Q. So how long have you been a firefighter with
9 one title or another?
10 A. All together, I am on my 30th year with Cal
11 Fire, and I have one year with CCCs.
12 Q. California Conservation Corps?
13 A. Yes.
14 Q. Now, do you have any medical training?
15 A. Yes. I am an EMT, Emergency Medical
16 Technician.
17 Q. And are you certified?
18 A. I'm certified.
19 Q. How long have you been a certified EMT?
20 A. For the last probably 25 years.
21 Q. And do you have to certify, or re-certify
22 regularly?
23 A. Yes. We are recertify every three years.
24 Q. And as a certified EMT, are you familiar with
25 first-degree, second-degree, and third-degree burns?
26 A. Yes, I am.

1 Q. Could you tell us what the difference is
2 between those.

3 A. The first-degree burn probably can be easily
4 explained as a sunburn with, shows redness on the skin,
5 no blister. Second-degree burn is the showing blisters.
6 The third-degree burn, as far as basically burning the
7 outer layers of the skin and going deeper into the skin.
8 In some cases, the skin turns relatively white and very
9 dry. And in other cases, depending on the what type of
10 burn it is, if it's direct flame burn, or if it's a
11 radiant heat burn, if there is contaminants, sometimes
12 the skin turns dark or black.

13 Q. And you said sometimes the skin will be dry?

14 A. Yes. It gets very, very dry and crinkled.
15 Pretty much looks like a person that has aged
16 tremendously. Because there is no moisture in the skin.
17 The skin starts contracting and crinkling and basically
18 prepares to burst into flames.

19 Q. Okay. What happens if you touch someone's skin
20 when it's in that condition, when it's dry and wrinkled?

21 A. Most of the time it becomes very flaky. And if
22 you apply too much pressure, it might come off the body.
23 It detaches, because it basically has burned off the
24 body. And the skin basically hanging there ready to peel
25 off.

26 Q. And in your 31 years in the fire service, have

1 you had occasion to see third-degree burns before?

2 A. Yes, I have seen previously.

3 Q. Were you on duty on November 8th, 2018?

4 A. Yes, I was.

5 Q. And how long had you been on duty for?

6 A. I was for a period approximate of, I believe,
7 about seven to eight days prior to it.

8 Q. And were you getting ready for a day off soon?

9 A. My day off was going to be on November 9th.

10 Q. Did you get a day off on November 9th?

11 A. No. I continue working until the end of the
12 fighting, until they declared the fire was controlled.

13 Q. So the morning of November 8th, can you tell us
14 how your day started?

15 A. The morning of -- well, I can probably -- I
16 should start from the 9th, or the day before of November
17 8th. The weather conditions kept me in a ready, as
18 specified to us via email that it was very dangerous.
19 The winds were expected to be blowing probably about 60
20 miles per hour or more with gusts.

21 So the night before, as I was asleep, I
22 remember listening to the wind moving leaves and hitting
23 the window in my room. I was expecting for something to
24 happen. Nothing happened that night, but the morning of
25 November 8th, I woke up and I basically thanked God that
26 nothing happened that night.

1 Q. And you slept at the fire station?

2 A. Yes, I was asleep on the fire station. And I
3 went to get a cup of coffee about 6:00 o'clock. And,
4 like I said, I was saying things kind of nothing happened
5 last night, so we are okay. As I was drinking my coffee,
6 around I believe probably 6:30, I heard the call that was
7 fire in the area of Pulga. And right away, due to the
8 weather conditions, I indicated to my firefighters north
9 of them to get ready and go and dress up in our safety
10 gear because we were going to go to this call. We were
11 going to be, whether assigned to the call or go to
12 another station to cover, and be prepared in case they
13 need us. By the time we got to the engine and we were
14 dressed, we heard on the radio that our engine number.
15 So they included us in the initial dispatch.

16 Q. So what did you do on, once you heard that you
17 are included in the initial dispatch?

18 A. Once I was included in the initial dispatch, I
19 ordered my firefighters to start taking all the
20 information necessary, as I was basically predicting to
21 them that this fire was going to be out of their
22 ordinary. I requested for them to be very, very careful
23 and give me all the routing instructions, as I was not
24 really familiar with the Pulga area. However, I am
25 familiar with the general location.

26 Q. So did you actually go to the Pulga area?

1 A. We never made it to the Pulga area. By the
2 time that we were crossing the bridge of the lake, we
3 receive orders that it went into, divert into the Concow
4 area as the fire had already started in that area.

5 Q. So did you head toward Concow?

6 A. Yes. As soon as we got those orders, I
7 redirected my firefighters to pull up any information
8 that we have on that area; maps and additional
9 information like schools and all their areas that we can
10 take people to to shelter in place. So we were driving
11 down there within, I don't remember, maybe a mile or so
12 on the road, we started seeing the smoke and the fire.

13 Q. Now, did you get dispatched to look for anyone
14 in particular initially?

15 A. Initially, we were not. Not right away. I
16 remember they, as we were going into the area, we
17 encountered zero visibility due to the heavy smoke. We
18 had to stop on the road, and we have active flames on the
19 right side of our fire engine. And I remember on the
20 left side that where multiple cars trying to evacuate the
21 area. The left side was involved in flames, the
22 vegetation; everything was just flames and smoke.

23 The wind was blowing in the direction of the
24 engine, so we are taking a lot of heat during that time.
25 At one point, my engine inside the cab, even though we
26 had the air conditioning to the maximum, we start

1 experiencing the temperatures increasing and the smoke
2 inside the fire engine.

3 Q. So what did you do?

4 A. At that moment, I had to order the engine that
5 was in front of me to try to make a U-turn wherever
6 possible because we needed to retreat. That was not
7 possible for the next probably 10 minutes, 15 minutes,
8 because the zero visibility and vehicles continuing to
9 try to evacuate the area.

10 I noticed that there was in front of that
11 engine a driveway, so on the radio I was trying to direct
12 them to do a U-turn right there. At one point, when the
13 wind changed and visibility became better, they were able
14 to take the opportunity to turn around. However, once
15 they left, I was stuck again because there was no
16 visibility, zero visibility came back again, and vehicles
17 were trying to evacuate. So I had to wait for another 5
18 to 10 minutes for me to turn around and leave the area.

19 Once the visibility was better, I was able to
20 turn around and we left the area. We probably drove
21 maybe about a half a mile to find an area to turn around,
22 because we were going to make another attempt to cross
23 that point. So we did that. And after we did that, then
24 we receive orders, specifically to my fire engine, 2162,
25 to go and look for a person in a wheelchair. And I have
26 hear before on the radio that all the personnel was

1 looking to locate this person in a wheelchair.

2 Q. So did you make efforts to find the person in
3 the wheelchair?

4 A. Yes. Me and one of the battalion chiefs who
5 was giving me the order to follow him, we tried multiple
6 routes to access the location that was given to look for
7 this individual. But it was, it came to be impossible
8 because every access, every road, everything was blocked
9 by fallen trees, power lines, fallen power poles, creeks.
10 There was multiple obstacles. And at one point, the
11 battalion chief told me to abandon that objective and
12 return back to my previous assignment. It was to try to
13 locate as many people and evacuate them from danger.

14 Q. So when you returned to your initial
15 assignment, were you able to assist anyone?

16 A. Yes. I returned to my ordinary assignment. I
17 encountered three people, I don't remember if it was one
18 male and two females, that they were here in the road. I
19 stopped and I ordered my firefighters to get them in the
20 fire engine. All of them got in the back of the fire
21 engine, in the backseat. They were telling me that there
22 was another lady in a creek taking shelter. So I turned
23 around, made the U-turn, turned around as fast as
24 possible, took them to the Camelot area, where a lot of
25 people were taking shelter. And I put my -- asked the
26 vehicles to go and find -- I believe there was a Butte

1 County Sheriff Deputy in the area, and called him for
2 information and also for accountability.

3 After that, I noticed that there was another
4 fire engine right in Camelot, so I came to the operator
5 and I asked him to follow me because we had another
6 victim, and I didn't know what to expect, if we were
7 going to need additional help.

8 As we arrived to the location, we found the
9 victim, the lady, in the creek.

10 Q. I'm going to interrupt real quick. When you
11 said "arrived" at the location, was that in Concow again?

12 A. Yes. So we went back to the Concow Road, and
13 we arrived to the location that was given by the three
14 people that we rescued previously. And we found the lady
15 in the creek, and we helped her out from the creek. She
16 didn't want to leave the area because she didn't want to
17 leave her car and her three dogs. So we tried to
18 dislodge the car. The car was high centered on a big
19 tree that came across the road. We cut part of the tree.
20 We were ineffective to dislodge the tree from under the
21 car. So I asked the lady to please get in the fire
22 engine and go with the firefighters. She insisted that
23 she wanted her dogs. So I ordered the firefighters to
24 take the dogs and put them on the back of the fire
25 engine. And when that happened, she was really happy and
26 willing to go.

1 Q. Now, was that your engine or the other engine?

2 A. The other engine I think that came to assist
3 me.

4 Once that happened, the engine, we help them to
5 make a U-turn to turn to Camelot, and we stay in there,
6 once the -- I got in the fire engine, I heard a message
7 over the radio of a lady that -- they didn't say "lady,"
8 but they said there was a victim with possible burns, in
9 the area of broken glass. When I heard that, I
10 instructed my firefighters to locate the area and to tell
11 me how close we were to that location.

12 Q. And were you very close?

13 A. Appears to be the, that we were the closest
14 resource to that location.

15 Q. So what did you do?

16 A. Well, as soon as I -- they told me that we were
17 nearby, I radioed in to, my engine number to the
18 battalion chief, and I told him that I was en route to
19 that location. It took us probably five minutes to get
20 to the location.

21 Q. What did you see, if anything, when you got
22 there?

23 A. When I got there, the very top of the road, the
24 road was very narrow. And due to the fire, the
25 conditions, I hesitated for a moment because we were
26 almost on zero visibility, very hard to see, with that

1 road so narrow. That moment I didn't want to put myself
2 in danger and put my firefighters in danger, that we
3 might start driving into something that we couldn't get
4 out, and we might end up being like in the previous
5 situation with fire on both sides of the road. But for
6 some reason, I just decided, well, you know what, we're
7 right here, might as well go and do it.

8 And I remember that I drove probably for about
9 two or three feet at low speed when suddenly out of the
10 smoke I saw -- I saw -- excuse me. I saw a hand was on
11 the ground. From the ground I saw a hand waving. And to
12 me it was something almost unbelievable.

13 So I sped up to try to get to that person that
14 was waving from the ground. And I stopped probably about
15 five feet. I ordered my firefighters to get out and get
16 the medical equipment to render first aid. Right next to
17 the lady there was also a male, who right away I went and
18 checked for vital signs; however, I didn't find no signs
19 of life. And rigidity was already setting. I turned
20 around and I ordered my firefighters to check on the
21 individual again for any signs of life. At the same
22 time, I was looking at the injuries that the female
23 victim had suffered. And I noticed that she had first,
24 second, and third degree, most of it was third-degree
25 burns, to the legs, to the hands, the face.

26 Q. About what percent of her body would you say

1 had suffered severe burns?

2 A. My quick calculation was that probably about 40
3 to 50 percent of the body was suffering from burns all
4 together between the second- and third-degree.

5 Q. Okay. Why don't we take a short break. And
6 that way, anybody needs to use the restroom can use it.
7 About a 10- or 15-minute break?

8 GRAND JURY FOREPERSON: Okay. Before we do, we
9 need to admonish him.

10 MR. NOEL: Yep. Give him the admonishment.

11 GRAND JURY FOREPERSON: Captain Ascencio, you
12 are admonished not to discuss or disclose at any time
13 outside of this jury room the questions that have been
14 asked of you or your answers until authorized by the
15 Grand Jury or the Court. A violation of these
16 instructions on your part may be the basis for a charge
17 against you of contempt of court. This does not preclude
18 you from discussing your legal rights with your own
19 attorney.

20 Captain Ascencio, what I have just said is a
21 warning not to discuss this case with anyone except the
22 Court, your lawyer, or the district attorney. Do you
23 have any questions?

24 THE WITNESS: No.

25 GRAND JURY FOREPERSON: Okay. Thank you.

26 THE WITNESS: You're welcome.

GRAND JURY FOREPERSON: All members of the Grand Jury have returned and are ready to proceed.

Captain Ascencio, I'd just like to remind you that you're still under oath.

THE WITNESS: Thank you.

Q. (By MS. DUPRE-TOKOS) So, Captain, you said that your quick initial assessment, the woman appeared to be 40 to 50 percent second- and third-degree burns; is that correct?

A. That's correct.

Q. Okay. Now, where was she located?

A. In relation to the road, as I was coming down, she was on the left-hand side. I cannot really, you know, tell you if it was north or south.

Q. Well, was there anything around her?

A. Oh, yes. There was a pickup right next to her. I believe the color was white. And the way that she was laying on the ground and the other person laid on the ground was like her head was facing to the road, and the other male victim was laying opposite, like, like they were touching themselves with their feet.

At the moment, I asked my firefighter to double check vital signs on the male, which it turned out to be that he didn't find any. There was no signs of life.

Q. And you hadn't found any signs of life?

1 A. And I did not find no signs of life. My
2 firefighter asked me to check for him. The situation was
3 probably a little bit different than what we ever been
4 in. And he was hesitating that he might have made a
5 mistake, so he wanted me to ensure that his assessment
6 was correct. So I went and I double check, and the
7 assessment was pretty much conclusive to the same
8 results.

9 Q. No signs of life?

10 A. No signs of life.

11 Q. So at that point, what did you do with regards
12 to the female?

13 A. In regards to the female, the same time there
14 was my second firefighter taking care of her, deploying
15 our oxygen bottle and oxygen mask to provide oxygen. One
16 of my biggest concerns was the possibility of heated
17 gasses inhaled and producing any burns in the lungs or
18 the airway. So for that I instructed my firefighters,
19 and I told them that there was no possibility for us to
20 render proper care under these circumstances with threat
21 of fire, and that it's no possibility for ambulances to
22 come to our location for any other additional help, that
23 we needed to provide adequate first aid and life support
24 to her. So my orders were to provide high oxygen and
25 quickly move her and put her in the fire engine, in the
26 backseat, and drive her away from the fire area.

1 Q. And did you do that?

2 A. Yes, we did that. I remember, I lift -- we
3 lifted the lady and actually I carried her in my arms,
4 because one firefighter had to get in the engine since
5 the fire engine's really tall. One got in the fire
6 engine, the other one helped me by carrying on the steps
7 of the engine, then we pretty much did like the bucket
8 brigade, passing her on to us on the seat.

9 I instructed the firefighter in the back taking
10 care of her that he needed to keep her as conscious as
11 possible and to start asking her questions about her name
12 and whatever he can ask her and maintain communication,
13 because I needed to know if she would lose consciousness
14 or if her vitals will change. Because if she would
15 suffer a cardiac arrest, then our, our objectives were
16 going to be changing quick and our mode of operation to
17 now we will have to start CPR.

18 Q. I'm going to take a step back. And I think you
19 said it, but I just want to check. Where did you see
20 burns on her?

21 A. The burns were on her legs. She -- well, let
22 me explain how I saw her. As I approached her, she only
23 had sweatshirt with a hood and she was trying to protect
24 her airway. She did -- she only had underwear and no
25 pants, no nothing to cover her legs. So most of all the
26 burns that I noticed right away were on her legs. Then I

1 noticed her arms, her hands, and part of the arms, even
2 though the sweatshirt was covering, but there was some
3 problem about her hands, some burns. And on her face.
4 Her face was extremely wrinkled because the contraction.
5 The heat pretty much evaporated all the moisture of the
6 skin and the skin was so wrinkly that she looked probably
7 like a 90-year-old lady.

8 Q. And so that's what you were telling us before
9 about like a third-degree burn that sucks the moisture
10 out?

11 A. Yes, third-degree burn.

12 Q. So when you picked her up, did you notice
13 anything about her skin at that time?

14 A. Yes, I -- when I pick her up, obviously my
15 hands touch her legs and I touched the skin. The skin
16 was very flaky and falling off. Also, I felt how dry the
17 skin was; have no flexibility, no moisture, was so dry,
18 so crackling.

19 Then, you know, I help her to get in the
20 engine. And I remember after we took her to the
21 ambulance, we had to clean a lot of her skin off the
22 seat.

23 Q. So you said you took her to an ambulance. At
24 some point when you were driving her out of Concow, did
25 you request to be met by an ambulance?

26 A. Yes. Once that she was secure in the fire

1 engine, I got in the engine, I needed to make a U-turn
2 because I didn't know where this road would take me to or
3 how bad it will -- you know -- long and travel through
4 that road was going to be. So I made, as fast as
5 possible, a U-turn. I run up the road, I drove up the
6 road, and at the same time I contacted the battalion
7 chief that was in charge of the area and I requested, I
8 -- first, I give him the information that I had the
9 victim with 40 to 50 percent of the body with burn
10 injuries, and I requested for a medic air, helicopter
11 flight care, and an ambulance to meet me outside the fire
12 area.

13 Q. And were you driving code 3 with lights and
14 sirens?

15 A. Yes. For that particular purpose, I deemed the
16 best, fastest way for me to open my way through the fire
17 was going to be to turn on my red lights and sirens
18 indicating that I had an emergency, not only through the,
19 through the people that were trying to escape, but by
20 this time the roads were relatively clear, but all the
21 other incoming resources I needed to advise them that
22 basically I need the right-of-way to get out of there.

23 Q. And how was that drive?

24 A. The drive was extremely long. As I was driving
25 out, I came -- at one point, I believe probably was in
26 the same area where I got stopped by zero visibility when

1 I was coming in, when I was coming out. For some reason,
2 I end up seeing something that was flickering in front of
3 me. I don't remember how far away. And I had to
4 basically do an emergency stop because it was actually
5 power lines down that were at my eye level. I didn't
6 want to, number one, damage the engine, but also I didn't
7 want to incur any injuries to anybody. So I had to do
8 that emergency stop and order my firefighter to go and
9 cut off the electrical power lines, which he hesitated,
10 because he asked me if they were live or if they were
11 without energy. By this time I was pretty sure that
12 there was no energy in those lines, so I told him that it
13 was okay to cut them off. And he did. And from there we
14 continue code 3 to where my supervisor chief has told me
15 that at the Dome Store on Highway 70 in Concow there was
16 going to be an ambulance waiting for us to provide life
17 care to the victim.

18 Q. Now, before we talk about that, what did you do
19 with the, with the male who showed no signs of life?

20 A. The male, I tried to, I tried to roll him over
21 so, so I can see his face, but he was very rigid. His
22 hands were basically covering around his face, his
23 airway, trying to breathe fresh air I'm assuming from the
24 ground. That was basically the position that I found
25 him. When I move him, his hands pretty much move
26 together.

1 Q. Did you have to leave him there or did you
2 bring him with you?

3 A. I have to leave him there because I had the
4 female's life that had become a priority. But I had
5 requested and I provided the information of the deceased
6 victim to my supervisor chief so they can send another
7 equipment or resources to secure the area.

8 Q. So when you got to the store, was there an
9 ambulance waiting?

10 A. Yes. As I arrived to the store, within
11 probably a hundred feet I saw the ambulance waiting
12 there. Then I park right next to it, I cut off the
13 engine, and I provided information to the paramedics. I
14 told them that my initial assessment was about 40 to 50
15 percent of the body with second- and third-degree burns,
16 and that I was very, very concerned about the facial
17 burns and also very concerned because probably the airway
18 and the lungs probably suffered some sort of burn
19 injuries.

20 Q. And so did you help remove her from the engine?

21 A. Yes. I ordered my firefighters to get ready
22 and, again, when we opened the door, I pretty much took
23 her in my arms, and I put her in the gurney with the help
24 of my firefighter and the medic.

25 Q. Okay. And when, when you were holding her
26 again and moving her to the gurney, was her skin

1 condition the same?

2 A. Yes. The same feeling, same skin condition;
3 flaky, falling apart, very dry.

4 Q. Now, did you ever learn her name?

5 A. No, not during that time. I do not remember if
6 she was able to provide the name to my firefighters or if
7 I was so busy and concentrating on saving her life and
8 moving her out of the fire area that I didn't pay
9 attention. That part I cannot remember because my
10 priority was her life.

11 Q. Did you ever learn her name?

12 A. Eventually I did. I was at work when my
13 mother-in-law send me a text with, with a video clip from
14 the news from Sacramento Channel 40. They were running a
15 news clip that, with her, with her and her story about
16 how she survived.

17 At the moment, I was confused because I didn't
18 know if she was the person that I actually rescued or
19 not, since I didn't have no name. Later on I was in Ione
20 Fire Academy, Cal Fire Academy, where one of our training
21 officers contacted me via phone, and he told me that
22 there is this lady named Tara Hill, that she would like
23 to meet me and my crew and that we were the ones who took
24 her from Concow to, to an ambulance, that we rescued her.
25 I -- still I was little bit confused. I didn't know.

26 Q. Why?

1 A. Because the way she looked during the time when
2 we had rescued her, it was thoroughly different than the
3 way that now she was looking. You know, my brain was
4 confused between that I saw a lady that was probably 90
5 years old, due to the burn injuries the face was sort of
6 wrinkled, and nowadays I'm seeing the lady that it was
7 healing, her face didn't look the same, and then I find
8 out that she was like, I believe she was in her 30s. I
9 don't remember exactly how old she is, but that is the
10 reason why I was a little bit confused.

11 Q. So when was the first time that you discovered
12 that she had survived?

13 A. When my mother-in-law sent me the video clip
14 from the news.

15 Q. And so you did actually get to meet her in
16 person?

17 A. Yes. Eventually, I was contacted again through
18 my supervisors, and I was told that she would like to
19 meet us. And I said that that was perfectly fine, that
20 we would like to do that. It took a little bit of time
21 because I believed she was still in recovery. And she
22 wanted to wait until she was able to be more mobile.

23 So it took -- I don't remember, maybe two
24 months later on we got to organize a meeting, Fire
25 Station 42 in Chico. The news, the local news, was in
26 there. And that was the first time I saw her since the

1 fire. We had the really good conversation and,
2 obviously, we hug and, and say "hi" and all those things
3 and talk for a little bit.

4 Q. But, again, at first you didn't recognize her?

5 A. No. She was not -- you know, in my mind she
6 was not the person that I had rescued just because the
7 injuries were totally different.

8 Q. Now, based on your training and experience,
9 were her burn injuries life-threatening?

10 A. Yes. Yes. The injuries were severe enough
11 that threaten her life and there is high possibility that
12 she probably could have died if no early rescue was
13 there. Not only did -- the burns are very threatening,
14 but also the threat of infection that complicates the
15 injuries.

16 Q. And then earlier you said you were also worried
17 about internal burn injuries?

18 A. Yes. Those are probably the most threatening
19 injuries; however, I do not know if she actually suffered
20 any of those injuries, because I never got any report of
21 that. And since they are internal, there was no way for
22 me to see that.

23 Q. But based on the physical burns that you saw,
24 her life was in danger?

25 A. Yes.

26 (Counsel confer.)

1 Q. (By MS. DUPRE-TOKOS) So just, let's talk just
2 generally about the fire.

3 Now, that day, after you dropped Ms. Hill off
4 with the ambulance, did you have any issues with your
5 fire engine?

6 A. Yes. As soon as I dropped her in the ambulance
7 and we assist the medics to put her in the ambulance,
8 then I was conflicted with another decision that I had to
9 make, because the medics sometimes want to have an
10 additional person to do treatment. But my conflict, my
11 confliction was that I have many other people that needs
12 help, and here -- and she is at the moment -- I was
13 seeing that she's already safe and medical emergency care
14 is, can be provided versus probably the people that are
15 still out there in the fire, they have no help. And I
16 have to make my command decision that I needed to return
17 back to keep returning more people from the fire.

18 However, when I turn off the fire engine, the
19 compressor, the air compressor in the engine stopped
20 working. And when I turned it back on, I realized that
21 my air tanks for the brakes mechanism was empty. So it
22 took a little bit of time to fill back to the normal
23 level. That allows the brakes to be released.

24 I had requested assistance from one of our
25 dozer operators, that they are more mechanically
26 inclined, to help me to locate where I have the air leak,

1 because I can hear there was an air leak. And thinking
2 back from there, from that time, I remember hearing that
3 air leak when I was rescuing Tara Hill. Right in there
4 when we were actually taking her into the engine, I
5 remember hearing air, but I was, I was thinking it
6 probably was the oxygen tank, that that's what the noise
7 was coming from. But then when I got to the Dome Store
8 and that happened, I realized that I have an air leak in
9 the system. However, when the compressor was running it
10 was able to maintain an adequate pressure for the brakes
11 to work. Which then I had to face another decision that
12 I had to make, and I -- again, I took the command
13 decision to take myself and drive all the way to
14 Oroville, requesting an emergency mechanic to come and
15 help me to fix it.

16 I arrived to the Oroville shop for the Butte
17 County Fire, and they helped me to repair two different
18 hoses that appears to be, that they melted when we were
19 stopped by the zero visibility previously. Luckily, the
20 fix was relatively simple and they were able to fix it
21 within like five to ten minutes.

22 Within the same time, I was walking outside the
23 shop and looking into the direction of Concow area,
24 Paradise, and I remember seeing a very, very dark black
25 smoke coming from that area which indicated that
26 basically the town of Paradise was already engulfed in

1 flames. It didn't feel good to be sitting at the
2 mechanics shop doing that when I can be over there with
3 my friends. So I had requested the mechanics to hurry
4 up, and they did. And as soon as the fire engine was
5 back in service, I communicated that I was back in
6 service to my dispatch, and I returned to the fire.

7 Q. And where did you go?

8 A. I returned to my previous assignment on Concow
9 area. I communicated that to my chief, and he
10 acknowledged that.

11 So we spend all day. The fire appeared to be
12 -- because it spread so far and so fast, that all that we
13 had left was some sections, pockets of areas that didn't
14 burn, but still with high threat of fire coming to that
15 area. So we were trying to prep houses, prepare houses
16 for the fire to come in, to move any combustibles,
17 materials, turn on sprinklers if they had any, raking
18 leaves, raking pine needles, removing any possible
19 flammables from around the structures. We made a few
20 attempts to continue on some roads, but the fire was
21 moving relatively fast down the hill.

22 I remember on one structure my supervisor asked
23 me to go into that location and try to prep the
24 structure. My trigger point to move out of that area was
25 the fire coming down, and I put my trigger point, I
26 believe probably about 500 feet. So I got on top of the

1 engine. And while my firefighters were executing the
2 orders of removing flammables and combustibles from
3 around the structure, I got on top of the engine to look
4 at what the fire was doing, and within a few minutes I
5 noticed that we were having a spot fires right on the,
6 next to the driveway. Basically at one point I perceived
7 that our escape route was going to be compromised, so I
8 ordered them to get back in the engine and we left the
9 area.

10 Multiple times we were trying to continue to do
11 some type of work to fight the fire, but the fire was
12 moving so fast and the terrain was so difficult that we
13 had to retrieve constantly and go further away from the
14 fire to continue preparing houses and structures. All
15 day long.

16 And when the night came in, I remember the fire
17 was still moving relatively fast. There was some
18 structures where we had hoses around it, and there was
19 one situation where the fire started moving so fast it,
20 it started to drop in embers, and we had probably 30 or
21 40 spot fires right next to our engine. So we took
22 action on that. And we thought like it was going to be a
23 lost cause, so we had to, again, move out of that area,
24 area further down the road to try to protect other
25 structures.

26 At one point, the winds changed and the fire

1 was slowing down a little bit, so they, they ordered us
2 to start doing patrolling along the roads to try to check
3 on every structure along the road. And if any structure
4 will be compromised we will be taking action on it.

5 Then they prepared for a backfiring operation,
6 and we were ordered to move into the Highway 70 area.
7 The wind conditions were not so good, so our fire
8 operation was compromised and the wind blew the fire
9 across the roads, that they were expecting to hold the
10 fire on. So all that we were able to do from then on,
11 and I believe that was around probably 3:00 o'clock in
12 the morning or 4:00 o'clock in the morning, all we could
13 do by then was just to stay in Highway 70 and patrolling
14 that area and trying to prevent the fire from crossing
15 Highway 70 into the, now will compromise the area of
16 Cherokee.

17 Q. Now, you've been working since 6:00 in the
18 morning, or 6:30 in the morning, when you first got
19 called out. How long before you actually got a break
20 from the fire line?

21 A. That specific day?

22 Q. Or whenever it was.

23 A. Yes. Our help didn't come back -- or we were
24 not given information to, that we were going to have a
25 break during that day on 70. Probably was about 12:00
26 o'clock that day, on November 9th, when finally somebody

1 said, "You guys are going to go to the fire camp that is
2 established in Chico at the Silver Dollar Fair; we are
3 just waiting for sources because we cannot let you go
4 until the other resources come and take your place." So
5 we probably waited maybe another hour before the
6 resources arrived and to give us a break so we could go
7 back to Chico.

8 Q. So that was around 1:00 p.m. when you finally
9 got to start --

10 A. I believe so.

11 Q. And then how long of a break did you have
12 before you went back to the fire?

13 A. That was only until 8:00 o'clock on the next
14 day, I believe probably November 10th. We returned to --
15 we went to Chico, we resupply our fire engines, one of
16 the number one priorities to have ready. We ate, we
17 provided ourselves with whatever needs. And then they
18 told us that we can go to some motel to spend the night
19 in there. And the next day we needed to be back by 6:00
20 o'clock in the morning.

21 So I remember we woke up probably about 5:00
22 o'clock or 4:00 o'clock to get ourselves ready and return
23 to the fire camp. And our next assignment was to go to
24 Paradise.

25 We were about eight fire engines who were on
26 the initial attack. And normally Cal Fire, when they

1 have fire engines, they are single increments of
2 equipment. After the first day of the initial attack,
3 they group them together to form a task force. So we
4 were a task force of eight fire engines that went to
5 Paradise. And our assignment was to assist every house,
6 every structure, that was destroyed by fire looking for
7 human remains.

8 Q. And so you spent your day in Paradise doing
9 that; is that correct?

10 A. Yes.

11 Q. And then when did you get to go back to the
12 fire camp?

13 A. The fire camp was rotation basically of about
14 24 hours.

15 Q. Work for 24 hours, then go back to camp for 16
16 hours?

17 A. Yes. What happens, the way it happens is we
18 start our day about 6:00 o'clock in the morning at the
19 fire camp, we get our assignments, we drive to our
20 assignments, we work in there so possibly until the next
21 day about 8:00 o'clock, our operational period. But due
22 to the resources, they have to be mobilized from the fire
23 camp to our location, so we can be relieved and then move
24 to the fire camp. Sometimes it can be 10:00 o'clock.
25 The time varies, depending on the resources availability.

26 Q. So was that basically the routine until the

1 fire was under control?

2 A. Yes. Not only on the initial attack, there is
3 a lot of, not surprising, that the resources can work for
4 48 hours or 72 hours without going to the fire camp due
5 to the fire, but also available resources coming to
6 assist us, and how fast we can establish our fire camp.
7 If everything works according to plan, then our time on
8 the initial attack on the fire can be reduced and it can
9 be 24 hours or 36 hours, 48 hours. But once they've,
10 once everything is established, then we try to go on a
11 24-hour clock. We go from 6:00 o'clock in the morning
12 until 8:00 or 10:00 o'clock the next day. And it becomes
13 a routine.

14 Q. Then you did that until --

15 A. And I did that all the way, I believe, until
16 November 22nd, whenever the fire was declared controlled.
17 I believe it started right in on that day. We were
18 assigned -- by that time, we were assigned in an area
19 closer to the Pulga area and the Jarbo Gap area.

20 Q. So your seven days on turned out to be a lot
21 longer?

22 A. Yes. And I had vacation during that time, but
23 I had to -- a cruise to go to the Mexican Riviera, but I
24 couldn't go and leave my people behind.

25 Q. Right.

26 Do you have anything else?

1 MR. NOEL: No.
2 MS. DUPRE-TOKOS: Do any of the jurors have
3 questions?

4 Thank you.

5 (Counsel confer.)

6 Q. (By MS. DUPRE-TOKOS) So, Captain, for the
7 entire duration of the fire that you worked, how many
8 people do you think that you and your firefighters
9 rescued and how many did you find that you could not
10 rescue?

11 A. I believe probably, probably about seven or
12 eight that we were able to rescue. I do not know --
13 there were a lot of people we couldn't rescue, but I
14 don't know how many.

15 Q. Okay.

16 Any other questions?

17 All right. Well, thank you very much.

18 THE WITNESS: You're welcome.

19 MR. NOEL: Madam Foreperson will have an
20 admonition for you.

21 GRAND JURY FOREPERSON: Captain Ascencio, you
22 are admonished not to discuss or disclose at any time
23 outside of this jury room the questions that have been
24 asked of you or your answers until authorized by the
25 Grand Jury or the Court. A violation of these
26 instructions on your part may be the basis for a charge

1 against you of contempt of court. This does not preclude
2 you from discussing your legal rights with your own
3 attorney.

4 Captain Ascencio, what I have just said is a
5 warning not to discuss this case with anyone except the
6 Court, your lawyer, or the district attorney. Do you
7 have any questions?

8 THE WITNESS: No, and I understand. Thank you.

9 GRAND JURY FOREPERSON: Thank you. Thank you
10 for your time today.

11 THE WITNESS: You're welcome.

12 GRAND JURY FOREPERSON: And for your service.

13 THE WITNESS: Thank you.

14 [DISCUSSION OMITTED.]

15 (Lunch break.)

16 [ROLL CALL OMITTED.]

17 [DISCUSSION OMITTED.]

18 GRAND JURY FOREPERSON: Okay. Lieutenant
19 Barkley, would you mind standing, raising your right hand
20 to be sworn?

21

22 LIEUTENANT JASON BARKLEY

23 having been called as a witness in
24 the matter now pending, having been first
25 duly sworn, testifies as follows:
26

1 THE WITNESS: I do.

2 GRAND JURY FOREPERSON: Thank you. Have a
3 seat.

4 MR. NOEL: And not to prejudice any of you guys
5 against him, but Lieutenant Barkley is in charge of
6 building all our PowerPoints and stuff. I couldn't
7 resist.

8
9 EXAMINATION

10
11 BY MS. DUPRE-TOKOS

12 Q. Could you state and spell your name for the
13 record, please.

14 A. My name is Jason Barkley, J-A-S-O-N
15 B-A-R-K-L-E-Y.

16 Q. And where are you employed and in what
17 capacity?

18 A. I'm employed with the Butte County District
19 Attorney Office as an investigative lieutenant.

20 Q. And how long have you been a sworn law
21 enforcement officer?

22 A. It will be 20 years in April.

23 Q. How long have you been with the DA's office?

24 A. I believe eight years; since 2011.

25 Q. And you said that you're a lieutenant?

26 A. Yes, ma'am.

1 Q. How long have you been a lieutenant?

2 A. I took over as lieutenant on 11/4 of 2018.

3 Q. You're the second person today who got a
4 promotion and started on 11/4/2018. Bad day.

5 Prior to being a lieutenant in the DA with the
6 DA investigators, what was your title?

7 A. Investigator.

8 Q. And how long were you an investigator?

9 A. Seven years.

10 Q. Prior to joining the DA's office, what did you
11 do?

12 A. Just prior to the DA's office, I was a
13 detective with the Oroville Police Department. I started
14 that in 2003. Prior to that, I was a patrol officer for
15 Oroville Police Department, which I started in April
16 2000.

17 Q. And is that the extent of your law enforcement
18 experience?

19 A. Yes, ma'am.

20 Q. Now, were you assigned to assist with the Camp
21 Fire?

22 A. Yes.

23 Q. And in what capacity were you assigned to
24 assist with that initially?

25 A. Initially as a First Responder.

26 Q. And as First Responder, what did you do?

1 A. Responded to Paradise and conducted evacuations
2 initially. Basically made sure all of my people were in
3 the places they were supposed to be for the rest of the
4 day and that they were safe.

5 Q. And how long did the First Responder duties
6 last before they transitioned to something else?

7 A. It's difficult to say. We started searching on
8 11/9, but there was kind of First Responder stuff
9 happening.

10 Q. Okay. And before we go into what the searching
11 entails, are you familiar with the burn area of the Camp
12 Fire?

13 A. Yes.

14 Q. And did you put together a map that shows that
15 burn area?

16 A. Yes.

17 Q. And on that map did you put in all of the
18 addresses of where people who died were found?

19 A. I think it's more accurate to say "locations"
20 where people were found. Some people weren't found at
21 addresses.

22 Q. And looking at the screen behind you, is that
23 the map that you put together?

24 A. Yes, ma'am.

25 Q. And are all of these addresses within the burn
26 zone?

1 A. Yes.

2 Q. Just going very quickly through the people that
3 you found, could you show us where? And you might have
4 to come over to the computer.

5 Or is that touch screen?

6 MR. NOEL: It's touch screen. And we probably
7 need to mark this 769.

8

9 (Grand Jury Exhibit 769 introduced for identification.)

10

11 MS. DUPRE-TOKOS: Okay. We'll do that. I'll
12 have to print it out.

13 THE WITNESS: So is this a Smart TV?

14 MR. NOEL: Yes, it is.

15 THE WITNESS: And you are pushing this to the
16 Smart TV from there?

17 MR. NOEL: Yes.

18 THE WITNESS: This is not a touch screen then.

19 MR. NOEL: Usually it is. We touch it. You
20 can have my laptop to do whatever you want.

21 THE WITNESS: Take up there?

22 MR. NOEL: Take it up there, do however you
23 want.

24 (Discussion off the record.)

25 Q. (By MS. DUPRE-TOKOS) Okay. Did you find
26 remains at 1909 Dean Road?

1 A. I did.

2 Q. Is that -- do you need to know the name or the
3 address for --

4 A. The name would be Forrest Rhea, 1909, I think
5 that was 1819530.

6 Q. Yes.

7 A. I apologize, these folks aren't in any specific
8 order, so I have to search. There we go.

9 Q. Okay. So that's 1909 Dean Road?

10 A. Yes, ma'am.

11 Q. And what about Teresa Ammons, 6674 Pentz Road?
12 19598.

13 A. I remember Teresa.

14 Q. Okay. So that's 6674 Pentz Road?

15 A. Yes, No. 112.

16 Q. And then 6290 Clark Road, John Digby?

17 A. Mr. Digby kept getting deleted, so he's out of
18 order.

19 Q. That's 6290 Clark Road?

20 A. Yes, space No. 3.

21 Q. Then 5326 Sawmill Road, Carol Tracy, 669? I'm
22 sorry, Joan Tracy.

23 A. Yes, ma'am.

24 Q. That's 5326 Sawmill Road?

25 A. Yes.

26 Q. 1378 Nb Lane, the Browns?

1 A. Larry and Cheryl.

2 Q. So 1378 Nb Lane; correct?

3 A. Yes.

4 Q. So you said that you went out and found
5 remains?

6 A. Yes.

7 Q. Was that as part of a team?

8 A. Yes.

9 Q. So how did that work?

10 A. It worked several different ways. It kind of
11 changed throughout the process. The first day,
12 Lieutenant Angel and I were paired up sort of doing First
13 Responder detail, and we started hearing investigators
14 being called for specific addresses. So we called one of
15 the detective sergeants, said, "Hey, what's going on?"
16 And it was that they were finding bodies at those
17 locations. So we were in the area of Dean Road and we
18 responded to the 1909 Dean Road.

19 Q. Then after that first day, how did people end
20 up, how did you end up at different places?

21 A. So the following couple days we responded to
22 areas that had missing people. There was thousands of
23 missing persons reports, and we would get sheets with
24 hundreds of addresses on them as part of a team, and we
25 would go to each address and search through with whether
26 it be a house or mobile home park, whatever.

1 Q. And did that change again after that?

2 A. Yes.

3 Q. Okay. How did it change?

4 A. Eventually some anthropologist teams came along

5 with search and rescue units, with cadaver dogs from

6 multiple agencies. And those of us who had some death

7 experience were assigned to coroner's unit, which is what

8 I was doing. And I would go with other coroners from

9 different agencies, and we would respond to locations

10 where anthropologists or search and rescue found remains.

11 Q. Was that the final way that --

12 A. Yes.

13 Q. -- that worked, essentially?

14 A. Yes.

15 Q. So you said that you went to 1909 Dean Road.

16 And that's in Paradise?

17 A. Yes.

18 Q. And so -- and, again, all the addresses you

19 just showed us are within the burn zone; correct?

20 A. Yes.

21 Q. And you said that you went to 1909 Dean Road on

22 the 9th?

23 A. Yes.

24 Q. And how did you know to go to that residence?

25 Was that one of the ones where people called or --

26 A. As you can imagine, there was a lot of radio

1 traffic going on. And as units are asking for
2 investigators at specific addresses, we started to
3 wonder, why is that happening? Communication wasn't all
4 that great in the beginning. So we contacted a detective
5 sergeant to find out, what do you need investigators for,
6 is this something that we can help with? Then we learned
7 that they were finding believed-to-be dead bodies at
8 these residences. And so when we heard 1909 Dean Road,
9 we happened to be right around the corner, so we
10 responded.

11 Q. And was a case number assigned to that --

12 A. Yes.

13 Q. -- address or?

14 And did you find human remains there?

15 A. Yes.

16 Q. Or did someone on the team?

17 A. It was just Lieutenant Angel and I. And, yes,
18 we found remains.

19 Q. And you said a case number was assigned. Do
20 you recall that case number?

21 A. I believe it was 1819530.

22 Q. Okay. And how are the case numbers assigned?

23 A. The sheriff's department has a report writing
24 system, and they assign case numbers.

25 Q. So do you just call in and they give you a
26 number --

1 A. Yes.

2 Q. -- eventually?

3 A. Yes. Sometimes it wasn't quite as easy as
4 that, but yes.

5 Q. Okay. And were other case numbers also being
6 assigned at the same time?

7 A. Yes.

8 Q. So you said -- may we have the computer back?

9 A. Sure.

10 MR. NOEL: Before we get away from the map --
11 let's back this off. Can you explain what we're looking
12 at there on the map?

13 THE WITNESS: Well, each arrow is the
14 approximate, sometimes exact, location of a decedent that
15 was found by someone on the teams.

16 MR. NOEL: And how did you chart those
17 locations? Where did you get the information?

18 THE WITNESS: When you -- I apologize. It's
19 going to take a minute to explain.

20 So the first reports that are taken are
21 original coroner's reports that are faced page. Often
22 when you're taking the coroner's report, you know exactly
23 where you're standing because the street signs are still
24 present or because you can see numbers laying in the road
25 or whatever. Sometimes they don't know where they're at.
26 So they're using GPS coordinates. Aren't always as exact

1 as we think they are.

2 So part of it is from the initial coroner's
3 face pages. Sometimes it is the final coroner's report
4 that indicates further information. There's -- an
5 example would be Richard Brown. He was listed at 11000
6 block of Hoffman. But because everything was burned,
7 they didn't know where they really were, and they were
8 actually on Eleran, which is a road that's just off
9 Hoffman, and there's lots of twists and turns. But we
10 don't know that until we read every bit of the
11 documentation.

12 Does that answer your question?

13 MR. NOEL: Right. Basically you reviewed the
14 coroner's reports.

15 THE WITNESS: Sometimes the autopsy, sometimes
16 -- to get this information.

17 MR. NOEL: And used the information from there
18 to chart this?

19 THE WITNESS: Yes.

20 MR. NOEL: And then you were clicking on
21 arrows, so if you'd explain to us what's on the left side
22 of the screen on the list and how the arrows work and
23 clicking on them.

24 THE WITNESS: So you'll see there's a search
25 engine at the top, up at the top left. I put an address
26 or a basic location or GPS coordinates there. And then

1 either from photographs or my own personal knowledge, I
2 looked in the area and find the exact location that I
3 know the body was. I drag one of these markers into that
4 location and explain who the person was, what the
5 address, the GPS coordinate, how many people were found,
6 and the case number. And you can see that in here. So
7 anytime you click on one of these, that information
8 populates.

9 MR. NOEL: And we've saved that. And that will
10 be Exhibit 769.

11 Q. (By MS. DUPRE-TOKOS) Okay. So we've
12 essentially covered most of this, but -- so case number
13 1819530, you testified that was found in the fire zone.
14 And, to your knowledge, is that a photograph of Forrest
15 Rhea?

16 A. Yes.

17 Q. And, to your knowledge, are those the remains
18 of Forrest Rhea?

19 A. Yes.

20 Q. Okay. At this point, we're going to excuse you
21 and we'll have Investigator Oakley.

22 MR. NOEL: Hold on. She's got to give an
23 admonition.

24 GRAND JURY FOREPERSON: Lieutenant Barkley, you
25 are admonished not to discuss or disclose at any time
26 outside of this jury room the questions that have been

1 asked of you or your answers until authorized by this
2 Grand Jury or the Court. A violation of these
3 instructions on your part may be the basis for a charge
4 against you of contempt of court. This does not preclude
5 you from discussing your legal rights with your own
6 attorney.

7 Lieutenant Barkley, what I have just said is a
8 warning not to discuss this case with anyone except the
9 court, your lawyer, or the district attorney.

10 THE WITNESS: Yes, ma'am.

11 GRAND JURY FOREPERSON: Any questions?

12 THE WITNESS: No, ma'am.

13 GRAND JURY FOREPERSON: Okay. Thank you.

14
15 INVESTIGATOR CHRIS OAKLEY
16 having been called as a witness in
17 the matter now pending, having been first
18 duly sworn, testifies as follows:

19
20 THE WITNESS: I do.

21 GRAND JURY FOREPERSON: Thank you. Have a
22 seat, please.

23 THE WITNESS: Thank you.

24
25 EXAMINATION
26

1 BY MS. DUPRE-TOKOS

2 Q. Could you state and spell your name for us for
3 the record?

4 A. Christopher Oakley, O-A-K-L-E-Y.

5 Q. Where are you employed and in what capacity?

6 A. I am a criminal investigator assigned to the
7 Homicide Unit at the Butte County District Attorney's
8 Office.

9 Q. How long have you been at the Butte County
10 District Attorney's Office?

11 A. About a year and a half.

12 Q. Did you have a previous assignment at the Butte
13 County DA's office?

14 A. I did. I was in Child Abduction for about six
15 months.

16 Q. And prior to joining the Butte County DA's
17 office, where did you work?

18 A. Prior to that I was at the Sutter County
19 District Attorney's Office as an investigator for a
20 little over a year and a half, and then at Yuba City
21 Police Department for about nine years.

22 Q. And do you have any other law enforcement
23 experience prior to that?

24 A. No.

25 Q. And were you assigned to assist with the Camp
26 Fire?

1 A. I was.

2 Q. And in what capacity were you assigned to
3 assist?

4 A. Initially, it was the rescue efforts and
5 patrolling for the citizens as far as evacuation goes,
6 and then our follow-up then was recovery efforts to
7 assist with coroner's cases.

8 Q. And did you do that as part of a team, the
9 assisting with the coroner's cases?

10 A. I did.

11 Q. And were you, was that team generally called to
12 a certain location?

13 A. Yes.

14 Q. And were you on a team that was tasked with
15 recovering human remains on November 10th, 2018?

16 A. Yes.

17 Q. And were you dispatched, for lack of a better
18 word, to 750 Meyers Lane in Paradise?

19 A. I was.

20 Q. And human remains located at that site?

21 A. Yes.

22 Q. And was a case number assigned to those
23 remains?

24 A. Yes.

25 Q. Do you happen to recall what the case number
26 is?

1 A. I believe it was 18, dash, 19542.

2 Q. And where were the remains at 750 Meyers Lane
3 located?

4 A. They were in the, in the basement of what was
5 left standing of the structure of the residence.

6 Q. So the residence wasn't fully destroyed?

7 A. Mostly, yes. It appeared to have a basement
8 area. Then the only thing left standing was the chimney,
9 the brick chimney, that was left. Everything else was
10 destroyed and burned.

11 Q. And could you just, very briefly, describe the
12 remains for us.

13 A. Yes. The remains appeared to be a female that
14 were still intact. The female's body was laying outside
15 of the threshold of the door to the basement, which
16 appeared to be like cement or cinder block walls. Her
17 body was facing face down. She still had her hair
18 intact, but you could see that she had severe redness
19 from both burns and apparent smoke inhalation. Still
20 clothed, but clothes appeared to be burned in certain
21 areas as well.

22
23 (Grand Jury Exhibit 762A introduced for identification.)
24

25 Q. And you have some exhibits on the table in
26 front of you. So there should be one marked 762A?

1 A. Yes.

2 Q. Okay. Is that the photograph that's on the
3 slide? There's a slide that's on -- the photograph
4 that's on the screen?

5 A. No, I have 762.

6 Q. That's 762 not, 762A?

7 A. I do not see this photograph in front of me. I
8 have that photograph in front of me.

9 Q. Okay. What's on the other side of that?

10 A. Okay.

11 Q. No, backside.

12 A. 762A is right here. So I'll move to 762A, and
13 that is what is on the screen that you see here.

14 Q. Are those the remains that you found of the
15 body that you found, or were part of team that located?

16 A. Yes.

17 Q. Okay. And that coincides with the case number
18 that you gave us, the 19542?

19 A. Yes.

20 Q. And then at any point did you receive
21 information that led you to believe that those remains
22 were those of someone by the name of Lolene Rios?

23 A. Yes.

24 Q. And have you ever seen a photograph of
25 Ms. Rios?

26 A. Yes.

23
24
25
26

(Grand Jury Exhibit 762 introduced for identification.)

Q. And so going back to 762, does that appear to be a photograph of Ms. Lolene Rios?

A. It is.

Q. And then were you also -- well, and then once you found the body of Ms. Rios, what procedure was undertaken to remove her body?

A. So initially we, it was still unsafe to enter the residence because it was still so hot and the structure was still falling apart that we couldn't initially get into where Ms. Rios's body was. So deputies from the Butte County Sheriff's Office remained on scene as part of their recovery unit. The process for that was to take the body, photograph it, place it into a body bag, then take the body down to the Openshaw Road sheriff's facility where we were directed that all the remains and bodies would go for further processing to a pathologist.

Q. And then were you also on a team that was tasked with recovering human remains on November 12th, 2018?

A. I was.

Q. And did you go to 432 Plantation Drive in Paradise?

1 A. Yes.

2 Q. And were you dispatched to that? Or how did
3 you know to go there?

4 A. I was dispatched to that regarding a missing
5 persons, I believe, report that still was not closed out.
6 So usually a family member or somebody is calling in
7 saying that my family is still not recovered yet or has
8 not contacted me. And so we would be dispatched as a
9 team to go back out and search for the people at that
10 address if there are possibly any remains. So that's how
11 we ended up going there.

12 Q. At some point did you get information that --
13 well, how many people were missing from 432 plantation?

14 A. Two that I know of.

15 Q. And at some point did you learn the names of
16 the people who resided at that address?

17 A. Yes.

18 Q. And at some point did you find out that that
19 was Joanne and John Malarkey?

20 A. I did.

21 Q. And did you ever see a photograph Joanne and
22 John Malarkey?

23 A. I did.

24

25 (Grand Jury Exhibit 763 introduced for identification.)

26

1 Q. And you should have in front of you Exhibit
2 763?

3 A. I do.

4 Q. Do you see that?

5 Is that a photograph of Joanne and John
6 Malarkey, and is that the same photograph that's on the
7 screen?

8 A. It is.

9 Q. So when you went to 432 Plantation Drive, was
10 the residence intact?

11 A. No.

12

13 (Grand Jury Exhibit 764 introduced for identification.)

14

15 Q. And on the screen -- and I did not label them,
16 and I will submit a corrected PowerPoint -- but in front
17 of you you show 764, it should match the photograph on
18 the screen?

19 A. That's correct.

20 Q. And is that what the house looked like at 432
21 Plantation?

22 A. It did.

23 Q. And how many remains did you locate in that
24 residence?

25 A. Two, two separate remains.

26 Q. And where were they found?

1 A. The first set of remains was located right
2 inside. So this is a picture -- I'm sorry, can you go
3 back to 764?

4 Okay. So this would be looking from, standing
5 near the front porch looking towards the front of the
6 house.

7 Q. You can stand up --

8 A. Okay.

9 Q. -- if you want to.

10 A. Yeah. So this would be looking at the -- if
11 you're standing right on edge of like a threshold of
12 where to the front door of the residence would be over in
13 this area right here, and this would be looking back like
14 towards the front of the residence if you were standing
15 at the front wall of the residence.

16 Q. Okay.

17 A. So to answer your question further, one of the
18 sets of remains, first set, was found over just near the
19 front door of the residence. So to the right, like in
20 this area here.

21 Q. And where was the second set of remains
22 located?

23 A. The second set of remains would have been found
24 back in this area over here near a stove. So appeared to
25 be a kitchen area of the residence.

26

1 (Grand Jury Exhibit 765 introduced for identification.)

2

3 Q. So this should be 765.

4 A. Okay. I have that. So go ahead.

5 Q. And are there any of the remains that were
6 located at 432 Plantation depicted in this photograph?

7 A. Yes, it's just very difficult to see because
8 it's zoomed out. But the remains that you can see are
9 going to be generally in this area right here.

10 Q. Is it the darker in that area?

11 A. Yes. And as you zoom in, you'll be able to see
12 some of the skeletal, so you can see some human bone
13 here, then charred human remains. And that is -- once
14 the anthropology team was able to pull the debris off of
15 it, we recovered more of what appeared to be a charred
16 human body.

17 Q. Down at the bottom, I don't know what that is,
18 but it's fairly distinctive looking. The dish or
19 something with the pattern or design on it? And then can
20 you see it in that zoomed-out picture as well?

21 A. Yes, right down here.

22 Q. So that's just zoomed in of the area where you
23 indicated the area where the remains were found?

24 A. Correct.

25

26 (Grand Jury Exhibit 766 introduced for identification.)

20
21
22
23
24
25
26

Q. And does that photograph match Exhibit 766?
Should be front of you?

A. It does.

Q. Now, you said that there were remains found by
the front door?

A. Yes.

(Grand Jury Exhibit 767 introduced for identification.)

Q. And looking at Exhibit 767, which is also up on
the screen, does that show human remains in that
photograph?

A. Yes. Again, because it's zoomed out, very
difficult to see, but if you look in this area here. I'm
assuming you'll have an exhibit that's zoomed in a little
further. And that does match the one that I have, 767.

Q. And I don't have one that's zoomed in much
more.

MR. NOEL: This is just like ours that we have
in the office.

THE WITNESS: Anyways, in here you can see some
dark, charred remains. As you get closer, you can
actually see what the shape of, like if you're familiar
with any body parts, but like a liver or organ. And then
initially what caught my attention with the body is the

1 rib bones. You can see portions of the rib bones. And
2 then as I looked a little bit further, I could actually
3 see the top teeth of the jaw line of the skull. And
4 that's the front door that was melted down, bent over.

5 Q. (By MS. DUPRE-TOKOS) And then up in the
6 photograph, above that door, you see that structure that
7 sort of looks like a chair?

8 A. Yes.

9 Q. And were you able to determine what that was?

10 A. This appeared to be a chair to me. But I
11 wasn't actually -- I'm getting confused. This appeared
12 to be some type of railing, but it did appear on scene
13 that there was a walker that was associated, like
14 assisting for the elderly.

15
16 (Grand Jury Exhibit 768 introduced for identification.)
17

18 Q. And looking at Exhibit 768, could you tell us
19 what that's a photograph of?

20 A. Yeah, that is burned PT Cruiser Chrysler.

21 Q. And where was that located?

22 A. That was located in the driveway 432 Plantation
23 Drive.

24 Q. Now, at any point were you able to find out
25 information as to who the owner of that PT Cruiser was?

26 A. So the -- yes. The VIN number was melted off

1 of that, so we couldn't get the VIN from that, which is a
2 Vehicle Identification Number that's stored in the DMV
3 database. Then, obviously, there's no license plates
4 left either, because those are burned.

5 So do you want me to explain that process?

6 Q. Yes, please.

7 A. So the DMV database is, as people know,
8 contains the registered owner's information, license
9 plate, year, make, model of vehicle, and Vehicle
10 Identification Number. We have tools that are available
11 to us in law enforcement through the California Law
12 Enforcement Telecommunications System which allows me to,
13 or any peace officer, dispatcher, to take someone's name
14 and run what we call "reverse license plate check" or
15 "vehicle registration check."

16 So what I later did is I ran the Malarkey's
17 name, John Malarkey specifically, to see what vehicles he
18 had registered to him. And when I did that, DMV showed a
19 result of a 2002 Chrysler registered to John and Joanne
20 Delores Malarkey at 432 Plantation Drive in Paradise.

21 Q. So that database, you said that's maintained by
22 the DMV?

23 A. Correct.

24 Q. So it's a government database?

25 A. Yes, it is.

26 Q. And I think I may have asked you this, but at

1 some point did you receive information that led you to
2 believe that the remains that you found at 432 Plantation
3 were those of Joanne and John Malarkey?

4 A. I did.

5 Q. And were the standard procedures followed with
6 removing the remains from that residence?

7 A. Correct. I actually hand-delivered these
8 remains myself and my team to Openshaw instead of relying
9 on the sheriff's office on this one.

10 MS. DUPRE-TOKOS: Do any of the jurors have any
11 questions?

12 (Counsel confer.)

13 Q. (By MS. DUPRE-TOKOS) So how did you know the
14 remains were John and Joanne Malarkey?

15 A. One was, again, confirming that the registered
16 owners' information through DMV likely being their
17 remains would be there. They were the two people that
18 were registered to a Chrysler at that address. The other
19 one was through dental records. So the dental records
20 confirmed the identity of both John and Joanne Malarkey.

21 MS. DUPRE-TOKOS: Any other questions?

22 No.

23 Okay. Thank you very much.

24 THE WITNESS: Thank you.

25 MR. NOEL: She has an admonition for you.

26 GRAND JURY FOREPERSON: Mr. Oakley, you are

1 admonished not to discuss or disclose at any time outside
2 of this jury room the questions that have been asked of
3 you or your questions until authorized by the Grand Jury
4 or the Court. A violation of these instructions on your
5 part may be the basis for a charge against you of
6 contempt of court. This does not preclude you from
7 discussing your legal rights with your own attorney.

8 Mr. Oakley, what I have just said is a warning
9 not to discuss this case with anyone except the Court,
10 your lawyer, or the district attorney. Do you have any
11 questions?

12 THE WITNESS: Nope. I understand.

13 GRAND JURY FOREPERSON: Thank you for your
14 time.

15 THE WITNESS: Thank you.

16 [DISCUSSION OMITTED.]

17 (Break taken.)

18 GRAND JURY FOREPERSON: Yes. All members of
19 the Grand Jury are present.

20

21 LIEUTENANT JASON BARKLEY, Cont'd
22 having been called as a witness in
23 the matter now pending, having been first
24 duly sworn, testifies as follows:

25

26 GRAND JURY FOREPERSON: Mr. Barkley, I'd like

1 to remind you that you are still under oath.

2 THE WITNESS: Yes, ma'am.

3 GRAND JURY FOREPERSON: Have a seat, please.

4 THE WITNESS: Thank you.

5 GRAND JURY FOREPERSON: We're ready to proceed.

6

7 EXAMINATION Cont'd

8

9 BY MS. DUPRE-TOKOS

10 Q. So, Lieutenant Barkley, I'm going to
11 backtrack just a bit to make sure we've covered
12 everything.

13 So you have exhibits in front of you?

14 A. Yes, ma'am.

15

16 (Grand Jury Exhibit 736 introduced for identification.)

17

18 Q. And looking at Exhibit 736?

19 A. Yes.

20 Q. Is that the same photograph that's on the
21 slide?

22 A. Yes, ma'am.

23 Q. And, to your knowledge, is that a photograph of
24 Forrest Rhea?

25 A. Yes.

26

1 (Grand Jury Exhibit 737 introduced for identification.)

2

3 Q. And then looking at Exhibit 737, is that the
4 photograph that's on the screen?

5 A. Yes, ma'am.

6 Q. And are those the remains that you located of
7 Forrest Rhea?

8 A. Yes.

9 Q. Now, you testified that you went to 6674 Pentz
10 Road, space 112?

11 A. Yes, ma'am.

12 Q. That was for case number 19598?

13 A. Yes.

14 Q. And at some point did you receive information
15 to lead you to believe that Teresa Ammons lived at that
16 address?

17 A. Yes.

18

19 (Grand Jury Exhibit 738 introduced for identification.)

20

21 Q. And looking at Exhibit 738, is that the same
22 photograph that's up on the screen?

23 A. Yes, ma'am.

24 Q. To your knowledge, is that a photograph of
25 Teresa Ammons?

26 A. Yes.

1 Q. Now, is 6674 Pentz Road, is that a trailer
2 park?

3 A. Yes.

4 Q. So everything, all the units in there, have
5 their own numbers?

6 A. Yes.

7 Q. And you said you went to unit 112?

8 A. Yes.

9 Q. And how did you know that you were at unit 112?

10 A. Well, a few ways. One, you see the 1 and the 2
11 that was on the ground outside of the address.

12

13 (Grand Jury Exhibit 739 introduced for identification.)

14

15 Q. And that's Exhibit 739?

16 A. Yes. I think you have other pictures.

17 We also found a -- I saw what I believed to be
18 a wallet sitting out in front of the trailer. "Out in
19 front" isn't exactly correct, but up the walkway. And
20 when I turned the wallet over, I saw a Social Security
21 card. So, I was concerned that someone's identity would
22 be stolen because there was people riding on quads and
23 motorcycles and stuff, so I had my team collect so that
24 the identity wouldn't be stolen.

25

26 (Grand Jury Exhibit 740 introduced for identification.)

Q. Okay. And we do have photographs, so we'll look at those.

But looking at Exhibit 740, is that what's on the screen?

A. Yes.

Q. And is that the remains of the residence at 6674 Pentz Road, number 112?

A. Yes. Yes.

Q. And do you see the people down at the far end, and there's bush there?

A. I do.

(Grand Jury Exhibit 741 introduced for identification.)

Q. Looking at Exhibit 741, is that what's on the screen now?

A. Yes.

Q. So is that a photograph from the other end?

A. Yes.

Q. And is that the bush that we could see in the last photograph?

A. Yes.

Q. Is there anything noteworthy in this picture?

A. Yes.

Q. Is there more than one noteworthy thing in this

1 picture?

2 A. Yes.

3 Q. Okay. Why don't you tell us what's noteworthy.

4 A. Can I get up?

5 Q. Absolutely.

6 A. Right here we have started to collect what we
7 later learned to be the contents of a purse. I initially
8 thought it was a wallet, but we can tell from what was
9 there, it was a purse, which contained Social Security
10 cards and other things.

11 Ms. Ammons is right here.

12 Q. That's the dark object just to the left of the
13 bush?

14 A. Yes.

15

16 (Grand Jury Exhibit 742 introduced for identification.)

17

18 Q. And then looking at 740 -- Exhibit 742, is that
19 the Social Security card that you mentioned?

20 A. Yes.

21

22 (Grand Jury Exhibit 743 introduced for identification.)

23

24 Q. Looking at Exhibit 743, can you tell us what
25 that's of.

26 A. Yes. That is, out on the Pentz side of the

1 road, it is the mailboxes for those two rows of trailers.

2

3 (Grand Jury Exhibit 744 introduced for identification.)

4

5 Q. And looking at Exhibit 744, can you tell us
6 what we're looking at.

7 A. Yes. It is a -- well, the important part is it
8 is the mailbox of Ms. Ammons, which was consistent with
9 the Social Security Card we found.

10 Q. And does the mailbox say what's space number?

11 A. Yes.

12 Q. What space number?

13 A. 112.

14

15 (Grand Jury Exhibit 745 introduced for identification.)

16

17 Q. And looking at Exhibit 745, can you tell us
18 what that is.

19 A. Yes. When we opened the mailbox, we found this
20 notation from the postal service saying deliver the mail
21 to the door, with the name and the address.

22 Q. And you testified when you showed us the map
23 that you also went to 6290 Clark Road, No. 3, in
24 Paradise?

25 A. Yes.

26 Q. Oh, and just stepping back, were the same

1 collection, essentially standardized collection
2 procedures, used with regards to recovering the remains
3 of Ms. Ammons?

4 A. Yes.

5 Q. And do you recall what date you went to 6920
6 Clark Road, No. 3?

7 A. Maybe the 12th, but I am not sure.

8 Q. Okay. Could it have been the 13th?

9 A. Yes.

10 Q. And at some point did you receive information
11 that led you to believe that the person who lived at that
12 residence was someone by the name of John Digby?

13 A. Yes.

14 Q. And does that -- well, when you went to 6920
15 Clark Road, No. 3, did you find remains?

16 A. Yes.

17 Q. And were those remains the assigned case -- or
18 do you remember what case number they were assigned?

19 A. They were assigned two case numbers, 1819643
20 and 644.

21 Q. Okay. Why were they assigned two case numbers?

22 A. The anthropologist on scene believed there were
23 two sets of remains.

24 Q. And so case numbers were assigned to both sets
25 of remains?

26 A. Yes.

1 Q. Okay. And, to your knowledge, did
2 anthropologists at some point determine that the remains
3 were only of one person?

4 A. Yes.

5 Q. So was one of the case numbers dropped or go
6 inactive?

7 A. Yes.

8 Q. Do you recall which number went inactive?

9 A. I don't.

10 Q. Okay.

11 A. I don't remember. I think it was -- 43 was the
12 first pulled, so we usually would stay with that.

13 Q. So then 19644 went inactive?

14 A. Yes.

15

16 (Grand Jury Exhibit 746 introduced for identification.)

17

18 Q. And then looking at Exhibit 746, and is that
19 what's up on the screen?

20 A. Yes.

21 Q. To your knowledge, is that a photograph of John
22 Digby?

23 A. Yes.

24

25 (Grand Jury Exhibit 747 introduced for identification.)

26

1 Q. Looking at Exhibit 747, is that what's on the
2 screen?

3 A. Yes.

4 Q. And can you tell us what that is?

5 A. It is a photograph of anthropologist units
6 collecting one of the sets of remains; and a single-wide
7 mobile home, the remains of a single-wide mobile home.

8 Q. And the mobile home appears to be completely
9 destroyed?

10 A. Oh, yes.

11

12 (Grand Jury Exhibit 748 introduced for identification.)

13

14 Q. And looking at Exhibit 748, which is up on the
15 screen, can you tell us what that is?

16 A. Yeah. It is what appears to be a chair, a
17 burned chair. And these, this area right here is human
18 remains.

19 Q. Okay. The darker area?

20 A. Yes.

21

22 (Grand Jury Exhibit 749 introduced for identification.)

23

24 Q. And 749, which is up on the screen, looks like
25 the remains of a license plate. Where was that found?

26 A. Parked in front of the trailer No. 3.

1 Q. And were the same standard procedures followed
2 for recovering the remains of Mr. Digby?

3 A. Yes.

4 Q. And then on November 14th were you again on a
5 recovery team tasked with locating human remains?

6 A. Yes.

7 Q. And did you go to a residence at 5326 Sawmill
8 Road in Paradise?

9 A. I did.

10

11 (Grand Jury Exhibit 750 introduced for identification.)

12

13 Q. Now, looking at Exhibit 750, which is up on the
14 screen, is it your understanding that that is a
15 photograph of Joan Tracy?

16 A. Yes.

17 Q. And at some point did you receive information
18 that led you to believe that Joan Tracy lived at 5326
19 Sawmill?

20 A. Yes.

21 Q. Her remains were recovered from that residence?

22 A. Yes.

23 Q. So human remains were located there?

24 A. Yes.

25 Q. Was a case number assigned to those remains?

26 A. Yes.

1 Q. Was that case number 1819669?
2 A. Yes.
3 Q. Looking at Exhibit 751 -- going back to Exhibit
4 750, could you tell us which of the two people in the
5 photograph is, to your knowledge, Joan Tracy?
6 A. The person without the glasses.
7 Q. Looking at it from here, would be the woman on
8 the left with the white hair?
9 A. Yes.
10
11 (Grand Jury Exhibit 751 introduced for identification.)
12
13 Q. So looking at Exhibit 751, that's up on the
14 screen, could you tell us what that is.
15 A. Yes. It's the burned remains of 5326 Sawmill.
16 You can see the anthropologist group standing right there
17 sifting. And that's a fireplace.
18
19 (Grand Jury Exhibit 752 introduced for identification.)
20
21 Q. Looking at Exhibit 752, which is on the screen,
22 what is that?
23 A. Well, had I known that picture was being taken,
24 I would have moved, but that's the anthropologist team
25 collecting the body.
26 Q. Is that you watching?

1 A. Yes, ma'am.

2 Q. And where were Ms. Tracy's remains located?

3 A. It appears as though --

4 Q. Do you want me to go back?

5 A. Well, it looks like the basement. The house is

6 on a hill, so maybe a basement isn't the right word, but

7 there's this slack space underneath the house, and

8 everything crumbled down into that spot. From my memory,

9 this was the ground floor and there was a cup with her

10 name on it.

11 Q. Which is coming up.

12 A. So she's fallen down into this.

13 Q. So was there -- to your recollection, was there

14 anything indicated where she had been prior to the floor

15 collapsing, if you recall?

16 A. Are you asking about the glass?

17 Q. No.

18 A. Inside the house.

19

20 (Grand Jury Exhibit 753 introduced for identification.)

21

22 Q. Okay. And looking at Exhibit 753, which is up

23 on the screen, can you tell us what this is.

24 A. Yes. That -- some of the remains are here, but

25 I remember them coming back further. Not so much in that

26 area, but more here. But that is part of it.

1 Q. So they were spread out?

2 A. Yeah.

3

4 (Grand Jury Exhibit 754 introduced for identification.)

5

6 Q. And in looking at Exhibit 754, which is on the
7 screen, is that the mug that you mentioned earlier?

8 A. Yes.

9 Q. Does it have a name on it?

10 A. Yes.

11 Q. What is the name that is on it?

12 A. Joan.

13 Q. Now, did you have occasion to check the mailbox
14 when you were at that residence?

15 A. I did.

16

17 (Grand Jury Exhibit 755 introduced for identification.)

18

19 Q. And looking at Exhibit 755, which is on the
20 screen, can you tell us what that is.

21 A. It is a newspaper, and I forget the name of the
22 newspaper now, and a -- looks like a natural gas envelope
23 or bill with the name Joan Tracy and address 5326 Sawmill
24 Road.

25 Q. Was that found in the mailbox?

26 A. It was.

1 Q. So the mailbox didn't burn?

2 A. No.

3 Q. Now, also on November 14th, 2018, did you also

4 go to a residence at 1378 Nb Lane in Paradise?

5 A. 87?

6 Q. 1378.

7 A. Yes.

8 Q. And was that, again, with the same team?

9 A. Yes.

10 Q. And at some point did you receive information

11 that led you to believe that Cheryl and Larry Brown lived

12 at that address?

13 A. Yes.

14

15 (Grand Jury Exhibit 756 introduced for identification.)

16

17 Q. And, to your knowledge, is -- looking at

18 Exhibit 756 -- is that a photograph of Cheryl Brown?

19 A. Yes.

20

21 (Grand Jury Exhibit 757 introduced for identification.)

22

23 Q. And looking at Exhibit 757, to your knowledge,

24 is that a photograph of Larry Brown?

25 A. Yes.

26 Q. And was that residence destroyed?

1 A. Yes.

2

3 (Grand Jury Exhibit 758 introduced for identification.)

4

5 Q. Looking at Exhibit 758, which is up on the
6 screen, can you tell us what that is a photograph of?

7 A. That's a photograph facing north of the
8 residence on Nb.

9

10 (Grand Jury Exhibit 759 introduced for identification.)

11

12 Q. And Exhibit 759, which is up on the screen, can
13 you tell us what that is.

14 A. It's the same residence, facing east.

15 Q. And are there, is there a team of
16 anthropologists?

17 A. Yes. There are anthropologists, and they're
18 collecting the remains of two people who are side by side
19 in like La-Z-Boy chairs.

20 Q. And that was going to be my next question.
21 Were remains found in that house?

22 A. Yes.

23 Q. And two sets of remains?

24 A. Yes.

25 Q. And have you received information that leads
26 you to believe that those remains were Larry and Cheryl

1 Brown?

2 A. Yes.

3 Q. And you just told us they were found side by
4 side in La-Z-Boy chairs?

5 A. Recliners, yes.

6

7 (Grand Jury Exhibit 760 introduced for identification.)

8

9 Q. Looking at Exhibit 760, can you tell us what
10 that is of. If you need to stand up, that's fine.

11 A. Yeah, this is a photograph of the general area
12 where both remains were found, kind of scattered on and
13 around both of those chairs.

14

15 (Grand Jury Exhibit 761 introduced for identification.)

16

17 Q. And then looking at 761, is that, can you tell
18 us what that is.

19 A. The same two chairs from a different angle you
20 can see there, and part of the remains here. This would
21 be the chair furthest to the south.

22 Q. And, Lieutenant Barkley, all the photographs
23 that we've shown you today, are those -- did you take
24 some of those?

25 A. I did.

26 Q. Did you take all of them?

1 A. No.

2 Q. To your knowledge, are they true and accurate
3 representations of what you saw on those days?

4 A. Yes, they are.

5 MS. DUPRE-TOKOS: And does the jury have any
6 questions?

7 Q. (By MS. DUPRE-TOKOS) And we're going to jump
8 back to Ms. Ammons.

9 So looking at Exhibit 741, is that the
10 photograph that's up on the screen?

11 A. Yes.

12 Q. So I want to go back over a few things. So you
13 mentioned that there was a person in this photograph, and
14 you also showed us where Ms. Ammons' body was located.
15 About how far apart were they in real life, as opposed to
16 trying to guess from the picture?

17 A. Ten or so feet.

18 Q. Is there anything in this photograph that
19 indicates to you that Ms. Ammons was alive at the time of
20 the fire occurred?

21 A. Yes.

22 Q. And what is that?

23 A. The front door of the residence was about here.
24 You can see that she had walked down and dropped her
25 purse. We didn't know it was a purse at first, but
26 dropped her purse. The fire was moving, roughly, east to

1 west. And appears to me as though she dropped the purse,
2 and turned, took a couple steps, was overtaken by the
3 fire.

4 Q. In looking at that picture, where is east and
5 where is west?

6 MR. NOEL: Do you want to use the drawing tool?

7 THE WITNESS: Two dimensional, so it's kind
8 of --

9 MR. NOEL: Right.

10 THE WITNESS: So that will be north.

11 Q. (By MS. DUPRE-TOKOS) Okay. So you've said the
12 fire was going east to west. So looking at this
13 photograph, it would be coming from left to right?

14 A. Yes.

15 Q. And her purse is on the left?

16 A. Yes.

17 Q. She's approximately ten feet to the right?

18 A. Yes.

19 Q. And you said that, based on your training and
20 experience, it appears that she was leaving, dropped her
21 purse, and tried to flee the fire, and was overtaken?

22 A. Yes.

23 Q. So let's dig a little deeper than the
24 photograph. Can you orient us with regards to
25 Ms. Ammons' body? For example, where are her feet in
26 that picture?

1 A. You want me to mark it?

2 Q. Sure.

3 MR. NOEL: Sure.

4 THE WITNESS: Those are the feet.

5 Q. (By MS. DUPRE-TOKOS) The two red circles?

6 A. Yeah. Here are the legs; come together at the

7 torso. Her head is back in here behind the bush. I

8 don't know if you want me to draw it, but she is on her

9 back. So face up. And if she had been standing, she

10 would have been facing east. It's difficult to show with

11 this picture. So she's right out in front of -- she

12 might be two feet from this.

13 Q. The side of her house?

14 A. Yeah. And I didn't see her until I stepped

15 right here looking for a serial number. You can see her

16 face. Well, you could see her skull.

17 Q. Is there anything noteworthy, kind of hard to

18 see in that picture, on the rock?

19 A. Uh-huh. Yeah. This was all over. There,

20 there, there, there, there.

21 Q. So the circles that you've just drawn that are

22 not the feet, not labeled "feet," what did you just

23 circle?

24 A. Molten aluminum that had sprayed out from the

25 residences onto the rocks. So had to be pretty hot, lots

26 of wind.

1 Q. And we can see Ms. Ammons' legs in this
2 photograph. What was the condition of her body?

3 A. Well, the majority of the flesh had been burned
4 off of her head. Her teeth were broken. So what I could
5 see was sockets. And her eyes were gone. There was
6 material in the eye sockets. Her upper torso had some
7 organs. They were charred. Her legs, the upper portion
8 of her legs, were charred, but there was still flesh.
9 And right about the knee on both legs you could still see
10 skin.

11 Q. Okay. So she was severely burned?

12 A. Yes.

13 Q. All right.

14 Did that give anyone else any other questions
15 before we get to the jury questions?

16 MR. NOEL: We'll save that as --

17 THE WITNESS: 741.

18 MR. NOEL: -- 741A.

19

20 (Grand Jury Exhibit 741A marked for identification.)

21

22 Q. (By MS. DUPRE-TOKOS) So why does Forrest Rhea
23 have ID number 18, dash, 19530 but the remains, but the
24 remains exhibited in 737 have ID number B 18, dash,
25 00022?

26 A. That's pretty perceptive.

1 So what's happening is the 1819 number is a
2 case number assigned by the Butte County Sheriff's
3 Department. So they have their own report writing system
4 and computer-aided dispatch system that generates case
5 numbers. All law enforcement agencies have that. These
6 bodies, I don't know if we've gotten that far, were taken
7 to Sacramento because of the large volume of bodies. So
8 that number right there is a number generated by the
9 Sacramento County Coroner's Office as to which autopsy it
10 is.

11 Q. Okay. Does that answer that?

12 And then how were you able to determine that
13 the remains of Joan Tracy were, in fact, her remains and
14 not those of the other person in the photo identifying
15 Joan?

16 A. Odontology is how she was identified.

17 GRAND JUROR #4: How?

18 MS. DUPRE-TOKOS: Odontology. Dental.

19 THE WITNESS: I did not do that, though.

20 MS. DUPRE-TOKOS: Then Marc has a question.

21 MR. NOEL: All right. The final question for
22 you: Spell "captain."

23 THE WITNESS: Did I spell it wrong? But I got
24 "lieutenant" right.

25 MR. NOEL: Yes.

26 For those of you who may have forgotten,

1 Captain Kluge's PowerPoint says "Caption Kluge."

2 THE WITNESS: That's right. It did.

3 [DISCUSSION OMITTED.]

4 GRAND JURY FOREPERSON: Mr. Barkley, you are
5 admonished not to discuss or disclose at any time outside
6 of this jury room the questions that have been asked of
7 you or your answers until authorized by this Grand jury
8 or the Court. A violation of these instructions on your
9 part may be the basis for a charge against you of
10 contempt of court. This does not preclude you from
11 discussing your legal rights with your own attorney.

12 Mr. Barkley, what I have just said is a warning
13 not to discuss this case with anyone except the Court,
14 your lawyer, or the district attorney.

15 THE WITNESS: Yes, ma'am.

16 GRAND JURY FOREPERSON: Thank you. Thank you
17 for your time.

18 [DISCUSSION OMITTED.]

COURT REPORTER'S CERTIFICATE

This is to certify that I, JENNIFER L. HUNT, CSR, a Certified Shorthand Reporter of the State of California, was present at the time and place the foregoing proceedings were had and taken in the within matter; that as such shorthand reporter I did take down in shorthand writing the aforementioned proceedings and afterwards caused my said shorthand writing to be transcribed into typewriting. Further, pursuant to CCP237 all reference to jurors by name has been redacted.

The foregoing pages beginning at:

1 through 96

are certified to be a complete transcription of said stenographic shorthand notes.

DATED: THIS 6TH day of JUNE 2022

1 OROVILLE, BUTTE COUNTY, CALIFORNIA

2 JANUARY 10, 2020; 8:45 a.m.

3 (Confidential Special Grand Jury Hearing Proceedings)

4
5 [ROLL CALL OMITTED.]

6
7 [DISCUSSION OMITTED.]

8
9 [Witness enters the courtroom.]

10 GRAND JURY FOREPERSON: Dr. Marvin, before you
11 have a seat, I would like you to raise your right hand so
12 we can swear you in, please.

13 Dr. Marvin, do you solemnly swear that the
14 evidence you shall give in this matter pending before the
15 grand jury shall be the truth, the whole truth, and
16 nothing but the truth so help you God?

17 THE WITNESS: I do.

18 GRAND JURY FOREPERSON: Thank you. Have a seat.

19 **EXAMINATION**

20 BY MR. NOEL:

21 Q. Dr. Marvin, for the record could you please
22 state your full name and spell your last name.

23 A. I'm Dr. Susan Marie Marvin.

24 Is this on? Can you hear me? Is it on now?

25 Okay. I'm Dr. Susan Marie Marvin, M-a-r-v-i-n.

26 Q. Dr. Marvin, are you employed?

1 A. I am.

2 Q. By whom are you employed?

3 A. By the Federal Bureau of Investigation at the
4 laboratory in Quantico, Virginia.

5 Q. And what is your job at the lab?

6 A. I am a metallurgist forensic examiner.

7 Q. What is a metallurgist?

8 A. A metallurgist is someone who studies metal,
9 everything from how they are produced from the ore in the
10 ground, how they're processed into usable materials, and
11 then how they perform in service and often how they break
12 under service or abuse conditions.

13 Q. And what is a forensic examiner?

14 A. As a forensic examiner I take the knowledge of
15 the metallurgically sciences and apply them to
16 investigations in criminal or other matters in the aid of
17 law enforcement.

18 Q. Do you have special training and experience that
19 qualifies you for these jobs?

20 A. I do.

21 [Exhibit 770 introduced
22 as evidence.]

23 BY MR. NOEL:

24 Q. In front of you you should have Exhibit 770.

25 A. Yes.

26 Q. Do you see Exhibit 770?

1 A. I do.

2 Q. What is Exhibit 770?

3 A. This is my curriculum vitae that details my
4 education and work experience.

5 Q. Could you please walk us through your education
6 and experience that qualifies you as a metallurgist and
7 forensic examiner.

8 A. In 1986 I earned a Bachelor of Science degree
9 from Rensselaer Polytechnic Institute in Troy, New York
10 in the field of materials science and engineering. And
11 in 2004 I earned a Ph.D in the same field of materials
12 science and engineering at the University of Virginia.

13 The work on my Ph.D. concentrated on defamation
14 of titanium alloys.

15 In between those two educational efforts, I
16 worked for a variety of different universities,
17 industries, and government laboratories as a materials
18 engineer always studying defamation of metals under
19 different load and environmental conditions.

20 In addition to the work experience and formal
21 education, once I arrived at the FBI, I learned how to
22 apply my metallurgical skills in the forensic examination
23 environment and record all of the results of my
24 investigations in a manner that can be retained and
25 presented in court.

26 Q. How long have you been with the FBI lab?

1 A. Since February of 2005.

2 Q. Describe for us a little bit what the FBI lab
3 is.

4 A. The laboratory is an organization of about 800
5 people who perform examinations and evidence retrieval
6 and instruct field representatives of how to collect
7 evidence to keep it in a form that allows further
8 examinations to be performed on evidence. And then the
9 main body of our work is to perform those examinations to
10 reveal information about evidence that will aid the court
11 in trial proceedings, investigations, legal -- law
12 enforcement investigations, and trial proceedings.

13 Q. In February of 2018 -- or I'm sorry. In
14 February 2019 were you assigned to assist Butte County
15 with the Camp Fire investigation?

16 A. Yes.

17 Q. And what was your role in the investigation?

18 A. My role is to examine metal evidence to detect
19 the material the components were made out of, the
20 manufacturing characteristics of the materials, and
21 examine the damage mechanism or cause of that damage on
22 the different materials that are involved in this case.

23 Q. As part of your role in the -- in the Camp Fire
24 investigation, were you provided physical evidence to
25 examine and test?

26 A. Yes.

1 Q. What type of physical evidence?

2 A. I received six hooks from transmission tower
3 lines, transposition tower lines, and four segments of
4 jumper arms or runners each of which had an attached
5 bracket on them.

6 Q. When you say "received," can you tell us how you
7 received these.

8 A. I received these pieces in the course of normal
9 business at the FBI laboratory. The FBI field office in
10 Sacramento and the Chico resident agency facilitated
11 transfer to the laboratory and the laboratory incoming
12 evidence management group forwarded that evidence to me.
13 And I received that in my laboratory.

14 Q. So the field agent for the -- from the Chico
15 resident agency of the Sacramento field office, was that
16 Agent Matt Catalano?

17 A. I have been in conversation with Agent Matt
18 Catalano, especially Agent Catalano, but I don't have
19 personal knowledge of his procedures receiving that
20 evidence into his resident agency.

21 Q. But you received the evidence from Catalano?

22 A. I received the evidence from our evidence
23 management group.

24 Q. Okay. Does the FBI have a specific and standard
25 evidence handling procedure for submitting evidence to
26 the lab?

A. Absolutely.

Q. Okay. And were those procedures followed?

A. To my knowledge, they were.

Q. Okay. So what were you asked to do with the evidence that was submitted to you?

A. I was asked to determine whether there was any material defects, manufacturing detects, or abuse that contributed to the failure of these parts.

Q. And did you do so?

A. I examined them to detect manufacturing characteristics and damage characteristics, yes.

Q. And did you author a report reflecting your examination?

A. Yes.

[Exhibit 771 introduced
as evidence.]

BY MR. NOEL:

q. You should have in front of you 771.

A. Yes.

Q. Do you recognize 771?

A. This is my laboratory report dated November 22nd with the results of my examinations of the hooks and runners that I received.

Q. We have Exhibit 771 up on the big board behind you now. So can you walk us through your report and how to read your report.

1 A. The initial information that you see up top is
2 administrative information that refers to the initial
3 request that we received on paper on May 1st, 2019. The
4 evidence description lists all of the different pieces
5 that I received in the form that I received them and
6 defines that this report only refers to the metallurgy
7 results although other investigations may have been or
8 examinations may have been performed at the laboratory.
9 The results of the examination section is a summary of
10 the results of my examinations.

11 Q. Okay. Now, let's stop there. First, up here we
12 have the item list.

13 A. Yes.

14 Q. Is that the list of the items you described
15 earlier; the six hooks and four runners?

16 A. It is.

17 Q. And they are listed item one through item ten?

18 A. Yes.

19 Q. And then there's a description to the right?

20 A. Yes.

21 Q. Where do you get -- where does that description
22 come from?

23 A. The description comes from that incoming
24 communication May 1st, 2019. And during my examinations
25 there were written identification markings on the pieces
26 that I made sure matched with the incoming communication

1 description.

2 Q. Okay. So can you go through the item list for
3 us as to item one through item ten and what each
4 individual item is.

5 A. The results of my --

6 Are you asking for the results of my --

7 Q. No, no, no, no. Just the description of the
8 items.

9 A. Item one is a right phase hook from
10 Transposition Tower 24/199. The FBI number 1B2, E6435062
11 that follows that is the resident agency's application of
12 an evidence number that was associated with the case. So
13 the 1B2 number comes from the resident agency in
14 Sacramento and the item one number is applied by the
15 laboratory.

16 Item two is a left phase hook from the
17 Transposition Tower 24/199. And item three is the
18 dead-end hook from Transposition Tower 24/199. Item four
19 is a right phase hook from Transposition Tower 27/222 and
20 five is the left phase hook from that same transposition
21 tower. And item six is the dead-end hook from that same
22 transposition tower.

23 Item seven is the right phase jumper arm, which
24 is also referred to as a runner, from Transposition Tower
25 24/199. Item eight is the left phase jumper arm from
26 that same transposition tower.

1 Item nine is a right phase jumper arm from
2 Transposition Tower 27/222 and item ten is the left phase
3 jumper arm from that same tower.

4 Q. All right. So let's go -- so we'll come back to
5 some of this. But before we get started in depth, I want
6 to have you define some terms for us that are used in
7 your -- in your report.

8 And specifically, we're on page 3, the end of
9 page 3 of 5. "The following Chemistry Unit standard
10 operating procedures were used."

11 And if you could walk us through those and
12 explain to us what those terms mean.

13 A. Certainly. First of all, standard operating
14 procedures define the manner in which I conduct my
15 examinations.

16 So Metal-100, the examination for association or
17 origin, concentrates on the manner in which I perform
18 visual and physical examinations and then instrumental
19 tests to acquire the information to answer the questions
20 of the original request.

21 Origin refers to what the material is made from,
22 how it's made, and manufacturing characteristics, and
23 potentially what it suffered during its lifetime.

24 Association would take the information gained
25 during an origin examination and compare it to another
26 item for similar either source of manufacturer or similar

1 deterioration during service.

2 Metal-200 is standard operating procedure that
3 specifically states some of the methods I use for
4 analyzing the damage of surfaces -- surfaces and main
5 body metal components.

6 Metal-400 is an overall over-arching
7 compositional analysis method using the Optical Emission
8 Spectrometer.

9 Metal-401 defines the --

10 Q. Let me ask you really quick what is a
11 spectrometer or spectroscopy?

12 A. Okay. This is an instrument that helps me
13 determine the compositional analysis of a metal, what the
14 metal is made out of.

15 Q. And it says "Spark Discharge in Argon Optical
16 Emission Spectroscopy. What is "spark discharge"?

17 A. Spark discharge is created when an electrical
18 arc is generated between an electrode and the sample
19 surface. We're getting into details of the instrument
20 operation, but that generates a plasma that the light is
21 then analyzed and the relative abundance of different
22 wave lengths of the light are compared to the known
23 emissions from different elements of metal alloys.

24 So by measuring the wavelengths of the different
25 light mounted to a different light, the spectrometer
26 quantifies the elemental information.

1 Q. All right. Move on to 401.

2 A. Metal-401 takes that technique and applies it to
3 low carbon steels.

4 Q. What do you mean by low carbon steels?

5 A. Steel is an iron alloy that contains carbon and
6 other alloy elements. And the response of the
7 spectrometer for this method is specifically for carbon
8 content below -- the maximum is two percent carbon in the
9 iron alloy.

10 Q. All right. Go ahead and move on to Metal-500.

11 A. Metal-500 is a qualitative compositional
12 analysis method by X-rays fluorescence spectroscopy. In
13 this method instead of creating a physical plasma burning
14 sample, we are instead radiating the sample with X-rays.
15 Those X-rays interact with the electronic cloud of the
16 atoms in the sample, the excited electronic decay, and we
17 measure the X-ray energy that is given off by those
18 characteristics at play.

19 Again, the spectrometer works by detecting the
20 energy of those x-rays that are given off and then
21 generating a spectrum, a picture for me of the different
22 relative abundance of those characteristic X-rays that
23 tell me what elements are present in that material.

24 Q. Metal-501.

25 A. Metal-501 is the instrument that's used for this
26 X-ray Fluorescence Spectroscopy, which is XRF for short.

1 The Thermal Quant'X Spectrometer is a bulk -- is an
2 instrument that has an analysis spot of about a half an
3 inch by about three-quarters of a inch on the sample. So
4 it measures a relatively large portion of the sample at
5 one time compared to the next standard operating
6 procedure Metal-502. The Bruker M4 Tornado is a
7 microspot XRF that measures only 25 microns spot size at
8 one time.

9 The difference between these two XRF instruments
10 and the reason I in this case used two different methods
11 is the analysis chamber is different sizes. So I had
12 different sizes of parts that I wanted to fit into this
13 chamber.

14 Metal-701 is the operation of Rockwell Hardness
15 Tester. The hardness test generates a quantitative value
16 of the hardness of the material.

17 Metal-800 defines metallographic examinations.
18 These are tests that look at the internal microstructure
19 of the metal so that I can detect more compositional
20 information about them. And this can also give me some
21 heat-treating information about the steel and other
22 materials.

23 IOSS-809 is the performance monitoring protocol
24 for scanning electron microscopies with energy dispersive
25 spectroscopy; SEM-EDS.

26 EDS is a compositional analysis tool much like

1 XRF except instead of exciting the sample with x-rays,
2 we're exciting it with electrons.

3 Again, the electrons react with the electron
4 cause of the atoms in the sample and those then emit
5 x-rays. We detect the x-rays that are characteristic to
6 the elements in the sample so we can determine the
7 composition of the sample.

8 And the CUQA-13 at the bottom is the procedures
9 for estimating measurement uncertainty. These -- this
10 procedure is followed to make sure that when I report a
11 number, that the asteric -- - the precision of that
12 number can be understood by the reader.

13 Q. So are all of these tests and procedures applied
14 to each and every one of the ten items?

15 A. No. For my investigation I used the methods
16 that were appropriate for the pieces of information that
17 I was trying to elicit from the evidence.

18 Q. All right. So one of the steps that you said is
19 visual. So I want to walk through the visual analysis
20 and have you describe everything about individual pieces
21 as we walk through it. Is that okay?

22 A. Okay.

23 Q. All right.

24 [Exhibit 772 introduced
25 as evidence.]

26 BY MR. NOEL:

1 Q. So you should have in front of you Exhibit
2 Number 772. It's up on the big board.

3 You recognize Exhibit 772?

4 A. I do.

5 Q. What is Exhibit 772?

6 A. This is a hook fragment from -- and it's labeled
7 item five. It is the left phase hook fragment from
8 Transposition Tower 27/222.

9 Q. Did you take this photograph?

10 A. I did.

11 Q. Why did you take this photograph?

12 A. This photograph demonstrates this piece of
13 evidence as it arrived to me in my laboratory.

14 Q. And why do you take photographs of evidence as
15 you examine them?

16 A. I document the receiving condition and I
17 document different features that I recognize on the
18 pieces that contribute to my analysis.

19 Q. What kind of photographic equipment are you
20 using for these photographs?

21 A. I use a variety of equipment. I have a macro
22 camera on a Kaiser stand that allows me to increase the
23 magnification of a part several times, up to five times
24 magnification for pictures of whole components.

25 I also use a stereo microscope to take some of
26 the pictures of features that I need to be magnified in

1 order for documenting the conclusions that I am drawing.

2 Q. All right. You have the entire stack of
3 exhibits there in front of you. I think all together
4 there are 52 photographs.

5 Are all of those your photographs?

6 A. Yes, they all appear to be photographs that I
7 took in the laboratory.

8 Q. And what type of resolution camera are you
9 using?

10 A. I don't have that information about the size on
11 the camera. I had to have high resolution. Photographs
12 generated are on the order of between two and thirteen
13 megs; megapixels.

14 Q. All right. So 772, item number five, is a
15 broken hook. Anything on this photograph that we should
16 talk about?

17 A. So this hook fragment under visual
18 examination -- so two things that I do preliminarily. I
19 want to identify the material and the construction and
20 then also any damage. So the combination of my
21 examination determines if the material is cast iron,
22 galvanized and has -- meaning it has a zinc coating --
23 and that there is defacement of several -- with several
24 indicators on the fractured surface.

25 Q. If you could explain to us very briefly what it
26 means to galvanize metal.

1 A. Zinc coating is applied to the exterior of the
2 component in order to be sacrificial layers so the
3 corrosion has the same zinc layer and not on the
4 underlying metal. It protects the metal from corrosion.

5 Q. So other than the visual check, what other tests
6 did you run or examinations did you run on item five
7 depicted in 772?

8 A. This is a depiction of the item before I do any
9 of the tests on it.

10 Q. Right.

11 A. Okay. So I subsequently looked at the
12 microstructure and measured the hardness of item five and
13 measured the composition of the exterior of item five.

14 Q. And what did you determine with the composition
15 of the exterior?

16 A. The exterior is coated with zinc that has other
17 elemental additions but predominately zinc coated over a
18 malleable cast iron-based material.

19 Q. Okay. What does malleable mean in that context?

20 A. Malleable in the context of defamiation means
21 it's easily pushed as opposed to ductile which is easily
22 pulled. Malleable cast iron is the definition of a type
23 of cast iron which I can explain better if we pull up the
24 microstructure.

25 Q. That's the next question. The next question is
26 can you define for us what cast iron means in this

1 context.

2 A. So earlier I mentioned that low carbon steel has
3 a -- low carbon steel is defined by the amount of carbon
4 in the iron matrix. Cast iron is also dependent on the
5 amount of carbon in the iron matrix. But there's so much
6 carbon in cast iron that it precipitates out or
7 agglomerates out during heat treatment. So the material
8 responds differently because of the different
9 composition.

10 So there's quite a few different kinds of cast
11 iron. This particular cast iron is -- backing up,
12 casting would be pouring the molten metal into a mold and
13 letting that solidify. In a malleable cast iron a high
14 carbon -- relatively high carbon molten material is
15 poured into the mold and allowed to solidify in a manner
16 that that carbon is distributed throughout the metal
17 alloy.

18 Malleable cast iron is then tempered so that the
19 excess carbon that is frozen in place is allowed to
20 defuse out. And it's done in conditions that form an
21 agglomerated asymmetrical mass of carbon, masses of
22 carbon throughout that microstructure.

23 Other cast irons are heat treated in different
24 ways to form different types of carbon masses throughout
25 the microstructure. And they have different mechanical
26 properties because of that.

1 [Exhibit 773 introduced
2 as evidence.]

3 BY MR. NOEL:

4 Q. All right. Let's move on to 773. What is 773?

5 A. This is the opposite side of item five.

6 [Exhibit 774 introduced
7 as evidence.]

8 BY MR. NOEL:

9 Q. And 774?

10 A. This photograph documents some of the deformed
11 metal along the edge of the separated surface of item
12 five.

13 Q. Get up and -- please feel free to get up and
14 show us what you're talking about.

15 THE WITNESS: May we please look at Exhibit 776.
16 There's two more pictures.

17 [Exhibit 776 introduced
18 as evidence.]

19 BY MR. NOEL:

20 Q. Yep.

21 A. Okay. So this is a face onto that separated
22 surface. Just to get a perspective of what we're looking
23 at here we'll back up to the picture previous. And we
24 will be looking around these edges.

25 So now back up two. So this lip of deformed
26 material here actually came from the surface, the

1 separated surface and is folded over the edge. So that
2 gives me indication of the wear direction. The damaged
3 material is pushed around the edge. This is an important
4 characteristic for my evaluation.

5 [Exhibit 775 introduced
6 as evidence.]

7 BY MR. NOEL:

8 Q. Okay. And 775.

9 A. This is the other side of that surface, that
10 separated surface that also has deformed material pushed
11 over the edge. So if you can imagine a flat surface and
12 deformed material is pushed over both edges, that means
13 the defamination is happening in two directions.

14 Q. And from inside to out?

15 A. From -- a better term is across.

16 Q. Across. Okay.

17 A. Across that.

18 Q. And we're referring now to 775, Exhibit 775;
19 correct?

20 A. Yes.

21 Q. And this is another what I would describe as
22 high definition and extreme close-up of item five.

23 A. This is a macrophotograph at a magnified view
24 which . . .

25 Q. All right. Let's move on to 776. What is 776?

26 A. So 776 is also a macrophotograph at a magnified

1 view of the flat separated surface. They flatten in
2 macro sense because you can see there's texture along the
3 surface that indicates to me there is a rotational aspect
4 to whatever formed these defamation features.

5 And when we compare that to the previous two
6 photographs, this -- I'm indicating an arced pattern that
7 has a rotational component of defamation that caused the
8 rims of deformed material over the edges that we saw in
9 the previous two photographs.

10 Q. Right. So they're either almost described as
11 arced striations. Would that be an appropriate
12 description of these?

13 A. In metallurgy failure analysis striations are
14 often attributed to fatigue defamation. This is not
15 fatigue defamation. So I don't want to confuse the
16 term -- the mechanism of defamation by calling them
17 striations. They are defamation marks.

18 Q. Okay. So if these aren't -- well, all of a
19 sudden I lost the verbiage you used.

20 What do these marks indicate to you?

21 A. That progressive rotational damage is happening
22 through this part.

23 Q. So rotational damage. So are we talking
24 about -- I'm demonstrating with my finger in a hole
25 rocking back and forth. This hook rocking back and forth
26 in a --

1 A. It's defamation on this surface. So it's
2 typical wear, rotational wear and could be formed by a
3 hook rocking back and forth in a slot. Or not in a slot.
4 Over a material that forms a slot in the hook. We will
5 see this later on in other hooks.

6 Q. Yep.

7 Now, on the edge of item five, the hook, the
8 left phase hook from 27/222, there appears to be some
9 discoloration. Was there corrosion on the broken hook
10 phase?

11 A. There was corrosion on the broken hook phase.
12 This (indicating) discoloration is corrosion product.

13 Q. Now, on the bottom is what I previously referred
14 to with the completely scientific term of the toenail of
15 the hook or the break. Can you describe that for us and
16 the conclusions that you were able to draw.

17 A. Will you please advance to the next photograph.

18 [Exhibit 777 introduced
19 as evidence.]

20 BY MR. NOEL:

21 Q. All right. So going to 777.

22 A. So while this separated phase shows me that wear
23 occurred in a progressive manner and with a rotational
24 aspect, the bottom fracture area is overload failure,
25 overload fracture. So the wear on this piece occurred
26 through the cross-section of the hook until finally the

1 hook was not strong enough to support the load that was
2 applied to it and broke off.

3 This (indicating) area is a more recent fracture
4 than all of this wear and it does not show as heavy
5 corrosion layers as on the rest of the surface.

6 Q. How do you tell the difference between wear and
7 fracture?

8 A. The characteristic of the surface.

9 Q. Okay.

10 A. The texture of the surface.

11 Q. Demonstrate on the picture itself if you can
12 show us.

13 A. So the texture of this fractured -- I'm going to
14 call it the ligament. The last little bit that fractured
15 is a very rough ridge area that actually shows the
16 separation points between the two halves of the hook.
17 Not that we have another piece of the hook to compare it
18 to, but that is typical of a fracture surface about where
19 the material is coming apart. And the little ridges
20 between the materials that separate are still remaining
21 there. That is present through this (indicating) entire
22 area.

23 Q. Now, there does appear to be some discoloration
24 on the ligament. Am I saying that correctly?

25 A. There is some light corrosion on part of the
26 ligament.

1 Q. Did that corrosion play any part in the failure
2 of the ligament?

3 A. It does not appear that that -- that any
4 corrosion played any part in -- no penetrating corrosion
5 was evident throughout any of this investigation.

6 Q. So based upon your examination and analysis,
7 were you able to form an opinion as to why this hook may
8 have failed?

9 A. Yes.

10 Q. And what was that opinion?

11 A. This hook failed under wear conditions,
12 body-on-body wear with a rotational component.

13 Q. Were you able to do an analysis to determine
14 approximately how long it would take for that
15 body-on-body wear to occur down to failure point?

16 A. No, I'm not able to make that prediction of
17 duration of the progression of the wear.

18 [Exhibit 778 introduced
19 as evidence.]

20 BY MR. NOEL:

21 Q. All right. Let's move on and let's go to 778.
22 And what is 778?

23 A. So I have my photographs organized by photograph
24 number and you don't have the labels on this. So if I
25 can cross-reference my notes, I'd be happy to tell you
26 what that exhibit is.

1 Q. Sure. Go ahead.

2 A. So 778 is item four, the right phase hook from
3 Transposition Tower 27/222.

4 Q. All right. Would you -- did you do the same
5 analysis and examination of the right phase hook?

6 A. I did. I did a visual examination for
7 manufacturing characteristics and for damage. I did a
8 compositional analysis. I performed a metallography
9 analysis.

10 Q. And so what were you able to determine about the
11 right phase hook from 27/222?

12 A. The right phase hook is galvanized plain carbon
13 steel that has suffered damage that is due to wear --
14 body-on-body wear with a rotational component.

15 Q. What is the difference between plain carbon and
16 low carbon steel?

17 A. There doesn't have to be any difference. A
18 plain carbon steel is simply a steel that has not been
19 alloyed with some of the more advanced alloying additions
20 that we use to increase strength, for example, of steel.

21 Q. Is there a manufacturing difference? For
22 instance, you said the other one was malleable cast iron?

23 A. Absolutely there's a manufacturing difference.
24 So whereas a cast iron component would be in a molten
25 state, the liquid metal poured into a mold of the shape
26 very close to the final product and solidified. A steel

1 like this would be cut -- a preliminary form would be cut
2 from, for example, a plate of steel and then that would
3 be heated up and forged into the final form of such a
4 hook.

5 Q. So the left phase and the right phase were made
6 from different types of steel and by different methods of
7 manufacture?

8 A. Yes.

9 Q. All right. So you see any damage on this hook?

10 A. This damage has a groove worn into the inner
11 diameter of the hook at the contact surface of its
12 support structures.

13 [Exhibit 779 introduced
14 as evidence.]

15 BY MR. NOEL:

16 Q. All right. Let's move on to 779.

17 A. That is the opposite side of the same hook.

18 [Exhibit 780 introduced
19 as evidence.]

20 BY MR. NOEL:

21 Q. And 780.

22 A. That's a close-up of the damaged metal that is
23 again overlapping the outside brim of that groove that's
24 worn into the hook.

25 [Exhibit 781 introduced
26 as evidence.]

1 BY MR. NOEL:

2 Q. And 781.

3 A. This is the opposite side of that. There's also
4 metal here and here.

5 [Exhibit 782 introduced
6 as evidence.]

7 BY MR. NOEL:

8 Q. And 782.

9 A. This one shows the rotational nature of the
10 damage of the wear. Some of these -- I'm going to call
11 them ridges right now rather than striations. I don't
12 want to use the word "striations" because I don't want to
13 confuse the failure mechanism.

14 Q. All right. So let's back up and make sure we
15 have a clear record. So 782 is another photograph of the
16 right phase hook from 27/222, item number four, I
17 believe?

18 A. If you can tell me the MAC number I can verify
19 that for you.

20 Q. I don't have the MAC number on it.

21 A. We did not keep that cross-reference.

22 Q. And I went off and left the notepad with the
23 cross references sitting on my desk.

24 A. I can do this.

25 Yes. Based on my records within my examination
26 notes, this photograph is of item four, which is the

1 right phase hook from that same transposition tower.

2 Q. Okay. The same hook that was shown in 781, 780,
3 and 779?

4 A. Yes.

5 Q. All right. So explain to us why this photo --
6 what this photo shows.

7 A. Okay. This photo shows the curvature of the
8 hook is this (indicating) way. The interior curvature of
9 the hook is this (indicating) way. So this is showing
10 the inner surface of the groove where wear -- at the
11 location that wear has occurred and it shows deformation
12 has formed in a rotational manner across this surface of
13 this hook.

14 Q. And what is the significance of that?

15 A. Again, that the wear is occurring with a
16 rotational aspect.

17 Q. And I guess I didn't ask you this when we looked
18 at the photographs and the broken hook. Does
19 body-on-body metal fatigue wear like this? Is this a
20 known phenomenon?

21 A. Fatigue is a different mechanism. So leaving
22 fatigue aside, body-on-body wear is a known mechanism, is
23 a manner of deformation, and academically there are many
24 other specific mechanisms that can -- that can define
25 body-on-body wear such as friction. Friction, wear,
26 fretting, abrasive wear -- all of those are body-on-body

1 wear. I did not identify specifically the mechanism by
2 which this body-on-body wear happened.

3 Q. But these are well-known and well-documented
4 phenomenon; correct?

5 A. Yes.

6 Q. And things that have been well-known and
7 well-documented for many years?

8 A. Yes.

9 [Exhibit 783 introduced
10 as evidence.]

11 BY MR. NOEL:

12 Q. All right. Let's move on to 783. Got it?

13 A. So 783 is item six, the dead-end hook from
14 Transposition Tower 27/222.

15 Q. Did you do your examination and analysis of --

16 A. Yes.

17 Q. -- the hook depicted in 783?

18 A. I performed visual and physical examinations. I
19 evaluated the deformation characteristics. I examined the
20 microstructure metallography and did compositional
21 analysis on the exterior of this hook.

22 Q. I guess we should go back. One of the things is
23 this hook seems to have a "B" -- it's kind of corroded on
24 this hook -- on it; correct?

25 A. Yes.

26 Q. Now, the previous hook has a "B" and an "O" and

1 a serial number on the other side or at least a number on
2 the other side. Correct?

3 A. A number, yes.

4 Q. And then going back to our first hook, it has a
5 raised "B."

6 A. Yes.

7 Q. So what can you tell us about the hook depicted
8 in 783? The dead-end hook from 27/222?

9 A. The dead-end hook has a raised "B" on this. So
10 part of my examination for origin of materials is looking
11 at identifying manufacturing markings that are on
12 components. And one of the things that I report on is
13 the origin of trademarks that are applied to different
14 components.

15 The circle "B," the "B" with a circle around it
16 or either an "O" around it in an oval form or circle
17 form, was trademarked in 1907 by Ohio Brass and then
18 owned subsequently by another company. And that
19 information comes from the U.S. Patent and Trademark
20 Office. The "B" was not patented separately from what I
21 could detect from the U.S. Patent and Trademark Office.

22 Q. What can you tell about the composition and
23 characteristics of the hook itself? The metal?

24 A. The item six hook, the dead-end hook from the
25 27/222 tower, is galvanized steel with wear that formed a
26 groove that was created by body-on-body wear with a

1 rotational component.

2 Q. Is this a cast iron metal like the hook from the
3 failed hook or is this a forged metal like the last hook?

4 A. This is not cast iron like the brackets looked
5 like that were separated from it. This is steel,
6 galvanized steel similar to item four, the right phase
7 hook off the same tower.

8 [Exhibit 784 introduced
9 as evidence.]

10 BY MR. NOEL:

11 Q. All right. So let's move on to 784.

12 A. So can you go back to 783, please.

13 Q. Sure.

14 A. Okay. So 784 is the opposite side of 783. It's
15 upside down from what my notes are. So I apologize. It
16 took me a little time to make sure it's the same
17 photograph.

18 Q. Let's make a record here. You took a lot of
19 photographs in your lab of these -- of all these various
20 parts; correct?

21 A. I did, yes.

22 Q. And of those photographs there were, I think, 52
23 photographs chosen?

24 A. Yes.

25 Q. And on your photographs you said what you refer
26 to as a MAT number on them, M-A-T.

1 A. M-A-C but, yes.

2 Q. And, of course, we have to put our exhibit
3 stickers on them. So we have different numbering; is
4 that correct?

5 A. That's correct.

6 [Exhibit 785 introduced
7 as evidence.]

8 BY MR. NOEL:

9 Q. All right. So let's move on to 785.

10 A. Okay. 785 is this item six hook again
11 depicting -- this is a close-up depicting the over -- the
12 deformed material forming a lip at the edge of the worn
13 groove.

14 Q. Why is that significant?

15 A. Again, that means that the wear deformation is
16 pushing material up over the edge of that groove. It
17 gives me an indication of the type of damage that
18 happened on this one.

19 [Exhibit 786 introduce
20 as evidence.]

21 BY MR. NOEL:

22 Q. Let's move on 786.

23 A. 786 is item six hook with the overlapping
24 material over the edge of the groove. And along the
25 inner groove there's also -- along the cross-section of
26 the interior curve of the hook is also some deformed

1 material that pushed -- pushed back this (indicating) way
2 toward that interior of that curve.

3 Q. Why is that significant?

4 A. Again, that's telling me the direction of the
5 defamation of the metal.

6 Q. And is all of that consistent with the
7 rotational wear?

8 A. In this particular hook and the other hooks that
9 we've looked at, most of the remaining indication of the
10 wear of the deformed metal occurred at the side edges of
11 the groove. In this case, it's also occurring along that
12 interior -- at the groove edge on the interior of the
13 curvature of the hook which indicates there's a little
14 bit of a sliding motion going on as well.

15 [Exhibit 787 introduced
16 as evidence.]

17 BY MR. NOEL:

18 Q. All right. Let's try and do one more. Let's
19 move on to 787. And I think, if I remember right, the
20 MAC number on this is number one.

21 A. It's item one.

22 Q. Yep.

23 A. Right phase hook from the 24/199 transposition
24 tower. So this is the condition in which I received this
25 hook.

26 [Exhibit 788 introduced

1 as evidence.]

2 BY MR. NOEL:

3 Q. All right. Let's go to 788.

4 A. This is the opposite side of the same hook.

5 [Exhibit 789 introduced
6 as evidence.]

7 BY MR. NOEL:

8 Q. And 789.

9 A. So this has a deep groove worn the majority of
10 the way through the cross-section of the hook and the
11 deformed metal along the edge of that worn groove.

12 Q. So I skipped a step. Did you do the
13 compositional analysis and everything of this hook also?

14 A. Yes, I did.

15 Q. And what did you find out about this specific
16 hook?

17 A. This is a galvanized malleable cast iron hook.
18 So the composition is similar to the separated hook that
19 is item number five in composition and manufacture.

20 Q. All right. Now, what do you see in this
21 photograph 789 of significance?

22 A. The photograph is taken to document the
23 defatation and the displacement of the material to the
24 outer edge of the groove and it's folding back onto the
25 hook.

26 Q. Why is that significant?

1 A. Again, this tells me the direction of the wear
2 contact surface, how the metal is being pushed out of the
3 way so that there's this rotational component of the
4 wear.

5 [Exhibit 790 introduced
6 as evidence.]

7 BY MR. NOEL:

8 Q. All right. And 790.

9 A. This is the opposite side of the same hook again
10 showing the deformed metal. So this is happening on both
11 sides of the groove. So the defamination is happening both
12 directions. And this shows that it's happened along the
13 whole groove. Here (indicating) is a little bit more
14 worn off. So this is a progression of defamination through
15 the hook.

16 [Exhibit 791 introduced
17 as evidence.]

18 BY MR. NOEL:

19 Q. All right. And 791.

20 A. This emphasizes the last point I just said where
21 there's folded-over deformed material on both sides of
22 that groove.

23 [Exhibit 792 introduced
24 as evidence.]

25 BY MR. NOEL:

26 Q. And 792.

1 A. This picture is an attempt to document the
2 rotational nature of the wear that is occurring on the
3 interior surface of the groove. This is looking down
4 into the groove from the interior curve of the hook. The
5 most recent wear occurred down here at the -- near the
6 remaining ligaments of this hook. These (indicating)
7 deep marks from their rotational wear have not been worn
8 away. The older wear is more smashed down and less
9 visible.

10 And then out at the very interior surface of
11 that curve, the first part of the groove that would have
12 been formed, the rotational wear marks are really visible
13 because they've been deformed away by the continued wear
14 that penetrated through the cross-section of that hook.

15 Q. On the worn sections do we see corrosion?

16 A. There is corrosion product on the worn sections,
17 yes.

18 Q. I forgot to ask you the same question. But let
19 me go on to the next one and then I'll come back to it.

20 [Exhibit 793 introduced
21 as evidence.]

22 BY MR. NOEL:

23 Q. And 793.

24 A. This is a picture of the opposing phase of that
25 same groove. So the groove is cut into the interior of
26 that hook. And the previous picture was one side of the

1 hook toward the tip of the hook. The other is the other
2 phase of the groove. This is the other phase of the
3 groove toward the body of the hook and again showing
4 rotational component of the wear surface.

5 Q. So in your analysis, in your examination, and
6 especially in your compositional analysis of this hook
7 item number one, did you find any defects?

8 A. I found no material defects in this hook.

9 Q. The same question going back to hook number five
10 or item number five, the broken hook from 27/222.

11 A. My examination did not reveal any manufacturing
12 defects or penetrating corrosion in any of these hooks.

13 MR. NOEL: Madam Foreperson, this would be a
14 good time for a break.

15 GRAND JURY FOREPERSON: Okay.

16 MR. NOEL: Take our morning break. We have
17 15 minutes. She'll have an admonition for you.

18 GRAND JURY FOREPERSON: Dr. Marvin, you are
19 admonished not to discuss or disclose at any time outside
20 of this jury room the questions that have been asked of
21 you or your answers until authorized by this grand jury
22 or the court. A violation of these instructions on your
23 part may be the basis for a charge against you of
24 contempt of court. This does not preclude you from
25 discussing your legal rights with your own attorney.

26 Dr. Marvin, what I have just said is a warning

1 not to discuss this case with anyone except the Court,
2 your lawyer, or the district attorney.

3 Do you have any questions?

4 THE WITNESS: I do not. Thank you.

5 GRAND JURY FOREPERSON: Okay. Thank you.

6 [Recess taken from

7 9:46 until 10:05 a.m.]

8 GRAND JURY FOREPERSON: All members of the grand
9 jury are present and ready to proceed.

10 Dr. Marvin, if you'd have a seat right here.
11 I'd like to remind you that you're still under oath.

12 **EXAMINATION CONTINUED**

13 BY MR. NOEL:

14 Q. All right. I want to go back because apparently
15 we skipped a couple or at least we could do a little
16 cleanup on a couple.

17 Go back is 776. And if you could just briefly
18 describe what is depicted in photograph number 776.

19 A. So 776 shows the item five hook, the phase of
20 the separated surface, and it is at a focus that depicts
21 the rotational nature of the wear that we were talking
22 about earlier. There's some arced ridges across this
23 plain.

24 Q. All right. And then 782. I think that should
25 be -- I have mine in order too. So I think it's 48, MAC
26 code 48. Either 43 or 48.

1 A. So that's not 48.

2 Q. Forty-five then?

3 A. No.

4 Q. Yeah, you're right.

5 A. This looks like MAC 031. Does that march your
6 correlation?

7 Q. Yep.

8 A. Okay. So this photograph is of item four.
9 Again, this is the interior curve of the hook where the
10 groove has worn across that interior surface. And the
11 photograph is taken at an angle to try to depict the worn
12 surface and show the rotational nature of the wear that
13 has occurred.

14 [Exhibit 794 introduced
15 as evidence.]

16 BY MR. NOEL:

17 Q. All right. Let's go to 794 and go back to where
18 we left off. This should be MAC code 10.

19 A. So this is hook item number two, the left phase
20 hook from the Transposition Tower 24/199.

21 [Exhibit 795 introduced
22 as evidence.]

23 BY MR. NOEL:

24 Q. And 795.

25 A. It's the opposite side of that same hook.

26 Q. And let me back up. Did you do compositional

1 analysis on this hook?

2 A. Yes. I did a compositional analysis of the
3 exterior coating to determine that it was a zinc coating
4 and the base material is plain carbon steel.

5 [Exhibit 796 introduced
6 as evidence.]

7 BY MR. NOEL:

8 Q. All right. So 796.

9 A. This photograph shows that same hook has similar
10 defamation that we've seen on the edges of the other
11 grooves on the hook where the deformed material is folded
12 over the edge of the groove.

13 [Exhibit 797 introduced
14 as evidence.]

15 BY MR. NOEL:

16 Q. And 797.

17 A. There's less of that material on this side, the
18 opposite side of the previous photograph. But this is
19 that worn edge. And there is still a little bit of that
20 deformed material folding over the exterior of that
21 groove on that side. So both sides show that deformed
22 material.

23 [Exhibit 798 introduced
24 as evidence.]

25 BY MR. NOEL:

26 Q. All right. Let's move on to 798.

1 A. This is hook number item -- laboratory item
2 three, the dead-end hook from the 24/199 transposition
3 tower.

4 [Exhibit 799 introduced
5 as evidence.]

6 BY MR. NOEL:

7 Q. And 799.

8 A. This is the flip side of that same hook.

9 Q. And did you do compositional analysis on this
10 hook?

11 A. I did. I did the compositional analysis of the
12 exterior to determine the galvanized coating. And the
13 interior base material is plain carbon steel.

14 [Exhibit 800 introduced
15 as evidence.]

16 BY MR. NOEL:

17 Q. On to Exhibit Number 800.

18 A. So the dead-end hook on this transposition tower
19 shows a little bit of a disturbance of the regular wear
20 pattern that we've seen on the other hooks. There is a
21 worn groove, but there is also a section of wear or
22 damage that occurred adjacent to the groove as if the
23 contact surface was disrupted and turned into a different
24 orientation.

25 So what this tells me is something is moving
26 between the contact area. Either the load has been

1 adjusted or the frequency of the vibration has been
2 adjusted. Something has happened in that contact
3 surface. So the wear is not as regular as we have seen
4 on the other hooks.

5 Q. Are you familiar with the term generally used in
6 construction of something being plumb?

7 A. Yes, generally.

8 Q. What is your understanding of the term?

9 A. Plumb would be in line perpendicular with an
10 axis that was perpendicular to the surface of the Earth,
11 gravity. So straight down in line with gravity.

12 Q. So the first five hooks that we looked at items
13 one through five, would you be able to say whether or not
14 those hooks were hanging plumb?

15 A. I can't say that. I can only see the grooves.
16 I can't determine what the angle of that hook was as it's
17 in service. So the groove is being formed at the
18 interior of the hook. I can't tell whether the load is
19 coming off at an angle or the load is coming plumb and --
20 so I don't have the ability to make that determination.

21 Q. What about on this hook item number three,
22 photograph number 800?

23 A. The damage on this hook tells me that the load
24 moved. So that angle of application of force could have
25 changed, yes.

26 Q. Okay. And move for quite -- obviously for a

1 while, not just once? Would that be -- I guess we can't
2 really -- you can't give us an opinion as to how long it
3 took. But is the damage consistent with that angle, that
4 movement over time or a one-time deal?

5 A. So there's several different major ridges on
6 this disturbed region. So there may have been several
7 different re-locations of the load application, but these
8 wear patterns form over time. So at each location that
9 forms a regular wear pattern that orientation existed and
10 those oscillations of whatever wearing against each other
11 happened over time.

12 And so the main groove pattern happened over a
13 period of time. And the wear that happened within the
14 disturbed region also happened over time, but I can't
15 predict what that time period was.

16 [Exhibit 801 introduced
17 as evidence.]

18 BY MR. NOEL:

19 Q. All right. Now we're going to switch gears a
20 little bit and move to the jumper arms and just get you
21 in the right place. This would be MAC code seven. Or
22 I'm sorry. It's 59.

23 A. Okay.

24 Q. And Exhibit 801. Do you see Exhibit 801?

25 A. This is a photograph of laboratory item seven
26 which is the right phase jumper arm from Transposition

1 Tower 24/199 as I received it in the laboratory.

2 Q. All right. And what types of analysis and
3 examination did you do on the jumper arm shown in 801?

4 A. So I did a visual analysis of the entire part
5 and the mounting bracket that is mounted onto the end of
6 this jumper arm. And I looked at characteristics like
7 the alignment of the hole between the bracket and the
8 jumper arm and the damage that is apparent at both of
9 those locations to show that nothing went straight
10 through both holes and created the damage at the same
11 time. These holes are not in alignment.

12 Also characterized the damage, the elongation of
13 each of the hanger holes that are on the end of the
14 jumper arm. And I compositionally analyzed the coating
15 and the base material of both the jumper and the bracket.
16 And I measured the hardness of both the jumper arm and the
17 bracket.

18 Q. And what did you find in your compositional
19 analysis of the jumper arm Exhibit 801?

20 A. Both the jumper and the bracket are galvanized
21 load -- excuse me, galvanized plain carbon steel.

22 Q. What does that mean?

23 A. Again, zinc-coated carbon steel.

24 Q. And by the way, did you analyze the
25 galvanization and zinc coating?

26 A. I did in place on the substrate material.

1 Q. And what did you determine about the zinc
2 coating?

3 A. The coating is predominantly zinc. There are
4 other elements within the coating that result from the
5 manufacturing process.

6 Q. And were you able to identify those other
7 elements?

8 A. They are identified, yes.

9 Q. Is one of those cadmium?

10 A. Now, I'll have to look at the notes. So the
11 application of galvanized coating occurs in several
12 steps, preparation steps. And some of the materials from
13 the preparation steps are retained through to the end
14 product.

15 Also, some additions to zinc are made to improve
16 the adherence of the zinc onto the substrate. Those
17 practices have changed over the years, but my analysis
18 reveal that it's predominantly zinc, a very, very small
19 addition. Some of the material that I measured had
20 indicia of cadmium. Some of them had indicia of lead.
21 For me to differentiate between the two of them I'd have
22 to look back at my analysis.

23 Q. And we don't need to go back through.

24 What is the significance about the presence of
25 cadmium?

26 A. Cadmium is a toxic material that is trying to be

1 eliminated from manufacturing practices these days.

2 [Exhibit 802 introduced
3 as evidence.]

4 BY MR. NOEL:

5 Q. Okay. All right. So let's move on to 802, MAC
6 number 63. And tell us what we're looking at.

7 A. This is the hole in the runner on that item
8 seven jumper arm. And it shows that the original -- what
9 can be presumed to be the original drilled hole in the
10 runner arm has been elongated by a significant amount
11 again by wear that created this lip of material at the
12 edge of the deformed hole.

13 [Exhibit 803 introduced
14 as evidence.]

15 BY MR. NOEL:

16 Q. So let's move on to 803.

17 A. A better picture. This is the other side of
18 the --

19 Would you mind going back one picture.

20 Q. Sure. That should be MAC 63.

21 A. Okay.

22 Q. And the next one should be MAC 64.

23 A. Yes. So then 63 was the exterior side of the
24 hole. The angle is formed like this (indicating), the
25 angle stock. And then the bracket is added on to make
26 kind of a "U."

1 We're talking about the outside of the hole when
2 I say exterior. So this (indicating) is the exterior,
3 the photograph of the exterior. And the next photo is a
4 photograph of the other side of that hole, the interior
5 surface of that again with a large lip of deformed metal
6 folded over the edge of that worn region.

7 Q. And what is the significance of that metal over
8 or the lip of metal folded over?

9 A. Again, that is an indication of the wear that
10 occurred, this type of deformation that occurred.

11 Q. And what type of wear is this?

12 A. A body-on-body wear.

13 [Exhibit 804 introduced
14 as evidence.]

15 BY MR. NOEL:

16 Q. All right. Let's move on to 804. That should
17 be 65.

18 A. This is the interior side of that. Did I
19 miss one? I'm sorry. Could we go back through the last
20 three pictures.

21 Q. 802, 803, 804.

22 A. Thank you. So this (indicating) is the interior
23 of that hole.

24 Q. And again, what is the significance in this
25 photograph?

26 A. I want to make sure I'm speaking correctly. Can

1 you go back to the first one.

2 Q. Yep.

3 A. Okay. So this is item seven. We are looking at
4 that exterior.

5 Q. Oh.

6 A. Oh, you went forward. This is also the
7 exterior. It's a close-up. And the following picture is
8 the interior of that same part.

9 Q. Okay. And let's talk a little bit about the
10 discoloration that is seen around the bottom of the hole
11 in all three photographs 802, 803, and 804.

12 A. So the discoloration has the color of corrosion
13 product. And I did not analyze whether that corrosion
14 product was formed on the layer of metal beneath the
15 galvanized coating or came from some of the disturbed
16 metal that had been under the wear, had been subject to
17 the wear process.

18 So it could be corrosion staining from the
19 material that is gone now or it could actually be
20 corrosion product from the underlying material because
21 the zinc coating has been disturbed and the material
22 underneath is corroding. I did not complete that
23 analysis.

24 [Exhibit 805 introduced
25 as evidence.]

26 BY MR. NOEL:

1 Q. All right. Let's move on to 805.

2 A. 805 is the bracket of the item seven jumper arm
3 as received in the laboratory. Again, there's uniformed
4 diameter of a hole over a portion of the circumference of
5 the circle and then a deformed region underneath that.
6 Also you can see on the exterior of the bracket that
7 there are those arced wear patterns worn into the
8 substrate material. In this region the zinc coating has
9 been completely worn off.

10 [Exhibit 806 introduced
11 as evidence.]

12 BY MR. NOEL:

13 Q. All right. And Exhibit 806.

14 A. That is a close-up of those arced patterns that
15 indicate --

16 Q. What is the significance of the arced patterns?

17 A. It indicates rotational body-on-body wear.

18 Q. And we are talking about these, for lack of a
19 better term, ridges running across there; correct?

20 A. Yes.

21 [Exhibit 807 introduced
22 as evidence.]

23 BY MR. NOEL:

24 Q. All right. And 807.

25 A. 807 is the interior of that same bracket showing
26 the other side of the hole.

1 Q. Is there any significance -- I forgot to ask --
2 between -- on the outside we have all these ridges and
3 arced ridges, but it doesn't appear to have that on the
4 inside.

5 A. The significance is that the pressure of
6 whatever is hanging onto it was tilted one way versus
7 another way. But I don't have structural information to
8 quantitate that description. So whereas on the interior
9 the zinc coating is not disturbed and there's corrosion
10 staining on the exterior, that zinc coating has
11 completely been worn away. It just means that the
12 contact area was tighter, a heavier load tilted onto the
13 exterior of the bracket and then onto this interior of
14 the bracket.

15 [Exhibit 808 introduced
16 as evidence.]

17 BY MR. NOEL:

18 Q. All right. So let's move on to 808.

19 A. This is the left phase from the 24/199, left
20 phrase jumper arm, which is item eight in the laboratory.

21 [Exhibit 809 introduced
22 as evidence.]

23 BY MR. NOEL:

24 Q. And 809. It should be number 55 on the MAC
25 code.

26 A. Fifty-five is the exterior of the runner hole

1 again showing the deformed material around the lip of the
2 worn region of that hole.

3 [Exhibit 810 introduced
4 as evidence.]

5 BY MR. NOEL:

6 Q. And 810.

7 A. It is the opposite side of that runner hole
8 again showing a great deal of material that has been worn
9 and deformed and folded over the edge of the hole.

10 [Exhibit 811 introduced
11 as evidence.]

12 BY MR. NOEL:

13 Q. Photograph 811.

14 A. Do you have a MAC photograph reference?

15 Q. Should be 57, I believe.

16 A. This is the hole in the bracket on item eight.
17 This is the exterior of that hole. We're kind of looking
18 down at it at a little bit of an angle, not straight on.
19 This shows the deformed material around the edges, the
20 worn region of the hole.

21 Q. Any significance to this shininess of this
22 material on the edge?

23 A. It did not retain a corrosion product as I
24 received it in the laboratory. So I can't tell you
25 whether the corrosion product was ever on that edge or
26 not, whether it was recently worn or whether it was

1 corroded and then removed during the shipping process.
2 Sometimes that happens.

3 [Exhibit 812 introduced
4 as evidence.]

5 BY MR. NOEL:

6 Q. All right. And 812.

7 A. This is the opposite side of that same hole in
8 that same bracket showing again the disturbed material
9 that is folded over onto the exterior of that worn region
10 of the hole.

11 [Exhibit 813 introduced
12 as evidence.]

13 BY MR. NOEL:

14 Q. All right. Moving on to Exhibit 813.

15 A. This is laboratory item number nine. It's the
16 right runner from the 27/222 transposition tower.

17 Q. Okay. And did you do compositional analysis on
18 this arm?

19 A. I did compositional analysis of coating of both
20 the bracket and jumper arm and the base material of the
21 bracket and the jumper arm.

22 Q. And what did you find in your compositional
23 analysis of those items?

24 A. These are also both galvanized plain carbon
25 steel.

26 [Exhibit 814 introduced

1 as evidence.]

2 BY MR. NOEL:

3 Q. And 814.

4 A. This is the exterior of the runner, the hole in
5 the runner. Again by "exterior" I mean the L bracket,
6 the original runner arm L bracket, the exterior of the L.
7 And this again shows the deformed material around the
8 worn portion of the hole.

9 [Exhibit 815 introduced
10 as evidence.]

11 BY MR. NOEL:

12 Q. All right. And 815.

13 A. It's the opposite side of that hole in the
14 runner.

15 [Exhibit 816 introduced
16 as evidence.]

17 BY MR. NOEL:

18 Q. 816.

19 A. This is the hole in the bracket on the item nine
20 runner, attached to the item nine runner again making it
21 obvious that the holes don't line up.

22 [Exhibit 817 introduced
23 as evidence.]

24 BY MR. NOEL:

25 Q. And 817.

26 A. Exhibit 817 is the exterior of the bracket hole

1 for that particular runner.

2 Q. And what is significant in these photographs?

3 A. There is deformed material forming a lip at the
4 edge of the deformed region of the hole.

5 [Exhibit 818 introduced
6 as evidence.]

7 BY MR. NOEL:

8 Q. And 818.

9 A. It's the opposite side of that hole in that
10 bracket. Again, it's item nine of that runner.

11 Q. And again on 817 is there a difference in the
12 wear patterns below the hole on 817 and 818 or is it just
13 the angle of the photograph?

14 A. On this particular bracket there was some heavy
15 corrosion product in this region that I did not remove to
16 examine whether or not those -- the contact area would
17 have received more load on the interior or the exterior
18 of that hole.

19 [Exhibit 819 introduced
20 as evidence.]

21 BY MR. NOEL:

22 Q. Okay. All right. Moving on to 819.

23 A. This is laboratory item number ten, the left
24 runner, the left phase jumper arm from the Transposition
25 Tower 27/222 with the runner and the bracket attached.

26 Q. Oh, did you do compositional analysis on these?

1 A. I did compositional analysis on both the runner
2 and the bracket, and both components are galvanized plain
3 carbon steel.

4 [Exhibit 820 introduced
5 as evidence.]

6 BY MR. NOEL:

7 Q. And 820.

8 A. This is the hole in the runner, the exterior of
9 that hole showing deformed material folded over the lip
10 of the outside of that hole.

11 [Exhibit 821 introduced
12 as evidence.]

13 BY MR. NOEL:

14 Q. 821.

15 A. The opposite side of the hole in the runner
16 again showing the deformed material folded over the edge
17 of the lip of the elongated deformed part of that hole.

18 [Exhibit 822 introduced
19 as evidence.]

20 BY MR. NOEL:

21 Q. 822.

22 A. This is the bracket from that particular runner
23 that was attached to this particular runner again showing
24 that the holes do not line up.

25 [Exhibit 823 introduced
26 as evidence.]

1 BY MR. NOEL:

2 Q. 823.

3 A. This is the exterior hole in that bracket with
4 the wear pattern and the folded material over the edge of
5 the elongated part of that hole.

6 [Exhibit 824 introduced
7 as evidence.]

8 BY MR. NOEL:

9 Q. And 824.

10 A. This is the opposite side of the hole in that
11 bracket. This is the interior surface of that bracket.

12 Q. Any other significant features in this
13 photograph?

14 A. This is quite -- we have quite deeply defined
15 ridge arced curvature deformation ridges on this side.

16 Q. Now, on the jumper arm, the runner, and the
17 bracket itself on item number ten, which is the left
18 jumper arm from 27/222, did you find in those visual
19 examinations or your compositional analysis or any other
20 examinations that you did any defects in the items?

21 A. I found no material or manufacturing defects in
22 any of the runners or the brackets from the jumper arms
23 that I examined.

24 Q. And I guess I should have you define the
25 difference between material and manufacturing defects.

26 A. So that's a good point. Materials are

1 manufactured and then they form the parts.

2 So by my calling out the two different ones
3 there, there can be flaws in the actual alloy of the
4 material such as inclusions or voids that reduce the
5 mechanical properties of the material. And that's what I
6 referred to just now as material defects.

7 Manufacturing defects might be something like a
8 tool slipped, created a gouge that creates a notch that
9 would be more sensitive to fracture than a pristinely
10 machined surface.

11 So what I'm saying is I don't see anything
12 that's intrical to the bulk of the material and I don't
13 see any manufacturing defects from the forming of that
14 material into a shape.

15 Q. So no defects on either the jumper arm or the
16 brackets?

17 A. Except for the defamiation that we see at the
18 holes.

19 Q. And what was your opinion would have caused that
20 defamiation?

21 A. This defamiation appears to be body-on-body wear
22 at the holes on both the runners and the brackets.

23 Q. Going back to item five, which is the partial
24 hook off of the left phase of 27/222, did you find any
25 defects in your manufacturing or material defects in that
26 hook?

1 A. I did not find any material or manufacturing
2 defects in that hook that would be contributed to the
3 separation. I didn't find any, but I didn't look at
4 other parts other than that separated surface.

5 Q. And going back talking about number five and the
6 compositional analysis, were you able to do a
7 compositional analysis of the zinc galvanizing materials?

8 A. Yes.

9 Q. And what did you find with number five?

10 A. That it was zinc galvanized. I have the record
11 of the analysis if I can refer to it now.

12 Q. Absolutely.

13 A. What other impurities might be present. This
14 may or may not be present as impurities in the zinc
15 itself that was applied. It could be a manufacturing
16 procedure that resulted in the other elements that are
17 present when analyzing the zinc coating.

18 So item five the zinc coating contains small
19 amounts -- the zinc coating process or the zinc coating
20 itself contains a small amount of lead and cadmium.

21 Q. And how about the compositional analysis on the
22 jumper arm and the brackets? The bracket on number ten,
23 the jumper arm by the left phase of 27/222?

24 A. None of the runners or brackets contained any
25 cadmium. They do contain a small amount of lead when
26 measured when the coating is compositionally analyzed.

1 Q. All right. Okay. So now let's move on. We've
2 talked about compositional and visual examination and
3 some about the others.

4 You also said you did hardness testing on the
5 items; is that correct?

6 A. Yes.

7 Q. Explain to us what is hardness testing.

8 A. So hardness testing measures the resistance to
9 indentation penetration of a material. So a point
10 indenter is pressed into a material with a light load and
11 then the load is increased and then removed. And the
12 amount of permanent defamation that is left behind is
13 representative of the hardness of the material. That is
14 the resistance to scratching, actually resistance to
15 penetration defamation.

16 There's several different types of hardness
17 tests that can be conducted. The Rockwell Test is
18 performed with one of two different types of indenter.
19 Hard materials are tested with a diamond indenter.
20 Softer materials are tested with a spherical tungsten --
21 sorry, a spherical steel carbide ball. And they are --
22 either one of these indenters, depending on the hardness
23 of the material, goes through the process that I just
24 described; a uniform application of a minor load, then an
25 application of major load, then the removal of the major
26 load back to the minor load. And the difference in that

1 penetration depth describes the hardness of the material.

2 By measuring -- by using this very regular test
3 to compare materials, you can compare the resistance to
4 pen -- resistance to indentation of different materials.
5 So you evaluate one material compared to the other.

6 Q. Why is the hardness of a metal significant in
7 your analysis?

8 A. Hardness is a demonstration of the mechanical
9 properties and the material structural resistance to
10 defatation.

11 Q. Okay. But why would that be important?

12 A. The hardness demonstrates several different --
13 has a contribution toward the wear resistance and it also
14 has a contribution or it's in the gift of the tensile
15 strength of the material.

16 Q. So we have up on the board an excerpt from
17 page 2 of your report which is a chart dealing with the
18 Rockwell hardness measurements that you did.

19 A. Yes.

20 Q. And if you could please explain to us that chart
21 on page 2.

22 A. So I measured the hardness on every runner and
23 every bracket on coupons sectioned from those pieces and
24 I also measured the hardness on three of the hooks. Our
25 subject hook item five was separated. Item one is the
26 other cast iron hook. So that's the same type of

1 material as the item five hook. And I used item two as
2 somewhat a representative of the other steel hooks.

3 Doing a hardness test on the hook requires
4 sectioning because the hooks themselves are complex
5 geometry and a hardness test requires support of a flat
6 surface on the opposite side from the flat surface that
7 received the indentation.

8 So I need two opposing parallel flat surfaces.
9 There are no such regions on those hooks. So I had to
10 section those hooks in order to perform the hardness
11 test. I also used those sections for metallography. And
12 in the interest of not damaging the rest of the evidence
13 by cutting it up we only tested these three hooks, but
14 every runner and bracket was tested.

15 Q. All right. I'm going to ask you to define a
16 couple of terms that you used talking about sectioning.
17 What do you mean by sectioning?

18 A. I cut a piece off.

19 Q. And you used the term "coupon."

20 A. Coupon is a small section, a small regular
21 section.

22 Q. All right. So what's the difference between
23 Superficial Rockwell HR30TW and Rockwell HRBW?

24 A. Rockwell HRBW is commonly used throughout
25 manufacturing. Steels -- structural steels in particular
26 fall in a range of hardness. When they are annealed,

1 they are relatively soft and measured with the spherical
2 indenter I described. When they are hardened, they're
3 measured with the diamond indenter that I described.

4 The Rockwell B scale, the HRBW in the right-hand
5 column, describes tests performed with a spherical
6 indenter with 30 kilogram minor load and 100 kilogram
7 major load.

8 Q. Ask you define the term you used "annealed."

9 A. So getting into the microstructure of the steel,
10 steel based on its carbon content may have the ability to
11 be hardened to a point that changes its mechanical
12 property. It's changing the microstructure of the
13 material. An annealed steel has a uniform microstructure
14 that has none of the mark sites that creates a very hard
15 resistance to penetration.

16 Q. All right. And what about -- what is the
17 Superficial Rockwell HR30TW?

18 A. So on samples that are not large enough to
19 receive the heavy load of the 100 kilograms that is
20 applied by the HRB scale, there is a uniform test that is
21 performed with lower loads.

22 So it would be -- I think I might have misspoke.
23 The minor --

24 Let me finish this idea first. The superficial
25 test applies a smaller minor load and a smaller major
26 load than the Rockwell B test. I believe that's a 3

1 kilogram minor load and 30 kilogram major load.

2 My thought process on the Rockwell Hardness test
3 is -- I can't remember the minor load of the Rockwell HRB
4 test right at the moment, but it will come to me.

5 So the Superficial Rockwell hardness values that
6 are listed in the middle column are not directly
7 comparable to the Rockwell values that are listed in the
8 right-hand column because I can't use the same testing
9 conditions. So they're not directly comparable because
10 they're not the same compositions, but within the column
11 they are comparable.

12 So the values of the HR30TW for the three
13 different hooks are reported as item one 61.0 plus or
14 minus 2.6. The 2.6 is the measurement uncertainty with
15 97 percent statistical confidence. I can tell you that
16 that 61 is correct within 2.6 hardness points on either
17 side of the 61 value.

18 So from 59 -- so from 58.4 to 63.6, if I did the
19 math right here, that hardness range -- that hard value,
20 the real hard value does fall within that range. That
21 was calculated by taking into account any uncertainty of
22 measurement from the test equipment, variation in the
23 values that I entered on the particular piece, but it
24 cannot take into consideration the difference in across
25 the entire hook that's only measuring one location.

26 So of the values that I measured I have regular

1 hardness of 61 on item one and 59.1 on item five. So you
2 can see that within that range of measurement uncertainty
3 item one and item five are in the same range. So they do
4 not differ in hardness.

5 Q. And those are the two low carbon cast iron
6 hooks; correct?

7 A. Those are not low carbon. Those are malleable
8 cast iron.

9 Q. Okay. Malleable cast iron.

10 A. Yeah. And item two is the steel. You can see
11 from the value listed there, the 81.1 plus or minus 2.5,
12 that the measurement uncertainty even if I apply that
13 range, it's still much harder than the item one and item
14 five.

15 So what that hardness value tells you is that
16 the item one steel -- or excuse me. Item two steel hook
17 is harder than the item one and item five cast iron
18 hooks. But what it tells me as a metallurgist is that
19 item two steel hook is still a relatively soft steel.
20 It's still being used in its annealed state which is a
21 condition of -- that offers mechanical properties that
22 are good ductility and good toughness for a structural
23 application as an appropriate component for a structural
24 application.

25 The item seven runner -- or all of the runners
26 and all the brackets were measured on the Rockwell B

1 scale. And you can see differences in hardness among
2 those materials, but they all fall within 65 to 81 points
3 of Rockwell B hardness, which again indicates those are
4 annealed steels. Those are soft steels. They have not
5 been hardened. And they are appropriately ductile and
6 tough for structural application.

7 Q. All right. So item one is the broken hook from
8 the left phase of 27/222; correct?

9 A. Item one is the right phase.

10 Q. I'm sorry. Item five is the broken hook from
11 27/222.

12 A. Yes.

13 Q. And item ten is the jumper arm runner from the
14 left phase of 27/222; correct?

15 A. Yes.

16 Q. And the Superficial Rockwell hardness for item
17 five is 59.1 plus or minus 2.6; correct?

18 A. Yes.

19 Q. And the hardness -- the Rockwell Hardness B for
20 the runner, the jumper arm is 73.8 plus or minus 2.9 and
21 for the bracket it's 80.6 plus or minus 3.3. Correct?

22 A. Correct.

23 Q. Now, just looking at these as a layperson, it
24 would appear that there's a big difference in the
25 hardness between the hook and the holes.

26 A. That would be an inappropriate comparison to

1 make.

2 Q. And can you explain for the jury why.

3 A. So within each column feel free to compare the
4 values. Between the columns do not compare the values.
5 This is a different scale of hardness.

6 Consider, if you will, Farenheit versus Celsius
7 degrees. Okay. A degree -- the size of a degree is
8 different on each of those scales. At minus 40 degrees
9 Farenheit and minus 40 degrees Celsius those scales match
10 up. But if you raise the temperature, one cell gets
11 higher faster with the same temperature change so that by
12 the time you reach the boiling temperature of water, you
13 have 212 degrees Farenheit and only 100 degrees Celsius.

14 The same type of thing is happening between
15 those two scales. So at about 50 Superficial Rockwell
16 Hardness 30TW and about 50 Rockwell HRBW, 50 and 50 is
17 about the same. But by the time you get to 100
18 Rockwell B you're only at about 83. I think it's 83
19 Superficial Rockwell. So you can't directly compare
20 those values between those two columns.

21 Q. Is there a formula to convert Superficial
22 Rockwell HR30TW results to Rockwell HRBW?

23 A. There is an ASTM specification for doing such
24 conversions that contains many tables for different
25 materials that allow estimates of conversions from one
26 scale to another scale as long as the materials are the

1 same.

2 So in this case someone could take the value of
3 item two and convert the superficial value into an HRBW
4 scale using the estimation that is documented in -- it's
5 ASTM E140 is the specification designation because they
6 are the same type of plain carbon steel.

7 It would be -- it may be appropriate. It may be
8 not appropriate. And the appropriateness could be
9 analyzed by someone who knows the microstructure of the
10 materials to compare item one and item five through that
11 ASTM specification because those are different materials
12 than the runner materials. That malleable cast iron is a
13 significantly different category of material than the
14 plain carbon steel.

15 Q. All right. And did you do those conversions?

16 A. I did not.

17 Q. So basically to put it in layman's terms, we're
18 comparing apples to oranges here. Is that an appropriate
19 analogy?

20 A. We -- we can use that.

21 Q. Now, does the -- we talked a lot this morning
22 about body-on-body wear. Does differing hardnesses of
23 metal affect body-on-body wear?

24 A. Hardness affects wear, yes.

25 Q. And how so?

26 A. So the harder the material the more resistant it

1 is to wear.

2 Q. Okay. So, for instance, five has the lowest of
3 the three which is our hook that broke?

4 A. Yes.

5 Q. One, which is the hook that was extensively
6 worn, is the second lowest; correct?

7 A. Yes.

8 Q. And those two hooks wore significantly more than
9 the other hooks which were harder or at least the -- the
10 example that we used was harder?

11 A. That's true, but it's not a conclusion that I
12 would draw only from the hardness differences. There may
13 be other significant differences in the geometry of the
14 hook design or the loading application or the duration of
15 service that may have contributed to the difference in
16 the depth of the penetration there that is due to wear.

17 Q. But the hardness itself, I guess, is not --
18 these aren't defective? These are --

19 A. Oh, absolutely not. These are appropriate
20 hardnesses for structural applications that don't
21 anticipate impact.

22 Q. Right. Good point.

23 Your last statement talked about structural
24 applications that do not anticipate impact and that these
25 hooks weren't defective; that they had the appropriate
26 hardness.

1 Could you explain what you mean by "anticipate
2 impact" and how that works.

3 A. So the materials that are here in this form
4 are -- have the hardness that is typical for applications
5 that require good ductility and toughness.

6 And I think I might have misspoke when I said
7 impact. That wasn't a good way to describe this. So
8 being tough means it would have good reasons for impact.
9 So I'm sorry about using a term that wasn't exactly what
10 I mean to say.

11 Q. What is ductility?

12 A. Okay. Ductility is the ability to absorb
13 defatation when I use it in this context. So as a
14 material, as a steel is either alloyed or heat treated to
15 harder and harder hardness levels, the steel would become
16 more resistant to wear but also more susceptible to a
17 brittle catastrophic failure. So it may not be the right
18 material for a load that is applied in an impulse
19 application.

20 Q. Were these-- the metal, the composition of
21 these hooks -- I don't want to use the term correct but
22 appropriate for something that is simply going to hang
23 and hold something?

24 A. So that is demonstrated by the evidence. So can
25 I explain this picture that you've brought up.

26 Q. That's why I brought it up.

1 A. So although these did not -- the item five hook
2 did not resist the wear that it had actually occurred,
3 had the wear not started and penetrated almost all
4 through the hook, the hook would have been perfectly
5 adequate to retain this load that is hanging from it.
6 And that is obvious because I define this as overloaded
7 fracture.

8 So the wear had been through the surface of this
9 hook to almost the entire cross-section -- through almost
10 the entire cross-section. And at all the time that this
11 slot was being worn into this hook, the hook supported
12 the load that was on it until the groove penetrated to
13 the very last bit of this hook.

14 So in reality from this picture, you can see
15 that it only took this (indicating) much of a net section
16 of hook material to hold up the insulation string on the
17 transposition tower for some period of time. It didn't
18 hold it forever because then it broke, but it had to get
19 through all of this (indicating) before it broke. So
20 this hook was strong enough even at half its
21 cross-section to adequately hold the load that was
22 applied to it. And that's -- that information is here.

23 So the hook was strong enough. The wear was the
24 reason it failed.

25 Q. And so moving on to 787.

26 A. So this hook is strong enough. It was retaining

1 its load. Even with this -- only this (indicating) net
2 cross-section of material supported the load of the
3 insulator string -- insulation string on the
4 transposition tower.

5 MR. NOEL: I believe that's all I have.

6 Does the jury have any questions?

7 [Conferring off the record.]

8 MR. NOEL: All right. We have a few questions
9 here from the jurors, written questions that I'll read to
10 you.

11 And before I forget it, I'm sure that once
12 you're done with your testimony here in a few minutes,
13 you're probably going to have a few questions from our
14 court reporter on how to spell some things.

15 So once we excuse you, if you could just hang
16 around for a few minutes. And I'm sure she'll have
17 plenty of questions for you.

18 BY MR. NOEL:

19 Q. "Can cast iron be considered steel?"

20 A. That is not the terminology that is used in the
21 metallurgy discipline.

22 Q. "Is steel stronger or weaker than cast iron?"

23 A. So strength is defined in several different
24 ways. Tensile strength and fracture toughness are all
25 different properties. If we're talking about the basic
26 concept of strength as in tensile strength, steel is

1 stronger in most situations than cast iron.

2 If we're talking about compressive strength,
3 that changes. But in this case, we are dealing with
4 tensile forces, things pulling against each other, not
5 pushing on each other.

6 Q. "Does cast iron or steel wear more quickly?"

7 A. There's several factors that go into wear
8 rights. So it's not only the material. It's the
9 geometry. It's the loading. It's the oscillation. It's
10 anything else in the atmosphere that can break up surface
11 contact, either interfere with surface contact or cause
12 materials to adhere to each other so that the wear is
13 increased.

14 So there's more factors than just the wear. In
15 general, the harder the material the less easily it is
16 worn. Again general but all of those other factors go
17 and come into play.

18 Q. And I guess I cut off the question here. It
19 goes on "Does cast iron or steel wear more quickly when
20 it's subjected to the same stresses?"

21 A. So again, the atmosphere matters, geometry of
22 the part matters. So in these hooks we have two
23 different geometry. Well, actually we have three
24 different geometry. But the steel hooks are similar in
25 geometry to each other and the cast iron hooks have the
26 little rounder cross-section. And that makes a

1 difference in this case.

2 So just by looking at the depth of penetration
3 in the cast iron hooks versus the depth of penetration in
4 the steel hooks we can't determine a duration more or
5 less of exposure to the oscillation just from the
6 material differences. However, the cast iron hooks prove
7 to be a softer material than the one steel hook that I
8 measured. And so if given -- if the geometry is given
9 the same structure, I would expect the cast iron hooks to
10 wear faster than the steel hook under the same
11 conditions.

12 Q. All right. "Given the amount of wear visible on
13 Exhibit 777 that we pulled up on the big board, could
14 close examination of the area of the hook and its runner
15 have anticipated the hook's failure?"

16 A. Any structural component should be inspected for
17 damage. One of the other aspects of my investigation
18 here, my contribution of examination including looking
19 through photographs that were supplied to me from the
20 disassembly process were aerial photographs of assembled
21 components as they were on the towers. And in some of
22 those photos there is visible space between the top of
23 the hole in the runner, the original hole in the runner,
24 and the top of the hook. So the visibility of that
25 material change is evident from a distance.

26 Can you read the question again. Should it

1 be --

2 Q. Yeah. "Could close examination of the area of
3 the hook and its runner have anticipated the hook's
4 failure?"

5 A. Close examination of the hook and its runner
6 immediately before failure would have revealed that there
7 was a problem.

8 Q. And when you're talking about looking at
9 pictures of the hooks and the runners or jumper arms in
10 place before they were disassembled, are you talking
11 about the aerial photographs that were taken by
12 Investigator Nick Moore back on January 31st, 2018?

13 A. I have several dates that were involved.

14 Q. 2019. Yes, 2019.

15 All right. "In this context what would you
16 interpret or what would you define the term 'immediately
17 before failure'?"

18 A. After some penetration of -- after penetration
19 into the groove. I would suspect that once wear began,
20 if the wear penetrated across the hook a small amount,
21 that that would be difficult to notice from a distance.
22 If you knew what to look for, there's always inspection
23 of manufactured parts. If you know what to look for, you
24 can find things faster. That's what happens.

25 But by the time the wear had penetrated down to
26 halfway through the cross-section of the hook, there

1 would be a large gap. Even if -- even if the runner was
2 not also wearing, there would be a visible gap between
3 the interior diameter of the original runner hole and the
4 top of the hook. So to somebody else -- for somebody
5 else to decide whether that is telling enough to go
6 inspect it closer.

7 For me "close inspection" means under a
8 microscope. So I can't do that. I wouldn't be able to
9 tell you if you can tell if that -- I can't tell you the
10 point on which that damage progression would be visible
11 while in place on the transposition tower.

12 Q. And to make sure I got this right earlier, this
13 concept of body-on-body wear is a well-known and
14 well-documented and long-known phenomenon; correct?

15 A. The concept is, yes.

16 Q. So it wouldn't be a surprise that when you have
17 two metals rotating back and forth against each other,
18 that you would have body-on-body wear?

19 A. It's -- the answer to that question is also
20 present in the evidence with the application of the
21 brackets to the runners. So the hole in the bracket -- I
22 mean, the hole in the runner elongated and a modification
23 was made by adding a bracket and then the hole in the
24 bracket elongated too. So wear was evident when that
25 modification to the end of the runner was made.

26 Q. And probably we should go back. You talked

1 about looking at several different kinds of photographs
2 and lots of different parts and pieces earlier. You
3 should probably point out when you first were assigned to
4 this, one of the first things you did was you actually
5 flew out here from Washington D.C. and met with my team
6 and reviewed all the photographs and actually removed --
7 reviewed all the physical evidence at the evidence
8 facility; correct?

9 A. I did not closely examine all of the physical
10 evidence at the facility, but the purpose of a lab
11 examiner to come out to the site is to determine what
12 evidence is appropriate to send to the laboratory for
13 further examination, yes.

14 Q. And as part of that you reviewed photographs of
15 other towers -- for instance, 24/199, 32/260, 35/281 --
16 and requested that we have all the parts removed from
17 those towers and preserved for analysis also; correct?

18 A. It's correct that I did look at other
19 photographs and identified additional parts. But you
20 have now mentioned several towers, and I would have to
21 make sure that I have the right tower numbers.

22 Q. Right. Well, we talked today about 24/199?

23 A. Yes.

24 Q. And that was one of the ones that you identified
25 based upon the photographs and said "Get me the evidence
26 off of those -- that tower."

1 A. That would provide comparable pieces of evidence
2 for analysis, yes.

3 Q. All right. If you were aware that the estimated
4 age of the pieces you examined was in excess of 90 years,
5 would that information affect your professional opinion
6 of the remaining durability of any of the items you
7 examined?

8 A. My role isn't to predict the remaining
9 durability of the items. My role is to only report the
10 wear mechanisms that I see.

11 Q. Okay. "In your professional opinion could
12 structures of metal of any kind manufactured 100 years
13 ago meet the manufacturing practices and standards of
14 current metal structures?"

15 A. Again, that's an opinion. I'm a little more
16 willing to offer the opinion. There has been quite a lot
17 of improvement in material -- structural materials and
18 alloy and technology. So although some of the standards
19 today are wide open, there are better materials and more
20 structural knowledge available today than there were --

21 What did you say? 100 years ago?

22 Q. One hundred years ago.

23 And I should point out, your Ph.D. is actually
24 partially in mechanical engineering; correct?

25 A. No, it is not. It's material sciences and
26 engineering.

1 Q. Okay. I thought it was mechanical science and
2 engineering. I misunderstood.

3 All right. "What is the significance of the
4 speckling on 882?"

5 I'm sorry. Exhibit 822. I'm sorry.

6 Here we go. I'm guessing this (indicating)
7 white would be what is --

8 A. That just looks like an irregularity in the
9 corrosion coating. Sometimes -- so this bracket is zinc
10 coated, and yet there's corrosion evident over most of
11 the surface. So some of the zinc coating has
12 deteriorated in the parts that look orange. Some of it's
13 worn away. And there's deposits of exterior corrosion
14 and some other things in the base material down in this
15 (indicating) region of wear under the hole elongation.

16 So these areas are either areas where something
17 has impacted and abraded the corrosion away and then
18 revealed the base metal or something has spattered onto
19 the material and protected the material from corroding.

20 So it's just an irregularity in the finish. I
21 don't have a good explanation for that, but it wasn't
22 unexpected. It's not unexpected for structural
23 components that are out in the weather to come back with
24 regular amounts of corrosion on different regions and
25 surfaces.

26 Q. "Can you describe in detail the complete chain

1 of custody from the Sacramento FBI field office and
2 sending with your lab."

3 So basically give us the basic explanation.

4 A. I can describe the general process that we
5 normally use, but I don't have the specifics for this
6 evidence.

7 So when an FBI field office retains their
8 evidence, they give the evidence the 1B numbers in order
9 to maintain traceability in our documentation system,
10 "our" being the overall FBI organization. They then
11 package that evidence up and send it FedEx to the
12 laboratory. The FedEx transfer to the shipping
13 organization is documented and the FedEx tracking number
14 becomes the chain of custody identifying number. And
15 when that arrives at the laboratory, that same FedEx
16 number is identified.

17 So that is in FedEx's possession under that
18 tracking number until it arrives at the laboratory. And
19 then at the laboratory the lab chain picks up. So
20 there's a chain of -- a documented chain of custody to
21 the shipping company and from the shipping company to us.
22 And in between it's on the truck under that -- or in the
23 shipping company's possession during that transition
24 phase.

25 We also inspect the packaging so we know the
26 packaging components when they leave the -- described by

1 the submitting agency, and we record that when we receive
2 it at our agency. So we know if anything has been opened
3 in the interim. And that is our standard operating
4 procedures.

5 Other evidence is also delivered in other ways.
6 People can drive in the evidence and make a hand-to-hand
7 transfer would be one other way.

8 Q. So each one of these parts is marked by each
9 agency; correct?

10 A. Either the part or the packaging depending on
11 the size of the part, yes.

12 Q. Right. So like we're looking at Exhibit 819
13 now. It's written "27/222 left phase and left runner"
14 and then in another part of it it's marked, I believe,
15 with the FBI numbers.

16 A. Either this part or the packaging would be
17 marked with the FBI 1B number, yes.

18 MR. NOEL: Okay. See if I can find another
19 example. All right. Okay. I think we got it covered.

20 I should also probably point out that to tie the
21 bow around all of this we will be hearing in the next few
22 weeks from FBI Special Agent Matt Catalano who will
23 testify about picking these things up, taking custody of
24 them from Captain Tom Kluge, and transporting them and
25 putting them in the FBI evidence system.

26 And you will get to hear again

1 from Captain Kluge about how he took these out of
2 evidence, what he did with them, prepped them and handed
3 them off to Agent Catalano. But that's to come in the
4 future.

5 THE WITNESS: One of the advantages of FBI
6 examiners going to the field and saying "Hey, I want that
7 piece of evidence and that one and I can't do much with
8 that one and please send it to me" is I get my eyes on
9 the evidence and know what to expect. So the evidence
10 that arrived to me was what I expected.

11 BY MR. NOEL:

12 Q. Right. And, for instance, let's see. Item five
13 was something you had already seen in the field; correct?

14 A. Yes.

15 Q. And this is the same thing and the same thing
16 with item ten where items that you saw in the field and
17 were able to say when you got them "These are the same
18 things that I looked at"?

19 A. Yes.

20 Q. All right.

21 A. I would like to elaborate one more point on
22 chain of custody. Although I don't have the chain of
23 custody for this evidence with me, it does exist at the
24 laboratory. I just don't have that today.

25 Q. Right. And this is the standard operating
26 procedure for --

1 A. Yes.

2 Q. And it's not like in the movies. We don't
3 handcuff the evidence to somebody and have them carry it
4 onto a plane and keep it with them?

5 A. That sometimes happens.

6 Q. All right. Item 778 through 782. Let's start
7 with 778. "Do you know when the hook was manufactured
8 and installed?"

9 A. I do not.

10 Q. And then the same question for 787 through 792.

11 A. I cannot detect -- determine that from the
12 markings on the hooks or from the manufacturer, the
13 manufacturing from composition or from the manufacturing
14 style.

15 Q. "Do you believe that PG&E should use a different
16 bracket and hook made of different materials?"

17 A. That would be a question to ask a structural
18 engineer. As a metallurgist this material is very
19 strong. It -- it's appropriate material used often for
20 structural applications.

21 MR. NOEL: That's it. Anything further?

22 We have no further questions for you. Madam
23 foreperson will be reading you an admonition.

24 GRAND JURY FOREPERSON: Dr. Marvin, you are
25 admonished not to discuss or disclose at any time outside
26 of this jury room the questions that have been asked of

1 you or your answers until authorized by this grand jury
2 or the Court. A violation of these instructions on your
3 part may be the basis for a charge against you of
4 contempt of court. This does not preclude you from
5 discussing your legal rights with your own attorney.

6 Dr. Marvin, what I have just said is a warning
7 not to discuss the case with anyone except the Court,
8 your lawyer, or the district attorney.

9 Do you have any questions?

10 THE WITNESS: No.

11 GRAND JURY FOREPERSON: Thank you for your time
12 today.

13 [DISCUSSION OMITTED.]
14

15 MR. NOEL: Oh, move the exhibits into evidence.
16 I'm sorry.

17 GRAND JURY FOREPERSON: Okay.

18 [Exhibits 770 through 824
19 admitted into evidence.]

20 GRAND JURY FOREPERSON: And we will meet again
21 on Tuesday at 8:30.

22 MR. NOEL: All right. Thank you, Everybody.

23 GRAND JURY FOREPERSON: Thank you.

24 [Matter adjourned at 11:26 a.m.]

25 --oOo--

OROVILLE, BUTTE COUNTY, CALIFORNIA

JANUARY 14, 2020; 8:30 a.m.

(Confidential Special Grand Jury Hearing Proceedings)

[Proceedings omitted.]

[The grand jury comes to order in Courtroom 9 at 9:06
a.m.]

[Discussion omitted.]

[Grand jury role call omitted.]

MR. NOEL: We will get the first witness.

[Witness enters the courtroom.]

GRAND JURY FOREPERSON: Mr. Stinnett, before you have
a seat, would you please raise your right hand to be
sworn?

Mr. Stinnett, do you solemnly swear that the
evidence you shall give this -- in this matter pending
before the grand jury shall be the truth, the whole truth
and nothing but the truth so help you God?

THE WITNESS: I do.

GRAND JURY FOREPERSON: Thank you. Have a seat,

1 please.

2

3

EXAMINATION

4

BY MR. NOEL:

5

Q. Before we begin, Mr. Stinnett, could you please
6 state your full name, spelling your last name for the
7 record?

8

A. Charles Newton Stinnett, S-T-I-N-N-E-T-T.

9

Q. Okay. Are you currently employed?

10

A. No, sir.

11

Q. Were you previously employed?

12

A. Yes, sir.

13

Q. By whom were you previously employed?

14

A. Pacific Gas and Electric.

15

Q. In what capacity?

16

A. I'm sorry?

17

Q. In what capacity?

18

A. At the time of my retirement, I was -- my title
19 was manager of Transmission System Reliability.

20

Q. How long were you with PG&E?

21

A. I worked for PG&E for 44 years, and I came back
22 on November 15th of 2018 at the request of the company to
23 assist them in the Camp fire to help them identify high
24 risk fire component failures, and I did that for one year.
25 My last date was November 15th of 2019.

26

Q. Can you walk us through PG&E career?

1 A. I hired on with PG&E in 1973 as a groundman,
2 which is a beginning classification. And after one year
3 of working on the ground, then I entered the master
4 apprenticeship program to be a journeyman, line man,
5 that's a three-year program.

6 So in 1977, I became a journeyman lineman, worked
7 at that capacity for about three years, which gave me
8 about ten years of service with PG&E. And I was with
9 actually hired on what they call the general construction
10 part of PG&E's business. You have construction, then you
11 have maintenance. The construction organization is a
12 group that travels throughout the PG&E service territory
13 and does whatever work that the areas have. So it's not
14 localized. It's -- it -- it totally relies on where the
15 work is at.

16 After 10 years, I became a transmission line --
17 excuse me. I became a GC heavy foreman, which is a
18 management job, and my job was to manage a crew of 12 up
19 to as many as 250 people doing reconstruction of
20 transmission lines and/or what we call cut overs or
21 distribution for the various divisions.

22 After 15 years with PG&E, I felt that I had
23 probably maximized what my learning was going to be, and I
24 had an opportunity to go into what they called then was
25 region transmission. Today they call it just TLine
26 organization. And as a transmission line supervisor or

1 region supervisor, my responsibility was two transmission
2 troublemen, and this was right around 1987.

3 Transmission -- there was two organizations, and I won't
4 go into that, but it -- they didn't quite have crews yet
5 so I mainly had transmission troublemen that were doing
6 patrols and inspections of about 3,000 transmission
7 structures of all voltage -- 60, 70, 115, 230 and 500 KV.

8 Shortly after that, within six months or a year
9 that transmission crews came on, and then I supervised
10 those crews to go out and perform the maintenance that was
11 the result of tags that were created by the troublemen
12 from their inspections.

13 And about 1990 -- '90, '91, the electric
14 superintendent that I was working for that worked out of
15 Fresno, he made a decision to retire, and he had been
16 mentoring me, and I interviewed for that position. I was
17 awarded the southern area transmission line
18 superintendent, which basically was from Stockton all the
19 way to Bakersfield. Three crews -- Stockton, Fresno,
20 Bakersfield, and I think there was a total of about 15
21 troublemen and 30 -- 30 line workers, which would be a
22 makeup of a supervisor, a crew foreman, and then three to
23 four linemen that were on that crew. And those were,
24 again, maintenance crews.

25 So I made that decision to leave the
26 construction, because there was a lot of challenges on the

1 maintenance side of the house, and I really wanted to
2 learn as much as I could about what was going on. I
3 enjoyed the transmission side of the house and was pretty
4 fortunate through my career from that time on to be
5 involved with the transmission organization. Then there
6 was another reorg that took place somewhere around '92,
7 '93, and the company made the decision that they wanted to
8 combine both substation and transmission line under one
9 superintendent, and I really didn't have a substation
10 background. I've worked in a lot of substations but it
11 really wasn't where my heart was at, and I was offered a
12 job in Fresno and I declined the position and took my
13 chances hoping that I would get an offer from within the
14 transmission organization and, fortunately, I did. I got
15 a call and was offered a job in the Bay area, but I spent
16 so much time in the Bay area, I declined that job, and
17 then I was offered the job to be the senior transmission
18 specialist for the north -- for the valley, which was
19 everything from Sacramento north, including Eureka was a
20 part of that. And -- and -- and, I'm sorry, also,
21 Lakeville, Petaluma and that was for gentleman by the name
22 of Richard Cashdollar. He was the director at the
23 substation and transmission line.

24 I functioned in that capacity for a couple of
25 years as a senior transmission line specialist, and then
26 they asked me to be a supervising transmission line

1 specialist. Kind of another change in the organization.
2 And I accepted that position and had four direct reports,
3 which covered the Bay area, the southern area, central
4 area and the north area. Functioned in that capacity
5 until there was another change within PG&E, and I was put
6 into a support group. What they wanted to do was separate
7 the -- like, the engineers, the specialists, and the
8 subject matter experts and separate them from the business
9 unit itself. At that time, I accumulated another seven
10 employees on the distribution side. So I had both the
11 transmission distribution throughout the whole
12 transmission system. And that went on for two or
13 three years, and another reorganization, a -- a change.
14 And I went in and -- into the, what they call still today,
15 the transmission asset management department, which
16 included asset management, asset strategy and asset
17 reliability. And the -- and so my role was reliability
18 and that was as a manager to use -- take the data that was
19 supplied from our engineering group and our operation
20 group to look at transmission lines to determine whether
21 they were suitable to be reconstructed or whether they
22 should be removed and replaced. And it was -- it was
23 based primarily on safety, reliability and asset life.

24 When we -- when you look at those categories,
25 what immediate comes to mind, you're looking at the outage
26 history of the line. You're looking at the impact to the

1 customers. How many outages are they seeing? How many
2 can you prevent? So that was really my role. The asset
3 management role was more to look at the asset line and
4 other factors determining when those assets should be
5 replaced.

6 And I functioned in that capacity until the
7 company made the decision to go through another reorg and
8 after 42, 43 years, I -- I just didn't really have it in
9 me to -- to basically train people that I personally -- it
10 was my personal opinion and only that -- well, they didn't
11 have the background that were going to be elite in the
12 organization, and it would also give other people an
13 opportunity. And after 43, 44 years, I felt I had done
14 all I could for the company.

15 Q. Sounds like reorganization is a way of life in
16 PG&E?

17 A. Yes. It -- I think it averaged about every three
18 to five years. It didn't necessarily mean that it was a
19 full reorganization where officers are replaced and -- and
20 those kinds of things. But as the business looked at
21 opportunities and what made best for PG&E as a business,
22 they would restructure and move people into different
23 departments. It's a great opportunity to do -- to do
24 something different or take what you know and help develop
25 others and for you to learn as well.

26 Q. But as a supervisor of pretty much the people on

1 the ground that -- how did that effect you?

2 A. As a transmission line supervisor?

3 Q. Yeah, and superintendent and...

4 A. I'm -- I'm sorry, sir, I don't understand the
5 question.

6 Q. Okay. How did the constant reorganizations
7 effect your ability to get things done?

8 A. It never really -- in the early years of
9 reorganizations, because of my position, it -- the --
10 the -- the new people that were coming in as leaders were
11 people that had a very strong background in the business
12 itself, and so I seen it as a benefit. And it was
13 probably the late 2000, in that period of time, where --
14 and, again, it, you know, it -- it was just me. I -- I'm
15 just a -- I'm a believer in -- in if it's working and it's
16 working well, why -- why would you change it? And the
17 last restructuring, I think, was the -- was the one that
18 was the -- had the biggest impact on me. It was a great
19 opportunity for the person that was coming in to have
20 somebody that -- with my knowledge, me being there, but
21 I -- it -- they were -- I was actually holding other
22 people that I felt would benefit from having that
23 opportunity and had done what -- what I had set out to do
24 in my career.

25 Q. When exactly did you retire?

26 A. I retired -- well, my wife worked for the company

1 as well, and we both set our retirement date for May 1st
2 of 2017. Unfortunately, a month before we retired, I had
3 a seizure. Never had one in my life. And I -- in the
4 seizure, I broke both my arms, and the company kept me --
5 because I was still employed, the company kept me on as an
6 employee until all my medical was taken care of, and --
7 and -- well, they took care of it afterwards -- and
8 afterwards as well. But my official retirement date was
9 October 1st.

10 Hers was May 1st; mine was October 1st. I wanted
11 to end my career -- my hire on date was May 1st. I wanted
12 to end my career on May 1st but, unfortunately, it went
13 beyond that.

14 Q. All right. Let's walk back to when you were a
15 superintendent, transmission superintendent.

16 What are the duties of a transmission
17 superintendent?

18 A. The duties of the transmission superintendent is
19 to manage the transmission system. With all aspects of
20 it, making sure that you've got supervisors that are
21 trained and qualified and have a background to supervise
22 union people. That we would be nonunion as management,
23 and they were -- were union people, and to make sure that
24 they had the skill sets and the training that they needed
25 in order to go out and perform whatever work was generated
26 on the maintenance tags that were created by the

1 troublemen. Make sure that the troublemen were trained
2 and qualified and went through annual -- both TLine crews
3 and troublemen went through annual training as well as
4 refresher training in order to be in the organization.

5 And that superintendent -- or that training, in
6 the early days, back in the '90s, that would be -- that
7 was my responsibility to take the patrols and inspections
8 documents, what we called then T&D, transmission and
9 distribution standards, which outlines specifically
10 what -- what it is you're out there to inspect. What you
11 should be looking for during your inspection. How to
12 create tags and log those tags and initial those -- those
13 tags, and to retain those tags until such time that the
14 work was completed, and that completed work package go
15 back with the tags, and then that all that documentation
16 was retained.

17 I think the rule at the time was for seven years,
18 but what we did is we made sure that we always had the
19 last two -- and I have to be careful with this -- I want
20 to -- I want to clarify because I may say it two different
21 ways. Routine inspections and detailed inspections.

22 Q. All right. Let's -- let me -- I don't mean to
23 cut you off. We will get to that in just a second.

24 A. Okay.

25 Q. So we talked about your duties as a
26 superintendent.

1 A. Yes.

2 Q. And you said that one of those duties was to
3 insure that the TLine supervisors working for you had the
4 training and experience to do their jobs?

5 A. Yes, sir.

6 Q. What type of training and experience did -- was
7 needed to be a TLine supervisor?

8 A. When they interviewed for the job, they had to
9 show or convince me -- even though, I could go through HR
10 to look at their background, but to make sure that they
11 were trained in all aspects of transmission distribution,
12 overhead and underground, and that they had been through
13 the master apprenticeship program and that they were a
14 journeyman lineman. If they were a journeyman lineman
15 then they would be -- they would -- through their raining,
16 they would have spent a minimum of six months -- and
17 that's a bare minimum of six months -- with a construction
18 crew working on towers and wood poles, so they would be
19 familiar with the tower, the -- making sure the tower is
20 safe before they can climb the tower, and that's basically
21 doing a walk around and may require you to get copies
22 of -- from engineering on the tower itself, what was the
23 history -- some history on the tower, you know, it would
24 depend on the type of tower that you're looking at, and
25 how those -- all those parts and those pieces work
26 independently and dependently on one another. That --

1 there are some members in the tower that only become under
2 stress depending on what the -- what we would call either
3 the wind loading of the tower or wind loading on the
4 conductor itself. But for the most part, they would never
5 see heavy mechanical stresses, but the foundation, the
6 legs and the arms, including the outriggers on them, which
7 is the point of the arm where your insulators are going to
8 be attached, whether they're vertical or horizontal-type
9 insulators on it.

10 Q. All right. After being a superintendent for a
11 few years, you moved up to being a -- a senior
12 transmission specialist, correct?

13 A. Yes, sir.

14 Q. And that's when you went to work for
15 Mr. Cashdollar?

16 A. Yes, sir.

17 Q. And how long did you work for Mr. Cashdollar?

18 A. I believe I spent three or four weeks with
19 Richard Cashdollar. It was -- he was a northern area. At
20 the time his title was director of north valley. There
21 were three directors. There was a director in Fresno.
22 There was a director in the Bay area, and a director in
23 the north. They -- and I want to believe that he was in
24 there, in that role, for about maybe two years; and then
25 they did away with the area directors and had all the
26 superintendents at the time -- because they were

1 transmission line and substation -- report to the director
2 who was in San Francisco. And Richard Cashdollar went to
3 San Francisco as manager of what I believe was engineering
4 and support. And I worked for him in that capacity for
5 two or three years before, I want to say, he either
6 retired or we went through a reorg and I went to another
7 department.

8 Q. All right. So what was your duties as a senior
9 transmission specialist?

10 A. The duty of a transmission specialist senior, or
11 a specialist is when you look at PG&E and how it's
12 structured -- so you have the people in the field, you
13 have engineers that are all, at the time, were in the Bay
14 area, and so a lot of questions would come from the people
15 in the field to the engineering crew, but it was more or
16 less apples and oranges because linemen have a tough time
17 talking to engineers and engineers have a tough time
18 talking to linemen. So the creation of the specialist was
19 that -- and in order to be a specialist, you had to have
20 been a supervisor, a transmission line supervisor. So
21 it's kind of a steppingstone.

22 So each area had a transmission and distribution
23 specialist, and the people in the field, when they had
24 questions, they knew that they could go to the specialist
25 that supported them and then the specialist, then, would
26 interact with the engineering group because, as a

1 supervisor, every day you're interacting with the
2 engineering group. You're looking at their drawings.
3 You're looking at their data sheets. You're looking at
4 their job packages so you've -- you've already developed
5 that relationship, so it's kind of a steppingstone on it.
6 And so questions come in out of the field, you try to
7 resolve them if you can yourself without going to the
8 engineer, because there are reference manuals that you can
9 go to get specific instructions on how to deal with
10 concerns that you find in the field. But if you had to go
11 to the engineers, then you could interact with the
12 engineers, and then relay that information back to the
13 field.

14 And then sometimes that would require, or you may
15 consider creating a document that you could foster that
16 could go out to everybody in the system because one area
17 found an issue, you would want to share that with other
18 people on how you resolved those issues.

19 But to be that -- be that support mechanism for
20 the TLine organization or the distribution organization.

21 Q. All right. I want to switch gears a little bit.

22 1987, you took over as a TLine supervisor,
23 correct?

24 A. Yes, sir.

25 Q. You were supervising a couple of troublemen?

26 A. Transmission troublemen.

1 Q. Transmission troublemen, I'm sorry. That was
2 essentially when the troublemen position was created,
3 correct?

4 A. They were actually created the year before. I
5 believe, it was 1986 when they -- when the transmission
6 and distribution separated and the transmission
7 organization was created, and the transmission troublemen
8 were awarded the positions based on their seniority and,
9 so as I mentioned, I had two -- I -- well, fortunately for
10 me, the superintendent I worked for was a -- was one of
11 the forefathers in writing the maintenance and inspection
12 practices that were -- they were using at the time, so I
13 -- I got mentoring from him, but I think I learned more
14 from -- or I didn't learn more, I learned a lot from the
15 transmission troublemen. I was impressed with -- with
16 that attitude and their knowledge -- their knowledge,
17 their commitment. And just the -- very, very good at what
18 they did. And I -- since I only had two people I had to
19 supervise, I got to spend a lot of time in the field with
20 them, asking them a lot of questions, and -- and being
21 able to see the system that I was responsible for. And so
22 that I knew what -- what I was dealing with.

23 Q. Who was the supervisor you said that was such a
24 good mentor, the superintendent when you were the TLine
25 supervisor?

26 A. I'm sorry?

1 Q. You said the TLine superintendent that -- was
2 quite a mentor to you and was very involved in the
3 development of the --

4 A. What was his name?

5 Q. Yeah, what was his name?

6 A. Raul W. Murray. He passed away about 15 years
7 ago.

8 Q. Okay. So I want to talk to you now about the
9 development of the troubleman's program.

10 A. The troubleman program or the electric
11 transmission preventive maintenance manual.

12 Q. We're going to talk about both.

13 A. Okay.

14 Q. The troublemen themselves, you have talked lot
15 about the troublemen when you started as a TLine
16 supervisor. What were the qualifications to be a
17 troublemen back in the -- the late '80s, early '90s?

18 A. You had to be trained, qualified and experienced
19 in working on and around transmission structures.

20 Q. Through your -- your career, did that -- those
21 qualifications necessary to be a troubleman change?

22 A. Those qualifications, if -- and excuse me --
23 the -- I -- I want to say that that language still exists
24 today in the ETPM manual that you have to be trained,
25 qualified and show experience. But I -- since I wasn't
26 part of the 2016 revision, I -- I can't say that it's

1 still there, but it was in there.

2 Q. Good segue into the next question. The training
3 that is required to be a troubleman, were you personally
4 involved in the development of the training troubleman
5 program?

6 A. At one point in my career, I was involved. I was
7 responsible in part of develop -- doing training for
8 transmission troubleman and transmission line supervisors
9 and transmission crew foremen, and in some cases, the
10 linemen on those crews as well, yes, sir.

11 Q. Was that the appropriately 1995 to 2007 period?

12 A. It -- it would be right around that period of
13 time, and I want to say that I probably -- I probably did
14 that for about -- well, I mentioned the TLine supervisor
15 so I want to -- I want to back up on that.

16 We developed a -- an initial and a -- initial
17 training and annual training for transmission troublemen
18 and crew foreman and lead linemen on the crew. That was
19 initially. And myself, and one or two of my other
20 specialists, we conducted that training on an annual
21 basis. After about five years -- so maybe year 2000 -- I
22 approached the director of TLine and shared with him that
23 I felt it would be of more benefit if I trained the
24 supervisors, and then the supervisors are responsible for
25 training their crew members. Because one of the things
26 that -- one of the challenges when you're doing the --

1 doing the training, and even though it was an eight-hour
2 classroom training, the supervisor would tend to be
3 distracted because there was issues going on, whether it
4 would be a car/pole accident in the area, or a report of a
5 person climbing -- climbing a tower somewhere within their
6 area. There were always moments where they may lose one
7 or two hours of the training. And that's what -- that's
8 not what training is all about, but that was just -- you
9 know, that was the -- the business. They had to respond.
10 So by me taking the approach with the director, and I was
11 able to con -- take -- I was able to consolidate the
12 training to -- to adapt to the supervisors, and then
13 during the directors -- one of his or her staff meetings,
14 then they would give me whatever time that I needed to go
15 through the training with them and to update them on any
16 changes that were made as a result of California ISO audit
17 or a CPUC audit where they had made some recommendations
18 to us, and we felt that they were good recommendations and
19 we wanted to adopt them into our filed maintenance
20 practices.

21 So there was a transition on there, and then the
22 supervisors then were annually required to do that
23 training. And I want to say in 2015, '14 or '15, the
24 training then was -- the decision was made by a director
25 of TLine to move that training to Livermore training
26 facility and have the instructors -- excuse me -- have a

1 instructors at the school actually do the training and
2 they, basically, took the training material that we used
3 and modified it more into PowerPoint-type presentation,
4 but to -- also the other good part about having it at the
5 school is the company went to no big expense to -- even
6 though we already had a lot of transmission facilities on
7 the school itself, we wanted to expand that, and so there
8 were a number of other types of framing and structures and
9 switches that were put in there, so I -- I believe it's --
10 it could be as much as a two, three-day, maybe even a
11 five-day school today, but I -- I couldn't -- I really
12 don't know at this point when it is.

13 Q. So, your --

14 A. But everybody had to have refresher and initial
15 training.

16 Q. So did you remain involved in the training until
17 your retirement?

18 A. Once it went to the school, I was no longer
19 involved in it.

20 Q. Okay. And it went to Livermore in 2017?

21 A. 2015. '14 or '15, I believe is when it was.

22 Q. All right. So you continued with some
23 involvement in the training program for the troublemen T
24 -- TLine supervisions until somewhere around 2014, 2015?

25 A. About -- no, about 2010, I want to say, is when
26 the -- we moved -- I moved from actually doing the

1 training myself and with my direct reports to actually
2 doing them -- the updates with the supervisors during the
3 directors staff meetings.

4 Q. Okay. Can you describe for us the development of
5 the content of the training for -- for the T-man and TLine
6 supervisors?

7 A. Well, again, the -- the focus was more on the
8 transmission troublemen, but you have to remember that the
9 transmission troublemen are -- actually function in two is
10 capacities. They perform switching during emergencies.
11 They do switching during routine, if it's for the work
12 that the transmission line crews are performing, as well
13 as having to work with the crews periodically. So the
14 important thing was is -- is the -- you have to make sure
15 that you get the lines inspected. There was -- you -- you
16 try to get these frequencies or timeframes depending on
17 weather and conditions in order to get those inspections,
18 and they can -- they can take a considerable amount of
19 time. You have to be able to be very detailed and -- and
20 I kind of -- being a veteran, you're very structured and
21 that's the way the military trains you. And so I tried to
22 incorporate that into the training, and it -- it -- it was
23 something that the others followed. They -- they thought
24 it was the right way to do it. So I if were to give you
25 an example, and we will do a tower itself, is if you do an
26 inspection, and -- and --I -- I got away a little bit from

1 the question, but -- and maybe I should finish that, and I
2 will come back to the tower.

3 But they -- you don't always have the luxury of a
4 troublemen being 24/7, 365. So then you either have to
5 use a crew foreman, who is the next most qualified person
6 or use somebody on the crew. So it's only logical when
7 you did the training, because it -- if you got a crew
8 foreman, now you got a crew out there that doesn't have
9 anybody to supervise them. And, yeah, you can send them
10 out to put visibility strips on poles or do some bore
11 testing on the poles, but for an eight-hour day of class,
12 it was great just to bring them it, because it helped
13 develop their skills as well. So you basically have a
14 whole transmission group in three different areas. We
15 would do it in Davis, we would do it in the Bay area, and
16 we would do it in Fresno.

17 But the -- the idea behind an -- an inspection is
18 to try to develop a process that you can stay pretty
19 consistent with. So when you walk up to a tower, the
20 first thing you want to start looking at is the
21 foundation. What kind of foundations are they? So
22 there's really two things that you're looking at. You
23 either have direct buried steel or you have a concrete
24 foundation. And so if you got direct buried steel, what
25 you want to do is look at the base of the steel and see if
26 you're seeing any erosion. If there's any kind of, what

1 we call, ponding of water that can accumulate there, then
2 that's a concern because that means when it rains or snows
3 or whatever the case may be, you're going to get water
4 that is settling. We all know that if water settles and
5 settles on metal, it's going to rust, and what you don't
6 want to do is have rust occur.

7 So if you still got a nice mound around the
8 foundation, you may just break it down. If you see
9 something that is concerning to you, then you're going to
10 create a tag for that, and the tag is going to go to the
11 tower department. One of the luxuries in PG&E is that
12 they do have their own tower department. And you create a
13 tag and a -- and a tower expert, somebody that deals with
14 those kind of conditions, can go out and look at it.

15 If it's concrete, if you got cracks in it, then
16 you want to -- you want to document that. You don't
17 necessarily want to do anything yet, but you want to
18 document it, and then you start from each leg and you
19 following the leg all the way to the top of the tower, and
20 you walk around the tower and you do that -- because what
21 you want to do is you want to look at the body of the
22 tower, and then what you're looking at is what we call a
23 bend line. So a tower tends to have a diagonal built into
24 it, and then it goes fully vertical and -- so the lower
25 part is called the body, and then you have the bridge of
26 the tower, which the arms are attached to on it. And you

1 want to look at it, and then you want to look at each arm,
2 and on the arms your looking at -- you're looking -- and
3 -- and you're using binoculars, okay. You're be talking
4 about something that is 100-foot tall, maybe 150-foot
5 tall. And you're just making sure that you're not seeing
6 any -- any rust pockets, you're not seeing bolts that are
7 missing, you can look at those arms and you look at those
8 arms all the way out to, what we call, the hanger plates,
9 and you're going to look at the hanger plates. And people
10 that have had a loft experience can look at that hanger
11 plate. We know that it's approximately an inch in
12 diameter, and there's some type of component that's
13 attached in that hanger plate hole that is supporting
14 those insulators, and so you -- you're -- even though you
15 may not be able to see what is going on with the C-hook,
16 if you've got an inch hole and you got a C-hook that's
17 inch in diameter you probably -- or half inch in diameter,
18 then you ought to be able to see roughly a half an inch
19 gap in it. And if you got good binoculars, you're going
20 to look at it and, if you're not comfortable with it, then
21 you're going to -- you may or may not make a note on it.
22 You're going to -- then you're -- what you're going to do
23 is you're going to look at your string of insulators,
24 you're going to look at your conductors, you're going to
25 look at the dampeners armor rot and -- and those kinds of
26 things. The intent is to --

1 Q. Let's -- let's we kind of got --

2 A. Okay.

3 Q. -- a little far here --

4 A. I'm sorry.

5 Q. I just let you go. The question was, the content
6 of the training for the TLine, TLine supervisions crew
7 leads, and lead linemen. And to see if I can summarize
8 it, it sounds like a big part of the training was
9 essentially here is how you do a detailed ground
10 inspection?

11 A. That is correct.

12 Q. And a systematic approach to the tower starting
13 from the bottom to the top?

14 A. That's correct.

15 Q. Was there specific training with regard to
16 different components of the tower and how to look for
17 wear, corrosion or other flacks?

18 A. In the training, we use -- we use training aids,
19 pictures, photos that have been taken, things that have
20 failed previously in the system that had gone to what we
21 call ATS, which is applied technical support. It's also a
22 dome that we have in San Ramon, it's where we have the
23 metallurgists at, and so we would show those components
24 and talk about those components and how they interact and
25 the things that you need to watch for when you're doing an
26 inspection.

1 Q. For instance, did you know a guy named (WITNESS
2 #17)?

3 A. I do know (WITNESS #17), yes.

4 Q. And when you were TLine supervisor, did you
5 become aware of some C-hooks somewhere -- some C-hooks
6 that (WITNESS #17) found?

7 A. I do not recall that. I believe it happened just
8 prior to me coming into the -- into the TLine
9 organization. I -- I just recall hearing about it. I
10 personally am not aware about -- aware of it.

11 Q. When you talk about using the examples for -- for
12 the TLine -- T-man for the foreman and the lead lineman,
13 what types of examples do you recall using?

14 A. Some of the examples that we used was, what we
15 call, ball-and-socket insulators where the galvanized
16 coating was gone from -- from the ball and socket, and it
17 was a great -- great way of showing and -- and just a
18 number of different types of components that didn't
19 necessarily always mean that they were at a failure point,
20 but there was a good training aid to help people
21 understand that once the galvanize is gone and the coating
22 is gone, that once rust starts, that -- that's an
23 indicator that you need to start monitoring it more. You
24 can say that about C-hooks or white ball connectors. Rust
25 is an indicator that there's no longer protection for that
26 component.

1 Q. Do you -- did you have any -- any worn C-hooks as
2 examples in your training?

3 A. I can recall having C-hooks as part of the
4 training, but they were -- they were actually C-hooks that
5 were manufactured incorrectly. They had black iron in
6 them, and we had to find -- we -- we knew which vender we
7 had bought those from. They were on a specific project.
8 And we had one or two failures on the project after the
9 line was installed, and we went back out and had to remove
10 all of those out of that -- off of that particular line,
11 that lot of C-hooks for that -- for that project.

12 Q. All right. So we've talked a lot about you
13 provided training for the perspective or the -- the
14 working T-man and foreman and lead lineman on how to do a
15 detailed ground inspection, did you always provide
16 training in how to do helicopter patrols?

17 A. We did talk about helicopter patrols and
18 inspections, and remember there's -- there's two parts to
19 it -- on it. Typically, the -- the only time that you
20 would call for a helicopter inspection would be because
21 you've got a landowner that refuses you access onto their
22 property, and you're going to have to work with law
23 enforcement to -- to get access for the next inspection or
24 work with the lawyers that deal with the land related
25 issues on it and -- or as part of a routine ground
26 inspection, there was a condition that you were not 100

1 percent sure was safe and that you wanted to get in the
2 air and get a different view from the air and be able to
3 get in closer.

4 Q. What's the difference between a hotel -- a hotel.
5 A helicopter inspection and a helicopter patrol?

6 A. A helicopter inspection is -- is an inspection
7 where you're -- you're -- you're going to be looking for
8 things that you are not able to see from the ground or you
9 didn't have access, so the only -- the -- the only thing
10 you're not going to be able to see is what's going on
11 at -- at the foundation itself. You can get a pretty good
12 view of it, but typically the way we wrote it in the
13 manual was that you had to do a ground -- you had to do a
14 grounds inspection, if these situations occurred, you were
15 allowed to do a detailed inspection from the helicopter
16 but the next year, you had to be on the ground and the --
17 the one use of the helicopter to do an inspection had to
18 be approved by the superintendent.

19 Q. So what is a -- a helicopter patrol then?

20 A. Helicopter patrol is -- is -- it has a little bit
21 different approach to it. What you're looking for is --
22 is a little bit more of the obvious things that can occur
23 out there. It could be things such as trees that are
24 leaning into the right of way. Dead trees that are
25 outside of the right of way. It could be vegetation is
26 growing in the right of way that's getting in close

1 proximity to the conductor. You're looking for insulators
2 that may be flashed or broken. You're looking for
3 anything that might be hanging on the conductor, it could
4 be -- it's -- it's intended more to look at the top half
5 of the tower. But the -- the air speed is going to be
6 different between the two, and that is really more or less
7 based on the person's skills and -- and how they approach
8 doing those inspections or those patrols on it.

9 Q. Now, you kind of brought this up a little bit,
10 have you been involved in the development of the
11 inspection and patrol policies for the transmission line
12 organization?

13 A. Yes, sir, I have been.

14 Q. All right. Let's go back to 1987, and you should
15 have in front of you a stack of documents.

16 Oh, no, I didn't pull this one. We have this one
17 on the screen.

18 A. I'm familiar with the document, yes, sir.

19 Q. I have up in front you Exhibit No. 608, do you
20 see 608?

21 A. I'm -- I'm familiar with it, yes, sir.

22 [Exhibit No. 608 was identified.]

23 BY MR. NOEL:

24 Q. What is 608?

25 A. It's the requirements for patrols and
26 inspections.

1 Q. And this was the patrols and inspections policy
2 that was in effect when you became a TLine supervisor in
3 1987?

4 A. Yes, sir.

5 Q. All right. And talking a little bit about it.

6 MR. NOEL: And, actually, this would be a good
7 time -- I did need to pull that one, I forgot.

8 It's a little after 10:00. Does the Court want
9 to take a -- I'm sorry, Madam Foreperson, do you want to
10 take a break?

11 GRAND JURY FOREPERSON: Yes, please.

12 MR. NOEL: All right. She's going to read you an
13 admonition and we're going to take a break for a few
14 minutes.

15 GRAND JURY FOREPERSON: Okay. Mr. Stinnett, what I
16 -- you are admonished not to discuss or disclose at any
17 time outside of this jury room, the questions that have
18 been asked of you or your answers until authorized by this
19 grand jury or the court.

20 A violation of these instructions on your part
21 may be the basis for a charge against you of contempt of
22 court. This does not preclude you from discussing your
23 legal rights with your own attorney.

24 What I have just said is a warning not to discuss
25 this case with anyone except the court, your lawyer or the
26 district attorney.

1 Do you have any questions?

2 THE WITNESS: No I don't.

3 GRAND JURY FOREPERSON: Okay, thank you.

4 MR. NOEL: 15-minute break?

5 GRAND JURY FOREPERSON: 15 minutes.

6

7 [Proceedings omitted.]

8

9 [Recess taken at 10:01 a.m. until 10:25 a.m.

10 whereupon the grand jury comes to order in Courtroom 9.]

11

12 GRAND JURY FOREPERSON: All members of the grand jury
13 are present and ready to proceed?

14 GRAND JURY COLLECTIVELY: Yes.

15 THE COURT: Mr. Stinnett, ready to resume the witness
16 chair?

17 GRAND JURY FOREPERSON: Mr. Stinnett, you're still
18 under oath.

19 THE WITNESS: Yes, I am.

20 GRAND JURY FOREPERSON: I wanted to remind you.

21 THE WITNESS: Thank you.

22 BY MR. NOEL:

23 Q. All right. Before we get going, let's go back
24 and clarify, make sure I understood this right earlier.

25 To be a troubleman, someone have has to be an
26 experienced lineman?

1 A. You'd have to have a journeyman lineman
2 background and have to get the experience and have the
3 knowledge.

4 Q. Microphone.

5 A. Yes. They'd have to be a journeyman lineman or
6 line person and have -- be able to demonstrate and have
7 knowledge in the job that they're applying for.

8 Q. So one of the examples that you were using
9 earlier is, you know, when you're talking about doing a
10 detailed inspection and looking for things, would be
11 things like a C-hook in a hanger hole and understanding if
12 it's a one inch hole and a half inch C-hook, you know, how
13 to see wear. But as a journeyman lineman, wouldn't a -- a
14 troubleman by definition have experience in hanging and
15 replacing insulators?

16 A. Yes, sir.

17 Q. Okay. So by the time somebody gets to be a
18 troubleman, they should know what -- how the -- the hooks
19 and holes are supposed to fit together before they ever
20 start?

21 A. Yes, sir.

22 Q. Okay. So now, getting into 608, and madam clerk
23 pulled 608 for us. First thing I want to talk to you
24 about is inspection frequency. And I think that's on page
25 three.

26 A. You think it's on three?

1 Q. Let's see, no, I was wrong.

2 A. Okay.

3 Q. Here let me find it and bingo, there it is.
4 Frequency.

5 A. Okay.

6 Q. So this we're talking about in 608 is the 1987
7 policy for inspection patrols, correct?

8 A. There was the document that was in place when I
9 came into the region transmission department.

10 Q. Okay. And so when we're talking about
11 frequencies of inspection and patrols in 1987, at that
12 time, the different transmission lines were identified as
13 class A, class B or class C circuits, correct?

14 A. That is correct.

15 Q. Do you recall how the distinction was made
16 between class A, class B and class C?

17 A. I cannot remember that.

18 Q. Okay. But for class A circuits: One annual
19 ground patrol, two annual aerial patrols at least six
20 months apart, infrared patrol every three years, and the
21 troublemen were expected to climb five percent of all the
22 structures on each line in each year?

23 A. I remember -- do remember that, yes.

24 Q. Okay. And class B circuits: One annual ground
25 patrol, two annual aerial patrols at least six months
26 apart, infrared every five years and, again, climbing five

1 percent of the structures on each line every year,
2 correct?

3 A. Correct.

4 Q. And that's that 608 says is the policy?

5 A. That the correct.

6 Q. And class C circuits: One annual ground patrol
7 and one annual aerial patrol, correct?

8 A. That is correct.

9 Q. All right. That's what the policy was in 1987?

10 A. Yes, sir.

11 Q. So even the least amount -- the least of the
12 circuits was getting a ground patrol and aerial patrol
13 every year?

14 A. Yes, sir.

15 Q. And that was the policy that was in place from
16 1987 until it was replaced?

17 A. Based on the class of the circuit.

18 Q. Okay. All right. So let's flash forward to
19 1995. And do you remember what you were doing in 1995?

20 A. I was either a senior transmission line
21 specialist or a supervisor specialist at the time working
22 for Rich Cashdollar.

23 Q. Ah. You should have there in front of you, right
24 there in your hands, Exhibit 825?

25 A. Yes, sir.

26 Q. Do you recognize 825?

1 A. I recognize 825.

2 [Exhibit No. 825 was identified.]

3 BY MR. NOEL:

4 Q. What is 825?

5 A. It's a guideline that is to assist in future
6 patrols and inspections to help the supervisor determine
7 the inspection frequency that should be applied based
8 under certain circumstances on it. There's some more
9 descriptive items in it, it's got definition of terms, but
10 it's the beginning of the -- of -- of getting away from
11 the old T&D bulletin and the way you report what you find
12 in the field and your frequencies and your inspections
13 with a proposed new changes in guidelines.

14 Q. Who was the signatory on this policy?

15 A. I believe Rich Cashdollar was the signatory on
16 this document.

17 Q. And did you assist with the -- putting together
18 this document in 1995?

19 A. I want to say yes. I would believe that I would
20 have been part of it working for him. I would have been a
21 member of a team of technical experts that would have
22 developed this document.

23 Q. All right. So let's look through this document.
24 And on page four, there's a table two that defines
25 inspection and frequency -- or inspection frequency and
26 priority.

1 Do you see that?

2 A. Yes, sir.

3 Q. And we have a copy of it up here on the big
4 board.

5 A. Okay.

6 Q. Is that correct?

7 A. That is correct.

8 Q. So under the 1995 policy, four a priority rating
9 one, there would be an aerial inspection every 12 months,
10 a ground inspection every 12 months and a climbing
11 inspection as triggered?

12 A. That is correct.

13 Q. So basically an aerial inspection and a ground
14 inspection every single year?

15 A. That is correct.

16 Q. Under a priority two ranking system, an aerial
17 inspection every 24 months, a ground inspection every 24
18 months and a climbing inspecting as triggered, correct?

19 A. That is correct.

20 Q. So basically every other year, you do a ground
21 inspection one year, aerial patrol the next, ground
22 patrol, aerial patrol, climbing like that?

23 A. That is correct.

24 Q. And then a priority ranking three, an aerial
25 inspection every three years, a ground inspection every
26 three years, and a climbing inspection as triggered?

1 A. That's correct.

2 Q. Do you recall why, in 1995, a decision was made
3 to essentially eliminate routine climbing inspections?

4 A. What I do -- what I recall was the purpose for --
5 and we never removed them, we -- we gave the option as a
6 trigger. So the intent of an inspection is the make sure
7 that you have looked at all the parts and the pieces of
8 the tower, the insulators, the conductor and any
9 associated hardware on it. If you could not see the
10 condition of an -- of a component on the tower, you were
11 going to be required, yourself either to climb it, create
12 a tag and have a towerman come and inspect it, or get a
13 helicopter and view it from the air.

14 Q. Going back just to clarify one thing with --
15 Mr. Cashdollar was the signatory on this document,
16 correct?

17 A. That is correct.

18 Q. But in your experience and PG&E -- would
19 Mr. Cashdollar actually have been the person who wrote
20 this document?

21 A. He would not have been the person that wrote the
22 document.

23 Q. You said probably done by a committee of subject
24 matter experts such as yourself?

25 A. Myself, engineers. There would have been
26 superintendents and -- at least one superintendent and one

1 supervisor from the TLine organization that was part of
2 it. But also remember that in 1995, we were all part of
3 the same organization. We hadn't separated where we
4 were -- where we became a support. So there could have
5 been as many as 20 people on the committee.

6 Q. All right. So we have had routine climbing
7 inspections, or yearly climbing inspections have now been
8 eliminated in '95, and now we have the introduction of the
9 term "as triggered," correct?

10 A. That is correct.

11 Q. Now, I'm sorry, but I'd asked why did they
12 eliminate the climbing inspections, and I am not sure we
13 got to the answer?

14 A. They eliminated the five percent of the climbing
15 inspections and put it as a triggered where it would
16 warrant the person needed to climb, get a different
17 viewing point or have somebody else climb it and inspect
18 it or use another means of access to where they can
19 inspect it.

20 Q. Okay. Why? Why not have someone actually climb
21 up into the tower and look?

22 A. If you're asking me specifically what -- what was
23 the reason for it, I -- I can't explain. I don't recall
24 exactly what our methodology was for doing it.

25 Q. Okay. All right. Let's go on -- go backwards
26 now to page three. And first up it refers to a table two

1 that we're going to get to in a minute, but we also have a
2 definition of triggers.

3 "Triggers are specific findings identified during
4 ruin aerial or ground inspections. If a trigger is
5 identified, it would require a follow-up inspection
6 scheduled by a supervisor independent of the routine
7 schedule. The frequency of a triggered inspection and the
8 best visual position to assess the extent of component
9 defect will assist in the development of priority
10 maintenance trends and needs."

11 Is that what it says?

12 A. That's what it says.

13 Q. All right. And then it defining the following
14 triggers:

15 "Component defects identified by other than the
16 best position for inspection."

17 A. Correct.

18 Q. Can you explain to us what that means?

19 A. I'm thinking about the wording on it. I can tell
20 you what I believe the intent was or what it -- what it
21 should be implying is that if you have looked at all your
22 options, you've taken all your options out there,
23 depending on what the level of the slope -- if you're
24 dealing with slopes -- all -- all these other things and
25 factors that you've used the tools that you have and you
26 can't see it.

1 Q. Okay.

2 A. Then you need to get a different viewing point.
3 And in the manual we do talk about -- not specific in this
4 document here, but we do talk about the parts of the tower
5 and the best view point is --

6 Q. Okay.

7 A. -- for certain conditions.

8 Q. We will get to the manual here in a few minutes.

9 A. Okay.

10 Q. For right now, 1995 to 2005, this is the document
11 that is setting the policy --

12 A. Right.

13 Q. -- establishing the policy. And I guess what I'm
14 asking you to explain if I'm looking more towards you were
15 teaching this to the linemen, and then the line
16 supervisors in those -- and -- and the crew foremen and
17 the lead linemen for years.

18 What were you teaching those people that this
19 first trigger was?

20 A. What I just described.

21 Q. Okay. Next trigger: "Component failure (like
22 components), or proven defective by testing"?

23 A. That goes back to where we've had a report of a
24 failure, we've done the investigation and determined a
25 certain style or manufacturer of a component that has
26 failed and they need to take a look at those in the air,

1 and we have identified which towers and which lines they
2 were installed on.

3 Q. "Wire/structure strike"?

4 A. That would be a situation where some type of
5 aircraft or flying device got in the line, and there was a
6 shock load that occurred on a tower as a result of
7 conductor down or impact to the -- to the structure or the
8 conductor or the shield wire.

9 Q. All right. "Burned area or high fire hazard"?

10 A. Just what it says, "burned area or high fire
11 hazard." If you're doing an inspection and you come
12 across an area where there's been a previous fire, that
13 would be concerning. Or if it's an area that has a high
14 fire hazard area, there's a lot of vegetation growth.
15 It's difficult to get into the right of way or to the
16 structures.

17 Q. "Failures caused by natural disaster or storms"?

18 A. Want me to explain that?

19 Q. Sure. Can you explain how you taught this to the
20 PG&E people for all those years?

21 A. Well, it's basically just what it says, "failure
22 caused by a natural disaster or a storm." So a natural
23 disaster, if we're talking about the state of California,
24 could be a fire. Storms are going to be storms -- heavy
25 winds, ice and snow loading.

26 Q. All right. "Third party observations and

1 complaints."

2 A. Some third-party property owner has -- has
3 obviously seen something or been complaining about noise
4 or a condition that they're concerned.

5 Q. All right. "Marginal capability component of a
6 re-rated line section."

7 A. Maybe a little misleading on the question. A
8 re-rate is a condition where the engineering has made a
9 decision that they're going to increase the load on a
10 line, and there are certain work activities that you want
11 to go out and take a look at to make sure that they're
12 going to be able to support the changes in the mechanical
13 stresses from the loading on it. And there's a conductor
14 size within the line that is of concern. That's what that
15 would be referring to.

16 Q. So something like, say, you wanted to up the --
17 up the -- the juice going through a 60KV line to 70KV
18 line?

19 A. Yes. And you -- and you've got to make sure
20 the -- you can increase the loading, you're increasing the
21 heating of the conductor, which is going to cause more
22 sag. It'll have distribution underbuild. Is there
23 adequate clearance between whether it's PG&E owned or a
24 municipality own it. You don't want -- you can't violate
25 the general orders on it.

26 Q. Okay. "RCM count based data triggers"?

1 A. Okay. Reliability centered maintenance count
2 based data triggers, and I can't answer that.

3 Q. All right. "Known recurring conditions which
4 jeopardize line integrity"?

5 A. Those are specific things on the line that you've
6 been aware of that have not been corrected.

7 Q. Vegetation proximity or fast growth concerns"?

8 A. Exactly what it is stating that there are certain
9 types of vegetations, trees and their growth
10 characteristic. You -- some -- some areas you can get a
11 four-year trim on it, and other areas you have to do it
12 annually.

13 Q. Okay.

14 A. Or you may have a property owner that limits you
15 to what you're allowed to remove because they don't want
16 to see the lines or the structures.

17 Q. Okay. So these are the triggers -- the things
18 that might a trigger climbing inspection starting in 1995?

19 A. I don't believe that that was the statement --
20 that that's what it's stating there. This says, "Triggers
21 are specified findings identified during routine air and
22 ground inspections. If a trigger is identified, it will
23 require a follow-up inspection scheduled by a supervisor
24 independent of the routine schedule. The frequency of the
25 trigger inspection and the best visual position to assess
26 the extent of the component defect will assist in the

1 development of a priority maintenance trends and needs.
2 The following triggers can be applied," so it's talking
3 about triggers that is going to require you to -- on the
4 inspection frequency, it's not talking about a climbing
5 inspection.

6 Q. Oh. So what are the -- what are the defined
7 triggers for climbing inspections?

8 A. It's in the ETPM manual.

9 Q. Well, at this time, there was no ETPM manual
10 correct, this was 1995?

11 A. Yeah, that -- that's correct. I would have to
12 look through the document to see if it's in there.

13 Q. Okay.

14 A. Just to know because I'm not --

15 Q. Please do so. Because I believe --

16 A. Okay.

17 Q. -- it talks about "as triggered," I believe this
18 is the only definition in that document of triggered. You
19 know, I may --

20 A. I don't believe that that indicates anything on
21 there as triggers to requiring a climbing inspection.

22 And also keep in mind that this is a guideline
23 that is a supplement to the existing practices until such
24 time that the ETPM manual is developed.

25 There's nothing specific in this guideline that
26 reference the issue of triggers for climbing, even though,

1 as you have indicated, it does show in here the frequency
2 and what the options are, and it does reference trigger,
3 but that's not what this is intended for.

4 Q. So when would you do -- what trigger would
5 trigger a climbing inspection?

6 A. Because you're unable to see a specific component
7 or element on a tower from the viewing point that you
8 have. That's a trigger.

9 Q. Is that the only trigger for a climbing
10 inspection?

11 A. The only need to try to climb a tower other than
12 work that is going to be required on the tower, which
13 requires climbing the tower, is something that is
14 concerning and needs climbed or an alternative vision
15 point such as a helicopter or an aerial lift vehicle so
16 that you may see that.

17 Q. Okay. Let me ask you this: If there's a part on
18 a tower or on an entire tower line that you say we can't
19 see that from the ground. We can't see it from the
20 ground. We can't tell what its condition is from the
21 ground, but we also can't see it from the air because of
22 various factors that make it impossible for a helicopter
23 to fly close enough and low enough and slow enough for you
24 to see that same component. Would that mandate a climbing
25 inspection?

26 A. That would require a climbing inspection,

1 absolutely.

2 Q. Okay.

3 A. But it doesn't necessarily require that the
4 troubleman be the person that does the climbing
5 inspection.

6 Q. Right.

7 A. It just requires a climbing inspection or the
8 access to the tower because we don't always climb our
9 towers, we have helicopters that put us on tower.

10 Q. Right. And -- and that's a very good point,
11 climbing doesn't necessarily mean climbing. Climbing
12 means getting up into the -- into the bridge of the tower
13 and looking around, correct?

14 A. And to a safe point on the tower, yes.

15 Q. Right.

16 A. Correct.

17 Q. Okay. So if you can't see something from the
18 ground and you can't see it from the air, you should be
19 climbing or getting into that tower to take a look at
20 that?

21 A. You have to find another method to verify what
22 the condition -- you cannot walk away from a tower and not
23 fully inspect the structure. Yes, you as a troubleman
24 have the option to climb the tower, create a tag to have
25 somebody else climb the tower, or get an aerial lift or a
26 helicopter to get you to that location.

1 If you choose to use a helicopter and you can't
2 see it, then the only other option is somebody has got to
3 climb the tower and look at it.

4 Q. All right. So moving on now, we're looking at
5 table two -- or no, table one on the 1995 guidelines.

6 A. Yes.

7 Q. One of the things that we noticed was that the
8 changed -- we're now looking at transmission lines and
9 doing a priority ranking. What is this table on -- on
10 table one on page three?

11 A. These are considerations in prioritizing what is
12 the appropriate inspection frequency or transmission line.

13 Q. Can you explain to us how this works?

14 A. The intent is -- the intent of this is that the
15 supervisor would take this document, go down through, read
16 each -- read each one of those categories as well as the
17 bulletin and give a check mark, and then once you've got
18 all your check marks in, you would check it -- and are you
19 going to show the next page on it? It shows where the box
20 check in table one?

21 Q. We can go back to that, yeah.

22 A. Okay. So when you come up with the total number,
23 then there's a -- a table two, then you use the number to
24 determine what that inspection frequency is going to be
25 for that particular transmission line.

26 Q. So if we can walk through this real quick. Are

1 you familiar are a Caribou-Palermo line?

2 A. I am very familiar with a Caribou line.

3 Q. How are you familiar with Caribou-Palermo 115KV
4 line?

5 A. I have responded to -- the -- the -- probably the
6 most, I won't say recent one, but -- because Camp fire was
7 the most recent one even though I haven't been up on the
8 line. There were four or five towers that collapsed on
9 that line a few years back, and I went up to work with the
10 engineering team to build a shoo-fly, which is basically a
11 temporary route around where the towers had failed until
12 such time that the weather allowed PG&E's tower department
13 to get back in to install/replace towers where those
14 towers collapsed.

15 Q. Okay. So let's assume you're back here as the
16 T-line supervisor at this time, and you're filling out
17 the -- the inspection frequency check list for the
18 Caribou-Palermo.

19 Does it have metered transmission service?

20 A. I won't go through what the intent of those are,
21 that would be very time consuming.

22 Q. Right.

23 A. It's not a metered transmission service.

24 Q. Is it radial feed?

25 A. It's not a radial feed.

26 Q. Is it a distribution substation?

1 A. It does feed a distribution substation.

2 Q. So we got one there.

3 Grid impact: Is it a generation outlets?

4 A. It is a generation outlet.

5 Q. System operations (deemed critical line/system)?

6 A. Yes.

7 Q. WSCC - transfer capacity agreements?

8 A. I don't know that it's on -- I -- I can't say

9 whether it is or not on that one, okay.

10 Q. Re-rated line section?

11 A. It's not a re-rated line. Can you put a question

12 mark by that, Mr. Noel, please?

13 Q. Yep. Structure type. (Wood or steel direct

14 buried) would that apply?

15 A. It's steel direct buried.

16 Q. Conduct loading (snow, ice or high wind area)?

17 A. It is in that area.

18 Q. Insulators/hardware (does not meet present

19 engineering standards)?

20 A. That would be correct.

21 Q. Age of system. It's over 30 years old, it's over

22 50 years old, it's over 70 years old, right?

23 A. That is correct. Oh, you can't check each one of

24 them.

25 Q. You can't check each one? Just one?

26 A. You should only check the one that applies to it,

1 so it's over 70 years old.

2 Q. Why is it not erasing this for me? They taught
3 me a new trick, how to erase with my hand.

4 All right. So you just check off the over
5 70 years there?

6 A. Right.

7 Q. All right. Geographic conditions: Adverse
8 terrain?

9 A. Correct.

10 Q. Extreme weather?

11 A. Correct.

12 Q. Dense vegetation (high fire hazard)?

13 A. I don't -- it's vegetation I can't agree with.
14 High fire area, yes.

15 Q. Accessibility. No heavy equipment?

16 A. No heavy equipment.

17 Q. No medium equipment?

18 A. Yeah, you can get medium.

19 Q. Light equipment?

20 A. Light equipment you can get.

21 Q. Endangered species habitat?

22 A. I don't know that -- if there is on that line.

23 Q. All right. Contamination/corrosion. Coastal,
24 industrial or agricultural?

25 A. No.

26 Q. Historical failures. Structures down?

1 A. In -- when they would use this in '95, no.

2 Q. Okay. But now?

3 A. If you applied it today, yes.

4 Q. Conductor down?

5 A. Yes.

6 Q. Insulators lock out -- to lock out?

7 A. I would say, yes.

8 Q. Historical inspection data. Critical component

9 problems noted? If you don't know that's okay.

10 A. I don't know.

11 Q. Okay.

12 A. I don't know.

13 Q. So, basically, just going through all the -- what

14 we have got -- one, two, three, four, five, six, seven,

15 eight, nine, ten, eleven, twelve, thirteen boxes checked,

16 right?

17 A. That is correct.

18 Q. So going back to our frequency that would put

19 us --

20 A. Priority two.

21 Q. Square in priority two, right?

22 A. That is correct.

23 Q. At the high end of priority two?

24 A. Yes.

25 Q. So that would define that basically every other

26 year. Ground inspection one year, aerial patrol the next?

1 A. For 1995.

2 Q. Yes, from 1995 until the ETPM took effect, right?

3 A. That is correct.

4 Q. All right. The -- when we were talking about
5 that, you brang up your experience during the Shoo-Fly on
6 the Caribou-Palermo in 2012. And did we understand
7 correctly, you said that you installed the Shoo-fly as a
8 temporary solution until the weather cleared and PG&E
9 could get in and replace the towers?

10 A. Yeah. I don't recall the exact month, because
11 there was -- it was wet and there was still snow on the
12 ground so pretty difficult to get in and do the work that
13 you need to do. Even though it was an emergency, you
14 could still cut roads that were necessary to access them,
15 but with the Shoo-Fly, it allows us to wait until the
16 weather or the conditions --

17 Q. So the Shoo --

18 A. -- were more adaptable.

19 Q. So the Shoo-fly really was meant to be temporary,
20 correct?

21 A. It is meant to be temporary.

22 Q. Right.

23 A. Correct.

24 Q. Are you familiar with the term "temporary
25 permanent"?

26 A. No.

1 Q. All right. We refer to that term sometimes and
2 that things are temporary but they're built to be -- to
3 permanent standards.

4 A. Okay. I am not familiar with it.

5 Q. Was the Shoo-fly that was built to replace the
6 towers that fell down in 2012 built for -- although it was
7 temporary -- built for permanent standards?

8 A. It was built per our design standards, but did
9 not have a right of way where we built the Shoo-fly, so it
10 could not remain where it was at. It had to be placed
11 back in the right of way.

12 Q. Do you know how long that Shoo-Fly ended up being
13 in place?

14 A. No, I don't know how long it had been in there.

15 Q. All right. All right. So that's 1995. 2005,
16 what are you doing?

17 A. We're developing the electric transmission
18 preventive maintenance manual.

19 Q. Let's be a little bit more general in terms of
20 what your job was then?

21 A. I'm not sure I understand the question.

22 Q. What was your assignment in 2005?

23 A. To be a subject matter expert with a group of
24 -- PG&E transmission and engineering group in developing a
25 more comprehensive manual designed to be used in a SAP
26 environment, which is -- SAP is just basically a software

1 program that allows you to sort out and -- sort out
2 documents used certain code numbers that are more easily
3 accessible to be able to pull out your next year's
4 inspection records. You can pull out all your open
5 notifications. You can pull out all the closed
6 notifications. It's just a place where all the data is
7 stored.

8 Q. Okay. So we're still talking about the SAP,
9 right?

10 A. We're talking about SAP, yes.

11 Q. Okay. So you have in front of you the binder
12 that is marked as Exhibit 149?

13 See the tag there --

14 A. Correct.

15 Q. -- up on the --

16 A. Yes.

17 [Exhibit No. 149 was identified.]

18 BY MR. NOEL:

19 Q. Do you recognize Exhibit 149?

20 A. I do recognize it.

21 Q. What is Exhibit 149?

22 A. What is what?

23 Q. What is Exhibit 149?

24 A. It's the patrol inspection maintenance records
25 retention manual for transmission line including all
26 standards, guidelines and bulletins associated and linked

1 to the section -- the first seven sections of the ETPM
2 manual.

3 Q. Uh-huh. So was 149 -- did 149 -- Exhibit 149,
4 the ETPM, replace the inspections -- overhead line
5 inspection guidelines issued by Mr. Cashdollar, Exhibit
6 Number 825, in 1995?

7 A. It would have, but I'm not certain that it didn't
8 happen before then. I don't -- I'm not sure.

9 Q. Okay. What would have happened before then?

10 A. It could have been a combination of the old T&D
11 as well as the guidelines. I -- I -- it just -- I
12 can't -- I can't say that this manual replaced what
13 Cashdollar put together --

14 Q. Okay.

15 A. -- in that period -- during that -- that gap in
16 there from the time he left until the time it was
17 developed.

18 Q. You don't recall if there was any further
19 guidelines or anything else?

20 A. I -- I don't.

21 Q. Well, for instance, 825 -- we can go back
22 there -- on the cover page, shows -- there should have
23 been a review date in March of 1998. Every three years.

24 Are you aware if there was a review date? If
25 this was reissued in 1998 or?

26 A. I do not know.

1 Q. Okay. And if this is all we had that would be an
2 indicator that there was none, correct?

3 A. Correct.

4 Q. All right. So getting back to ETPM. All right.
5 Going on page two of this document. There's a chart then
6 that shows the stakeholder/subject matter/technical expert
7 review of the document. See this list of people?

8 A. I do.

9 Q. Is -- Chuck Stinnett, is that you?

10 A. That is me.

11 Q. And these other people, are these the -- is this
12 the group that you talked about earlier being part of to
13 put together this manual?

14 A. It's a stakeholder/subject matter/technical
15 expert review, yes. And there's -- I was a supervising
16 specialist then and Joe Hemstock, Bob Scholler both worked
17 for me, and I worked for Maria Ly. The third person down
18 on the top.

19 Q. All right. So one of the big changes with this
20 was, again, you changed the inspection and patrol
21 frequency, correct?

22 A. That is correct.

23 Q. One thing that you did now, is in 1995, as we
24 just went through, inspection patrol frequencies were
25 determined by the priority code of the line, correct?

26 A. The priority that was developed --

1 Q. Right.

2 A. -- here. Correct.

3 Q. By going that through the checklist and looking
4 at things like age of the tower, history of -- age of the
5 line, history of the line, where the line is located and
6 all of that.

7 In 2005, that's all eliminated, correct?

8 A. That's correct.

9 Q. And now you're strictly looking at the voltage of
10 the line, correct?

11 A. Looking at the voltage and the type of structure
12 as well as some other concerns that we have. Bay waters.
13 We're looking at most critical towers in the system.
14 There's other factors that are built into it.

15 Q. Well, just based upon voltage, correct? 500s?
16 230s?

17 A. As well as the type of -- the type of structure.

18 Q. Okay.

19 A. Structure type.

20 Q. Okay. Why did you eliminate the requirement or
21 the -- the procedure of looking at the line to determine
22 frequency and just go to a straight one size fits all?

23 A. So what I recall -- it's not a one size fits
24 all -- but what I do recall was that there was data that
25 was used based on historical findings to determine what
26 was the appropriate -- appropriate frequency for the

1 voltage in the type of structure.

2 Q. Okay. Now, let's talk about a 115 line. A 115
3 line with a steel structure?

4 A. Right.

5 Q. A hundred year old line going through the Feather
6 River Canyon is going to get the exact same attention that
7 a two year old line in Sacramento is going to get,
8 correct?

9 A. That is correct.

10 Q. So you've eliminated looking at any of the
11 environmental factors, age factors, equipment factors all
12 of that, and if you've got a 115 and it's a steel tower,
13 and it's not in the Bay waters foundation, it's one size
14 fits all?

15 A. That's not necessarily true, because in the ETPM
16 manual, it gives the transmission line supervisor the
17 ability to set the frequency based on his knowledge of the
18 performance of the line.

19 Q. Right. It actually says, "This is a minimum that
20 you're going to do" --

21 A. That's correct.

22 Q. -- "but you can do more if you want," right?

23 A. That is correct.

24 Q. So why are the Bay waters foundation towers
25 treated differently than others?

26 A. Because they're in the bay waters. They're

1 exposed to salt, and salt eats away at concrete and steel
2 faster than natural earth, whether it's in the valley or
3 in the mountains.

4 Q. Okay. So now for the 115 -- for the
5 Caribou-Palermo 115 KV line, steel structures. Now, we're
6 looking at a detailed inspection, ground or aerial, every
7 five years?

8 A. Every five years, yes.

9 Q. So it's gone from every other year to every five
10 years now?

11 A. That is correct.

12 Q. So --

13 A. Well, I don't know that it has or not. I'd have
14 to -- the -- the supervisor may very well have it on a
15 more frequent inspection. And if you ask me if I know
16 that, I don't know that.

17 Q. Right.

18 A. But that is that option.

19 Q. But, again, let's talk about that. Because the
20 superintendent -- or the supervisor does have the option
21 of doing more frequent inspections, correct?

22 A. That is correct.

23 Q. But does the supervisor -- the T-line supervisor
24 have an unlimited budget?

25 A. I can't answer that question. I don't know.

26 Q. When you were a T-line supervisor back in the --

1 in the late '80s, did you have an unlimited budget?

2 A. I did not have to deal with budget.

3 Q. Ah. And how about --

4 A. As superintendent I had to deal with -- with
5 budget, but you budget it based on what you knew about
6 your transmission lines and how long -- how many
7 inspectors you needed and how often -- or what you -- what
8 you were finding out there as a result -- how much time it
9 would take to do the inspection on those lines.

10 Q. Okay. We will come back to that in a minute.

11 A. Okay.

12 Q. All right. And, again, detailed climbing or now
13 we have the term aerial lift. What's an aerial lift?

14 A. A bucket truck.

15 Q. Okay. As triggered?

16 A. Correct.

17 Q. And there are definitions of triggered in there.
18 That's from page 57, a definition of triggers that follow
19 -- that requires follow-up inspections and or maintenance?

20 A. It's not specific to climbing inspections.

21 Q. Okay. Is there a specific definition in there of
22 triggers for climbing inspections?

23 A. I am going to look.

24 Q. All right.

25 A. There's no tabs in here, so it's going to take me
26 a second.

1 Q. All right. Section two, which defines
2 frequencies of inspections, I believe starts around page
3 55, 56.

4 A. Are you attempting to direct me to where it's at?

5 Q. No, I don't know where it's at.

6 A. I went to -- there's a general section of 1.5,
7 which is definition of terms in the book. But it is not
8 specific to climbing triggers, it's -- it's more related
9 to what we have there, but what it says is "condition that
10 may require follow-up inspection and/or maintenance of
11 facility at a frequency different than the intervals
12 determined by line prioritization or condition
13 assessment." And I'm not certain that we put anything in
14 the manual specific to what the -- what the definition of
15 a trigger is other than what we already have in here.

16 Q. Okay. All right. So that's the -- ETPM that
17 takes effect in 2005. Flash forward to 2010.

18 Do you remember what your position in the company
19 was in 2010?

20 A. Looking at the -- looking at the required
21 attendees, I can't recall --

22 Q. No, no, I don't -- I'm not asking about the
23 exhibit yet, I'm simply asking what your position within
24 the company would have been in 2010?

25 A. I was a supervisor in transmission asset
26 management, I believe.

1 Q. Okay. And what -- what does a supervisor in
2 transmission asset management do?

3 A. I supervised a small group of engineers and
4 technical individuals. Looking at reliability and
5 possibly dealing with some issues with asset management.

6 Q. Got it. So you have up in front of you, you have
7 it directly in front of you printed is Exhibit Number 826.
8 See 826?

9 A. Yes.

10 Q. What is 826?

11 A. It's a request -- an e-mail request for
12 individuals to attend a meeting to look at a Quanta
13 report.

14 [Exhibit No. 826 was identified.]

15 BY MR. NOEL:

16 Q. Okay. Let's stop right there.

17 A. Okay.

18 Q. So there's something -- first, it's the T-line
19 structure committee.

20 A. So talking specifically about structures in this
21 one, yes.

22 Q. Okay. So this is a committee that you're part
23 of?

24 A. Correct.

25 Q. All right. And this is setting up a meeting, and
26 then there are a required attendees?

1 A. That is correct.

2 Q. All right. What do to you recall about the
3 purpose of this committee itself?

4 A. I don't recall a lot about meet -- the meeting.
5 When I look at the attendees, and the location of the
6 meeting, I believe that I -- I attended this meeting.

7 Q. All right. I guess I'm trying to be more general
8 than this specific meeting.

9 A. Okay.

10 Q. I am talking about what is the T-line structures
11 committee?

12 A. I'm not a member of the T-line structures
13 committee. I don't know why it's subject that way.

14 Q. Okay.

15 A. But, evidently, they're -- there is something in
16 the Quanta report, and that's why that's the subject
17 matter that is going to be -- going to be discussed.

18 Q. All right. Required attendees: Who are these
19 people?

20 A. Feven Mihretu is a engineer that worked for me.
21 Rich Stockand would be of my peers, he was a supervisor.
22 Randy Hopkins is an engineer. Henry Ho is an engineer.
23 Nick Bhatt is an engineer. Rayond Thierry was my manager.
24 Dale Brock was a -- I believe, during this period of time,
25 he was a -- either a tower supervisor or a senior tower
26 specialist. Then myself. Ron Nixon on an engineer. Jeff

1 Lockwood worked for me, he was subject matter expert. Bob
2 Cory was a supervisor in the tower department, and I can't
3 read the -- the last name that's on there. But he was an
4 engineer. Fahny was a new engineer at the time. I think
5 it -- probably less than that year with the company.

6 Q. Now, it shows that the topic is to review the
7 final Quanta report on T-line structures?

8 A. That is correct.

9 Q. What is Quanta?

10 A. Quanta is a outside contractor that -- a large
11 part of their business is responding to emergencies or
12 building new lines or restructuring existing lines
13 worldwide.

14 Q. Okay. You should have on the desk next to you
15 Exhibit Number 827?

16 A. Yes, sir.

17 [Exhibit No. 827 was identified.]

18 Q. What is 827?

19 A. It is a report from Quanta outlining some
20 recommendations, some findings and comparisons that they
21 have made with PG&E transmission practices.

22 Q. Is this the transmission line structures report
23 from Quanta that was being referred to in February 2010
24 meeting?

25 A. That is correct.

26 Q. All right.

1 A. I believe it's correct.

2 Q. Okay. Now, did you review the Quanta report?

3 A. I have not.

4 Q. All right. Now let's move on. This is 828. Do
5 you see 828 in front of you?

6 A. Yes, I do.

7 [Exhibit No. 828 was identified.]

8 Q. Do you recognize 828?

9 A. Yes, I do. This was an e-mail between Luther
10 Dow, who, at this particular time, was working for Quanta.
11 It's an e-mail to Randy Hopkins who was one of our
12 electric transmission line standards engineers, and I
13 believe it has to do with a conference call -- a one-hour
14 conference call to basically talk about the things that
15 they were going to be -- that they were going to need from
16 PG&E in order to evaluate PG&E's transmission inspection
17 program.

18 Q. Okay. So this is a T-line inspection project
19 conference call --

20 A. Correct.

21 Q. -- correct?

22 A. That's correct.

23 Q. To occur on January 26, 2012?

24 A. Correct.

25 Q. The organizer Luther Dow of Quanta Technology?

26 A. That's correct.

1 Q. Now, did you know Luther Dow?

2 A. Yes, I worked with Luther Dow. Most of the
3 conversations that we have had when I referred to a
4 director, Luther Dow was the director of transmission
5 lines.

6 Q. So Luther Dow was the director of transmission
7 lines with PG&E, and then he moved to Quanta?

8 A. He retired and went to Quanta. That's correct.

9 Q. All right. Harold -- the required attendees:
10 Luther Dow and Harold Taylor. Who is Harold Taylor?

11 A. He was now director of transmission line.

12 Q. So he was the guy that took Luther Dow's place?

13 A. That is correct. I think there was somebody else
14 in there before Harold Taylor came in.

15 Q. Okay.

16 A. But it -- he -- that would have been basically
17 it. Joscelyn Wong is asset management. She's an
18 engineer -- or I'm sorry, transmission planning engineer.

19 Q. All right.

20 A. Rich Stockand was a supervisor in asset manager
21 with myself. Raymond Thierry was our manager. (EMPLOYEE
22 #3), at this particular time, would have been the north
23 area transmission line superintendent.

24 Q. Okay.

25 A. Neil Stockton would been the south -- southern
26 area transmission line superintendent. Nik Bhatt was an

1 engineer, and then myself.

2 Q. All right. And then down here it says, "Team,
3 please plan on attending. PG&E is contracted with Quanta
4 technology to identify industry best practices for
5 controls and inspections and evaluate our practices
6 against those benchmarks. Briefly the scope of work
7 includes the following: ETPM manual and CAISO filed
8 maintenance practice review. Review of inspection
9 processes, industry surveys and research, analysis and
10 evaluation of industry practices."

11 Do you recall that?

12 A. That's what it says, but I don't recall that that
13 --

14 Q. Okay.

15 A. -- is all the things that were discussed on the
16 call. But I -- I -- I recollect that I -- it seems to me
17 I remember being on that call.

18 Q. Okay. Now, let's move up to 829. That is really
19 hard to read on the board, it should be easier to read in
20 printed form.

21 [Exhibit No. 829 was identified.]

22 BY MR. NOEL:

23 Q. If you want to grab the exhibit, the actual
24 physical exhibit. So what is 829?

25 A. So 829 is a e-mail from Randy Hopkins to Joscelyn
26 Wong, myself and John Culbertson. We all three reported

1 to Raymond Thierry, which is in the second half of the
2 page.

3 Q. All right.

4 A. Are you going to read what it says?

5 Q. First off, who is John Culbertson?

6 A. John Culbertson was an acting -- what's the date
7 on this? 2012. He's either acting supervisor with me and
8 Joscelyn or he was an acting manager. I can't recall what
9 our titles were at the time.

10 Q. All right. And --

11 A. I'm sorry, he would have Niel -- Rich Stockand,
12 he would have replaced him on the previous e-mail. Rich
13 Stockand had left and went back to his previous
14 department.

15 Q. Okay. And so we always try and read -- we have
16 to read these things backwards because e-mails are
17 actually organized from newest to oldest. So the oldest
18 would be on the bottom. So let's start with the oldest
19 e-mail and have you read the e-mails.

20 A. So this -- this e-mail is from Raymond, he CC'd
21 Randy Hopkins as well as Joscelyn Wong, myself and John
22 Culbertson, and the subject was PG&E maintenance and
23 inspection review. He says, "Randy, is a Quanta report
24 finalized at this point? John, should we make" -- I think
25 he meant use "of this document in the T-line maintenance
26 strategy," talking about the strategy.

1 Q. Right.

2 A. Part of it. And then Randy e-mails again and
3 it's directed to Raymond and he CC'd the three of us, and
4 he says, "Raymond, the Quanta report is still in draft
5 form. I don't expect to see a lot of changes in the final
6 report. The major takeaway from the drafts are we have a
7 very detailed and comprehensive manual with more detail
8 than what is typical in the industry. There are no gaps
9 between the regulatory requirements of the California ISO
10 GO98 -- CAISO, GO985, GO128 and the ETPM manual. The
11 inspection frequencies with the exception of the 500 are
12 within industry norms. 500 KV inspection frequencies are
13 less than other utilities (we supplement with patrols.)
14 Typical for the industry. The requirements of QCR is
15 relative," and then he clarifies a words on that.

16 Q. Okay. All right. So you guys are expecting
17 another Quanta report, this time on inspections and
18 patrol?

19 A. A final report, that's correct.

20 Q. Okay. So you should have next, Exhibit 8 -- I
21 went the wrong, yeah. Exhibit 830. Do you recognize
22 Exhibit 830?

23 A. I do not recognize the -- I recognize the
24 document, I -- the -- the contents of it, I don't
25 recognize.

26 Q. Okay. All right. But this is a Quanta PG&E

1 transmission line inspection procedures final report?

2 A. Correct.

3 [Exhibit No. 830 was identified.]

4 BY MR. NOEL:

5 Q. Does this appear to be a document that was being
6 referred to in those e-mails --

7 A. That is correct.

8 Q. -- that at that time were in draft form? All
9 right. So you reviewed this report?

10 A. I have not reviewed this -- this document.

11 Q. All right.

12 A. To the best of my knowledge, I don't recall
13 reviewing this document. And I say -- and I say that
14 because I was focused on reliability and not particularly
15 on what the results of this review of our practices.

16 Q. Okay. So let's move on the 831. You should have
17 831 sitting there on top. Do you see 831?

18 A. I do.

19 Q. Do you recognize 831?

20 A. I have seen this document.

21 [Exhibit No. 831 was identified.]

22 BY MR. NOEL:

23 Q. Okay. Let's walk through this document. This
24 appears to be another meeting invite, correct?

25 A. That is correct.

26 Q. And this time, the subject: "Patrols and

1 inspections continuous improvement." Do you recognize
2 being involved in that program?

3 A. I don't recall.

4 Q. All right. The date here, November 12, 2013.
5 The organizer: Hassaun Valentine?

6 A. He was an associate engineer, new to the company.

7 Q. All right. Required attendees: (WITNESS #12)?

8 A. (WITNESS #12) would have been the supervisor at
9 Table Mountain. Pete Dominguez would have been the
10 supervisor at -- in Los Padres. Boris Gankin is the
11 supervisor in San Francisco. These are all for
12 transmission line. I believe that is me, and I say that
13 because my son is also a transmission line specialist, so
14 it kind of gets confusing sometimes on the e-mails, but I
15 believe that would have been me. Niel Stockton was the
16 superintendent for the southern area. Joyce Pefferman was
17 quality assurance, and then Kevin Pancoast, I think his
18 role during this -- he was part of T-line. I'm not sure
19 about his capacity. And (EMPLOYEE #3) would have been
20 transmission line superintendent north. Harold Taylor was
21 a director. Vanita Chhabra, she was the director of a
22 support group as well.

23 Q. All right. So if you can read to us what this
24 meeting was all about down here?

25 A. So the intent of this meeting, it says, "Update:
26 Added Genesys" -- so you could -- you could actually call

1 into it. If I participated, I don't remember whether I
2 was there or called in or I didn't participate at all.
3 But it says "Patrol and inspections has been identified as
4 a critical continuous improvement project for 2014.
5 Please hold this time for the kickoff meeting to discuss
6 in more details. In short, we need to analyze our patrol
7 and inspections to determine efficiency opportunities.
8 Are we doing the right frequency? Are we doing more than
9 the industry standard? How do -- how do our tools,
10 processes and costs compare with others in the industry?
11 Where can we find efficiencies? Forward me any background
12 information that will be of help -- be helpful. Some of
13 you may remember going through a similar process in 2004.
14 Thank you and looking forward to working with you all."

15 Q. All right. So you're looking again to redo your
16 patrol inspection -- your -- your patrol and inspection
17 frequencies in the ETPM, correct?

18 A. Yes.

19 Q. Looking to make them more efficient?

20 A. I guess to see if they're up to -- if we are
21 using the appropriate frequencies, how do we compare to
22 industry standards, and he talks about the processes and
23 costs compared with others in the industry.

24 Q. Okay. Reference to 2004?

25 A. I don't know what he's referencing. Again, I --
26 I don't recall what he --

1 Q. We're talking --

2 A. -- going through this --

3 Q. We're talking about changing the frequencies and
4 inspections again --

5 A. Right.

6 Q. -- in 19 -- in 2014 referencing 2004, but didn't
7 you change the --

8 A. That's about the time that we were developing the
9 ETPM manual, correct.

10 Q. The ETPM was -- the actual, original ETPM was
11 published in 2005, correct?

12 A. Right.

13 Q. That changed the frequencies of patrols and
14 inspections from what it was from the 1995 Cashdollar --

15 A. Correct.

16 Q. All right. So would it be safe to say that
17 you're looking here at a -- at a comparison, if you need
18 to change the -- the frequencies to become more efficient
19 like we did in 1995?

20 A. That's exactly the way that reads, yes.

21 Q. Okay. So now I want to move onto 832, and this
22 will be real quick. This is a slide from a transmission
23 operations, December 2013, EO continuous improvement
24 project status update. Do you recognize this?

25 A. No, I don't.

26 [Exhibit No. 832 was identified.]

1 BY MR. NOEL:

2 Q. What -- do you know what EO continuous
3 improvement project is?

4 A. I don't know what that is.

5 Q. That is actually -- refers to December '13, but
6 it's dated January of '14, right?

7 A. Correct.

8 Q. All right. That -- there's a cover slide. Now,
9 I want to go inside 833, which is a slide from that slide
10 deck from the -- the January '14.

11 [Exhibit No. 833 was identified.]

12 BY MR. NOEL:

13 Q. And this is a slide that is entitled T-line
14 patrol and inspection continuous improvement chart,
15 correct?

16 A. That's what it says, correct.

17 Q. And the sponsors up here, Harold Taylor, (EMPLOYEE
18 #3)?

19 A. That's correct. Harold Taylor, director of
20 T-line; (EMPLOYEE #3), north valley superintendent.

21 Q. All right. And what's it mean to be a sponsor?

22 A. They're the ones that have asked this group to
23 come together and to develop a -- a problem statement, a
24 business objective and a scope. These -- this is a list
25 of all the players and their titles.

26 Q. All right. The lead Hassaun Valentine?

1 A. He -- he was -- like as I indicated earlier, he
2 was a --

3 Q. We don't have to go through that --

4 A. Okay.

5 Q. -- but that's who the lead is on this?

6 A. He's just going to be the lead.

7 Q. All right.

8 A. Correct.

9 Q. Now, we go over here to the team members:
10 (EMPLOYEE #3), Pete Dominguez, (WITNESS #12), Chuck
11 Stinnett, Sam Gutierrez, Gerald Hammer, Damon Caughell,
12 Donna Thorne, Kevin Pancoast, and John Boven. That's what
13 it lists --

14 A. Correct.

15 Q. -- correct?

16 A. Yes.

17 Q. And Taylor, (EMPLOYEE #3), Valentine, (EMPLOYEE
18 #3), Pete Dominguez, (WITNESS #12) and yourself were all
19 involved in the meeting -- the phone meeting that we were
20 just referencing before this exhibit 831, correct? That
21 would have been two months before this slide was
22 published?

23 A. That is correct.

24 Q. So let's walk through this slide. This is for
25 your T-line patrol and inspection continuous improvement.
26 The problem statement: T-line patrols inspections have

1 not been modified in approximately ten years," right?

2 A. That's what it says.

3 Q. So the -- this comes in out in 2014. It was last
4 modified in 2005, so nine years. Relative to frequency
5 and work methods. "There may be opportunities to reduce
6 costs by, one, changing frequencies of patrols/inspections
7 or, two, finding more efficient work practices." Correct?

8 A. That's what it says.

9 Q. So that's the -- the -- the problem statement
10 that you on the T-line patrol and inspections group are
11 looking at, correct?

12 A. That's what it says.

13 Q. So you're looking at -- when we talked about the
14 efficiencies, you're looking at cutting costs in
15 inspection and patrol, correct?

16 A. It's -- we're -- we're looking at it, it doesn't
17 necessarily mean we're going to cut costs, but it's being
18 looked at.

19 Q. Then under objectives: "Define improvements in
20 our frequencies" -- it's a little hard to read on this
21 board. "Tools or processes to find efficiencies in
22 patrols and inspections. Determine frequency of patrols
23 (are we doing more than the industry standard?) Is that
24 what it says?

25 A. That's what it says.

26 Q. So why is the industry standard or you're doing

1 -- maybe doing more than the industry standard important?

2 A. Because there's a bunch of people that believe
3 that we need to be comparing ourselves to what the other
4 utilities in the state of California are doing.

5 Q. State of California or the country?

6 A. Or the -- the United States.

7 Q. Doesn't sounds like you agree with that?

8 A. I don't agree with it.

9 Q. Why not?

10 A. Because California -- you can't -- the only real
11 comparison that you can have between utilities are those
12 utilities that are on the Pacific Coast and that's going
13 to be your municipalities. It's going to be Southern Cal
14 Edison. It's going to be San Diego. It's going to be
15 Oregon Power & Light. It's going to be something up in
16 Washington. We are more dry and arid out here. We don't
17 have a level of humidity. We don't have all the other
18 weather conditions that they have in the Midwest or on the
19 east coast.

20 Q. So if you're comparing your standards to, say,
21 somebody -- you know, in the panhandles of Nebraska,
22 you're comparing apples and oranges. Is that your belief?

23 A. You're -- absolutely, you are. Most of the
24 Midwest and the east, their -- their lines are built
25 horizontally, which a majority of PG&E's lines are built
26 vertical, single circuit or double circuit.

1 Q. But yet, the company is looking at, "Hey, we're
2 doing more than these other people, so maybe we should cut
3 back"?

4 A. I don't know what their intent was on this,
5 Mr. Noel. Nothing changed in the ETPM manual as a result
6 of this effort that they have here, and I can't even tell
7 you that I participated in it.

8 Q. Okay.

9 A. A lot of people put my name on a lot of things
10 because they want me to be there and be a part of it.

11 Q. All right.

12 A. Doesn't mean that I am going to go do it.

13 Q. So going back to this. You talked about
14 earlier -- about climbing inspections, and that ETPM is
15 written so that it says that this is the minimum that you
16 can do, but if you're a T-line supervisor, you can do
17 more, right?

18 A. Exactly what it says.

19 Q. I asked you, well, how does budget play into
20 that? Well, it seemed to be here, they're -- they're
21 saying do even less; is that correct?

22 A. Well, they're not saying doing -- let's -- let's
23 look at these specific issues and see if there's
24 opportunities.

25 Q. Right. We're looking for opportunities to reduce
26 costs --

1 A. Right.

2 Q. -- by changing the frequencies for --

3 A. That's what it says.

4 Q. So in that environment, do you still think a
5 T-line superintendent has the ability to say additional
6 patrols or inspections?

7 A. Yes, they still have the ability to do that,
8 absolutely.

9 Q. And is that going to continue -- is that going to
10 work? Is there going to be a budget there to do it?

11 A. That's going to be between him, his
12 superintendent and the director and they need to weigh the
13 risk.

14 Q. All right. So you brought it up, so let's talk
15 about the ETPM. 2015 -- let me grab them for you because
16 they're all in the box. There's one missing.

17 MR. NOEL: And do we see 2018 somewhere?

18 GRAND JURY SECRETARY: Yeah.

19 BY MR. NOEL:

20 Q. All right. I'll give you two more binders here
21 to look at.

22 All right. First up, Exhibit 155 should be the
23 binder marked 2015.

24 A. 2015.

25 Q. Yep. If you flip it open, there should be an
26 evidence tag on the top right corner.

1 A. 155.

2 [Exhibit No. 155 was identified.]

3 BY MR. NOEL:

4 Q. All right. You recognize what's marked as
5 Exhibit 155?

6 A. I know that there was a revision done in 2015. I
7 was not a participant in the revision of this manual.

8 Q. Okay. But does that appear to you to be the ETPM
9 revised in 2015?

10 A. That is correct.

11 Q. All right. And I want to go back to table three,
12 which defines the overhead inspection frequencies. This
13 is identical to the one in 2005, correct?

14 A. Correct.

15 Q. Now, let's go onto 2018. And I just want to look
16 at -- have you look at that. It says --

17 A. I wasn't employed in 2018.

18 Q. I know. I know but you know the -- you know the
19 ETPM. And it should have the evidence tag Exhibit 289 on
20 the front.

21 A. Maybe the next page.

22 Q. For some reason -- no, I can fix that very
23 quickly. Somehow we're missing an evidence tag.

24 MR. NOEL: Exhibit tag, got one?

25 MS. DUPRE-TOKOS: Do you have one?

26 MR. NOEL: Got one.

1 MS. DUPRE-TOKOS: Do you need a Sharpie?

2 MR. NOEL: Yep, I need a Sharpie.

3 That's 289, right?

4 GRAND JURY SECRETARY: Uh-huh.

5 THE WITNESS: 289, correct.

6 [Exhibit No. 289 was marked for identification.]

7 BY MR. NOEL:

8 Q. There we go. Now it's 289. Now, it's got the
9 exhibit tag on it. And, simply, when -- I will let you
10 identify it. That is a 2018 ETPM manual, correct?

11 A. That is correct.

12 Q. And that was published November 20, 2018?

13 A. Actually just -- I have to correct myself, I
14 actually was back November 15th under contract, so.

15 Q. Doesn't matter. You know the ETPM, you've been
16 doing this for a long time.

17 A. I know the ETPM, yes.

18 Q. Yeah. I don't think in your two years of
19 retirement, you forgot about it, huh?

20 A. I haven't forgot about it. I have no idea what
21 kind of changes they made in it.

22 Q. All right. But, again, I just want to go to --
23 now it's table 11 in here, which defines the inspection
24 and patrol frequency. That's identical to the '15,
25 correct?

26 A. That is correct.

1 Q. Which is identical to the '05?

2 A. That is correct.

3 Q. All right. So they hasn't made any changes. So
4 in '13, '12 and '13, there were discussions of changing
5 frequencies of patrols and inspections to save money,
6 correct?

7 A. That's what the e-mails and some of the meeting
8 notices indicate, that's correct.

9 Q. And that doesn't appear to have happened based
10 upon the ETPM from '15 and '18?

11 A. It doesn't appear that it happened.

12 Q. All right. So let's change topics now. Let's
13 talk about helicopter inspections and patrols. And first
14 off, is there a difference between helicopter inspection
15 and helicopter patrols?

16 A. Yes, there is.

17 Q. Can you explain that to us?

18 A. A helicopter inspection is a detailed inspection
19 identical to a ground inspection with exception to the
20 condition of the foundation or the steel grillage at
21 ground level.

22 A patrol of a line is more of a -- a patrol --
23 yeah, helicopter patrol is intended to take a aerial look
24 at the system at a average speed -- and I can't tell you
25 what -- what -- what speed it should be, but it should be
26 similar to what you do in an inspection, but slightly -- I

1 hate to use the word faster, but that's basically what
2 you're doing. You may be elevated a little bit higher
3 because, during inspection, you're going to be required to
4 circle that tower two or three times in order to look at
5 all parts and pieces in a tower. Different angles. You
6 may have to drop lower on the tower in order to look at
7 the bottom phases and conductors. There's a lot more
8 detail in a -- in a aerial inspection whereas the patrol
9 is -- you're basically looking -- you're doing two things:
10 You have an object list with you from the last inspection
11 or patrol, and you want to specifically look at that tower
12 when you get to it to see if the condition has gotten
13 worse and warrants a new reevaluation of the condition,
14 and there may be cases where that work has been completed
15 already and the tag hasn't been closed out. But you're
16 looking for things in the right of way that can get into
17 the transmission line. You're looking for flash, broken
18 insulators. You're looking for gunshot conductors.
19 You're -- you're able to look ahead as you're approaching
20 the tower to a specific hardware, but you've already done
21 an inspection on it, you shouldn't have to do another
22 inspection. That's not what you're out there to do. You
23 want to find out if something has happened in that right
24 of way or on that structure before the next detailed
25 inspection. That's the difference.

26 Q. I heard with regard to the -- well, if I can just

1 talk about altitude and speed. That with regard to
2 helicopter inspections that generally the troubleman
3 would -- wants to fly low enough and slow enough that they
4 can step out into the tower if they wanted to; is that
5 true?

6 A. If they're comfortable with it, they would be
7 fine. You're not necessarily going to -- it -- it doesn't
8 help you from a viewing point to put you in a helicopter
9 in that type of position.

10 Q. Okay.

11 A. Everybody's eyes are different. And, you know --
12 and the pilot is the command of the ship. You may want to
13 get on top of it, and the pilot tell you "No, that's an
14 unsafe position. We need to move off a little bit. We
15 need to -- we may need to turn around and fly with the
16 nose in the wind," there's other things that you have to
17 take into factor on it.

18 But my practice, and the way that I have done it
19 most of my career and how I taught troublemen and other
20 specialists and other people, was to get approximately a
21 45-degree angle to the tower and -- in doing an
22 inspection, like I said, you have to go -- you have to
23 circle the tower. There's a number of things that you
24 have to look at. And to make sure that you have looked at
25 the things that you know historically are of great
26 concern. So insulators, hardware, hanger brackets,

1 conductors, dampeners, shield wire, armor rot, all these
2 things are components that have a life cycle in them. You
3 need to what the condition of them are.

4 Q. How about in a patrol, a helicopter patrol?

5 A. In a patrol -- as I mentioned, it's not the
6 intent of the patrol to do that level of an inspection.
7 It's to look to see if things have changed out there that
8 are obvious things. Even though you've got a storm coming
9 through, you've got a line that is -- that is relayed or
10 gone to lock out, it was inspected before this routine
11 patrol has taken place. There's two types of patrol. We
12 have an event that happens on the line, you have to go out
13 and investigate it. That cannot be substituted as a
14 routine patrol.

15 Q. Okay.

16 A. So, again, it's looking for a more obvious
17 things.

18 Q. All right. Altitude and -- and speed for routine
19 patrol, helicopter patrol?

20 A. Well, speed is always a hard one to talk about,
21 but I still use low and slow.

22 Q. Okay. So yesterday, we reviewed with you some
23 helicopter records.

24 A. Yes, sir.

25 Q. And first up, there's Exhibit 457. Do you
26 recognize 457?

1 A. Yes, you shared this with me yesterday.

2 [Exhibit No. 457 was identified.]

3 BY MR. NOEL:

4 Q. Right. This looks like a work report or -- for a
5 period, 8/14 of '16. And this shows that on that day, the
6 plan was to do patrols on the Grizzly Tap, the Cresta-Rio
7 Oso line, the Caribou-Palermo line, the Butte Valley
8 Caribou line, the Plumas Sierra tap, 1050 structures in
9 total in a six-hour period.

10 Is that consistent with your practices of
11 helicopters patrols in your experience?

12 A. It's not in my experience, no.

13 Q. It shows that the following day on August 5th,
14 scheduled to do the Oroville-Thermalito-Table Mountain,
15 Oroville-Thermalito-Table Mountain #3, Oroville-Table
16 Mountain, Palermo-Pease, Table Mountain-Butte, Caribou #2,
17 Caribou-Plumas junction. Over almost 1700 structures in a
18 six-hour flight.

19 What do you think of that?

20 A. I -- I -- I don't know how to respond, Mr. Noel.
21 I -- I -- I'm -- as I have seen it yesterday, I am
22 devastated by the information that I see.

23 Q. I think the term that you used yesterday is "This
24 isn't a patrol, this a fly by."

25 A. That is correct.

26 Q. Do you remember that?

1 A. I do.

2 Q. Is that what you feel?

3 A. Yes.

4 Q. We're not patrolling now, we're just flying
5 overhead and waving at the towers as we go by, correct?

6 A. Unless their eyes are better than me and they've
7 got a dozen people in the helicopter. I -- I don't know.

8 Q. Let's move on and go to Exhibit 459. This is an
9 e-mail that's already in evidence. From (WITNESS #18), do
10 you know (WITNESS #18)?

11 A. I know (WITNESS #18), yes.

12 [Exhibit No. 459 was identified.]

13 BY MR. NOEL:

14 Q. And Aja Lodigiani?

15 A. Aieda.

16 Q. Aieda?

17 A. Yes.

18 Q. Okay.

19 A. She's a strategist, transmission strategist.

20 Q. All right. (WITNESS #21)?

21 A. I don't know.

22 Q. (WITNESS #22)?

23 A. (WITNESS #22) is the superintendent in the north.

24 Q. All right. "I completed the following air
25 patrols on 5/17/18: Woodleaf-Palermo, Sly Creek tap,
26 Forbestown tap, Kanaka Tap, Caribou-Table Mountain, Bucks

1 CREEK-ROCK Creek-Cresta. Belden Tap, Orofino Tap. So
2 apparently, all of these transmission lines were done on
3 one day.

4 The next day: Palermo-Colgate, Palermo-Oroville,
5 Glenn #1, Elk Creek tap. What do you think about that?

6 A. It doesn't say how many hours they've flown, and
7 I am not sure. I would have to look in ETGIS to see what
8 the differences are. They're pretty close lines. Some of
9 them are small -- short lines and some of them are long
10 lines. But that's a lot of lines for a patrol in a single
11 day, even if it's eight hours.

12 Q. Right. Are you familiar with the Caribou-Table
13 Mountain line?

14 A. I am.

15 Q. Are you familiar with Bucks Creek-Rock Creek?

16 A. Oh, I'm sorry, I didn't hear you say Caribou
17 Table Mountain.

18 Q. Caribou Table Mountain.

19 A. Yeah. Bucks Creek-Rock Creek-Cresta, yes, I am
20 familiar with it. Belden tap. Orofino, I can't picture
21 it in my mind. Elk Creek, I know. Wood leaf, I know.
22 That's -- that's not a patrol, that's a fly by.

23 Q. All right. We're -- and we're getting there.
24 This is 253. Another e-mail from -- talking about
25 (WITNESS #21) to Aja about scheduling helicopter patrols
26 or helicopter patrols that have gone.

1 [Exhibit No. 253 was identified.]

2 THE WITNESS: Aja -- Aja is a coordinator in
3 helicopter operations.

4 BY MR. NOEL:

5 Q. Right.

6 A. Yes.

7 Q. All right. So this says, "On 9/13 of '16" -- or
8 '17, I'm sorry. "Caribou-Palermo, Caribou Westwood, Butte
9 Valley-Caribou," are you familiar with all three of those
10 lines?

11 A. Yes, I am.

12 Q. You've been doing this for a long time, you said
13 44 years, correct?

14 A. That is correct.

15 Q. You were very involved in the development of this
16 program?

17 A. That is correct.

18 Q. Training the troublemen in how to do these
19 things?

20 A. That is correct.

21 Q. You know the Caribou-Palermo line, correct?

22 A. Every structure.

23 Q. How long would it take you to do a routine patrol
24 in a helicopter in Caribou-Palermo?

25 A. I -- I don't recall exactly what -- what numbers
26 I gave you when we talked about this before, but I have

1 had time to think about -- think more about it, and it
2 would be a minimum of three days and it could be as much
3 as five days.

4 Q. And that's to do a patrol and not an inspection?

5 A. No, that was to do an inspection, I'm sorry.

6 Q. Okay.

7 A. For patrol, you can do that. You can do a patrol
8 on that line, just the Caribou-Palermo -- if I was doing a
9 patrol, it would take me somewhere between six to
10 eight hours just to patrol on that line alone.

11 Q. Okay. All right. So let's move on one more. I
12 think I went the wrong way.

13 GRAND JURY SECRETARY: That's correct, 460.

14 BY MR. NOEL:

15 Q. All right. 460. Exhibit 460. This is A&P
16 helicopter request summary, 18-01226 for helicopter
17 flights on September 11, 2018. You see that?

18 A. I do.

19 [Exhibit No. 460 was identified.]

20 BY MR. NOEL:

21 Q. And right here in the middle is Caribou-Palermo,
22 with it's -- the number, 496 structures, 55 miles and a
23 order number, correct?

24 A. That is correct. But there's also one below
25 that, that's --

26 Q. Yep.

1 A. -- twice the number. Caribou #2.

2 Q. Caribou #2. I guess this is a good time as any,
3 are you familiar with Caribou #2?

4 A. Every pole on it.

5 Q. Is it in your opinion, your experience,
6 reasonable to expect a troubleman to do a annual patrol of
7 just the Caribou-Palermo and the Caribou number two in one
8 day?

9 A. No.

10 Q. All right. So let's move on. Now, we've got
11 461, which is an e-mail that's in -- what I want to point
12 out is this is all foundational for the next one. It says
13 that because of the weather they could not complete
14 Caribou-Palermo. So they had to stop at Belden so 47 of
15 the 55 miles. So they're going -- 47 of 55 miles were
16 done, and then they went and did these other lines instead
17 of the planned lines, which included the Caribou #2
18 because of the weather.

19 [Exhibit No. 461 was identified.]

20 BY MR. NOEL:

21 Q. So now I want to show you what's marked as 834 --
22 and don't worry about any of this -- but do you think it
23 was reasonable that they flew 55 miles in the
24 Caribou-Palermo or 47 miles in the Caribou-Palermo, and
25 the other lines and did that inspection in 5.7 hours?

26 [Exhibit No. 834 was identified.]

1 THE WITNESS: And this -- and this was a patrol?

2 BY MR. NOEL:

3 Q. Yeah, this was a patrol.

4 A. So would you repeat that, again, for me?

5 Q. Is it reasonable doing all these inspections that
6 are listed here -- the Caribou-Palermo, the
7 Oroville-Thermalito-Table Mountain, the Oroville-Table
8 Mountain, the Polermo-Pease, the Oroville-Thermalito. All
9 of those are done in less than six hours, 5.7 hours of
10 flying time?

11 A. All I can say is I couldn't do it in that period
12 of time.

13 Q. So would it be reasonable to conclude that maybe
14 back in '13, when they were looking for efficiencies in
15 how to cut costs in inspection and patrol that maybe
16 instead of changing the frequency, maybe they changed the
17 degree that they were actually inspecting things?

18 A. I guess that's a possibility, I don't know.

19 Q. All right. So when you're flying by in the
20 helicopter -- can you see where we're referring to
21 Exhibit 171 now, the cold-end attachment points?

22 A. I can definitely see the cold-end attachment
23 points.

24 [Exhibit No. 171 was identified.]

25 ///

26 ///

1 BY MR. NOEL:

2 Q. Would you do it the way that you've taught that
3 it -- it's supposed to be done and the way you taught it to
4 be done, correct?

5 A. That the correct.

6 Q. Showing you Exhibit 175, do you see any issues
7 with -- with the tower marked in 175?

8 [Exhibit No. 175 was identified.]

9 THE WITNESS: The issue I see on that tower is that
10 the oval eye and a C-hook both are worn.

11 BY MR. NOEL:

12 Q. How can you tell that?

13 A. Because I see a whole bunch of daylight through
14 the hole.

15 Q. We're talking about right here?

16 A. That is correct.

17 Q. How do you know that that means it's worn?

18 A. Because of experience.

19 Q. All right. Let's move on to 176. See anything
20 wrong in 176?

21 [Exhibit No. 176 was identified.]

22 THE WITNESS: It's worn. Severely worn.

23 BY MR. NOEL:

24 Q. How can you tell?

25 A. From my experience.

26 Q. 267 -- or 266, I'm sorry.

1 [Exhibit No. 266 was identified.]

2 THE WITNESS: It's severely worn. Greater than 50
3 percent metal loss. I can see it.

4 BY MR. NOEL:

5 Q. All right. Are these things that you should be
6 able to see from the helicopter?

7 A. Those are the things that you're looking for from
8 the helicopter and/or on the ground.

9 Q. And what if you say we can't see this from a
10 helicopter?

11 A. Then you create a tag and you have somebody go
12 back and climb the tower or get an aerial lift, or create
13 a tag and get tower department out there to look at it
14 more closely.

15 Q. So if you --

16 A. There are options for you.

17 Q. Right. So if you can't see this from the air,
18 there should be other options, it's not an excuse to say
19 we couldn't see it from the air?

20 A. That's not acceptable. You can't walk away from
21 the tower without a hundred percent inspection completed.

22 Q. All right. I want to show you a couple of more
23 real quick. Let's skip through here. 139.

24 A. May I walk over so I can see it better?

25 Q. Absolutely.

26 [Exhibit No. 139 was identified.]

1 MR. NOEL: And we're already into the lunch hour. We
2 have only got a couple of more things with him, and then
3 -- is that okay with everybody? We will finish up with
4 him and start fresh in the afternoon.

5 THE WITNESS: From a -- from a helicopter, I would be
6 uncertain about the condition of this C-hook, because
7 it's the -- even though it's got a -- it appears that --
8 oh, I'm -- I'm sorry, I take it back. That's got a hanger
9 plate on the backside. I can't see that hanger plate.

10 BY MR. NOEL:

11 Q. Okay.

12 A. So should I explain that to them?

13 Q. Sure. Go ahead.

14 A. Can you hear me okay? On this hanger arm here,
15 you see this dark area there? That's the original
16 position that the bells and insulators were hanging on.
17 It wore out. They -- they made a plate and adapted and
18 bolted it onto the arm and moved the insulators over to
19 it. But you've got to be able to inspect that. If you
20 can't get another viewing point from the helicopter, then
21 it's going to require either you climb it or you have
22 somebody else climb it. You can get an aerial lift in
23 there, which, likely, you're probably not going to do it
24 on this line.

25 I can see this one here. I see too much daylight
26 in it. When I see too much daylight in it, I can't -- I'm

1 not comfortable giving it an echo tag saying it's going to
2 last a year. I am going to create a tag for a bravo,
3 which is going to be three months in order words to get --
4 you got to do it in three months or you got to do it in
5 one year, but under the new rules of General Order 95,
6 12.3, they use the fire Tier. So this particular line
7 would fall within the tier one, so I could make a six
8 month tag out of it.

9 Tier two -- Tier three, you can make a six month.
10 Tier -- I get my tiers mixed. Tier three, you can do a
11 six month; Tier two, you can't do a six month. It's
12 either a three or a six -- or a three or a 12, and then
13 Tier one is not as -- not seen as being part of a fire.
14 It's s thing that is in the valley. Might be in orchards
15 and those kinds of thing.

16 Q. When you're talking about tiers, you're talking
17 about the --

18 A. I'm talk about the fire tier.

19 Q. -- Tier one, Tier two, Tier three, high fire
20 threat district --

21 A. That is correct.

22 Q. -- as defined by the CPUC?

23 A. That is correct.

24 Q. All right. Do you see anything else other than
25 the cold-end attachment points that's wrong with this
26 tower?

1 A. There are things that are concerning to me that
2 would require me to go back. This corona ring. Can you
3 hear me okay? This corona ring here, may be wearing on
4 the jumper and you don't want it to wear and break the
5 strands because eventually it would separate on it.
6 Another thing that concerns -- concerning to me, this here
7 has a -- looks like a Y-ball connector. Y-ball connector
8 is going to kind of mislead you on what the condition of
9 the eye -- the eye is because it's larger than what you
10 would see in a C-hook application. So you'd have to get
11 somebody -- somebody would have to get in stable into the
12 tower to look at that. You have some galvanized issues
13 that are going on here that need to be addressed. They're
14 not an emergency type of an address on it, but if you
15 put -- what will be consistent is what you see on this
16 side of the tower is also -- is exactly what you're going
17 to see on the other side of the tower.

18 MR. NOEL: And before I volunteered you guys to keep
19 working into lunch. I should have asked, are you -- are
20 you guys going to have a lot of questions for this
21 witness, do you think?

22 GRAND JURY COLLECTIVELY: (Nonverbal responses.)

23 MR. NOEL: So maybe we should take lunch then and --
24 and come back. He's still got maybe 10 or 15 minutes of
25 testimony just from me, a couple of exhibits to look
26 through. That way we can get lunch. We have got more

1 witnesses waiting outside that I can send away.

2 Do we want to do that?

3 GRAND JURY FOREPERSON: Yes.

4 THE PEOPLE: Finish up.

5 GRAND JUROR NUMBER THIRTEEN: Why don't we just
6 finish up, and then go to lunch?

7 GRAND JURY FOREPERSON: Yeah, I say finish up.

8 MR. NOEL: Finish up with him and then go to lunch?

9 GRAND JURY FOREPERSON: Yep.

10 MR. NOEL: Okay. All right.

11 BY MR. NOEL:

12 Q. How about the way this insulator on the left is
13 hanging?

14 A. That's okay, as long as it doesn't create any
15 stresses for the shoo or separate what we call the socket
16 to the ball on the bottom of it. We actually teach this
17 in some aspects of it. What you got to be careful with is
18 when you get a loose jumper, can that loose jumper now
19 become a moving object to where it can short circuit into
20 the steel. Obviously, this is not that close. You have
21 to know the design for the tower. It's just the angle
22 that it's taken. But that -- that's okay. Now, what it
23 does, it does create another problem. It will -- by
24 having it in this condition, what you would have to do is
25 be able to look in where those two connectors that are --
26 are located to see if there's a wire brush in there.

1 Because if you don't have a wire brush in there that brush
2 is in there to create an electrical connection between the
3 two parts. You ever notice going down the road and the
4 radio -- you ever hear that buzzing sound going on?

5 That's typically because there's two pieces of electrical
6 connection that are close together and it -- it's setting
7 off a -- a -- an electrical discharge on it. And you'll
8 get ham operators and people like that that will start
9 complaining about it. Doesn't impact the reliability of
10 the line, but it can become a nuisance to other people.

11 Q. One last question about this picture, 139. Why
12 does this insulators look so much different than the other
13 insulators?

14 A. I believe, because this insulator was probably
15 changed out within the first 10 to 20 years of the -- of
16 the line. Maybe it had a lightning strike that occurred,
17 and they had to replace the jumper and so they put in
18 basically the same type of insulator. Typically, when you
19 look as these insulators here, we already know that
20 they're a hundred year old insulators, and they're
21 starting to lose their color and starting to lose the
22 gloss on them as well. And that's why we do infrared to
23 start seeing where, you know, as part of the inspection,
24 are we seeing discharges that are taking place. That's
25 what corona cameras do for you.

26 Q. All right. This thing right here. What is that?

1 A. Okay. So it's a -- this is another one of the
2 trans -- what they call a transposition tower, and I don't
3 have a chalkboard to draw it so I will try to explain it
4 real quickly.

5 So you -- the -- the -- the main part of the
6 conductors are dead ended on insulators on this tower.

7 Q. Oops, I switched -- I switched to go onto the
8 next one.

9 A. Okay. So if you see here, these are dead-end
10 insulators. It looks like they're double string dead end
11 insulators. So you have these transpositions in the line
12 -- and I won't into the theory of the transposition -- but
13 basically what you're doing on this is you're taking this
14 outside phase on this side of the tower, and you're
15 bringing -- bringing it underneath and over to the other
16 side. So everything is doing a roll. You basically --
17 your line is rolling in this direction on it. And this
18 bar that's placed between both of these strings is to help
19 control the movement of the strings of insulators and the
20 jumpers, so.
